This is counter-intuitive, and various investigation of the output seems to suggest that the subroutine that calculates reduced steel area for development length is making an error in calculating the reduced steel area for the Grade 60.

FROM:kkennelly DATE:2/26/2007 1:36:33 PM

The basic dev length of a rebar is a function of the fy of the rebar. See AASHTO Article 8.25.1. The fy is in the numerator of the equations in 8.25.1 so the stronger the rebar the longer the required development length of the bar.

The difference in rating factors can be explained by the following details found in the output file containing the calculations for computing the rebar development length. This file "Std Reinf Dev Length Calcs Log File" can be opened from the "View latest analysis output" toolbar button when the name of your member alternative is selected in the Bridge Workspace tree.

Reviewing the Std Reinf Dev Length Calcs Log File for Reinf. Set #: 4 Bar Mark Def: #10T5, I see the following:

At start of bar:

Computed Dev. Length = 81.93 in

Bar Start Distance = 55.5' + 81.93" = Bar developed at: 62.327 ft

4/19/2016 3:20:03 PM

HRS AASHTO

2288

**Complete Issue Information**

###Error! Bar is not long enough to be considered developed at start and at end. Bar will not be exported!

At end of bar:  
Computed Dev. Length = 81.93 in  
Bar End Distance = 68.5' - 81.93" = Bar developed at: 61.673 ft

###Error! Bar is not long enough to be considered developed at start and at end. Bar will not be exported!

So when the rebar fy is 60 ksi, the rebar in set #4 is not exported to the BRASS engine.

-----  
When the rebar fy is 40 ksi, the required development length is

At start of bar:  
Computed Dev. Length = 54.62 in  
Bar developed at: 55.5' + 54.62" = 60.052 ft

At end of bar:  
Computed Dev. Length = 54.62 in  
Bar developed at: 68.5' - 54.62" = 63.948 ft

The rebar in set #4 is exported when its fy is 40 ksi.

-----  
I see several error messages about bars not long enough to be exported in the Std Reinf Dev Length Calcs Log File when the fy is 60 ksi.

### Description

FROM:xli DATE:2/22/2007 2:15:19 PM  
To reproduce, use attached bridge,  
Analyze G2 - Plate Girder with HL-93  
Report tool/LRFD analysis output/Generate

In generated report, DL moment and shear at 36.67' are all blank. There is a POI at 36.67'.

FROM:hlee DATE:2/23/2007 2:14:09 PM  
The numbers are in the "LRFD Critical Loads" tabular report and also the BWS report. I suspect there's a bug in generating the canned LRFD Analysis Output report.

FROM:kkennelly DATE:5/2/2007 2:43:58 PM  
The report code recognizes the fact that the results for the IDoMemberCriticalLoadsLrfdPtr and the IDoSteelLSSummaryDetailPtr do not use the same point of interest ids so the report checks the distance of the points of interest to find a match for a poi in these tables. The abw\_interest\_pt table has 2 values for the point at 36.67' - 11.17583m (36.6661') and 11.17601m (36.6667'). I don't know why 2 points are generated for this location, I think we get these values from BRASS and have no control over them.

When the report tool checks to see if the poi's match, it uses a hardcoded tolerance of 0.0001 so these points don't match and the dead load is not printed from the IDoMemberCriticalLoadsLrfdPtr. I'm reluctant to change the tolerance because that could result in the report combining output from close points of interest thus breaking what we have working now. However, the tolerance of 0.0001 does seem awful tight.

4/19/2016 3:20:03 PM

HRS AASHTO

2290

**Complete Issue Information**

FROM:kkennelly DATE:5/7/2007 2:38:43 PM  
I relaxed the tolerance to 0.001 and values print out now.

FROM:xli DATE:6/18/2007 11:12:48 AM  
It's still not working for 5.6 Beta3.

FROM:kkennelly DATE:6/18/2007 2:00:26 PM  
Changing the tolerance in the UI to compare the distance of the points in these 2 tables doesn't seem to work in the release build.

Brian, do you know why the results fills up two locations in the abw\_interest\_pt table for the point at 36.67' - 11.17583m (36.6661') and 11.17601m (36.6667')?

FROM:bgoodrich DATE:Wednesday, July 25, 2007 12:58:00 PM  
The point of interest is input at the cross section change of 36.666666'. However, the POI is converted to the BRASS format of 102.2774. Due to limiting the number of digits right of the decimal to four digits, the POI is converted back to a length in BRASS as 161\*0.22774=36.66614. We could revise the export to use six digits for the POI to help avoid this problem.

This issue may also be due to BRASS not outputting actions for POI when only the 10th point output option is turned on. This was just fixed in Incident 7740. I change the Action Output Level to "Print actions at all node points" and the report from the output tool showed actions at 36.67'.

FROM:bgoodrich DATE:Thursday, September 20, 2007 10:52:29 AM  
This issue appears to be addressed with the new BRASS-GIRDER(LRFD) engine released with Opis 5.6.0. The generated report now shows results for 36.67'.

### Description

FROM:dteal DATE:Monday, February 26, 2007 11:13:50 AM

Technical Note 0011 on our support page is misleading. It leads one to believe that using the term and format for "Copy/Convert the data" is an automated process. Like there's a button someplace to copy/convert the Time data.

Our agency has approx. 400 structures that this effects, I have been doing them one at a time as needed.

Version 5.5 and 5.6

From you view/preferences/report tool tab you can set your report tool to open in a new window. Sometimes when you do this the new window is created minimized (I think that's the term) and the only way to view it is to use the pull down – Window - and then select it from the bottom of the list – other times it's not created at all. All you get is quick flash of the cursor hour glass and then it goes away.

Is it supposed to work that way or should it have opened up on your desktop in a new window (that is what I expected it to do)?

If I uncheck this option the report window is created just fine.

FROM:jihnat DATE:3/8/2007 11:21:48 AM

I haven't been able to reproduce this.

Are you running Windows XP SP2 and IE 6?

FROM:dteal DATE:Thursday, March 08, 2007 12:44:42 PM

Yes - XP SP2 and IE6

FROM:jihnat DATE:3/15/2007 8:56:22 AM

Changed project to Support Center, since it's being reported for a released version (5.5).

**Description**

FROM:tarmbrecht DATE:Tuesday, February 27, 2007 5:16:14 PM

In the subject example, PSRtgProb-VSE (0930021).xml, a 4-Span continuous composite PS Bulb-Tee beam, the rating factor values at 0.75' of Span 3 are less than half of the values @ CL of pier w/moment strength controlling. It would seem that the rating factors should be nearly the same or slightly higher.

SPAN 3

=====

```

      MOMENT STRENGTH  RATING FACTORS
X  POSITIVE NEGATIVE  IR    OR
0.00  976.9 -5040.8  1.55 U  2.59 U
0.75  439.8 -5040.8  0.73 U  1.22 U
4.15  5126.8 -5040.8  2.36 U  3.94 U

```

FROM:hlee DATE:3/1/2007 8:48:54 AM

I'm not able to reproduce above low rating factor values at 0.75' of Span 3. I tried both the default tolerances and the tolerance settings listed in Incident 7284. Belows is the output from both runs.

SPAN 3

=====

```

      MOMENT STRENGTH  RATING FACTORS
X  POSITIVE NEGATIVE  IR    OR
0.00  976.9 -5040.8  1.57 U  2.61 U
0.75  439.8 -5040.8  1.66 U  2.78 U
4.15  5139.2 -5040.8  2.17 U  3.63 U

```

Tim, could you try to see whether you can reproduce those values at 0.75' of Span 3? If yes, please attach the generated 72\_\_PS\_Bulb-Tee dat, log, and out files to this incident.

FROM: Tim Armbrecht DATE: 7/11/2008 10:33:16 AM Eastern Daylight Time  
Herman, I had my consultant look at this. here is his response:

I checked it out in v. 6.0 (Beta 4) and got essentially the same results. Pos. moment strength is radically less at the bearing centerline than it is at the pier centerline only 9" away. And the rating factor is much less, It should be almost the same. The example is for lane loading, "SP-1" I think.

I have attached the revised problem report, the v.6.0(Beta4) export file and the three requested output files.

FROM: Herman Lee DATE: 3/14/2010 4:10:11 PM Eastern Daylight Time  
I'm able to reproduce the issue in 6.1 Release. Attached Virtis Std Engine input and output files (61-72\_\_PS\_Bulb-Tee).

4/19/2016 3:20:04 PM

HRS AASHTO

2295

**Complete Issue Information**

Hasmukh, please investigate the reported positive moment strength at Span 3 0.75'.

FROM: HasMukh Lathia DATE: 3/14/2010 9:31:27 PM Eastern Daylight Time

The positive moment strength at 0.75' in Span is much less because it is reduced by a reduction factor k.

Virtis Std Engine uses flexural strength reduction factor k (AASHTO Manual 6.6.3.3) when  $\Phi * M_n$  is less than 1.2 times the cracking moment  $M_{cr}$ . If a rating agency decides not to use provision of this reduction factor, then the rating factor should be calculated using the moment strength without a reduction factor. Also see incident 9615. Providing a user option (an enhancement) to use or not to use this reduction in strength will resolve this issue.

FROM: Herman Lee DATE: 3/15/2010 8:11:48 AM Eastern Daylight Time

Duplicate of Incident 9615.

FROM: HasMukh Lathia DATE: 3/15/2010 12:12:46 PM Eastern Daylight Time

After looking at this issue further, I inquired with PennDOT if their PSLRFD program checks for cracking moment strength at center line of bearing. I got the following response:

PSLRFD does not compute a  $M_{cr}$  between the simple support locations. See the output below. Also, the program only computes and reports the required positive moment connection reinforcement area. It does not use this steel for any other calculations. It is only computed for the continuous only analysis option.

I recommend that Virtis Std Engine should not compute  $M_{cr}$  and use the strength reduction factor k between the bearing lines at piers. This would be an enhancement to Virtis Std Engine.

### Description

FROM:tarmbrecht DATE:Tuesday, February 27, 2007 5:20:14 PM

From my consultant:

In the subject example, PS-ViProb (0930021).xml, two POI's, @ 37.75' & @ 38.25' of Span 1 in a 4-Span continuous composite PS Bulb-Tee beam, were specified. As indicated in the BRASS output below (see attached Word document), the values for "Shear concurrent with maximum mom." are radically different, 0.17 kips for the first, and 30.45 kips for the second. By inspection and experience, one would expect the two values to be close to the same and within 80% or so of the "Live load pos shear" (~35 kips) since they are only 0.6% of the span away from each other. Please advise.

FROM:bgoodrich DATE:Wednesday, February 28, 2007 5:58:43 PM

I investigated the issue and was able to duplicate the problem using the following tolerances:

| Unit | Tolerance |
|------|-----------|
| ft   | 0.01      |
| in   | 0.125     |

FROM:bgoodrich DATE:Wednesday, February 28, 2007 6:00:26 PM

This issue can sometimes be fixed by increasing the wheel advancement denominator. I tried 100, 150, and 200, but the concurrent shear went from one extreme to the other and then back again. Next, I ran the bridge (with the various wheel advancement denominators) with the latest BRASS-GIRDER engine. For all cases, the concurrent shear at the points in question was around 30 kips, which is reasonable. This engine will be included in the next major release.

### Description

FROM:rcurtis DATE:Wednesday, February 28, 2007 11:14:55 AM

I have a structure of post-tensioned, side-by-side box beams that has no deck. There is a wearing surface and sidewalks.

Currently, BRASS is modelling the structure with all of the loads being treated as DC1, even though they are entered as DC2.

Is there a fix for this other than inserting a fictitious deck thickness?

FROM:kkennelly DATE:2/28/2007 2:21:21 PM

I'm assuming that you want the wearing surface on the Structural Typical Section window to be considered composite because if it is not composite there is no difference in the loads being applied to DC1 or DC2. (The section properties would be due to the beam acting alone if the wearing surface is not composite for both stage 1 and stage2)

Virtis does not consider the thickness entered on the Future Wearing Surface tab to be made composite with your beam. It is considered to be a non-structural overlay.

I think this workaround will work:

Specify the strength of the wearing surface as the Deck Concrete material on the Structure Typical Section: Deck (Cont'd) tab. Specify the thickness as zero on this tab.

Specify a deck range on the Deck Profile: Concrete tab that has 4" for the structural thickness and an eff flange width and then specify that the vertical shear reinf extends into the deck on the Shear Reinforcement Ranges window. Then BRASS will apply the DC2 loads to stage 2.

You should verify that the Stage 1 and Stage 2 section properties in the BRASS output file reflect what you want to model and that the dead loads are correct.

## Complete Issue Information

| Name | Current State | Summary |
|------|---------------|---------|
|------|---------------|---------|

### Description

FROM:dteal DATE:Wednesday, February 28, 2007 2:31:22 PM

In the wearing surface tab of the structure typical section, the load case.

Why do we get a choice of load cases when DW or Not assigned are the only ones that will be used?

We treat Silica Fume Overlays as structural, and we would code them DC2. But selecting DC2 will result in DW when Opis is run.

These other choices shouldn't even be there.

FROM:jduray DATE:3/8/2007 8:35:29 AM

Is this issue new to 5.6 Beta 1?

If not it should be changed to a support center incident and investigated under our maintenance task.

FROM:dteal DATE:Thursday, March 08, 2007 9:25:47 AM

Not a 5.6 beta issue

Version 5.5 and earlier

FROM:jduray DATE:3/8/2007 10:20:37 AM

You can define a many load case descriptions as you want - the window doesn't have knowledge of a specification so it can't filter load cases based on stages (and I don't think it should).

I assigned the wearing surface to DC1 and the results are different than when it was assigned to DW so it seems the export is applying as requested (for both Opis and Virtis).

I assigned the wearing surface to DC2 and the results matched the results produced when it is assigned to DW

FROM:bgoodrich DATE:Tuesday, March 13, 2007 8:34:15 PM

I believe the issue that Dean is referring to is the warning in the log file:

WARNING (High):

The load case assigned to the Wearing Surface is not a DW type!

The wearing surface is always applied to a BRASS DW load case in the specified stage.

The load is getting into BRASS just fine, but it is being factored as a DW load and Dean would like it factored as a DC load.

The BRASS export takes the information on the wearing surface tab as a non-structural wearing surface and applies this to the stage assigned to the dead load case assigned to the wearing surface load. If the wearing surface load is input using the BRASS "wearing surface" command parameters, BRASS assumes the load is DW, which is why the warning is printed. BRASS uses these commands for the automatic dead load distribution as well.

Regarding ways to address this issue, one alternative would be for the export to determine the distributed wearing surface weight, which would take a fair amount of effort given all the distribution methods (tributary, transverse simple-beam, transverse continuous-beam, etc.). Another alternative would be to modify the BRASS engine to allow the assignment of a dead load type (DC or DW) to the

4/19/2016 3:20:05 PM

2300

**Complete Issue Information**

wearing surface load.

FROM:jduray DATE:3/14/2007 12:43:25 PM  
Seems like this is an enhancement, not a bug.  
I think the change should be made in BRASS rather than the export since that is probably a lot easier.  
I'm changing the incident to Enhancement for Brass.

FROM:dteal DATE:Monday, March 19, 2007 11:04:41 AM  
I don't think this is a BRASS issue, it's a GUI issue.

I think we all missed the point here.  
In the wearing Surface Tab the user can assign a load to DC2 but it will NEVER get exported and analyzed as a DC2 load, it will ALWAYS be analyzed as a DW load case with DW load case factors.

We are letting the user believe they are getting DC2 load case factors and behind the scenes we give them DW factors.

DW should be the only load case available, the others should be grayed out.

Some agencies consider wearing surfaces such as silica fume, structural (DC2 Load) and not simply a wearing surface (DW).

## Complete Issue Information

Where did it get THAT idea without being told? Or, alternatively, where did we tell it?

Steven Maberry, NMDOT

FROM:kkennelly DATE:3/12/2007 4:16:37 PM

Email question from Joe to Steven:

Did "5-Girder system Span 7" always have 1 span and 5 girders? Or was it originally something else?

Email response from Steven:

There is a small possibility that the "5-Girder system Span 7" MAY have started as 1 span and 7 girders. Not sure if it did or not. The person who is trying to model the bridge says he MAY have started it that way thinking the longer span would control--then later changed it when he realized he would have to model all spans to find the controlling span.

FROM:smaberry DATE:Friday, March 23, 2007 3:37:30 PM

FROM:kkennelly DATE:4/2/2007 11:00:07 AM

Email sent to Steven on 4/2/07:

I'm unable to reproduce any steps that cause this situation to occur. Something must have gone wrong with the internally computed G5 member length and the values written to the database when inputting the skewed supports, splayed girder spacing and flared deck width but I can't determine what went wrong.

Do you need the data in this xml file to be corrected to continue working with this structure? If you do I will try to repair the values written to the database. Otherwise I will leave this incident as "Not reproducible".

FROM:kkennelly DATE:4/2/2007 11:08:58 AM

FROM:kkennelly DATE:4/9/2007 8:10:25 AM

Email received from Steven on 4/6:

To reproduce the error in Incident 7891, take the steps outlined below. This procedure FIRST fixes the problem (see the web site where I reported a work around), then reproduces the problem.

Load the XML file that is attached to Incident 7891

FIX THE PROBLEM:

- 1) Double click on SUPERSTRUCTURE DEFINITIONS>> 5-Girder System Span 7>> G5  
VERIFY that G5 shows a second span (length 0.000018)
- 2) Double Click on SUPERSTRUCTURE DEFINITIONS>> 5-Girder System Span 7>> "Framing Plan Detail."
- 3) Change Skew degrees from 45 to 0 for both supports.
- 4) Click "Apply"
- 5) Change the Skew degrees BACK to 45 for both supports.
- 6) Click "Apply" or "OK"

THIS fixes the problem. You can verify that it has been fixed by going back to G5 and noting that the

4/19/2016 3:20:05 PM

HRS AASHTO

2304

**Complete Issue Information**

second span has disappeared.

**REPRODUCE THE PROBLEM:**

- 1) Go To SUPERSTRUCTURE DEFINITIONS>> 5-Girder System Span; double click to open.
- 2) Change the Span Length from 70.74 to 75.
- 3) Click "OK"
- 4) Go back to G5 and note that the beam has again acquired a new second span (0.000056 feet)

Looks like a recalculation problem when the span length is changed on a skewed, splayed structure.

FROM:kkennelly DATE:5/7/2007 2:04:50 PM  
Fixed for version 5.6.

Problem was in the DoGirderSystemStructDef:SetSpanLength() function. Code for setting girder mbr ref line lengths did not work for splayed girders.

FROM:xli DATE:6/15/2007 3:04:20 PM  
Verified resolved with 5.6 Beta 3.

**Description**

FROM:ttompson DATE:Tuesday, March 13, 2007 1:15:00 PM

I was looking for some help to run a SQL script against my ASA DB so the Member Alternative for ASD has BRASS ASD selected. When we imported all of our structures into Virtis, it only populated BRASS LFD for LFD Analysis Module.

I suspect it's an easy script, but wanted assistance. Thanks.

We are currently 5.3.0 and waiting for our IT folks to install 5.5.0 running ASA 9.0.1

FROM:ttompson DATE:Tuesday, April 10, 2007 2:19:34 PM

We are upgraded to 5.5.0 with ASA 9.0.1

FROM:hlee DATE:4/26/2007 8:50:42 AM

E-mail reply to Todd:

=====

Todd,

Please find the attached SQL script. The script will set the ASD module to "BRASS ASD" for all the member alternatives/definitions that have "BRASS LFD" set in LFD module. The script has been tested against both 5.3.0 and 5.5.0 Sybase databases. You could run the script using Sybase Interactive SQL and log in as the owner of the database. Make sure you have a backup of the database before running the script.

Please let me know if you have any questions.

Herman

In the attached bridge, using member G1

In the Beam Details, Continuity Diaphragm tab

Leave the "ignore positive moment at supports in ratings" un-checked

When you run an LRFD Design review, there are no Design Ratio failures.

Check this box, Now I get design ratio failures.

When we give instructions to ignore this in Virtis, why is it effecting Opis results?

FROM:kkennelly DATE:5/21/2007 12:47:20 PM

The engine related help for BRASS LRFD does not say that this data is ignored so I think it is functioning as intended.

FROM:dteal DATE:Wednesday, May 30, 2007 10:54:36 AM

The help states:

## Complete Issue Information

"Ignore positive moment at supports in ratings

Check this box to ignore the positive moments at the supports in the rating calculations"

The problem is that checking this box effects design calc's when it should only effect rating calc's??

FROM:bgoodrich DATE:Wednesday, June 06, 2007 9:53:20 AM

I think Dean is correct that this "Ignore..." checkbox should only apply to ratings. I can revise the export to ignore this field for a design review, but will this change affect existing bridges? If users checked this box for a design review, then the bridge will not be analyzed because there will be no reinforcement over the interior supports. Could another checkbox be added for a design review, similar to the Structural Slab Thickness checkboxes for rating and design on the structure definition window?

FROM:kkennelly DATE:6/6/2007 12:06:55 PM

Dean - do you want 2 checkboxes on this window? The boxes would be as follows:

1. the existing check box "Ignore positive moment at supports in ratings"
2. a new check box "Ignore positive moment at supports in design"

Does it get even trickier? When you do a design review using BRASS LRFD, BRASS LRFD also computes rating factors. Do you want the pos moments considered for design but not for the rating factor calculations?

Brian, am I correct in my following assumptions on how these check boxes work?

1. Check the box to ignore pos moment in ratings -
  - 2 things happen: a. Positive creep, etc moments are not deducted from the DL moment at the support
  - b. Connection steel not checked for the positive creep, etc. plus pos live load at the support.

FROM:dteal DATE:Thursday, June 21, 2007 7:35:06 AM

I would like to see it stay with the one check box "Ignore positive moment at supports in ratings" and I think we would want to consider Pos moments for design.

FROM:dteal DATE:Thursday, June 21, 2007 8:46:20 AM

FROM:bgoodrich DATE:Wednesday, July 25, 2007 1:18:09 PM

BRASS calculates the factored moment at the support from all loads, including dead, live, creep, shrinkage, etc. If this result is positive and the "Ignore positive moment at supports" is checked, then BRASS bypasses the flexural calculations for that POI. BRASS also has an option to ignore the negative moment at supports too. How should we proceed?

FROM:kkennelly DATE:7/26/2007 2:55:07 PM

Dean, I think there are some users who achieve continuity by extending the PS strands and cannot adequately describe this condition in Virtis/Opis. They will need to be able to specify to ignore the positive moments so I don't think we can force everyone to always consider the positive moments in design.

Therefore we are thinking that we should resolve this issue by:

1. Revising the wording on the checkbox to read "Ignore positive moment at supports" and continue to have this checkbox exported to both Virtis and BRASS. Our thinking is that if you don't consider it in design you won't want to consider it in rating either so one checkbox will suffice.

**Complete Issue Information**

What are your thoughts?

FROM:kkennelly DATE:7/26/2007 3:05:25 PM  
Refer to incident 4683 for why we implemented this checkbox in Opis.

FROM:dteal DATE:Wednesday, August 01, 2007 2:51:40 PM  
FROM:dteal DATE:Wednesday, August 01, 2007 2:51:40 PM  
Here are my thoughts/comments:

- 1. It seems to me that the original "intent" of the check box was to ignore Pos Mu at supports for ratings (ratings only and not for design). I think the original intent should be cleared up.
- 2. The user , in my opinion, should have the flexibility to check the box for rating and not checking it for design. Again, back to the original intent, the way the user thought it was working.

Solutions:??

- 1. Provide two check boxes, one to ignore Pos Mu over supports for Rating and one for Design.
- 2. When migrating to the new version, if the single box was checked for rating then let the migration utility check both boxes. If the box wasn't checked, then leave both boxes blank in the new version. Results for both Virtis and Opis will remain unchanged unless the user manually changes the box condition after migration.

**Complete Issue Information**

```
return ANALYSIS_FAILED;
}
```

After the failure I cannot analyze again (in a debug build). Program asserts in CCmdTarget::InternalRelease().

FROM:kkennelly DATE:3/21/2007 1:24:02 PM  
Response email sent to Rob:

I looked into your problem and found that in the Deck Profile: Deck Concrete tab you have defined the concrete deck over a range from 0' to 135'. The members in your bridge have a length of 137'. The FE model that is being generated by Virtis has an error in it due to the last 2' of the beams not having a concrete deck defined on the Deck Profile: Deck Concrete tab. If you change the range length on that tab from 135' to 137' your structure can be analyzed for the NSG truck.

We are revising Virtis so that you will be alerted to this missing data in the future.

Please let me know if you have further questions.

Regards,  
Krisha Kennelly, PE

**Description**

FROM:hlee DATE:3/20/2007 2:23:04 PM

If AddRow and AddVehicle are done in the same loop for each vehicle, the vehicle ids will get mixed up in DoMemberRatingSummary.

To reproduce: Loop through DoMemberRatingSummary to GetVehicleId after the following.

=====  
=====

```

long IExportVehicleId = 0;
if (m_AnalysisEventPtr->FirstEventVehicle())
{
    while (m_AnalysisEventPtr->MoveNextEventVehicle())
    {
        IExportVehicleId++;
        lpVehicleDisp = m_AnalysisEventPtr->GetEventVehicleDisp().Detach();

        // Add vehicle to results object
        if (!MemberResultsPtr->AddVehicle(lpVehicleDisp, (LPCTSTR) "Vehicle Name",
            TYP_VEHICLELD_VLDLANAXL, IExportVehicleId))
            return FALSE;

        // Both impact and lane loadings are as requested
        MemberRatingSummaryPtr->SetLoadingConditions(0, 0);

        // Populate member rating summary
        long INullBitMask = 419424; // 2^5+2^6+2^9+2^10+2^13+2^14+2^17+2^18
        if (!MemberRatingSummaryPtr->AddRow(IExportVehicleId, // 0
            (short) MemberResultsPtr->GetDesignMethodType(), // 1
            TYP_RATCODE_SUCCRAT, // 2

```

### Description

FROM:bmccaffrey DATE:Thursday, March 22, 2007 10:26:16 AM

The deck portion of my double tee section in the attached bridge does not appear in the view in the strand layout window. Single and triple tee sections appear fine.

FROM:hlee DATE:3/23/2007 9:03:23 AM

See whether adjusting the size of the strand layout window helps. Sometimes the scroll bars will only appear after you adjust the window size.

FROM:bmccaffrey DATE:Monday, March 26, 2007 10:39:20 AM

You are correct. Once I alter the window size the view control icons become active and I can fit the section on the screen. Still looks like a bug. The view controls should always be active, not just after minimizing and maximizing the screen.

**Description**

FROM:tarmbrecht DATE:Friday, March 23, 2007 5:08:32 PM

In the subject example, VSEWontIgnorePosMomatSupport.xml, a 3-span continuous PS I-beam bridge, we're trying to analyze the bridge, ignoring the positive moment at the supports (see Member Alternative/Beam Details/Continuity Diaphragm tab). This works for BRASS but not when utilizing the Virtis Standard Engine. Perhaps some documentation warning the user displayed near the button that makes the selection. Of course, we would prefer to make it function with VSE.

FROM:jduray DATE:3/26/2007 12:51:07 PM

Let's see what it would take to modify VSE to handle this.

**Complete Issue Information**

FROM:hlee DATE:3/30/2007 1:36:46 PM

Virtis Std Engine Help states that "Ignore positive moment at supports in ratings" is not used by Virtis Std. We use Engine Help to document engine specific information.

FROM:hlathia DATE:Monday, April 02, 2007 10:43:09 AM

This will be added to the VSE enhancement list.

### Description

FROM:jihnat DATE:3/26/2007 9:12:41 AM  
Received via email (Bridgeware):

Find attached a Virtis 5.5 bridge model.

When you open the model, rate the Girder G2 with an HS20-44 Vehicle Live Load

NOTE that the result is Rf of Inventory 2.137 Operating 2.843 for the truck and 2.695/3.585 for the lane load.

NOW go to STRUCTURAL TYPICAL SECTION ... WEARING SURFACE and increase the thickness from 0 to 20-inches (or any other thickness).

Rate G2 again ... notice that the rating remains UNCHANGED despite the rather dramatic increase in load.

NOW go to G2 Member Loads. Add a line under DC1-Uniform Load. Fill in 1 kip/ft (All Spans).

Rate G2 again ... the rating STILL remains UNCHANGED.

Kind of hard to fathom that such increases in dead loads are being ignored by Virtis Opis in ASD ratings for timber bridges.

Steven Maberry, NMDOT

FROM:bgoodrich DATE:Wednesday, March 28, 2007 10:40:02 AM  
I am able to duplicate the problem. The wearing surface thickness is being written to the GENLDIM command. I'll continue to investigate.

FROM:bgoodrich DATE:Tuesday, February 12, 2008 2:47:59 PM  
I found the source of the loading issue in the export. The deck density was input as zero and was

4/19/2016 3:20:08 PM

HRS AASHTO

2318

**Complete Issue Information**

being exported as such. The Madero engine requires that a non-zero deck density be input; however, it does not issue an error message. A short warning message is written to the output file that states that an input error occurred. When this input error is detected, the engine exits the subroutine it is in and does not load any of the dead load information. This is why changing the wearing surface or uniform dead load had no effect on the rating factors. Madero was basically ignoring all the dead loads. I revised the CMaderoDeadLoads::PrepareStringerBridge function to export deck density as small number when it is zero to get past Madero's validation.

We might want to consider revising the Madero engine to issue error messages when an input error is detected and halting the analysis.

## Complete Issue Information

### Description

FROM: bgoodrich DATE: Monday, March 26, 2007 3:54:50 PM

Training Example STL5: The first parapet dimension on page iii should be 12" instead of 9".

FROM: xli DATE: 3/27/2007 2:07:52 PM

Fixed STL5 files in Originals - v5.5 folder.

FROM: bgoodrich DATE: Tuesday, March 27, 2007 3:54:28 PM

There are no final rating result pages for STL3 and FS3, so the users have nothing to compare to during the training.

FROM: bgoodrich DATE: Wednesday, March 28, 2007 12:54:38 PM

For FS1 example, the effective flange width of the girder is shown as 102" (See Deck Profile window on page FS1-62). The slab thickness X 12 appears to control the effective width. This assumes that the spacing is from girder to girder (30 ft), rather than the spacing from girder to stringer (6 ft). Should the spacing actually control, i.e., 1/2 spacing + overhang (3'+2'=5'=60")? Please include a description at the beginning of the example that illustrates how this is calculated (maybe for the stringer too) and why it controls over the spacing check.

FROM: bgoodrich DATE: Wednesday, March 28, 2007 2:20:58 PM

For FS2 and FS4 examples, a user pointed out a difference in the input that should be reviewed. The Deck Profile window for the floorbeam on page FS2-20 shows an effective flange width of 63" while the same window on page FS4-24 shows 102". These should both be the same. Also, should we add a note somewhere discussing that a separate floorbeam definition for exterior and interior locations may be necessary if the effective width happens to be different?

FROM: bgoodrich DATE: Wednesday, March 28, 2007 3:43:32 PM

Entering the truss commands for example T1 was quite tedious. I suggest adding this example to the sample database or providing the commands in a file that the user paste into the truss field. Maybe the majority of the commands could be provided and the user wouldn't have to type so much during the training.

FROM: bgoodrich DATE: Thursday, March 29, 2007 9:24:43 AM

On example STL6, the schematic window shown on page STL6-29 needs updated. The top flange lateral support shading is only shown over span 2, when it should be shown over the entire length of the girder.

Also on STL6, the generic appurtenance window on page STL6-7 does not show the distance to the centroid of the load. Based on the figure at the beginning of the example, it looks like the centroid should be around 7 or 8 inches.

FROM: Xinmei Li DATE: 9/4/2008 3:44:42 PM Eastern Daylight Time

Example FS1,

Stringer deck effective flange width is calculated according to AASHTO Article 10.38.3, the effective flange width shall not exceed one-fourth of the span length of the stringer,  $39'-11\frac{1}{2}"/4 = 59.875"$ , the distance center to center of stringers,  $6' = 72"$ , and twelve times the least thickness of the slab,  $12 \times 8.5" = 102$ . One-fourth of the span length of the stringer,  $59.875"$  controls.

Girder deck effective flange width is calculated according to AASHTO Article 10.38.3, the effective flange width shall not exceed one-fourth of the span length of the girder,  $80'/4 = 20' = 240"$ , the distance center to center of girders,  $30'/2+2' = 17' = 204"$ , and twelve times the least thickness of the

**Complete Issue Information**

slab,  $12 \times 8.5 = 102$ ". Twelve times the least thickness of the slab, 102" controls.

Example FS2,

Page FS2-20 shows an effective flange width of 63", it's for floorbeam.

floorbeam deck effective flange width is calculated according to AASHTO Article 10.38.3, the effective flange width shall not exceed one-fourth of the span length of the floorbeam,  $21\frac{1}{4} = 63$ ", the distance center to center of floorbeams, 45', and twelve times the least thickness of the slab,  $12 \times 9 = 108$ ".

One-fourth of the span length of the floorbeam, 63" controls.

FS4-24 shows 84", not 102". It's for stringer.

Interior stringer deck effective flange width is calculated according to AASHTO Article 10.38.3, the effective flange width shall not exceed one-fourth of the span length of the stringer,  $45\frac{1}{4} = 11.25' = 135$ ", the distance center to center of stringers,  $7' = 84$ ", and twelve times the least thickness of the slab,  $12 \times 9 = 108$ ". The distance center to center of stringers, 84" controls.

Above text will be added to the examples for 6.0 update.

FROM: Xinmei Li DATE: 9/5/2008 9:46:27 AM Eastern Daylight Time

Example FS4,

Floorbeam deck effective flange width is calculated according to AASHTO Article 10.38.3, the effective flange width shall not exceed one-fourth of the span length of the floorbeam,  $35\frac{1}{4} = 105$ ", the distance center to center of floorbeams, 45', and twelve times the least thickness of the slab,  $12 \times 8.5 = 102$ ".

One-fourth of the span length of the floorbeam, 102" controls.

Stringer deck effective flange width is calculated according to AASHTO Article 10.38.3, the effective flange width shall not exceed one-fourth of the span length of the stringer,  $45\frac{1}{4} = 11.25' = 135$ ", the distance center to center of stringers,  $7\frac{1}{2} + 2.25' = 69$ ", and twelve times the least thickness of the slab,  $12 \times 8.5 = 102$ ". The distance center to center of stringers, 69" controls.

| 7911.15424 | Resolved      | Unable to save and import bridge. |

**Description**

FROM:dteal DATE:Tuesday, March 27, 2007 3:08:16 PM

In the attached bridge, reinforced concrete haunched slab. Imported into Virtis several versions ago.

When Virtis used BRASS 5.9.0 and/or 5.9.1 the HS20 inventory rating factor was 1.18

Now with BRASS version 5.9.3 the inventory rating factor is 0.31

This is a known problem in BRASS, as of today it hasn't been fixed yet.

I don't have the PL #

I just wanted to be sure it was listed as a Virtis problem (BRASS Bug)

The problem may have occurred in 5.9.2 but I can't verify that.

FROM:bgoodrich DATE:Wednesday, June 06, 2007 8:49:48 AM

WYDOT assigned this issue to BRASS Problem Log 734.

FROM:bgoodrich DATE:Wednesday, July 25, 2007 12:22:57 PM

This issue has been addressed in BRASS-GIRDER(STD) 6.0.0. Fixed for version 5.6.

### Description

FROM:jihnat DATE:3/30/2007 10:59:29 AM  
Received via email (Bridgeware):

I'm trying to use the Report Tool to create a BWS report. When I generate the report I get the following error message in my web browser:

The XML page cannot be displayed

Cannot view XML input using XSL style sheet. Please correct the error and then click the Refresh button, or try again later.

I have tried this on two separate computers with the same results. The first computer is running IE6 on Windows 2000. The second is running IE7 on Windows XP.

The XML and XSL files are both being generated and saved in my Reports subdirectory of my Virtis 55 folder. [Files are attached to this incident]

Eric Evenson, URS

FROM:jduray DATE:4/2/2007 10:17:04 AM

We need the rpt file to try to reproduce the problem. I was able to double-click the xml file and display the report.

FROM:jihnat DATE:4/3/2007 8:18:23 AM

What rpt file?

I can also open the report, but the report is only partial and an error displays at the end: "End tag 'Member\_Alt\_Prestressed\_Concrete\_I\_Beam\_Schd\_Gs' does not match the start tag 'Analysis\_Event\_Gs\_Psis'. Error proce..."

If I import the bridge, I can successfully generate the entire report.

FROM:jihnat DATE:4/3/2007 8:56:59 AM

Eric's abr file (BWS Report for ps girders.abr) had the Release timestamp, but his file may have somehow become corrupted.

When I sent him a new file he was able to generate the report.

### Description

FROM:jihnat DATE:4/4/2007 2:18:55 PM  
Received via email (Bridgeware):

I am currently working on some bridge rating for MassHighway. The instructions for the ratings requires each member to have two reports produced. The first report is to determine the lowest rating value (analyzed by using POI control #3), the second report determines the rating value at each point of interest (analyzed by using POI control #5). The way I have been doing this is by running the analysis with POI control #3 then copying each member. I change the POI control to #5 for the "Copy of .. " delete all but one POI, then run the analysis, printing the report and then change to the next POI and repeat for each POI for each member. This has become very time consuming and I was hoping there is a more efficient way.

Is there a way the analyze a member and get the rating values at each point of interest without having to run each POI separately? A co-worker who used VIRTIS a while ago remembered getting some information outside of the bridge workspace, but did not remember if everything could be done in the bridge library to meet the MHD reporting requirements.

Thank you for any assistance.

Response sent via email:

If you are using the BRASSLFD program as your analysis engine, you cannot see the rating factors for each point of interest on one screen in Virtis. You can only see the most critical rating factor on the Analysis Results window.

If you use the Virtis Std analysis engine, you can view the rating factors for 10th points and cross section change points by selecting "Detailed Rating Results" in the Analysis Results window but you can't see the rating factors for user defined points of interest (You will be able to view the rating factors for user defined points of interest in that window in Version 5.6).

The only workaround I can think of for you to produce these reports using the BRASS LFD engine is to:

1. Analyze the member using the POI control option 3. The Analysis Results window then gives you the critical rating factor report.
2. Change the POI control option to 5 and analyze the member. Then open the BRASS LFD output text file (from the "View Latest Analysis Output" window in Virtis) and search for the words "Rating Factor Report". That will lead you to the portion of the BRASS output that lists the output for each user

4/19/2016 3:20:09 PM

HRS AASHTO

2327

**Complete Issue Information**

defined point of interest. Cut and paste that portion of the output file into your report.

3. Change the POI control option back to 3.

FROM:rcurtis DATE:Friday, April 06, 2007 1:01:22 PM  
I checked to make sure the member span lengths equal the span input already.

FROM:hlee DATE:4/6/2007 2:42:14 PM  
The length of the distributed load for "False Decking" is 65.3647 ft, which is longer than the span lengths (65.3439 ft).  
G3 and G7 ran ok after this is fixed. For G1, the BRASS engine complains "Cross-section area less than or equal to zero".

I didn't input the length of the load (it is a member load input) and so how do you check that it is too long and how do you change it?

FROM:hlee DATE:Sunday, April 08, 2007 3:45:44 PM  
The distributed member load is on the second tab of the Member Loads window. You can change the length of the load there.

I guess when the uniform member load was entered in the first tab with the "All spans" selection, the span lengths was 65.3647 ft and Virtis stored this load length internally. Then, the span lengths changed to 65.3439 ft. When the Member Loads window is opened again, the uniform load with load length 65.3647 ft will go to the distributed tab since the load length doesn't match the new span lengths.

Virtis Help describes an opposite scenario in "Loads - Member: Uniform":  
"If you enter a uniformly distributed load over an entire span on the Loads - Member: Distributed tab, the data will be saved as a uniform load and will appear on this tab the next time you reopen the Loads - Member window."

FROM:kkennelly DATE:5/21/2007 11:38:16 AM

Member Load, the load will appear on the Distributed Load tab.

Brian still to investigate problem running G1.

FROM: bgoodrich DATE: Wednesday, June 06, 2007 11:57:03 AM  
BRASS is not getting the cross section dimensions from the library file. This structure is currently being exported as a wide flange that varies from one cross section to another, which is not permitted by the BRASS engine. Rather than request an engine change, I suggest revising the export. If the member is exported as a plate girder, the analysis is successfully run. We do this already for tapered cover plates or if loss exists.

FROM: bgoodrich DATE: Wednesday, June 06, 2007 3:42:25 PM  
E-mail from Krisha:

Jim and I discussed this and we would like this to only be implemented if the rolled beam shape varies over the length of the member. We want to be sure that we don't change any existing ratings for rolled beams.

FROM: bgoodrich DATE: Wednesday, June 06, 2007 3:43:07 PM  
The change I proposed would not affect the ratings of existing structures. It would only affect how the section dimensions get into BRASS - either from the section library or from the XSECT-B command. This basically means the XSECT-STD command would no longer be exported. The cross sections are generated and then assigned to the ranges, so I don't think we can detect a difference prior to the cross section generation.

FROM: bgoodrich DATE: Thursday, June 07, 2007 8:30:00 AM  
E-mail from Krisha:

If you are sure that neither the selfweight of the beam nor the cross section properties will change you can make the change for all rolled beams.

Krisha

FROM: bgoodrich DATE: Friday, August 03, 2007 3:14:17 PM  
Modified BrassStdCrossSections.cpp to force the rolled beam to be exported as an equivalent plate girder. This method bypasses a BRASS engine error check that requires that a rolled beam be constant over each range. This change affects how the section dimensions get into the engine.

FROM: bgoodrich DATE: Friday, October 05, 2007 6:21:40 PM  
Reopened after comments from Brian McCaffrey regarding changes to some ratings.

FROM: jduray DATE: 10/9/2007 3:18:25 PM  
Becky's mbr alt deck profile description is not symmetric and she describes tapering eff. flg width. I don't see anywhere in the spec where it says to taper the eff. flg width. So, I suggest we remove the changes to BrassStdCrossSections.cpp that force the rolled beam to be exported as an equivalent plate girder and suggest Becky describe the mbr alt as follows:

| Support | Range    | Eff. Flg W |
|---------|----------|------------|
| 1       | 0 - 5.47 | 16.41      |

### Description

FROM:rcurtis DATE:Wednesday, April 18, 2007 12:26:34 PM

In the following bridge, I ran G1 and then generated a report. As you can see, the summary load ratings differ dramatically from the detailed rating results portion.

FROM:rcurtis DATE:Tuesday, April 24, 2007 4:06:14 PM

I am attaching another bridge with a similar problem. See structure "Spans 1-3 SD". I am also attaching a pdf of the Brass and Virtis input. The Brass input seems to match the detailed rating results portion more accurately than the summary load rating from Virtis.

FROM:jduray DATE:4/25/2007 8:43:20 AM

May - please investigate and let me or Krisha know what you find.

FROM:xli DATE:4/25/2007 9:01:51 AM

Emailed Beckie:

Hi Beckie,

I've investigated incident 7925 you submitted on 4/18.

Detailed rating results In LFD report match that in Virtis Standard Engine output file. If the section is compact, detailed rating result matches compact rating factor of the section in Virtis Standard Engine output file. If the section is non-compact, detailed rating result matches non-compact rating factor of the section in Virtis Standard Engine output file.

For example,

G1, Span1, 31.67',

Detailed rating results In LFD report: IR = 1.699, OR =2.831

Virtis Standard Engine output file: Non-Compact factor IR = 1.16, OR =1.93 , Compact factor IR = 1.70, OR =2.83

Section is compact, so detailed rating results In LFD report matches Compact factors Virtis Standard Engine output file.

G1, Span1, 132.48',

Detailed rating results In LFD report: IR = 1.630, OR =2.717

Virtis Standard Engine output file: Non-Compact factor IR = 1.63, OR =2.72, Compact factor IR = NA, OR = NA

Section is non-compact, so detailed rating results In LFD report matches Non-Compact factors Virtis Standard Engine output file.

Virtis Standard Engine assumes that the plastic moment capacity can only be used for the calculation of ratings if all sections over the entire length of the member (whether composite or non-composite) qualify as compact sections (Virtis Std User Manual 3.9.1.1 page 3-56).

Because there are non-compact sections over the girder we analyzed, Virtis Standard Engine can only use non-compact moment capacity for the calculation of ratings based on above assumption. In the

4/19/2016 3:20:10 PM

HRS AASHTO

2332

**Complete Issue Information**

summary rating results, non-compact rating factors are reported.  
Summary rating results: IR = 1.160, OR =1.934  
Virtis Standard Engine output file: Non-Compact factor IR = 1.16, OR =1.93

So the difference between load rating summary and detailed rating results is due to the Virtis Standard Engine assumption stated above.

Please let me know if you have additional questions.

FROM:kkennelly DATE:5/21/2007 12:44:33 PM  
Enhancement is to add a note in the report if the compact or non-compact rating factor is being printed out.

| 7929.15406 | Assigned      | Question Total Nominal Shear Force |

### Description

FROM:dteal DATE:Tuesday, April 24, 2007 9:20:09 AM  
Attached My BID #2680, My County-Serial 054-074

Using Superstructure Definition: Design Check MLL, Let Oct. 2007

In my example a specification check is done at the 104.51 point instead of using the 104 point (the location of the maximum positive Live Load plus impact moment). Why is Opis using the 104.51 point instead of the 104 point? On long spans it makes a big difference in the number of shear connectors Opis determines the user has defined if the proper point is not used. According to the specifications for the Strength Limit State the number of shear connectors is checked between the maximum positive live load plus impact moment and the adjacent end and the maximum positive live load plus impact moment and the centerline of the interior support for continuous spans that are composite for negative flexure. How does Opis calculate the number of shear connectors between these points? In span 1, I couldn't get the same answer as Opis. In Span 2, I was able to calculate the same number as Opis.

4/19/2016 3:20:11 PM

HRS AASHTO

2335

**Complete Issue Information**

BRASS is determining the maximum live load moment using the critical of the design truck (w/ impact) + lane, design tandem (w/ impact) + lane, etc. This results in a maximum moment at the 104.51 point. By default, actions at 10th points are turned on, so I changed it to print actions at all points using the engine properties for the Analysis settings.

Attached My BID #2680, My County-Serial 054-074

Using Superstructure Definition: Design Check MLL, Let Oct. 2007

question is related to the calculation of the total nominal shear force (6.10.10.4.2), P, between the point of maximum positive design live load plus impact moment and the centerline of adjacent support. P is equal to Pp plus Pn. According to the specifications, Pp is at the point of maximum positive live load plus impact moment and Pn is over an interior support. Looking at the Opis (BRASS) output shows that at the point 110 (over an interior support) the section parameters for the calculation of the

4/19/2016 3:20:11 PM

HRS AASHTO

2336

**Complete Issue Information**

longitudinal shear force are for over the pier. These parameters were used to calculate the value for Pp (the lesser of Equations 6.10.10.4.2-2 or 6.10.10.4.2-3) instead of using the section parameters at the point of maximum positive live load plus impact moment. I believe this to be an error.

In the Opis (BRASS) output under Nominal Shear Resistance (6.10.10.4.3) it lists input parameters of which Ec is listed. The value listed for Ec does not match the value that is listed under the materials properties tab for the slab concrete.

FROM:bgoodrich DATE:Wednesday, June 06, 2007 6:25:33 PM  
Dean's comments regarding the Pp calculations appear to be correct. I forwarded this issue to WYDOT.

FROM:bgoodrich DATE:Wednesday, July 25, 2007 1:04:04 PM  
WYDOT assigned this issue to BRASS Problem Log 764.

FROM: Brian Goodrich DATE: 2/10/2009 7:13:40 AM Mountain Standard Time  
This issue has been addressed in the BRASS-GIRDER(LRFD) V2.0.2 engine. Fixed for Opis 6.1.

| 7931.15404 | Resolved      | Incorrect ASD analysis module in BID 2. |

**Description**

FROM:dteal DATE:Tuesday, April 24, 2007 9:23:27 AM

Thickness of the slab used in the equations that determine the value for Pp and Pn. Opis uses the structural thickness and when I calculated it by hand I used the total thickness. Which is correct?

FROM:bgoodrich DATE:Wednesday, June 06, 2007 6:31:43 PM

BRASS does not provide an input for the actual slab thickness as part of the cross section. If the deck was defined for dead or live load distribution, this could be used; however, there is no user control over if this should be done or not. I forwarded this issue to WYDOT.

FROM: Brian Goodrich DATE: 7/16/2008 1:30:24 PM Eastern Daylight Time

WYDOT assigned this issue to BRASS Problem Log 764.

FROM: Brian Goodrich DATE: 7/9/2009 9:46:44 AM Mountain Daylight Time

BRASS has been modified to allow input of the actual slab thickness as part of the cross section. Furthermore, control options have been added to allow the user to choose if the actual or structural thickness is used in the longitudinal shear force calculation. These changes must now be implemented in the export and engine properties.

## Description

FROM:rcurtis DATE:Monday, April 30, 2007 10:38:38 AM

Under "Beam Details:Stress Limit Ranges", it says "No exceptions to this tab for Virtis Std."

Does this mean that Virtis Std uses this information, or that like the Brass engine it doesn't use it? We are trying to clarify whether or not this tab is used in any way by Virtis/Brass. There was a difference in

4/19/2016 3:20:12 PM

HRS AASHTO

2340

### Complete Issue Information

interpretation of what this help item meant in our office, especially since the other tabs specifically say "Not used by Virtis Std."

Thanks!

FROM:kkennelly DATE:5/2/2007 9:42:47 AM

The phrase "No exceptions to this tab for Virtis Std" means that the Virtis Std engine uses all of the data shown on the tab.

The phrase "Not used by Virtis Std" means that the Virtis Std engine does not use that data.

### Description

FROM:kobeidat DATE:Tuesday, May 08, 2007 1:53:46 PM

OPIS uses the approximate estimate of time-dependent losses of article 5.9.5.3. is there an option to calculate the refined estimate of time dependent losses in accordance to article 5.9.5.4? If not OPIS needs to provide that option

Does OPIS give you a choice of using the transformed section properties (transforming the strands) vs. the gross section.properties? what section properties are used in calculating refined losses?

FROM:kobeidat DATE:Friday, May 11, 2007 12:16:54 PM

FROM:kkennelly DATE:5/14/2007 10:38:33 AM

Khalid called this morning to discuss his questions. He would like his questions answered within this week so he can prepare a presentation on Opis.

The Prestress Design Tool in Opis uses the refined method in Article 5.9.5.4 to compute the losses and also uses the transformed section properties. The Prestress Design Tool computes a preliminary strand layout for the user but does not perform all of the specification checks that a final design requires.

**Complete Issue Information**

Brian will answer what the BRASS LRFD analysis program uses.

FROM:kkennelly DATE:5/14/2007 1:43:16 PM  
Email from Brian Goodrich:

The export is using the BRASS default for the AASHTO losses, which is the approximate method in this case. We can change it to the refined method since that is the only AASHTO loss option for Opis. Will the approximate method ever be available as an option?

BRASS LRFD uses gross section properties.

FROM:kkennelly DATE:5/14/2007 1:47:24 PM  
The export should keep using the Approximate for now. This incident is being marked as an enhancement to allow the user to select either the "AASHTO Approximate" or "AASHTO Refined" method for ps loss computation.

## Complete Issue Information

### Description

FROM:rcurtis DATE:Thursday, May 10, 2007 4:42:28 PM

In the following structure I have a couple of issues that I am hoping you can help me with.

1. The original design list 1.125in<sup>2</sup> as the rebar for some locations (not a 1.125 diameter bar), which doesn't match any current size. We attempted to model this as a #9 and a #3 bar at the same location. Is the the best work around, or is there a way to add a new rebar size to the library?

2. The Virtis engine creates an error when the analysis is run, but Brass is able to run.

3. Compared to an old BARS run that appears to be relatively accurate in the input, the Load Rating from Brass is very low. I am attempting to find where the differences are, but I am not completely understanding the BRASS output. In the attached word document (the output log from Brass) I pulled out the rating results at 105.03. I am not sure how the values for R5 are calculated. I can figure out the values for R1, R2 and R4.

This is a high priority for our department and so I am eagerly anticipating your response!

FROM:hlee DATE:5/14/2007 7:54:24 AM

1. Another way is to model as #9 with number of bars equals to 1.125. There's no option in the library to define new rebar.

2. "THE NUMBER OF RC PROPRTIES RANGES EXCEEDS THE MAXIMUM OF 150" in the Virtis Std Engine analysis. Attached CVAR\_56.png, Interior\_Beam\_55.dat, and Interior\_Beam\_56.dat for investigation.

FROM:hlee DATE:5/14/2007 11:05:04 AM

3. At 105.03 (Span 1 - 20.25 ft), A112 (Reinf. Set #: 1) is partially developed (38.5%). Only 38.5% of the bar will be exported. With the member alternative selected, the development length calculation "Std Reinf Dev Length Calcs Log File" can be opened from the Analysis Output window (Bridge menu | Output). If you want the whole length of bar fully developed, check the "Fully Developed" box in the last column of the reinforcement grid.

### Description

FROM:rcurtis DATE:Monday, May 14, 2007 3:51:07 PM

When running the attached structure, I get an error using the Virtis Engine. The Brass Engine doesn't have a problem running.

FROM:hlee DATE:5/15/2007 7:47:57 AM

The shear at supports live load distribution factor is a required input for the Virtis Std LFD engine.

FROM:rcurtis DATE:Thursday, May 17, 2007 8:00:09 AM

The shear at the supports was only affecting G1. I modified that, and now I get the message "Error - Unknown exception when preparing Lateral Brace Points and Stiffener Spacings!" for the other two modeled girders. I have checked the lateral bracing input and that is correct. There are no interior stiffeners. However, when I check the bearing stiffeners the I don't have bearing stiffeners at the abutments. If you have bearing stiffeners entered at a pier, are you required to enter them at the abutment, even if the structure doesn't have them there?

When I make this change, the beam runs. They are encased in concrete backwalls, so I don't have a problem putting a stiffener there for this bridge, I just don't know if I would want to have to do so for all bridges.

FROM:hlee DATE:5/17/2007 9:50:12 AM

4/19/2016 3:20:13 PM

HRS AASHTO

2346

**Complete Issue Information**

The problem you described is a duplicate of Incident 7913. 7913 is related to a span with only one lateral bracing. Since lateral bracing and stiffener are entered in the same Virtis Std Engine command. The problem of having only one bearing stiffener in a span is also resolved in 7913 for the 5.6 release. If you consider the beam support (encased in concrete backwalls) is fixed at abutment, you need to change the abutment support type in the Supports window. Currently, only BRASS will support fixed abutment. Virtis Std Engine will support this condition in new year 6.1 release.

**Description**

FROM:jihnmat DATE:5/16/2007 8:04:27 AM  
Received via email (Bridgeware):

I would just like to point out something that I believe might be a bug in the software, albeit a minor one. When modeling a splayed girder system (for rating with the VirtisSTD engine), the "Lane Position" in the "Structure Typical Section" is not auto computed properly if you have no railings/curbs/parapets modeled. This is the case on several bridges, where the fascia assembly is bracketed directly to the fascia girder and first interior, and is not supported on the deck.

4/19/2016 3:20:13 PM

HRS AASHTO

2347

**Complete Issue Information**

Virtis properly calculated the lane width for the begin section of the bridge, it then uses this same width for the end section automatically. In a splayed girder system the begin and end deck widths are often different.

Its easily corrected by manually entering the numbers, I just wanted to bring this to someone's attention. This issue does occur if you have railings/parapets/curbs modeled.

Frank DeOrtentiis  
Chas H Sells

FROM:hlee DATE:12/31/2007 10:53:11 AM  
Fixed a bug in setting the deck width at end.  
Resolved for 6.0 release.

### Description

FROM:dteal DATE:Thursday, May 17, 2007 7:55:58 AM

In the attached jpg of a GUI of the Girder System Superstructure Def, look at the Frame Connections pull down box. With a 3 span (4 supports), the box for support #4 is partially hidden. If you click on the check box for #4 the window moves up hiding Support #1, a side slide bar never appears letting you navigate back to #1, you have to do some random clicking to get #1 back. I maximized the window, doesn't make any difference on the size of the frame connections box.

I think the window (Frame Connections input box) is missing the side navigation bar.

FROM:dteal DATE:Thursday, May 17, 2007 8:00:01 AM

We are provided a Right /Left slide bar that's not needed, but no up/down one that is needed??

FROM:jihnat DATE:5/17/2007 1:22:12 PM

This looks like a minor scrollbar quirk.

If you slightly narrow the first column, the horizontal scrollbar goes away.

The vertical scrollbar appears if another span is added.

**Complete Issue Information**

“This looks like a minor scrollbar quirk.” Sounds like a bug in the scrollbar GUI that should be fixed??

“If you slightly narrow the first column, the horizontal scrollbar goes away.” Is a work around but it doesn’t sound like a permanent fix?

This only happens (I think) when describing a girder system being it’s on the Girder System Superstructure Definition GUI. When used for girder line this scroll bar is on the Member GUI and is not a problem.

### Description

FROM:bmccaffrey DATE:Wednesday, May 23, 2007 10:44:02 AM

Looks like some data fields are either being switched or moved on the angle box command and being passed to the engine incorrectly. This effects both English and Metric command sets.

When you run the attached truss .xml file with Section 1 defined as a channel box, which is the section alternative defined as "Section1alt1", the Fy is correctly defined as 30ksi. When running section 1 as an anglebox section, as either "Section1alt2" or "Section1", the Fy changes to a figure below 30ksi. The Modulus of Elasticity also changes. See the attached file.

Also, when adding an additional web plates, the following things occur:

1. The web plates add inward, not outward as in the User Manual.

4/19/2016 3:20:15 PM

HRS AASHTO

2353

**Complete Issue Information**

2. The "Iyy" section modulus is not calculated correctly and the documented calculations for the Right Web Plates are incorrect(i.e. for AZ => 16.25 x 18.56 = 167.06). See the attached file.

FROM:gbhanushali DATE:7/30/2007 11:46:24 AM  
This has been fixed for 5.6 beta build 6 ~ Aug/07

FROM:ssalata DATE:8/3/2007 1:06:51 PM  
Verified that Fy is correct.

FROM:ssalata DATE:8/6/2007 4:19:15 PM  
From my investigation of these issues:

1. The web plates are adding correctly although the documentation should be more specific on how the web plates add. For angle boxes the web plates will add in the opposite direction of the angles. For example if the angles are specified as outward facing, then the web plates add inwardly.

2. The AZ values for the right web plates are incorrect. The values for A and Z for the right web plates are correct however.

FROM:gbhanushali DATE:8/7/2007 4:56:51 PM  
Issue 2 is fixed - ~ Aug 07 5.6 - Beta 4

### Description

FROM:dteal DATE:Friday, June 08, 2007 9:04:07 AM

I got the following form one of our designers - the graphs referenced are in the attached Word document

I am doing a design check for Br. No. 183-26-27.77 (059). It is a part of Proj. No. 183-26 K-7422-01. The bridge is a 42.7-57-57-42.7 m Welded Plate Girder structure. I have entered the bridge into Opis. I used BRASS LRFD as the design engine. When reviewing the Rating Factors for Moment, I noticed that the Rating Factors were different at Pier No. 1 and Pier No. 3. As this is a symmetrical structure the values at these two points should be identical. I have placed a copy of the graphical output for the Rating Factors below. As can be seen there is a difference. To determine the cause for this difference, I reviewed the intermediate output for the POI at the two piers, 200.00 and 310.00 respectively. Within the two reports I discovered that the difference was in the calculation of the Moment Gradient Modifier, Cb. Using the same input values, BRASS LRFD calculates two different values for Cb. I have placed copies of the two calculations below the Rating Factor graph. I believe that the program's logic used to determine the midpoint Moment, Mmid, is incorrect. At Pt. 310.00, the program uses the larger value of the two moments at the brace points. At Pt. 200.00, the program uses the smaller value of the two moments at the brace points. By looking at the graph of the Critical Moment Envelope, it is apparent that the Midpoint Moment should be a value that is between the moments at the brace points, probably very close to the average. I have placed a copy of the Critical Moment Envelope at the bottom of this e-mail. Additionally I have attached a copy of the Opis file for this bridge.

MINIMUM Actions: Unbraced Length 2

PERFORMING AASHTO LRFD SPECIFICATION CHECKS - 6.10.6 Strength Limit State

Point of Interest : 200.00  
Construction Stage: 3

AASHTO REFERENCE: A6.3.3 (Moment Gradient Modifier)

EQUATION NO. : A6.3.3-7

Units: Stresses are in (MPa).

### Description

FROM:tarmbrecht DATE:Tuesday, June 12, 2007 5:49:51 PM

Incident 2876 would be a duplicate of this incident. I note that it has been suspended since 2000, and was wondering what it would take to add additional fields to Bridge Explorer? In addition to the fields Todd proposed, I also feel there should be a field for analyst identification in order to note who is entering these in and modifying them.

Would this be a great undertaking?

FROM:jduray DATE:6/15/2007 7:09:30 AM

The Bridge Explorer currently get its data from a couple tables. In order to display the name of the person who last modified a component in a bridge would require a query that would be rather slow. However, we could add a new colukmn to the abw\_bridge table that stores the id of that person and then it would be very quick. The development effort (for just this request) is in the small category.

Work tasks:

add new column to db

modify the Save function for the BWS to update the new column with the current user id (may want a timestamp too)

modify the report tool

modify the Find Bridge dialog

modify the Bridge Explorer to display

modify the Domain, Db, De, Dm

 Virtis calculates the St. Venant torsional constant for box beam with rectangular void based on AASHTO LRFD Equation C4.6.2.2.1-3. This equation only applies to closed thin-walled shapes. That's why it is not used for box beam with circular void.

## Description

FROM:jihnat DATE:6/20/2007 9:50:18 AM  
Received via email (Bridgeware):

Regarding defining my superstructure typical section in Virtis:

4/19/2016 3:20:16 PM

HRS AASHTO

2360

**Complete Issue Information**

I would like to define the shoulders of the bridge as having a 3" asphalt overlay (wearing surface), but I do not want to apply a lane load in this area. The only way I have found to apply the wearing surface is in conjunction with the lane load. Is there a way to apply a wearing surface to a portion of the bridge without lane loading?

Also, when examining the "dead load actions" report type in the analysis results, are the resulting forces (moment, shear, axial, reactions, etc.) unfactored?

Aaron M. Lachance

Aaron.Lachance@stantec.com

FROM:hlee DATE:7/2/2007 1:08:56 PM  
You may apply the shoulder 3" asphalt overlay in the Member Loads window.  
The Dead Load Actions in the Analysis Results window are unfactored.

### Description

FROM:hlathia DATE:Friday, June 22, 2007 11:53:35 AM

VSE prints an error message when some spans have harped strands and some spans have debonded strands in a multi-span continuous prestressed concrete structure. See the attached input and output files for a VSE run. Enhance VSE to allow the above configuration. The scope of this enhancement will be limited each span having the same type of strand configuration (all straight, straight with harped or straight with debonded). A span having both the harped and the debonded strands in the same beam is a separate enhancement (see VI7804)

FROM:hlee DATE:7/23/2007 1:49:50 PM

This incident describes the situation that some spans are harped and some spans are debonded. Incident 7804 describes the situation that harped and debonded strands are in the same span.

### Description

FROM:dteal DATE:Tuesday, June 26, 2007 8:11:29 AM

The third column heading in the Rating Results Summary Report is misleading. It states "Design Method"

I think it should state "Rating Method" like it does on the Analysis Settings GUI where the type of rating is defined.

FROM:jihnat DATE:6/29/2007 3:18:57 PM

Fixed for 5.6.0 Release.

## Description

FROM:dteal DATE:Tuesday, June 26, 2007 8:13:59 AM  
Using our delivered "in the can" Example 7  
In the Analysis Settings GUI I selected ASD as the Rating Method  
After running a rating using the BRASS Engine  
The Rating Results Summary Report still states LFD in the Design Method column.

4/19/2016 3:20:17 PM

HRS AASHTO

2364

**Complete Issue Information**

If I where to rate our delivered "in the can" TrainingBridge3 the same way, the Design Method column says ASD.

FROM:hlee DATE:6/26/2007 8:58:32 AM  
This issue is a duplicate of Incident 3568.

FROM:dteal DATE:Friday, June 29, 2007 12:44:12 PM  
I knew that BRASS didn't do ASD and only did LFD. My thinking was that the process should have stopped instead of letting the user think they where getting ASD results. If they don't check warning messages or catch it in the output, they may still think they are getting ASD. It would be nice if it stopped and forced the user to select LFD.

FROM:hlee DATE:7/2/2007 9:27:25 AM  
I think we should remove "BRASS ASD" from ASD Analysis Module for new prestressed member alternative. For existing prestressed member alternative, BRASS export should stop and inform the user.

FROM:hlee DATE:9/4/2007 1:34:35 PM  
Changed Category to Enhancement. Enhancement of BRASS export to detect and stop ASD rating of prestressed member. Currently, BRASS will switch to do LFD rating with the following message in the analysis log.

WARNING (High):  
The ASD method is not applicable for prestress structures.  
Therefore, an LFD analysis will be performed by BRASS.  
Refer to Section 6.6.2.5 of the Manual for Condition Evaluation of Bridges for details.

FROM: Herman Lee DATE: 4/12/2010 1:12:29 PM Eastern Daylight Time  
Related to Incident 9719.

FROM: Herman Lee DATE: 4/2/2012 2:21:30 PM Eastern Daylight Time  
Task Force direction (Jan. 2012 TF Meeting): Category changed from Enhancement to Maintenance.

FROM: Herman Lee DATE: 6/10/2013 2:16:33 PM Eastern Daylight Time  
When using AASHTO ASD to rate PS girders, the engine will warn the user with the following message.

=====  
Warning - As per MBE Article 6B.6.2.5, rating of prestressed members should be by Load Factor Method,  
not Allowable Stress Method. Rating will continue using the Load Factor Method!  
=====

There are two ways to specify ASD as the Rating Method.  
1. Select ASD in the Analysis Settings window.  
2. Select Member Alternative in the Analysis Settings window and set the Default rating method in the member alternative to ASD. If we stop the analysis and force the user to switch to LFD, the user will need to switch the Default rating method to LFD for all the member alternatives. Having the Member

In a rating Analysis Results report, using the Detailed Report option.

It appears to me we are duplicating data making the report longer than it needs to be. We have the As Requested Data on one report. When you use the Detailed Report you also get the "As Requested" data. The As Requested data is always going to be one of the lines in the report, there is no need to duplicate it.

**Description**

FROM:tarmbrecht DATE:Tuesday, June 26, 2007 10:26:55 AM

My consultant was reviewing beta 3, and was questioning the Multi-lane "Shear at Supports" wheel distribution factor. Could you please verify the calculation for interior beams? In the attached example, LLDF-20-24ft(0160046-560B3).xml, which has a 22' roadway supported by 4 beams spaced 8'-3½", the Shear at Supports factor calculated by Virtis is the same for both 1-lane and multi-lane conditions (1.276). This is correct for 1-lane but are not sure about multi-lane. We feel there is a contribution from the second lane where the nearest wheel line is 4' from the 1st lane, placing it 5.48' from the beam in question, which results in an additional .339 to be added to the 1-lane factor for a total multi-lane wheel distribution factor of 1.616.

FROM:hlee DATE:7/3/2007 8:30:52 AM  
 Changed Project to Support Center since it's an existing issue.

The number of lanes on the attached bridge is 2 based on MCEB spec. The truck needs to be placed in the center of the 11' wide lane. The resulting interior beam Shear at Supports factor for 1-lane condition is 1.276 and for multi-lane condition is 1.475. These two numbers matches those entered for the interior beams in the attached bridge. I'm not able to get the 1.616 number entered above.

Resolved for the 5.6 Release.

FROM:tarmbrecht DATE:Wednesday, May 14, 2008 3:06:35 PM

Accepted, though we see a problem with the exterior beams now. Entered as incident 8662.

### Description

FROM:tarmbrecht DATE:Tuesday, June 26, 2007 10:40:42 AM

For a Girder-Floorbeam-Stringer system bridge, when doing a stringer analysis, Virtis generates Stage 2 Dead Load New Computed Reactions that appear to be 4 times what they should be. However when the values are "Accepted" and the window closed w/<OK>, then re-opened, the correct former values are again present in the "Previous Computed" column and the erroneous values still appear in the "New Computed" column. After this, when the Stringer is re-analyzed the results are unchanged from the original analysis. Check N Stringer in Unit1 Stringer1 of GFSSStrgrReactProb(560B3).xml

FROM:hlee DATE:7/30/2007 8:42:30 AM

This bug didn't affect saved reactions in existing database.  
Resolved for 5.6 and 6.0 release.

### Description

FROM:tarmbrecht DATE:Friday, June 29, 2007 12:18:10 PM

I'm not suure how much of an effort it would be to fix this, but I don't think that a user should be required to go into each member for each structure that s/he wants analyzed for NSG and have to check both the "Existing" and "Current" boxes. First of all, selecting only "Current" is the normal way of selecting members to be analyzed for standard linear analysis. Nearly all of our bridge models (2700+) are entered so that only the critical members remain active for routine analyses. To have to manually change them so that NSG may be run is time consuming and also results in substantial and undesirable increases in the time to perform daily routine analyses of groups of bridges on requested overweight permit routes. I suggest that the program override the "Current" & "Existing" checkboxes (leaving them be) and just do the analysis to get a successful run.

FROM:tarmbrecht DATE:Friday, June 29, 2007 2:22:36 PM

Sorry, I really should put in a more descriptive title for this incident and 7992. Any way to alter the subject to read "NSG suggestion - disable checkbox requirement for analysis"

FROM:jduray DATE:7/2/2007 4:05:53 PM

The "Existing" is required for processing member alternatives if you select any object above the member alternative (structure def, structure, structure alt , bridge alt or the bridge). That is the analysis

4/19/2016 3:20:18 PM

HRS AASHTO

2373

## Complete Issue Information

requirement for system definitions and is not new to NSG. "Current" has nothing to do with identifying the member alt to be analyzed. "Current" is used to select the member alt to be drawn in the schematics.

The processing could be changed to to use the only member alt for a member is there is only one so existing does not have to checked by the user. This would apply to the BWS if a structure def, structure, structure alt , bridge alt or the bridge is the slected object. It souel als apply to rating from the bridge explorer.

FROM:jduray DATE:7/2/2007 4:11:34 PM

The following is from the online help:

### Existing

Check the box next to the name of the member alternative that represents the existing member. The existing member alternative is selected for analysis during a batch analysis process. Only one member alternative may be selected as existing. The member alternative selected as "Existing" displays in the Bridge Workspace tree with a (E) following the name.

### Current

Check the box next to the name of the member alternative that represents the current alternative being modified or reviewed. The schematics draw the alternative marked as current. Only one member alternative is allowed to be the current alternative, but the current alternative does not need to be the same alternative as the alternative selected as existing. The member alternative selected as "Current" displays in the Bridge Workspace tree with a (C) following the name.

FROM:tarmbrecht DATE:Monday, July 02, 2007 5:10:31 PM

Jim, I understand what you are saying, and this is fine for a normal analysis. We use "existing" to only analyze the members we are interested in and to cut down on analysis time because of redundancy. For a normal rating, this is prefered. However, and correct me if I'm wrong, ALL the members need to be checked "existing" to run a NSG analysis. If I'm doing a overweight analysis for 300 bridges, I would prefer not to go into each structure and check all the check boxes, run the analysis, and then go in and undo everything to get it back to normal. I just want all the boxes "checked" during NSG, so is it possible to code the program to think that all the boxes for the structures selected are checked during a NSG analysis even though in reality they are not? This would be during a NSG analysis only.

FROM:jduray DATE:7/23/2007 10:55:37 AM

Yes, all members must have a mbr alt marked existing in order to do a NSG analysis. Otherwise we don't know which mbr alt to use (if there are more than one). We could modify so if there is only one mbr alt we could use it even if it isnot marked as existing. The problem I have with this approach is we are assuming the unmarked alt is correct and complete. So changing to match your business process may not work for others. It would take a few hours to make the change you are requesting and then some testing by us and the TAG so it is not a big deal. The TF needs to authorize the change.

FROM: Herman Lee DATE: 7/16/2014 11:04:58 AM Eastern Daylight Time

The processing has been enhanced to use the only member alt for a member if there is only one so existing does not have to be checked by the user.

### Description

FROM:tarmbrecht DATE:Friday, June 29, 2007 2:16:39 PM

This is related to incident 7426. Obviously, we've been doing some NSG testing lately. I realize that BRASS gives both inventory and operating results, but why does Virtis need to put them both in the results, when under analysis settings, only Operating is chosen? Can't Virtis be coded to not print the inventory results if not requested? It's just an example of TMI from BRASS, and Virtis doesn't need to publish the info when the user clearly doesn't desire it.

Typically, every agency evaluates superloads at the operating level.

FROM:jduray DATE:7/2/2007 4:19:38 PM  
Brian - can we do this?

FROM:tthompson DATE:Wednesday, July 25, 2007 12:44:27 PM  
See VI 2726, this has been a long standing enhancement request. I think it's a bug and not an enhancement. The user is led to believe that by assigning a truck to only inventory or operating, one will get only that.

Might be a cheaper enhancement to just add a truck to do an analysis and get both results.....

FROM:bgoodrich DATE:Wednesday, July 25, 2007 2:19:19 PM  
I don't see any problem with Virtis filtering results based on options that are not supported by an engine.

FROM:hlee DATE:9/24/2007 3:08:13 PM  
Related to Incident 8157.

## Description

FROM:ttompson DATE:Tuesday, July 03, 2007 1:09:41 PM

I have a structure that is a 4 girder system. Girders G1 and G2 are entered and G3 and G4 are linked to G1 and G2. (G1 and G4 exterior girders, G2 and G3 interior girders).

I get symmetrical NSG DF results, but I've observed the output of the analyses are different. I've tracked it down to the BRASS data set being created for girders G3 and G4 are incorrect. They appear to be missing some of the DL.

Example:

For Girder G2

COMMENT DC1

LOAD-DESCR 2, 1, 0.00, DC1

4/19/2016 3:20:19 PM

HRS AASHTO

2378

**Complete Issue Information**

UNIFORM-DL1 1, 0.0000, 0.0350, 54.0000, 0.0350

But for Girder G3, these 3 lines of code are missing - and thus one gets different rating results with these missing deal load actions.

The only work-around that I can see is to unlink and copy all the girders so they are all defined.

FROM:ttompson DATE:Tuesday, July 03, 2007 1:50:51 PM  
same behaviour in 5.6 Beta

FROM:hlee DATE:7/6/2007 7:55:02 AM  
G3 is linked to G2. The loads entered in G2's Member Loads window should be exported to the engine for G3 NSG analysis. Currently, the loads in G3's Member Loads window (hidden) are exported for G3 NSG analysis. This causes the reported missing DL in G3 since there is no load entered in G3's Member Loads window. I suspect the m\_lpMemberDisp passed from the Analysis Progress dialog to the export is incorrect.

Another work around is to unlink G3, copy G2's member loads to G3, link G3 to G2, do the same for G4, and perform NSG analysis for the superstructure. Please note that this problem is not in standard analysis.

FROM:mordoobadi DATE:8/24/2007 3:07:51 PM  
I think the export should just verify if a girder member is linked. If it is linked to another member then it must get the loading from the linked member.

FROM:hlee DATE:9/12/2007 12:16:17 PM  
The suggested linking check is not needed to fix the bug. Updated Virtis Std LFD Engine, BRASS-GIRDER(STD) and MADERO exports to locate the correct girder member for NSG analysis. Resolved for 5.6 Release.

FROM:ttompson DATE:Tuesday, October 02, 2007 3:30:48 PM  
Appears to be resolved. BUt found new problem.

FROM:ttompson DATE:Tuesday, October 02, 2007 3:33:06 PM  
No new problem. Please accept this as fixed in Beta 6.

FROM:ssalata DATE:10/3/2007 11:09:39 AM  
Verified in 5.6 Beta 5.

## Description

FROM:aprice DATE:Tuesday, July 10, 2007 12:09:54 PM

I am inputing a 3-span bridge into OPIS. I have different concrete strengths for each span. Each of these three strengths has its own corresponding stress limits. My file runs fine, but I am getting the error below:

ERROR: Stress limit concrete material does not match girder concrete material in span 1.

Is Opis capable of running different concrete strengths?

Thank you

FROM:kkennelly DATE:7/16/2007 8:22:09 AM

The BRASS LRFD program does not support different concrete materials in different spans. The log file produced when you analyze the beam should contain the following message:

WARNING (High):

BRASS does not support different concrete materials for each span.  
The concrete material from the first span will be utilized.

The error message that you reported above is a Validation error message produced by Opis. It is telling you that on the Beam Details: Stress Limit Ranges tab you have specified for Span 1 a Stress Limit that contains a Concrete Material that is different from the Girder Concrete Material specified on the Beam Details: Span Details tab.

**Description**

FROM:tthompson DATE:Wednesday, July 11, 2007 12:42:30 PM  
I had a 5 girder (Steel) bridge with G1 and G2 defined. With G3, G4, and G5 linked. We had an overheight hit, so I decided to unlink G3, G4, G5.

4/19/2016 3:20:20 PM

HRS AASHTO

2381

**Complete Issue Information**

I then copied G1 member alt to G5. And copied G2 to G3 and G4.

Everything looked ok - EXCEPT that the member loads (DC1) were NOT copied along with the rest of the member alternative data.

This may or may not be related to VI 7996.

But it is very troubling when you do a copy and NOT all of it copies over. COPY is one of the most powerful features of the application, but if one can not trust it - we have serious issues.

FROM:hlee DATE:7/12/2007 8:52:51 AM  
Making a copy of a member alternative will copy all the data belong to that member alternative. Member Loads sits above MEMBER ALTERNATIVES in the Bridge Workspace tree. Member Loads belongs to the member, not the member alternative. That's why Member Loads will not get copied when you copy member alternative. Incident 7996 describes a member linking problem in NSG analysis. Linking member is at the member level; all data (including Member Loads) below the member should be linked.

FROM:tthompson DATE:Monday, July 16, 2007 9:01:35 AM  
Ok.

Maybe need to revise this to an enhancement to COPY member loads.

### Description

FROM:rcurtis DATE:Friday, July 13, 2007 4:19:36 PM

In the attached file, I can generate POI for G1 using the wizard at the development points. However, for G2, when I try to generate the points of interest at the rebar development points, nothing happens.

FROM:kkennelly DATE:7/16/2007 8:45:47 AM

Member G2 is using Bar Mark Def A183. This Bar Mark Def does not have a Bar Size assigned to it. This is causing the calcs for the reinforcement dev lengths to fail. If you assign a Bar Size to that Bar Mark Def the wizard will work.

FROM:kkennelly DATE:7/16/2007 9:13:19 AM

Error message added for version 6.0 so user will know that an error occurred due to missing data.

FROM:rcurtis DATE:Monday, July 16, 2007 1:41:34 PM

Now that I have changed the bar size, the member will run. The shear spacing is the same as Member G1, however I get a rating of 0 for Member G2. I attempted to run in Virtis, however I get the following error:

Info - Virtis Std data file successfully exported.

Error - Unhandled exception in the analysis engine!

Error - Analysis failed!

FROM:kkennelly DATE:7/17/2007 9:03:58 AM

I think G2 is getting a shear rating of zero because there are no bottom rebars at Support 1 so the

4/19/2016 3:20:20 PM

HRS AASHTO

2383

**Complete Issue Information**

BRASS program computes the "d" value to compute the concrete shear capacity as zero. Comparing the Reinforcement Profile of G2 to G1 I think you want G2's Reinf Set 26 to start 0.58' to the LEFT of Support 1, right now it starts to the RIGHT of Support 1. Make that change and you will not get zero shear rating factor at the first support anymore.

Herman,  
The Virtis Std error appears to be an error with the array size.

FROM:hlee DATE:7/20/2007 1:58:22 PM  
The error is due to "THE NUMBER OF RC PROPRTIES RANGES EXCEEDS THE MAXIMUM OF 150" in the Virtis Std Engine analysis.  
This is a duplicate of Incident 7939.

FROM:rcurtis DATE:Tuesday, July 17, 2007 1:25:48 PM  
I have a multi-span (34), pin and hanger structure with skewed beams. Over the course of the bridge, beams are gained and lost using floor beams at the pin and hangers. I was planning on modeling this as A girder system for the girders that remain constant throughout the bridge and then as girder lines for the beams that end prematurely. Is this the best workaround or are there other options?

### Description

FROM:tarmbrecht DATE:Wednesday, July 18, 2007 5:08:09 PM

I've been having my consultant do some in-depth investigation of the truss module with one of our bridges (file attached). He's getting some questionable results which we can't figure out. His points are as follows:

1. The tension capacity, which according to the program documentation, is the product of the net Area of a truss member and  $F_y$ , is being reported as significantly less than what one computes by hand. For example, in the referenced truss model, LOL2, with  $A_{net} = 46.4$  sq. in. and  $F_y = 50$  ksi, Tension Capacity should be 2320 kips. In the Virtis "Load Factor Rating Summary" it is reported as 580.1 kips. (Also, see comparison spreadsheets in the attached MS Excel file.)

2. Live load forces reported by in the Virtis "Detailed Truss Member Rating Results" range from approximately 34% to 44% less than the values listed on the construction plans and those generated

4/19/2016 3:20:21 PM

HRS AASHTO

2386

### Complete Issue Information

by the AASHTO BARS bridge rating program (which are virtually the same).

3. The subject truss was designed in 1991 using ASD for HS20 loading, including a 25psf allowance for future deck overlay, yet minimum inventory rating factors generated by the Virtis truss analysis, using LFD, for lower & upper chord members and compression diagonals range from 0.18 to 0.77. In comparison, AASHTO BARS, utilizing ASD, for the same members has rating factors ranging from 2.47 to 6.82.

Please advise. Thanks, Tim

FROM:gbhanushali DATE:7/25/2007 4:44:47 PM  
Part 1 - Issue regarding capacity is resolved. (for 5.6 beta Aug 07)

FROM:ssalata DATE:8/3/2007 2:16:46 PM  
Verified that Part 1 is fixed in latest debug build using Truss Training Example.

FROM:gbhanushali DATE:8/6/2007 2:16:16 PM  
Hi Tim,

Provided spread sheet has following members specified that don't exist or they don't show up in virtis truss model within attached bridge.

L0L2

L2L4

L4L6

U1U3

U3U5

U5U5'

Please advise.

After fixing part 1 (capacity) of this incident - virtis rating results now vary as follows: (refer to attached bitmap image)

Inv : 1.298 - 3.610

Op: 2.168 - 6.030

DLs still don't agree between BARS results and Virtis. This requires further investigation to see if BARS and Virtis Truss calculate the super structure dead load the same way (which may not be the case). LLoad disagreements still need to be investigated.

FROM:gbhanushali DATE:8/6/2007 3:37:04 PM

FROM:rmbest DATE:Monday, August 13, 2007 11:39:41 AM

Tim is out of the office so I will respond to this one.

The members mentioned above are just short hand for:

L0L2 is L0L1 & L1L2

L2L4 is L2L3 & L3L4

L4L6 is L4L5 & L5L6

U1U3 is U1U2 & U2U3

U3U5 is U3U4 & U4U5

U5U5' is U5U6 & U6U5'

**Description**

FROM:rcurtis DATE:Friday, July 20, 2007 2:01:30 PM

I am wondering how the "d" value is calculated for Shear. In the attached file, the girders have the same depth at analysis points 1.00 and 2.05. The rebar at these locations are the same distances from the bottom of the beam. However, at point 1.00 the output lists d as 38.75in and at 2.05 as 35.74in.

FROM:hlee DATE:7/24/2007 8:06:36 AM

The shear depth in BRASS-GIRDER is taken as the distance from the extreme compression fiber to the centroid of the reinforcement in the opposite face.

Fascia Girder

=====

For Analysis Point 100 (Span 1 - 0 ft), the exported cross section is Cross Section 1.

### Description

FROM:jihnmat DATE:7/24/2007 10:03:11 AM  
Received via email (Bridgeware):

I am having some problems load rating a bridge using Virtis and was wondering if you had any advice and/or examples that would help find a solution.

The bridge is a 3 span, simple span bridge with 8 steel rolled girders. My problem is that I am unsure how to tell the software that my bridge consists of simple spans, not continuous spans over the supports. I did find an example which showed how to input a similar bridge with prestressed concrete girders, but that used the Beam Details tab under Member Alternatives, which is not an option for rolled steel girders. Thanks for your time,

Reply e-mail:

=====  
Evan,

If you have a superstructure with 3 spans, those 3 spans are continuous spans. What you need is 3 superstructures, each represents a simple span. Please see General Bridge Description topic in Virtis Help.

| 8035.17034 | Resolved      | Problem defining a Stringer Group Definition to a Stringer Unit |

### Description

FROM:ttompson DATE:Wednesday, July 25, 2007 11:35:22 AM  
After completing defining our floorbeam, we keep getting an error message:

End Distance is 23.00 FT  
Beam Distance is 24.00 FT  
Do you want to change the length?

As best as I can tell I can't find where Virtis would think that 23 ft would be a possible length.  
Everywhere I checked, it is 24 ft.  
Between main girders = 24 ft

We've pretty much completed the entire bridge, but it won't pass stringer reactions to the floorbeam and do an analysis with this mismatch in floorbeam length.

PS> We originally had this problem in 5.5, and then I tried it in 5.6 in case it might have resolved it's

2397

**Complete Issue Information**

self between versions. I've attached the 5.6 Beta 3 of the structure.

FROM:ttthompson DATE:Wednesday, July 25, 2007 11:40:57 AM  
We are also NOT analyzing the main girders because of the limitations of BRASS.  
Our plan is to take the Floorbeam reactions, convert them to a uniform load and then apply that to a "normal" 2 girder system.

FROM:jihnata DATE:7/25/2007 12:49:19 PM  
Since the web must be defined over the entire beam, the window is checking for End Distances that are within one foot of the end of the beam.  
That is usually the right most portion of the web, but not in this particular case.  
You can just answer "No" to accept the data as it is.  
There is a separate request outstanding to always only check the right most End Distance.

We can't seem to assign String 6 - 235' (12 spans) to Stringer Unit 8.  
See error message - attached.

4/19/2016 3:20:23 PM

HRS AASHTO

2398

**Complete Issue Information**

We've checked, rechecked and the floorbeams appear to be located in the correct location.

Alternatively, we can't seem to assign a stringer definition to any stringer in Stringer Unit 8. See error messages - attached.

FROM:kkennelly DATE:7/30/2007 8:34:28 AM  
Can you attach an xml file of the bridge?

I can't be sure since I don't have your bridge but the error message about not being able to assign a stringer definition in Stringer Unit 8 because the stringer mbr length is zero sounds like you may not have a Stringer Group Definition assigned to Stringer Unit 8 on the Floor System Geometry window.

FROM:kkennelly DATE:9/25/2007 4:06:40 PM  
Problem fixed by using the user defined tolerance when checking the floorbeam mbr locations vs. where the stringer group definitions say floorbeams should be.

Problem assigning a stringer definition to the stringers in Unit 8 is fixed once the above fix lets you assign a Stringer Group Def to Unit 8.

Fixed for 5.6 and 6.0

### Description

FROM:ttompson DATE:Friday, July 27, 2007 11:15:44 AM

I can't seem to find an enhancement on this, and it probably should be.

I don't see where you can add a coverplate on a steel plate girder that is defined using schedule based. You can add coverplates if it is defined as Cross Section Based. If we really want to promote schedule based for folks, we need to add all the capabilities that Cross Section based offer.

Or am I just missing where cover plates can be added on schedule based?

FROM:ttompson DATE:Friday, July 27, 2007 11:21:45 AM

FROM:jduray DATE:7/31/2007 12:49:19 PM

Cover plates on welded plate girders is not supported so this would be an enhancement as you suggest.

### Description

FROM:jtriezenberg DATE:Monday, July 30, 2007 3:24:00 PM

Is there any way to have Virtis debond strands in the middle of the beam? I have a bridge where the strands on top have been debonded in the middle half of the span.

Thanks,  
Jeff

FROM:hlee DATE:8/1/2007 9:15:13 AM

Virtis doesn't support strands debonded in the middle of the beam.

## Description

FROM:rcurtis DATE:Thursday, August 09, 2007 8:25:02 AM

In the attached structure, I am trying to model a beam who's spacing changes. Although I entered three different deck widths, Virtis is only using the smallest width, which is dramatically affecting the rating in the first span that actually has a larger deck width.

Is there a way to get Virtis to use the deck width at the location?

FROM:hlee DATE:8/27/2007 10:00:49 AM

I assume the structure in question is "SB Spans 1 thru 3 Beam AA (Beam AC similar but not exact)" and the question is for the Virtis Std LFD engine.

The structure in question is entered as girder line. Varying deck width is not supported for girder line definition.

FROM:dteal DATE:Thursday, August 09, 2007 10:08:13 AM

Our County-Serial 082-029

In the attached bridge – I wanted to change the concrete material being used in the cross section. I added a new concrete material from the library.

Go to cross sections for girder 1

Change the concrete material to Class AAA for the pull down

Click apply and go to the Reinforcement tab – you will see all is ok (the row column is populate)

Click OK and then go right back into the same cross section – you will see that the Row column in the rebar tab is now blanked out.

FROM:jihnat DATE:8/9/2007 12:48:34 PM

When the window is first opened the values in the Row cells are "Bottom of Girder" and "Top of Girder", but the choices in the drop down list are "Bottom of Slab" and "Top of Slab".

Not sure yet why they don't match. But you can reselect "Bottom of Slab" and "Top of Slab" as a workaround.

**Description**

FROM:jihnat DATE:8/14/2007 9:57:44 AM  
Received via email (Bridgeware):

After I run the analysis for my bridge in Virtis and I look at the output, each load rating points out a specific "controlling point." Each controlling point has a specific number which some how relates to a location along the bridge.

For Example:

LOAD NO. 1: Truck: AASHTO H 20-S 16 Loading, 1944 Ed  
CONTROLLING POINT: 206.00 <-- <-- <--  
Limit State: STEEL GIRDER (FLEXURAL - STEEL STRENGTH)  
RATING FACTOR (pos): 2.56  
LOAD RATING: 92.05 (tons)

How do I determine the location along the bridge that relates to the controlling point?

Thank you for your help.

### Description

FROM:jihnat DATE:8/20/2007 10:53:29 AM  
Received via email (Bridgeware):

I am trying to analyze a flared steel plate girder system using the Virtis LFD Analysis Engine. I have attached the .xml file for the bridge and the Virtis Engine Output for the first interior girder (Girder B). The Virtis Engine is incorrectly using 21.07 ft (6.421 m) for the beam spacing - see the Virtis Engine output .txt file line 67. The actual beam spacing varies from approximately 7 ft (2 m) at Abutment A to 8 ft (2.5 m) at Abutment B. The 21.07 ft spacing that the Virtis Engine is using is the beam spacing along the support, not perpendicular to the girders - see the framing plan detail in the Bridge Workspace

### Description

FROM:jtriezenberg DATE:Friday, August 24, 2007 8:38:57 AM

When running this structure, after exporting the bridge information to the BRASS engine, this error appears:

----- Contents of BRASS Error File -----

File: C:\Program Files\AASHTOWARE\Virtis55\80180023000S080\Spans\_1\_\_2\_\_3\_\_AND\_4\G1\Fascia\_girder\BRASS\_LFD\Fascia\_girder.ERR  
Fatal Error Encountered - Unexpected Termination  
Data File: \G1\Fascia\_girder\BRASS\_LFD\Fascia\_girder.DAT

-----  
Error No.: 1200  
Type : Input Error  
Location : web\_gen.for

A web depth on span 4 could not be determined due to an invalid range. (iseg\_store = 0)

----- End of Contents of BRASS Error File -----

I can't figure out why span 4 is not a valid range. The span length match the superstructure definition. See the attached file. Only the fascia girder has been defined so far.

4/19/2016 3:20:27 PM

HRS AASHTO

2415

**Complete Issue Information**

FROM: bgoodrich DATE: Friday, August 31, 2007 11:10:19 AM

I was able to duplicate the error message when my units tolerances (in the Configuration Browser window) were set to 0.001 ft and 0.00001 inches. The last web range for span 4 was being exported as 42.94 ft instead of 42.9479 ft. Several of the bar marks are ending near the end of span 4, which creates several small ranges in that region. Virtis tries to resolve the short ranges with the units tolerances. When the tolerance is too small, this type of error occurs. I changed the tolerances to 0.01 ft and 0.0001 inches and the structure was analyzed.

FROM: jtrizeenberg DATE: Monday, September 17, 2007 2:34:15 PM

I was able to analyze the bridge, but the rating returns a zero. Do you get the same result? I've checked all the obvious places where I might have inputted the wrong units.

FROM: hlee DATE: 9/17/2007 3:04:38 PM

Please review the BRASS output at the controlling location to determine why the rating is zero. This may reveal the problem.

FROM: jtrizeenberg DATE: Wednesday, September 19, 2007 12:51:43 PM

I have attached a text file with the output at the controlling location. BRASS is showing  $\phi \cdot V_n = 0.6$  kips. It is also showing the concrete strength, web depth and web thickness as 3,000psi, 36in and 21in respectively. If  $V_c = 2 \cdot \sqrt{f'_c} \cdot b_w \cdot d$ , this shear capacity should be much higher. BRASS seems to be computing the capacity correctly in the next point of interest. I don't know why the capacity is being rated so close to zero at this point.

FROM: jtrizeenberg DATE: Wednesday, September 19, 2007 1:24:01 PM

I have also attached a new file for the bridge. This will ensure we are working from the same information.

FROM: bgoodrich DATE: Thursday, September 20, 2007 10:23:00 AM

I turned on the intermediate output for the left end of the beam. The shear depth reported is 0.251 inches, which appears to be why the shear capacity is so low. At the end of the beam, BRASS obtains the actions "d" away from the support, but it uses the section properties and reinforcement at the end of the beam. Based on the input, there does not appear to be any "developed" reinforcement in the bottom of the beam. Therefore, BRASS cannot calculate the shear depth.

FROM: hlee DATE: 9/20/2007 11:03:25 AM

Please check the end bearing locations and reinforcements input data. Below is copied from the FAQ.

=====  
=====

Why do I get a zero shear rating for a schedule based reinforced concrete bridge?

Virtis/Opis computes the required development length of flexural reinforcement and takes this development length into consideration when it creates cross sections for export to an analysis engine.

If

your reinforcement bars start at the first support line of the member or end at the last support line of the member, Virtis/Opis computes the percent of bar developed at the support line to be zero percent and the

4/19/2016 3:20:27 PM

HRS AASHTO

2416

**Complete Issue Information**

cross section that exists at these locations will have zero rebar. If no rebar exists, the analysis engine cannot compute the "d" distance from the extreme compression fiber to the centroid of the tension reinforcement. If the "d" value does not exist, the shear capacity of the beam cannot be computed. To solve this problem, first enter a value for the "End Bearing Locations" on the Member Alternative window. This is the distance from the end centerline of bearings to the physical end of the beam. Once this value is entered, you can start your reinforcement to the left of the first bearing and end it to the left of the last bearing. Then when Virtis/Opis will determine that the bars are partially developed at the end bearing lines and a "d" value can be computed.

An alternate solution to this problem is to specify the bar as "Fully Developed" on the Girder Profile: Reinforcement tab. This will cause Virtis/Opis to assume that the bar is fully developed along its entire length.

Another cause of this problem is the lack of shear reinforcement ranges being defined. Assign shear reinforcement definitions along the length of the member in the RC Shear Reinforcement Ranges window.

**Description**

FROM:jtriezenberg DATE:Monday, August 27, 2007 8:34:06 AM

I have a situation where a steel plat girder is not continuous over a support (there are 2 bearings on the pier with a 2" gap between girders) However, the concrete deck above the pier is continuous. Is there any way to model this in Virtis?

FROM:kkennelly DATE:8/27/2007 3:25:31 PM

You cannot model steel beams as simple span for DL and continuous spans for LL in Virtis. You can only use such a model if you have prestressed beams.

### Description

FROM:rcurtis DATE:Monday, August 27, 2007 1:14:14 PM

I am attempting to run a structure with LRFR. I'll attach the file. the error "Invalid analysis method requested!" Is shown. Could you let me know what steps I should be taking to run a structure LRFR?

I am trying to run Typical End Span, G3.

FROM:rcurtis DATE:Monday, August 27, 2007 2:04:37 PM

4/19/2016 3:20:28 PM

HRS AASHTO

2421

### Complete Issue Information

Also, when using the LFD Brass Engine, the plastic moment capacity at midspan for this structure is listed as 936.7k\*ft in the output. However,  $F_y * Z$  would be  $33 * 346 / 12 = 951.5k*ft$ . Any reason for this difference?

FROM:kkennelly DATE:8/27/2007 3:27:52 PM

Version 5.5 does not have an analysis engine for performing LRFR ratings. It only provides the user interface so you can enter LRFR data in anticipation of Version 5.6 having the BRASS LRFR analysis engine for LRFR ratings.

The plastic moment capacity question is being referred to Brian Goodrich.

FROM:bgoodrich DATE:Friday, August 31, 2007 11:36:04 AM

BRASS does not use the plastic section modulus or any other section properties from Virtis/Opis. BRASS calculates these properties based on the section dimensions, which does not include the small "fillets" at the flange/web interface. This causes a slight reduction in the plastic moment capacity in this particular structure.

**Description**

FROM:dteal DATE:Wednesday, August 29, 2007 2:04:24 PM

Is it true that a sidewalk can not cantilever over the edge of a deck as shown in my input, plans and schematic (attached)?

When modeled the way I showed, the rail, parapet and sidewalk loads are not located on the structure?

What is the best way to model this situation?

FROM:hlee DATE:9/11/2007 9:07:28 AM

In the above model, the loads for the sidewalk and the rightmost rail and parapet are exported to the BRASS engine.

Dean, Are you concern about the moment induced by the rightmost rail and parapet?

Brian, Please check the export. I don't think the "700 Pedestrian Rail" should be exported for Member F since it's located outside Member F tributary area.

Loads in BRASS export for the right exterior girder (Member F):

FROM: bgoodrich DATE: Saturday, September 15, 2007 12:57:41 AM  
The BRASS export does not filter the deck loads based on the tributary area. All the loads are sent to the engine, and the engine distributes the loads according to the method selected for each stage.

FROM: dteal DATE: Tuesday, October 02, 2007 9:59:52 AM  
Herman - to answer your question:  
I get a message from Virtis/Opis during validation that states -

Structure Definition: As Designed, but sidewalk loads arne't applied properly  
ERROR: Appurtenance not located on structure typical section at start of structure.  
ERROR: Appurtenance not located on structure typical section at end of structure.  
ERROR: Appurtenance not located on structure typical section at start of structure.  
ERROR: Appurtenance not located on structure typical section at end of structure.  
ERROR: Sidewalk not located on structure typical section at start of structure.  
ERROR: Sidewalk not located on structure typical section at end of structure.

I don't think this was a BRASS issue??

FROM: hlee DATE: 10/3/2007 11:21:11 AM  
During the validation, the locations of the sidewalk and rightmost rail and parapet are check against the deck. Validation will complain "not located on structure typical section" if any part of the sidewalk or appurtenance is located outside the width of the deck.

## Complete Issue Information

Since the loads for the sidewalk and the rightmost rail and parapet are exported to the BRASS engine correctly, the engine should pick up what you entered in the Structural Typical Section window.

FROM:dteal DATE:Wednesday, November 07, 2007 2:42:21 PM  
If everything is working correctly - why are we getting error messages?

FROM:kkennelly DATE:11/26/2007 2:53:42 PM  
Validation message changed from error to warning for version 6.0

## Description

FROM:mordoobadi DATE:8/31/2007 9:53:42 AM  
This issue came up in the Mass Highway user training last year.

One of the Mass Highway IT personnel indicated that it takes so much effort to maintain Virtis/Opis software on client machines in their organization.

4/19/2016 3:20:28 PM

HRS AASHTO

2425

**Complete Issue Information**

One of the problems that he mentioned was that their users normally have limited privileges on their machines and they cannot write to the folders under Program Files, but Virtis/Opis writes to folders in the Program Files/VirtisOpis folder. He suggested that Virtis/Opis should follow the Windows Logo program guidelines. The windows logo program suggests that the files written by an application should not be written to the program files folder instead they should be written to the user's My Documents folder. (e.g. "My Documents\Virtis Opis" folder)

This folder should probably be configurable so that it defaults to My Documents\Virtis Opis and can be changed to something else if needed. This option may be configured within Virtis/Opis installation or in User preferences or both.

## Complete Issue Information

Your explanation of the use of ellipsis is incorrect.

An ellipsis should be used when additional information is required to complete the command. For instance, an ellipsis should certainly not be used on Edit-Paste or Help-About. Whether or not a modal dialog appears is not the issue.

I did find that we were using the ellipsis in too many places. I've removed it from the following:

File-Open

Please attached the bbd file to this incident. We can migrate the bbd file to 5.5 for you.

FROM:mlebeau DATE:Tuesday, September 11, 2007 6:02:45 PM  
Thank you so much for you repid reply. The .bbd file has been attached

FROM:hlee DATE:9/12/2007 8:42:05 AM  
The migrated 5.5 XML file is attached.

FROM:mlebeau DATE:Wednesday, September 12, 2007 9:04:42 AM  
I got the file, batch imported and it works. Thank you so much. Just one question, when we want to open the old file which created in the previous version, we have to do this all the time?

FROM:hlee DATE:9/17/2007 8:27:23 AM  
Below is part of the "Import/Export Virtis/Opis Data" topic in Virtis/Opis Help. If you want to archive the bridges, follow Step 2 in the AASHTO BRIDGEWare Startup Guide to backup your database.

=====  
Data exported to a BBD file can be imported back into the AASHTO BridgeWare® database. The export function for BBD files is not intended for use as an archiving mechanism. The export function is intended for use of exchanging files between agencies or consultants but only within the same version of the database. The BBD export and import functions cannot be used from one version of Virtis/Opis to the next version of Virtis/Opis. For example, you cannot export a bridge from Version 2.1 and then import it into Version 3.0.

Data exported to an XML file can also be imported back into the AASHTO BridgeWare database. The export function for XML files is not intended for use as an archiving mechanism. This XML import/export feature was introduced for Version 5.4. Future versions of Virtis/Opis will provide a mechanism for exporting and importing XML files between versions of Virtis/Opis. For example, you will be able to export a bridge from Version 5.4 and then import it into Version 5.5 in the future.

**Description**

FROM:jtriezenberg DATE:Wednesday, September 12, 2007 6:17:32 PM

This bridge has a smaller girder hinged with a larger girder. I have two superstructure definitions; one for spans 1 and 2, and one for spans 3 and 4. Both definitions have the same change in girder depth but spans 1 and 2 give an error when BRASS analyzes it. Please help me to find what is wrong.

Thanks,  
Jeff Triezenberg

FROM:hlee DATE:9/13/2007 8:44:37 AM

I'm able to rate both "Spans 1 and 2" and "Spans 3 and 4" using BRASS LFD. What are the tolerance settings in your Configuration Browser System Defaults window? Could you describe the error you are getting or attach a screen capture or log file to this incident?

FROM:jtriezenberg DATE:Thursday, September 13, 2007 1:19:21 PM

After increasing the tolerances to 0.05 ft and 0.1 in, I still get two error messages:

----- Contents of BRASS Error File -----

File: C:\Program Files\AASHTOWARE\Viridis55\03103034000S010\Spans\_1\_and\_2  
\Fascia\_Girder\Spans\_1\_and\_2\BRASS\_LFD\Spans\_1\_and\_2.ERR  
Fatal Error Encountered - Unexpected Termination  
Data File: der\Spans\_1\_and\_2\BRASS\_LFD\Spans\_1\_and\_2.DAT

**Complete Issue Information**

-----  
Error No.: 1200  
Type : Input Error  
Location : web\_gen.for

A web depth on span 1 could not be determined due to an invalid range. (iseg\_store = 0)

----- End of Contents of BRASS Error File -----

and:

Input Errors (1200) - Web segment range invalid

I increased the tolerances to 1 foot and 1 inch and the same error was still generated.

-Jeff

FROM:jtrizeberg DATE:Thursday, September 13, 2007 1:28:11 PM

FROM:hlee DATE:9/17/2007 10:25:49 AM

Try using the default tolerances (0.001 for ft and 0.00001 for in). I was able to rate both superstructure definitions with the default tolerances.

FROM:jtrizeberg DATE:Monday, September 17, 2007 1:46:01 PM

I was able to run the bridge with those tolerances. Thats odd that smaller tolerances allowed the structure to be rated.

FROM:mlebeau DATE:Tuesday, September 18, 2007 12:01:20 PM  
 I have Precast Deck Beam Superstructure. Is there a way to setup virtis and it give Rating Result Summary for Serviceability-Concrete Tension?  
 Thank you

FROM:hlee DATE:9/19/2007 11:01:14 AM  
 I assume the question refers to the BRASS LFD engine.

FROM:bgoodrich DATE:Thursday, September 20, 2007 11:16:51 AM  
 The BRASS LFD engine does not use the Stress Limits that are available in Virtis. Instead, the engine uses the "ASD Factors" located on the "Factors" tab or the "Member Alternative Description" window. The concrete tension factor under the "INVY" heading can be used to obtain the rating.

There is no button to duplicate all wheels from one axle to another while entering data. What I mean, if several axles of a NSG vehicle are identical, there should be a way to duplicate similar axles simultaneously along with the wheel spacing and wheel loads. Currently if one duplicates an axle, the wheels on the axle do not get duplicated.

Received via email (Bridgeware):

My name is Ai Fen Jimenez from Bryant Associates. I have trouble trying to define the floorbeam locations for my bridge. Attached is the bbd file of what I have inputted so far and I couldn't get Virtis to create the framing correctly. Also attached is the framing plan for the bridge. I keep on getting the error message that said "Unable to create a IDoFlrSystemMbrLocationList! Unknown exception occurred while trying to create a IDoFlrSystemMbrLocationList!".

Please take a look and let me know what is wrong. If you prefer to call me, my number is (617) 248-0300 ext. 2114. Thank you very much.

FROM:hlee DATE:9/21/2007 3:08:58 PM  
Bridgeware e-mail reply:

=====

====

Do you use the Floorbeam Location Wizard to generate the floorbeam locations in the Floorbeam Member Locations window? There is a defect in the Floorbeam Location Wizard in version 5.5, please see Incident 8142 (GFS Floorbeam Location Wizard Apparently Creates Erroneous Floorbeam Locations) for more information. A work around is to enter each floorbeam location manually in the Floorbeam Member Locations window.

**Complete Issue Information**

File attached. The main girder (a built-up riveted plate girder) of the subject Girder-Floorbeam system has a BRASS LFD inventory rating factor of 0.284 for lane loading at rating point 3.0 and similar for truck loading @ 2.5. The BRASS ASD inventory RF for lane loading @ 3.0 is 1.092 and for truck loading @ 2.5 is 1.052. As a separate check, we note that Bentley's LARS software LFD controlling inventory RF is above 1.0. The bridge was originally designed ASD for HS20. Therefore it appears that the Virtis/BRASS LFD rating is questionable. (Note: We checked and this is not new to Virtis 5.6.0 (Beta 4).)

Note: The BRASS check for negative moment, AASHTO Std. Spec. Eqn. 10-100 where  $b/t \leq 24$  is said to fail. But,  $b = 16$  and  $t = 1.625$  so  $b/t = 9.85$  which is less than 24. It's possible that this may be the root of the problem.

FROM:hlee DATE:9/25/2007 1:52:24 PM  
I suspect this is related to Incident 8002 and 5218.

FROM:bgoodrich DATE:Tuesday, September 25, 2007 7:17:20 PM  
Herman is correct that this is the same issue as Incidents 5218 and 8002. I will forward to WYDOT.

FROM: Brian Goodrich DATE: 7/16/2008 1:39:41 PM Eastern Daylight Time  
One possible solution that has been discussed is for BRASS to allow input of user-defined capacities. This would address cases where the user does not agree with the implementation of the specifications within the BRASS engine.

### Description

FROM:tarmbrecht DATE:Tuesday, September 25, 2007 2:24:08 PM

For Floor Line and Truss Line superstructures there is no way to enter the "n" value in the Deck Profile window. This affects girder, floorbeam and stringer members. For Girder Line and System and Floor and Truss Systems the last data entry field under the Deck Concrete tab of the Deck profile window allows entry of the "n" value.

FROM:kkennelly DATE:10/8/2007 11:02:39 AM

Are you running more than 1 version of Virtis on your pc? Sometimes the column width gets corrupt in the registry when you have multiple versions installed.

FROM:tarmbrecht DATE:Tuesday, October 09, 2007 3:41:01 PM

No, we uninstall previous versions before installing the new version.

2443

**Complete Issue Information**

The column for the "n" entry is visible on my pc.

Is this occurring on all of your pc's or just 1?

FROM:tarmbrecht DATE:Monday, October 15, 2007 2:10:30 PM

Krishna, I attached an xml file. Two things:

1. Let's call this "not-reproducible". My consultant is getting the problem - I've seen it with my own eyes (see attached Word document). It is on his login on the PC that has the beta version installed. He is not getting the problem in 5.5, and I am not getting the problem in either 5.5 or with my login on the beta machine. I'm going to assume that this will work out when we install 5.6 on our production machines.

2. Note that for superstructure def. "spans D36-D39 (4-Sp. Cont.) GFS", there is no Deck Profile for the main girder "D2- S Girder". However, there are deck profiles for the other floor line superstructure definitions. This happens for either my consultant or me on both 5.5 and 5.6beta5.

FROM:kkennelly DATE:10/16/2007 9:42:24 AM

1. Not seeing the "n" column is marked "not reproducible".

2. The presence of the Deck Profile window in the tree for the Girder should be controlled by the "Main members support the deck" checkbox on the Structure Def window. That box is not checked in that structure def so the Deck Profile and Haunch Profile windows shouldn't show up. But when I do check that box I would expect to see the Deck and Haunch Profile windows appear in the BWS tree but they don't.

FROM:jihnat DATE:11/9/2007 1:22:06 PM

#2 fixed for Alpha Build 5.

FROM:tarmbrecht DATE:Tuesday, December 11, 2007 12:16:54 PM

### Description

FROM:tarmbrecht DATE:Friday, September 28, 2007 11:33:56 AM

In the example (GFSCantChangeLength(560B4).xml), which is to be a model of a Truss Floorbeam Stringer system, the second span was originally entered as 225.4661 ft (for a total length w/the end spans of 275.4661 ft) and the <OK> button was clicked. Diaphragm spacings were then entered but in doing so it was discovered that the center span length was incorrect. It was corrected to 244.8828 ft. (now w/a total bridge length of 294.8828 ft. When the user attempted to enter the diaphragm spacings and error message came up stating that the spacings could not be entered because the total length was 275.4661 ft., the former bridge length value.

FROM:hlee DATE:10/9/2007 3:24:06 PM

When the center span length changed from 225.4661 ft to 244.8828 ft, the reference line for each member didn't get updated correctly. Attached the diaphragm validation message with the previous total length.

FROM:kkennelly DATE:10/15/2007 9:38:22 AM

Existing bug in truss - charge to fixed price maintenance.

Truss is calling base class DoFloorSystemStructDef:SetSpanLength() which only works with girders and not trusses.

FROM:kkennelly DATE:10/15/2007 10:46:44 AM

Also made change to SetSupportLineSkew.

Fixed for 5.6

FROM:kkennelly DATE:10/15/2007 1:05:20 PM

Code change does not fix Tim's bridge. Somehow Tim's bridge has different span lengths for the left and right truss members. I've attached a revised version of Tim's bridge with both truss members at

FROM:mordoobadi DATE:1/18/2008 7:42:27 AM

Since the stringer dead load analysis updates records in the database, it is not allowed when the bridge is not checked out or when the bridge is being exchanged. This behavior is intended.

FROM:mordoobadi DATE:1/18/2008 7:54:58 AM

Structure Definition check-out issue:

- (1) When bridge is opened and the structure definition is checked out, and then an analysis is performed, the errors shown above occur.
- (2) If structure definition is checked out and then bridge is closed and reopened and analysis is performed the errors do not occur.

I noticed when doing scenario (1) the properties of existing steel shapes are all null except name and description.

FROM:mordoobadi DATE:1/18/2008 4:04:27 PM

I Found source of the problem in the Dm classes for sub-type tables.

4/19/2016 3:20:35 PM

HRS AASHTO

2454

**Complete Issue Information**

When a structure definition is checked out the the domain is cleared and bridge is read from the database again but some data (De objects) corresponding to mid and leaf-level sub-type tables is left behind and not cleared. That's what is causing the Analysis to fail; because the cross section dimensions are coming back as null; or when opening a steel shape all of the values in the steel shape window are empty.

FROM:mordoobadi DATE:1/22/2008 9:16:04 AM  
Code generation templates for sub-typed tables modified so that all data is cleared before a structure definition is checked out. Corresponding Dm classes generated.

FROM:mordoobadi DATE:1/22/2008 9:19:51 AM  
Fixed for 6.0.0 Beta 3.

Noticed a leak. Two DeDouble's leaked when checking out a structure definition. The leak was not due to recent changes (leaked since 2005).  
Leak is fixed in 6.0.0 Beta 3.

FROM:tarmbrecht DATE:Tuesday, January 22, 2008 10:00:31 AM  
Mehrdad,

I'd like to see a little more discussion about the check-out requirement here. If I want to run a bunch of structure analyses for a particular truck in a batch-type situation, I will not be checking out every structure to do this, I will be selecting all my structures from Bridge Explorer. There needs to be a better way to include these types of bridges in a batch analysis so that I can analyze them alongside the non-GFS structures.

Tim

FROM:jhnat DATE:10/4/2007 11:05:18 AM  
Received via email (Bridgeware):

I am using Virtis for the first time and am trying to load rate a Virginia standard PCBT-45". This bulb-tee shape is slightly different in the bottom flange than the prestressed I beam input that appears in the program. Do you have any suggestions on how to address this issue?

Reply e-mail:

=====

=====

You can copy the "AASHTO-PCI Bulb-Tee BT-54" from the library (see attached) and modify the bottom flange. Or you can entered the bulb-tee shape into the window directly. If the strand locations are different, you also need to modify the strand grid data in the third tab of the PS I Beam window.

=====

Thank you for responding to my question. I understand the options you have informed me of; however, the Virginia Standard PCBT-45 is different than the "AASHTO-PCI Bulb-Tee". It appears that there is an additional chamfer dimension added to the PCBT-45 located at the top of the bottom flange that I cannot account for in the Virtis program (see attachments

for details of beam in question). I guess I was wondering if this issue had arisen previously and how it was handled.

=====

Reply e-mail:

=====

My suggestion is to enter A (see attached) as what is in the Virginia Standard and enter a B so the I and A of the beam are close to the Virginia Standard. You may also ask VDOT to see whether they have the beam in their Virtis Library. If they have one entered already, they can export the beam to a file and you can import it to your Virtis Library. I assume you are using Virtis for VDOT contract.

=====  
=====

I'm not able to reproduce the reported error. The error you are getting is most likely related to the tolerances set in your database. You can find the tolerance settings in the Configuration Browser's System Defaults folder. I used the default tolerances, which are 0.001 for ft and 0.00001 for in, when I tried to rate Floorbeam 1.

### Description

FROM:jihnat DATE:10/11/2007 2:56:23 PM  
Received via email (Bridgeware);

Is it possible to override the Dead Load automatically calculated by the Virtis Engine for a girder with a user-defined Dead Load? I tried changing my file under "Superstructure Loads - DL Distribution" tab in Virtis to select "User-defined dead load" for both Stage 1 and Stage 2. I then entered my user-defined dead load under the "Member Loads" tab for the particular girder. However, when I run the analysis for load

4/19/2016 3:20:37 PM

HRS AASHTO

E-mail reply:

=====

When you select "User-defined dead load" in the DL Distribution tab of the Superstructure Loads window, ONLY those loads applied on the Structural Typical Section window will not be computed. If you have haunch defined for the member, haunch load will still be computed and exported as Stage 1 load. The loads you entered in the Member Loads window will be exported in the "Girder Dead Loads", not the DL1 and DL2 in the "Bridge Cross Section and Loading". You can check each computed loads in the analysis log.

Please let me know if you need more information.

### Tasks

| Name       | Current State | Summary      |
|------------|---------------|--------------|
| 8207.16862 | Resolved      | Virtis Error |

### Description

FROM:rcurtis DATE:Friday, October 12, 2007 12:03:18 PM

I have run the attached structure in both Virtis and Brass. The results are very different, 0.44 vs 0.58 (brass and then Virtis respectively) for HS-20 Inventory.

Vcw is controlling, and so I don't believe that the  $M_{max}/M_{cr} \leq 1$  is the issue.

I know that Virtis uses transformed properties, but I am checking to see why the difference is so large as transformed sections are not supposed to create this large of a difference. I have created a hand check of just  $H/2$ . I have a number of issues that I differ from Virtis's calcs. First, I was wondering if you could tell me how Virtis is coming up with the transformed area ( $381.96 \text{ in}^2$ ). I am getting  $369 + (7-1) * 18 * .144 = 384 \text{ in}^2$ .

Is there anyway for me to print out greater detail of the Virtis intermediate calculations other than what is present in the standard output file?

FROM:hlee DATE:10/15/2007 8:50:00 AM

For the second question, to print out detail output:

1. Select Engine tab in the Analysis Settings window.
2. Select Virtis LFD in the dropdown and click Properties.
3. Select the Output Options tab.
4. Select "A Detailed rating abalysis" and click OK.

FROM:hlathia DATE:Monday, October 15, 2007 6:43:37 PM

For the first question, how transformed area is calculated:

$f'_c(\text{beam}) = 5.0 \text{ ksi}$

$E_s = 28000 \text{ ksi}$

$E_c = (150^{1.5})(33)(\text{SQRT}(5000))/1000 = 4286.82 \text{ ksi}$

$n = E_s/E_c = 6.53 = 6$  (taken as integer value)

Basic Beam Area =  $369 \text{ in}^2$

Transformed Area =  $369 + (6-1)(0.144)(18) = 381.96 \text{ in}^2$

The detailed output should provide sufficient information on how VSE calculates ratings of a PS beam.

### Description

FROM:tarmbrecht DATE:Friday, October 12, 2007 3:03:34 PM

We're not sure, but this may be related to Incident 8015. The Virtis truss analysis appears to be generating live load values that are approximately double of what they should be.

This conclusion was arrived at by comparison with values listed on the plans for a 12 panel 1-span Warren thru truss designed in 1991. As an additional check, the truss was also modeled in AASHTO PC-BARS, which generated nearly identical live load values as in the plan table. Dead loads and member capacities were in reasonable agreement for all three sources.

Excel spreadsheets with supporting analysis results are attached as well as the Virtis v. 5.6.0 Beta 5 export of the subject truss.

FROM: Girish Bhanushali DATE: 9/11/2009 10:30:45 AM Eastern Daylight Time

Live Load distribution factors in the Virtis Truss command should be entered as Lane. This is indicated in the commnad language manual under command 6.16.

Your truss input file has following values:

LLDistribution  
OneLane 1.7348 1.7348  
MultiLane 3.5873 3.5873

Above values should be entered as:

LLDistribution  
OneLane 0.8674 0.8674 // Lane based  
MultiLane 1.79365 1.79365 // Lane based

After correcting your above input : Rating factors matched with PC-BARS:

As an example following are the New Reported results for :

U5 L6 member

-----

Virtis RF = 3.16  
AASHTO PC\_BARS = 3.159 // from your spreadsheet  
User Calc. = 3.157 // from your spreadsheet

U5 L6 member Live Load = 57.5kips which is consistent in getting 3.16 Rating Factors (based on the RF formula in Method of solution) as shown below:

$$\text{RF} = \frac{978.30 - (1.3 \times 130.85)}{2.17 \times 57.5 \times 1.14 \times 1.79365 \times 1.0} = 3.1677$$

Similarly, member L0L1 (your spreadsheet shows this member as an L0L2):

Virtis RF = 3.91 (w/ Impact = 1.09)  
PC\_Bars = 3.886 (w/ Impact = 1.10)  
User Calc = 3.889  
Plan table - User Calc = 3.286

HRS AASHTO

2466

**Complete Issue Information**

Live Load actions reported by virtis are correct as they are arriving to the RF matching with all other software reported in spreadsheet.

Results summary Report PDF Attached.

FROM: Tim Armbrecht DATE: 9/14/2009 11:25:12 AM Eastern Daylight Time  
Girish, I can accept this explanation and as long as it's spelled out in the manual, OK.

However, I think it's important to note that there is an inherent inconsistency with the program when we need to use axle (or lane, as you put it) fraction for the truss module, but wheel fraction everywhere else in the program. This is the kind of thing that we should be avoiding in the big picture because it creates confusion among the users, and as a result, the credibility of the developer takes a hit.

I suggest the development team take a look at this and consider making LL distribution input consistent throughout the program.

### Description

FROM:rcurtis DATE:Tuesday, October 16, 2007 11:09:22 AM

1. In my bridge I am using 145 plf for the concrete weight, which gives a E of 4.074 ksi. So  
Econc/Esteel = 28.5 / 4.074 = 6.996  
Even in this case Virtis will use n = 6 instead of rounding to 7?

2. In looking at the data, I believe that Virtis is using fpc = 202.5psi for the equation  
 $V_{cw} = (3.5 \cdot \sqrt{f_c}) + 0.3 \cdot f_{pc} \cdot b_w \cdot d + V_p$

Using the other numbers that I find in the Virtis output, I find

Pe=313.1  
A=381.96  
I=52539  
ync=15.451  
ycom=32.487  
enc=10.784  
Mdl=48.2 (k\*ft)=578.4kip\*in

and I calculate

$$f_{pc} = 313.1/381.96 - 313.1 \cdot 10.784 \cdot (32.487 - 15.451) / 52539 + 578.4 \cdot (32.487 - 15.451) / 52539 = -87 \text{ psi}$$

This number matches closely with the result from Brass. However, Virtis has 202.5 psi. Could you tell me how Virtis is calculating this number?

I am including a portion of the Virtis output.

FROM:hlathia DATE:Tuesday, October 16, 2007 8:09:06 PM

Response to item 1:

Concrete weight is hard coded as 150 lbs/cft. Hence Ec value is slightly different. Modular ratio Es/Ec is taken as an integer value and not as nearest whole integer. These are coming from PennDOT's PS3 program. These two values can be revised if necessary.

4/19/2016 3:20:38 PM

HRS AASHTO

2468

**Complete Issue Information**

Response to item 2:

Since composite section N.A. lies in the flange, fpc is calculated at the junction of web and flange  
Use  $y=D-T2-B3=27$

Also, Mdl reported in the detailed output is  $=47.4 (k*ft)=568.8kip*in.$

Using above values, fpc is calculated as

$$fpc = 313.1/381.96 - 313.1*10.784*(27-15.451)/52539 + 568.8*(27-15.451)/52539$$
$$= 0.2025 \text{ ksi} = 202.5 \text{ psi (as reported by Virtis StdEngine)}$$

FROM:rcurtis DATE:Thursday, October 18, 2007 7:47:15 AM

Thanks for the clarification. Is this NA check present in the Brass Engine? If not, will it be added in the future?

FROM:bgoodrich DATE:Monday, October 22, 2007 2:41:53 PM

BRASS Problem Log 757 has already been assigned to calculate fpc based on the location of the N.A.

FROM:bgoodrich DATE:Wednesday, June 04, 2008 10:32:36 PM

The fpc calculation has been corrected in BRASS-GIRDER(STD) Version 6.0.1.

### Description

FROM:tarmbrecht DATE:Thursday, October 18, 2007 6:07:35 PM

This model produces reasonable results when section SecL29U29 is entered as AngleBox w/only one flange plate but, when entered as NonDetailed the dead load forces in all of the members are shown in the Rating Results Report as "-1.#J" and, when entered as AngleBox w/multiple wed plates no live load forces are generated. The problem entries is in the attached export under "East Truss" w/the NonDetailed called SecL29U29 and the problem AnglBox called SecL29U29-x. The properly functioning (as far as this issue is concerned) truss is described under "West Truss".

In addition, please verify the impact factors. The impact factors output for members L14U14 & L29U29 is 1.30, while for corresponding member L14pU14p they are 1.09 (compr.)/1.30 (tens.) & for L29pU29p it is 1.09. We think that for L29U29 it should be 1.09 and for L14U14 it should be ~1.14 for both compr. & tens. and for L14pU14p it should be 1.09 for both.

FROM: Girish Bhanushali DATE: 9/14/2009 10:47:30 AM Eastern Daylight Time  
This truss can not be analyzed since it is statically instable. Validation check may not have existed in the past to check for truss stability condition.  
In current version analysis does not run.

FROM: Tim Armbrecht DATE: 9/15/2009 12:09:59 PM Eastern Daylight Time  
This incident is not an issue with us anymore. We can get the truss the run, and Virtis produces acceptable results. Not sure why it's statically unstable on your end. As far as I'm concerned, this incident is resolved. Please go ahead and close it.

FROM: Girish Bhanushali DATE: 9/21/2009 10:13:34 AM Eastern Daylight Time  
Validation message came up while using the attached xml file.

Thanks.

**Description**

FROM:dteal DATE:Friday, October 26, 2007 4:03:58 PM

I got an error message I don't understand and don't know how to resolve it.  
It is on a concrete prestressed girder system  
When I validate it get the following message:  
"EROR: Deck panel ranges not defined for entire structure definition length"  
Bridge is attached

FROM: Krisha Kennelly DATE: 6/23/2008 3:48:59 PM Eastern Daylight Time

Deck panels are not exposed in Virtis. Somehow the length of the deck panel in your bridge is less

4/19/2016 3:20:40 PM

HRS AASHTO

2475

**Complete Issue Information**

than that of the structure def. It should exactly equal the struct def length. That is why you are getting this message.

Workaround: To fix the data mismatch you can do the following: Open the Structure Definition window, change the length of Span 3 from 82 to 92 feet. Click OK, reopen the window, change the length of Span 3 from 92 back to 82 feet.

I don't know how the bad data got into your bridge but for 6.0 Beta 5 I have added code to the domain to ensure that the deck panel length matches the structure def length when you add a span, delete a span or change a span length. I think that will prevent this problem from occurring in the future. Note that the fix for 6.0 Beta 5 does not fix the data in your bridge, you have to follow the workaround listed above to fix your data.

### Description

FROM:dteal DATE:Tuesday, October 30, 2007 7:48:48 AM

1. Copy Girders – (not girder lines but girders in the same line)

Many times PS girders are identical like 75-4@90-75

Enter 4 - 90 foot identical girders is a waste of time

2. If we can't copy girders, then at least make it possible to copy the stirrup ranges from one girder to another.

3. Radio button to extend stirrups into the slab. The button could be "Extend All" (new) or Extend Selected" (existing method).

4. Horizontal Shear reinforcement – option to space the horizontal shear bars with the vertical shear bars (usually do it that way).

## Description

FROM:jihnat DATE:10/30/2007 8:25:31 AM

The Help for Member window states that the span length for Girder System is the value entered in Structure Def window.

This should be clarified to state it is calculated from that value and the Framing Plan.

The Structure Def span length and Member span length may differ in decimal positions.

FROM:jihnat DATE:10/30/2007 10:11:03 AM

Structure Typical Section numbers are also apparently used in the calculation.

FROM:hlee DATE:11/6/2007 2:04:10 PM

Resolved for 6.0 Release.

### Description

FROM:jtriezenberg DATE:Wednesday, October 31, 2007 9:33:46 AM

Is there any way to use a train of trucks with a given spacing for the live load? A uniform lane load could be used for this, but the adjacent lanes need to have truck loading, not lane loading. Is there any way to have lane loading in one lane and truck loading in another lane? This is required by the DOT for spans over 200 ft.

Regards,  
Jeff Triezenberg

FROM:kkennelly DATE:11/5/2007 11:43:24 AM  
There is currently no way to specify these items in Virtis.

**Description**

FROM:jtriezenberg DATE:Friday, November 02, 2007 9:21:29 AM  
I'm having trouble rating this 2 span spread box beam bridge. Both the BRASS and Virtis engines return ratings of 0.0. The dead loads and live loads seem to be within reasonable limits. The problem may be because there are 2 nodes within 5 cm of each other near the end of span 1. If this is the case, can I eliminate one of those nodes?

See the attached file.

-Jeff Triezenberg

FROM:hlee DATE:11/6/2007 8:53:17 AM  
I reviewed your bridge. Do you have a row of deck reinforcement from start of span 2 with length equal to 6.95 m?  
The question is being referred to Brian Goodrich.

**Description**

FROM:jihnat DATE:11/2/2007 1:56:06 PM  
Received via email (Bridgeware):

I am trying to do a bridge rating with the Virtis program and I'm having some trouble. It is a 3 span steel structure with a hinge just inside of each pier line on the center span. It is not recognizing the hinge and locates the critical point just inside the hinge with bending being critical. I'm sure that really isn't the case, so I think the Virtis model isn't correct and isn't modeling the hinge correctly. I'm sure its my fault and I'm wondering if you have an example with a hinge in the steel girder that I could use as a guide?

In the attached bridge  
Second Superstructure Definition "Schedule Based LRFD Design"  
Member "2 1/2" clear to Top Steel"  
First Member Alt (To be Deleted)

When I try to delete this Member Alt I get the following error message  
Unable to save Bridge data!  
11:28:06 AM - Line 884 in source file .\UiBWSDoc.cpp.

FROM:dteal DATE:Monday, December 10, 2007 10:53:34 AM  
I can't do it in version 6.0 beta 1

FROM:mordoobadi DATE:1/22/2008 3:38:26 PM  
There seems to be a kind of dependency between the two member alternatives. If I remove the second member alt then save and then remove the first member alt and save, it saves successfully.

FROM:mordoobadi DATE:1/22/2008 4:40:21 PM  
May be related to the order of primary key columns in abw\_anal\_pt\_reinf\_conc table.

4/19/2016 3:20:42 PM

HRS AASHTO

2486

## Complete Issue Information

The order is:

bridge\_id  
anal\_pt\_id  
struct\_def\_id  
super\_struct\_mbr\_id  
super\_struct\_spng\_mbr\_alt\_id

The anal\_pt\_id must be the last PK column in this table. Note that the Dm code is generated. In the generated code there are functions like FindDeObject() that have arguments which have the same order as the table primary keys. If a function in another generated object calls this FindDeObject with its expected column order that is different, it may cause unexpected issues.

FROM:mordoobadi DATE:1/23/2008 9:18:48 AM  
Follow these steps to duplicate this incident in 6.0.0 Beta 2.

- 1 - Open RCTrainingBridge1
- 2 - Go to 2nd Structure Def "Schedule Based RC Structure" Member G2 Member Alt "Schedule Based Tee" add 10 Points of interest
- 3 - Copy the member alt to same member
- 4 - Go to Member G2 and select the new (copied) member alt as current and existing.
- 5 - Save the bridge and close BWS.
- 6 - Open the bridge and delete the first member alt (2nd Structure Def "Schedule Based RC Structure" Member G2 Member Alt "Schedule Based Tee")
- 7 - Save and get the error:  
Unable to save Bridge data!  
09:37:54 AM - Line 884 in source file .\UiBWSDoc.cpp.

FROM:mordoobadi DATE:1/23/2008 11:10:03 AM  
Duplicate of incident 8382

FROM:mordoobadi DATE:1/23/2008 3:46:21 PM  
Verified that the order of columns (as described above) is not the source of this problem.

FROM:mordoobadi DATE:1/23/2008 3:58:11 PM  
The problem was that in the copied member alt the data in the analysis point development tab were referring to the beam def of the original member alt.

Deleting of the original member alt failed because the copied member alt was referring to some data in it.

FROM:mordoobadi DATE:1/23/2008 4:02:28 PM  
Changed GUI code for copying member alt to copy the beam definition before copying the member alt. Before it copied member alt and then the beam definition.

FROM:mordoobadi DATE:1/23/2008 4:49:02 PM  
The following SQL command will identify the list of problem records in the database.

```
SELECT bridge_id, struct_def_id, super_struct_mbr_id, super_struct_spng_mbr_alt_id, COUNT(*)
FROM abw_anal_pt_conc_reinf APCR
WHERE APCR.spng_mbr_def_id <>
      (SELECT MA.spng_mbr_def_id
```

Here are the results

From: Janette McGrath  
Sent: Thursday, January 24, 2008 9:37 AM  
To: Dean Teal  
Subject: RE: VI Incident 8258

BRIDGE\_ID STRUCT\_DEF\_ID SUPER\_STRUCTURE\_MBR\_ID SUPER\_STRUCTURE\_SPNG\_MBR\_ALT\_ID  
COUNT(\*)

4473 2 1 2 15

FROM:mordoobadi DATE:1/24/2008 1:20:31 PM

The results indicate that the problem is minimal on your database. Only one member alt has this problem. That is a member alt in bridge with BID = 4473. The bridge export that was attached to the incident 8258 seems to be for the same bridge. This problem can be fixed by removing some points of interest from the copied member alt

Schedule Based LRFD Design, 1 Ft Strip / 2 1/2" Clear To TOp Steel / Interior 1' Strip (E) (C)

Please remove the user defined (UD) Points of Interest from the member alt (there are four of them) :

- Span 1 - 46.5000000 - Right - UD
- Span 2 - 1.50000000 - Right - UD
- Span 2 - 62.5000000 - Right - UD
- Span 3 - 1.50000000 - Right - UD

and then save the bridge. Add the above four points of interest manually. Now you should be able to remove the first member alt.

Please note that this will fix bridge with BID = 4473 only. If you copy another schedule based reinforced concrete member alternative that has Points of Interest, the copied member alt will have the same issue. This problem is fixed in 6.0.0 Beta 3. We should probably consider fixing this issue in a 5.6 service pack.

## Complete Issue Information

FROM:mordoobadi DATE:2/25/2008 1:19:22 PM  
Created a new software tool "POI Integrity Scanner" that Reports the list of corrupt records. Data contained in the corrupt rows are part of this report. The tool can also remove the corrupt records.

FROM:mordoobadi DATE:2/28/2008 9:34:54 AM  
This tool should be provided as part of 5.6 Service Pack 1.

FROM:mordoobadi DATE:3/18/2008 9:35:44 AM  
This is fixed in 5.6.1.

Added code to warn the user if there are bridges in the database that have point of interest integrity issues and advise them to run the "POI Integrity Scanner" to review and correct the issues.

Also changed the domain to correct the bad data when a bridge is retrieved from the database.

FROM:xli DATE:4/7/2008 10:00:53 AM  
Tested with 6.0 Beta 3, problem is resolved.  
Used RCTraingingBridge1, followed the steps Mehrdad posted above to duplicate the incident, bridge can be saved with no problem.

### Description

FROM:jihnat DATE:11/12/2007 3:17:43 PM  
Received via email (Bridgeware):

I am getting several error messages when I run an analysis using the Virtis Engine. I have just upgraded to Virtis version 5.6. I have attached the .xml file.

Beams A and C seem to run fine.

For Beam B, the analysis runs but when I try to use the Bridge\Report Tool\LFD Analysis Output I get a message that says "An invalid argument was encountered".

For Beams D, E, and F, I get errors when I try to run the analysis. Please see the attached .pdf files for the error text printout.

I tried changing the tolerance for Beams D, E, and F but I still got the same error message.

Can you tell me how to fix this file so that it will run?

CHRISTOPHER DOMBROWSKI, PE

FROM:jihnna DATE:11/12/2007 3:57:14 PM  
More from Chris:

I was able to fix the errors for Beams D, E, and F. The span lengths were incorrect for the live load distribution factors, so after those were corrected I was able to run the beams. However, I am still getting the error with the report tool for Beams B and G.

FROM:hlee DATE:11/13/2007 1:58:14 PM  
Content of e-mail reply:

=====  
=====  
For the LFD Analysis Output problem, a workaround for now is to change the ft tolerance to 0.0012. Please make sure you change the focus to other input in the Tolerance tab for updating the meter tolerance before you hit the Save button.  
=====  
=====

Rating Results Summary also has the same defect.  
Resolved for 6.0 Release.

### Description

FROM:kobeidat DATE:Tuesday, November 13, 2007 10:17:44 AM

Can you list the limitations on truss in releases 5.5 and 5.6? where are those limitations listed? we have 5.5 and we would like to know what are the limitations on use for trusses and what limitations will be eliminated in 5.6  
When will 5.6 be released?

FROM:hlee DATE:11/13/2007 10:45:55 AM

The limitations are listed in the last topic of the Truss Method of Solution Manual.  
The Truss Command Language User Manual and Truss Method of Solution can be accessed from the Virtis Truss window's help topic (Open the Truss window and click F1).

5.6 had been released. We shipped out 5.6 Release CD last Thursday.

## Description

FROM:dteal DATE:Tuesday, November 13, 2007 12:28:47 PM

Is it possible to add more choices to the system defaults that currently available in the Config. Browser. At least then if designers don't select the agency suggested engine settings they will be correct by default.

1. Member Alt. Properties In Prestress, LFD and LRFD, be able to set the Prestressing Modeling Method to Centerline of simple span bearing or Centerline of final supports.
2. Member Alt. Properties In Steel, LRFD Misc Tab, the two check boxes at the top – these should be options set by agency defaults too.

FROM:dteal DATE:Tuesday, December 11, 2007 9:19:03 PM  
There may be some more that should be included -

### Description

FROM:jtriezenberg DATE:Thursday, November 15, 2007 11:33:51 AM

Virtis seems to be inconsistent in how it calculates the standard LFD live load distribution factors. Try this:

In the EB superstructure open girder G2

Have Virtis compute the live load from the typical section for G2

Open girder G3

Have Virtis compute the live load from the typical section for G3

Go back to girder G2

4/19/2016 3:20:44 PM

HRS AASHTO

2498

**Complete Issue Information**

Have Virtis compute the live load from the typical section for G2  
See how the factors change.

Is there an explanation or any sample calcs for how Virtis calculates these LFD distribution factors.

Regards,  
Jeff Triezenberg.

FROM:hlee DATE:11/16/2007 10:50:49 AM  
Fixed a bug in variable initialization. This bug is only in the Release version.  
Resolved for 6.0 Release.

Virtis Help has some explanation on how Virtis calculates LFD distribution factors. Open the Live Load Distribution window and click F1 for the Help.

In analyzing this flared steel bridge, girder G2 of Spans 3 and 4 gives an error.

4/19/2016 3:20:44 PM

HRS AASHTO

2499

**Complete Issue Information**

\*\*\*\* Analysis Engine Errors. \*\*\*\*

Structural Analysis Error (2410) - Input or computational error encountered.  
Internal Error (1) - Invalid index

This error is not very specific and I can't find the cause. This girder is exactly the same as the girders below it.

Thanks,  
Jeff Triezenberg

FROM:hlee DATE:11/21/2007 9:21:27 AM  
Attached Virtis Std Engine input and output files.

FROM:hlathia DATE:Wednesday, November 21, 2007 5:42:19 PM  
The Live Load Distribution Factor Ranges entered for Moment, Shear and Deflections (58.12) are not equal to Span Length (58.13) for span 2. Check if the Export has any thing to do with this. Corrected input and output files are attached..The error message should be more specific and included in the next release of Std Engine.

FROM:jtriezenberg DATE:Monday, November 26, 2007 9:09:19 AM  
The span lengths inputted in the Superstructure Definition are 158 ft and 58.125 ft for a total of 216.125 ft. This length was entered into the Live Load Distribution tab. An error occurs unless the length entered into the Live Load tab is changed to 216.13 ft.

FROM:hlee DATE:11/26/2007 10:05:35 AM  
Although G2 is parallel to the superstructure reference line and all support skews are the same, G2 span lengths are computed based on the framing plan and typical section. The computed span lengths are shown in the Member window. The total length is 216.125094 ft.

### Description

FROM:jtriezenberg DATE:Friday, November 16, 2007 9:53:17 AM

In the attached bridge, I defined the fascia girder, then copied the definition to the other fascia girder. All inputs are the same for the two girder definitions. The only difference is that a 5 lb/ft load was applied to the second girder. In rating these, the BRASS engine shows the first girder to rate much lower than the second.  $\Phi^*M_n$  is calculated 20% lower although the inputs are the same. Can you provide some insight as to why this should be happening?

Thanks,  
Jeff Triezenberg

FROM:bgoodrich DATE:Monday, November 19, 2007 1:31:49 PM

Due to the skew, the unbraced lengths for the two fascia girders are different. At the interior support (200 POI in BRASS), BRASS determines the section to be non-compact and partially braced, so AASHTO Article 10.48.4 is applicable. Ultimately, BRASS uses AASHTO Equation 10-103c to determine the moment capacity. The intermediate output for the 200 POI can be turned on to see the bracing and compactness checks.

| 8286.16783 | Assigned      | Single Lane loaded set in migrated template. |

### Description

FROM:jihnat DATE:11/20/2007 3:39:05 PM  
Received via email (Bridgeware):

I have upgraded to Virtis 5.6. When I try running a truck template containing 10 trucks that was created in Virtis 5.5, the LFD Analysis Output Report only shows 8 trucks. Why doesn't it print the other 2 trucks? Virtis still shows 10 trucks under the Analysis Settings and does not give me any errors when I try to run all 10.

Also, is there a way to get the LFD Analysis Output to show "single lane" instead of "as requested" under the Lane heading? When I selected the single lane loading under the "Advanced" Tab in the Analysis Settings, it does not show up on the output anywhere.

I have attached sample output from a bridge run in 5.6 (S11) and a previous bridge run in 5.5 (R02) using the same template.

FROM:mordoobadi DATE:12/4/2007 10:34:04 AM  
The analysis settings are the same between 5.5 and 5.6, so the the problem is not migration.

FROM:hlee DATE:12/13/2007 10:10:16 AM  
I'm not able to reproduce what you described. My 5.6 LFD Analysis Output Report shows 10 trucks for the truck template I created in 5.5.  
There is no way to show "single lane" instead of "as requested" under the Lane heading in the LFD Analysis Output Report.

## Description

FROM:jihnat DATE:11/26/2007 9:13:30 AM  
Received via email (Bridgeware):

Is there any way to generate an .xml LRFR Analysis Output instead of an LFD Analysis Output in VIRTIS 5.6?

Also, is there a way to view a summary output file that corresponds to the FDOT LRFR Summary Tables (particularly the table for prestressed concrete bridges)? In other words, is it possible to view a summary of the controlling moment and shear DF for each limit state.

FROM:jtriezenberg DATE:Monday, November 26, 2007 11:54:18 AM  
In order to run a single lane of trucks I've checked the single lane box in the advanced button in the Analysis Settings window. The single lane with impact generated here does not match the single lane with impact generated when the box is not checked. This seems to be repeatable for any multi-girder

## Complete Issue Information

bridge. See the attached output.

Also, is it possible to have the report tool show that the single lane option has been chosen in the Analysis settings? Somebody reviewing the output should be able to know if "As Requested" refers to single lane or multi-lane.

Thanks,  
Jeff Triezenberg

FROM:hlee DATE:11/26/2007 1:44:16 PM  
Looks like only the operating numbers are not matching.

FROM:jtriezenberg DATE:Thursday, December 13, 2007 8:57:18 AM  
Any resolution?

FROM:bgoodrich DATE:Thursday, December 13, 2007 1:23:50 PM  
I'm trying to identify the source of the problem. I don't have a resolution yet.

FROM:bgoodrich DATE:Thursday, December 13, 2007 3:58:40 PM  
I finally determined why there are different results for the various permutations of single/multi lane loaded and with/without impact depending on whether a vehicle is marked as single lane or not. When we implemented these permutations in the BRASS engine to send back to Virtis, we (the Virtis development team) made one major assumption – that the rating factor would vary linearly with the applied live loads. While the live load actions vary linearly with the applied live load, the capacity may not always be constant.

The P/S shear capacity is a function of shear concurrent with maximum moment. The two different runs have different shear capacities and therefore result in different normalized rating factors (with distribution and impact removed). For this structure, a 5% difference in shear capacity is causing this difference. We wouldn't have this problem if all capacities were independent of the load effects.

Jim - What would you like to do about this? Document this limitation in the help? Make multiple runs? Does anyone have other ideas?

FROM:bgoodrich DATE:Friday, December 14, 2007 11:08:11 AM  
E-mail from Jeff Triezenberg:

So, which one has the error? Does the linear interpolation occur when the single lane option is selected or when un-selected?

FROM:bgoodrich DATE:Friday, December 14, 2007 11:08:39 AM  
The rating factors are scaled linearly for both ways. I consider both ways incorrect because the capacity is based on the load effect, which includes one particular distribution factor and impact, i.e., the "As requested" values.

FROM: Herman Lee DATE: 5/6/2010 6:04:55 PM Eastern Daylight Time  
Enhancement to make multiple runs for various permutations of single/multi lane loaded and with/without impact.

### Description

FROM:jihnats DATE:12/7/2007 10:11:03 AM

Received via email (Bridgeware):

I have been working on the attached problem of a through truss.

<<00125 - 0119\_BW.xml>>

Please examine the part of the problem called Bridge 119.

When I get the LFD rating for an HS-20 truck, the software gives me an Inventory RF of 0.098, and an Operating RF of 0.164.

It lists the weakest link as L3U3, and the failure mode as axial compression.

A sketch of the member is shown below.

<<AutoCAD Drawing>>

Radius of gyration = square root [moment of inertia/area]=sq rt[102/8.82]=3.4 in.

From the Highway Bridges Manual, the acceptable stress for short columns in compression is:

$$FCR = F_y [1 - (F_y / 472E)(KLC/r)^2] = 30 \text{ksi} [1 - (.0000262)(1.0 \times 411 \text{ in} / 3.4)^2]$$

$$FCR = 18.51 \text{ ksi}$$

$$PCR = .85 \times 181.51 \times 8.82 \text{ sq in} = 139 \text{ kips in compression}$$

I then created a StaadPro model of the truss, and ran two HS-20 trucks across the bridge, using load factors of 1.3 for the dead loads, and 2.171 for the live loads.

4/19/2016 3:20:47 PM

HRS AASHTO

2514

**Complete Issue Information**

The largest compressive load that L3U3 saw was 13.6 kips, considerably less than the previously computed critical load.

How is VirtisOpis calculating the capacity of those members, and where in the output are the capacities listed? At this point, I am unable to verify the VirtisOpis ratings.

Bernie Weinstein, P.E.  
NMDOT - Bridge Design

FROM:hlee DATE:12/14/2007 1:00:29 PM  
E-mail reply:

=====  
Hi Bernie,

Member capacities are listed in the Rating Results Report and Virtis Truss Method of Solution Manual Section 1.4 describes how Virtis computes those capacities.

I reviewed your truss model and the rating results. There are 2 issues in the truss model.

1. The effective length factor (K) in the DefaultEndConnection command is entered as 0.75. Virtis incorrectly read and set the factor to 0. That's why you don't see any compression capacities in the report. A work around is not to enter the factor in the DefaultEndConnection command. Since the end connection type is Riveted, Virtis will default to 0.75 internally.
2. In the two NonDetailed member cross sections, Izz, Iyy, Szz and Syy are not entered. The moment of inertia is required to correctly computes the compression capacity. Those entries should be required in the NonDetailed member cross section.

Please let me know if you need more information.

Herman Lee

### Description

FROM:jtriezenberg DATE:Tuesday, December 11, 2007 7:49:22 AM

When using the simplified input there are two inputs for shear, shear at the supports and shear along the girder. When using the advanced input, there is only one place to input shear. Does Virtis use this for shear at the supports or shear along the girder?

Thanks,  
Jeff Triezenberg

FROM:hlee DATE:12/11/2007 1:12:06 PM

The advanced method of input allows you to describe the distribution factors in ranges along the length of the member. You could enter a range of shear distribution factor for "shear at support" and another range for "shear along the girder".

**Description**

FROM:tambrecht DATE:Tuesday, December 11, 2007 10:36:29 AM

I just had someone from work email me the attached xml file that contains NSG vehicles. When I tried to import into 5.6, I get this message.

Unable to validate xml file  
 Unable to obtain export file header information  
 Invalid xml file encountered.

FROM:hlee DATE:12/13/2007 9:33:37 AM

I'm not able to reproduce above message. Attached vehicle import screen captures. Please ask the user to try the NSG vehicles import again.

FROM:tambrecht DATE:Thursday, December 13, 2007 4:26:46 PM

My bad - I figured out what I did wrong. Can close this incident.

Received via email (Bridgeware):

I have attached a word document with the wearing surface density field circled. The unit asked for is pcf, but that would produce erroneous result at the output. Please indicate how this field is to be input. Thanks.

Received via email (Bridgeware):

I have included the XML file and the output showing the wearing surface load for girder G2 to be 0.116k/ft. Hand calculation produces a load of 0.231 kip/ft. Please indicate how this number should be input. Thanks.

FROM:bgoodrich DATE:Wednesday, December 19, 2007 3:20:45 PM

The second travelway is not being considered when determining the overall travelway boundaries for BRASS. The export assumed the distance to the right was greater than the distance to the left when it searched for the overall travelway boundaries. The export must be modified to either detect when the right distance is less than the left distance and issue an error message OR the export must be modified to look at both the left and the right distances when determining the overall travelway width for BRASS.

A workaround would be to define Travelway 2 locations with the distance to the left as 0 ft and the distance to the right as 15 ft rather than 15 ft to the left and 0 ft to the right.

FROM:bgoodrich DATE:Tuesday, February 12, 2008 12:36:42 PM

The CBrassCmd::GetTravelWayLocations export function has been revised to check both the left and right edges of each travelway when determining the BRASS travelway. A warning was also added when the left edge is greater than the right edge. Fixed for version 6.0.0.

## Description

FROM:dteal DATE:Tuesday, December 18, 2007 7:54:57 AM

When using engines like BRASS or Virtis Std engines for both LFD and LRFD we have engine tabs to set agency preferences. With Opis LRFD engine there are no engine properties settings. I had a short discussion with Jim about this and if I remember correctly he didn't want any options or engine settings. That would restrict designers from using options provided in the LRFD specification or rules set by individual agencies.

In concrete we are missing:

Under the Member Alt Engine Properties:

Load sequence, Element Type, Wheel advancement, POI controls, spec checker output on/off and Load Combination output.

Under the Analysis Event Engine Properties:

Main output options and Intermediate Output Options

4/19/2016 3:20:50 PM

HRS AASHTO

2527

## Complete Issue Information

If this line of thought continues, when we do Prestressed we will be missing the same options as reinforced concrete plus:

Under the Structure Def Engine Properties:  
LL Distribution

Under the Member Alt Engine Properties:  
Prestressed modeling method (very important)

And in steel we will be missing the same options as reinforced concrete plus:

Under the Structure Def Engine Properties:  
LL Distribution

Under the Member Alt Engine Properties:  
The miscellaneous tab that contains info on appendix 6 usage, Plastic Moment analysis and Compactness at the pier

FROM:dteal DATE:Thursday, December 20, 2007 1:33:46 PM

For Concrete:

In the view analysis report, being you can't tell it 10th points or user defined points, you get them all.

Makes digging out values much more difficult.

The same is true with the Report tool LRFD Analysis Output – many more values are printed, filling up the report, being you don't have any control.

FROM:dteal DATE:Thursday, December 20, 2007 2:38:49 PM

User defined points are important to check your steel cutoffs and area of steel required. Tenth points are used for most all other things that refer to points on the bridge (dead load and live load deflections, design of camber boards and haunch boards.

Sure would be nice if they all (user pts and 10th pts) didn't show up in one big ugly report.

FROM:jduray DATE:1/2/2008 8:14:24 AM

What I suggested to the Beta testers is that we try to eliminate the engine data for the AASHTO LRFD engine. I believe our goal should be (we need to discuss this with the TF) to make Opis as easy to use as possible. I think the engine data as it presently exists works well for third-party engines. But I would like to see the Opis UI optimized for use of the AASHTO FE engine and spec-checker. If possible, all data, output and processing control should be out in the open for users to easily see and configure instead of being "hidden" on an engine data tab.

Load Sequence - I don't think BRASS does anything with this for RC since cross section properties do not vary by load type. - Not necessary for Opis.

Element Type - No option for Opis - always uses stepped.

Wheel Advancement increment - BRASS steps the vehicle across the member at a user-defined increment - Opis loads the peaks of the infl line and therefore does not use an increment.

LL Dist - Cross section code - Opis determines this automatically.

POI Control - Opis always generates at tenth points, user-defined points and at concrete and reinforcement change points. We (Baker staff) have discussed the possibility of allowing the user to select points for spec-checking. This would allow for a reduced number of spec-check locations (for

4/19/2016 3:20:50 PM

HRS AASHTO

2528

**Complete Issue Information**

preliminary design). It could also facilitate a design process where the user focuses on experience-based locations first (locations of maximum/minimum actions) for determining reinforcement requirements.

Where would you like to control the POI output - for the mbr alt or for the event?

Spec-check and load combination output - why would the user want to turn these off?

As far as the reporting goes, I would like for the TAG to let us know which reports we are currently producing they would like to be able to disable. We can then decide the best way to handle that. There are some very large files being produced that should be optional. Are there others?

FROM:jduray DATE:1/2/2008 9:04:12 AM  
Attached are two mockups for reporting and control options.

| 8420.16649 | Closed        | Informational messages when attempting to open a structure |

### Description

FROM:hlee DATE:1/14/2008 11:38:10 AM

To reproduce:

1. Open RCTrainingBridge1 BWS.
2. Delete "Schedule Based RC Structure" superstructure definition
3. Get following system error when trying to save the bridge.

Unable to save Bridge data!

11:40:54 AM - Line 884 in source file .\UiBWSDoc.cpp.

FROM:mordoobadi DATE:1/15/2008 10:40:28 AM

It appears that both the superstructure definition 2 "Schedule Based RC Structure" and the bridge alternative are using the same reference line in this bridge.

The save fails because when the function GetModificationStatus() is called it cannot find the bridge alternative's reference line. The reference line was deleted when structure def was deleted.

FROM:mordoobadi DATE:1/15/2008 2:03:57 PM

I investigated the domain source code that's called when a super structure definition and a bridge alternative are created and they both create new Reference Lines (see below)

```
BOOL CDoStructDef::Create(LPDISPATCH pBridgeDisp, LPDISPATCH pParentDisp, CDeStructDef* pDeStructDef)
```

```
{
```

```
...
```

```
    if (IFkRefLineId == 0) // No reference line
```

```
    {
```

```
        if (!(pDeRefLine = pDmRefLine->AddNewDeObject()))
```

```
        {
```

```
            ADD_ERROR(CSysError::system, IDS_ERR_SYS_ADD_NEW_DEOBJECT);
```

```
            return FALSE;
```

```
        }
```

4/19/2016 3:20:52 PM

HRS AASHTO

2536

## Complete Issue Information

```
        if (!pDeRefLine->m_petypLineTypeCom->SetValue(TYP_REFLINE_STRAIGHT))
        {
            ASSERT(FALSE);
            return FALSE;
        }

        if (!pDeStructDef->m_peiFkBridgeRefLineIdCom->SetValue(
            pDeRefLine->m_peiFkBridgeRefLineIdCom->GetValue()))
        {
            return FALSE;
        }
    }
}
```

STDMETHODIMP\_(BOOL) CDoBridgeAlt::XDoDataControlCom::Create(long IObjectId, LPDISPATCH pBridgeDisp, LPDISPATCH pParentDisp)

```
{
...
    if (IFkRefLineId == 0) // No reference line
    {
        if (!(pDeRefLine = pDmRefLine->AddNewDeObject()))
        {
            ADD_ERROR(CSysError::system, IDS_ERR_SYS_ADD_NEW_DEOBJECT);
            return FALSE;
        }

        if (!pDeRefLine->m_petypLineTypeCom->SetValue(TYP_REFLINE_STRAIGHT))
        {
            ASSERT(FALSE);
            return FALSE;
        }

        if (!pThis->m_pData->m_peiFkBridgeRefLineIdCom->SetValue(
            pDeRefLine->m_peiFkBridgeRefLineIdCom->GetValue()))
        {
            return FALSE;
        }
    }
}
```

They do not reuse old/existing reference lines.

FROM:mordoobadi DATE:1/16/2008 9:39:22 AM

The new structure definition was added in version 5.2 in 2004. At that time the new structure definition's reference line ID was 3 and now it is 2. So I think that the data in the database was edited by hand.

FROM:mordoobadi DATE:1/16/2008 11:23:05 AM

I verified that the utility program UpdateReferenceLines.EXE (Migration from 5.2 to 5.3) is not responsible for this.

## Description

FROM:tarmbrecht DATE:Wednesday, January 16, 2008 12:10:09 PM

This probably can't be duplicated on your end because I can't duplicate it nor can my consultant. However, two guys in my unit are consistently getting these messages (attached) when they try to open structures in Virtis. It doesn't appear to be fatal, as they close out the message and the structure

4/19/2016 3:20:52 PM

HRS AASHTO

2538

### Complete Issue Information

opens. However, would you happen to know why the message may appear? Is there something that needs to be done on my guys' machines?

FROM:mordoobadi DATE:1/16/2008 2:10:04 PM

Ask your system administratot to check their file access permissions on the folder where Virtis/Opis is installed. They should be able to write to that folder.

FROM:tarmbrecht DATE:Wednesday, January 16, 2008 4:36:49 PM

We just figured that out. Thanks. Please close this incident.

| 8446.16623 | Assigned      | Can't print just the first page |

## Description

FROM:dteal DATE:Friday, January 18, 2008 12:48:47 PM

When you view a spec (for printing) with the report tool it will place a header (title) which includes the location. (.xml attached)

The header indicates the location is 5.7 ft

The actual location is 5.75 ft

Shouldn't the head location be accurate and display 2 decimals?

FROM:jduray DATE:1/23/2008 8:37:27 AM

What are we doing for the BRASS spec-viewer? Does the object we get the location have a string formatted to 1 decimal place or a double?

FROM:jhnat DATE:1/23/2008 11:03:27 AM

This is common code. Same thing happens with BRASS.

Changed project to Support Center and fixed for version 6.0.0 (Beta Build 3).

### Description

FROM:jihnat DATE:1/25/2008 9:39:59 AM  
Reported by George Khury, B&H Engineering.  
This is new to version 5.6, version 5.5 worked OK.

Rate a bridge then view Analysis Results (Rating Results Summary).  
File/Print, then select to print pages 1 to 1. The entire document will print.  
If you select to print pages 2 to 2, only page 2 will print.

BWS View does the same thing.

FROM:jihnat DATE:1/25/2008 3:21:43 PM  
This may be a bug in VS 2005. Opened incident with Microsoft, SRX080125600342.

FROM:jihnat DATE:1/30/2008 7:37:23 AM  
This also affects Schematics.

FROM:jihnat DATE:5/2/2008 2:57:35 PM  
This is supposed to be fixed in VS 2008. There's no hot fix for VS 2005.

FROM: Joseph Ihnat DATE: 11/5/2009 10:45:28 AM Eastern Standard Time  
Working OK in the VS 2008 build of Virtis 6.2 Dev. Build 1.  
Fixed for version 6.2

## Description

FROM:wmetcalf DATE:Thursday, January 31, 2008 9:48:20 AM

Ok in the following Bridge the when I try to run the structure who's BRIDGE ALTERNATIVE is 'structure 3' corresponding to the SUPERSTRUCTURE DEFINITON 'Girder System 42' (Steel Beam)' I get the following error :

Unable to run FE engine for 3D model.  
08:51:25 AM - Line 2076 in source file .\AbxVirtisDistFactEngine.cpp.

Error performing finite element analysis!  
08:51:25 AM - Line 637 in source file .\AbaFiniteElementEngine.cpp.

\*\*\*FEA ERROR - Modulus of elasticity for beam element 79 is 0..  
08:51:25 AM - Line 892 in source file .\ModelBuilder\ModelBuilderFeModel.cpp.

FROM:kkennelly DATE:1/31/2008 2:24:59 PM

The NSG analysis is not running due to an error in your input. For members G1, G2, and G3 the Deck Profile is only defined for the first 42' but the actual member lengths are 53.67', 49, and 44.33'. The NSG analysis creates shells for the deck but there is no deck defined after 42' for these 3 members so it is failing.

Revise the lengths on the Deck Profile: Deck Concrete tab of these 3 members to match the member lengths and the NSG analysis will run.

Virtis should have a better error message to inform the user of the input problem.

### Description

FROM:rfulton DATE:Friday, February 08, 2008 4:01:09 PM

Not Robert Fulton but Daniel Jones. I ran the NSG advanced analysis on a RCDG that is a symmetrical simple span structure. I placed standard vehicles at both the center position and the left / right combination. I was thinking in each instance the results (DF) would be identical for the outside girders but this was not the case. Thank you.

FROM:hlee DATE:2/14/2008 3:25:23 PM

There is a 30 degrees skew at the start and end of the structure. If you lowered the Vehicle longitudinal increment in the Superstructure window's Vehicle Path tab, G1 and G3 distribution factors will be the

4/19/2016 3:20:54 PM

HRS AASHTO

2545

**Complete Issue Information**

same for centered path. The G1 distribution factor for left path will be equal to the G3 distribution factor for right path and the G3 distribution factor for left path will be equal to the G1 distribution factor for right path.

FROM:rfulton DATE:Friday, February 15, 2008 12:14:25 PM

Yes, I did not notice the structure had a skew. I have submitted another structure that shows the DFs to be off when the span is actually symmetric. The same vehicles were used. Thank you.

FROM:hlee DATE:2/15/2008 1:44:11 PM

The vehicle is loaded on the left edge of the travelway. G1 distribution factor will not be the same as G4 distribution factor.

FROM:rfulton DATE:Tuesday, February 19, 2008 9:44:37 AM

But I have both travelways loaded with the exact same vehicle in each. One is in the "LEFT" position while the other adjacent identical vehicle is positioned as "RIGHT". If I read the definition of LEFT and RIGHT for the vehicle positions in HELP then G1 and G4 have a vehicle the same distance laterally from each girder. Therefore G1 and G4 should have the same distribution factor.

FROM:hlee DATE:2/21/2008 1:59:45 PM

In Virtis Help "Superstructure: Vehicle Path" topic:

=====  
Adjacent Vehicle Path Type

Select the type of the vehicle path for the adjacent vehicle if one exists. If an adjacent vehicle should not be considered concurrently with the non-standard gage vehicle, select "None". The location is specified relative to the NSG vehicle. The adjacent vehicle is placed a passing distance away from the NSG vehicle as shown in the diagrams below.

=====

The location of the adjacent vehicle is relative to the NSG vehicle. In you case, the adjacent vehicle is placed to the right of the NSG vehicle, not the right edge of the travelway.

**Description**

FROM:dteal DATE:Wednesday, February 13, 2008 12:47:10 PM

See the attached jpg for a visual description.

When doing a RC slab we extend the bars past centerline of bearing on both ends. The bars start 1' before and extend 1' past the slab CL bearing.

In this case, on the right side we have a bar that starts in span #2 with 12'9" still in span #2, goes through span #3 and ends 1 foot right of the right abutment CL bearing.

The schematic shows the bar in span 2 as 12'9" and does not show any part of the bar in span 3. On the right side the dimension shows it 37' left of the abutment (which is wrong).

If 100% of the bar was in span 3 it would draw it correctly. But when the bar appears in 2 spans, it is drawn incorrectly.

The Reinforcement tab shows the S1 Right bar correctly in the table.

### Description

FROM:sboukamp DATE:Wednesday, February 20, 2008 3:13:26 PM  
During testing Virtis Std. Engine V6.0.0.0, I created a splayed girder bridge to verify that the effective slab width can be entered for rating analysis (VI 6954).

I noticed, that the "Compute from Typ. Section" button displays the "Compute Deck Profile from Structure Typical Section" window, but no action follow it.  
An xml file of a splayed girder bridge example is attached.

FROM:jihnat DATE:2/21/2008 8:37:02 AM  
I think it's because the girder profile is not defined, not because the girders are splayed.  
Need REPORT\_ERROR to be called.

FROM:sboukamp DATE:Thursday, February 21, 2008 10:00:36 AM  
I agree: After entering the Girder Profile, the compute button worked correctly.

FROM:jihnat DATE:2/21/2008 11:20:03 AM  
Changed project to Support Center.  
Added call to REPORT\_ERROR for version 6.0.0

## Complete Issue Information

significant trap.

See model SUPERSTRUCTURE DEFINITIONS ... MEMBERS ... G2 ... Interior Beam ... Girder Profile: Section & Web

Most engineers will generally consider the "Web" of a "Tee" to consist of the length from the bottom of the top flange to the bottom of the beam. BRASS appears to consider that to be the case as well (see JPEG).

Virtis apparently interprets the web depth to be from the TOP of the flange to the bottom of the beam. We found no instructions illustrating this non-standard interpretation.

We find this to be a dangerous invitation to making a modeling blunder.

FROM:jduray DATE:Thursday, March 06, 2008 8:45:53 PM

FROM: Tim Ambrecht DATE: 7/11/2008 10:24:21 AM Eastern Daylight Time  
My consultants have just noticed this as well. This is taken from the email of one of them:

What is measurement that should be entered for "Depth" for RC Tee-beams ("Web" tab under "Girder Profile" for "Reinforced Concrete Tee"). Is it from bottom of beam to bottom of the deck or to the top of the deck?

Suggestion: This should be described in Help and shown in the cross-section diagram under the "Section" tab under Girder Profile. (This is such a simple fix that there should still be time to do this under the v. 6.0 development.)

In the Help topic for View/Compute Column Stiffness

There are 2 items:

Depth at Top and Depth at Bottom

They state – Enter the column depth at the top (bottom) of the column.

If using Circular columns, depth is rather ambiguous and confusing.

Shouldn't this state – Enter the column depth or diameter at the top (bottom) of the column.

4/19/2016 3:20:56 PM

HRS AASHTO

## Complete Issue Information

And this is repeated in the Help Topic for Structure Framing Plan Details: Frame Connections Instead of Depth at Top (Bottom) it is called out as Top depth and bottom Depth (not being consistent with the other help topic nomenclature.

This is stated as – Enter the column depth at the top (bottom) of the column

It should be stated as – Enter the column depth or diameter at the top (bottom) of the column

Error No.: 1203  
Type : Input Error  
Location : prop\_gen.for (property\_generate)

A web depth on span 2 was computed based on parabolic or elliptical equations, however, it is not equal to the web depth input by the user at this location. This error occurs at the junction of two "continuous" parabolic or elliptical segments.  
Distance = 12.000 (in,mm)  
Web depths (in,mm): Computed = 51.217258 Input = 51.520000

There is no user input at 1-ft in span 2. Not sure what is going wrong here.

FROM: bgoodrich DATE: Wednesday, March 11, 2008 10:20:00 AM  
My preliminary investigation did not turn up any sources for the problem; however, I was able to duplicate the problem.

FROM: Brian Goodrich DATE: 7/16/2008 8:02:37 PM Eastern Daylight Time  
I found a the source of the issue. The span commands generated for span 2 have slight discontinuities in the web depth between the end of one range and the start of the next. BRASS uses these discontinuities to tell when consecutive web ranges belong to the same parabolic web profile. The ranges on each side of 142.4700" is where the first web depth discontinuity occurs (34.3900" vs. 34.3869"). See the block of commands below:

### Description

FROM:tarmbrecht DATE:Thursday, March 13, 2008 5:14:52 PM

RE: 0161154prop.xml

For a wide flange member in the subject bridge model, the factored moment strength at a pier support is significantly greater for BRASS than for Virtis Standard Engine and also MDX. The factored strengths at the first (and last) interior supports are as follows:

Virtis Standard Engine – 2060 ft-k

MDX – 2093 ft-k

BRASS – 2364 ft-k

Also, the MDX bending strength at .8 & .9 of the first span is virtually identical to the BRASS value at the pier support (2364 ft-k).

FROM:hlee DATE:3/18/2008 1:33:12 PM

Tim - Are you requesting us to validate the factored moment strength at pier supports for the BRASS, Virtis Std Engine or both engines?

## Complete Issue Information

I guess both, though it appears that BRASS is off in this case, since the other two engines have similar numbers. We'd like to know the reason for the difference. We had reported the BRASS-calculated rating to our Design Section, which indicated that the consultant's design was sufficient (>HS20). However, a subsequent check with MDX showed that the bridge was deficient(<HS20), and a followup check with VSE confirmed MDX's result. This caused some trouble because Design wants to know which answer they should report to the consultant - that it was a good design or a bad design. Note that we did not change the file between the check for BRASS and the check for VSE. Seems like the same file should produce the same (or similar) numbers despite using two different engines.

FROM:hlee DATE:3/19/2008 3:16:18 PM

Brian, please take a look first and assign to me after you are done.

FROM:bgoodrich DATE:Thursday, March 20, 2008 3:27:43 PM

I ran the structure with BRASS LFD and found the moment capacity of 2364 ft-kips over the interior supports. Over the piers, the structure is non-composite. BRASS is calculating the moment capacity as the plastic moment. I think the other engines might be limiting the moment capacity to yield. I do not see any way to limit the moment capacity to the yield moment in BRASS LFD for a non-composite section.

FROM:bgoodrich DATE:Thursday, March 20, 2008 5:46:55 PM

E-mail from Tim:

Brian,

Thanks for the reply. Isn't there a checkbox in Virtis that determines whether the section is compact over the piers? Or isn't that carried over to BRASS?

If it's non-compact, the plastic moment shouldn't be used. The other two programs treat the section as non-compact, can you determine why BRASS thinks it's compact?

Thanks, Tim

FROM:bgoodrich DATE:Thursday, March 20, 2008 5:47:33 PM

I put a point of interest at the first interior support (200 POI to BRASS) and turned on the detailed output for BRASS. The girder at this point is non-composite and passes all the compactness checks. The pier compactness setting you mentioned is only used when the section is composite.

Herman – How is VSE coming up with a non-compact section? One of the bracing checks was close in BRASS. Could there be a difference in moments that is causing the compactness checks to not be satisfied in VSE.

Right Unbraced Length:

Input Parameters:

Lb = 16.437 (ft) M1 = -513.32 (ft-kips) Fy = 50040. (psi)  
ry = 3.258 (in) Mu = 2364.39 (ft-kips) M1/Mu = 0.2171

Calculated Value : Lb/ry = 60.5488

AASHTO Limit : [3.6 - 2.2(M1/Mu)] \* 10E6 / Fy = 62.3975

Return Code : Pass

**Complete Issue Information**

FROM:hlee DATE:3/21/2008 11:18:23 AM

I reviewed the BRASS and VSE outputs for the first interior support in the "2 - 1st N Int" member. VSE reported the section at Span 2 - 0 ft (BRASS 200 POI) as compact. However, the section at Span 2 - 21.65 ft (BRASS 203 POI) is reported as non-compact due to failed bracing check. Since VSE assumes that the plastic moment capacity can only be used for the calculation of ratings if all sections over the entire length of the member (whether composite or non-composite) qualify as compact sections, the plastic moment capacity is not used at Span 2 - 0 ft. I believe BRASS also reported the section at Span 2 - 21.65 ft as non-compact.

FROM:hlee DATE:4/3/2008 11:25:25 AM

Since there is no more comments on the investigation, the status is changed to Resolved.

It is common bridge design practice to distribute dead loads added after the concrete deck has cured equally to all supporting longitudinally beams. Such practice is permitted by the AASHTO Std. Spec.

4/19/2016 3:20:57 PM

HRS AASHTO

2561

## Complete Issue Information

for Highway Bridges 17th Ed. – 2002, 3.23.2.3.1.1 where it is stated "...Curbs, railings and wearing surface, if placed after the slab has cured, may be distributed equally to all roadway stringers or beams." We refer generically to such load as "Superimposed Dead Loads" or SDL.

For composite deck steel or concrete beam bridges Virtis refers to these SDL's as "Stage 2 Dead Loads". As such their distribution to the beams is appropriately defaulted to be "Uniformly to all girders". Likewise for non-composite steel beam & reinforced concrete bridge models the SDL's, if defined by the user as "Composite (long-term) (Stage 2)", are treated by the Virtis/BRASS analysis as being distributed to all girders. This all is correct.

However, for prestressed concrete box beams and non-composite prestressed I-beams the SDL's cannot be defined to Virtis so that they will be equally distributed to all beams. This capability only exists for beams made composite with the deck slab. Article 3.23.2.3.1.1, referenced above, applies to all bridges with longitudinal beams, not just those that with composite decks.

Therefore, Virtis should be modified so that the SDL's, as referred to in Article 3.23.2.3.1.1, can be equally distributed to all beams in all longitudinal beam & stringer type superstructures just like they already are for steel & reinforced concrete composite & non-composite beams. Whether the resultants from these loads are ultimately reported as Stage 1, 2 or 3 is of no consequence for rating purposes. What is important is that they can be distributed equally to all beams.

FROM: Krisha Kennelly DATE: 6/22/2008 4:33:15 PM Eastern Daylight Time  
The distribution of appurtenances to the beams occurs in the export to each engine.

To test what is being done for the Virtis STD engine I checked BID10, G1. I removed the checkboxes on the Shear Reinf Range window so that the shear reinf doesn't extend into deck thus making the beam noncomposite. The Virtis STD engine distributes the parapets equally to all girders as requested for the Stage 2 DL. So I don't think the export for the Virtis STD engine needs modified.

I tried to do the same for the BRASS LFD engine. The export to the BRASS LFD engine is applying the appurtenance load entirely to the ext beam which is the selection for the Stage 1 DL.

I think this incident is a request to modify the export to BRASS LFD/LRFD. If the appurtenance load is applied to Stage 2 for non-composite PS beams, the export should distribute the load as per the Stage 2 selection in Virtis and then assign it to Stage1.

FROM: Brian Goodrich DATE: 6/23/2008 1:05:45 PM Eastern Daylight Time  
This issue is a duplicate of 7280.

FROM: Brian Goodrich DATE: 8/28/2009 9:24:35 AM Mountain Daylight Time  
Stage 2 deck loads that are to be uniformly distributed are now handled by the BRASS export for non-composite P/S beams in the same manner as was implemented for R/C beams.

**Complete Issue Information**

The "Dead Load Analysis Report", "Member Section Property Report" & "Rating Results Report" can not be viewed. After running the analysis they are listed when, under the "Bridge" menu item, "Output..." is selected but when one attempts to open them nothing happens. Refer to v.5.6.0 export file, "TrussRptProb(0013417).xml".

FROM:gbarnhill DATE:Thursday, March 13, 2008 5:23:56 PM  
I have the same problem with the Truss output xml files created. They will not open within Virtis. If I navigate to the folder where they are saved, I can open them from there. I think we had this problem at the User Group meeting and determined there is an add-on for Microsoft Internet Explorer that's needed, but it's never been documented.

FROM:jihnat DATE:3/14/2008 7:13:48 AM  
Internet Explorer may not be the associated application for opening xml files on your system.  
To fix:  
1) Right-click on an xml file in Windows Explorer.  
2) Select Open With - Choose Program  
3) select IE in the list, also check "Always use the selected program..."

FROM:gbarnhill DATE:Friday, March 14, 2008 1:28:59 PM  
OK, that worked, I'm fixed.

FROM:tambrecht DATE:Friday, March 14, 2008 2:13:35 PM  
We're good too - thanks.

FROM:jihnat DATE:3/14/2008 3:18:41 PM  
I've added this to the Virtis/Opis FAQ for version 6.0.0

### Description

FROM:tarmbrecht DATE:Monday, March 17, 2008 5:23:54 PM

RE: PSMultibmLLDFCalc-560B5().xml

In the referenced bridge model, a 1-span multi-beam PS concrete box beam structure with split roadways of 36'-9" (WB) and 27'-1" (EB) (5-lanes total), it appears that Virtis is calculating the multi-lane live-load distribution factor as if it only had two lanes.

The user calculated values, from AASHTO Std. Specs, 17th Ed., for 5, 2 & 1 lanes, respectively are 0.5464, 0.5313 & 0.5265. The Virtis computed values are 0.5315 for multi-lane and 0.5237 for single lane. These values correspond to the user calculated values for 2 lanes and 1 lane. The multi-lane value should be for 5 lanes however.

FROM:hlee DATE:3/18/2008 3:13:44 PM

I think this is a duplicate of Incident 8439. We will use the attached bridge to test the fix for 8439.

Reply e-mail:

Virtis assumes each floorbeam location has a corresponding panel point. A work around is to delete Bm1 and Bm31 in the Floorbeam Member Locations window. Please make sure all applied dead loads to the truss are what you expected in the Dead Load Analysis Report.

File used – TrainingBridge1  
LRFD Analysis with Fatigue Truck

**Complete Issue Information**

In 5.6 I get an error message, (attached) I don't get the error in 6.0 beta  
Has this been this way for a while and we missed it or did something change

Using the HL93 Design Review Template  
After the analysis go to Analysis Results, Live Load Actions and select the LRFD fatigue Truck (US)  
You get an error message that states "The Parameter is incorrect"

I uninstalled and reinstalled 5.6, I used the provided database and TrainingBridge1 and still get the error.  
I tried the same thing in 6.0 beta and don't get the error??

FROM:jihnat DATE:3/27/2008 9:20:50 AM  
Changed project to Support Center.  
This looks like 8281. A bug was introduced in version 5.6 and is fixed in version 6.0

FROM:dteal DATE:Thursday, March 27, 2008 11:21:24 AM  
VI 8281 is about pedestrian loads - I dont' get the relationship??

FROM:jihnat DATE:3/27/2008 12:47:51 PM  
It's the same window and the same error message (just a different way to produce it).  
I've stepped through the code and your error is in the same code.

| 8519.16550 | Resolved      | LRFR Analysis Error |

### Description

FROM:rcurtis DATE:Wednesday, March 19, 2008 1:34:25 PM

In the attached bridge, please see Superstructure "NB Spans 35 to 37". There appear to be two different issues.

1. Shear is controlling in the Virtis engine for beams M, J, and L. Looking at the output, it appears Virtis is treating Span 3 at 0% as being unstiffened even though stiffeners are provided in the input. This is not a simple end and so Eq. 10-119 should not apply.

2. Top Steel is controlling at span 2 at 40% for beams K, MA, and N. It seems that Virtis is treating these sections as non-composite. I generated the deck section using the "Compute from Typical Section" Button, and I have shear connectors added at this location.

FROM:rcurtis DATE:Wednesday, March 19, 2008 1:45:16 PM

Also, I tried to modify the deck input to be one section. When I tried to run Virtis engine next I got this error:

Internal Errors (1) - Invalid index

Structural Analysis Errors (2410) - Input or computational error encountered.

Input Errors (1135) - Girder member properties entered out of sequence.

FROM:hlee DATE:3/26/2008 11:03:27 AM

Both #1 and Input Errors are defects in the 5.6 release. For #2, Virtis Std Engine is treating the section at 40% of Span 2 as composite.

Resolved for 6.0 Release.

**Complete Issue Information**

\*\*\*\* ERROR \*\*\*\*

Increment of load movement across structure is too small. Decrease the Wheel Advancement Denominator (wheel\_adv) for influence functions, see Parameter 7 on LOAD-LIVE-CONTROL command. (wheel\_adv = 100.00)

----- End of Contents of BRASS Error File -----

FROM:hlee DATE:3/21/2008 2:39:40 PM

I'm able to run G2 after I decreased the Wheel advancement increment from 100 to 80.

To change the Wheel advancement increment:

1. Open "Interior Girder" Member Alternative window.
2. Select the Engine tab.
3. Select BRASS LRFR in the Configure engine properties box and click on the Properties button.
4. Change the Wheel advancement increment to a smaller number and click on the OK button to save the changes.

Following is copied from BRASS help on Wheel advancement increment:

Parameter 7 is used to move the unit load across the bridge spans. It computes the length to move the load as 1/100 of the length of the shortest span. If the shortest span is very small, problems could arise. For example, if the shortest span is 12 feet and the Advancement Denominator is 100, BRASS marches the truck across ALL top spans at an interval of 12/100 - 0.12 feet = 1.44 inches. Because BRASS is a finite element analysis engine, as the elements get smaller and smaller (i.e. 0.12 feet), the elements themselves become infinitely rigid. Thus, if a short span is input, the user needs to reduce the Wheel Advancement Denominator.

### Description

FROM:rcurtis DATE:Thursday, March 27, 2008 10:15:23 AM

In the attached structure, I get the error "The parameter is incorrect" when I try to view the live load actions of the last live load in the list in the report table. I have run it a couple of times with different live loads, and it didn't matter.

FROM:jihnat DATE:3/27/2008 11:14:27 AM

Same as 8511 and 8281. Fixed for version 6.0

**Description**

FROM:dteal DATE:Thursday, March 27, 2008 11:17:36 AM

For the attached bridge, structure #3, which is a 3 span prestressed with 6 girder lines.

Ran a NGS analysis to completeing (15 minutes on my pc)

When I select to view the Advanced Rating Results Summary Report I get the error you see below. I tried this on 2 different pc's and got the same message. I am able to do NSG analysis on other structures and view the report – just not from this bridge (unit #3)

Copy of error message:

The XML page cannot be displayed

Cannot view XML input using XSL style sheet. Please correct the error and then click the Refresh button, or try again later.

FROM:dteal DATE:Thursday, March 27, 2008 12:12:12 PM  
Same error for Unit #2 in the attached bridge

FROM:jihnate DATE:3/27/2008 1:40:36 PM  
A workaround is to edit the xml file and change the "&" (there's only one) to "&amp;"  
The ampersand in the bridge name is causing this. However, the other xml reports are already being generated with "&amp;" instead of "&"

FROM:dteal DATE:Thursday, March 27, 2008 3:56:13 PM  
In researching what character NOT to use I came up with the following - do you agree that these can't be used?

**Special Characters and XML Strings**

XML has a special set of characters that cannot be used in normal XML strings. These characters are:

1. & - &amp;
2. < - &lt;
3. > - &gt;
4. " - &quot;
5. ' - &#39;

FROM:hlee DATE:4/2/2008 3:01:06 PM  
The bridge name should be tagged as CDATA so the XML parser will not process the bridge name.  
The Advanced Rating Results Summary Report will display the special characters listed above.  
Resolved for 6.0 Release.

FROM:dteal DATE:Tuesday, June 17, 2008 11:47:10 AM  
Should this be tested in beta 4?

FROM:hlee DATE:6/17/2008 2:13:34 PM  
Yes, please.

FROM: Dean Teal DATE: 7/1/2008 3:27:14 PM Eastern Daylight Time  
Accepted in beta 4

Received via email (Bridgeware):

I have attached my VO file for Bridge 119.  
In attempting to rate the bridge, I find that the rating is extremely low, because of compressive failure of some of the minor members.

Can I use the following command to state that the minor members cannot take compression?

I am working in Virtis 5.6 doing load ratings for the NYSDOT and I think I may have found an error that

4/19/2016 3:21:00 PM

HRS AASHTO

2576

## Complete Issue Information

I was hoping you could investigate and confirm.

The issue occurs on a Girder/FB/stringer superstructure, although I cannot say if it is limited only to this configuration, and involved the built-up floorbeams.

The floorbeams have section losses to the bottom angles, both the horizontal and vertical legs; there are no cover plates on the bottom angles of this built-up member. The issue is when inputting the section losses that were measured in the field, I noticed that the Vertical Leg % Thickness loss does not affect the load rating at all. I even tried excessive numbers like 95% thickness loss to the vertical legs and the number did not change from As-Built.

I did some more testing and noticed that the "% Width/Depth" loss for vertical legs did appear to affect the load rating properly. The horizontal leg losses also worked correctly for both % Thickness and width. Therefore, so I believe this is isolated to only the Vertical Leg % Thickness loss.

I am unaware of any known issues for built-up floorbeams regarding the section losses, but let me know if you already know about this issue.

This potential incident would significantly affects a number of bridges that are currently posted, and may require a lowering of that posting, so I would appreciate it if you could get back to me as soon as you can.

If you would like me to send you the Virtis file I am using let me know. I can be reached at this e-mail address or by phone at 914-747-1120.

Thanks,

Frank DeOrtentiis

FROM:hlee DATE:4/4/2008 2:44:15 PM  
Attached Virtis file.

Bridgware e-mail from Frank DeOrtentiis:  
I believe the condition I described happens on every floorbeam.

FROM:bgoodrich DATE:Monday, April 07, 2008 2:12:23 PM  
BRASS only allow input of one thickness for angles, which is used for both the horizontal and vertical legs. Therefore, any loss to the vertical leg thickness cannot be exported to the BRASS engine.  
Options for addressing this issue include:  
1. Convert built-up beam to equivalent plate girder and export to BRASS.  
2. Request that BRASS be revised to allow different thicknesses for angle legs.

FROM: Herman Lee DATE: 7/29/2008 10:20:12 AM Eastern Daylight Time  
The TAG would like to request that BRASS be revised to allow different thicknesses for angle legs.

FROM: Brian Goodrich DATE: 8/18/2008 9:39:49 AM Mountain Daylight Time  
An e-mail from Jim 7/31/08 indicated that he will check with the Task Force again before having me draft the request letter.

### Description

FROM:jihnat DATE:4/7/2008 11:02:06 AM

In Beta 3:

Open TrainingBridge2 and TrainingBridge3.

Copy "Interior Member" from TB2 to TB3.

Try to validate "Copy of Interior Member" now in TB3, program crashes.

FROM:kkennelly DATE:4/8/2008 10:29:21 AM

I can't reproduce this in either the release or debug versions of beta 3.

FROM:jihnat DATE:4/14/2008 11:14:35 AM

Try it this way:

Open TrainingBridge2 and TrainingBridge3.

Copy "Interior Member" from TB2 to TB3.

In TB3 under "Copy of Interior Member" copy "Build-up Alt" to TB2.

\*\*Copy "Interior Member" from TB2 to TB3 again.

Try to validate the second "Copy of Interior Member" in TB3, program crashes.

Also crashes if you go vice versa (switch above instructions and start with TB3 member to TB2).

FROM:jihnat DATE:4/14/2008 12:15:29 PM

Changed project to Support Center. Also crashes in version 5.6, 5.5 and 5.4, but not in version 5.1

FROM: Krishna Kennelly DATE: 7/15/2008 2:37:02 PM Eastern Daylight Time

The problem isn't in the Validate, it is in the Copying.

4/19/2016 3:21:01 PM

HRS AASHTO

2580

## Complete Issue Information

When I do the preceding \*\*Copy "Interior Member" from TB2 to TB3 again, CBridgeWorkSpaceView::AddMemberAltItem() is going to assert because the lpMemberDefDisp is null because in line 1487 the ISpngMbrDefId is 0.

When the validate is called it crashes in line 12716 of DoGirderMbrAlt because the SpngMrbDefDisp is null. I've fixed this crash for 6.0 beta 6.

We have to figure out why the member alt in the second Copy of Interior Member does not have a spngmbrdefid assigned to it.

FROM: Mehrdad Ordoobadi DATE: 7/21/2008 9:30:08 AM Eastern Daylight Time  
This problem is reproducible. It will be very improbable that a user would go through this scenario. Krishna suggested that this issue be suspended and be fixed in a future release.

FROM: Mehrdad Ordoobadi DATE: 10/8/2009 10:55:25 AM Eastern Daylight Time  
In 6.1 release build I am not able to reproduce the crash. But the validation gives the following messages:

Total Number of Messages: 6  
Number of Information Messages: 5  
Number of Warning Messages: 0  
Number of Error Messages: 1

-----  
Member: Copy of Interior Member  
Existing member alternative: Built-up Alt  
Current member alternative: Built-up Alt  
Built-up Alt (Member Alternative)  
No errors or warnings.  
Copy of Built-up Alt (Member Alternative)  
ERROR: A beam definition has not been applied to the member alternative.

Also, the "Copy of Built-up Alt" does not show up in the tree.

FROM: Mehrdad Ordoobadi DATE: 10/9/2009 11:53:43 AM Eastern Daylight Time

FROM: Mehrdad Ordoobadi DATE: 12/16/2009 10:01:08 AM Eastern Standard Time  
The crash no longer happens in 6.1 and later builds.  
The "Severity" field changed from "Crash" to "Confusion"  
Since this scenario is unlikely to happen real usage of software the priority is changed from "High" to "Low"

FROM: Joseph Ihnat DATE: 3/30/2011 1:12:40 PM Eastern Daylight Time  
I found a more straightforward way to reproduce the problem in the current code:  
Open TrainingBridge2 and TrainingBridge3.  
Make a copy of "Built-up Alt" in TB2.  
Copy "Interior Member" from TB2 to TB3.  
Validating "Copy of Interior Member" in TB3 gives the same error message as above.

### Description

FROM:jihnat DATE:4/9/2008 10:56:32 AM

The example bridge in tutorial PS4 no longer works correctly.

It worked OK through version 5.4, but since version 5.5 we get the following message from the PS Design Tool:

Theoretical Pi and e could not be found!

Try a bigger beam size or decreasing the concrete strength!

FROM:jihnat DATE:4/9/2008 11:02:17 AM

Bridge is attached.

FROM:jihnat DATE:4/9/2008 1:38:38 PM

This may have been a compiler-related problem.

Fixed for version 6.0.0

types) must first be checked out. We feel that checking out a truss bridge should not necessary when rating a bridge directly from Bridge Explorer.

FROM:jduray DATE:4/17/2008 9:24:26 AM

This is by design and is necessary because floorbeam reactions are computed and saved to the database during the analysis.

We will investigate an alternative solution that does not save the the floorbeam reactions to the db.

 Adam.Price@state.tn.us

FROM: bgoodrich DATE: Monday, April 21, 2008 10:17:41 AM  
 The details of how BRASS calculates the -0.629 ksi stress can be found after running the LRFD analysis by opening the "Specification Checks" window, expanding the "Stage 3" folder, and clicking on the "Span 1 – 60.60 ft" folder. Scroll down to the first occurrence of "Determination of Stresses" and double-click this item. The following output will be shown:

**PERFORMING BASIC MECHANICS OF MATERIALS - Determination of Stresses for Concrete**

## Complete Issue Information

Stage 2 Stresses:

| Location   | S, in <sup>3</sup> | Dead + Prestress Loads |               | Total Loads |               |
|------------|--------------------|------------------------|---------------|-------------|---------------|
|            |                    | f(mom), ksi            | f(axial), ksi | f(mom), ksi | f(axial), ksi |
| Slab       | -48219.875         | -0.171                 | 0.000         | -0.926      | 0.000         |
| Top Flange | -53781.809         | -0.153                 | 0.000         | -0.830      | 0.000         |
| Bot Flange | 20465.523          | 0.402                  | 0.000         | 2.182       | 0.000         |

Combined Stresses for ALL Stages:

| Location   | f(dead), ksi | f(total), ksi |
|------------|--------------|---------------|
| Slab       | -0.171       | -0.926        |
| Top Flange | -2.852       | -3.529        |
| Bot Flange | -0.629       | 1.150         |

Notes:

- => The negative sign (-) on stresses denotes compression.
- => Total loads include live load.

BRASS sums the stresses from the applied dead load moments as well as the axial force and moment from the prestress. The dead load moments are determined as follows:

$$\begin{aligned}M(1) &= 2200 + 2059 + 498 = 4757 \text{ ft-kips (self-weight, DC, haunches \& diaphragms)} \\M(P/S) &= -3704 = -3704 \text{ ft-kips} \\M(2) &= 449 + 237 = 686 \text{ ft-kips (DW, load group 2)}\end{aligned}$$

The difference between BRASS and Conspan may be in the dead load moments or the section properties.

FROM:aprice DATE:Monday, April 21, 2008 4:11:08 PM

Does Brass transform either the prestressing strands or the rebar when computing section properties?

FROM:bgoodrich DATE:Friday, April 25, 2008 10:35:55 AM

BRASS uses the gross section properties for stress calculations in prestressed concrete girders. Strands and rebar are not transformed.

FROM:bgoodrich DATE:Friday, May 02, 2008 7:42:25 AM

E-mails from Adam Price:

Brian,

I just wanted to let you know that it appears to me that in the analysis charts Opis is listing service III live load moments when the option for live load moments is selected. The live load factor for service III is 0.80. This does not seem to be labeled, so some users may assume they are looking at service I moments, which have a load factor of 1.0.

Sincerely,  
Adam Price

HRS AASHTO

2589

**Complete Issue Information**

615-741-5390

Brian,

The email I just sent you does not correctly explain my problem. I am looking at point 104.00, 60.5 feet into span 1. The live load stress for service III is given as 1.492 ksi. The live load moment at this location is given as 1942 k-ft. The composite section is modulus is 19537.85 in<sup>3</sup>.

If I assume that this moment is service I, then the service III live load stress would be  $1942 * 0.8 * 12 / 19537.85 = 0.9542$  ksi.

If I assume that this moment is service III, then the service III live load stress would be  $1942 * 12 / 19537.85 = 1.1928$  ksi.

If I assume that this moment is service I, but divide by the load factor instead of multiply, then the service III live load stress would be  $1942 * 12 / (19537.85 * 0.8) = 1.491$  ksi, which is the stress that is given by BRASS.

If the moment of 1942 k-ft is indeed service I, then BRASS would appear to be making a serious mistake. However, I designed this beam with Conspan, and Conspan reports the service III live load stress as 1.432 ksi, which is very close to 1.492 ksi. The service III live load moment given by Conspan is 2576.7 k-ft, which would give a stress of  $2576.7 * 12 / 21590 = 1.432$  ksi. (Conspan transforms the strands, so the section modulus is higher.) I believe BRASS is incorrectly reporting live load moments. Please let me know what you decide about this.

Thanks,  
Adam Price  
Tennessee Department of Transportation - Structures Division  
615-741-5390

FROM: bgoodrich DATE: Friday, May 02, 2008 8:03:21 AM  
The live load moment of 1942 ft-kips is only the truck portion of the HL-93. The lane portion is 1094 ft-kips. BRASS analyzes each live load case separately and then combines them as per the specification. Combining these two moments yields the stress reported by BRASS:

$$f = (1942 + 1094) * 12 * 0.8 / 19538 = 1.492 \text{ ksi}$$

## Description

FROM:rcurtis DATE:Friday, April 18, 2008 12:43:40 PM

The following is from one of our consultants:

There appears to be an error with the Virtis software. As such we cannot analyze a prestressed concrete structure using the BRASS Engine with the Mcr/Mmax ratio set to "no limit". Many of the prestressed concrete structures that we analyzed using the BRASS Engine have poor rating factors with shear controlling apparently due to the Mcr/Mmax ratio being limited to 1.0. It is my understanding that AASHTO (9.20.2.2) does not require the ratio to be limited to 1.0. Note that the Virtis Std Engine does not limit the Mcr/Mmax ratio to 1.0. However, on many of the prestressed concrete structures we have to use the BRASS Engine because the beams have both draped and debonded strands. When using the BRASS Engine the Virtis software interface gives the user the option of limiting the Mcr/Mmax ratio in the Vci calculation to 1.0 or setting "no limit" to this ratio. So to stay consistent and to prevent overly conservative results when using the BRASS Engine we would recommend setting the Mcr/Mmax ratio to "no limit" if it worked.

The issue is that BRASS does not appear to be applying the user defined option correctly through the Virtis interface. When the Mcr/Mmax ratio is set to "no limit" BRASS ignores shear, no shear

4/19/2016 3:21:04 PM

HRS AASHTO

2591

## Complete Issue Information

calculations

are performed and consequently no shear ratings are given. Review of the BRASS-Girder Manual indicates that command line 310 controls the analysis settings. Command line 310 has 11 command parameters. The Mcr/Mmax ratio setting is controlled by the 7th command parameter. There are three possible codes for this parameter 0, 1 or 2. A "0" code means that the Mcr/Mmax ratio is set to "limit 1.0",

a "1" code means that shear rating is to be "ignored" and a "2" code means that the Mcr/Mmax ratio is set

to "no limit. As stated above through the Virtis interface under the BRASS LFD Engine properties when we set the Mcr/Mmax ratio to "no limit" the 7th command parameter should be a "2". After an analysis is ran a review of the BRASS LFD output file shows that 7th command parameter at Command Line 310 is

a "1" in which shear is ignored and no shear ratings are performed. In comparison if through the Virtis interface under the BRASS LFD Engine properties we set the Mcr/Mmax ratio to "limit 1.0" and run the analysis a code "0" is correctly placed at the 7th command parameter for command line 310. Shear calculation are performed and shear ratings are reported; however because the ratio was limited to 1.0 the results are overly conservative and often give poor ratings for shear. Virtis and BRASS appear to apply the code correctly when the user wishes to limit the Mcr/Mmax ratio to 1.0, but not if the user wishes

to set "no limit" to the ratio.

FROM:hlee DATE:4/21/2008 8:46:41 AM

Duplicate of Incidentn 8403 (Shear shouldn't be ignored when no limit is selected for Mcr/Mmax in engine properties).

FROM:gbarnhill DATE:Tuesday, April 22, 2008 7:25:08 PM

Related to this issue:

- 1 Create a PS member alt and check IGNORE SHEAR on the Member Alt Description tab.
- 2 Copy this member alt.
- 3 Open the Engine Tab/BRASS LFD - Configure engine properties....
- 4 Note that the last line is METHOD USED TO DETERMINE Vci: LIMIT Mcr/Mmax to 1.0
- 5 Click the PROPERTIES button
- 6 Note that in the MICELLANEOUS tab there are no options for Vci
- 7 Click OK and note that the last line is METHOD USED TO DETERMINE Vci: NO LIMIT ON Mcr/Mmax.

If you now Uncheck IGNORE SHEAR and re-open the Engine Tab/BRASS LFD - Configure..., the last line is still NO LIMIT. In the MISCELLANEOUS tab the Vci options are now available.

Is this what is supposed to happen ??

FROM:hlee DATE:4/23/2008 9:33:13 AM

Related to the fix for Incident 7593.

1. When ignore shear is checked, the options for Vci are hidden in the misc tab. The last line "Method used to determine Vci: ..." in the engine tab shouldn't be shown.
2. Clicking ok in step 7 shouldn't change the Vci option.

FROM: Brian Goodrich DATE: 6/27/2008 1:58:22 PM Eastern Daylight Time

I revised the BRASS component of the GUI (AbxBrass2 and AboBrass) so the Vci method is not

4/19/2016 3:21:04 PM

**Description**

FROM:jihnat DATE:4/18/2008 1:59:10 PM  
Received via email (Bridgeware):

I am using the Virtis software to perform a load rating for a bridge in Virginia. In an attempt to verify the results, I noticed the negative section properties in the Virtis output are less than what we calculated during the design of the bridge using hand calculations and other software.

We expected the moment of inertia for "Section 2" and "Section 3" to be

4/19/2016 3:21:04 PM

HRS AASHTO

2593

**Complete Issue Information**

approximately 14600 in^4 and 20600 in^4 respectively. The Virtis output calculated 13100 in^4 and 19000 in^4 respectively. If you could provide any additional details regarding how these numbers were determined, I would greatly appreciate it.

I have attached the .xml file that I have created for your review.

Please feel free to contact me to discuss this issue.

Thanks,

Tony

FROM:bgoodrich DATE:Monday, April 21, 2008 9:41:03 AM  
This issue pertains to the Virtis LFD engine, not BRASS LFD. Search for the header "GIRDER SECTION PROPERTIES (COMPOSITE, NEGATIVE MOMENT)" in the output file. Also, the attached XML file is from version 5.4.

FROM:hlee DATE:4/24/2008 8:26:21 AM  
Reply e-mail:

Section 3.2.3 in the Virtis Std User Manual describes how the section properties are calculated. For composite section under negative moment, the concrete area in tension is not included in the calculation. If you are not able to confirm the numbers in the output, please send us your calculations for investigation.

### Description

FROM:hlee DATE:4/28/2008 11:13:29 AM  
Currently, it is available when Library Explorer is opened.

FROM: Joseph Ihnat DATE: 3/19/2009 8:37:04 AM Eastern Daylight Time  
Behavior is like BWS toolbar. It only has a context when its view is open.

FROM: Herman Lee DATE: 3/21/2009 1:38:31 PM Eastern Daylight Time  
I think the behavior for the Library Explorer toolbar should be like the Bridge Explorer toolbar. When Bridge Explorer is closed, the toolbar is still available but all buttons are disabled. Users control whether they want to see the toolbar or not. Currently checking or unchecking the BWS or Library Explorer toolbar doesn't have any effect. Virtis will always check and show the toolbar next time the user open the BWS or Library Explorer. I think this behavior is acceptable for BWS but not for Library Explorer since BWS is a level below the Bridge Explorer.

FROM: Joseph Ihnat DATE: 10/14/2009 2:20:17 PM Eastern Daylight Time  
Fixed for version 6.2

FROM: Joseph Ihnat DATE: 4/30/2010 12:45:41 PM Eastern Daylight Time

## Description

FROM:jihnat DATE:4/28/2008 12:17:48 PM

Received via email (Bridgeware):

We are trying to analyze a 9 span haunch slab bridge. And each time I run it, it takes about 30-40 minutes to run. Have you ran a bridge this large? Would you have any idea of why it take so long to run and a way to fix it? If you would like, I can send you the file to see if works any faster on your computer.

FROM:hlee DATE:5/21/2008 10:39:31 AM

There are 301 points of interest defined for this bridge. One recommendation is to reduce the number of points of interest in initial design and include all points for final design check.

After I removed all reinforcement development points of interest, it took 5 minutes to analyze the 9-span bridge.

### Complete Issue Information

The database was created using the AllScripts-SampleDB-60-SQLServer.SQL file.

FROM:jihnat DATE:4/29/2008 8:17:21 AM

Changed project to Support Center.

The Rating Engineers group does not have Read access privileges for Bridge List, which is why the button is disabled.

Probably the Bridge Explorer shouldn't even appear when Virtis is started.

Apparently it's been this way for quite a while.

FROM:ddominguez DATE:Thursday, May 01, 2008 5:10:15 PM

I have a user that has not been able to rate a bridge after he opens one up from the bridge explore. Contrary to another issue you guys have pending; where the person cannot rate from Bridge Explore, my user can. But its when he opens up a bridge that the rate (icon) becomes deactivated.

FROM:jihnat DATE:5/6/2008 8:52:42 AM

Rating from inside the bridge workspace does not use the same Rate button that is used from the Bridge Explorer.

Use the Analysis Settings button and Analyze button on the BWS toolbar (or Bridge/Analysis Settings and Bridge/Analyze from the menu bar).

In the bridge workspace, the Analyze button will be disabled until vehicles are selected in the Analysis Settings window.

If it remains disabled, make sure the user has sufficient Access Privileges (i.e. Create) for Rating Events (and/or Design Events).

-----  
Results Example A: (Loop was executed 3 times)  
HS 15-44 was selected as an Inventory vehicle and an HS 20-44 vehicle was selected as an Operating vehicle for analysis.  
The results are as expected, however why was the Pedestrian Load 'vehicle' returned?

1st Loop  
trkName = HS 15-44  
ICategory = 1 (Inventory)

2nd Loop  
trkName = HS 20-44  
ICategory = 2 (Operating)

3rd Loop  
trkName = Pedestrian Load  
ICategory = 7 (assuming pedestrian)

noVehicles = 3

-----  
Results Example B: (Loop was executed 2 times)

The same vehicle an HS 20 - 44 was selected for Inventory and Operating analysis. The results are not as expected receive a Design vehicle and a Pedestrian Load 'vehicle' ?

1st Loop  
trkName = HS 20-44  
ICategory = 3 (Design)

2nd Loop  
trkName = Pedestrian Load  
ICategory = 7 (assuming pedestrian)

noVehicles = 2

=====  
=====  
Please see the following comments for the first issue in your forwarded e-mail.

4/19/2016 3:21:07 PM

**HRS AASHTO**

2607

**Complete Issue Information**

1. GetVehicleCategory returns a bitmask, see API Reference and DoEventVehicleCategories.h for more information. Most likely you need something like

```
BOOL bInv = (ICategoryMask & ABW_EVNTVEHCAT_INVENTORY) ? TRUE : FALSE;
```

2. Each unique vehicle will appear in the loop only once but may appear in more than one category. You may want to use IsVehicleInCategory to check whether a vehicle is in a particular category.

3. Pedestrian Load is a dummy vehicle which will always appear as a vehicle in the loop. Some states treat Pedestrian Load as a separate vehicle and some states just want to treat it as a uniform load. If you don't want to use it, just filter it out in the loop.

With Joe's e-mail for the response of the second issue, the status of Incident 8637 is marked as Resolved.

=====

FROM:hlee DATE:5/12/2008 8:11:18 AM  
Received e-mail:

=====

I forwarded your response to the person working on this. He is still not clear on what needs to be done. We are selecting an inventory and operating vehicle in the Virtis Analysis Settings window and are looking for these vehicles in our export module so we can pass them to our load rating engine. Here is his response (in quotes "").

" The answers provided do not explain the results in Example A and B.

Please ask the following.

The code snippet does show us 'testing' the vehicle category and dismissing pedestrian loads.

The question(s) that remain, specifically are:

1) In Example A we see three vehicles come through in the loop whereas in Example B we see two vehicles come through. Why? Expected 3 vehicles in Example B. (since pedestrian load always accompanies the vehicle collection).

2) In Example B we had specified an Inventory vehicle and an Operating vehicle. When we review the vehicles we see (other than the 'Pedestrian Load' which was dismissed) a Design vehicle. Where did the Design vehicle come from? What happened to the Inventory and Operating vehicles? The results of Example A is consistent with our expectations but am unable to understand the results from Example B."

=====

**Complete Issue Information**

Reply e-mail:

=====

In Example A, you have a HS 15-44 vehicle and a HS 20-44 vehicle. The HS 15-44 vehicle is in the Inventory category. The HS 20-44 vehicle is in the Operating category. With the dummy Pedestrian Load, there are 3 UNIQUE vehicles in the analysis event. That's why you see 3 vehicles in Example A.

In Example B, you have a HS 20-44 vehicle. The HS 20-44 vehicle is in the Inventory category and also the Operating category. With the dummy Pedestrian Load, there are 2 UNIQUE vehicles in the analysis event. That's why you see 2 vehicles in Example B. The first vehicle in the loop in Example B is HS 20-44. When you check the category, the vehicle is a decimal 3. The decimal 3 doesn't represent the Design category. The decimal 3 is a bitmask which represents a hexadecimal 3. The hexadecimal 3 represents the Inventory category and also the Operating category at the same time. Copied below is part of the DoEventVehicleCategories.h. You need to use bitwise AND (&) to operate on the hexadecimal 3 to tell which category or categories that vehicle belongs to.

For example,

BOOL bInv = (ICategoryMask & ABW\_EVNTVEHCAT\_INVENTORY) ? TRUE : FALSE;  
If bInv is TRUE, the vehicle is in the Inventory category.

BOOL bOpr = (ICategoryMask & ABW\_EVNTVEHCAT\_OPERATING) ? TRUE : FALSE;  
If bOpr is TRUE, the vehicle is in the Operating category.

```
#define ABW_EVNTVEHCAT_INVENTORY      0x0001 // 1
#define ABW_EVNTVEHCAT_OPERATING     0x0002 // 2
#define ABW_EVNTVEHCAT_DESIGN        0x0004 // 4
#define ABW_EVNTVEHCAT_PERMIT        0x0008 // 8
...
```

### Description

FROM:tarmbrecht DATE:Thursday, May 08, 2008 5:01:54 PM

For Prestressed Concrete I-beam bridges continuous for the composite section but simple span for initial dead loads the non-composite (Stage 1) reactions should be the same at each end of each span but as shown in the attached Word Document they are doubled at the ends adjacent to the next span.

Accompanying xml file is also attached.

FROM:hlee DATE:5/12/2008 9:09:42 AM  
Looks like Virtis Std Engine has the same issue.  
Brian, please assign to Mehrdad after you are done.

FROM:bgoodrich DATE:Wednesday, May 14, 2008 9:14:58 AM  
I have reviewed this issue and requested input from Jay Puckett.

FROM: Brian Goodrich DATE: 3/23/2010 9:33:44 AM Mountain Daylight Time  
BRASS only stores the reaction for the final support condition, i.e., it does not store the reaction on both sides of a double-bearing pier. This issue was forwarded to WYDOT.

FROM: Brian Goodrich DATE: 4/15/2010 2:04:44 PM Mountain Daylight Time  
Within BRASS, the reaction represents the force applied to the abutment/pier and not the force to the

4/19/2016 3:21:07 PM

HRS AASHTO

2610

**Complete Issue Information**

bearing. An e-mail from Mike Watters stated "We will leave the program as is." I am assigning this issue to Mehrdad now.

FROM: Mehrdad Ordoobadi DATE: 5/7/2010 7:14:50 AM Eastern Daylight Time  
The values that we have always been showing at the middle support for steel or RC or PS beams have been the total support reaction at the support. The total reaction at the pier is not the sum of the reactions at the left and right of the support. I think this is not a bug.

Stage 1 bearing line reactions are available in the shear column. So in this example the reaction at the left of the support is 31.2 kips and at the right is 29.4 kip.

### Description

FROM:tambrecht DATE:Wednesday, May 14, 2008 2:54:22 PM

Since there has been no further discussion for 7761, I am resubmitting. I do not believe this is an enhancement.

The attached message is generated for PS I-beams when attempting to generate live load distribution factors if only the "Current" box is checked for either of the neighboring I-beams. Since only box/deck beams are subject to being constructed as "adjacent" beams, why would PS I-beams, which have distribution factors more similar to steel beams than box beams, have this constraint placed upon them?

Also, why is it necessary to have both Existing and Current checked in order to generate the LLDF for adjacent box beams? If only Current is checked and the adjacent beam is adequately described shouldn't Virtis have all the information it needs to calculate the LLDF?

FROM:jduray DATE:5/15/2008 9:09:07 AM

Virtis should only use Current for drawing the schematic. It should be looking at Existing for computations. We will investigate.

4/19/2016 3:21:08 PM

HRS AASHTO

2614

## Complete Issue Information

FROM: Herman Lee DATE: 3/3/2010 10:12:37 AM Eastern Standard Time

I agree that Std Spec 3.23.4 doesn't apply for PS I beams. The constraint of having adjacent beams defined has been removed for PS I beams and the distribution factors computation will be based on simple beam or Std Spec Table 3.23.1. Resolved for 6.2 Release.

As described above, the Current member alternative is for drawing the schematic and the Existing member alternative is for computations. When there is no Existing, the distribution factors computation could ask the user whether to use the Current member alternative or just use the member alternative if there's only one. I will consider this as an enhancement to the distribution factors computation. Please let us know if you want to change this to an Enhancement request.

### Description

FROM:jonysko DATE:Wednesday, May 28, 2008 10:41:42 AM

I am rating a nine-span prestressed concrete structure made continuous for live loads. The structure consists of 14 butted box beams and two fascia box beams that are separated by sidewalk utility bays. After entering the input and running the analysis, the controlling inventory and operating locations for several of the beams occur at analysis points that do not exist. They are neither one of the 10th points, nor are they one of the points of interest I entered. For example, for Beam B-2, which is the first butted box beam, the controlling location is Span 8 at 0.705L according to the Summary Report. However, 0.705L is not a tenth point, nor is it one of my points of interest. Furthermore, when I search through the BRASS output, I see that the controlling rating values displayed in the Summary Report actually correspond to a different location: Span 9, 0.00L. I do have points of interest that are near the location 0.705L in Span 8. However, the rating values at these locations are much larger than the controlling rating values. So basically, it appears the VIRTIS summary is telling me that the controlling location occurs at an analysis point that does not exist, and the controlling rating values actually correspond to a different analysis point. Is this a problem that someone has come across before, and if so, is there a way to get around or fix it? I have attached a copy of the VIRTIS file.

FROM:bgoodrich DATE:Thursday, June 05, 2008 12:57:05 PM

Incident 5879 discusses this same issue.

BRASS does not have the capability to analyze the span length of simple-span bearing for the

2617

**Complete Issue Information**

non-composite stage and a different span length of the continuous span for the composite stage. The prestress modeling method option can be utilized, so the BRASS Export will generate commands associated with the shorter or longer span lengths. You have the "Centerline of Simple-span Bearing" method currently selected, so BRASS will use the span lengths adjusted to remove the bearing offset at each end of the span.

BRASS determines the critical ratings and sends the location back to Virtis in the form of a distance along the length of the BRASS structure. Virtis is taking this distance and comparing it to the Virtis model, i.e., the centerline-of-pier to centerline-of-pier span lengths. Due to the number of spans, the cumulative effect on the distance really adds up.

The remedy for this issue is to convert the BRASS locations to locations on the Virtis model.

FROM:bgoodrich DATE:Thursday, June 05, 2008 2:12:45 PM  
Comment to development team:

Is this a BRASS issue or does this happen with the Virtis engine too? It looks like we need to develop some function to convert the engine locations to the appropriate location in Virtis. Does this belong in the results object or by some utility after the engine analysis? Either way, we will need some mechanism to store the BRASS span lengths for use by either method.

FROM:bgoodrich DATE:Thursday, June 05, 2008 2:13:43 PM  
E-mail from Herman Lee:

For continuous span PS structure, Virtis Std Engine uses simple span bearing span lengths for DL1 analysis and centerline of support span lengths for DL2 and LL analyses. Analysis points considered for DL1 analysis correspond to tenth points of the continuous span lengths used for DL2 and LL analyses. Analysis points for which the results are reported correspond to tenth points of the continuous span lengths.

Since each engine may have it's own interpretation of span length, I think the conversion should be done either in the engine or in the post processing part of the export.

Herman

FROM: Jim Onysko DATE: 6/26/2008 1:49:32 PM Eastern Daylight Time  
Okay, thank you very much.

FROM: Herman Lee DATE: 7/17/2008 2:51:36 PM Eastern Daylight Time  
E-mail from Brian Goodrich (6/5/08):

=====  
Another alternative would be to pass an array of interior-support bearing offsets into the engine and add these to the span lengths when determining the location to save to the results object. However, WYDOT would need to authorize this change.

Would you like me to pursue an engine solution with WYDOT, a post-processing export solution, or hold off?

One item that should be added next time this GUI is touched is Route Number. When you create a bridge with this wizard and then save your bridge, unless you add the route number to the Bridge Description, validate will always indicate an error. It would be best for users if they could complete the Layout Wizard and save their new bridge without validate indicating an error is present.

### Description

FROM:tarmbrecht DATE:Friday, May 30, 2008 4:30:08 PM

While checking someone else's work, I ran the attached structure in Opis and, without changing anything, ran in Virtis (LRFR). The Design Ratio for Opis was not close to the Virtis rating factor, so I tracked it down to the moments. BRASS LRFD used a Live Load Scale Factor = 1 and Lanes Loaded = Critical, while Virtis used a Load Scale Factor = 0.833 and Lanes Loaded = One. See attached pdf for flexure results from output. Why would the applied moments for LRFR be different than those for LRFD?

FROM:hlee DATE:6/2/2008 9:10:13 AM

The described issue is a duplicate of Incident 8450. Incident 8450 has been resolved and will be included in the 6.0 Release. The fix is also in 6.0 Beta 3.

FROM:tarmbrecht DATE:Tuesday, June 03, 2008 2:58:34 PM

I checked it in Beta 3 - looks like it's fixed, thanks.

FROM:jruby DATE:Thursday, June 05, 2008 4:34:02 PM

1)  
If I export a bridge that I have previously imported and run, I get the error as shown in the first ScreenShotError.jpg when I choose the "Delete files and folders" checkbox. When I hit ok the bridge is removed, but not all of the files and folders are deleted.

2)  
I don't know if this is related or not. But If I try to import the very same bridge, I have to give it a unique BID and unique NBI Structure ID. Is this normal? I don't think it should be.

My bridge is attached, but I don't think it matters what bridge you try and import.

4/19/2016 3:21:10 PM

HRS AASHTO

2623

## Complete Issue Information

By the way. If you want me to continue checking things with this bridge, I would appreciate you fixing the offset problem in my file and attaching the fixed version like you did for Dave Warner.

FROM:jduray DATE:6/9/2008 8:06:56 AM

2) Each bridge must have a unique BID (system assigns this number, not the user). As stated in the Help the Bridge Id and the NBI Structure Id must be unique within the system.

FROM:jduray DATE:6/9/2008 8:16:26 AM

FROM: Jeff Ruby DATE: 6/23/2008 9:00:17 AM Eastern Daylight Time

So, the "system" always remembers that you used this number in the past, even if you deleted it? I think this is a garbage clean-up problem. I can see all of the bridges in the "system". They are all the "example" bridges only. But, I still can't import my bridge. So the system has a memory like an elephant. Or, maybe this isn't the desired behavior. If I remember right, I haven't had this problem in the past. So I think this is new bug.

FROM: Jeff Ruby DATE: 6/23/2008 9:26:22 AM Eastern Daylight Time

I just checked this in beta 4. It is still broke. Try it if you want. I attached the the version 5.6 xml file of the bridge I imported. Import it. Save it. Delete it. Restart Virtis/Opis if you want. See the list. It is all clean. Only 23 example bridges. Now, Import the same bridge again. Try to save it. Bingo. It shouldn't be this way.

Thanks.

By the way. Did you actually try this? Also, What about issue #1? I am running out of time I'm sure. So I will have to update and get back to you. Can't tell, don't have a timer anymore.

FROM: Jim Duray DATE: 6/24/2008 9:38:16 AM Eastern Daylight Time

Regarding the import issue described in (2) above - When you delete a bridge it is not actually deleted from the database, it is marked as deleted and is displayed in the Deleted Bridges folder. This is not an accident and it is not a "garbage" cleanup problem, it is by design and the request of the UI TAG ten years ago. This gives you an opportunity to recover the bridge if you mistakenly delete it. Viewing and removing bridges in the Deleted Bridges folder is a privileged operation so you may not be able to see the folder. If that is the case you will have to ask your administrator to delete it. After that you can import it with the same Bridge Id and the NBI Structure Id as the original.

FROM: Jim Duray DATE: 6/24/2008 10:40:18 AM Eastern Daylight Time

I copied RcTrainingBridge1, did a LRFD analysis, closed the BWS and deleted the bridge. The bridge is moved to the Deleted Bridge folder (as it should be) but the Opis\_LRFD folder cannot be deleted. Using File Explorer I started at the bottom of the folder structure and deleted files until I found one that I could not delete. It was the Opis\_LRFD folder, all files below that point could be deleted. I thought the current directory may still be set to Opis\_LRFD so I analyzed another bridge thinking that would force the current directory to change. I still could not delete Opis\_LRFD. I suspect this is a problem in previous releases.

FROM: Jeff Ruby DATE: 6/25/2008 9:49:55 AM Eastern Daylight Time

Oops! Sorry about issue (2). I apologize for my ignorance. I forgot about the deleted bridges folder.

FROM: Joseph Ihnat DATE: 7/14/2008 11:21:31 AM Eastern Daylight Time

Fixed issue with deleting Opis\_LRFD (see Jim's comments 6/24/2008).

Fixed for 6.0 release.

FROM: Herman Lee DATE: 7/18/2008 3:11:59 PM Eastern Daylight Time  
Verified the fix in Beta 6.

FROM: Jeff Ruby DATE: 7/22/2008 10:45:47 AM Eastern Daylight Time  
I still get this error. I think it has to do with the fact that Virtis/Opis is not "releasing" the file descriptors to open files. I hypothesize that if I would exit Virtis/Opis and then delete it it will work. It seems silly, but maybe someone really wants to delete a bridge immediately after running an analysis. See the screenshot I attached for the error number.

### Error at line 32 ###:

?

User cannot find any deviation from entry requirements as documented in the Virtis "Truss Input Command Language". Although the message says the section is not supported, the documentation says that it is supported as far as we can tell. I've attached the xml file causing the problem. Any ideas? Thanks.

FROM:hlee DATE:6/9/2008 9:17:22 AM

The 6 supported bultup section are shown on section 6.9.2 (page 25) in the Truss Input Command Language Manual. One of the supported bultup section allows web lacing but also requires top and bottom flange plates. The bultup sections coded in the attached truss are not supported since there are no top and bottom flange plates. Please let us know if you want to change this to an enhancement request.

3 Span prestressed bridge

In the Beam Details, Continuity Diaphragm GUI

See the correct and incorrect jpg's

Using the tab key to navigate, just finished entering the 2nd set of continuity data for span 2  
 Pressing the tab key several times to put the focus on the Duplicate Button I pressed enter.  
 Instead of getting another line for span 2 with both left and right support fields available I got a line for span #1 with only right support fields.

I think it should have duplicated the last line shown for span 2. Is it not supposed to work that way?

It works fine if the focus is on a field in the last line and you poke the Duplicate button.

### Complete Issue Information

FROM: Joseph Ihnat DATE: 7/2/2008 3:27:34 PM Eastern Daylight Time

Not a Beta incident. Changed to Support Center.

Probably nearly every grid works this way. The "current cell" gets set back to the first row when you tab off the grid.

We could probably leave the "current cell" at the last row and/or add a keyboard shortcut to the New, Duplicate and Delete buttons.

## Description

FROM: Tim Armbrecht DATE: 7/28/2008 10:22:57 AM Eastern Daylight Time

The attached Virtis model, VSEFlaredBmError-060019().xml, a girder line with variable width deck and LLDF will not run in Virtis Standard Engine. The following error message is produced in the output file...

FORMAT ERROR OCCURRED ON THE FOLLOWING LINE

1M 40250670058506700585

THE PROGRAM WAS EXPECTING GIRDER MEMBER PROPERTIES  
BUT THE ABOVE DATA LINE WAS ENCOUNTERED.

FROM: Herman Lee DATE: 8/27/2008 11:07:46 AM Eastern Daylight Time

The above error message is caused by a defect in the 5.6 Release and had been fixed in the 6.0 Release. To run the model in 6.0, the Girder spacing in the Member window and the Start and End Effective Flange Widths in the Deck Profile window need to be entered. Incident 8863 (Virtis Std Engine export for effective flange width.) was discovered during investigation and had been fixed for 6.0 Service Pack.

During the export process in 6.0, the error message "Unable to get slab width!" is displayed. Two issues are identified:

1. After ADD\_ERROR\_MSG in DoGirderMbrAlt line 26172, ComputeGirderSpacing should return FALSE.
2. GetSlabWidth should either handle steel girder or complain girder spacing is not entered.

FROM: Krisha Kennelly DATE: 9/2/2008 1:57:40 PM Eastern Daylight Time

Items 1 and 2 are fixed for 6.0.1 but it really isn't a fix that makes this beam run without the user revising the data.

To analyze this member you have to follow the instructions above - "To run the model in 6.0, the Girder spacing in the Member window and the Start and End Effective Flange Widths in the Deck Profile window need to be entered"

FROM: Xinmei Li DATE: 5/28/2009 12:02:35 PM Eastern Daylight Time

**Complete Issue Information**

I tested with 6.1 Beta1. I entered girder spacing in the Member window and the Start and End Effective Flange Widths in the Deck Profile window, got the following error while doing rating with Virtis std engine.

Internal Errors (1) - Invalid index  
01:21:18 PM - Line 2473 in source file .\DoMemberResults.cpp.

Structural Analysis Errors (2410) - Input or computational error encountered.  
01:21:18 PM - Line 2473 in source file .\DoMemberResults.cpp.

FROM: Krisha Kennelly DATE: 3/1/2010 9:51:03 AM Eastern Standard Time  
Herman - I don't know if you or Hasmukh should look into this.

FROM: Herman Lee DATE: 3/1/2010 11:06:56 AM Eastern Standard Time  
I imported the attached bridge in 6.1 Release. The following error is listed in the Virtis Std Engine output file.

```
=====
DUPLICATE RANGE ENTERED FOR STEEL MEMBER PROPERTIES
PREVIOUS RANGE 46.75 EQUALS CURRENT RANGE 46.75 FOR SPAN 3
=====
```

Hasmukh, please investigate why it's complaining about the previous range. The previous range is for span 2.

FROM: Hasmukh Lathia DATE: 3/1/2010 3:11:17 PM Eastern Standard Time  
It appears that the enhancement made for Incident 9027 (check for a duplicate range in the steel member properties input) introduced a deficiency in the code to cause this error. A correction has been made that will be included in the next release of Virtis. Meanwhile, the workaround is to introduce an additional range in each span. This error would occur if there is only one range in each span.

### Description

FROM: Tim Armbrecht DATE: 7/30/2008 4:56:36 PM Eastern Daylight Time

After running several RC culverts lately, I suggest that the program have the option to calculate the shear capacity per AASHTO equation 8-59, which is the special provision for shear capacity of slabs of box culverts with more than 2' of fill. Equation 8-59 is very similar to the standard or default equation used 8-48. Since a great amount of the culverts input in VIRTIS are controlled by the shear capacity of VIRTIS, the batch runs for permit loads over culverts may show incorrect shear capacities which may affect the time required to evaluate permit applications.

FROM: Herman Lee DATE: 7/16/2014 10:35:45 AM Eastern Daylight Time

Resolved in the 6.4 release (AASHTO Culvert Engine).

FROM: Tim Armbrecht DATE: 7/31/2008 9:39:29 AM Eastern Daylight Time

When the top flange is entered as slightly less than the total width of a prestressed concrete box beam in an adjacent box-beam superstructure the rating factors are significantly less than when the top flange width is set as the total width. Please see attached word document for an example.

FROM: Brian Goodrich DATE: 8/15/2008 1:21:54 PM Mountain Daylight Time

The 1.25" difference in the flange width should cause differences in the results. However, the rating

4/19/2016 3:21:11 PM

**HRS AASHTO**

2633

## Complete Issue Information

differences shown in the document are quite large. The XML file was not attached, so I am not able to duplicate the issue exactly. We need to examine the detailed output for the controlling limit state to see why the difference in flange width is affecting the rating so much.

FROM: Tim Armbrecht DATE: 8/18/2008 11:44:51 AM Eastern Daylight Time  
Sorry about that. I have attached it.

FROM: Brian Goodrich DATE: 8/20/2008 4:00:51 PM Mountain Daylight Time  
I rated the interior member with the standard and modified box beams. The difference in the rating is due to a difference in the factored live load moment, which is due to differences in the live load distribution factors. BRASS is calculating the live load distribution factors per the LRFD formulas. BRASS uses the width of the top of the box beam for the formulas, which is subject to a range of applicability ( $35" \leq b \leq 60"$ ). The standard box beam has a top width of 34.75", which is outside the range of applicability. When this occurs, BRASS is programmed to use the lever rule override, which results in a higher live load distribution factor than the formulas. The modified box beam has a top width of 36" and is within the range of applicability, so the LRFD formula distribution factors are used. Note that the next version of the BRASS engine has already been changed to use the maximum of the top and bottom box widths.

FROM: Brian Goodrich DATE: 11/20/2008 9:24:45 AM Mountain Standard Time  
The BRASS engine was already changed to use the maximum of the top and bottom box widths, so this issue is marked as resolved. Fixed for version 6.1.

FROM: Tim Armbrecht DATE: 7/24/2009 3:31:49 PM Eastern Daylight Time  
It does not appear that this has been fixed -

There is no change in the BRASS LRFR rating factors between v. 6.0 and v. 6.1 Beta 2.

Using BRASS LRFR (v. 6.1 B2 & v. 6.0), w/the 34.75" top flange, the Inv/Op rating factors are 0.583/0.756.

Using BRASS LRFR (v. 6.1 B2 & v. 6.0), w/the 36" top flange, the Inv/Op rating factors are 1.471/1.907.

Using Virtis LRFR (v. 6.1 B2), w/the 34.75" top flange, the Inv/Op rating factors are 1.495/1.938.

Using Virtis LRFR (v. 6.1 B2), w/the 36" top flange, the Inv/Op rating factors are 1.506/1.953.

FROM: Brian Goodrich DATE: 7/27/2009 9:21:54 AM Mountain Daylight Time  
Back in 2008 when I made my comments, I assumed that the new version of BRASS would have been included in version 6.1. However, it will not be. BRASS-GIRDER(LRFD) 2.0.1 was release in August 2008 and version 2.0.2 is scheduled for release in August 2009. AASHTO may release a new BRASS version with Virtis/Opis 6.2.

**Description**

FROM: Tim Armbrecht DATE: 7/31/2008 9:56:28 AM Eastern Daylight Time  
When defining PS Box-beams with circular voids strand locations cannot be placed continuously across the bottom flange of the beam. When that is attempted the strands appear in groups separated by gaps. What is the purpose? See attached word document for illustration and attached xml.

FROM: Herman Lee DATE: 8/14/2008 1:46:55 PM Eastern Daylight Time  
In the Strand Layout window, the method that used to position the strands is listed in red font at top of the schematic. Virtis/Opis Help of the Strand Layout window describes the reasons and the uses of the Original, Revised and Generic Strand Positioning Methods. If you want to have more strand locations in a row, increase the "No of Strands" in the PS Beam Strand Grid. Please note that BRASS doesn't

4/19/2016 3:21:12 PM

HRS AASHTO

2635

**Complete Issue Information**

use the Horizontal Spacing you specified in the strand grid.

FROM: Tim Ambrecht DATE: 8/15/2008 11:45:28 AM Eastern Daylight Time  
Herman,

Your response does not answer my question. We typically have strands below the voids, so why does the schematic have gaps below the voids which prevent us from modelling strands at those locations? If there is no technical reason, then the schematic should be modified to allow placement of strands underneath the voids. Also note that this is not a BRASS issue ultimately when the AASHTO engine comes online for prestressed.

I realize this is a modest issue, and that it doesn't really affect the results. However, the logic for the gaps makes no sense to me. I'm trying to help identify a (in my opinion) nonsensical issue and see if it can be simply resolved.

FROM: Herman Lee DATE: 8/19/2008 12:14:51 PM Eastern Daylight Time  
E-mail sent to Tim:

=====  
Tim,

The Strand Grid tab of the PS Box Beam doesn't have enough information to describe the exact horizontal location of each possible strand location. Are you requesting to modify the logic to evenly distribute the locations in each row of the strand grid? Or, requesting to modify the Strand Grid tab to describe the exact horizontal locations of each possible strand location? Modify the logic to evenly distribute the locations will make the schematic looks better but still cannot represent IDOT 21" x 36" Deck Beam (IDOT Prestressed Concrete Manual Page 2-59). I guess the question is how exact you would like the strand locations modeled in Virtis.

Thanks,  
Herman

=====

FROM: Tim Ambrecht DATE: 8/19/2008 3:17:32 PM Eastern Daylight Time  
Herman,

I see, so the grid tab is a generic representation and is not intended to represent a specific box beam.

Seems like it would be a waste of service units to pursue. I appreciate the clarification.

Thanks,

Tim

I wanted to get this added as an incident so it will be fixed.  
KDOT had this problem loading on 3 out of 4 laptops  
ILL had this problem on 1 out of 3 laptops  
VT had this problem on Georges laptop

So it's not an isolated problem – it needs fix'in

Below is the email volley from start to finish:

RE: Installing Stand Alone SQL 2005 Server  
Joseph Ihnat [JIHNAT@bakercorp.com]  
Friday, August 1, 2008 3:33 PM  
To: Jeff, Jim, Dean & Mehrdad

Nice work.

The ODBC connections have always been configured as User DSNs on a Virtis/Opis install.  
(The workstation versions configure as System DSNs for reasons I no longer remember.)

I don't disagree that this should be changed.

Thanks.

- Joe

>>> Jeff Ruby <JRuby@ksdot.org> 8/1/2008 4:16 PM >>>  
Jim,

I finally got it to work. The following is for documentation so that perhaps this problem will get resolved, or at least I can fix it again when it happens.

The problem appears to be mostly a Microsoft thing. Virtis/Opis installs a new instance of SQL 2005 server express. From what I can determine, it is version 9.00.2047.00 (sp1?). On some machines when SQL server express tries to install, the MSXML6 component fails to install. Virtis/Opis will not install correctly no matter what you do.

I traced the problem down to the msxml6.msi. From Microsoft's web site the file is called msxml6\_x86.msi. In order to successfully install Virtis/Opis I had to replace the msxml6.msi and add the msxml6\_x86.msi to the temporary setup subdirectory during the Virtis/Opis install on the fly.

Observations during my troubleshooting:

1) If you already have a working install as one user, when you log in as another user Virtis/Opis will not have a connection to the database. In version 5.6 there was, but not in version 6.0. And if you want to uninstall and reinstall you first need to login as the "original" user to be able to successfully uninstall SQL Server. Because if you don't uninstall SQL Server 2005 Express first, Virtis/Opis will not install.

2) I could install SQL 2005 Server Express SP2 without incident.

Recommendations:

- 1) Update the redistributable SQL Server 2005 Express to SP2 in the Virtis/Opis 6.0 install.
- 2) Configure the ODBC connection like in 5.6 so that all users on the computer can access it.

If you have any questions or comments, please let me know.

Jeff.

Cc: jihnat@mbakercorp.com; Dean Teal  
Subject: RE: Fwd: Installing Stand Alone SQL 2005 Server

Jim,

Dean gave the computer to me to troubleshoot. There wasn't any file in the location you mentioned.

During the install of the SQL stuff, there were 2 red x's before the "Send your error to Microsoft" box popped up. I didn't get a chance to save that info. It just disappeared. I zipped up the SQL log files. These are attached. I didn't see anything in the event viewer except the successful installs.

I also installed by itself the "SQL Server 2005 Express SP2" runtime. It installed successfully. During this install I identified one of the "failed" parts of the install previously. It was the top one, the MSXML6 install. I couldn't determine exactly what the other problem was.

Thanks,

Jeff

Jim,

Version 6.0 install with standalone 2005 server May be related to VI #8636

Has anybody reported install problems with standalone SQL 2005 Server?

I have had 3 out three unable to install the SQLServer 2005 On laptops that have never had Virtis installed before (getting ready for UG meeting) They would not install the SQL Server (failed) During the install of the SQL Server, it gets down to the second to the last item (SQL Server Database Services) - then it fails

My laptop and desktop that had previous versions - they work fine.

## Complete Issue Information

I split that problem off to a new incident (8868).  
In any event, he's going to try it again.

FROM: Dean Teal DATE: 3/26/2009 7:36:01 AM Eastern Daylight Time  
It would appear that we don't have this fixed yet

Using the updated CD's sent 8/28/08 I tried to install Virtis/Opis 6.0 with provided database and the SQLServer 2005 on 3 desktop pc's

At the end of the install I received a message that the server failed to start on all three pc's.

FROM: Dean Teal DATE: 3/30/2009 7:57:14 AM Eastern Daylight Time  
Below is an email and response with Jim Friday March 27th:

We will investigate...

>>> Dean Teal <Teal@ksdot.org> 3/27/2009 11:18 AM >>>  
Jim,

I held training class yesterday for HNTB's Kansas City KS and MO office. As I wrote yesterday, KDOT had another issue with the SQL Server install from the CD (the new one provided I think it was 8-28-08) and could not get the stand alone installed. We work around that by having the consultants use my network log in and we actually used our production database. Not desirable but when your in a bind you just have to make due.

I got an email from one of the HNTB engineers that was at the training yesterday. He has been unable to install the SQL database from the CD. See his email below:

We are trying to get the Virtis software up and running here but are having some problems. We get an error trying to install the SQL components but everything else seems to be working. Are there any downsides to going with any of the other database options (MS access perhaps)? If we absolutely need the SQL components we will start trying to contact the support group from Virtis to see if they can help resolve this issue. Thanks.

Mike Briggs, E.I.T.  
Bridge Engineer

I know his problem description is light on details, but I am assuming he is having the same issue I had last August and this week. I emailed him for more details - but if it is the same issue, I need a solution.

Do we have a fix for this???

Dean

## Description

FROM: Dean Teal DATE: 8/6/2008 2:26:00 PM Eastern Daylight Time

Using TrainingBridge

Opis review using BRASS LRFD

The total deck thickness is 10"

The structural thickness is 9.5"

When you review the Load Distribution file I see that the LRFD Distribution Factors are calculated on total thickness and not structural thickness.

Shouldn't it be using structural thickness and not the total thickness?

Checking or unchecking the box in the Structure Definition Analysis tab does not make any difference??

It is always using the total thickness for DF calculations.

FROM: Krisha Kennelly DATE: 8/11/2008 9:20:34 AM Eastern Daylight Time

The ts used in the distribution factor calcs is controlled by the checkbox on the Structure Definition: Analysis tab.

I'm not sure what TrainingBridge you are referring to that has a total thickness = 10" and structural thickness = 9.5" but I ran BID11, Structure Definition #1 and the RC6 training example from the user group meeting and the ts that shows up in the Dist Factor detailed calcs file varies based on the checkbox on the Structure Definition: Analysis tab.

Can you reproduce this and if so please attach the xml file.

FROM: Dean Teal DATE: 8/13/2008 4:45:50 PM Eastern Daylight Time

Used TrainingBridge1

Attached TrainingBridge1, screen shot of total thickness and structural thickness

Below is an excerpt from the Distribution file (attached) starting with line 309.

Notice that Ts=10" and not 9.5"

### Complete Issue Information

I'm sorry I didn't read the original description correctly. I thought you were discussing the new Opis RC LRFD engine since the incident was submitted during the User Group meeting. That engine does use the slab thickness based on the checkbox on the Structure Definition: Analysis tab.

The BRASS LRFD engine does not consider the checkbox on the Structure Definition: Analysis tab when determining the slab thickness to use in the LRFD dist factor calcs. This is a duplicate of 4315 and related to 2759,7874

### Description

FROM: Joseph Ihnat DATE: 8/8/2008 8:19:27 AM Eastern Daylight Time  
Received via email from Brent Long, Fisher Assoc.

I'm having some problems with Virtis 6.0. When launch the program it does nothing. It doesn't even show up as a process running. I had version Virtis 5.6 previously and I removed it before I installed the newest version. I need to run it to be able to send you the codes correct? Any Ideas to what might be wrong?

Brent is running Windows XP SP3 and Symantec Endpoint protection ver: 11.0.2010.25  
He traced the problem to a conflict with the Symantec Endpoint.  
Just disabling the protection still would not allow Virtis to run, he had to uninstall Symantec Endpoint.

I am able to reproduce this in a VM running XP SP2 and Symantec Endpoint.

FROM: Joseph Ihnat DATE: 8/8/2008 9:38:35 AM Eastern Daylight Time  
Seems to be a problem that Symantec Endpoint is having with other apps.  
I don't think there's a solution yet, but here are two workarounds. I've verified both of them.

1) Open up Registry Editor and find:  
[HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Services\SysPlant]  
Change "Start" to DWORD:00000004  
Exit and restart your system.

2) Uninstall Symantec Endpoint. Then reinstall Symantec Endpoint.  
During the reinstall, perform Custom install and unselect Application and Device Control.

Bridge file and supporting documents are attached.

FROM: Joseph Ihnat DATE: 9/18/2008 8:52:48 AM Eastern Daylight Time  
The schematic gets the spacings by calling IDoGirderSystemStructDef::ComputeGirderSpacing.  
Krisha, can you check if that function is working correctly in this case?

FROM: Krisha Kennelly DATE: 9/22/2008 10:08:49 AM Eastern Daylight Time  
Function is working correctly. When we display the girder spacing in the Structure Typical Section schematic we always display the spacing as measured perpendicular to the structure def ref line. The attached hand calcs show that the correct numbers are being displayed for G1 spacing as measured along a line perpendicular to the structure def ref line at the start of the structure. Due to the skew of support 1 the spacing is measured way out in the middle of G1 and not really at the support.

May,  
Remove the following sentence in paragraph 5 of that help topic "This view is also not available for splayed beams." Add the following sentence to the end of paragraph 5. "Girder spacings and deck overhangs displayed in the schematic are measured perpendicular to the superstructure definition reference line as shown below." Then add the attached 'StructureTypSectionSchematicHelp.vsd' below this paragraph.

FROM: Herman Lee DATE: 9/22/2008 10:51:15 AM Eastern Daylight Time

On wide top flange PS beams that have radius fillets

If you enter the correct dimensions and use the calculate button on the properties tab – you will not get the correct properties. You will get a area that is closer to a taper flange without fillets.

On a Nebraska NU78 section, the area will be off by 27 square inches. This will throw off all you other calc's that are dependent on area.

Being BRASS does not use radius fillets, we have to fudge in our numbers without a radii and trick the properties calculations into being correct.

FROM: Herman Lee DATE: 8/14/2008 7:50:35 AM Eastern Daylight Time

PS Beam Properties tab Compute button Virtis/Opis Help states that

"For prestressed I beams with curved fillets, the properties are computed assuming the curved fillets do not exist."

Following requests are identified:

1. Request the Compute button to include radius fillets.
2. Enhance BRASS to accept radius fillet as input or enhance BRASS to accept properties as input.

FROM: Herman Lee DATE: 7/12/2012 2:33:49 PM Eastern Daylight Time

### Description

FROM: Dean Teal DATE: 8/14/2008 8:19:49 AM Eastern Daylight Time

The Nominal Load (unit weight) calculated in the PS Properties tab in Library calculates the weight using 150 #/ft<sup>3</sup>

High performance deep beams like the Nebraska NU2000 (NU78) is 6.5" deep with wide top flanges. These beams are made with high strength concrete – 7 ksi to 10 ksi.

The unit weight of the concrete is more like 155 #/ft<sup>3</sup> (may have granite aggregate)

On these beams, spanning 145', this may make a difference of 2.3 kip reaction at each beam end.

We need to add an estimated concrete weight to the properties grid so we get a more accurate Nominal load value in 6.1

FROM: Tim Armbrecht DATE: 8/15/2008 11:56:55 AM Eastern Daylight Time  
Under "Stiffener Ranges", tab "Longitudinal Stiffener Ranges" for Steel Girders, the "Y" dimension is indicated as "(in)" when in fact it can be entered as either inches or a percentage of the distance between flanges (see screen image in attached file). From the Help for item "Y": "Enter the distance or percentage from the location selected in the "Measured From" column to the centroid of the longitudinal stiffener plate, as shown in the sketch."

This should be corrected on any affected data entry screens. Perhaps have it say "(in. or %)".

FROM: Herman Lee DATE: 8/18/2008 12:53:29 PM Eastern Daylight Time  
Related to Incident 2816.

### Description

FROM: Tim Armbrecht DATE: 8/20/2008 3:46:45 PM Eastern Daylight Time

We're having a couple of issues related to analysis of a Girder-Floorbeam system superstructure:

Virtis is generating a message that there are too many (46) distributed loads for BRASS to handle (max 38). We're wondering if anything in the attached model can be changed to get around that even though this girder does have a large number of section changes along its length. (Obviously it would be best if BRASS were enhanced to allow more loads, as this could be a problem for the analysis of a significant number of major bridges, which we're starting to enter into Virtis.)

In the attached model, the cantilevered floorbeam, when entered as part of a Floor System Superstructure seems to yield reasonable results (Inventory/Operating rating factors = 1.243/1.597) with the control point being at the support. However, when entered using the Floor Line Superstructure method the rating at that point drops to Inventory/Operating rating factors of 0.064/0.107. It was determined that the reason for this was that Mr, from Eqn. 10-103c, was greatly reduced. This in turn seems to have been caused by the value of Lb, which for the Floor System was 10.5', being 53.0' under the Floor Line model. Have we made some error in the input of the Floor Line model (which should be essentially the same as the Floor System), or is there a bug in Virtis that is causing this? (Attached the BRASS output files for both Floor System & Line floorbeam analyses.)

FROM: Brian Goodrich DATE: 8/26/2008 2:08:09 PM Mountain Daylight Time

There is a difference in the unbraced lengths between the system and line models. I will investigate why they are not consistent.

FROM: Brian Goodrich DATE: 3/23/2010 12:46:57 PM Mountain Daylight Time

This issue is related to Incident 5416. For a floor system, the bracing is assumed to be at those locations where stringers intersect the floorbeam. For a floor line, there is no input related to bracing. Should we assume that the main girder provides bracing?

FROM: Tim Armbrecht DATE: 3/25/2010 9:10:59 AM Eastern Daylight Time

From my consultant:

4/19/2016 3:21:16 PM

HRS AASHTO

2659

## Complete Issue Information

Virtis doesn't provide for manual input of lateral bracing points for floorbeams. However, I had thought that to get reasonable results entering top flange support for the full length of the floorbeam under "Lateral Support" would work. That was done for the line floorbeams in the bridge model we provided for this incident. (I was not previously aware that the stringers in a GFS system are being automatically used as bracing points.) However, we should definitely be able to enter lateral bracing points for line floorbeams. The main girder could be assumed to provide bracing but if we had a way to manually enter the bracing points we would naturally enter them there. The latter is what I recommend since that would be consistent with the way bracing is entered for longitudinal beam lines. I don't think we should have both a manual and an automatic entry of main girders as bracing points.

Somewhat related, Virtis should allow for entry of cantilevered floorbeams in Truss-Floorbeam systems, just like it already does in Girder-Floorbeam systems.

Also, what about the first issue brought up regarding "too many distributed loads"? Is there any workaround available?

FROM: Brian Goodrich DATE: 4/15/2010 2:21:00 PM Mountain Daylight Time  
The number of distributed loads request is already on the BRASS enhancement list. I did forward your request to add your name to the other users making this request.

FROM: Brian Goodrich DATE: 5/5/2010 1:36:04 PM Mountain Daylight Time  
E-mail from Mike Watters:

I will add this to my documentation for Enhancement Requests. The users will need to prioritize this request.

FROM: Dean Teal DATE: 8/27/2008 2:45:00 PM Eastern Daylight Time  
 I wanted to get this issue logged into VI for tracking purposes:  
 I have copied the email trail below.

Dean,

We are fixing this issue and we will send you one or more DLLs in a couple of days so that you can verify that the fix resolves the problem. In the meanwhile, the only way to avoid this problem is to check-out the bridges that you want to open, export, rate, or copy.

Thanks,  
 Mehrdad

## Complete Issue Information

>>> Mehrdad Ordoobadi 8/25/2008 5:51 PM >>>  
Dean,

I got the database and imported it into our Oracle Server. I was able to reproduce the problem. I tracked down the problem and have corrected it for the next version of Virtis/Opis release (6.1.0). This fix can be included in the 6.0 Service Pack 1.

Thanks,  
Mehrdad

>>> Janette McGrath <janette@ksdot.org> 8/25/2008 4:00 PM >>>  
The .zip file is in the Incoming/KSDOT/ folder.

Subject: RE: Virtis Problem

Dean,

My suggesting the possibility of problems with Points of Interest was a wild guess that does not seem to be the case. Since we weren't able to reproduce the problem, we will need to get a copy of your Oracle database to be able to investigate this problem further.

Jan, could you please send us an export dump of your Virtis/Opis database? Please export the database and compress it using WinZip and copy it to our FTP site at ftp.mbakercorp.com (username/password is hrsdept/jetta). Please put the file in the Incoming/KSDOT/ folder.

Thanks,  
Mehrdad

>>> Dean Teal <Teal@ksdot.org> 8/25/2008 2:41 PM >>>  
I have never gotten the error message you are talking about.  
I ran the POI Integrity Scanner on our current production test server – it returned with “no POI issues were discovered”.  
Therefore nothing to fix?

Back in version 5.5 (I think, or testing 5.6) we had a problem with the POI wizard overlapping when it had POI's for both LFD and LRFD. Could this be related?

You are correct that this is only happening with our RC Schedule based bridges.

## Complete Issue Information

I have never gotten the message you are referring to?

Being I have never gotten the message you reference, should I run this utility in an attempt to fix this error?

Being I didn't have this issue until version 6.0, is this something that should have been taken care of in the migration from 5.6 to 6.0?

Dean

Subject: RE: Virtis Problem

Dean,

I was not able to reproduce the problem. But I noticed that the bridge is a RC schedule-based bridge. When you start Virtis/Opis do you get a message stating:

"There are XXXXX inconsistent rows in table abw\_anal\_pt\_conc\_reinf.

Please run the POI Integrity Scanner utility program to review and correct the issues.

Refer to the POI Integrity Scanner Help located inside the Windows Start Menu's Virtis-Opis program folder for more information."

If you get the message, I suspect that the inconsistent rows in table abw\_anal\_pt\_conc\_reinf may be the cause of the problem that you are experiencing. You should run the POI Integrity Scanner utility program.

Please let us know what you find out.

Thanks,  
Mehrdad

### Complete Issue Information

As I stated in my email I understand that you have trouble copying and opening the bridge. In order for us to reproduce the problem, I will need to get an XML export of the bridge. As part of exporting the bridge the bridge is retrieved from the database (uses the same functionality as when you open a bridge). So since the opening of the bridge fails when the bridge is not checked-out, the exporting of that bridge will also fail (that's what I expected, because opening of the bridge failed). So In order to successfully export your bridge I would like you to do the following:

- 1 - Check Out the bridge
- 2 - Export it with either batch export or single bridge export.
- 3 - Send the bridge export XML file to us.

Thanks,  
Mehrdad

>>> Dean Teal <Teal@ksdot.org> 8/25/2008 1:03 PM >>>

I think you misunderstood the problem.

I am not trying to export a bridge

I can't open or make a copy of the bridge unless it is checked out.

I did try to export this from the explorer window and got an error message stating "Cannot add to bridge description because all or part of description is read only."

Dean

Could you please send us an XML export of the bridge that you have trouble opening and copying? If the export fails as it does when you open the bridge, you may need to check the bridge out then export it.

Thanks,  
Mehrdad

>>> Dean Teal <Teal@ksdot.org> 8/25/2008 12:33 PM >>>

Jim,

I am not able to open or copy a bridge in our database unless it is checked out.

Example:

This bridge is not checked out, but I do have check out privileges

When I try to open it I get

4/19/2016 3:21:16 PM

## Complete Issue Information

I get the same message if I try to make a copy of it

My oracle database administrator (Jan McGrath) does not know what to look for. No error messages have been created by the database. It appears to be an application problem??

I am fairly sure that this worked last week being I did some one on one training with a user.

Comments/suggestions?

Dean,

We have fixed the problem that you reported (Virtis/Opis issue 8866). The fix affected four DLLs that we have placed on our FTP site in the <ftp://ftp.mbakercorp.com/Outgoing/KSDOT/> folder.

ABGPRST1.DLL  
ABGRC1.DLL  
ABOBRDG.DLL  
ABOCNCB.DLL

4/19/2016 3:21:16 PM

HRS AASHTO

### Description

FROM: Joseph Ihnat DATE: 8/29/2008 9:19:06 AM Eastern Daylight Time

When SQL Server is already installed, Virtis/Opis installation may fail to configure the ODBC connections.

This happens because the installation does not know the sa password.

Workaround is to manually configure the ODBC connections.

FROM: Dean Teal DATE: 8/29/2008 10:54:37 AM Eastern Daylight Time

Was this with the new disk that was just sent out to KSDOT, ILDOT, VADOT and VTRANS?

FROM: Joseph Ihnat DATE: 8/29/2008 12:30:59 PM Eastern Daylight Time

The new disk did not address this problem.

This has probably always been an issue, it's just that we are more likely to see it now because SQL Server 2005 requires "sa" to have a password.

Prior to this "sa" was permitted to have a null password.

FROM: Joseph Ihnat DATE: 5/28/2009 7:36:25 AM Eastern Daylight Time

Fixed for version 6.1.0

The installation now establishes a Trusted Connection, instead of using the sa login.

**Description**

FROM: Herman Lee DATE: 9/22/2008 12:01:49 PM Eastern Daylight Time  
Unable to open G2 Supports window in AS-BUILT (Span 3 - Span 4). A "workaround" is to change the span length from 71.9271' to 71.9270' in AS-BUILT (Span 3 - Span 4).

**Developer Notes:**

ISupportId in CSupportConstraintBeamGeneralDlg Line 684 returns 0.

**Line 684:**

ISupportId = m\_DoGirderMbrPtr->GetSpanRightSupportId(iSupport - 1);

FROM: Krisha Kennelly DATE: 9/23/2008 9:04:51 AM Eastern Daylight Time  
I think the best that we can do for this problem is to use the workaround. If you just open the Structure Def window and re-type in the 71.9271' or 71.927083' for the first span length you will then be able to open the Supports window for G2. Making that change causes the coordinate geometry to be re-computed.

Due to the support skew, varying deck overhang and varying girder spacing I think there is a teeny tiny little error introduced into the generated coordinate geometry for the reference line for G2 that causes it to be a tiny bit shorter than it should be so line 684 above can't find the intersection of G2 with the last support.

G2 ref line length when you can't open the Supports window: 43.8689723309977 m  
ref line length after you reset the span length: 43.8689748984 m

**Description**

FROM: Dean Teal DATE: 9/30/2008 2:25:27 PM Eastern Daylight Time  
I am creating a Bridge Explorer Report using 3 Bridge List Attributes (Bridge ID, Bridge Name and Year Built).  
Using Bridge Id as the first item

Our bridge Id is made of CCC-SSS  
Where CCC is a 3 digit county number  
Where SSS is a 3 digit serial number

No matter what order I have the Bridge Explorer sorted in, the report always generates the report by the ascending BID number.

Are there any controls for sort order?

FROM: Herman Lee DATE: 10/1/2008 1:32:14 PM Eastern Daylight Time  
There's no control of the sort order in the Bridge Explorer Report.

FROM: Dean Teal DATE: 10/7/2008 3:10:50 PM Eastern Daylight Time  
To bad!

 Bridge Workspace

When there are multiple superstructure definitions, using the report tool, you will get a report on all of them and not just the one you have focus on. Is there any way to work around that?

FROM: Herman Lee DATE: 10/1/2008 1:58:45 PM Eastern Daylight Time  
 There is no workaround to just report the one you selected.  
 Duplicate of Incident 4057 and 8885.

### Description

FROM: Mehrdad Ordoobadi DATE: 10/3/2008 11:51:00 AM Eastern Daylight Time  
This issue is reported on behalf of Christopher Laughlin from FDOT.

Steps to reproduce the problem:

- 1 - Import the attached BBD file. (5.3.1 format)
- 2 - Open the Superstructure Alternative window (Flat Slab)
- 3 - Switch the Superstructure Definition from Flat Slab to None.

4/19/2016 3:21:19 PM

### Complete Issue Information

We just started getting another POI Integrity error. This is on a bridge that was started some time ago and modified recently. It might have been started in version 5.6. Anyway, we are using version 6.0 now and didn't see the error until the bridge got modified under 6.0. The scan utility cleaned the database of errors when we migrated to 6.0. I am enclosing an export of the bridge in question. Screen prints of the error message and the POI integrity scanner are below. (ATTACHED)

Cc: Jim Duray  
Subject: Re: POI Integrity error

Richard,

I imported the bridge XML file export that you sent me. But I was not able to reproduce the problem that you are having. I am wondering if you could send me a copy of your database?

Also, do you know what happened to the bridge? Do you know what changes were made to the bridge that caused the bad POI data?

Thanks,

Mehrdad

I have uploaded the database in question to [ftp://ftp.mbakercorp.com/Outgoing/Virtis/IL\\_DOT/](ftp://ftp.mbakercorp.com/Outgoing/Virtis/IL_DOT/). Bob Perkins is the one who last modified structure 0160759. Here is his comment:

FROM: Herman Lee DATE: 10/14/2008 7:48:14 AM Eastern Daylight Time  
Submitted on behalf of Laura Volle, Michael Baker Jr., Inc.

The exported haunch load is 0.015104 k/in for the G1 girder in the attached bridge.

The hand calculated haunch load is 0.01224 k/in.

### Complete Issue Information

$$\begin{aligned} \text{Haunch Area} &= (Y1 + Y2) \times \text{Top Flange Width} / 2 + Y2 * Z4 / 2 \\ &= (3.5 + 2.5) \times 42 / 2 + 2.5 * 12 / 2 \\ &= 141 \text{ in}^2 \end{aligned}$$

$$\begin{aligned} \text{Haunch Load} &= 141 \text{ in}^2 * 0.150 \text{ k/ft}^3 \\ &= 0.01224 \text{ k/in} \end{aligned}$$

FROM: Brian Goodrich DATE: 10/15/2008 6:27:11 AM Mountain Daylight Time  
The export calculates the haunch area as:

$$\begin{aligned} A &= 3.5 * 42 + (3.5 + 1.0) * 12 / 2 \\ &= 174 \text{ in}^2 \end{aligned}$$

See the attached bitmap (Haunch.bmp).

FROM: Dean Teal DATE: 10/24/2008 11:05:20 AM Eastern Daylight Time

Currently we know the steel volume for studs and stiffeners.

The DL from these items are not calculated and used inside VO, they should be!

Splice Plates – We can enter splice plate locations but not sizes. We should either allow for entering the size for DL calculations OR provide a field to enter the DL in that GUI.

### Description

FROM: Dean Teal DATE: 11/5/2008 9:19:24 AM Eastern Standard Time

Attached pdf of framing plan

Attached xml export

Attached jpg of Framing Plan Screen shot

This skewed structure is supposed to have a diaphragm at the end of the last span. According to the input, one should be placed at 66' (end of span 3).

The Schematics does not show one at the end of span 3.

FROM: Xinmei Li DATE: 11/5/2008 9:54:04 AM Eastern Standard Time

In Virtis input, Structure Framing plan details, diaphragms, last row support number 3, Diaphragm spacing is 18.6667 ft, number of spaces is 3, the result location of the last diaphragm is  $18.6667 \times 3 = 56.0001$  ft + 10 ft (start distance) = 66.0001 ft > span length 66 ft.

So the location of the last diaphragm is beyond the end of span 3. If you change the Diaphragm spacing to 18.6666 ft for all girder bays, the end diaphragm will show up in the framing plan Schematics.

FROM: Dean Teal DATE: 11/5/2008 12:53:26 PM Eastern Standard Time

Shouldn't that have triggered an error message stating that it was off the end of the beam?

## Complete Issue Information

From: Bridgeware [mailto:Bridgeware@mbakercorp.com]  
Sent: Wednesday, December 03, 2008 12:01 PM  
To: Chao, Tsemin B.  
Subject: RE: Load Factor Rating Calculations for Concrete Tension Control

Hi Billy,

The  $I_y$  calculated by Virtis used in the  $I_p$  in LRFD Equation C4.6.2.2.1-2 is  $25196.7 \text{ in}^4$ . Please send us your calculation for the investigation.

The  $J$  is used only for the calculation of the LL distribution factors. There is no particular reason to use the LRFD equation. The LRFD has one more equation than the LFD. Please note that the user can enter/override the  $J$  value.

Herman

>>> "Chao, Tsemin B." <ChaoTB@dot.state.sc.us> 12/3/08 10:13 AM >>>  
Herman,

How was your Thanksgiving holiday? I am sorry that I am here bothering you again. The following was my calculation of the moment of inertia about the prestressed channel beam which we discussed before.

Area:  $341.451 \text{ in}^2$   
Perimeter:  $134.9782''$   
Centroid:  $(14.25, 12.397, 0)$

Moments of Inertia:  $(9821.46, 44300.8, 54122.3)$

Principal Moments:  $X = 9821.46$   
Principal Moments:  $Y = 44300.8$   
Principal Moments:  $Z = 54122.3$

Radii of Gyration:  $(5.3632, 11.3905, 12.5899)$

The calculation result is very close to the Virtis program's calculation (cross section area =  $341.75$  and  $I_{x-x} = 9841.18$ ). However, the St. Venant torsional constant calculation ( $341.45^4 / (40 * 54122.3) = 6278.7$ ) based on LRFD 4.6.2.2.1-2 was much different from Virtis' computation ( $J = 9732.77$ ). Would you please verify this for me?

Besides the question above, why is LRFD C4.6.2.2.1-2 equation used in Virtis for LFD analysis? Is there any particular reason that the Virtis program was written in this way? As far as I know that analysis performed by mixing design codes is not permitted.

Thanks again for your help and wish you a Merry Christmas!

T. Billy Chao, P.E.

Subject: RE: Load Factor Rating Calculations for ConcreteTensionControl

Billy,

Virtis doesn't use 3.23.4.3 in Std Spec to calculate J for tee beams.  
Virtis uses AASHTO LRFD Equation C4.6.2.2.1-2 to calculate J for tee beams.

Herman

>>> "Chao, Tsemin B." <ChaoTB@dot.state.sc.us> 11/24/08 11:43 AM >>>  
Herman,

Would be please verify the program calculation on St. Venant torsion constant (J = 9372 in^4). Based on the equation  $J = 1/3 * \text{Sum of } (b*t^3)*(1-0.630*(t/b))$  in 3.23.4.3, it seems the program calculated J value is quite big than it supposed to be.

This year due to our budgetary cut, we did not get a chance to joint the conference. Hopfully, next year either Mark or I would joint the meeting in Denver. We are looking forward to it.

=====

FROM: Xinmei Li DATE: 10/22/2009 11:18:33 AM Eastern Daylight Time  
When calculating MOI about y axis the self MOI about x axis was used. This error caused wrong results of Polar MOI calculation and St. Venant torsion constant calculation.  
This error occurs to Tee beam with one tee and 3 tee, too. All are fixed now.

The new St. Venant torsion constant calculated by Virtis is 6293.568 which is close to hand calculation.

FROM: Jim Duray DATE: 5/6/2010 9:00:58 AM Eastern Daylight Time  
I assume this is about the calculation being done int he PS Tee Beam window, not the BRASS or AASHTO engines. I found the changes in the window code.  
Verified - 6.2 alpha 4.

What kind of database are you using? Is it SQL Server, or Oracle? What version?

Could you please give us the debug description of the error.

FROM: Mehrdad Ordoobadi DATE: 2/11/2009 10:11:27 AM Eastern Standard Time  
Similar issues have been reported when using a SQL Server database

Debug Description of the Error:  
Unable to save Bridge data!  
11:39:57 AM - Line 884 in source file .\UiBWSDoc.cpp.

Saving New and Modified objects failed while processing CDmPsPrecastStrandLayout (SaveOrder object 562).  
11:39:51 AM - Line 448 in source file .\DmBridgeCache.cpp.

Error updating database record set.  
11:39:51 AM - Line 993 in source file .\DmPsPrecastStrandLayout.cpp.  
State:37000,Native:8023,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]  
The incoming tabular data stream (TDS) remote procedure call (RPC) protocol stream is incorrect.  
Parameter 13 (""): The supplied value is not a valid instance of data type float. Check the source data for invalid values. An example of an invalid value is data of numeric type with scale greater than precision.

This is due to too much accuracy in some double precision fields in the abw\_ps\_precast\_strand\_layout table. The value for left and right harp point distances have too much accuracy. The SQL server database cannot store them.

For example Virtis/Opis is trying to put a value of 6.748272000000001 into the left and right harp point distance, and the SQL Server database cannot handle it.

FROM: Mehrdad Ordoobadi DATE: 10/8/2009 12:51:45 PM Eastern Daylight Time  
The problem is tracked down to values in the Strand Layout object for radii of curvature that were too small "5.389869678000e-313#DEN".

In order to resolve this issue we need to revise the DeDouble and DeFloat little buckets to change the values to 0.0 if smaller than the smallest for double (1.7E-308) and float (3.4e-38) data types.

This will avoid similar situations in other places in the future.

FROM: Mehrdad Ordoobadi DATE: 11/11/2009 4:07:09 PM Eastern Standard Time  
DeDouble and DeFloat::SetValue and ::InitValue revised.

Verified that the fix resolves this issue.  
Fixed for 6.2

When trying to save new bridge files in Virtis, numerous users are reporting the following error.

"Saving New and Modified objects failed while processing CDmBridge(SaveOrder object 53)"

See the attached file for a screenshot of the error message.

FROM: Mehrdad Ordoobadi DATE: 3/19/2009 10:17:26 AM Eastern Daylight Time  
This problem was reported by Mike Farron and was addressed by e-mail correspondence shown below:

>>> "Mike Farron" <mfarron@dot.state.ny.us> 01/23/09 2:17 PM >>>  
Hi Mehrdad,  
Our virtis users have been reporting that they are getting an error in virtis for the last day or so.  
I was wondering if the attached might look familiar or you might have some advice off the top of your head as to what may need attention, or if we've hit some limitation of some sort.

Thank you very much.

Mike,

We found the source of the problem that you reported, and we have already fixed it. This required source code changes. We are going to send you a DLL (ABMBRDG.DLL) that contains the fix. This bug does not affect anything other than creating new bridges. Without this revised DLL, Virtis/Opis users will not be able to create new bridges (as they have already experienced).

We are going to do some testing and send you the revised DLL tomorrow.

Thanks,  
Mehrdad

>>> "Mike Farron" <mfarron@dot.state.ny.us> 1/26/2009 11:53 AM >>>

Mehrdad,

As you might recall we have 2 databases for virtis/opis.  
Do you have any idea why we haven't encountered this same problem in our other database (orp4) ?

Regarding the .dll you mentioned. Will that need to be applied to all client machines where Virtis/Opis is installed ?

## Complete Issue Information

Mike,

The problem was due to the way we computed the next ID for the overflow\_id in the abw\_overflow table. The code mistakenly assumed that the field is a short integer (-32768 to +32767). Since your last overflow\_id was 32767 the next ID will go beyond the limits of a short integer and it returns a -32768 which is an unacceptable ID in the Virtis/Opis code. The reason that creating new bridges fails in one database but not the other one (ORP4) is that the overflow\_id has reached its limit in the one that you have problem with, but not in ORP4.

Thanks,  
Mehrdad

>>> "Mike Farron" <mfarron@dot.state.ny.us> 1/26/2009 12:10 PM >>>

That makes sense.

Thanks.

Regarding the .dll will it need to be applied to all client machines ?

-----  
Michael Farron  
Oracle Database Administration  
NYS Dept of Transportation  
50 Wolf Road  
Albany, NY 12232  
(518) 485-0171

>>> Mehrdad Ordoobadi 1/27/2009 8:34 AM >>>

Mike,

Yes, the DLL needs to be applied to all client machines. But before doing that I would like someone in NYDOT to try it to make sure it fixes the problem with creating new bridges.

Which version of Virtis/Opis are you using? Are you using 6.0?

Thanks,  
Mehrdad

>>> "Mehrdad Ordoobadi" <MORDOOBADI@mbakercorp.com> 1/27/2009 9:32 AM >>>

Mike,

The revised ABMBRDG.DLL file is now placed on our FTP site at  
<ftp://ftp.mbakercorp.com/Outgoing/NYDOT/> username/password is hrsdept/jetta.

Please do this on one machine first.

4/19/2016 3:21:22 PM

HRS AASHTO

2705

**Complete Issue Information**

- 1 - Shutdown Virtis/Opis application if it is running.
- 2 - Rename the original ABMBRDG.DLL to ABMBRDG.DLL-ORIG in the folder where Virtis/Opis is installed.
- 3 - Copy the ABMBRDG.DLL file from the FTP site to the folder where Virtis/Opis is installed.
- 4 - Launch Virtis/Opis and connect to the database that you had problem adding new bridges to.
- 5 - Create a new bridge.
- 6 - Save

Please let me know how it goes.

Thanks,  
Mehrdad

>>> "Mike Farron" <mfarron@dot.state.ny.us> 1/27/2009 9:44 AM >>>

Will do .  
Thanks Mehrdad

FROM: Doug Horton DATE: 2/10/2009 2:18:58 PM Eastern Standard Time

Just received same error reported in Incident 8939 when using version 5.6. Occured for two structures, then stopped. Was able to successfully upload several other structures.

FROM: Mehrdad Ordoobadi DATE: 2/10/2009 3:02:59 PM Eastern Standard Time

Doug,

What kind of database are you using? Is it SQL Server, or Oracle? What version?

Could you please give us the debug description of the error.

Could you please attach an XML export of the bridge, if it is different from the Incident 8939.

Thanks,

Mehrdad

FROM: Doug Horton DATE: 2/11/2009 7:56:28 AM Eastern Standard Time

Database is Oracle 10 - not sure of version

Debug description and two files that provided error are attached for review.

Note: Only these two out of over 40 files resulted in this error.

FROM: Mehrdad Ordoobadi DATE: 2/11/2009 10:07:51 AM Eastern Standard Time

The error was due to a large value for the Year Built field in the Bridge/Description window. The value was 14899. The field allows for up to 4 digit year values. I changed the value to 1899 and was able to save successfully.

Note that this problem is different from the problem reported in issue 8939 in IssueNet.

### Description

FROM: Joseph Ihnat DATE: 2/12/2009 8:46:35 AM Eastern Standard Time

1) I installed Virtis 5.4 with MSDE databases, then installed Virtis 6.0 (SQL Server 2005) and attempted to migrate our sample database from 5.4 to 6.0. Got error:

Unexpected error while executing "...\RemoveOrphanedBeamDefs.exe" "BRIDGEWARE" "bridgeware" "VIRTIS54\_SQLSERVER".

2) I clicked "Ignore" but migration then ended.

3) The View Log button at the end of the migration did nothing. I had to open the log file from Windows Explorer.

If you do the migration in two steps (5.4 to 5.5, 5.5 to 6.0) it works OK.

FROM: Mehrdad Ordoobadi DATE: 3/19/2009 10:30:34 AM Eastern Daylight Time

3) The file in the list box should be selected before clicking the view log button. We probably should make the button disabled when a file is not selected.

### Description

FROM: Dean Teal DATE: 2/26/2009 9:47:24 AM Eastern Standard Time

All of our RC slab structures have rebar that starts 1' left of the member and ends 1' right of the member.

See export of RCSH 48-64-48 structure and see jpg of GUI named "Bar off Member prior to 6.0"  
Notice that for Set 1, 2 3 25, 26 & 27 – the bars start left of the member and end right of the member.  
This structure was created prior to version 6.0

Now in 6.0

I created the same situation with the bar starting left of (before) member.

See export Validation Error.xml

This is not allowed now in 6.0, I get a Validation Error that will not let me continue until I move the bars onto the member. See jpg "Bar off Member Validation Error"

I can model it this way "IF" I copy over a pre-existing RC Slab and modify it. But I cannot start a new

4/19/2016 3:21:23 PM

HRS AASHTO

2711

**Complete Issue Information**

bridge and continue.

Re-Steel is modeled this way to obtain anchorage. I have to hook the bars on the ends that extend into the abutments. The hook is a work around being we cannot indicate fully developed on one end only.

FROM: Krisha Kennelly DATE: 2/1/2010 3:48:05 PM Eastern Standard Time  
In the Validation Error.xml file, the end bearing locations are entered as 1.25 inches on the Member alt Window. This is the distance the beam extends past the cl bearing. The rebars are entered as extending 1 foot past the cl bearing. The inches vs. feet discrepancy is causing the error. Enter the end bearing locations as 15" and the rebars can be extended past the cl bearing.

### Description

FROM: Rich Schoedel DATE: 4/2/2009 8:37:59 AM Eastern Daylight Time  
Pressing Alt+Letter shortcuts does not operate correctly in the Floorbeam Definition Window, Description Tab. For example pressing Alt+A should take the cursor to the ASD drop down menu and it does not. The same thing occurs for all underlined text on this window tab.

FROM: Joseph Ihnat DATE: 4/6/2009 10:40:11 AM Eastern Daylight Time  
Changed Folder to Support Center.  
Probably been like this for a while. Factors tab was similar.  
Fixed for version 6.1 (Alpha Build 2).

FROM: Xinmei Li DATE: 5/28/2009 3:15:13 PM Eastern Daylight Time  
Verified fixed for 6.1 Beta1.

**Description**

FROM: Herman Lee DATE: 4/5/2009 11:07:41 AM Eastern Daylight Time  
Submitted on behalf of Chris Dombrowski, Williams & Works.

This incident is for the member alternative copy issue. Incident 9027 is for the G3 array size error.

Received Bridgeware e-mail:

=====

Please see the attached .xml file. I previously sent a version of this file which had an array size error (See Virtis Incident 8992). As a workaround to this error, I have separated the file into 3 separate superstructures to reduce the array size and get the girders to run.

For the superstructure definition "WB Spans 9-15 (Continuous Pin and Hanger)", I was able to enter girder G2 and get it to run. However, when I copied the information to girder G3 and adjusted the properties for the different span lengths, I received an array size error when I tried to run G3. The only differences between G2 and G3 are the span lengths and plate girder flange thicknesses for Spans 1 and 5. Spans 2, 3, 4, 6, and 7 are exactly the same. Can you tell me why I am getting an array size error on one girder and not the other?

Also, when I copied the data from G2 to G3 Virtis recalculates all of the start distances. For example, the transverse stiffener spacings for Spans 2, 3, 4, 6, and 7 are exactly the same for Girders G2 and G3. However, when I copy the member alternative Virtis changes all of the start distances for the transverse stiffeners in these spans. Therefore, I had to retype all of the stiffener spacings for G3. Virtis also changes the distances for the hinge locations and deck reinforcement. Can you tell me how to copy the member alternative without having Virtis change the start distances for these spans?

Thank you,

CHRISTOPHER DOMBROWSKI, PE  
Project Engineer

## Complete Issue Information

=====

FROM: Joseph Ihnat DATE: 4/10/2009 10:32:41 AM Eastern Daylight Time  
When ranges are entered, the start distance is from a particular support.  
However, the start distance is actually stored as the distance from the first support.  
Because the length of span 1 is different for G2 and G3,  
the start distances are being displayed differently.

FROM: Joseph Ihnat DATE: 11/12/2009 2:24:14 PM Eastern Standard Time  
When copying a member alt to a member that has different span lengths,  
a message will now pop up to alert the user that the ranges will need to be adjusted.  
Done for version 6.2

Alt+ shortcuts not consistently applied in Floorbeam Definition Window, Factors Tab

There is an Alt+ shortcut for the LRFD factors and LFD factors but not for the LRFR factors. Assign R or F to LRFR.

FROM: Joseph Ihnat DATE: 5/12/2009 2:08:06 PM Eastern Daylight Time  
Shortcuts L,R,F are already being used.

FROM: Rich Schoedel DATE: 5/13/2009 1:18:21 PM Eastern Daylight Time

4/19/2016 3:21:25 PM

HRS AASHTO

2722

### Complete Issue Information

Then perhaps some reassignment is needed. LFD could use "D". LFD factors could use "a". Then LRFR could use "F". and LRFR factors could use "t" or something like that.

FROM: Joseph Ihnat DATE: 5/13/2009 2:12:28 PM Eastern Daylight Time

I don't think we should change shortcuts that have been in use for years.

It's a fact of life that not every field in the UI has a shortcut. Just shortcut to the nearest field and then tab.

## Description

FROM: Keith Turner DATE: 5/11/2009 11:39:10 AM Eastern Daylight Time  
Open "FSys GFS TrainingBridge1"; under MEMBER DEFINITIONS, FLOORBEAM DEFINITIONS, Floorbeam Def 1, Click on Stiffener Ranges. It will open but then immediatiely close, not allowing the user to see anything within the window.

FROM: Joseph Ihnat DATE: 5/12/2009 10:16:19 AM Eastern Daylight Time  
To reproduce, add a steel angle shape to the bridge.  
Then open Stiffener Ranges as above. On the Logitudinal tab add a row to the Angle grid, click OK, try to reopen window.  
It looks like it's been like this for a while. Changed Folder to Support Center.  
Fixed for version 6.1.0 (Alpha Build 4).

FROM: Xinmei Li DATE: 5/28/2009 3:25:57 PM Eastern Daylight Time  
Verified fixed for 6.1 Beta1.

**Description**

FROM: Keith Turner DATE: 5/11/2009 11:59:43 AM Eastern Daylight Time  
Create a Detailed Steel Truss for a New Floorbeam Definition. Select the Truss Member Cross Sections folder. Select Built-Up Section. When changing the width of the columns within the angle description table (the one in the bottom left corner), the bug occurs right when the width changes so that the word "Leg" or "Thick" wraps down to the second line, within the cell. As you can see the The respective words mash with the defined units "(in)" to make that part of the cell illegible.

FROM: Joseph Ihnat DATE: 5/12/2009 8:06:04 AM Eastern Daylight Time  
It looks like it's been like this for a while. Changed Folder to Support Center.  
This window is shared with steel builtup cross section. Changed Subject of this incident from "Truss Member" to "Builtup".  
Fixed for version 6.1.0 (Alpha Build 4).

FROM: Xinmei Li DATE: 5/28/2009 3:25:22 PM Eastern Daylight Time  
Verified fixed for 6.1 Beta1.

### Description

FROM: Paul Jensen DATE: 5/14/2009 11:56:17 AM Eastern Daylight Time

we have found when a user changes from english to si, the screen dose not behave correctly. when the user make the switch to si from english, the hover on the strand reports the location correctly. the screen that reports the harp locations dose not change to the si value. when the user switchs back, the harp locations (and all of the values on the leftside of the screen) convert to the english values.

summary- the witch from english to si dose not convert the area in the gray areas, but dose when you change back to english. durning our training, had half of the systems work correctly with others not working correctly. the only differences, is having 2007 office program(s) open [power point, word].

the systems was using the installed sqlserver express, sample database and program from the production cd.

|------|---------------|---------|

**Description**

FROM: Richard Withers DATE: 5/20/2009 10:33:51 AM Eastern Daylight Time

We have recently upgraded our database from 5.4 to 6.0. After running an LRF rating, I can't save the results to the database. I get the following error message:

"Error updating database record set.

03:20:15 PM - Line 432 in source file .\DmLrfdSpecCheck.cpp.

State:23000,Native:2291,Origin:[Oracle][ODBC][Ora]

ORA-02291: integrity constraint (PONTIS.R\_2214) violated - parent key not found "

It appears that the table "PONTIS.R\_2214" does not exist in our database. The migration log shows that everything was updated successfully.

All other functions, including saving LFD ratings to the database, are working.

## Complete Issue Information

FROM: Mehrdad Ordoobadi DATE: 5/29/2009 9:40:03 AM Eastern Daylight Time  
R\_2214 is a foreign key it is not a table.

It appears that there may be some records missing in the abw\_lib\_spec\_article table.  
Could you please ask your Oracle Database Administrator (DBA) to send us the result of the following queries:

```
set linesize 255;  
set pagesize 800;
```

```
SELECT major_version_num, minor_version_num, patch_num, build_num FROM abw_sys_database;
```

```
SELECT maintenance_keyword, name, development_timestamp FROM abw_sys_db_maintenance  
order by development_timestamp, maintenance_keyword
```

```
SELECT maintenance_keyword, stage_keyword , name, maintenance_stage_timestamp FROM  
abw_sys_db_maintenance_stage ORDER BY maintenance_stage_timestamp;
```

```
SELECT count(*) from abw_lib_spec_article;
```

```
SELECT spec_id, spec_article_id, spec_article_reference FROM abw_lib_spec_article ORDER BY  
spec_id, spec_article_id;
```

To: Bridgeware,

Subject: RE: Virtis/Opis issue 9172 - Unable to save LRFR rating to database

Attached is the bridge that I can't save the rating for. It is the only bridge that I have run the LRFR spec on.

Richard

((Attached file: MDOT\_LRFR\_29\_01290.xml))

FROM: Mehrdad Ordoobadi DATE: 6/10/2009 1:58:28 PM Eastern Daylight Time  
Verified the contents of the `abw_lib_spec_article` table and it is correct.  
Imported the attached XML file and ran an LRFR analysis. I was not able to reproduce the error.

### Description

FROM: Tim Armbrecht DATE: 5/21/2009 2:24:37 PM Eastern Daylight Time

The attached files are giving us an error message as described below when trying to run from Bridge Explorer. Note that we attempted to analyze them on a different machine. 0108302 & 0108303 originally produced the error message, but after running on a separate machine, we were able to run the structures, and then run them on the original machine. However for 0108340 & 0108341, we got the error message on both machines.

FROM: Tim Armbrecht DATE: 5/29/2009 10:47:35 AM Eastern Daylight Time

Tacking on to this incident. I tried to run a batch export, and three structures wouldn't export because they weren't checked out. the others that successfully exported were also not checked out. the log is as follows. If you need the xmls of any of the files, let me know.

FROM: Mehrdad Ordoobadi DATE: 9/18/2009 10:25:50 AM Eastern Daylight Time  
We were not able to reproduce this issue with any of the XML files in Versions 6.0 or 6.1.

FROM: Mehrdad Ordoobadi DATE: 9/18/2009 10:39:10 AM Eastern Daylight Time  
Using an old database from IDOT I noticed similar issues when opening bridge BID = 1878. The bridge does not open and gives these errors:

Unable to retrieve bridge object!  
Incomplete retrieval of data.  
Incomplete retrieval of data.  
Incomplete retrieval of data.  
Incomplete retrieval of data.  
Cannot add to bridge description because all or part of description is read only.  
Bridge or Structure Definition is not checked-out!

When I check-out the bridge I am able to open it.

FROM: Mehrdad Ordoobadi DATE: 9/18/2009 11:26:04 AM Eastern Daylight Time  
This is reproducible in 6.0 but not in 6.1. (Opening the bridge 1878)  
In the migrated IDOT database bridge 1878 opens successfully without being checked-out. LFD analysis of the bridge from the bridge explorer is successful.  
See attached screenshot.

FROM: Mehrdad Ordoobadi DATE: 9/18/2009 12:39:13 PM Eastern Daylight Time  
Not reproducible in 6.1.0 Acceptance build.  
This issue appears to be resolved in 6.1 Acceptance build.

Submitted on behalf of George Khury (gkhury@bheng.com).

Received bridgewater e-mail:

=====

Joe

As per our conversation, attached is a zip file for the agency library (NYSDOT) that I was unable to import.

Thanks for your help.

George

=====

**Complete Issue Information**

I'm able to import the library XML file after I removed all the vehicles in the file.

FROM: Herman Lee DATE: 3/15/2010 2:29:30 PM Eastern Daylight Time  
The attribute VEHICLE\_GAGE\_TYPE was added to the database in 5.4. This attribute is for identifying standard gage and non-standard gage vehicles and is required during library import. The attached library file is exported from a 5.3 database. This attribute is missing from the library file.

Fixed for 6.2 Release.

FROM: Herman Lee DATE: 5/9/2010 11:38:24 AM Eastern Daylight Time  
Tested the library XML file (inside the ZIP file) in this incident.  
Verified in 6.2 Beta 1.

4/19/2016 3:22:38 PM

HRS AASHTO

2780

**Complete Issue Information**

The vertical distances to rebar in some generated cross sections are negative. These negative vertical distances are in both the BRASS and Virtis Std Engine data files.

FROM: Tim Armbrecht DATE: 6/12/2009 2:39:06 PM Eastern Daylight Time  
Herman, could you please clarify? Where is the measuring being done? Maybe provide some screen shots? Thanks.

FROM: Herman Lee DATE: 6/15/2009 7:15:02 AM Eastern Daylight Time  
The measuring is done inside the export process during generating cross sections for the rating engine. Attached is a screen shot of those negative distances in the BRASS data file.

FROM: Tim Armbrecht DATE: 6/22/2009 3:44:25 PM Eastern Daylight Time  
So it's an export bug in Virtis? Not an input error on our part?

FROM: Herman Lee DATE: 3/16/2010 10:18:29 AM Eastern Daylight Time  
Summary of issues:

1. The vertical distances to rebar in some generated cross sections are negative. This is input error. We updated the export to issue useful message when a bar is above or below the beam. This is a duplicate of Incident 8984.
2. Virtis Std Engine crashes. In addition to the export message in 1, we added a check in the Virtis Std Engine export for negative distance to rebar c.g..
3. Elements too small error message when using the BRASS Engine. This is a duplicate of Incident 7751 and 7643.

Resolved for 6.2 Release.

FROM: Jim Duray DATE: 5/6/2010 6:26:55 PM Eastern Daylight Time  
Verified for 6.2 a4.

FROM: Tim Armbrecht DATE: 6/17/2010 12:41:31 PM Eastern Daylight Time  
Accepted.

**Description**

FROM: Tim Armbrecht DATE: 6/22/2009 3:04:39 PM Eastern Daylight Time

My consultant reports that Virtis crashes when attempting to run the stringer, "1st N Int-x" (xml attached). This happens in both v. 6.0 and 6.1.0 Beta 1. I have also attached a Word document displaying the error messages.

FROM: Herman Lee DATE: 6/22/2009 3:07:57 PM Eastern Daylight Time

Related to Incident 9185.

FROM: Tim Armbrecht DATE: 9/9/2009 2:56:31 PM Eastern Daylight Time

Checked in the Acceptance Build. Virtis still crashes. Has this attached structure been checked?

FROM: Mehrdad Ordoobadi DATE: 9/10/2009 12:31:45 PM Eastern Daylight Time

This was fixed for acceptance build but was not included in the build. We will send you a new DLL to verify.

FROM: Tim Armbrecht DATE: 9/11/2009 2:08:03 PM Eastern Daylight Time

Tested the new dlls. It appears to be working correctly. Note that Jim says the dlls will be included in the release. Accepted.

### Description

FROM: Dean Teal DATE: 6/25/2009 9:05:40 AM Eastern Daylight Time

I would classify this a bug

When a superstructure definition is copied and then pasted into another bridge, all materials and beam shapes will be copied along with it.

When a material or beam shape is present in each superstructure definition, they are different but have the SAME name - when you copy it in you will not get two materials/shapes, only one. One of them gets overwritten.

One gets lost.

FROM: Joseph Ihnat DATE: 7/15/2009 8:26:02 AM Eastern Daylight Time

When we find a material with the same name at the destination, we use that material. This is by design.

4/19/2016 3:22:39 PM

HRS AASHTO

2783

**Complete Issue Information**

The assumption was that if two materials had the same name they were the same material, and this is probably the most common case by far. Otherwise, if you always copy the materials you'd end up with lots of duplication.

FROM: Dean Teal DATE: 6/25/2009 12:47:41 PM Eastern Daylight Time  
When the "final allowable slab compression" fields are not filled in - what does the engine do?  
Brass LDF -  
Brass LRFD -  
Opis LRFD -

**Complete Issue Information**

Being the program doesn't stop or produce an error i am assuming that the engines find the slab concrete material and calculate it? Or is that a bad assumption?

FROM: Herman Lee DATE: 6/29/2009 8:23:47 AM Eastern Daylight Time  
Brian, please assign to Krisha after you are done.

FROM: Brian Goodrich DATE: 7/2/2009 2:30:23 PM Mountain Daylight Time  
BRASS LFD - This field is not used by LFD engine.  
BRASS LRFD - 0.60 f'c (calculated in engine)

FROM: Krisha Kennelly DATE: 7/14/2009 2:21:08 PM Eastern Daylight Time  
Opis LRFD will compute this value for you in article 5.9.4.2.1 if it is left blank in the UI.

FROM: Dean Teal DATE: 7/20/2009 1:47:23 PM Eastern Daylight Time  
Accepted in 6.1 beta 2

**Description**

FROM: Herman Lee DATE: 6/29/2009 9:40:26 AM Eastern Daylight Time  
Submitted on behalf of Richard Pickings, BridgeSight Inc. (rdp@bridgesight.com).

Received e-mail:

=====

Another head scratcher. I'm trying to use the DoBridge.Copy function so I can allow users to select a "template" bridge to be used as a seed for bridges exported into O/V. However, the function fails on some bridges and I don't know why.

This is easy to replicate. Attached is a bridge sent to me from Jeff Ruby at KDOT. Import it into OPIS, save it, and then use the UI to copy/paste it. I end up with an error that says:

Error occurred while copying the bridge data!  
04:53:36 PM - Line 4676 in source file .\UiDescDtopGridView.cpp.

This appears to be the same thing that happens from my program. Any insight?

Thanks,  
Richard

=====

Copy and paste work ok after I delete and recreate "Try #1" superstructure. I suspect the internal relationship between the superstructure and superstructure alt/def is incorrect.

FROM: Jeff Ruby DATE: 7/7/2009 1:05:05 PM Eastern Daylight Time  
This also occurs in version 6.1 beta 2

FROM: Mehrdad Ordoobadi DATE: 8/21/2009 9:40:05 AM Eastern Daylight Time  
Fixed for 6.1 acceptance build.

FROM: Paul Jensen DATE: 7/14/2009 12:52:53 PM Eastern Daylight Time  
attached is a png file with the error we are now receiving- this (I think) is for Opis Sub. We are using all three product and now substructure is part of the products, this licence should be the same and superstructure. V/O 6.1 will not be available until October, we need a patch for the time-out

FROM: Joseph Ihnat DATE: 7/14/2009 1:11:55 PM Eastern Daylight Time  
The substructure exes were to expire after one year for the non-participants. You should have a VirtisOpis.exe to run that is superstructure only and does not expire.

### Description

FROM: Dean Teal DATE: 7/22/2009 4:58:16 PM Eastern Daylight Time

When we use the Compute from Typical Section to find the effective width for the Deck Profile – we have to enter the structural thickness. The structural thickness populated by the program by default is the total thickness. Usually by the time the user gets to this point they already have the field populated for structural thickness.

Why can't the program populate with the structural thickness?

The way it is, the user has to change that number every time – and if we set the program up correctly the user would most likely never have to change the value and just except the default.

See attached screen shot

FROM: Jim Duray DATE: 7/27/2009 8:41:11 AM Eastern Daylight Time

FROM: Krisha Kennelly DATE: 7/27/2009 10:04:05 AM Eastern Daylight Time

The user should hit the 'Compute' button before they enter any data in the grid and the Structural Thickness on the Deck Profile grid would be populated with what you entered on the Compute dialog.

I don't think we want to encourage the user to enter partial data in the grid and then hit the Compute button.

The Compute button generates rows in the grid and it will delete any rows the user has entered before the Compute button is hit.

## Complete Issue Information

The point I was making is that when using the compute button - the field is already filled in "with the wrong value"

FROM: Krisha Kennelly DATE: 7/29/2009 9:11:39 AM Eastern Daylight Time

The grid on the Deck Concrete window is the only place where the user can enter the structural thickness. So if you want the compute button populated with the structural thickness we would require the user to create 1 row in the grid solely to enter the structural thickness so the Compute button could retrieve it. Then the Compute button will delete the row in the grid that the user entered anyway. Why not just enter the structural thickness in the Compute dialog instead of creating a row that gets deleted anyway?

FROM: Dean Teal DATE: 8/19/2009 3:11:36 PM Eastern Daylight Time

Look at the screen shot I attached – it's the Deck Profile GUI.

When you select the "Compute from Typical Section" button in the lower left the wizard pops up.

Now if you look at the Wizard GUI, you see that it has two fields, both populated with in this case with 9".

Why can't the wizard take the 8.5 inch value that is already in the Deck Profile GUI that the wizard was launched from?

The structural thickness value came from the superstructure wizard, right?

I just don't understand why the value used can't be populated from the value that is on the Deck Concrete tab –

It's so frustrating to have to type it in when the value is right there on the same GUI. I would rather have a blank value than a pre-populated value that is wrong 99% of the time.

It's one of those user things that is frustrating – and all you ask yourself is why – it's right there – use it

FROM: Krisha Kennelly DATE: 8/25/2009 2:42:03 PM Eastern Daylight Time

Joe,

If the user has entered a row in the grid on the Deck Concrete tab, retrieve the structural thickness from that grid and populate it on the Compute dialog.

thanks.

|------|---------------|---------|
|------|---------------|---------|

### Description

FROM: Tim Armbrecht DATE: 7/29/2009 11:53:13 AM Eastern Daylight Time  
This applies to 6.0 and 6.1 beta 2. From my consultant:

There are two issues with the LRFR analysis results for Unit 1 of 082-A001:

- This HL-93 designed structure is getting rating factors far below 1.0 in both v. 6.0 & v. 6.1 Beta 2.
- The first two Live Load Types are different between them (Design Truck & Design Tandem in v. 6.0 vs. Axle Load & Tandem in v. 6.1 Beta 2).

See incident 9406 for related xml file. Attached are screen shots showing discrepancies.

FROM: Brian Goodrich DATE: 7/29/2009 12:39:46 PM Mountain Daylight Time  
I ran 6.1 Beta 2 and received the same results as the user. I took the BRASS data file and ran it with the BRASS DLL from 6.0 and got the same results as 6.1 Beta 2. There must have been an export change between 6.0 and 6.1 that is causing the difference. I'll investigate this next.

FROM: Brian Goodrich DATE: 8/12/2009 1:51:20 PM Mountain Daylight Time  
I found there is a difference in the generated data files between 6.0 and 6.1. In version 6.0, there is a gap in the transverse stiffener range at the end of span 1. BRASS interpreted this as there being no transverse stiffeners present and hence the lower rating. The 6.1 export was revised to adjust the schedule distances near the span ends to make up this small difference in length. The 6.1 export is functioning correctly and now gives a higher rating for this structure.

FROM: Tim Armbrecht DATE: 9/9/2009 3:00:50 PM Eastern Daylight Time  
This does not appear to have been fixed. The Unit 1 Inventory/Operating LRFR ratings for BRASS in the Acceptance Build:

Axle 0.555/0.721  
Tandem 0.608/0.790  
Truck Pair 0.478/0.621

LFD - 1.192/1.991

FROM: Brian Goodrich DATE: 9/10/2009 9:46:48 AM Mountain Daylight Time  
The source of the 0.555 inventory rating factor is due to web bend-buckling for the Service II limit state. BRASS is determining the web bend-buckling resistance ( $F_{crw}$ ) as 42.1 ksi at the right end of span 2 (POI = 210). This stress resistance is less than the combined dead and live load stress. Can you tell me if this resistance or the stresses due to applied loads are different from the design calculations?

Reported by Mary Walker (marywalker@byu.net), Idaho Transportation Department during the 2009 User Group Meeting.

To reproduce:

1. Open TrainingBridge1 BWS
2. Create a new LRFR Factors
3. Copy the 2003 factors in the library
4. Select the Permit Loads tab
5. Hit Apply will change the load factor values.
6. Click OK and reopen the Permit Loads tab will see duplicate rows in both grids (see attached)

FROM: Tim Armbrecht DATE: 8/11/2009 5:41:16 PM Eastern Daylight Time

One of my engineers inadvertently dragged a heading of the grid and was able to place it into the grid. Seems like this shouldn't be allowed. See attached for illustration.

FROM: Joseph Ihnat DATE: 8/13/2009 8:10:56 AM Eastern Daylight Time

Probably always been like this. Changed Folder to Support Center.

FROM: Joseph Ihnat DATE: 10/15/2009 3:29:24 PM Eastern Daylight Time

Fixed for version 6.2

FROM: Joseph Ihnat DATE: 4/30/2010 11:15:39 AM Eastern Daylight Time

Verified - 6.2 alpha 4

FROM: Tim Armbrecht DATE: 6/17/2010 12:42:35 PM Eastern Daylight Time

Accepted.

FROM: Amjad Waheed DATE: 8/13/2009 4:14:24 PM Eastern Daylight Time

At the organizational level Virtis/Opis are installed on several workstations at different premises. New releases of the software require uninstalling and re-installing the client portion on several workstations. To save time and resources IT departments of several DOTs have started pushing the updates remotely during the after-work hours. This process not only saves time and manual efforts but also keeps the upgrades consistent across all machines.

I understand that it is the functionality/discretion of individual IT department whether they want to push the updates remotely or not. However the software should be tested/verified & marked ready for remote update of clients. This is request to test and mark the software Virtis/Opis ready for remote updates of the client machines within an organization holding a site license.

### Description

FROM: Amjad Waheed DATE: 8/13/2009 4:29:04 PM Eastern Daylight Time  
Virtis/Opis are quite stable products now and the basic features of the GUI and library items do not change quite often. I think it will be in the better interests of the users as well as the consultants that videos of trainings on the basic/fundamentals of Virtis/Opis be produced. Those videos can then be posted on the VOBUG website. They would help the new users to get started quickly on the program without waiting for any training session. They will also save time on repeating the same fundamental training sessions at the conferences. The trainers' time would be better spent on giving trainings on new and complex features of the program.

### Description

FROM: Herman Lee DATE: 8/21/2009 1:36:26 PM Eastern Daylight Time  
Submitted on behalf of Tyler Haney, WH Pacific (THaney@whpacific.com).

Attached is the received bridgeware e-mail.

FROM: Xinmei Li DATE: 10/6/2009 8:54:52 AM Eastern Daylight Time  
When user changes information on "Dimensions" tab without saving to domain, the "Compute" button on "Properties" tab will compute section properties base on the information in domain instead of that on UI.  
Added a message when user click compute button, so that user will have a chance to save changes to domain before doing computation.  
Same message is added to all Ps beam shapes.  
Resolved for next release.

FROM: Jim Duray DATE: 5/6/2010 10:02:26 AM Eastern Daylight Time  
Verified - 6.2 alpha 4.

## Description

FROM: Tim Armbrecht DATE: 8/25/2009 12:46:01 PM Eastern Daylight Time  
What would be the reason that one of my engineers can double click on the "Member Section Property Report" in "View Analysis Output" and the report will automatically open in Internet Explorer, but when another engineer (on a different machine) double clicks on it, nothing happens, i.e. no windows pop open with the report? They both have V/O 6.0 on their machines and IE 6.0. I also checked "About Internet Explorer" and they have identical versions and updates (SP3).

**Complete Issue Information**

FROM: Herman Lee DATE: 8/25/2009 12:48:19 PM Eastern Daylight Time  
Most likely the xml file extension is not associated with IE in the machine that doesn't work. Below is copied from the Frequently Asked Questions in the Help menu.

=====  
Why won't my report open from the Analysis Output window?

Internet Explorer needs to be the associated application for opening xml files on your computer.

- 1) Right-click on any xml file in Windows Explorer.
- 2) Select Open With - Choose Program
- 3) Select IE in the list, also check "Always use the selected program...", click OK.

=====  
Please let us know whether this fixes the problem.

FROM: Tim Armbrecht DATE: 8/25/2009 2:16:23 PM Eastern Daylight Time  
It fixed it, thanks. I had assumed that IE would automatically open with any double click of an XML file (because that's what happens in Windows Explorer), but when I went through the procedure above, it worked.

|------|---------------|---------|
|------|---------------|---------|

**Description**

FROM: Herman Lee DATE: 9/1/2009 10:27:25 AM Eastern Daylight Time  
To reproduce:

1. Navigate to Library Explorer | Steel Shapes | Tee | Agency.
2. Select File | New.
3. Enter Name "New Tee" and Year "200999". Click Save and close the window.
4. Open "New Tee" will show Year as "4391".

FROM: Jim Duray DATE: 9/1/2009 11:44:12 AM Eastern Daylight Time  
This issue applies to previous versions as well.

FROM: Joseph Ihnat DATE: 10/14/2009 10:35:45 AM Eastern Daylight Time  
Mehrad, please set min/max values in the data dictionary.  
For "year" in tables abw\_lib\_stl\_shape and abw\_lib\_ps\_shape, set min\_int\_value=0 and max\_int\_value=9999 (or other appropriate values).

FROM: Mehrdad Ordoobadi DATE: 11/19/2009 2:33:16 PM Eastern Standard Time  
Fixed for 6.2 in the Sample database.

FROM: Herman Lee DATE: 5/9/2010 11:48:17 AM Eastern Daylight Time  
Still show Year as "4391".

FROM: Mehrdad Ordoobadi DATE: 5/17/2010 9:37:26 AM Eastern Daylight Time  
The min/max values are set in the data dictionary, but if you use a value like what Herman is trying "200999" it saves as a different number.

The Year edit control is probably not handling this right. I think if the value is beyond 32768 it automatically gets cast to a short integer and if the conversion is within the range (0 - 9999) it gets saved.

FROM: Joseph Ihnat DATE: 5/20/2010 1:37:39 PM Eastern Daylight Time  
Fixed for 6.2 Beta 2. Input is limited to 4 digits when max is 9999.

FROM: George Colgrove DATE: 9/27/2010 1:20:10 PM Eastern Daylight Time  
Verified in VO62B7

This originated from 9470.

The following changes need to be made to the sample and production databases for Bridge BID 22 G1.

Beam Details/Span Details:

| SPAN | Left End Beam Projection | Right End Beam Projection |
|------|--------------------------|---------------------------|
| 1    | 9.5000                   | 7.500                     |
| 2    | 7.5000                   | 7.000                     |
| 3    | 7.0000                   | 12.000                    |

Beam Details/Stress Limit Ranges:

| SPAN | Length |
|------|--------|
| 1    | 115.75 |
| 2    | 115.54 |
| 3    | 115.92 |

Look at G2 for the full decimal values.

## Description

FROM: George Huang DATE: 9/30/2009 11:12:19 AM Eastern Daylight Time

I use the file exchange to export a bridge file from my main database. But this bridge file can't be imported (under exchange) by my stand alone database, and even can't be imported with the same main database. In both cases, I got the same system error "Unable to exchange bridge. Invalid bridge exchange file."

We have a need for this exchange function in one or two weeks. I may need to call someone the resolve this issue quickly. Please provide the contact phone number if it's possible. Thanks.

FROM: George Huang DATE: 10/5/2009 4:17:48 PM Eastern Daylight Time

The exchange function is working for the 6.1 testing version. The "respository" box was not checked before.

My new question is how to define a 6.0 version database as a Respository Database? Thanks.

**Description**

FROM: Jim Duray DATE: 10/6/2009 2:28:28 PM Eastern Daylight Time  
From 9287...

I found the following behavior regarding DLA in the UI:

4/19/2016 3:22:47 PM

HRS AASHTO

2830

## Complete Issue Information

For the BRASS LRFR analysis, if mbr alt DLA is NULL we get the struct def DLA. If the struct def DLA is NULL we get the bridge DLA. This is the desired behavior and it was also implemented for the AASHTO LRFD/LRFR engine.

If the mbr alt and structure def DLA are NULL, the analysis checks the bridge DLA and if it is NULL the analysis is aborted with the following message.

```
"Error generating LRFD load commands!  
Error generating LOAD-LIVE-DYNAMIC command!  
Unable to determine LRFD impact factors!"
```

This is the desired behavior.

The DLA windows have some problems with default values for DLA:

For the struct def DLA window, if DLA is NULL it populates the window with the DLA from the bridge DLA – even if the user closes the window by clicking Cancel.

If the bridge DLA is NULL and the struct def window is opened, the struct def DLA gets set to 0 and the analysis will be performed without warning. Not desirable.

If the bridge DLA window is opened and the DLA is NULL the window sets it to 15% and 33% even if the cancel button is clicked. Probably acceptable behavior.

The mbr alt window never gets populated from the struct def or bridge DLA (except when a new mbr alt is created).

I think we should change this behavior to use in the analysis the default AASHTO impact/DLA values if mbr alt, struct def and bridge DLA are NULL. The struct def window DLA should get set to NULL if the bridge DLA is NULL instead of zero. If the mbr alt DLA is NULL it should get set to the struct def DLA. Or we should change the behavior so mbr alt and structure def windows do not get DLA from the parent DLA window.

-----  
From Todd 10/6/09

I can import and run the steel bridge and never open any window and I get the behaviour.

Let me go right to the DB where I don't have to "open" or not open any GUI windows.

Upon digging into it further, and going directly into the DB to review the data of the 6.1 DB the ABW\_SUPER\_STRUCTURE\_SPNG\_MBR\_ALT.LRFD\_CONSTANT\_IMPACT\_FACTOR is actually stored as Zero after being imported from an XML.

And upon digging into my 6.0 DB, appears most if not all of my steel girder bridges have Zero for ABW\_SUPER\_STRUCTURE\_SPNG\_MBR\_ALT.LRFD\_CONSTANT\_IMPACT\_FACTOR (whereas my RC had blanks/NULLS) - Not sure what the difference is between the two structure types.

The vast majority of all of my bridges were originally from BARS imports, although all of my steel girder bridges are now defined as a Girder System, but evidently when creating a new superstructure definition from scratch does not populate the LRFD DLA values, or if they do - populates them with

4/19/2016 3:22:47 PM

HRS AASHTO

2831

**Complete Issue Information**

Zeroes. Or at least that is what appears to be happening.

Appears my best bet is to populate manually (via script) all of my LRFD DLA values with 15 and 33 and not rely upon the application to populate them when one creates a new superstructure definition.

FROM: Joseph Ihnat DATE: 12/4/2009 8:39:55 AM Eastern Standard Time  
The Impact window should not be modifying the Domain when the window is opened.  
Fixed for version 6.2

FROM: Joseph Ihnat DATE: 12/4/2009 2:32:28 PM Eastern Standard Time  
When a new member alternative (or struct def) is created, and the impact values in the struct def (or bridge) are null, the impact values in the new member alternative (or struct def) should also be null, not zero.  
Fixed for version 6.2

1) In the Library, create a vehicle with no axles then try to open the Library LRFD Substructure Design Settings window. Virtis will crash.

The Bridge LRFD Substructure Design Settings window cannot be opened but Virtis does not crash.

2) Mehrdad, please review the code in CDoLibVehicle::GetAxleWeight()

FROM: Joseph Ihnat DATE: 11/3/2009 3:19:38 PM Eastern Standard Time

#1 is fixed for version 6.2

FROM: Mehrdad Ordoobadi DATE: 12/1/2009 9:28:52 AM Eastern Standard Time

Fixed item 2 for Version 6.1 SP 1 and 6.2. (DoLibVehicle.CPP)

Also required changes to the UiLibLrfdSubDgnSetSubstructLoadDlg.CPP to avoid a crash.

FROM: Krisha Kennelly DATE: 5/7/2010 10:51:44 PM Eastern Daylight Time

verified fix in 6.2 beta 1. Added a vehicle with no axles to the library. Was able to open Library and Bridge substructure Design Settings windows without crashes.

**Description**

FROM: Todd Thompson DATE: 11/5/2009 2:24:05 PM Eastern Standard Time

We've been reviewing a bridge and using the Analysis Settings - Traffic Direction (options of both directions up and down mileposts).

With 6.1 and BRASS LRFD - appears to work ok. For example, one gets slightly different Reactions because of the different direction and placement of a truck.

With 6.1 and OPIS LRFD - question on whether this is working, as we get identical results whether one does both directions, up or down. Appears that this control setting only works on BRASS and not OPIS (and possibly not on VIRTIS, but didn't check).

We are looking for clarification if this analysis setting is valid for the OPIS and VIRTIS engines.

RC Slab bridge was the type of bridge in question that our designer was working on.

**Complete Issue Information**

We're having a problem with Virtis 6.1 for built up steel sections. After inputting the data in the member cross sections and clicking apply, we are getting a runtime error and the whole program crashes. This happens if we are entering a new cross section and if we open one that was previously inputted and click apply without making any changes. I have attached the file we are having problems with.

Thank you for your assistance. Feel free to call if you have any questions or need further information.  
David A. Packard  
BAYSIDE ENGINEERING, INC.

FROM: Joseph Ihnat DATE: 11/9/2009 1:24:15 PM Eastern Standard Time  
For example, open TB2, add a bolted cvr plate, click Apply, Virtis crashes.  
If you click OK instead of Apply, Virtis doesn't crash.  
Also, the effective area edit box should be hidden.

### Description

FROM: Tim Armbrecht DATE: 11/10/2009 8:08:21 AM Eastern Standard Time

This concerns PS concrete beam bridges brought into v. 6.1 with shear ignored (see Engine tab under Member Alternative Description). If the LFD Shear Computation Method, under the Control Options tab, is changed from "Ignore" to "Use current AASHTO" or to "Use AASHTO 1979 Interim code" the statement "Shear ignored (see member alternative)", under the Engine tab (for BRASS LFD), remains. It is then impossible to control the Vci switch so that it may be changed from the default Wyoming DOT value (1.0 max) to the AASHTO specified value (unlimited). Captured images of the applicable windows/tab views are attached.

Also, because the Ignore shear switch is no longer present under the Description tab of Member Alternative Description the aforementioned instruction, "see member alternative" is misleading.

I have attached an example file, PSI-Vci\_SwitchProb-v61(0600319).xml. The Member used is 9 - 2nd N Int-x.

FROM: Brian Goodrich DATE: 11/12/2009 8:15:14 AM Mountain Standard Time

I found the problem in the AbxBrass2 project. The beam definitions' GetLfdIgnoreShearInd() function is being called to determine if shear is to be ignored. For P/S structures, the GetLfdShearComputationMethodType() function should be used instead. For the BRASS ASD, we may need to use the GetAsdShearComputationMethodType() function.

FROM: Brian Goodrich DATE: 11/19/2009 4:02:26 PM Mountain Standard Time

I revised AbxBrass2 project to use GetLfdShearComputationMethodType() function. There are no ASD

control options for P/S. Fixed for version 6.2.

FROM: Herman Lee DATE: 5/9/2010 9:09:36 AM Eastern Daylight Time

Two more issues still have to be investigated.

- 1. Access to BRASS Engine Vci switch for bridges brought into 6.1 with shear ignored and changed to consider shear in 6.1.
- 2. The "Shear ignored (see member alternative)." description for BRASS Engine Properties.

**Description**

FROM: George Colgrove DATE: 11/10/2009 2:47:33 PM Eastern Standard Time

Trying to enter a fully non-composite bridge (specifically example A5 from the 2008 MBE). Live load distribution factors are being calculated considering a composite section. According to AASHTO LRFD (2009):

4.6.2.2 Beam-Slab Bridges

4.6.2.2.1 Application

Unless otherwise stated, the stiffness parameters for area, moments of inertia and torsional stiffness used herein and in Articles 4.6.2.2.2 and 4.6.2.2.3 shall be

4/19/2016 3:22:49 PM

HRS AASHTO

2839

**Complete Issue Information**

taken as those of the cross-section to which traffic will be applied, i.e., usually the composite section.

There is a suggestion (albeit very weak) that there is a different process for composite vs. non-composite. The example shows that  $eg = 0$  for non-composite construction. I have yet to find justification for this elsewhere but assuming this is true, BRASS LRFD/LRFR calculates the distribution factor with a calculated value for  $eg$ . This results in a 1.11 times increase for the distribution factor for the particular example.

I think this needs to be looked into. More specifically, there is no place in the GUI that I could find that defines a bridge as non-composite throughout. The steel girder wizard provides partially composite or composite options. We need to add that option which needs to be communicated to the engine so live load distribution factors can be calculated properly.

FROM: Krisha Kennelly DATE: 11/17/2009 8:26:31 AM Eastern Standard Time  
A non-composite throughout bridge in Virtis is one in which no shear connector ranges are defined. You don't define it as non-composite, you just don't enter any shear connector ranges.

FROM: Brian Goodrich DATE: 11/17/2009 4:22:55 PM Mountain Standard Time  
With respect to BRASS, WYDOT chose (in 1998) to have BRASS compute the non-composite steel  $K_g$  the same as for composite. BRASS does not consider a zero eccentricity for non-composite beams.

FROM: Brian Goodrich DATE: 11/19/2009 10:58:20 AM Mountain Standard Time  
The philosophy regarding these kinds of decisions is that if a user doesn't agree with a the BRASS calculation for live load distribution factors, he can input his own factors using the schedules.

FROM: Brian Goodrich DATE: 1/26/2010 10:22:20 AM Mountain Standard Time  
WYDOT assigned this issue to BRASS Problem Log 929.

FROM: Brian Goodrich DATE: 1/26/2010 11:09:43 AM Mountain Standard Time  
BRASS was modified to allow the user to choose if the "eg" term should be set to zero for non-composite sections. A control option must be implemented in engine properties and the export must be updated accordingly to take advantage of this feature.

**Description**

FROM: Dean Teal DATE: 12/1/2009 2:14:14 PM Eastern Standard Time

I have attached a structure that will not allow me to save if I use the Brg Alt Superstructure Wizard. this has happend on 2 bridges todote.

I have to delete the superstructure alternative and enter it manually in order to save the structure.

I was using the last 2 superstructure definitions.

FROM: Herman Lee DATE: 12/1/2009 3:31:36 PM Eastern Standard Time

We don't see the structure attached in this incident. Please attach the XML file again. Thanks.

FROM: Herman Lee DATE: 12/1/2009 3:55:24 PM Eastern Standard Time

Attached the bridge XML file.

FROM: Mehrdad Ordoobadi DATE: 1/13/2010 2:00:57 PM Eastern Standard Time

The name of the generated Superstructures and Superstructure Alternatives are blank if the user does not specify their names. However the save is successful in Sybase and SQL Server databases. Saving the changes to an Oracle database produces errors shown below:

-----  
Unable to save Bridge data!

03:34:24 PM - Line 885 in source file .\UiBWSDoc.cpp.

Saving New and Modified objects failed while processing CDmSuperStruct (SaveOrder object 110).

03:34:17 PM - Line 448 in source file .\DmBridgeCache.cpp.

Error updating database record set.

**Complete Issue Information**

03:34:17 PM - Line 792 in source file .\DmSuperStruct.cpp.  
State:S1000,Native:1400,Origin:[Oracle][ODBC][Ora]  
ORA-01400: cannot insert NULL into ("VIRTIS"."ABW\_SUPER\_STRUCT"."NAME")

-----  
which is due to blank values for the Superstructure names.

Dean are you getting the same errors?

If so the work around is to open the generated superstructures with empty names and enter a name, then click OK.

Then open the generated superstructure alternatives with empty names and enter a name and click OK.

Then you should be able to save.

The GUI code should be modified so that it does not accept empty names for superstructures and superstructure alternatives.

FROM: Mehrdad Ordoobadi DATE: 1/14/2010 12:09:19 PM Eastern Standard Time  
GUI code was updated so that it does not accept empty names for superstructures and superstructure alternatives.

Fixed for 6.2.0.  
Code repinned in 6.1 SP1.

### Description

FROM: Doug Horton DATE: 12/8/2009 9:50:04 AM Eastern Standard Time

The current export does not include the multimedia links for the structure. Thus, if structures are manually exported and transferred, the multimedia links are not maintained.

The current export also does not include links to Pontis if the user has a combined database (as does Virginia).

It would be very beneficial and time saving if the above could be implemented as options (or default settings) for the export process.

Virginia would be interested in assisting with the cost of adding the above features, assuming it is not extremely high.

FROM: Doug Horton DATE: 10/13/2010 12:16:06 PM Eastern Daylight Time

This request is indeed an enhancement, however it was my understanding that an estimate was going to be prepared and provided to VDOT and the Task Force. As previously noted, we have over a thousand files that have links to Pontis and multimedia attached. When we upgrade to a new version, say 6.2, we will not have any method of transferring the links.

Please reopen this and provide the estimate requested.

FROM: Herman Lee DATE: 10/15/2010 12:04:26 PM Eastern Daylight Time

We are preparing an estimate for this enhancement. The estimate will be presented to VDOT and the Task Force in the TF Meeting at the end of October.

When migrating a combined database to a new version using the Migration Wizard, the Pontis and multimedia links will not be affected during the database migration.

**Description**

FROM: Doug Horton DATE: 12/8/2009 10:02:27 AM Eastern Standard Time  
 The multimedia dialog for linking a file currently defaults to jpg files. This is reasonable since pictures are usually what are added. There are many times however that documentation files are added for easy reference. In Virginia they are generally pdf files. If the default was set to all files, then the selection would not have to be resset each time an attachment is made to a structure.

We would suggest that all files become the default, and, if possible, the chosen document type set for the first link would stay active for the whole session. In other words, if we picked pdf files on a structure and then followed with several other structures, pdf would be the default for every structure until the user logs out.

FROM: Herman Lee DATE: 5/17/2010 9:10:39 AM Eastern Daylight Time  
 Requested by TF and TAG during 6.2 Beta Testing to set default filter to "All Files". Done for 6.2 Release.

**Description**

FROM: Tim Armbrecht DATE: 1/6/2010 12:31:48 PM Eastern Standard Time  
Related to 3426 & 5313.

It's my understanding from these two incidents that BRASS does not support the 10.48.1.3 provision of the standard specs which allows a 10% redistribution of moment from the negative moment areas to the positive moment areas.

This provision is also in the LRFD specs in Appendix B. My questions:

- Is it correct to assume that BRASS-GIRDER still does not support redistribution of moments?
- Does Virtis Std. Engine support it?
- Does BRASS-LRFD support it?
- Is it in the plan to be supported by the new AASHTO Engine in this current workplan?

Thanks, Tim

FROM: Herman Lee DATE: 1/6/2010 3:13:37 PM Eastern Standard Time  
Virtis Std Engine supports 10.48.1.3 through the "LFD Allow moment redistribution" checkbox in Control Options.  
AASHTO LRFD/LRFR Engine in the coming 6.2 Release will support moment redistribution based on LRFD specs Appendix B.

Brian, please comment on the BRASS Engines.

FROM: Brian Goodrich DATE: 1/8/2010 1:32:55 PM Mountain Standard Time  
None of the BRASS-GIRDER engines support moment redistribution. I have forwarded this issue to WYDOT.

FROM: Brian Goodrich DATE: 1/22/2010 10:55:15 AM Mountain Standard Time  
WYDOT put this issue on the BRASS enhancement list. It will be ranked at a later date.

#### Description

FROM: George Colgrove DATE: 2/12/2010 9:13:54 AM Eastern Standard Time  
Would it be possible to add a "Stop Run" button to the error message box to stop a run? For large structures that have many stringers and floorbeams, it takes a long time to keep pressing Close between each successive error. Could be numerous and takes up time to get through. I'm thinking this feature would benefit us in the development realm - but would also be appreciated by the customer as well. See example in Documents.

FROM: Herman Lee DATE: 6/9/2011 9:48:23 AM Eastern Daylight Time  
As discussed with the TAG (April 2011), more checks for aborting the analysis (Cancel button) can be added during the run for a single member alternative.

I think what George is looking for is a Cancel button for an analysis event (eg. batch rating or analysis the whole superstructure definition).

FROM: Herman Lee DATE: 4/25/2013 8:57:18 AM Eastern Daylight Time  
Resolved for 6.5 release.

FROM: Beckie Curtis DATE: 2/17/2010 4:07:39 PM Eastern Standard Time

Looking for some clarification on how the engines apply live loads that vary in distribution factor along the length of a structure. I want to make sure I'm not making any incorrect assumptions.

For the engines that allow LL dist factors to vary:

lets say for every 10th of the span there is a new distribution factor. The vehicle in question has 10 axles, each in a different range. When calculating the load effect in range 5, do the engines calculate the effect of all 10 axles times the load distribution in range 5, or is it the effect of the axle in range 1 \* dist from range 1 plus the effect of the axle in range 2 \* dist from range 2 and so on.

FROM: Brian Goodrich DATE: 2/22/2010 9:00:41 AM Mountain Standard Time

For the BRASS LFD engine, there is only one distribution factor that is applied to all live load actions.

For the BRASS LRFD/LRFR engine, the distribution factors are applied based on the range in which the particular analysis point is located. If calculating the load effect in range 5, the effect of the axles times the load distribution in range 5. BRASS also has the capability to apply the distribution factor

based on the axle position, but this method was never exposed to the Virtis user through the engine data.

FROM: Jim Duray DATE: 2/22/2010 11:48:12 AM Eastern Standard Time

The AASHTO LRFD/LRFR engine applies the distribution factor that corresponds to the location of the axle, not the location of the point of interest.

**Description**

FROM: Mehrdad Ordoobadi DATE: 2/18/2010 11:14:12 AM Eastern Standard Time

The vertical location of the longitudinal stiffeners are specified by the following two fields:

- 1) Y Vertical Distance or Percentage
- 2) An indicator that indicates the location is measured from top or bottom flange, and if it is a percentage instead of distance.

The data dictionary for the vertical location indicates that the values are stored in mm. This is not working correctly because there is no conversion from percentage and distance.

## Complete Issue Information

This should be fixed in 6.2.0:

- 1) DB Work - Add a new column to store the percentages
- 2) Db, De, Dm and domain changes
- 3) GUI - the longitudinal stiffeners tab should be revised to display the value in the Vertical Distance field when the Vertical Distance Reference type is from the top and bottom flange, and it should display the Vertical Location as percentage field when the Vertical Distance Reference type is as percentage of the web from top or bottom flange. Also schematics should be updated to use the new column.
- 4) Database Migration - An executable should be added to the migration wizard that looks at the Vertical Location Reference Type values and if they are set to percentage, it should calculate the percentage that the user intended to put in the Vertical Distance field (Y) and place it in the new column that was added in #1 above and set the Vertical Distance to null.
- 5) Version Conversion - (Similar to #5) a new method should be added to perform this in the abvconvert project.
- 6) Export - BRASS Export should be modified to use the new field when percentages are chosen.

Weidong, please do 1,2, 4, 5, 6. Once finished with 1 and 2 please assign to Joe for the GUI changes (3)

FROM: Mehrdad Ordoobadi DATE: 2/18/2010 3:25:45 PM Eastern Standard Time

The new column that I suggested previously has been in the database/domain for a long time but we are not using it. We need to display the column "vert\_dist\_by\_web\_fraction" when the distance reference type is percentage of web and the old column "vert\_dist" when distance reference type is in inches or mm.

FROM: Brian Goodrich DATE: 2/22/2010 10:37:10 AM Mountain Standard Time  
Submitted e-mail from Mark Mlynarski:

Hey Brian,

I was running the attached file in BRASS through Virtis. Virtis returns critical rating factors (which happen to be shear for this problem) of 5.10 and 8.51 (see table below from the BRASS output files). I can't find these values in the 12-50 output. This is the only case I have thus far that I can't retrieve the critical rating values from the 12-50 output. Not sure what is peculiar about this particular problem. It seems like other LRFR and LFR files, I'm able to get the critical rating from the 12-50 file. I've attached the input, output and CSV file for your reference.

Thanks,

Mark

FROM: Brian Goodrich DATE: 2/22/2010 10:49:35 AM Mountain Standard Time  
Submitted e-mail from Vanessa Storlie:

Brian,

I was running the attached file in BRASS through Virtis. Using the 12-50 output, I am verifying that the unfactored dead load moments and shears from LFR are the same as for LRFR. I encountered several cases where Stage 2 dead loads are present in the BRASS output (see table below from the BRASS output files) but I can't find these values in the 12-50 output. I've attached the input, output and CSV file for your reference. For the particular case shown there are 8 girders in the cross-section and the dead load moments and shears for Girder 1 through Girder 5 are the same for both methods, but for Girder 6 through Girder 8 the DC2 moments and shears are different.

To: Clancy, Chad M.  
Subject: Additional BRASS Output IDs

Chad,

If you talk to Brian Goodrich could you see if he would be able to include the following 12-50 Report IDs in the LFR output from BRASS:

For Steel Cross-Sections:

40049 – Mr – Factored Moment Capacity at Strength I limit state

40053 – Fr – Allowable Flexural Stress at Strength I limit state for non-compact sections

40093 – Vr – Factored Shear Capacity at Strength I limit state

For Concrete Cross-Sections:

50029 – Mr – Factored Moment capacity at Strength I limit state

50042 – Vr – Factored Shear Capacity at Strength I limit state.

Thanks.

Vanessa

FROM: Brian Goodrich DATE: 2/22/2010 10:54:48 AM Mountain Standard Time  
I forwarded these issues to WYDOT for assignment to a BRASS problem log.

**Description**

FROM: Todd Thompson DATE: 2/23/2010 4:56:56 PM Eastern Standard Time  
I happened to notice today after I exported 6 bridges from a 6.0 DB and Imported them into a 6.1 DB - that the county number came across for only 2 of those bridges. The other 4 bridges were blank.

I'll attach the 6 files.

FROM: Todd Thompson DATE: 2/23/2010 4:59:52 PM Eastern Standard Time  
This does make we wonder and question if there are other data items that did not get across.

FROM: Todd Thompson DATE: 2/25/2010 9:08:35 AM Eastern Standard Time  
Appears this lies in that there was not a value for that specific county in the paramatrs table. So it didn't import anything for the county.

Guess I'm not sure if this is the right behaviour one would expect. I thought the county value would still import, just it wouldn't display a name - just the value. Instead, if appears if there is not a match, then there is no value for county.

FROM: Mehrdad Ordoobadi DATE: 2/25/2010 10:07:56 AM Eastern Standard Time  
I imported the 6 XML files using batch import. All of the county information were transfered correctly. (See attached screenshots)

The only way that this problem could happnen is if you use File/Import to import each XML file, then Click Apply or OK in the Bridge Description window. Clicking OK or Apply will replace the county with NULL value because it cannot find the matching row in the paramters table.

FROM: Todd Thompson DATE: 3/1/2010 2:07:33 PM Eastern Standard Time  
I used the Batch Import

**Description**

FROM: Beckie Curtis DATE: 2/24/2010 8:50:12 AM Eastern Standard Time  
 For parabolic reinforced concrete beams, there are a large number of cross-sections generated using the wizard. Often when we run the structure the number of cross-sections exported exceed the capabilities of the engine. In my opinion, the wizard should not create more cross-sections than can be analyzed with the program.

FROM: Herman Lee DATE: 2/24/2010 9:08:17 AM Eastern Standard Time  
 Separating bridge model dependency from analysis engines is one of the strengths in Virtis. This allows switching to another engine without changing the bridge data. I think the engine should check the limit and adjust the number of cross sections during the export process. Please let us know your comment.

FROM: Herman Lee DATE: 2/24/2010 9:47:28 AM Eastern Standard Time  
 Beckie's e-mail received on 2/24/2010:

=====  
 Sounds reasonable.

 Consider skipping in the export POI if change in rebar area less than certain amount and if location interval is less than a certain amount.

### Description

FROM: George Colgrove DATE: 3/3/2010 8:17:44 AM Eastern Standard Time  
There is a problem with copying a girder line when entering a girder system. I cannot find a reason why. Somehow the copied girder line gets corrupted and wont analyze. I have tried to export and re-import to no avail. The only thing that works is to re-enter the girder line from scratch. I have come across this in my employment at VT, and have seen it here in some of the support questions.

George

FROM: Joseph Ihnat DATE: 3/3/2010 1:28:22 PM Eastern Standard Time  
Can you provide some specific information on how to reproduce this?

FROM: Joseph Ihnat DATE: 3/5/2010 11:08:29 AM Eastern Standard Time  
The specific issue that George provided in this case turned out to be a data entry error. He will monitor this issue and may resubmit at a later time.

**Complete Issue Information**

Krishna,

Enclosed is the bridge file used for this test. The model used is the one with a sidewalk. I checked this with code available today. We have good results for both Evenly distributed over girders, and Tributary Area. For Transverse Simple-Beam Analysis we do get good correlation for Girder 1, but nothing comes up for girder 2. For Transverse Continuous-Beam Analysis we get errors on the analysis. Below you can find my results.

Side walk data

**Complete Issue Information**

Below is the e-mail without embedded graphics. Please see attached PDF file for the e-mail with embedded graphics.

=====
I'm in the process of reviewing a RPG bridge. When I'm within the "Cross Sections" window (shown below) and click "Apply" the program locks up and I get the error message (shown below at the bottom), the program then automatically shuts down. Attached is the xml file for the bridge that this is occurring on. If I make the changes necessary and then click "OK" the program does not lock up, only when clicking "Apply".

**Description**

FROM: Tim Armbrecht DATE: 3/25/2010 9:29:11 AM Eastern Daylight Time  
From my consultant (Souther):

In the model, GirderNotParallelError-v61(0161009).xml, I am getting an error message when attempting to open the Framing Plan Detail or Structure Typical Section stating "...Girder Spacing Display Type is set to "Perpendicular" but the girders are not parallel...". When I examine the input data I can't find logic for this message.

It's possible that it could be related to the fact that the dimensions were converted from metric and are therefore mostly have six or more non-zero decimal places. In a different copy, after rounding them to 4 & 3 decimals (for feet & inches respectively), the error no longer occurred and the analysis ran successfully.

FROM: Herman Lee DATE: 8/20/2010 11:46:05 AM Eastern Daylight Time

I'm able to fix the geometry by the following steps:

1. Open the Structure Typical Section window and select Yes for the warning message to change "Girder Spacing Display" to "Along Support".
2. Click OK to close the Structure Typical Section window.
3. Open the Framing Plan Details window and change the selection back to "Perpendicular to girder".
4. Click OK to close the Framing Plan Details window.

I'm not able to locate or duplicate the cause of this issue.

## Description

FROM: Tim Armbrrecht DATE: 3/29/2010 3:25:24 PM Eastern Daylight Time  
From my consultant (Souther):

In the attached Virtis Model, the load case "WS" cannot be deleted. All usages of the load case have been removed, which was verified by a search of the "Review" text. Nevertheless, when I attempt to do the delete, I get an error message stating, "Cannot delete load case since it is being used elsewhere!" I'm guessing that the data has been corrupted in some way.

FROM: Joseph Ihnat DATE: 3/29/2010 3:49:26 PM Eastern Daylight Time  
For girder members 1,2 and 3, Member Loads - Settlement was set to "WS" but no data was entered in the grid.  
After changing these to "None" I was able to delete Load Case "WS".  
I used Report Tool to find this.

FROM: Tim Armbrrecht DATE: 4/13/2010 9:27:52 AM Eastern Daylight Time  
Joe, from my consultant:

Regarding VI 9688 (Can't Delete Load Case "WS"), I verified Baker's solution. However, while the Load Case is shown in the BWS Report under Report Tools, the Load Case Name does not display under Member Loads - Settlement portion of the report generated by clicking <View BWS Reports> icon. I tested this by assigning values to Settlement and by changing from WS to another load case.

## Complete Issue Information

The latter method of generating a report for review is much preferred since it will usually provide all the data needed for reviews with far less effort than required using the "Report Tools" method.

## Description

FROM: Krisha Kennelly DATE: 3/30/2010 2:08:43 PM Eastern Daylight Time  
See attached screenshot. GirderDeadLoad shouldn't show up in this list.

Joe, please investigate and assign as accordingly.

FROM: Joseph Ihnat DATE: 4/27/2010 1:12:59 PM Eastern Daylight Time  
Modified the UI.

Since this was available in version 6.1, the migration wizard needs to check if it is in use (plug in D,DC instead).

Likewise, the import needs to check for this.

FROM: Mehrdad Ordoobadi DATE: 5/1/2010 6:25:26 PM Eastern Daylight Time

We should not do different things on different customer databases during migration. I think we should keep the Girder Dead Load in the type table.

### Description

FROM: Richard Best DATE: 3/31/2010 11:49:20 AM Eastern Daylight Time

There are multiple problems with the shear stirrup wizard for prestressed beams, which render it virtually unworkable for multi-span continuous PS I-beams. Refer to the Virtis model export, PSShearStirrupWizardProbs.xml.

First, when attempting to apply symmetry, the application doesn't appear to recognize the full length of the beam in the applicable span. For Span 1, which has an end-to-end beam length of 81.8334', the following message was produced...Attached

The 40.92 ft is actually the correct value but for some reason Virtis is erroneously reporting 41.42 ft. (However, in this case, when <OK> is selected the stirrups are laid out correctly in the model, except for the second issue.)

Second, when applying "Finish by symmetry" after entering multiple spans the above warning message only appears for one of them, even when it should apply to more than one of them. It would seem that the best solution would be to apply the Stirrup Wizard to each span separately, which might solve more than one of these issues.

Third, second, after entering the data for one span, then selecting another span and subsequently returning to the previously entered span, stirrup data is not visible. However, when applying the Wizard the data entered for the previous span is present. Even though the data is not lost, this problem prevents review and correction of the previously entered data, which is essential.

Fourth, when "Extends to deck" is selected it applies to all stirrups, even though all stirrups may not extend into the deck. This should be like in the manual stirrup entry where it's only selected for the applicable bars.

Fifth, with regard to "Start Distance", the operation of the Wizard is inconsistent with the way that stirrups are and have always been entered. When entering stirrups manually, there is and has never been a stirrup added at the Start location but only at the spacing specified to the right of it. Conversely, when the Wizard is applied, a stirrup is placed at the beginning (and at the end if symmetry is used). I think it would be best to make the Wizard work consistent with manual entry in order to avoid confusion, reducing the chance of data entry error.

Sixth, when stirrups already exist clicking the Stirrup Wizard button brings up the following warning dialogue box...Attached

Aside from the typos ("Stirrup" & "reinforcements" should be "Stirrups" & "reinforcement" or "reinforcement entries") it states, "...may delete...", when in actuality all stirrup information is always deleted. At a minimum, the information in the warning should be corrected so that it's accurate. Ideally, the programming should be modified so that only the information in the spans that the wizard is applied to is deleted. Stirrup information for all other spans should not be deleted.

## Complete Issue Information

FROM: Xinmei Li DATE: 10/6/2010 10:11:21 AM Eastern Daylight Time

#1 is not a bug. The span length of the beam is 40.92, but shear reinforcement is defined from end to end of the beam instead of support to support of the beam, so the 6" projections is added to 40.92'.

#2 is not a bug. In the attached bridge, you have 3 spans, if you decide to finish by symmetry, you need to define stirrups in the first span and half of the second span. So validation only checks the first span.

#3 is a bug. It is fixed for the next release.

#4 could be an enhancement. Now if you decide to define stirrups with wizard you have to set them all "extends to deck" or set them all "not extends to deck" and then make changes in the stirrup window.

#5 is not a bug. This is done on purpose. Wizard is a convenient way to create stirrups.

#6 Typo is fixed for next release. The suggestion about deleting partial stirrup information could be an enhancement.

FROM: Srujana Thogaru DATE: 4/8/2011 11:01:20 AM Eastern Daylight Time

Tested and found that #3 and #6 has been fixed for 6.3

FROM: Tim Ambrecht DATE: 5/13/2011 9:55:30 AM Eastern Daylight Time

Accepted.

## Description

FROM: Richard Best DATE: 4/1/2010 4:28:14 PM Eastern Daylight Time

In the attached example, "FlaredBmX-SecDisplayWrong(0160420).xml" a 4-span continuous with flared (splayed) wide-flange beams on 36.4667 degree skewed supports the schematic view of the superstructure cross-section seems to be wrong.

The spacings along the supports were input as 6.9761' at the first support and 11.2597' at the fifth support. This would correspond, respectively to spacings at a right angle to the superstructure definition line of 5'-7 5/16" & 9'-0 11/16". However, what is displayed ranges from 5'-11 9/16" to 6'-5 1/2" for the first support and from 9'-5 5/16" to 10'-2 11/16" at the fifth support. Not only do the values not match the appropriate values but each one is different from the others.

In addition, the farthest right beam appears in the diagram outside of the right edge of the deck. It does appear that the overhang value on the right is correct at 2'-10 1/4" even though it is displayed upside down. Also, the computed analysis results appear to be reasonable.

 Subject: RE: Virtis questions

Krisha,

That's good to know. However when you select ASD in any place you do get different rating results when compared with the LFD settings. I think that if the beam type is prestress, the ASD selections should automatically switch to LFD (or rather not allow ASD in the default rating method dropdown) and the ASD analysis module selection dropdown should be hidden in the Member Alternative Description dialog.

 Subject: RE: Virtis questions

That is correct that prestress ratings are not done in ASD. In the LFD/ASD bridge rating manual, the

## Complete Issue Information

section for ASD for prestress beams says to use the LFD method for ps beams. So if you pick ASD in Virtis, you will get the LFD ratings only.

I think the error about the hinge you get in Alpha 3 was fixed by Herman on Wednesday. The file was in the gui/abxvirtisstdlfrd directory.

To: Kennelly, Krisha  
Subject: FW: Virtis questions

Krisha,

Got an interesting issue revealed in this support call. When you set the Rating Method to ASD in the Analysis Settings and the Default Rating method set to ASD, then run the analysis. The resulting rating table shows LFD as the rating method. This is in VO 6.1. I ran it in 6.2 Alpha 1 and 2 and it did the same thing, but got different rating values. I ran it in Alpha 3 and it gave me this error:

Error generating BRASS span commands!  
Error generating HINGE command!  
No hinge location sets are defined!  
Error getting hinge locations!

Am I right in that prestress ratings are not done in ASD?

**Complete Issue Information**

I just gave you a call and left a message. I ran the model in ASD, LFD and LRFR and everything rated fine for each method. I could not get a low rating as you related in your message. Will you please send me more information. What methodology are you rating with (I am assuming ASD)? I ran the model exactly as you sent it. Are there specifics about how you are analyzing the model? Will you please send me either the output file or a screenshot of the output in the view analysis report, wherever the rating factor you mentioned is published.

Thanks,

- George Colgrove

### Description

FROM: Tim Armbrecht DATE: 4/15/2010 10:33:59 AM Eastern Daylight Time

We would like Virtis and Opis to include an option to use the alternate distribution factors for Concrete Beams used in Multibeam Decks, Cross section (g)-"if connected only enough to prevent relative vertical displacement at the interface" in Table 4.6.2.2.2b-1 on page 4-36 of the LRFD specs. It turns out that our Design Section has determined that Illinois should be using these formulas instead of the ones on the previous page, which is what Virtis/Opis is currently using. I am proposing to use service units and would like to see this in the 6.3 release, assuming that it is an easy fix. Thanks, Tim

FROM: Herman Lee DATE: 5/13/2014 1:56:54 PM Eastern Daylight Time

Implemented the option to specify sufficiently connected PS box beam for live load distribution factor calculations in the upcoming 6.6 release.

**Description**

FROM: Tim Armbrecht DATE: 4/15/2010 11:01:24 AM Eastern Daylight Time  
For this PPC I-beam structure my consultant (Chamberlain) noted that there is a big disparity between the AASHTO Engine and BRASS results. With no wearing surface applied, BRASS determines the RF to be 1.014 Inventory for truck pair, and AASHTO Engine determines it to be 0.136. I also note that the only live load listed in the results is the 90%(truck Pair + Lane) Load, apparently the other live load cases (axle load, tandem) were not analyzed. File attached, please advise.

FROM: Herman Lee DATE: 4/16/2010 9:18:42 PM Eastern Daylight Time  
I'm able to reproduce the BRASS 1.014 RF with the "2 - 1st N Int" member. When switched to the AASHTO Engine, the analysis failed while computing the LL distribution factors.

Developer Note:  
The development build asserts inside CAbaLrfdDistFactorCalc::ComputeMultiLaneLeverRule.

## Complete Issue Information

FROM: Krisha Kennelly DATE: 4/20/2010 2:26:45 PM Eastern Daylight Time

1. "2 - 1st N Int" member does not analyze with Virtis LRFR due to problem computing distribution factor for member that is not under a travelway.

2. Member "3-2nd N Int - x" is the member that produces RF = 0.136

Comparison of Virtis LRFR distribution factors and BRASS distribution factors shows the factors are essentially the same between the 2 programs. So have to investigate what is causing the difference.

FROM: Krisha Kennelly DATE: 5/2/2010 2:44:01 PM Eastern Daylight Time

1. DF is fixed for version 6.2. but final rating result is still too small (0.136). only 90% (truck pair + lane) shows up.

2. still haven't found source of this problem.

FROM: Krisha Kennelly DATE: 6/20/2011 10:43:14 AM Eastern Daylight Time  
Srujana - please investigate

FROM: Srujana Thogaru DATE: 6/22/2011 1:13:21 PM Eastern Daylight Time

Tested with 6.3 Beta 3 and was found to be fixed due to other updates, Please see the attached PDF for reference.

## Description

FROM: Brian Goodrich DATE: 5/10/2010 11:31:01 AM Mountain Daylight Time  
Submitted on behalf of Brent H. Schiller [BSchiller@Forsgren.com].

I have a question regarding the BRASS LFD engine in Virtis 6.1. We are rating a prestressed beam bridge which has a low rating for shear. As we looked at the BRASS output, it appears that the Vi term may be too low. We've reviewed Issue ID #'s 6511 & 6549 and have used a larger denominator for the live load increment to try and obtain more accurate results, but the Vi selected still remains the same. A HS-20 Lane Load is controlling and we calculated the concurrent LL shear for the maximum LL moment that occurs at the point of interest. The point load that occurs with the uniform lane load was positioned right at the point of interest in our calculations which causes maximum moment at that point. This causes a large drop or discontinuity in the shear diagram right at that point load. Since we have very small increments for live load advancement, it is my understanding that BRASS would pick the larger shear value when the point load is moved to the next increment (Issue ID 6549 @ end of the text). This would effectively pick the larger shear at the "high" end of the discontinuity vs the "low" end of the discontinuity which appears to be being picked by BRASS. I've attached the Virtis XML file. The point we are investigating is at 9.92 ft (27.5%) for Inventory rating, in span 1, girder G2. Rating is 0.62. Any thoughts on this?

FROM: Brian Goodrich DATE: 5/10/2010 11:32:01 AM Mountain Daylight Time  
E-mail from Bridgeware:

I ran the model through RISA and was able to verify the values reported by BRASS.

| Node | X    | Y | Z |
|------|------|---|---|
| N1   | 0    | 0 | 0 |
| N2   | 9.92 | 0 | 0 |
| N3   | 36   | 0 | 0 |

Moving load = 18kip on 0.640 k/lf. The shear reported was that for the largest imposed moment. See below (highlighted)

## Complete Issue Information

FROM: Brian Goodrich DATE: 5/10/2010 11:36:38 AM Mountain Daylight Time  
E-mail from Brent Schiller:

I do not dispute what you get from RISA as we get something similar from our shear diagram (see attached pdf). However, what we are questioning is why BRASS is grabbing the lower shear value at the discontinuity (Point B = 0.21k vs Point A = 18.21k in our pdf). I know there are differing opinions about what to use for  $V_i$  in the the profession. Some engineers use the shear envelope to determine  $V_i$  while others look at the factored shear that occurs due to the same loading that creates the maximum moment at the section. I understand that BRASS uses the latter method. However, it seems to be overly conservative to use the the lower value (point B) instead of the higher value from the discontinuity. It is my understanding that BRASS has already been modified (at least for truck loads) to account for this issue and to take the HIGHER shear at the discontinuity based on the discussion in Issue ID 6549 (the text at the end of this issue seems to clarify how BRASS was modified to avoid taking the low value). I've attached the text of Issue ID 6549 in a Word file and highlighted the text at the end that I'm referring to. Am I reading/interpreting Issue ID 6549 incorrectly and is BRASS actually supposed to take the lower value at the discontinuity (point B)?

FROM: Brian Goodrich DATE: 5/10/2010 11:34:01 AM Mountain Daylight Time  
E-mail from George Colgrove:

Hi Brent,

There is a lot more to this equation than just this. First at the point you are at,  $M_{cr} > M_{max}$ . This equation was not intended for use in this case. As the maximum moment increases, the ratio ( $M_{cr}/M_{max}$ ) reduces the overall resistance as what would make sense, because the section is under increasing cracking. However the resistance cannot be any greater than what it is uncracked. However the equation as published does not limit the ratio to 1, therefore the equation (and how BRASS is using it) is inherently unconservative.

The first term of the equation represents the applied shear that precipitates the inclined crack. The second term is the applied shear due to self weight. The final term is the coincidental shear acting at the same time the maximum moment occurs which should be reduced depending on how much the section is cracked. From the BRASS output, the ratio  $M_{cr}/M_{max}$  is 1.21. So using the larger of the two values (1.21) not only is less conservative, but the way the equation is being used (albeit, correctly as prescribed by AASHTO) perpetuates that to probably something unconservative. Using the lower value is more conservative, but that is somewhat lessened by the use of a ratio that exceed 1 (in this case by increasing the minimum value by 21%!).

Please see enclosed article from PCI. The article also warns against overestimating  $V_i$ .

### Complete Issue Information

looks like it is checking both element ends adjacent to a node point, but the smaller concurrent shear is getting saved. I'll forward this issue to WYDOT for further investigation.

### Description

FROM: Beckie Curtis DATE: 5/11/2010 10:27:47 AM Eastern Daylight Time  
The number of decimal points shown for an input should either be increased by default, or at least reflect the accuracy assigned for the analysis run.

FROM: Herman Lee DATE: 5/11/2010 11:03:38 AM Eastern Daylight Time  
An edit mask (e.g. #####.##) is associated with each input data to determine how many decimal points to display. Edit masks are stored in the database. It would be nice to provide the capability for agency to modify the edit masks through the user interface.

### Description

FROM: George Huang DATE: 5/11/2010 12:09:17 PM Eastern Daylight Time  
After haunch data were entered under one haunch type, the data won't change (and should change) when chose different haunch types. This may cause data entry mistakes.

FROM: Krisha Kennelly DATE: 5/11/2010 12:50:45 PM Eastern Daylight Time  
Issue was entered during beta testing but this is the behavior the window has always had.

FROM: Herman Lee DATE: 5/11/2010 1:11:29 PM Eastern Daylight Time  
The Haunch Profile window behaves like this for a long time. For users that select the wrong type but enter the correct data, they would probably prefer the data still there when they change to the correct type. I changed the Category to Enhancement for now. If there are more requests, the data should be cleared when the type is changed.

**Description**

FROM: Beckie Curtis DATE: 5/12/2010 2:36:49 PM Eastern Daylight Time  
For spans over 200-ft, the MBE requires a train of legal vehicles in one lane and then a different vehicle in the other lanes. Currently, different loads cannot be used at the same time. This is an enhancement request to add this functionality.

### Description

FROM: Krisha Kennelly DATE: 5/18/2010 10:51:01 AM Eastern Daylight Time  
Submitted from the agenda presented at the Version 6.2 beta testing meeting.

This is from an Illinois consultant, he brings up a good point. However, instead of entering it in as an enhancement request, I thought maybe this should go through the Beta TAG for discussion and concurrence. I think if the TAG agrees, we should classify it as a bug and request Baker fix it. What do you all think?

The terminology for parabolic and circular haunches in steel plate girder webs is confused. The "pot-belly" haunch enhancement for v. 6.1 necessitated that we specify the orientation of the curvature. The system calls convexly curved (pot-belly) haunches as "Up" and concavely curved as "Down". This seems to me to be opposite of what it should be, but whether or not I am right there could be no argument either way if the curvature orientation descriptions were changed to "Convex" and "Concave". A potential analogy could be the confusion of using right, left, up or down when we mean east, west, north or south. Up / down (or left / right) changes according to the perspective of the observer.

Therefore, I propose that what is now under the Depth Vary column as "Circular / Parabolic Down" be changed to "Circular / Parabolic Concave" and as "Circular / Parabolic Up" be changed to "Circular / Parabolic Convex".

FROM: Krisha Kennelly DATE: 5/18/2010 10:55:55 AM Eastern Daylight Time

FROM: Richard Withers DATE: 5/19/2010 1:26:00 PM Eastern Daylight Time

This is the same problem that Mississippi Dept of Transportation has previously encountered with the software as documented in issue 9172, most recently dated June 10, 2009. It appears that there has never been a resolution to this issue; the most recent response was that the problem was not reproducible. Inasmuch as MDOT is still encountering the problem, I would like to continue to pursue a resolution.

I am attaching two files: the first is a series of queries against the database which were requested from a year ago. The second is the email describing the problem from the end-user. It would appear that there are two resolutions to get past this. The first would be to simply remove the foreign key constraint that is being violated. The second would be to change the application to assure that the parent table has the necessary key present prior to it being inserted into the child table. While removing the constraint is both easy and possible, it certainly weakens the integrity of the data. Changing the application is something that MDOT cannot do on its own.

Please let me know what further actions we can take to assist you in finding a resolution to this problem.

Regards,  
Jim Lane

Submitted on behalf of Rachel Mertz (RLMertz@modjeski.com), Modjeski and Masters, Inc.

Received e-mail:

=====

I started with the first floorbeam definition, opened the sections tab (there was only one section defined for the first FB type), changed the top flange, web, and bottom flange material to carbon, hit Apply then OK.

Minimized that floorbeam definition and went to the next one. It has two section types. Started with the first one. Changed the top fl, web, and bottom fl material to carbon, hit Apply then OK. Opened the second section type. Tried following the same steps but that is when I got the runtime error.

**Complete Issue Information**

=====

A workaround for now is not to use the Apply button in the Cross Sections window. The OK button will save the Carbon material to the cross section and close the window.

FROM: Joseph Ihnat DATE: 6/21/2010 10:53:29 AM Eastern Daylight Time  
Same as 9548. This is fixed for version 6.2.

**Description**

FROM: Tim Armbrecht DATE: 6/18/2010 12:43:53 PM Eastern Daylight Time  
From my consultant. Let me know if you need a structure file or can replicate the problem based on his description below. Note that this is not related to the beta testing.

This is a problem that's been present at least starting with Virtis 6.0. After doing a truss analysis, certain truss output reports will not display when attempting to open them through the "View analysis output" function. It is still occurring in Virtis 6.2 Beta 2. The only reports that open are the first and last, "Live Load Analysis Summary" and "Log File".

The reports may be viewed by using Windows Explorer and finding the files.

Tim Souther, PE

FROM: Herman Lee DATE: 6/18/2010 1:55:03 PM Eastern Daylight Time  
Below is copied from the Analysis Output Help topic. Please see whether this fixes the problem. Thanks.

Internet Explorer needs to be the associated application for opening xml files on your computer.

- 1) Right-click on any xml file in Windows Explorer.
- 2) Select Open With - Choose Program
- 3) Select IE in the list, also check "Always use the selected program...", click OK.

FROM: Tim Armbrecht DATE: 6/21/2010 10:44:59 AM Eastern Daylight Time  
Herman, thanks, your solution worked. However, is there a reason why the default browser isn't always selected? Why do we need to associate a program with these particular xml files when we don't need to do this step with other xml files in V/O?

FROM: Herman Lee DATE: 6/22/2010 12:05:31 PM Eastern Daylight Time  
I think the other files (Live Load Analysis Summary and Log File) has txt as the file extension. Those txt files will be opened by Notepad. Some users reported the same issue after they installed Windows Updates. The program associated with xml files switched from Internet Explorer to Microsoft Office XML Editor.

## Complete Issue Information

Under the floorsystem geometry for a FSG system, under the Computed Stringer Reactions tab, when I try to accept the new reactions, a new column titled "K" appears. Reactions are not accepted if this column is not filled in. The help section does not mention this variable. Do you know what it is? Thanks.

RACHEL L. MERTZ, PE, SE | Project Engineer

Modjeski and Masters, Inc.

-----  
I have confirmed this problem in both Virtis 6.1 and 6.2 Beta 3.  
Here it is in detail (RE: 0010019.xml, Virtis 6.2 Beta 3):

- Go to Floor System Geometry / STRINGER UNIT LAYOUT / Stringer Unit 1 Layout.
- Open Computed Stringer Reactions, examine and close.
- Do an analysis on each of the stringers, S1 through S5.
- Open Computed Stringer Reactions.
  - o Check the boxes under the Accept New Reactions column for Stringers S1, S3 & S5 (or, just click <Select All>) Note that the values for these stringers under the New Computed Reaction (kip) column are in red since they are different from the Previous Computed Reaction (kip) column values.
  - o Click <Apply> The new reaction values have replaced what was formerly in the Previous Reactions column and there is now an additional column with a top row heading labeled "K". There is no reference to the meaning or purpose of this column.
  - o Click <OK>.
- Open Computed Stringer Reactions again. The Computed Stringer Reactions table is displaying exactly as it was before the attempt to apply the new computed reactions with the former values back in the Previous Computed Reaction column and the red values back in the New Computed Reactions column. (Note: The same happens if <OK> is clicked instead of <Apply>.)
- Close, save and then re-open the model, then re-open the subject Computed Stringer Reactions. The table is now the same as it was before the analyses were previously performed on the stringers.

This presents two problems:

1. There appears to be no way to update values for the stringer reactions when changes have been made to the Virtis model.
2. The column "K" is mysterious.

Tim Souther, PE  
IDOT Local Bridge Unit

Note that this was discovered in my consultant's (Mertz) 6.1 version - not related to beta, though it has been confirmed that the problem exists in the 6.2 beta. However, Tim Souther believes this actually may be related to VI 7980.

FROM: Tim Armbrecht DATE: 6/25/2010 10:50:49 AM Eastern Daylight Time

Please note that this is a bridge that is currently in production. Rachel has to put this on hold because she can't delete the incorrect stringer reactions. Here is her followup:

-----  
Tim,

If we delete key results folders from the previous analysis, do you think this would reset the dead load reactions for the stringers and allow the reactions to be recalculated and used for an updated or

4/19/2016 3:23:20 PM

HRS AASHTO

2919

**Complete Issue Information**

revised model?  
-----

If it needs to wait until after July 1, fine, but after that, she will need a workaround or patch in order for her to complete her work for me.

FROM: Herman Lee DATE: 6/26/2010 8:20:20 PM Eastern Daylight Time  
I removed all the stringer reactions in the 6.1 bridge XML file received from Tim and sent it to Rachel so she could complete her work for IDOT.

FROM: Joseph Ihnat DATE: 6/6/2011 1:41:00 PM Eastern Daylight Time  
Found this to be working OK in 6.3 beta 3. Probably fixed by 10686. Also see 10452.

FROM: George Colgrove DATE: 6/6/2011 1:49:59 PM Eastern Daylight Time  
Analysis of bridge ran to completion

Problem above as reported by Joe has been fixed. The behaviour is as expected.

Verified fixed for 6.3 Beta 3

### Description

FROM: Todd Thompson DATE: 7/28/2010 12:49:41 PM Eastern Daylight Time

I'm reviewing the analysis of a simple span, non-composite steel girder system bridge. And I noticed an odd warning/error message in the Virtis LRFR Log file.

It states that:

Warning - Tributary Area was selected for Stage 1 dead load distribution method on the Superstructure Loads window DL Distribution tab!

Warning - The Parapet load of a Parapet location entered on the Structure Typical Section window Parapet tab is zero!

Warning - The Parapet load will not be applied!

Warning - Tributary Area was selected for Stage 1 dead load distribution method on the Superstructure Loads window DL Distribution tab!

Warning - The Parapet load of a Parapet location entered on the Structure Typical Section window Parapet tab is zero!

Warning - The Parapet load will not be applied!

I've reviewed the parapet load and how it's applied and everything looks ok. So I'm trying to figure out why it is not being applied.

I have option "by Tributary Area" chosen.

If I try "transverse simple span" -

4/19/2016 3:23:20 PM

HRS AASHTO

2922

## Complete Issue Information

Warning - Simple Beam Analysis was selected for Stage 1 dead load distribution method on the Superstructure Loads window DL Distribution tab!  
Warning - The Parapet load of a Parapet location entered on the Structure Typical Section window Parapet tab is zero!  
Warning - The Parapet load will not be applied!  
Warning - No load cases are specified for Stage 2 Model Span superstructure!

If I try "transverse continuous" option -  
It fails even faster  
Cannot compute deck dead load by continuous beam analysis!  
11:46:31 AM - Line 9215 in source file .\DoGirderSystemStructDef.cpp.

So I guess I'm struggling figuring out why the parapet load isn't getting picked up correctly or why the Continuous Beam Option fails.

FROM: Herman Lee DATE: 8/11/2010 11:15:43 AM Eastern Daylight Time  
When a dead load component on the typical section doesn't have any load distributed to the analyzed member, a message will be outputted to the analysis log.

The "Interior Rolled Girder W 27 x 114" member alternative is the Simple G2 member (first interior) in the "Single 41'-0" Span, 5 Girder System". When Tributary Area distribution is selected, both parapets don't have load distributed to the Simple G2 member. Two set of messages are outputted to the analysis log. When Simple Beam Analysis distribution is selected, the right parapet doesn't have load distributed to the Simple G2 member. One set of message is outputted to the analysis log.

The continuous beam analysis is not supported. Since the load distribution computation is performed in the domain, the AASHTO FE Engine needs to be implemented at the domain level in order to support the continuous beam analysis.

I'm changing the Category of this incident to Maintenance.

FROM: George Colgrove DATE: 8/31/2010 10:57:01 AM Eastern Daylight Time  
Will the Parapets be applied at the deck concrete placement? Usually the parapets are placed after the deck has cured. You have used DC1 for the parapets. Should you use DC2? This would be the case if the parapets are placed after the deck is cured.

I added a DC2 load case for stage 2 and moved the parapet load to DC2. The parapet load was included in the loadings. I did not add any shear studs for the deck or the like and this maintained the non-composite section properties, even though it says composite section stage 2 in the drop down for the load descriptions.

FROM: Todd Thompson DATE: 8/31/2010 1:51:55 PM Eastern Daylight Time  
My Beta 5 has expired so I can not check this out. Will do with Beta 6. (My 6.1 doesn't do Steel Virtis LRFR).

I did check with Brass LFR and that does not work as described.  
If I add a DC2 load case and assign the parapet loads to DC2  
Exterior Girder still gets the entire parapet load  
Interior Girder gets (5 girders) 2/5 of the parapet loads

4/19/2016 3:23:20 PM

HRS AASHTO

2923

**Complete Issue Information**

So Brass LFR really gets messed up when you do it this way.

So at a minimum, this workaround would produce odd results with LFR. Long-term solution really needs to have the ability to uniformly distribute these loads to all girder lines and not just exterior girders.

These parapets are placed on cured concrete.

FROM: Todd Thompson DATE: 9/7/2010 10:45:01 AM Eastern Daylight Time  
Checked with Beta 6 - Brass LFR still gets all messed up doing this work around approach.  
Still need a long-term solution.

FROM: Herman Lee DATE: 3/27/2015 2:33:16 PM Eastern Daylight Time  
Specifying user-defined DL distribution by percentage has been implemented in the 6.7 release.

### Complete Issue Information

continuous configuration. Later, a simple span group definition was added but the Floor System Geometry tab would not allow a change from a two span continuous group definition to a simple span group definition. If the last unit was changed, there were no error messages, but the last bay did not have any stringers in it. If any other units were changed there were several error messages and the user could not exit this tab until the stringer unit was changed back.

Thanks,  
Daniel

FROM: Herman Lee DATE: 8/12/2010 8:56:05 AM Eastern Daylight Time  
Robert Fulton gave me the attached bridge for this incident in last week User Group Meeting.

Below are the steps to replace the first two span continuous unit with 2 simple span units in the Span 5 superstructure definition:

1. In Superstructure Definition window, change Number of stringer units from 25 to 26.
2. In Floor System Geometry window, select S10 and End of Previous Unit for Unit 26.
3. Change Unit 16 from S10 to S31  
Change Unit 14 from S31 to S33  
Change Unit 13 from S33 to S31  
Change Unit 11 from S31 to S10
4. Change Unit 1 from S10 to S51  
Change Unit 2 from S10 to S51
5. For all the stringer member alternatives in Stringer Unit 1 and 2 Layouts, change the stringer definition from S10 to S51.

This is an existing issue in 6.1 Release. I'm changing the Folder to /Support Center.

FROM: Jeff Ruby DATE: 8/11/2010 10:27:00 AM Eastern Daylight Time

As an enhancement it would be nice to be able to enter a user specified value for flange lateral bending stress,  $f$ . Currently Virtis/Opis only calculates flange lateral bending stress for the wind load. Once Virtis/Opis can handle curved girders or large skews with 3D analysis, this will be taken care of. Until then, it would be nice to be able to input a flange lateral bending stress for use in the applicable equations. See Article 6.10.1.6 and commentary for reference.

To: Ordoobadi, Mehrdad; Withers, Richard  
Cc: Bridgeware,  
Subject: RE: Virtis/Opis issue 10215

Good Morning Richard,

I think that I may have found what is causing the problem with deleting the bridge (BID = 751) from your Virtis/Opis database:

Values for the columns LENGTH and KMPOST in table ABW\_OVERFLOW have too many digits beyond the decimal point. Please open the attached file "PONTIS\_ABW\_OVERFLOWData.html". You can see that the values for these columns are 174.49000549316401 and 13.019000053405801 for OVERFLOW\_ID = 60 (this corresponds to bridge BID = 751). There are more bridges like this for example the following bridges:

| BID |
|-----|
| 10  |
| 11  |
| 12  |
| 15  |
| 16  |
| 30  |
| 31  |
| 32  |
| 33  |
| 96  |
| 97  |
| 754 |
| 767 |
| 696 |
| 881 |
| 889 |
| 762 |
| 778 |

I suggest that your database administrator (DBA) run the following SQL Script file to round the values in LENGTH and KMPOST columns to 4 decimal places. Please ask you DBA to backup the database before making these changes.

```
UPDATE abw_overflow SET length = ROUND(length, 4), kmpost = ROUND(kmpost, 4);
```

## Complete Issue Information

Regarding the other bridge (BID = 746) there may be a different problem. Could you please send me the error message that you get from Virtis/Opis when deleting bridge 746.

Thanks,  
Mehrdad

FROM: Mehrdad Ordoobadi DATE: 10/8/2010 1:11:18 PM Eastern Daylight Time

From: Ordoobadi, Mehrdad  
Sent: Friday, October 08, 2010 2:14 PM  
To: 'Withers, Richard'  
Subject: RE: Virtis/Opis issue 10215

Richard,

I have investigated the problem with modifying and deleting some bridges in your database and have found the cause of this issue. It happens with some of the bridges that have non- empty values in the Latitude and/or Longitude fields in the bridge description window. This appears to be happening only when using an Oracle database. We have determined what needs to be done in the Virtis/Opis software to resolve this issue. But this will be corrected in the next release of Virtis/Opis software that is scheduled to be released next Summer. We have developed a work around that will help you avoid these types of errors.

The problem happens with some values (but not any value) in the latitude or longitude field. These fields can have real values with two decimal places. But when Virtis/Opis reads some of the values the values that is read is slightly different. For example the value in the database is 89.85 but Virtis/Opis reads it as 89.950000000001. To make the story short, When you update or delete the bridge Virtis/Opis is not finding the row in the ABW\_OVERFLOW table that existed before because it is looking for a row that has a value of 89.950000000001 in it and it does not exist. This causes the delete or update to fail.

Here is the work around.

OPTION 1 – I have noticed that you have values in the latitude or longitude columns in ABW\_OVERFLOW table just for 11 of the bridges in your database. If it is acceptable to you and your organization I suggest that you make those fields empty. Your database administrator can run the following SQL script to make those fields empty for all Virtis/Opis bridges. Note that this will not affect any Pontis bridge data.

```
UPDATE abw_overflow SET longitude = NULL, latitude = NULL;
```

OPTION 2 – This is a more conservative approach. Whenever you have a problem with a bridge, you can ask your DBA to empty the latitude and longitude columns just for that bridge. Here is a sample SQL script that your DBA should run if you needed to fix bridge with BID = 801:

```
UPDATE abw_overflow SET longitude = NULL, latitude = NULL WHERE overflow_id = (select overflow_id FROM abw_asset_xref WHERE virtis_bridge_id = 801 OR opis_bridge_id = 801);
```

For another bridge the script should be modified. The two instances of 801 in the above SQL script should be replaced with the BID of the bridge that you want to fix.

Please let me know if you have any questions or concerns.

Regards,  
Mehrdad Ordoobadi

Mehrdad,

We went ahead with option 1 and it appears to have corrected the problem. Thanks for your assistance with this.

Richard

FROM: George Colgrove DATE: 8/26/2010 10:05:22 AM Eastern Daylight Time  
I think there should be a special install branch that just installs the database and not the software. If the software was already installed, it would be good to have an install path that only installs the database and related software, if necessary.

FROM: Herman Lee DATE: 8/26/2010 11:08:19 AM Eastern Daylight Time  
Uncheck all boxes in "Select Features" during installation will just install the database. Please let me know if you want this to be an enhancement request for making this option more clear.

FROM: George Colgrove DATE: 8/26/2010 11:35:37 AM Eastern Daylight Time  
Yes, please make this an enhancement to make more clear. Currently, this represents an undocumented feature and it is not apparent to the user.

### Description

FROM: Tim Ambrecht DATE: 8/26/2010 2:51:23 PM Eastern Daylight Time  
From one of my consultnats (Souther):

Regard to entry of schedule-based bent reinforcement bars in reinforced concrete members:

- The Help for the entry of "Distance" for schedule based entry of Types 2 and 3 bent reinforcement could be more clear. (In the Help, see Girder Profile: Reinforcement. Since it is required vertical placement within the beam must be according to the of the end (Item "A") portion it should be so stated in the text. They are shown this way in the diagram, but this could be (and has been) interpreted as merely possible or suggested examples and not requirements. (A possible program enhancement would be to enable Distance entry for bent bars to be according to the distance of the middle portion from either the top or bottom of the beam.) Also, there should be an example diagram for Type 2 bent reinforcement bars.

Recommended modified text is as follows –

Distance

Enter the distance from the centroid of the reinforcing steel described in this row to the location selected in the "Measured From" column. Distance for Bent Type 3 bars is measured from the end section of the bar and for Type 2 bars from the middle portion. The reinforcing steel is assumed to be parallel to the location selected in the "Measured From" column as shown below.

An export file that can be used for this is "BentRebarIssues - 0760019 (6.2 Beta5).xml".

FROM: Herman Lee DATE: 8/27/2010 6:53:33 AM Eastern Daylight Time

I think it's a good suggestion to add a figure for Type 2 bar. Adding a sentence for Type 2 and Type 3 bar are necessary for satisfying 508 requirements.

In the Analysis Settings window, I would like to have the ability to click one truck, then press shift, and select another truck down the list which then highlights the trucks between the two clicks in the list. By clicking on the "Add to Permit" button, it will send all highlighted bridges.

The same would be true, by clicking on several trucks while pressing the control key on the key board. This will make this list work like most Windows software.

## Description

FROM: Herman Lee DATE: 8/27/2010 3:41:47 PM Eastern Daylight Time

To reproduce:

1. Open TrussTrainingExample.
2. Select "Truss 1" and click on the "View schematic" button (see attached).

If I open the Truss window, verify the truss and cancel out the truss window, I'm able to view the truss schematic.

FROM: Herman Lee DATE: 8/31/2010 9:00:40 AM Eastern Daylight Time

This issue can only be reproduced using the TrussTrainingExample in Oracle database. There are characters at the end of each truss command line that the truss parser doesn't recognize. If I open the truss command window, hit delete and enter at the end of each line, the problem is fixed.

This issue is not critical for 6.2 release.

### Description

FROM: Tim Armbrecht DATE: 9/3/2010 2:36:43 PM Eastern Daylight Time

My consultant (Souther) make some good points about the functionality of entering bearing stiffeners in 6.1. I think these are functionality bugs:

There are a few user friendliness issues regarding shear & bearing stiffener entry that should be addressed:

1. When either a Transverse or Bearing Stiffener Definition window is opened the cursor focus is on the <OK> button instead of the first data entry position. It takes four tabs or use of the manual pointer device to move the focus to where data entry can take place. (Also, there may be other incidences in Virtis/Opis where the opening focus should be moved to the most common starting point of a window.)

2. In the Bearing Stiffener Location data entry window, when "1" is entered for "Pairs of bearing stiffeners at this support =", the entry for "Offset (in)" value should be defaulted to "0.0000". For a single pair of bearing stiffeners that is nearly always the offset value. Currently, if left blank, the following error is returned when doing an analysis,

"Error generating LFD/ASD schedule commands!

For Support No. 1, the offset for a bearing stiffener pair is not specified!

Error generating STIF-BEAR-SCHEDULE or STIF-BEAR-GROUP commands!"

An alternative to having Virtis automatically enter "0.0000" is for a null entry in the field to be considered by Virtis to be zero.

3. The Stiffeners between Diaphragms window (opened from the Stiffener Ranges window) cannot be size adjusted (under window view) in order to be able to view all (or at least, more) of the data. Scroll bars must be used. Window resizing should be added to this window.

**Complete Issue Information**

Error updating database record set.

[bridge is attached to this incident]

FROM: David Koenig DATE: 9/8/2010 9:01:53 AM Eastern Daylight Time  
This may be similar to Incident 9860, which we submitted back in May, which has not been addressed.

FROM: Mehrdad Ordoobadi DATE: 9/27/2010 11:35:12 AM Eastern Daylight Time  
The problem is caused by a value of 100 in the TRUCKPCT field. The database field accepts a 2 digit integer 0 to 99.  
Mike, please enter a number between 0 and 99 for the Truck PCT field in the Traffic tab of the bridge window.

If the user should be allowed to only enter values from 0 to 99 then the Data Dictionary should be updated to accept only values between 0 and 99. Currently it accepts values between -1 and 100. In resolving this issue, we should consider existing bridges in the clients' databases and bridge descriptions in XML or BBD file format.

If the user should be allowed to enter a value of 100 in the truck PCT field, we can fix the issue by changing the data type for the TRUCKPCT column to numeric(3,0) and then changing the data dictionary to accept values between 0 and 100. We should coordinate this with the Pontis team to see if this is an acceptable change to the structure of the Pontis database.

Secondly, the computation of the values in the Traffic tab is very annoying. It pops up a message whenever a field is selected. It should only ask the user when some value has changed.

FROM: Mehrdad Ordoobadi DATE: 9/27/2010 1:16:55 PM Eastern Daylight Time  
This does not appear to be related to 9860.

FROM: Mehrdad Ordoobadi DATE: 2/2/2011 8:37:10 AM Eastern Standard Time  
Changed the upper limit for the TRUCKPCT field to 99 instead of 100.  
Fixed for 6.3.

FROM: Mehrdad Ordoobadi DATE: 4/8/2011 1:42:45 PM Eastern Daylight Time  
Modified the version conversion and migration scripts to change the values in the TRUCKPCT field to 99 if they are greater than 99.

**Description**

FROM: Doug Horton DATE: 9/10/2010 9:27:15 AM Eastern Daylight Time  
VDOT is currently using Virtis 6.1 in local, standalone mode while we are updating our combined production database. We are using SQL Server Express 2005 as shipped with the install package. We have recently experienced several instances where Virtis works fine one day and then will not access the local databases the next. The error is something like "Unable to connect - SQL Server not installed or access denied". While this is not the exact message, it gets the point across - SQL Server is not functioning correctly. NO changes were made in any of the cases where this occurred. We have backups of the existing local databases, so we can add them back into the system. We tried the following:

- 1: We searched Microsoft and this database for possible solutions. Incident 9585 did not help as neither of the two conditions existed. Microsoft suggestions also did not correct the problem
- 2: Reinstallation of SQL Express 2005 was performed outside of the V/O install but the existing databases could not be accessed
- 3: The V/O 6.1 Install disk was used to load V/O and SQL Express 2005. The existing databases were

4/19/2016 3:23:24 PM

HRS AASHTO

2948

## Complete Issue Information

NOT overwritten. Virtis would still not open the existing databases.

2: We

FROM: Doug Horton DATE: 9/10/2010 9:55:39 AM Eastern Daylight Time

4: We then used the install disk to reinstall V/O and SQL Express, overwriting the existing databases. Virtis worked fine with the newly created blank databases.

5: We replaced the new databases with the previous databases and tried to access them without success (See ErrorMessage1)

6: We generated a new ODBC entry for the previous databases and tried to access them without success (See ErrorMessage2) - Based on the schema error, Virtis 6.1 was reregistered but this did not solve anything.

Is there something that V/O does when databases are added which makes their signatures or whatever unique?

Any suggestions would be appreciated. We can provide the database and log files for one of the previous databases if needed (Too large to upload - got caught in loop).

FROM: Joseph Ihnat DATE: 9/10/2010 10:38:19 AM Eastern Daylight Time

If it's working fine one day and then stops working, there's nothing in Virtis that will cause it to stop working.

I've seen two causes of the "Unable to connect - SQL Server not installed or access denied" error:

1) The SQL Server service may have stopped running (Windows Update may cause this). Open the SQL Server Configuration Manager and make sure the SQL Server (MSSQLSERVER) service is running and the start mode is set to Automatic.

2) Changing the computer name will cause this error and then the ODBC connection will need to be reconfigured.

ErrorMessage1 and ErrorMessage2 were not caused by VirtisOpis. These are SQL Server procedures that need to be performed a certain way.

For procedure (5) above, you should use SQL Server Management Studio to take the database offline, then copy in the new database files, making sure they're not readonly, then bring it back online.

FROM: Joseph Ihnat DATE: 9/10/2010 11:12:51 AM Eastern Daylight Time

I see that 9585 already explains my two causes above. I haven't seen any other cause. Will have to investigate.

### Description

FROM: Tim Armbrecht DATE: 9/15/2010 12:32:45 PM Eastern Daylight Time  
From one of our designers:

Tim,

AASHTO Table 4.6.2.2.2b-1 (page 4-36) clearly states that the formula given is "Regardless of the number of loaded lanes". We think the distribution equations depict a best fit line from a set of research data points and AASHTO is aware that these equations can yield a slightly higher distribution factor for one lane loaded than two lanes loaded. This is odd however the difference is so miniscule they just direct you to use the same equation regardless of the number of loaded lanes.

Tim Souther was rating a structure for a one directional permit load so he entered a single lane on Virtis and noted the higher distribution factor for a single lane. See the attached Virtis computed LLDF for adjacent box beams. In my opinion, if Virtis was following the AASHTO code on this issue they wouldn't permit a single lane to be entered and/or show a comparison of the two. This only causes confusion among designers and gets them questioning the validity of the equations.

Kevin

I think Kevin and Tim Souther are suggesting that it is not reasonable for a single lane distribution to be higher than a two lane distribution. If a load rater had to choose between the two, he/she would

4/19/2016 3:23:25 PM

HRS AASHTO

2952

## Complete Issue Information

choose the two lane factor even if the intent is to run the vehicle on the bridge by itself. Since the situation described in the table says "regardless of number of loaded lanes", Virtis should be fixed so the the one lane and two lane are the same in this situation. Tim.

FROM: Krisha Kennelly DATE: 9/15/2010 1:33:07 PM Eastern Daylight Time

For the LFD load factor calcs, Virtis follows Std Spec Article 3.23.4.3 to compute the distribution factor. It is computed as  $S/D$  where  $D$  is a function of the number of lanes. Virtis computes the single lane DF using 1 lane and the multi lane DF using the total number of lanes on the structure. This article does not place restrictions on the single lane DF having to be less than the multi lane DF.

For the LRFD spec, the  $D$  value used to compute the DF is also a function of the number of lanes. Opis computes  $D$  using 1 for single lane and the number of lanes on the structure for the multi-lane. There is no restriction on single lane having to be less than multi lane.

I think AASHTO says 'Regardless of Number of Loaded Lanes' to simply distinguish that this structure type always uses the same equation  $S/D$  as opposed to other structure types that have 1 equation for single lane and a different equation for multi lane. Since the equation for  $D$  includes the number of lanes in it I think it should be evaluated for both single and multi lane.

(The attached document shows the Standard Spec LL distribution factors. Above discussion from Kevin references the LRFD specification.)

FROM: Krisha Kennelly DATE: 9/15/2010 3:25:10 PM Eastern Daylight Time

FROM: Tim Ambrecht DATE: 9/15/2010 3:53:38 PM Eastern Daylight Time  
Krisha, OK, thanks.

FROM: Krisha Kennelly DATE: 9/22/2010 3:08:59 PM Eastern Daylight Time  
email received 9/17/10

Tim,

We agree that the  $D$  value is a function of the number of design lanes. The AASHTO LRFD Bridge Design Specifications specifically defines the terms to be used in determining the distribution of loads. At the bottom of page 4-28 of AASHTO it states "The following notation shall apply to tables in Articles 4.6.2.2.2 and 4.6.2.2.3". Within the list of variables you will find a definition for  $NL$  as follows, " $NL$  = number of design lanes as specified in Article 3.6.1.1.1". In the text of Article 3.6.1.1.1 it defines the number of design lanes based on clear roadway width alone. There is no mention of the number of loaded lanes being used. We think there is an intentional distinction between design and loaded lanes.

We ran some numbers to see what happens if you assume  $NL$  to be defined by "loaded lanes" instead of "design lanes". Specifically we were looking to compare the distribution factor obtained using the maximum number of "loaded lanes" verses the least number (1) of "loaded lanes". The results appear to show that the distribution factor went slightly up when using the least number of loaded lanes. This seems odd and contrary to engineering judgment which tends to lean us towards using the current definition in the LRFD code as spelled out above that the number of "design lanes" should be used for determining  $NL$ .

Since our original inquiry we have discovered in Article 4.6.2.2 that if one lane is loaded with a special vehicle or evaluation permit vehicle, the design force ... is determined according to 4.6.2.2.5. This addresses our original condition that was related to a permit vehicle. It is interesting to note from

4/19/2016 3:23:25 PM

HRS AASHTO

2953

## Complete Issue Information

equation 4.6.2.2.4-1 that if all other routine traffic were restricted from the structure when a permit load crossed, the force effect distribution from the permit vehicle alone would be less than a single lane loaded. This also seems to support our stance. What do you think?

email response sent 9/22/10:  
Hi Tim,

I agree with their interpretation. We can make this change for 6.3. For Load Factor, we will revise the bending moment distribution factor to use the number of design lanes for both the single and multi lane distribution factor calculations.

For LRFD, Opis assumes concrete box beams are Superstructure Type "f" in Table 4.6.2.2.1-1. This leads them to a different equation for the LRFD distribution factors.

In LRFD, the S/D calculation is used by Opis for precast tee beams. In that calculation, Opis is currently using the number of design lanes for both the single and multi lane calculations. Therefore, no change is required to the LRFD distribution factors.

I'll make note of this in the incident.

Krisha

One is allowed to enter a strand pattern outside the girder cross section. Please reference the picture.

Thanks,  
Daniel

FROM: Herman Lee DATE: 10/7/2010 6:53:01 AM Eastern Daylight Time  
Virtis/Opis allows the strand grid (PS Beam window Strand Grid tab) and the PS shape to be specified independently. Please note that the purpose of the strand grid is to specify the possible prestress strand locations, not all strand grid locations need to have a prestress strand in the Strand Layout window.

Below is copied from Virtis/Opis Help's Strand Layout topic:

=====

**U Beam Strand Positioning Method**

The first row (measured from the bottom of the cross section) grid positions are centered about the centerline of the cross section. The first row is assumed to be in the bottom flange. The available grid positions are spaced horizontally based on the input spacing. The first row establishes the boundary for all rows below the top flanges. The first and last spacing of grid positions in other rows located in the bottom flange are based on the input spacing of the first row, the vertical distance to the first row, and the outside wall slope. Grid positions located in rows located in the top flanges are centered about the boundary established by the first row.

The following issues were noticed in LRFD article 6.10.11.2.4:

4/19/2016 3:23:27 PM

HRS AASHTO

2961

**Complete Issue Information**

- The MOI calculated for each stiffener plate is from the face of the web ( $b \cdot h^3/3$ ) and not the centerline of the web.

- The offset of a stiffener from centerline doesn't seem to be taken into account when the web strip is calculated. Currently,  $9 \cdot tw$  is compared to the distance from the centerline of the bearing group to the end girder distance. This is incorrect if the user has specified an offset for the stiffener.

- If the web strip is reduced on one side due to the nearness of the member end, the opposite side is also reduced. The opposite side should be  $9tw$ .

### Description

FROM: Krisha Kennelly DATE: 10/27/2010 10:12:34 AM Eastern Daylight Time  
In the release 6.2, a and b are printed out instead of "Comp" and "Tens".

Programmer notes:

But in 6.3 debug I see "Comp" and "Tens".

Please investigate so 6.3 release will show the words and not the letter for this article as well as the LFD articles.

FROM: Wayne Skow DATE: 10/27/2010 2:22:27 PM Eastern Daylight Time

The problem code was heavily nested. I removed the nesting and that cleared the problem up. The nested code must have confused the optimizing compile.

FROM: Srujana Thogaru DATE: 3/31/2011 4:39:05 PM Eastern Daylight Time

Release version of 6.3 Alpha 6 still shows a and b. Please reinvestigate.

FROM: Wayne Skow DATE: 4/4/2011 1:07:44 PM Eastern Daylight Time

this time i had to add the enumeration description to the enum StressType ([EnumDescription ("Comp"))).

FROM: Srujana Thogaru DATE: 4/12/2011 11:09:01 AM Eastern Daylight Time

Tested and found to be fixed for 6.3

**Description**

FROM: Jeff Olsen DATE: 11/1/2010 6:50:41 PM Eastern Daylight Time  
Prestressed I beams that are used as deck beams are type "j" beams according to AASHTO Table 4.6.2.2.1-1. In the Library Window for the Prestressed I Beam shapes there is a check box to designate that the beam is a deck beam. According to the AASHTO code this should designate the beam as a type "j". The distribution factor calculations in the output file show that a type "k" beam is designated. This is incorrect. Furthermore, the designer needs to designate whether these "j" beams are connected sufficiently to act as a unit or only to prevent relative displacement. There needs to be an additional button or check box to designate how the beams are connected. This designation needs to

4/19/2016 3:23:27 PM

### Description

FROM: Dean Teal DATE: 11/16/2010 9:12:23 AM Eastern Standard Time

In the attached PS bridge, Member 2

Using Virtis LRFR Design Load Rating

I have selected User Defined POI only at midspan of the span 1 and 2

Perform rating and review results

I find a rating for the 90% Truck pair + lane rating location not at my user defined POI but instead at the ends of the beams.

The control doesn't appear to be working – is there a work around?

FROM: Herman Lee DATE: 11/16/2010 4:56:29 PM Eastern Standard Time

Continuous span support locations, simple span support locations and mid span locations of simple spans are always added for spec check without checking the Points of Interest control option.

I couldn't find a workaround for this defect in 6.2.

4/19/2016 3:23:28 PM

HRS AASHTO

2969

## Complete Issue Information

FROM: Dean Teal DATE: 11/18/2010 12:10:06 PM Eastern Standard Time

Then without a workaround i would have to consider this to be a bug

When the user requests information at a particular POI and gets results other than that POI then the program is not performing correctly and not giving the user what they asked for or what they expect.

FROM: Jeff Ruby DATE: 4/14/2011 8:14:50 AM Eastern Daylight Time

Testing for 6.3 Beta 1, I found this would greatly help if it would be possible to "turn off" ALL stress calculation, spec checks, etc. for all points except what is chosen as user POI. This is an unresolved incident in the mainenance plan for 6.3. The beta TAG discussed this issue Tuesday. Krishna mentioned "Not calculating" all points would be preferrable to "calculate all" and then only display what was requested. I agree, since performance (meaning it is very slow and takes a lot of memory) is an issue, especially with more than one truck.

The example I am thinking about is my 5-span, 850 ft steel bridge with 8 trucks. I had to give up after about an hour on my 2GB machine was using 1.5GB for Virtis LFR.

FROM: Krishna Kennelly DATE: 4/14/2011 1:32:15 PM Eastern Daylight Time

I don't think we can turn off all calculations and spec checks for points other than POI. For prestress we need to know the ps force at debond + transfer length, harp points, we need to know the loss at midspan, etc. For steel we need to know the moments and stresses at brace points, etc.

I was suggesting we turn off the rating articles at all points other than user defined poi's. Then we won't get any rating factors at points that aren't user defined poi's.

FROM: Krishna Kennelly DATE: 4/26/2011 2:59:19 PM Eastern Daylight Time

in 6.2 Release, if the user picks only "Generate at user-defined points" for the AASHTO LRFR engine:

1. Steel LRFR - rating factors only computed at POI's. Brace points and mid-brace points have only a few articles evaluated only to determine the stresses at these locations so Cb can be determined. Correct behavior.
2. RC LRFR - only user defined POI's are evaluated and rating factors are only computed here. Correct behavior.
3. PS LRFR - user defined POI's and prestress control points (simple span supports, midspan, harp points, debond + transfer lengths, dv points) are evaluated and rating factors are computed at these points. Incorrect behavior.

Fixed for 6.3, for prestress members if the user picks only "Generate user defined points" for any AASHTO engine, only those POI's will be evaluated and rating factors computed in the final round. The prestress control points are only considered in the first round where the Prestress Calculations occur.

FROM: Krishna Kennelly DATE: 5/4/2011 11:06:41 AM Eastern Daylight Time

Note that with this change you will only evaluate the critical shear location (dv from the support) when the "Generate at section change points" is selected.

4/19/2016 3:23:28 PM

HRS AASHTO

2970

**Complete Issue Information**

FROM: Bin Zhang DATE: 5/6/2011 1:33:53 PM Eastern Daylight Time

Verified in beta2 will the dll updates by May 6th.

1. If the I pick only "Generate user defined points" for any AASHTO engine, only those POI's appear in the stage 3 spec check
2. The prestress control points are only considered in the "Prestess Calculations" if I pick only "Generate user defined points" .
3. When the "Generate at section change points" is selected, the spec check works fine at the critical shear location (3.86 ft from the support in this case).

### Description

FROM: Dean Teal DATE: 11/16/2010 12:10:22 PM Eastern Standard Time

I think we missed adding a control option for PS concrete

5.14.1.4.6 Suggests two analysis methods for interior supports for simple span precast girders made continuous.

It states:

Alternatively, the top of the precast girders at interior supports may be designed as reinforced concrete members at the strength limit state. In this case, the stress limits for the service limit state shall not apply to this region of the precast girder.

And the commentary states:

This option allows the top of the girder at the interior support to be designed as a reinforced concrete element using the strength limit state rather than a prestressed concrete element using the service limit state.

We should have added a control option to ignore the service limit state

If a designer has chosen to ignore the service limit state and apply strength limit state as reinforced concrete, when you checking ratings in LRFR you may get a  $RF < 1.0$  controlled by service III near the pier with no way to ignore it or work around it (cannot set a POI farther from the pier, see VI 10294)

FROM: Dean Teal DATE: 11/16/2010 12:32:08 PM Eastern Standard Time

I think that BRASS ignore service III and only uses strength limit states near the pier

FROM: Krisha Kennelly DATE: 11/16/2010 2:23:39 PM Eastern Standard Time

10282 is related to this incident.

Just so I understand what is needed:

Following sketch is a 2 span ps beam made continuous. region B is the region over the pier where the beams are made continuous by the deck rebar and a CIP concrete diaphragm.

## Complete Issue Information

A

BBBBBB

A

^

^ ^

^

1. Right now, the AASHTO LRFD/LRFR engine does not check the stress limits in 5.9.4.2 for the points in between the simple span supports at a pier (region B). It analyzes those points as a reinforced concrete girder using the rebar in the deck for the flexural resistance. It also does not compute a rating factor for SerIII tensile stress there.

2. For the other points (region A), the Service III tensile stress is checked and a rating factor is computed. See the attached picture for the rating article. Is this the rating that you would like to be ignored? Over what length of region A near the pier should this rating be ignored?

FROM: Dean Teal DATE: 11/18/2010 11:57:21 AM Eastern Standard Time

Comments to your #1:

I know it doesn't compute a rating factor for Service III tensile stress between bearing points, but it does "at or near" the bearing point. This is a huge problem is for LRFR having it control when Service III should never control a rating. Ratings should be controlled by strength conditions. If I was to debond the first 10" of the strands, the issue would go away – that would be an ugly work around!

Comments to your #2:

Yes, the Service III rating near the pier is what I would like to ignore.

Over what region? – The code states at or near the support - not an easy answer, is 1' enough? The simple answer is to follow BRASS's lead on this, make a check box to ignore tension in the top of beam. This way the agency has choices. KDOT's policy is to design the negative moment over the pier as a strength I condition and we ignore the fact that there is tension in top of the PS beam.

The way things are for Virtis LRFR in PS right now – if I have Service III control at the pier with the Virtis engine - being I can't choose to ignore it and I can't change my POI's to exclude it - the only work around I have is to change to the BRASS engine.

FROM: Aaron Kemna DATE: 11/18/2010 2:31:50 PM Eastern Standard Time

In my experience in design, you will only need this option near the supports. I have never had a problem at the nearest 1/10th pt. Ignoring final tensile stresses at the top of the beam at all locations is probably the easiest fix as long as Virtis is doing strength checks for negative moment at all applicable locations.

FROM: Dean Teal DATE: 11/22/2010 7:53:15 AM Eastern Standard Time

Aaron - what would you consider "near the supports"? What distance?

FROM: Aaron Kemna DATE: 2/4/2011 4:53:52 PM Eastern Standard Time

I think it can be argued that the intent is for the negative moment region between contraflexure points, but don't quote me on that. In design I don't think I ever had an issue at the 0.1 or 0.9 tenth point. I believe the best solution is to ignore tension in the top of the beam for final loads or have an option.

FROM: Krisha Kennelly DATE: 2/22/2011 1:49:26 PM Eastern Standard Time

This control option is being added as per Task Force direction via email on Feb 17, 2011. It will be in Version 6.3.

See attached document for screen shot of the control option.

**Description**

FROM: Herman Lee DATE: 11/17/2010 4:13:06 PM Eastern Standard Time  
Submitted on behalf of Tim Ambrecht, IL DOT:

Below is the e-mail without embedded graphics. Please see attached PDF file for the e-mail with embedded graphics.

=====

The discussion below is in the context of the attached export, StrgrGrpProb6.2(0690016).xml. And, while it specifically is for a truss-floorbeam-stringer (TFS) system, the same would also apply to a girder-floorbeam-stringer (GFS) system.

I entered the stringers in a TFS system and afterward made a slight change to the floorbeam spacing (fr/30.10415' to 30.1'). When re-opening the Stringer Group Definition Geometry (SGDG) window for the previously entered "Stringer Group" the following message appeared...

This was expected, but after clicking <OK> and selecting the new Floorbeam Spacing, the system would not make the change. Subsequently, after clicking <OK> to close that window, and then re-opening it, the same error box appeared and I confirmed that the Floorbeam Spacing specified in the Stringer Group Definition Geometry window was not changed. I have worked around this by deleting the initial Stringer Group entirely and re-creating it. However, the fact that it can't be revised by simply clicking the new floorbeam spacing.

Additionally...

The reason I changed from 30.10415' to 30.1' also indicates a program bug. With the former value, when the SGDG window was opened, there were two "Possible Floorbeam Spacing (ft)" values, 30.1041 & 30.1042, not the single 30.10415 that should have been there. In addition, under "Floorbeam Spacing (ft)" in the table the value displayed was 30.1042 which, when selecting the 30.1041 value, would not change.

Note: The initial entry w/the Floorbeam Spacing = 30.10415' is represented by Superstructure Definition named "Span 1a TFS". The revised entry w/the Floorbeam Spacing = 30.1' is represented by Superstructure Definition named "Span 1b TFS".

**Complete Issue Information**

From my consultant (Souther) testing in 6.3B2:

RE: StrgrGrpProb6.2(0690016)-62.xml

Can't revise span length in Stringer Group. See Superstructure Definition, "Span 1a TFS". Stringer span options shown in Stringer Group (30.1041' & 30.1042') do not match the floorbeam spacing (30.10415'). See Superstructure Definition, "Span 1b TFS".

FROM: Geoffrey Trees DATE: 5/13/2011 10:42:45 AM Eastern Daylight Time  
The issue has not been resolved yet and the cause of the above behavior has not yet been determined.

FROM: Qiang Gao DATE: 6/7/2011 10:18:23 AM Eastern Daylight Time  
The problem is that the string comparison was used to determine whether the spacing pattern exists or not. For an example, 30.10415 could be rounded up to 30.1042 or 30.1041 due to some calculation error. If we don't consider the tolerance for double, the system would treat these two numbers as different spacing. Right now the prolem has been solved by considering a tolerance and using double comparison.

FROM: Qiang Gao DATE: 6/7/2011 10:27:55 AM Eastern Daylight Time  
It would be in 6.4 release.

FROM: Phil Litchfield DATE: 6/26/2012 4:51:09 PM Eastern Daylight Time  
Checked with 6.4 beta 1, and appears to be fixed.

FROM: Matt Kolis DATE: 8/29/2012 10:45:10 AM Eastern Daylight Time  
Verified in VO64 Beta 4.

### Description

FROM: George Colgrove DATE: 12/15/2010 11:12:49 AM Eastern Standard Time

This is to post a problem with VirtisOpis when running version 6.2 in Windows 7 with version 6.1 running in a XP Virtual PC.

When trying to copy a bridge element, material type or whatever from version 6.2 from the Win7 environment to version 6.1 in the virtual PC environment, version 6.1 in the virtual PC crashes. I was able to reproduce this repeatedly.

This would be monumental to fix. I think we should just document this for users who will use the same

## Description

FROM: Qiang Gao DATE: 12/29/2010 4:25:32 PM Eastern Standard Time

Problem 1: DoStringerMbrAlt->ComputeHaunchLoadPerUnitLength method always return 0 for floorline bridges.

Reason (could be incorrect): floorline and floorsystem use different tables to store the 'haunch\_dim\_type' data (the former uses 'abw\_super\_struct\_spng\_mbr\_alt', while the latter uses 'abw\_beam\_def'). During the haunch load calculation, only DoSteelXXXBeamDef classes are used to get the 'haunch\_dim\_type' data so that the category of haunch cannot be determined, which results in the width, and hence load, of the haunch will be always 0.

Problem 2: When run the analysis for floorbeam haunch load, it shows:

Debug Assertion Failed!

Program: C:\Working\virtis\_TFS\Main\Debug\VirtisOpis.exe  
File: c:\working\virtis\_tfs\domain\abognrl\dogetobjectfunctions.cpp  
Line: 4460

Reason: Try to 'GetDeckPanelRangeSetObject' in 'ComputeBmDefHaunchLoad' function, but it is not supposed to do so to floorline bridges.

Have a nice holiday! :p

Submitted on behalf of Mike Pichura (MPichura@mbakercorp.com), Michael Baker Jr., Inc.

=====  
It appears that Virtis does calculate the distribution factors (LRFD) for PS adjacent box beams correctly. However, the BRASS engine is calculating them incorrectly. The problem is with the St. Venant Torsional Constant, J. We believe it is only using one side for the s/t portion of the equation rather than all four. I attached a copy of a hand calculation. Would you be able to submit a report? I'm not sure if this is a problem for spread box beam bridges as well.  
=====

FROM: Brian Goodrich DATE: 1/10/2011 10:23:57 AM Mountain Standard Time  
The box beam is exported to BRASS as an equivalent I girder. Therefore, BRASS thinks the section is a stocky open section and calculates the torsional constant according to AASHTO LRFD C4.6.2.2.1-2.

The solution is to export the torsional constant from the Virtis beam shape on the DIST-CONTROL-LL-SPAN command.

=====  
For a PS adjacent circular voided box beam we believe both Virtis and the BRASS engine are calculating the St. Venant Torsional Constant, J incorrectly. See the attached hand calculations. We also verified our hand calculations with PennDOT's BSP program.  
=====

This issue for the BRASS engine is entered in Incident 10345.

## Complete Issue Information

FROM: Krisha Kennelly DATE: 11/15/2012 9:37:17 AM Eastern Standard Time  
The computation of J in Virtis uses Eq. C4.6.2.2.1-2 to match the BRASS implementation.

### Description

FROM: George Colgrove DATE: 1/13/2011 2:17:00 PM Eastern Standard Time

Calculating the Section Properties

For AASHTO LRFD/LRFR the engine is not subtracting the area of reinforcing steel from the concrete deck. It then adds the entire deck area (transformed) with the reinforcing steel thus doubling up on that area.

BRASS subtracts the area of the reinforcing steel from the deck area then it transforms the area of the concrete. We should do the same for the AASHTO engine.

FROM: Krisha Kennelly DATE: 2/15/2011 2:50:27 PM Eastern Standard Time  
Agree.

Notes for developer:

1. Let's discuss moving the xxx\_Stl\_Elastic\_Section\_Properties class to 1 location and then have each spec edition derive a class from that 1 location. The section properties aren't based on a spec edition.
2. Revise the Area of the transformed slab to remove the transformed area of rebar ( $-A_{reinf}/(m \cdot n)$ ). Keep the centroid of the slab as is, don't adjust it for the rebar removed.

FROM: Wayne Skow DATE: 2/18/2011 9:15:42 AM Eastern Standard Time  
Both 1. and 2. are complete.

For 1., I compared the 4 versions (LRFD 4th/2008, LRFD 5th, LFD 17th, ASD 17th. LRFD 4th/2009 and LRFD 5th/2010 inherit from LRFD 4th/2008 and LRFD 5th). There were a few differences where fixes were made in some but not in all versions. I merged the variations into a single class in namespace AbanSpec.Articles.AASHTO which all versions now inherit. The differences between versions are where the results are stored and that is taken care of in a version's constructor. Bug fixes are now made in Abanspec/Articles/AAASHTO/Article\_Stl\_Elastic\_Section\_Properties.cs and will be common to all versions.

When in the Spec Check Window can we program the escape key to be used to close the window?  
When we open the window and wish to close it we need to move the mouse to the OK button. This can take up a lot of time when having to do it over and over. If one were to put their finger over the escape key, then if they open the spec check window, then wanted to go to the next one, all they need to do is press the escape key and the window will close.

One could have the list of specs on one side and the spec window on the other, then they could just click on the spec of choice, but there are a lot of times having the spec window as large (i.e. full screen) as possible is advantageous.

This enhancement could be very low cost and could provide great benefit.

FROM: Brian Goodrich DATE: 1/26/2011 8:29:37 AM Mountain Standard Time

For a girder system structure definition, I copied a girder member alternative and pasted it within the same member. On the Factors tab, the LRFR checkbox and LRFR factors were not copied from the original. The LFD and LRFD factors copy fine.

FROM: Joseph Ihnat DATE: 1/26/2011 11:42:52 AM Eastern Standard Time

Looks like this is already fixed for version 6.3 (works OK in Alpha Build 2). I don't see an incident for it, though.

FROM: Joseph Ihnat DATE: 1/26/2011 12:32:08 PM Eastern Standard Time

While investigating this incident, I found a similar problem when the member alt is copied to another BWS. I fixed that problem for version 6.3.

FROM: Srujana Thogaru DATE: 3/31/2011 2:18:30 PM Eastern Daylight Time

Verified and found to be fixed for 6.3 Alpha build 6

We should add the database conversion step to the install process. Once the software is installed, the installer should ask the user if they want to update the database. If they do, the database manager should pop up allowing the user to update the database at the point of install. Very good if the install is for a single machine install.

From Bradley T. Jones PE, Bridge Engineer, KORDA:

I'd like to suggest that the analysis results be put in table form too. I figured out how to do the printing last week. You can also print out the analysis results using the same procedure, however, in order to print out the analysis you have to print out each separate DL and LL condition for each Limit State. That was a little too cumbersome but it can be done. It would be nice if that was included in a results output.

Brad

### Description

EROM: Dean Teal DATE: 3/2/2011 8:40:52 AM Eastern Standard Time  
Ran into some snags with the Alaska DOT and using the evaluation software

1. Can't handle enough girder lines to enter the Timber example we have. Needed 13 and limited to 8 I think (or something like that)
2. While entering structures we exceeded the number of structures you can have in the database

Are these things we should address?

FROM: Herman Lee DATE: 3/2/2011 9:28:16 AM Eastern Standard Time  
Maybe we need to revisit whether these limits are reasonable for evaluation purpose.  
Dean, do you have suggestions for the limit of a practical evaluation use?

Current program limitations listed in the release notes:

|                                          | Academic | Evaluation |
|------------------------------------------|----------|------------|
| Maximum number of spans:                 | 3        | 3          |
| Maximum span length:                     | No limit | 200 ft     |
| Maximum number of girders per structure: | 10       | 8          |
| Maximum number of bridges:               | No limit | 30         |

FROM: Joseph Ihnat DATE: 3/14/2011 3:08:45 PM Eastern Daylight Time  
Fixed for version 6.3

FROM: George Colgrove DATE: 4/7/2011 9:06:55 AM Eastern Daylight Time  
I was able to install VO 6.3 in both XP and Win7. Both went without a hitch. Both had sqlserver installed already.

I am created a new virtual machine and will installed VO along with SQL Server in that environment.

This new virtual box was a basic windows setup - with no dotNET, no SQLServer or any other supporting software that is needed for VirtisOpis. I installed the software from the provided ISO for

4/19/2016 3:23:33 PM

HRS AASHTO

2998

**Complete Issue Information**

Beta 1.

It installed:

dotNET 2.0 SP2, 3.0 SP2, 3.5 SP1, 4.0 Client Profile and Extended

SQLServer 2008, Browser, Native Client, Policies, Setup Support Files, VSS Writer

SQL Server Compact 3.5 SP1 English, Query Tools English

Microsoft Visual C++ 2010 x86 Redistributable

Microsoft Visual Studio Tools for Applications 2.0

Virtis Opis Version 6.3

The software installed with no errors or messages. This was installed in a virtual XP box with limited space so the aforementioned error would have been triggered. The software ran without incident.

**Description**

FROM: Krisha Kennelly DATE: 3/7/2011 1:57:57 PM Eastern Standard Time

The modular ratio, n, between the deck and beam was always being computed as Ebeam/Edeck even if the user had input a value for n in the UI. Now it will use the n value input by the user. If not input by the user, it will be computed.

Fixed for 6.3

FROM: George Colgrove DATE: 4/7/2011 9:26:53 AM Eastern Daylight Time

Verified fixed.

I checked the Area used in the FE model. This meant I had to turn on the FE models in the Analysis Settings:

>> Output tab, after analysis use eyeglass button to open the FE model for stage 2 or 3.

The Area of the beam includes the transformed concrete. I entered a drastically different value for n in VO 6.2 and ran AASHTO.

The composite girder area in the spec check was different than the area in the report.

In 6.3 I entered the same drastically different n and to see if the Area in 6.3 is different than 6.2.

The area in 6.3 obtained from the report matched the area in the 6.3 spec check article.

### Description

FROM: Doug Horton DATE: 3/14/2011 5:27:20 PM Eastern Daylight Time

We are experiencing a problem with 6.2 installation on a user PC. The install starts fine and seems to be working. It progresses through registering the files and then produces a message to reboot and restart the install. It never gets to the SQLExpress 2008 installation. Rebooting and restarting terminates in the same message to reboot.

We tried 6.1 to see if it could be something with the computer, however the 6.1 install ran fine and completed.

We have no idea what may be causing the install to loop as it appears to be doing.

We have installed it successfully on several other PCs.

If you have not seen this issue, then it may be PC specific and we will have to re-image. Any suggestions or guidance could be appreciated.

FROM: Joseph Ihnat DATE: 3/15/2011 7:47:25 AM Eastern Daylight Time

There's some problem with the OS on that machine, though not sure exactly what.

Here's a procedure that worked for another user:

Open the registry editor (regedt32) and navigate to "HKEY\_LOCAL\_MACHINE\SYSTEM\CurrentControlSet\Control\Session Manager". If there's a key named "PendingFileRenameOperations", rename it to "PendingFileRenameOperations\_".

**Description**

FROM: Weidong Shi DATE: 3/25/2011 5:27:10 PM Eastern Daylight Time  
OS: Windows XP sp2  
DB: MS SQL Server 2008 Express; Integrated DB (pontis5103 + viritis6.3)

Steps to reproduce the issue:

- select a bridge linked to a Pontis bridge (04 07603)
- go to Bridge Multimedia Attachments window
- select "Bridge" from Context drop down list
- there are 2 records shown in the attachment list and the first item is highlighted by default
- click Open
- the file could not be opened

However when selecting the second record, and then clicking the Open button, the corresponding file could be opened; and selecting the first record again, then the first file could be opened too.

**Complete Issue Information**

You can get the testing database at G:\USERS\WEIDONG\IntegratedDBForDebug

FROM: Herman Lee DATE: 3/26/2011 6:53:29 AM Eastern Daylight Time  
Please see whether this issue should be in Support Center instead of Alpha Testing.

FROM: Joseph Ihnat DATE: 3/31/2011 9:59:43 AM Eastern Daylight Time  
Changed folder to Support Center. Weidong was able to reproduce this in versiion 6.2 (probably always been like this).

FROM: Joseph Ihnat DATE: 9/20/2011 3:08:11 PM Eastern Daylight Time  
Fixed for 6.4.0

### Description

FROM: Krisha Kennelly DATE: 3/26/2011 1:25:28 PM Eastern Daylight Time  
found while testing shortened path names

line 8720 of UiAnalysisProgressDlg.cpp issues a message about being unable to open a log file. Please make it a more descriptive message that it can't be opened because the path + filename exceeds 260 characters.

eg, the SpecCheckController now issues the following type of message:

\*\*\*WARNING\*\*\* - SpecCheckResults output file cannot be created due to path and filename length of 261 exceeds maximum allowable size of 260 characters!  
Revise the output folder or Bridge, Structure, Member and Member Alternative names!

FROM: Joseph Ihnat DATE: 3/29/2011 8:44:26 AM Eastern Daylight Time  
Changed folder to Support Center since this problem was present in previous release(s).  
Found and fixed same problem in a couple other places of the same file.  
Fixed for Beta Build 1.

**Description**

FROM: Herman Lee DATE: 4/5/2011 4:36:58 PM Eastern Daylight Time  
 Submitted on behalf of Scott Cavanaugh, HNTB:

Below is the e-mail without embedded graphics. Please see attached PDF file for the e-mail with embedded graphics.

=====

George / Herman,  
 Good morning. HNTB is currently modeling a simple prestressed I beam structure which happens to have negative haunch for all of the girders. Separate runs using the Virtis and BRASS engines seems to indicate that there is a problem with the ratings using the Virtis engine. See the below results for flexure. Any idea why this would be occurring with the Virtis engine? Note that the shear ratings have been turned off under control options in order to examine the controlling moment rating results. I will attach the .xml file for your reference.

Rating results of fascia girder at mid-span.

=====

**Complete Issue Information**

FROM: Qiang Gao DATE: 4/7/2011 7:15:03 PM Eastern Daylight Time  
I found that AASHTO will give a negative number (-0.24 kips) of haunch dead load, while BRASS doesn't output the haunch dead load at all (maybe it just ignores any negative number or zero for loads).  
I tried to remove the haunch from the girder (set y1 = 0.0, y2=0.0 and y3=0.0), AASHTO gives a close result with BRASS. So Herman and I guess the problem is probably in the cross section calculation. Maybe it is just not tolerant with the negative area number.  
I attached both the results with negative haunch and the results without haunch in "Documents" tab.  
Good luck!

FROM: Srujana Thogaru DATE: 5/18/2011 3:29:08 PM Eastern Daylight Time  
Fixed for 6.4 Release.

FROM: Srujana Thogaru DATE: 8/24/2011 8:58:31 AM Eastern Daylight Time  
Fixed for 6.3 Service Pack 1

FROM: Xinmei Li DATE: 9/8/2011 2:45:53 PM Eastern Daylight Time  
Verified for 6.3 Service Pack 1.  
I ran G1 with AASHTO engine LRFR analysis, rating factor is 1.841 vs. 1.832 (BRASS engine provided by Scott Cavanaugh in attached file).

FROM: Srujana Thogaru DATE: 10/24/2011 1:30:11 PM Eastern Daylight Time  
This fix for 6.3 service pack has been backed off.  
Code has been added in 6.3.1 to issue a warning message if a negative haunch is present in the cross section and the incident will remain open until the issue is fixed.

FROM: Srujana Thogaru DATE: 3/1/2012 2:49:58 PM Eastern Standard Time  
PS Cross-section computations have been updated to handle Negative haunch. Fixed for 6.4 Release.

FROM: Geoffrey Trees DATE: 9/27/2012 1:18:55 PM Eastern Daylight Time  
Verified with Jim.

## Description

FROM: Aaron Kemna DATE: 4/5/2011 4:50:05 PM Eastern Daylight Time

I have an adjacent concrete voided slab beam bridge where the interior girders do not meet the I and J limitations for shear distribution factors. Thus, Virtis defaults to the Lever Rule. Then Virtis uses this value in calculating the exterior distribution factor (e\*g.interior). This can't be correct. These equations were set up to use the corresponding equations. I believe the Lever Rule should be used for the exterior beam. If you look throughout the tables, you will see that the exterior girder always uses the lever rule when the interior beam uses the lever rule except in one case where it uses the lesser of the equations or the lever rule. While I pointed to a specific bridge type, I think this is applicable for all cases where Virtis defaults to the Lever Rule for the adjacent interior girder and the exterior girder is dependant on that value. I will attach my bridge for reference.

P.S. For adjacent box beam bridges, AASHTO gives you the option to use the moment distribution factors for shear when the I and J limitations are not met (AASHTO 4.6.2.2.3a). I think Virtis should consider implementing this.

FROM: Aaron Kemna DATE: 4/5/2011 4:57:08 PM Eastern Daylight Time

Sorry, I'll try to get you the bridge tomorrow.

FROM: Herman Lee DATE: 8/31/2012 2:06:47 PM Eastern Daylight Time

4.6.2.2.3a not being considered is duplicate of Incident 11879.

FROM: Krisha Kennelly DATE: 4/15/2013 10:52:05 AM Eastern Daylight Time

Issue 11889 is the issue that addresses 4.6.2.2.3a not using the moment DF for shear. That issue has been resolved for 6.5.0.

This issue is resolved for 6.5.0. If the adj int beam uses the lever rule, the ext beam will also use the lever rule. This change was made for both shear and moment DF's.

Note shear in ext beams for structure type F in the LRFD spec: if I and/or J for the adj int beam is outside the range and the moment DF is used for shear for the adj int beam, this case is not addressed

4/19/2016 3:23:35 PM

HRS AASHTO

**Complete Issue Information**

by Tables Table 4.6.2.2.3a-1 or Table 4.6.2.2.3b-1. So the ext beam shear DF will equal the lever rule as per Art. 4.6.2.2.3b.

FROM: Bin Zhang DATE: 4/24/2013 2:26:47 PM Eastern Daylight Time  
Verified for version 6.5 beta 1.

FROM: Aaron Kemna DATE: 5/15/2013 1:57:46 PM Eastern Daylight Time  
Looks like this is working as Krisha is describing it above. I found one issue that relates back to Incident 11049. When the lever rule is calculated for the exterior girder (Shear), the single-lane is equal to the multi-lane. I think BrR is saying that a second truck cannot be placed to affect the beam so it defaults to the single-lane value which uses the 1.2 MPF. A multi-lane check cannot use the single lane MPF. It is important to differentiate the two so the appropriate value can be used according to whatever criteria the MBE will use now and in the future. I'll attach an image of the DF calculations used by BrR.

FROM: Krisha Kennelly DATE: 5/21/2013 1:10:22 PM Eastern Daylight Time  
Hi Aaron, Please enter your latest comments as a new issue since it isn't exactly the same as this issue. I think your comments may be subject to TAG review and I don't want their review to hold up resolution of this issue. thanks.

FROM: Aaron Kemna DATE: 5/21/2013 3:33:13 PM Eastern Daylight Time  
Created new Incident for SL vs ML that does not deal with range of applicability.

FROM: Krisha Kennelly DATE: 5/22/2013 9:29:04 AM Eastern Daylight Time  
Ok, thanks. This issue marked as resolved.

**Description**

FROM: George Colgrove DATE: 4/6/2011 10:18:31 AM Eastern Daylight Time

In the Analysis Progress Tree, could we have another character (like a dash ' - ') in the check boxes or have the check box greyed out if the girder associated with that check box either {not included} or otherwise not to be included in the analysis.

This way the overall check box for the entire structure will be based on all members that are being analyzed - and not on all girders that may or may not be included.

A girder not to be included in the analysis provides a visual 'X' in the check box which is carried on up to the top of the tree. This makes it seem that the bridge did not rate or was analyzed.

See images in Documents to see what the changes should look like.

## Description

FROM: Tim Armbrecht DATE: 4/13/2011 12:00:11 PM Eastern Daylight Time  
From my consultant (Souther):

The export file, 0160036.xml (attached) can't be imported into Virtis 6.2. I created it last night when the model would not save. When attempting to import it this morning, the following debug messages were generated...

1st -

Incomplete retrieval of data.

08:14:04 AM - Line 1229 in source file .\DoSuperStructDefList.cpp.

Data management object unavailable.

08:14:04 AM - Line 2492 in source file .\DoGirderMbr.cpp.

2nd-

Unable to create document!

08:17:39 AM - Line 2705 in source file .\UiDescDtopGridView.cpp.

Unable to open Bridge Workspace!

08:17:39 AM - Line 2704 in source file .\UiDescDtopGridView.cpp.

Could you forward it to Baker to see if they can retrieve it?

This business of Virtis models that won't save seems to be a somewhat common occurrence in v. 6.2. Unfortunately, it usually cannot be reproduced. What I've submitted above is the closest I can get to reproducing the problem. I can often recover the lost data by exporting and then recreating it using some of the data from the export.

Tim Souther, PE  
%IDOT Bridge Ratings Unit  
(217) 785-2935  
timothy.souther@illinois.gov

FROM: Mehrdad Ordoobadi DATE: 5/5/2011 10:08:10 AM Eastern Daylight Time  
I examined the bridge export file and was not able to determine the cause of this data corruption.

Do you remember what you were doing before you try to save the bridge?

FROM: Tim Armbrecht DATE: 5/6/2011 11:01:24 AM Eastern Daylight Time  
Mehrdad, he can't remember what he did, and he just went ahead and re-entered the data. I guess it's a dead end here, so let's go ahead and close the incident.

## Description

FROM: Brenda Crudele DATE: 4/13/2011 1:58:26 PM Eastern Daylight Time

If a vertical point load is input in the member loads window, when the shear diagram for that load is viewed in the charts it should be a vertical line at the location of load. The shear force in the diagram goes up diagonally to the next POI. The program should automatically place a POI in the left and right side of a point load to account for this.

This is also true for an applied moment input under the member loads window.

FROM: Jim Duray DATE: 4/19/2011 8:37:33 AM Eastern Daylight Time

I confirmed this issue and am changing it to a "Release" issue since it is not new to this development cycle and has existed since the first release. BRASS LFD does not report two values of shear at a location for DL. Neither does the AASHTO engine. I am setting the category to "Maintenance". This issue has been discussed in the past.

**Description**

FROM: George Huang DATE: 4/13/2011 6:01:28 PM Eastern Daylight Time  
In the construction for RC-T-beam, the concrete for the lower part of the girder and top part of girder with deck might be poured separately with a web construction joint. The provision of longer development length for deep beam should not be applied to the top reinforcement. The option of ignoring the deep section provision need to be provided.

**Complete Issue Information**

FROM: Krisha Kennelly DATE: 4/19/2011 2:45:37 PM Eastern Daylight Time  
George, What deep section provision are you referring to in the spec?

For LFD, Virtis uses the Std Spec Article 8.25.2.1 for a 1.4 factor for top bars placed with more than 12" of concrete below.

For LRFD, a similar article is considered.

12" doesn't seem very deep, is there another article you are referring to? Please view the Virtis help topic "Export of Schedule Based Reinforced Concrete Members" to see what articles are considered in computing the development lengths.

FROM: George Huang DATE: 4/19/2011 4:37:31 PM Eastern Daylight Time  
Krisha, Std Spec Article 8.25.2.1 is the provision I referred to. I agree with you that 12" is not very deep, sorry for the confusion.

**Description**

FROM: George Huang DATE: 4/21/2011 1:11:31 PM Eastern Daylight Time  
For many old RC bridges, the bend over bars are used for longitudinal reinforcement. In the current AASHTO LFR engine, the bend over bars are not used to calculate the shear and bending capacities at the bending location. We would like to have the option to include the bend over bar in the capacity calculation. The bridge file, 10C0163.xml, using bend over bars is included.

FROM: George Huang DATE: 4/21/2011 1:14:05 PM Eastern Daylight Time

### Description

FROM: Xinmei Li DATE: 4/29/2011 3:52:03 PM Eastern Daylight Time  
Moved from incident 10754

Submitted on behalf of Tim Armbrecht, IL DOT:

3. The Wizard, when used for one span, deletes all entries for all other spans. It should be that the stirrups should be entered using the Wizard for each span without affecting the other spans.
4. The use of symmetry does not allow one span to be specified "Even number spaces" and another to be "Odd number spaces", when this may be the way they are actually configured.
5. "Extends to deck" must be selected or not selected for all stirrups even though neither selection may be correct for all stirrups.

### Description

FROM: Tim Armbrecht DATE: 5/3/2011 10:41:59 AM Eastern Daylight Time  
From my consultant (Shoup):

I got a "unable to determine parapet, median or generic loads entered on the structure typical section window!". I removed the (-12) value in the parapet description in the appurtenances section and was able to run the structure. See attached files for reference.

FROM: Joseph Ihnat DATE: 5/6/2011 1:23:25 PM Eastern Daylight Time  
Probably always been able to enter negative values, only Brass didn't seem to mind.

FROM: Herman Lee DATE: 6/10/2011 8:26:32 AM Eastern Daylight Time  
With the -12" dimension in the "Rail-base Parapet (21X12)", the parapet is a line located outside the deck. That's why the AASHTO Engine complains it is not attached to the deck.

FROM: Tim Armbrecht DATE: 6/28/2011 9:33:39 AM Eastern Daylight Time  
Unlike BRASS, the new AASHTO engine will not run when it determines that an appurtenance is not within the bounds of the deck. This is a problem for us in that we have often described parapets for which this will happen.

A typical case would be when there is a parapet, applied as a Stage 2 DL, on top of a curb that may be applied as either a Stage 1 or 2 DL. In order for this to appear correctly in the cross-section view, the parapet is described with a portion that extends from the deck surface to the top of the curb as having a zero thickness. Therefore, all of this portion is located at the point indicated for "Distance At Start/End" under the Parapet tab in the Structure Typical Section window. Since this point is typically 2 inches off of the deck, Virtis 6.3 returns an error message as follows:

Error - Concrete railing not attached to the deck!

Error - Unable to determine parapet, median, or generic loads entered on the Structure Typical Section window!

Error - Analysis failed!

Admittedly, the way we do this is a workaround to make the cross-section look similar to the plans. We should be able to enter the model so that the cross-section appears as on the plans without having to do a workaround. To this end, I propose that an additional field be added to specify the vertical position of the bottom of a parapet, median, railing, generic appurtenance and sidewalk. This would be entered under the applicable tab in the "Structure Typical Section" window. The default value should be set at

4/19/2016 3:23:37 PM

3021

**Complete Issue Information**

0.000”.

As an example of a bridge model with a parapet on curb, I've attached RC-Tee 1-sp(0260029)63B4.xml.

FROM: Joseph Ihnat DATE: 7/19/2011 12:28:10 PM Eastern Daylight Time  
I don't see a UI issue. Jim, what do you want to do with this?

FROM: Jim Duray DATE: 9/23/2011 4:25:24 PM Eastern Daylight Time  
I think we should relax the error to a warning and allow the analysis to proceed. If Tim wants the additional field for specifying the vertical location of the appurtenance we should make it an enhancement request.

FROM: Jim Duray DATE: 9/23/2011 4:30:40 PM Eastern Daylight Time

FROM: Herman Lee DATE: 9/26/2011 8:26:46 AM Eastern Daylight Time  
Changed to warning message when the appurtenance is not attached to the deck.  
Fixed for 6.3 Service Pack 1.

Submitted Incident 11117 (Additional field for the vertical location of appurtenance) for the enhancemenet request.

**Description**

FROM: Amanda Jackson DATE: 6/3/2011 9:53:57 AM Eastern Daylight Time  
I can't find anywhere in the Help where it tells me if the depth of the web in reinforced concrete slab and tee beam girder definitions is from the top of the full slab or the top of the structural slab. I've been entering them from the top of the full slab, which could be giving me the wrong rating. Please clarify.

FROM: Xinmei Li DATE: 6/27/2011 10:35:57 AM Eastern Daylight Time  
If you're entering depth in the cross section window dimensions tab, it means total depth including Slab Sacrificial Wearing surface. In order to consider this in rating analysis, you will need to go to superstructure definition window, analysis tab, check appropriate boxes.  
If you still get wrong rating, please attach your bridge along with comparison of the right rating and analysis results.

FROM: Amanda Jackson DATE: 7/1/2011 9:58:45 AM Eastern Daylight Time  
That is what I needed to know. I don't think there is anything wrong with the ratings, but I will check it more closely one of these days. If I discover a problem, I will log another incident. I think we can mark

### Description

FROM: Tim Armbrecht DATE: 6/9/2011 4:41:13 PM Eastern Daylight Time  
From my consultant (Souther):

In investigating VI #10871 ("Floorbeams Won't Run"), which has been resolved, another issue presented itself. When making revisions to the model that changes the dead loads, re-analysis of the floorbeams does not result in a different load rating. The rating factors for stringers do reflect the revisions after re-analysis but the former computed dead load reactions are still displayed in the Computed Stringer Reactions tables.

There is a workaround but it is rather involved, laborious and time consuming. It is as follows:

- Make appropriate model revisions.
- Save and close the model.
- Re-open the model.
- Do an analysis of each stringer unit affecting the floorbeams in question and "Accept" the new computed reactions for each one.
- Do the re-analysis for each of the floorbeams.

To test this problem, in the attached export file, change the wearing surface Load Case from "Wearing Surface" to "Not Assigned" and do an analysis of Floorbeam Member, "Flbm3-x" and the stringers that affect it. Then, after doing the workaround, go from Not Assigned back to Wearing Surface and observe the Computed Stringer Reactions table.

When such model revisions are made, they should immediately be reflected in the results from the re-analysis of any affected members.

FROM: Herman Lee DATE: 6/10/2011 12:41:48 PM Eastern Daylight Time  
I was able to reproduce this in 6.2 so it is not new to 6.3.

FROM: Jim Duray DATE: 6/15/2011 1:06:15 PM Eastern Daylight Time

FROM: Mehrdad Ordoobadi DATE: 6/15/2011 3:19:21 PM Eastern Daylight Time  
I investigated this issue and believe the reason that the dead load reactions are not invalidated when the wearing surface properties is changed is because we only consider direct properties of the floorbeams and stringers when we check to see if the dead load reactions are up to date. Currently any change that is made to some domain object that is not related to stringers or floorbeams will not cause the dead load reactions to be marked invalid but if a change is made to the properties of the stringers or floorbeams or related objects they will cause the existing dead load reactions to be marked invalid. For example if the density of a material that is used by a stringer is changed the dead load reactions will be marked as invalid. But when the thickness of a wearing surface or its assigned load case is changed in the typical section window the dead load results will not be invalidated. Because these do not cause a change in the properties of the stringer in the domain. In fact there are more situations that a change in the values in the user interface should cause the dead load reaction results to be invalidated but they are currently not considered. Here is a list of windows that if you make changes to the values in them those changes will not affect the validity of the dead load reactions but they should.

- Superstructure loads
- Appurtenances
- Superstructure Definition

I think there could be many more.

I believe this has been like this since floor system was implemented and I think now is too late to try to fix this issue and include it in 6.3.

FROM: Tim Armbrecht DATE: 6/30/2011 3:33:37 PM Eastern Daylight Time  
After the latest update, now the floorbeam analysis doesn't work at all. From Souther:

RE: VI# 10960/10871/10861 file name - FlbmRunFails-StrgrReact(0310001)63B4.xml (attached)  
It is understood that the issue about re-running floorbeams for changed dead loading will not be fixed until after the production release of Virtis 6.3. When very slightly modifying a "direct property for the stringers & floorbeams, say concrete density from .150kcf to .1499kcf, the stringer dead-load reactions are re-computed, which can subsequently be viewed in the Floorbeam Stringer Reactions window. However, the floorbeam analysis terminates with the following...

...

Info - Finished generating virtual stringer Stage 3 Virtual Stringer Model...  
Info - Generating load cases for all models...  
Error - Unable to determine stringer dead load reactions!

Error - Analysis failed!

Since the reactions were in fact computed, this message is in error. The same error occurs whenever the analysis is executed for a floorbeam with the "Up To Dated" column boxes checked. It occurs for both Truss and Girder System floorbeams.

If this can't be corrected prior to acceptance of 6.3, it should be corrected along with VI# 10960.

Since the new reactions can be viewed in the Floorbeam Stringer Reactions window a workaround can be performed by selecting the "Override Computed" column boxes and entering the corresponding values in the "User Defined Reaction" column, then re-analyzing the bridge model.

Tim Souther, PE

FROM: Qiang Gao DATE: 7/1/2011 9:15:32 AM Eastern Daylight Time  
Regarding Tim's comments on 6/30/2011. I cannot reproduce the problems. The analysis for each floorbeam can be completed without any error even I changed the density (from 0.150kcf to 0.1499kcf). The "up to dated" checkboxes in "Advanced floorbeam stringer reactions" dialogue are always checked and readonly. By the way, my version is 6.3 beta4 with all the updates. I discussed with Herman and

4/19/2016 3:23:39 PM

HRS AASHTO

3032

## Complete Issue Information

we will test it again after 6.3 is released.

FROM: Mehrdad Ordoobadi DATE: 3/6/2012 10:36:05 AM Eastern Standard Time  
Fixed for 6.4.

FROM: Phil Litchfield DATE: 6/26/2012 5:48:03 PM Eastern Daylight Time  
(From Consultant Souther):

Incident is not completely resolved in 6.4 beta 2. The issue reported was that changes made in data within a Floorbeam-Stringer System type Superstructure Definition that would affect dead load and rating of a floorbeam are not immediately included in the floorbeam rating if the floorbeam was previously analyzed during the present session.

RE: VI10960(031001).xml

In Supstr. Def. Span 8 TFS, run Flbm 02(d). Apply any affected Computed Stringer Reactions. Note the applied Stage 2 Dead Loads and the load ratings for the floorbeams. Now, change the wearing surface thickness from 1.75" to 3" and then run Flbm 02(d) again. The stringer reactions are not recomputed as evidenced by no new Computed Stringer Reactions for Stage 2 Dead Loads and no change in the floorbeam load ratings. The increased wearing surface loading should be immediately reflected in subsequent analyses of the floorbeams.

In order for loading modifications that affect stringer reactions to be reflected in the floorbeam ratings, one must close and then reopen the Virtis Model then rerun the floorbeam analysis.

There is another problem that is happening in the referenced Virtis Model. When attempting to analyze all of the floorbeams within the Span 3 TFS Superstructure Definition and the Floorbeams marked "(error)" in Span 8 TFS terminate with an error. The error message box states, "Unable to complete analysis." The error occurs after the stringer reaction computations are completed, during Floorbeam analysis as follows:

Processing vehicle HS 20-44 (As Requested)...

Info - Finished loading influence lines with selected vehicles for Stage 3 Stringer Model...

Info - Performing transverse live load analysis for Stage 3 Span Model...

Info - Computing transverse live load combinations...

Error - Unable to perform analysis!

Error - Analysis failed!

FROM: Mehrdad Ordoobadi DATE: 7/10/2012 9:59:37 AM Eastern Daylight Time

Observation: Changing the wearing surface thickness is affecting the stage 1 reactions and not the stage 2 reactions. See the attachment "Floorbeam Stringer Reactions for Flb 02.docx"

Observation: When all of the stringer reaction data is removed from the database manually and an analysis is performed no values are reported for Stage 2. Computed reactions are all empty.

FROM: Mehrdad Ordoobadi DATE: 7/10/2012 10:13:32 AM Eastern Daylight Time

Ben, please investigate why stage 2 results are not populated and stage 1 results are increased when the wearing surface thickness is increased.

FROM: Phil Litchfield DATE: 8/8/2012 12:49:01 PM Eastern Daylight Time

Checked in 6.4 Beta 3, and problem still exists.

FROM: Herman Lee DATE: 8/19/2012 12:38:06 AM Eastern Daylight Time

4/19/2016 3:23:39 PM

HRS AASHTO

3033

**Complete Issue Information**

"Changing the wearing surface thickness is affecting the stage 1 reactions and not the stage 2 reactions." is related to Incident 10990.  
Ben, please verify the fix for this incident in 6.4 Acceptance Build.

FROM: Bin Zhang DATE: 8/21/2012 2:08:35 PM Eastern Daylight Time  
I verified the Implemented code to cleanup previously accepted reactions.  
Please note that the stringer reaction from the wearing surface is 0.53 kip for the new calculation while the number was 0.16 kip for the old calculation. This difference happened due to the bug fix of #11646. Please read the incident #11646 (incorrect calculation of the stringer reactions for wearing surfaces) for details.

FROM: Herman Lee DATE: 8/23/2012 9:06:39 AM Eastern Daylight Time  
The floor beam analysis problem in VI10960(031001).xml was caused by incorrect stringer locations (FE nodes) in the FE models. The floor beam length (24.0625') is less than the distance between the trusses (25.3958') in the model. The stringer locations should be measured from the start of the floor beam instead of the location of the left truss.

Fixed for 6.4 Release. Note that this problem is different than the one submitted for this incident.

FROM: Phil Litchfield DATE: 6/4/2013 10:40:17 AM Eastern Daylight Time  
Fixed in 6.4.1.

FROM: Mehrdad Ordoobadi DATE: 6/4/2013 10:58:41 AM Eastern Daylight Time  
Accepted by Phil Litchfield on 6/4/2013.

### Description

FROM: Todd Thompson DATE: 6/30/2011 12:15:51 PM Eastern Daylight Time

As I try to track down why I'm getting about 60% less for a bridge, I've come across some oddities.

When I was looking at the Spec Checker and the properties used - I noticed that the haunch width is being displayed as zero. The haunch depth is correct.

And the haunch DL's appear to be correct.

Not sure if this is just a report problem or if the haunch width is actually being used as zero?

Same bridge as from VI 11017

FROM: Todd Thompson DATE: 6/30/2011 1:51:21 PM Eastern Daylight Time

I believe the lower RF results where the result of how BRASS can consider which sections are composite/non-composite vs AASHTO LF engine. I revised my model and get consistent RF results now, but the spec checker still displays 0 haunch width when it shouldn't.

FROM: Krisha Kennelly DATE: 6/30/2011 3:05:09 PM Eastern Daylight Time

This is just a reporting problem, the haunch width is correctly being used to compute DL as you noted. The concrete haunch area is not considered in the composite section properties. Only the haunch depth is used to position the slab for the composite section properties.

this reporting problem actually also exists in 6.2 in the AASHTO LRFR engine but was submitted during 6.3 beta testing (Beta 3 Update 3)

FROM: Krisha Kennelly DATE: 6/30/2011 3:30:42 PM Eastern Daylight Time

issue changed to support category since it is a release bug.

FROM: Krisha Kennelly DATE: 3/6/2012 9:56:25 AM Eastern Standard Time

Programmer notes:

This fix is only needed for schedule based beams.

In ScSuperSteelGirderElement::PopulateCompositeInfo(), first determine if the beam is schedule based.

if it is schedule based, don't call the following line in this function:

```
VERIFY(SetDeDoubleValue(CrossSectionPtr->GetHaunchWidth(), xsecProp->SlabHaunchWidth));
```

instead, add a function to ScSuperSteelGirderElement to compute the haunch width for steel girders, stringers and floorbeams. This new function should be similar to the commented out code in

4/19/2016 3:23:40 PM

HRS AASHTO

3037

**Complete Issue Information**

DoGirderMbrAlt::FillCrossSectionData() that starts with the line /\* ##### Haunch width is set to zero. CrossSection haunch width is only

then after you compute the haunch width in the new function, you can set xsecProp->SlabHaunchWidth equal to the computed haunch width.

FROM: Xinmei Li DATE: 3/12/2012 4:49:56 PM Eastern Daylight Time Resolved for 64 release.

FROM: Krisha Kennelly DATE: 3/19/2012 1:57:39 PM Eastern Daylight Time Notes for alpha tester: Test schedule based steel rolled beams and plate girders, int and ext beams. Run in 6.3.1 and note the section properties. Run in 6.4 and verify the haunch width is now properly displayed but the section properties did not change from 6.3.1.

FROM: Srujana Thogaru DATE: 8/29/2012 8:57:45 AM Eastern Daylight Time Above fixed has been verified with 6.4 Beta 4. Verification document document attached.

### Description

FROM: Assistant Administrator Amjad Waheed DATE: 7/1/2011 1:20:11 PM Eastern Daylight Time  
Export/Import of Parameters from Configuration Browser

Currently, it is not possible to export or import Parameters defined in the Configuration Browser. The information contained in the Parameters are usually common all over the states and an administrator should be able to share with consultants/county engineers. Export/Import of Parameters from the Configuration Browser functionality needs to be provided.

FROM: Herman Lee DATE: 7/1/2011 3:13:48 PM Eastern Daylight Time  
Export/Import system defaults is a planned enhancement for the 6.4 release.

This incident is part of the requests in Incident 10700. I'm changing the Status to Duplicate.

**Description**

FROM: Bin Zhang DATE: 7/12/2011 3:19:58 PM Eastern Daylight Time  
 Submitted on behalf of Sally D. Doles from LONCO, INC. The original email was listed as below.  
 \*\*\*\*\*

I am doing a LRFR rating for a composite concrete deck on steel girders and am having issues with the live load distribution factors (xml file attached). I have entered all of the information for the girders and am able to use the Virtis "Compute Distribution Factors" button for the exterior girder, but when I try to use the "Compute" button for the interior girder I get the following message:  
 Unable to perform analysis!  
 Line 313 in source file .\AbxLfrdDistFactCompUiCtrl.cpp

Under the Virtis/Opis Technical support online, on the tutorial page, STL 6 - Virtis Steel plate Girder Tutorial says that the Virtis LRFR Engine will compute the live load distribution factors at runtime if the table is left blank. I also tried this and got the following message:  
 Unable to perform analysis!  
 Line 598 in source file .\AbxVirtisStdUiCtl.cpp  
 \*\*\*\*\*

FROM: Bin Zhang DATE: 7/12/2011 3:49:51 PM Eastern Daylight Time  
 When the input for "lane position" in "structure typical section" is not appropriate (figure 1), the LRFD LL DF could not be automatically computed by the program. (figure 2)

The error message does not tell the user the appropriate information (figure3). The error message

**Complete Issue Information**

should state the "lane position" definition error in "structure typical section", so the users could have correct information to modify their input data.

Please read the attached document with figures for detail. The XML file for the bridge model was also attached in the document.

FROM: Srujana Thogaru DATE: 8/23/2011 8:44:03 AM Eastern Daylight Time  
Error message added to notify if the lane positions were entered incorrectly. Fixed for 6.4 releases.

FROM: Xinmei Li DATE: 8/29/2012 9:34:43 PM Eastern Daylight Time  
Verified that the error message was added when the lane positions were entered incorrectly for 6.4 Beta4.

FROM: Todd Thompson DATE: 7/18/2011 12:01:33 PM Eastern Daylight Time  
Can you change the output folder location?  
Since our state has My Documents on a network drive for each user - our IT folks are concerned it will fill up that drive. (I know in Beta testing I accumulated 10's of GB's of output data)

**Complete Issue Information**

And they want to revise that to something like c:\work instead of My Documents.

Version 6.3

FROM: Joseph Ihnat DATE: 7/18/2011 12:12:53 PM Eastern Daylight Time  
It is set in the Preferences window (View-Preferences-Analysis tab) and will need to be set for each user.

FROM: Todd Thompson DATE: 7/18/2011 1:33:37 PM Eastern Daylight Time  
Sorry - got sidetracked thinking it was in the registry (a change we had to manually make between Beta 1 and Beta 2). And I missed the obvious. Sorry.

Thanks and this can be closed.

Todd

Question on technical notes

- 17 replaces the file: abaspecctrl.dll
- 18 replaces the file: abocncb.dll
- 19 replaces the file: abaspecctrl.dll

Since 17 and 19 replace the same file, is it safe to say 19 is inclusive of 17 ?

Please respond ASAP as we are moving 6.2 to production this weekend.

Thanks !

FROM: Joseph Ihnat DATE: 7/20/2011 8:08:26 AM Eastern Daylight Time  
Yes. TN 19 includes the fix for TN 17.

### Description

FROM: William Metcalf DATE: 7/20/2011 10:31:10 AM Eastern Daylight Time

All the beta versions installed no problem, but when I try to install the release version I got it gets to near the end of the install then tells me it needs to restart my computer (I don't remember virtis having to restart my computer in the past) once the computer restarts after I log in it just goes to a black screen for a minute or two then the "you have to restart your computer" message pops up again and this seems to continue ad infinum.....

I'm kind of in a spot here b/c our database has already been migrated and the scripts run so until we get this resolved or go through the pain of restoring from a backup we basically can't use virtis.

FROM: Joseph Ihnat DATE: 7/20/2011 3:23:51 PM Eastern Daylight Time

There was interference from another app (LANDesk) that he was able to resolve by removing a registry key.

### Description

FROM: Todd Thompson DATE: 7/27/2011 11:16:17 AM Eastern Daylight Time

I'm trying to get a laptop ready for our OPIS user to take with the SQL Server Express Sample DB for the Montana UG Training next week.

But I keep getting an error message and it appears to be happening in the ODBC connection creation area of the install.

I've attached the screen shot of the error but we don't know what is broken so we know what to fix.

THis machine is XP and i don't think it ever had Virtis Opis on it before.

I was hoping to have this ready before next weeks meeting.

## Complete Issue Information

FROM: Joseph Ihnat DATE: 7/27/2011 3:34:26 PM Eastern Daylight Time  
It looks like Virtis/Opis 6.3 (a beta?) may have been installed at one time. As far as I can tell, the error indicates that the database has been marked as "suspect" by SQL Server.  
Unless you would like to try to recover the database, you can try deleting it from SQL Server Management Studio. Then rerun the Virtis setup to configure the ODBC connection.

FROM: Todd Thompson DATE: 7/27/2011 3:43:03 PM Eastern Daylight Time  
I'll give that a try - but this laptop never ever had 6.3 Beta installed and I'm pretty sure it's never had Virtis Opis installed before.

FROM: Todd Thompson DATE: 7/28/2011 9:21:12 AM Eastern Daylight Time  
Used SQL Server Management Studio to delete the databases, manually deleted the ODBC Profiles. Reinstalled software and it worked.

Evidently something broke during the initial install and this was the only way to fix it, as re-installation by itself would not work. Again this PC never ever had 6.3 (or any alpha or beta) installed. In fact I'm pretty sure it never had any version of Virtis Opis installed. It was just an extra laptop we grabbed to bring to the Virtis Opis Training in Helena.

But this can be closed.

FROM: William Metcalf DATE: 7/28/2011 5:12:07 PM Eastern Daylight Time  
the error is in G4 of the CPGCCD. I get this error for multiple structures this is just an example. (or some form of P/S loss error sometimes it references section 9.17) i added the xml file:

Building Spec Check Domain objects.

Typ. Interior - Stage 1

Typ. Interior - Stage 2

Typ. Interior - Stage 3

Computing Prestress Losses.

System Error - Contact Technical Support: Missing data in article: "9.16.2.1 - Prestress Losses - General" - stage 2, round 2

Fatal error occurred while computing Prestress Losses.

Error - Error performing prestress loss LFR specification checking!

Error - Analysis failed!

FROM: Srujana Thogaru DATE: 8/10/2011 9:35:49 AM Eastern Daylight Time

Error is due to missing of "ALRFD\_IndexPsNonCompositeDLTable.Midspan\_MDL1\_ExclGirder" from "ALRFD\_IndexPsStageTables.NonCompositeDL" table from Stage1 in stage 2 of article 9.16.2.1.3 during computation of PS Loss at end of Span 3 (208.5 ft).

Reason for missing data is computations are not performed at location 208.5 ft in stage 1. Please refer to the attached PDF for details.

FROM: William Metcalf DATE: 8/10/2011 11:36:59 AM Eastern Daylight Time

So is there a way to fix this or what is the status?

FROM: Krisha Kennelly DATE: 8/15/2011 9:15:34 AM Eastern Daylight Time

Problem is similar to 10751. There is some bad data in the abw\_mbr\_alt\_support table. This bridge appears to have been copied from a ps bridge with more spans and the data in the in the abw\_mbr\_alt\_support table was not modified to reflect the lesser number of spans. Testing in 6.3 shows that copying a ps bridge and then reducing the number of spans does not leave the bad data anymore. The BRASS engine is not able to analyze the simple spans for DL and continuous spans for LL so it wasn't using the data in the abw\_mbr\_alt\_support\_table so the bad data wasn't exposed before.

I've attached a modified version of your xml file that has this bad data removed, 'revised 11043.xml'.

If you have other bridges with an error like this you can send them to us and we can remove the bad data so you can run them while a fix is put into a service pack.

FROM: William Metcalf DATE: 8/16/2011 10:43:55 AM Eastern Daylight Time

Krisha,

I do have some others what is the best way for me to send them to you?

FROM: Herman Lee DATE: 8/18/2011 11:10:47 AM Eastern Daylight Time

Bridgeware e-mail from Billy Metcalf:

=====

Actually when I run it from the bridge explore I get this error message "Error moving to the next record

**Complete Issue Information**

in database record set.” But the rating appears to be ok. This did not happen when run from inside the bridge file.

=====

FROM: Krisha Kennelly DATE: 8/23/2011 4:11:35 PM Eastern Daylight Time  
The AASHTO engine model generation and spec controller have been modified to ignore this bad data.

Mehrdad - please add code to the domain to set this bad data to null when the bridge is retrieved from the db or an xml file.

FROM: Mehrdad Ordoobadi DATE: 8/26/2011 1:34:12 PM Eastern Daylight Time  
Updated the domain to set the Bearing distances for first and last support to null if they are not.

FROM: Xinmei Li DATE: 9/8/2011 11:01:35 PM Eastern Daylight Time  
Verified fixed for 6.3 service pack 1.

FROM: Aaron Kemna DATE: 8/3/2011 1:24:08 PM Eastern Daylight Time

Currently, Virtis sets the ML DF equal to the SL DF when the SL DF is calculated to be greater than the ML DF. This is incorrect for Permits with the Frequency set to "Unlimited Crossings". For this case, the lower ML DF should be used. The load factors in the table were calibrated to the ML DFs in AASHTO. What Virtis is doing is conservative, but is also unnecessary. If the user manually enters the values correctly, the design truck and legal load ratings will be incorrect (AASHTO engine) because the lower ML DF values will be used instead of the controlling SL DF value. The SL and ML DF need to be seperated out and the program needs to compare and choose the appropriate values.

BRASS has similar issues, but has some really bad flaws when design, legal & permit trucks are mixed. I'll put a incident in for this, once I check their new release so everyone can be made aware.

FROM: Krisha Kennelly DATE: 8/15/2011 1:30:51 PM Eastern Daylight Time  
Subject to TAG and/or Task Force direction on how to handle this situation.

FROM: Herman Lee DATE: 3/1/2012 8:29:58 AM Eastern Standard Time  
Received e-mail from Vinacs Vinayagamoorthy (murugesu\_vinayagamoorthy@dot.ca.gov), Caltrans.

=====  
=

The Virtis software calculates, when compute from typical section key, the LLDF internally and populates the values in the system.

1. In some cases, calculation shows that LLDF for one lane (when MPF of 1.2 is included) is higher than the two or more lane live load distribution factor. In those cases, software populates the Multi-Lane DF with single lane distribution factor.

Though this seems correct, it is creating a problem for us to rate the bridges for "Routine" permit trucks. According to MBE (see below), we are supposed to analyze bridges using LLDF of Two or more Lanes. When the software places the one lane distribution factor (in the multi lane distribution factor), we are essentially using the LLDF with MPF of 1.2.  
(Embedded image moved to file: pic04591.jpg)

2. Also, we noticed that the AASHTO Engine uses LLDF listed within the multi-lane distribution factor column when establishing the demand for HL93 and Legal Trucks. As a result, if we enter One Lane distribution factor (with 1.2 MPF) and two or more lane distribution factor within multi-lane system, rating factor of HL93 and Legal were incorrectly calculated.

The software should be codes such that the user to enter One Lane DF in the 1 Lane column and Two or more Lane (excludes of single lane DF) in the multi-Lane column. The software will then uses the largest (one vs two or more) DF to establish HL93 and legal truck demands. The permit trucks for single trips are established using LLDF of 1 lane (without 1.2 factor) and Annual or Routine trucks are established suing Two or more lane DF.

**Complete Issue Information**

FROM: Krisha Kennelly DATE: 4/20/2012 12:55:03 PM Eastern Daylight Time

The following questions were posed to Bala Sivakumar for his input as a developer of the MBE Specification on the interpretation of Table 6A.4.5.4.2a-1 regarding the distribution factor to use for routine permits.

=====  
Is it the intent of the MBE Specs to use the same distribution factor when evaluating design loads, legal loads and routine permits, or can a user "mix and match" distribution factors? For example, can a structure be evaluated using a single lane DF for design loads, multi-lane for legal loads and a single lane for routine permits?

<<BS>>Keep in mind that the LRFR calibration in the MBE was done using LRFD distribution factors as the method of analysis. That is the variability in the distribution method was part of the calibration. We now have a ballot item that addresses the use of refined analysis and provides an adjustment to the load factors when using 3D methods. Also the live load factors were selected so that the two lane distribution will govern the design and legal loads for multi lane bridges. That is you don't need to check the single lane, except if you have a single lane bridge. So if you check only the single lane for the design load or a routine permit on a multi-lane bridge, you may not be checking for the worst loading on the bridge when trucks are on more than one lane. We find that many states have large numbers of routine permits that multiple presence is a possibility. So the load rating may be unconservative with only the single lane DF check. Also note that the single lane DF in LRFD can be lower than the Std Spec values. It needs to be applied correctly for rating.

For the case where the single lane DF exceeds the multi lane DF, some Virtis users want to use the larger single lane DF to evaluate design and legal loads. For routine permits, they want to use the smaller multi-lane DF. Is that the correct approach, and the intent of the MBE? I

<<BS>> would refer you to Report 454 where you will find tables with one-lane and two-lane DFs compared for girder bridges. The one lane DF > Two lane DF may happen, say an exterior girder using the lever rule. If the single lane DF is greater than the 2 lane DF, we should use the higher DF with the load factors in the MBE to be on the conservative side. This would apply to routine permits as well. Recommendation is to use the higher DF in all cases.

As you can see the LRFR calibration only considered the typical case where the two lane DF > one lane DF. If the bridge varies from this use the higher DF with the LRFR load factors.

=====  
Based on his response, Virtis is accurately interpreting the MBE Specification. This issue is an enhancement request to allow for a different interpretation of the Specification. They are considering adding this clarification to the Specification as a ballot item for 2013.

FROM: Aaron Kemna DATE: 4/20/2012 2:53:24 PM Eastern Daylight Time

My comment about the AASHTO engine needing to choose the appropriate value still applies. The user may enter the factors manually choosing to enter the smaller ML factor. It would be reasonable for the user to assume that the engine will pick the appropriate value.

## Complete Issue Information

We need to roll it back and introduce the older way.

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer  
916-227-2676

FROM: Krisha Kennelly DATE: 9/18/2012 10:01:08 AM Eastern Daylight Time  
Based on emails the following will be done:

1. Revise the computation of LFD and LRFD distribution factors in Virtis to not set the multi lane DF equal to the single lane DF when the single lane DF exceeds the multi lane DF.
2. Revise the export to determine the number of lanes on the structure.  
If the structure can hold more than 1 lane, use the largest of single/multi lane DF for the Design and Legal loads.  
For Routine permits, use the max of single lane/1.2 and multi lane DF.  
For Special permits, use the single lane DF/1.2.

If the structure can only hold 1 lane, use the single lane DF for Design and Legal Loads.  
For routine permits, use single lane/1.2.  
For special permits, use single lane/1.2.

The single lane loaded checkbox on the Advanced Vehicle Properties window and the LRFR routine/special permit settings will still take preference during the export.

FROM: Aaron Kemna DATE: 9/18/2012 1:31:51 PM Eastern Daylight Time  
Here's a sample bridge. The current distribution factors were calculated by the old method. The new factors should give smaller ML values for the exterior girders.

FROM: vinacs vinayagamoorthy DATE: 9/19/2012 2:41:35 PM Eastern Daylight Time  
Attached is one model 02 0068nyb.xml. Also, attached an excel spread sheet (LLDF for 02 0068) that shows the LLDF for one Lane and MultiLane that should be displayed in the GUI. Also, it shows the the LLDF that would/should be used for different trucks (HL93+Legal, Routine Permits, Special Permits).

Submitted on behalf of Brian Goodrich, BridgeTech.

Received e-mail on 8/11/2011:

=====  
Herman,

My version of Virtis 6.3 does not appear to be saving any of the BRASS point-of-interest engine properties to memory. I haven't made any changes to the POI part of the AbxBrass2 module. The engine properties for the analysis event, structure definition, and member alternative work just fine. BRASS is the only engine with POI engine properties, so I don't know if this would be happening for any engine. Are you able to duplicate this or see how this is happening?

Brian

FROM: Richard Withers DATE: 8/17/2011 4:05:24 PM Eastern Daylight Time  
 A consultant created and load rated the attached bridge named "VIRTIS\_WB\_NATCHEZ\_FINAL.xml". After successfully importing the bridge, I tried to save it. I got the attached error message named "bolt\_def\_error.jpg". It looks like an oracle database error. What do I need to do to correct this problem?

Let me know if you need any further information.

Thank you,  
Richard Withers

FROM: Mehrdad Ordoobadi DATE: 8/26/2011 1:11:10 PM Eastern Daylight Time  
 The error indicates that the value in the "Library Designation" field for the Bold Definition "Rivets" is not properly set. It is perhaps because your consultant had a custom library bolt in their database that you don't have in your database. To fix this please open the Bolt Definition "Rivets" and choose an item other than the "User Specified", click OK, and Save the bridge.

FROM: Herman Lee DATE: 8/31/2011 8:06:54 AM Eastern Daylight Time  
 E-mail from Richard Withers:

=====  
 Mehrdad, below is a screenshot from my consultant showing the bolt definition screen for his connector named "Rivets". This is exactly how my screen looks. I can't save the bridge with the Library designation set to "User Specified". When I change the Library designation to something other than "User Specified" I can save the bridge. However, this changes the allowable shear stresses, nominal slip resistance, design slip resistance, etc. Obviously, this will change the load rating of the structure.

The consultant does not have a custom library bolt in his database. What can I do so that I can input his specifications for this connector?

**Complete Issue Information**

Thanks,  
Richard

=====

Reply e-mail:

=====

Richard,

A workaround for now is to change the Library designation to something other than "User Specified". After you changed the Library designation, don't hit the "Compute from library..." button so the stresses, resistances and strengths will remain the same. Please note that the data inside the "Rivets" definition are not used by the BRASS LFD engine.

We will further investigate the save problem you are having. When you drop down the Library designation, do you have two "User Specified" selections in the list?

Thanks,  
Herman

FROM: Herman Lee DATE: 8/17/2011 4:03:24 PM Eastern Daylight Time  
See attached for the issue.

To reproduce:

1. Open Analysis Settings window from Bridge Explorer.
2. Open the LRFR Design Load Rating template.
3. Select the Engine tab and hit the drop-down button for the engine properties.

FROM: Geoffrey Trees DATE: 8/22/2011 1:16:45 PM Eastern Daylight Time  
Resolved for 6.4 Release.

To: Armbrecht, Tim A  
Subject: Virtis Error

Tim,

Have you heard anything about the cause of this error. The beam is defined over the length of the structure. This is the second time I've seen this error, neither time have I found the cause.

Phil

=====

FROM: Krisha Kennelly DATE: 8/23/2011 9:35:46 AM Eastern Daylight Time  
The error is not related to the beam definition. It is related to the Analysis Setting window must have 'Rating' selected or the default Analysis Settings template is set to a rating template.

A workaround is to open the Analysis Settings window and select 'Design Review'. Then open the Live Load Distribution window and click the Compute button.

A proper fix will be in Service Pack 1.

FROM: Krisha Kennelly DATE: 8/23/2011 11:27:53 AM Eastern Daylight Time  
Fixed for SP 1.

Testing scripts:

1. Set the default Analysis Settings template to the HS20 LFD rating. Open the Analysis Settings window, set 'Rating'. Open the Live Load Distribution: LRFD tab, hit the compute button. Verify it works.
2. Set the default Analysis Settings template to the HL93 Design Review. Open the Analysis Settings window, set 'Rating'. Open the Live Load Distribution: LRFD tab, hit the compute button. Verify it works.

FROM: Xinmei Li DATE: 9/9/2011 10:22:28 AM Eastern Daylight Time  
Verified both 1 and 2 are fixed for 6.3 service pack 1.

FROM: Srujana Thogaru DATE: 8/29/2012 10:15:57 AM Eastern Daylight Time  
Test 1 and 2 verified with 6.4 beta 4.

FROM: Tim Ambrecht DATE: 8/24/2011 3:40:53 PM Eastern Daylight Time  
From my staff (Litchfield):

I tried to run this structure and truck combination (both attached), and virtis continues to lock up. Tried the truck on a different structure and it ran fine. Also, HS20 truck runs fine on the structure too. I'm not sure if it's the PC or structure file.

Thanks,

Phillip R. Litchfield, P.E.

FROM: Bin Zhang DATE: 8/30/2011 10:40:31 AM Eastern Daylight Time  
Virtis locked up because it was performing linear solution... You don't need to do anything during this process.

I think it's a memory issue. I ran Virtis63 on a WinXP OS with 1G RAM and 1.5G virtual memory. I would suggest Phillip to install more RAM if he needs to conduct such large scale rating analysis very often. He can assign a larger virtual memory (paging file) for his computer as a temporary solution. Please let me know if these 2 solutions does not work for Phillip.

FROM: Tim Armbrecht DATE: 9/1/2011 10:31:12 AM Eastern Daylight Time  
We have 3GB physical memory on our machines.

## Description

FROM: Xinmei Li DATE: 8/25/2011 11:45:14 AM Eastern Daylight Time

Submitted by Vinacs Vinayagamoorthy  
-----

We came across a bridge where the Virtis underestimated the Effective Flange width. Further inquiry revealed that the Virtis uses girder spacing established at bb of the bridge. Unfortunately, section taken is too far from the actual girder location and yielded very low effective flange width.

Attached is the Framing Plan of the bridge. Though the girder spacing of the 1st interior girder is about 9.86ft, the girder spacing at the BB at Reference Line came out as 3.5ft. I am wondering this error occurs within Virts 6.3 as well. If it does, we need to create a incident. Please let me know whether this occurs within 6.3 as well.

(Embedded image moved to file: pic15068.jpg)

Attached is the bridge xml file.

Problem could be found by using Structure Alternative: Span 1 (MDL 1 of 1) ; Then Go to DECK GUI and let the software establish the effective flange width by clicking on Compute by Typical Section.

(See attached file: 39 0130L mjj.xml)

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer  
916-227-2676

FROM: Xinmei Li DATE: 8/25/2011 11:47:53 AM Eastern Daylight Time  
I imported the attached bridge and confirmed that the issue still exists in 6.3 release version.

FROM: Xinmei Li DATE: 8/25/2011 1:12:21 PM Eastern Daylight Time  
Also need to check if dead load due to slab is properly established. (requested by Vinacs)

FROM: Xinmei Li DATE: 8/29/2011 10:30:23 AM Eastern Daylight Time  
The export of dead load due to slab is checked fine. Since Deck slab tributary width varies along the girder system structure definition, is exported and an additional triangle dead load is added to the model for the extra slab dead load. Skew is considered while computing the minimum deck slab tributary width. See attached screen shot for more details.

**Complete Issue Information**

FROM: Xinmei Li DATE: 2/2/2012 3:39:15 PM Eastern Standard Time  
 Spacing was not correctly computed in CDoGirderSystemStructDef::ComputeGirderSpacing.

FROM: Xinmei Li DATE: 4/5/2012 3:49:02 PM Eastern Daylight Time  
 Krisha, can you take a look when you get a chance.

FROM: vinacs vinayagamoorthy DATE: 6/11/2012 10:13:51 AM Eastern Daylight Time  
 We are noticing that the live load distribution calculation also get wrong results, since the cross section is created at the reference line. We believe the girder spacing should be established at 10th point of the girder (not along the reference lines).

FROM: Krisha Kennelly DATE: 8/24/2012 2:41:47 PM Eastern Daylight Time  
 Fixed for 6.4 beta 4 build.

When computing the deck effective flange width, the girder spacing is now computed perpendicular to the girder at points along the girder. See attached hand calcs that show how we compute the eff flange width for G2 in Span 1 in the attached bridge.

When computing the distribution factors, the girder spacing is still computed perpendicular to the structure def ref line but it is now being computed in the correct locations along the girder. (The spacing has to be perpendicular to the structure def ref line since: a) the girders are splayed they each have a different angle and b) the parapets, etc. are located relative to the structure def ref line.)

For adjacent members with a slab, the slab weight distributed should be equal to the top flange width of the member. When you select Tributary Width, BRASS or AASHTO just looks at the centerline of the girders and distributes the loads accordingly. These programs need to look at the top flange widths and set minimum and maximum values accordingly.

FROM: Krisha Kennelly DATE: 9/13/2011 2:43:50 PM Eastern Daylight Time  
Hi Aaron,

Do you have an xml file that illustrates this problem or can you give me some more information like what type of member (PS box?) and some numbers (girder spacing and top flange width) showing what you would like?

thanks.

FROM: Aaron Kemna DATE: 9/14/2011 9:18:46 AM Eastern Daylight Time  
I'll attach a file. I get errors for G1 and G3 of Structure 3 (may be others). I was going to wait for the service pack to test this bridge again. If you run into the same problem and determine it's an error, feel free to enter a new incident. As for the DL Distribution issue, The issue occurs when you have different width members side by side. The bridge I am sending has a 4' box beam for G1 next to a 3' beam for G2 next to 4' beam for G3. This gives 3'-6" beam to beam spacing when measuring to CL of girder. Thus, when Tributary Width is selected for the distribution method, the resulting slab width distributed to say G2 is 3'-6" when it should be 3'-0". Since it's difficult for a program to understand adjacent beam construction, I think limits could be set according to the top flange width so that the slab width distributed is no less than the beam width and does not run into the next beam width. Another option would be to have an option set up that identifies structures with adjacent construction.

FROM: Krisha Kennelly DATE: 11/18/2011 1:07:28 PM Eastern Standard Time  
Fixed for 6.4.

When computing the slab dead load (or any structure typical section dead load like parapets, sidewalks, etc.) the actual beam width is used for adjacent ps beams (any type of ps beam: box, I, Tee, U that is adjacent) instead of the average beam spacing. (Developer note: change was made in

### Description

FROM: Tim Ambrecht DATE: 9/23/2011 9:47:49 AM Eastern Daylight Time

From my consultant (Chamberlain):

Tim, can you forward this on to Baker to determine where the program is pulling the "actual spacing" from? This is a line girder of a slab bridge and I have entered all the reinforcement, which includes spacing, however when the program is checking cracking it seems to be getting 0 for the actual spacing, resulting in several areas that fail the code check for cracking. I have attached the output from one such location. Design checker is flagging crack control, but VIRTIS is using 0 for the actual spacing.

FROM: Srujana Thogaru DATE: 10/19/2011 1:14:48 PM Eastern Daylight Time

BarLocation array in DoGirderMbrAlt.cpp Line 32718 was not stored correctly. Horizontal Location and Bar dia are similar values in all the rows in the array.

FROM: Krisha Kennelly DATE: 11/17/2011 10:17:35 AM Eastern Standard Time  
Virtis uses the values input by the user for side cover, spacing, number of bars and cg location to place the bars within the cross section and then computes the clear spacing between bars based on their locations.

See attached VI 11115 bar input.png to see the rebars at the 11.625' location that was attached to the issue. This shows the 4 bars at this location.

The attached VI 11115.pdf shows where Virtis puts these bars based on the side cover all being entered as 1". This puts the b3(E) and b4(E) bars in at the same location so the clear spacing is computed as zero.

I do notice a problem that when computing the clear spacing the software is considering all rebar in the section and not just the layer closest to the surface. That will be fixed for Version 6.4.

FROM: Krisha Kennelly DATE: 11/17/2011 1:10:33 PM Eastern Standard Time  
Code has been fixed to consider only the rebar in a row when computing the bar spacing. Fixed for version 6.4.

This fix will not change the outcome of the attached bridge however since the user has entered bars on top of each other. The software will still compute the bar spacing as zero for this case.

FROM: Herman Lee DATE: 9/23/2011 5:19:44 PM Eastern Daylight Time  
Submitted on behalf of Vinacs M Vinayagamoorthy, Caltrans:

Received e-mail:

=====  
Herman

I am attaching a xml file that works with the default tolerance level (default set up of Virtis when shipped by Bakers) in the individual machine (consultant database), These models are created by Vritis 6.2 version.

(Embedded image moved to file: pic03063.jpg)

However, when imported into the our main database, that has the following tolerance level, it does not work.

(Embedded image moved to file: pic28647.jpg)

When I ran it using BRASS the following error pops up:

(Embedded image moved to file: pic13987.jpg)

When I ran it using Virtis Engine, the following error pops up:  
(Embedded image moved to file: pic31955.jpg)

In the past, we have been assuming that if the consultant creates the model using very "stringent" tolerance and then imported to our main database, where the tolerance is relaxed, would work without any problem.  
Unfortunately, it is not the case.

This issue is NOT with the analysis engine (as Srujana suggested in the past - given below), because the export program from both engines are not able to create sections.

When I changed the tolerance level to match the tolerance used to create the model, the software analyzed the bridge without any problem.

Previously reported bridge:

4/19/2016 3:23:47 PM

HRS AASHTO

3079

**Complete Issue Information**

We had similar problem earlier. I contacted the Bridgeware. Srujana checked that out, but she mentioned the problem is with BRASS engine and asked to contact Brian. (Bridge Model is 04\_0163RR.xml). I still have doubt about this finding.

I think the problem is not with BRASS engine. It has something to do with tolerance level set up and some data is not populated correctly. Or how the export program functions.

(See attached file: 53 0534.xml)

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer

Developer Notes:

Error message when trying to rate the G2 member alternative in the attached bridge:

=====  
Error getting ConcBeamDefWebProfile to left of 0.0100000 ft!  
Current tolerance for ft is 0.0500000.  
=====

Two issues for further investigation:

- With tolerance set to 0.05, export considers the point at 0.01 ft the same as the point at 0.0 ft and failed to locate the cross section to the left of 0.0.
- The point at 0.01 ft is coming from Reinf. Set # 6. It's a Type 3 bar with A = 0.01 ft. The dev length computation log has "###Error! Bar is not long enough to be considered developed at start and at end. Bar will not be exported!". The point at 0.01 ft should not be included.

FROM: Krisha Kennelly DATE: 10/3/2011 2:41:50 PM Eastern Daylight Time  
Workaround has been added to this issue:

Workaround for this issue is to slightly modify the "T3-TBS-1.25" Sq(=1#11)-33ksi-B1" Bar Mark Definition to have the dimensions shown in the attached '11116 temporary workaround.png'.

This slight modification in the bar dimensions will allow the girder to be analyzed using the tolerances of 0.05 in and 0.05 ft.

FROM: Krisha Kennelly DATE: 10/4/2011 2:08:56 PM Eastern Daylight Time  
Fixed for version 6.4.

Developer notes: The point at 0.01' was being evaluated to determine the development length of the rebar. It could not be ignored like the developer above said.

Code changed in MoveDistance() in DoRangeSetCmdTarget and DoSteelAssemblyRangeSet so that a point within the tolerance to the right of the starting range returns the starting range.

FROM: Herman Lee DATE: 10/5/2011 7:46:47 AM Eastern Daylight Time  
The point at 0.01 ft should not be included in cutting the cross section since there's an error in the

**Description**

FROM: Herman Lee DATE: 9/26/2011 9:58:05 AM Eastern Daylight Time  
Below request is moved from Incident 10821.

=====

We should be able to enter the model so that the cross-section appears as on the plans without having to do a workaround. To this end, I propose that an additional field be added to specify the vertical position of the bottom of a parapet, median, railing, generic appurtenance and sidewalk. This would be entered under the applicable tab in the "Structure Typical Section" window. The default value should

4/19/2016 3:23:47 PM

HRS AASHTO

3081

**Complete Issue Information**

be set at 0.000”.

As an example of a bridge model with a parapet on curb, I've attached RC-Tee 1-sp(0260029)63B4.xml.

A typical case would be when there is a parapet, applied as a Stage 2 DL, on top of a curb that may be applied as either a Stage 1 or 2 DL. In order for this to appear correctly in the cross-section view, the parapet is described with a portion that extends from the deck surface to the top of the curb as having a zero thickness. Therefore, all of this portion is located at the point indicated for “Distance At Start/End” under the Parapet tab in the Structure Typical Section window.

Subject: Hole Dimensions - Riveted Built-up X-Section

I would like for Baker to clarify the proper way to enter the hole dimension, "Number", for a riveted built-up beam coverplate. An example would be as follows:  
The coverplates, top and bottom, are 14" x 3/4" plates on a girder made up of a 3/8" x 46" web and 6"x6"x3/4"angles. They are fastened to each of the angles by two rows (gage = 2 3/16") of alternately spaced (pitch = 4") 7/8" diameter rivets. The rows adjacent to and each side of the web are spaced 5 3/8" apart.

The questions are as follows:  
What should be entered for the field "Number"?  
Does Virtis compare the area deduction based on S2/4g with the area deduction based on a right angle section with two holes and then use the more critical?

FROM: Wayne Skow DATE: 9/27/2011 9:51:20 AM Eastern Daylight Time  
Presently, the user interface does not accomodate this bolt configuration. The article sees 4 bolts but only 1 pitch/gage combination. In this particular case, it results in a net section reduction of 3 holes where the correct answer should be 2.

The answer to your second question is no. It simply takes the number of bolts x diameter, then subtracts the s^2/4g effect to get the area reduction. It does not check multiple configurations.

Locations where shear stirrup spacing increases in RC & PS Concrete members should be considered as section change locations. Therefore, when <Generate at section change points> under Control Options tab is selected, a POI should be generated there. For example, say we have stirrup bars "A", "B" & "C" spaced 6" between A & B and 12" between B & C. This program enhancement would result in a POI being generated just to the right of stirrup B.

The benefit of this will be a substantial reduction of user input time by eliminating the need to manually enter many necessary POI's.

### Description

FROM: Tim Armbrecht DATE: 10/7/2011 10:15:29 AM Eastern Daylight Time

It is understandable in a steel or concrete girder system with some splayed girders that live-load distribution can't be computed for the girders affected by variable spacing. However, when attempting to have Virtis compute the LLDF for beams not affected by the variable beam spacing an error message is produced.

Since the spacing for the girder in question is not variable, there should be no reason that the LLDF could not be computed by the system.

I propose that Virtis be modified so that the LLDF may be computer generated. For reference see LLDF\_Comp\_Splayed-bm\_Bridge(0220108).xml. The girders that would be subject to this enhancement are #5 through #14.

FROM: Herman Lee DATE: 7/14/2015 8:00:49 AM Eastern Daylight Time

6.7 release is capable of computing the Std Spec and LRFD Spec LL distribution factors for splayed girder system.

FROM: William Metcalf DATE: 10/17/2011 11:46:16 AM Eastern Daylight Time  
when I try to import a file (these are a different version so they get migrated) then i try to save it I get the following error:

File error while writing data.  
File exception!  
Error accessing file [Bridgeld\_5996.bak]!  
The file could not be accessed.

however the bridge appears to save i just don't know if everything is getting save correctly? (i'm using version 6.3.1 beta 2.

attached one of the files im trying to import.

FROM: Herman Lee DATE: 10/17/2011 11:49:51 AM Eastern Daylight Time  
This is probably a permissions issue. Try granting "Full Control" to "Everyone" for the folder where Virtis is installed (eg. C:\Program Files\AASHTOWARE\Virtis63).

## Description

FROM: Bryan Silvis DATE: 10/17/2011 3:02:09 PM Eastern Daylight Time

According to AASHTO Article 6.10.8.2.3, the lateral torsional buckling resistance may be determined assuming the transition to the smaller section does not exist provided the transition is less than or equal to 20 percent of the unbraced length from the brace point with the smaller moment and the lateral moment of inertia of the flange or flanges of the smaller section is larger than one-half the corresponding value in the larger section.

In the attached .xml file, the criteria is satisfied, but a Cb value of 1 is used. See "Route 29 Sketch.pdf" for drawing and hand calculations and "Virtis LRFR Engine Cb Calculation at Pier.txt" for program results.

Bryan

FROM: Bin Zhang DATE: 11/1/2011 4:54:35 PM Eastern Daylight Time

It's a program bug, the bPrismatic definition should be modified in the SCSuperSteelGirderElement.cpp file.

FROM: Bin Zhang DATE: 1/6/2012 8:47:26 AM Eastern Standard Time  
resolved for the VO6.4

FROM: Bin Zhang DATE: 4/13/2012 1:18:29 PM Eastern Daylight Time

Verified in VO6.3.1 with today's dll update. The "Section Prismatic in Unbraced Length" check is Yes now. Cb is now calculated using the equation (6.10.8.2.3-7) at that cross section.

### Description

FROM: Bryan Silvis DATE: 10/18/2011 2:45:02 PM Eastern Daylight Time  
For the attached file, the load rater over-wrote previous span lengths in the Girder System Superstructure Definition. However, the span lengths shown in the Member window do not update past 3 decimal places. When rating analysis is run, the Analysis Progress window show the span lengths for the incorrect spans in the Member window not the corrected value from the Girder System Superstructure.

The .xml file and screenshots of the Girder System, Member and Analysis Progress windows are attached.

Checked for Version 6.3 and same problem exists.

FROM: Joseph Ihnat DATE: 12/27/2011 3:32:29 PM Eastern Standard Time  
Herman, I don't know what the issue is. Please investigate.

FROM: Herman Lee DATE: 12/28/2011 7:13:34 AM Eastern Standard Time  
In the Structure Typical Section window, the left overhang at the start and at the end of the bridge are different (see attached "Structure Typical Section.png" file). That's why the computed span lengths for the girders are slightly different than the entered span lengths along the superstructure reference line.

## Description

FROM: Creightyn McMunn DATE: 10/19/2011 4:50:50 PM Eastern Daylight Time  
When running Span 1, Typical Interior Beam with Service Pack 2 installed, the AASHTO engine yields a rating factor of 0.000. This did not happen in the release version of 6.3.

FROM: Srujana Thogaru DATE: 10/20/2011 3:47:23 PM Eastern Daylight Time  
PS tensile stress rating factor shows as zero in the rating summary results window because of a bug fix done in 6.3 service pack, which was not considering the RF from PS tensile stress before.

Reason for the PS tensile stress RF's to be zero in the current bridge is that jacking stress ratio in PS Properties window entered as 70.

FROM: Creightyn McMunn DATE: 10/21/2011 9:01:15 AM Eastern Daylight Time  
Thank you. I fixed the tensile stress issue but I am now getting 0.00 RF for Span 1 Fascia and Span 6 Fascia. "Design Flexure - Concrete" is controlling, where "Design Shear - Concrete" was controlling in v6.3 release (with rating factors greater than 1.0). See attached documents.

FROM: Srujana Thogaru DATE: 10/24/2011 1:19:34 PM Eastern Daylight Time  
The difference in the ratings is due to Virtis does not handle negative haunch. This is an duplicate

4/19/2016 3:23:51 PM

HRS AASHTO

3099

## Complete Issue Information

incident of 10642.

Code has been added to issue a warning message and stop the analysis if there is negative haunch in the cross-section.

FROM: Bin Zhang DATE: 10/24/2011 1:35:39 PM Eastern Daylight Time  
verified in Service Pack 1 Beta 2 Update 2, a warning message will appear saying "Negative haunch depths are not allowed!" and the analysis will stop if there is negative haunch in the cross-section.

FROM: Creightyn McMunn DATE: 9/10/2012 3:16:34 PM Eastern Daylight Time  
This error is still happening in V6.4 Beta 4. When running the attached xml file, I do not get a warning message about negative haunches, nor does the analysis stop.

FROM: Srujana Thogaru DATE: 9/14/2012 11:33:21 AM Eastern Daylight Time  
Negative haunches are implemented in 6.4 and there will not be any warning messages issued in 6.4.

As explained above : PS tensile stress rating factor shows as zero in the rating summary results window because of a bug fix done in 6.3 service pack, which was not considering the RF from PS tensile stress before.

Reason for the PS tensile stress RF's to be zero in the current bridge is that jacking stress ratio in PS Properties window entered as 70.

Change in "Design Flexure - Concrete" is controlling in span 6 from "Design Shear - Concrete" is due to VI 11237.

FROM: Creightyn McMunn DATE: 9/26/2012 3:58:18 PM Eastern Daylight Time  
I am still getting a 0.00 rating factor for Span 1 Fascia and Span 6 Fascia. I have already corrected the issue with the jackson stress ratio (see V6.4 file attached). I'm not sure if it's related to the negative haunch issue because Span 2-5 Fascia also has a negative haunch and gives ratings greater than 0.00. See attached spreadsheet for a comparison of results between versions. (Side note: I believe the increase in rating factors for Span 2-5 Interior Beam is due to the implementation of the '79 Shear Specs in the AASHTO engine.) When reviewing the Spec Check,  $\Phi * Mn = 0.00$  at the first and last points of interest for Span 1 Fascia and Span 6 Fascia.

FROM: Jim Duray DATE: 10/3/2012 7:31:21 AM Eastern Daylight Time  
The problem was with the calculation of the lower left corner of the deck (used to reference the deck object to the beam object). For the case of a negative haunch the reference pt on the deck did not have the same coordinates as the corresponding pt on the composite beam. This resulted in the possibility of the NA intersecting the composite beam but not the deck object thus preventing convergence to a capacity. I modified (for 6.4.1) the I narrow and I wide cross sections.

Srujana - please apply my changes to the other PS shapes.

FROM: Srujana Thogaru DATE: 10/10/2012 9:08:34 AM Eastern Daylight Time  
Applied similar changes as I narrow and I wide cross sections for other PS Shapes.

FROM: Matt Kolis DATE: 10/31/2012 9:59:23 AM Eastern Daylight Time  
Verified Span 1 Fascia and Span 6 Fascia do not give zero ratings (LFR).

FROM: Creightyn McMunn DATE: 11/15/2012 4:05:24 PM Eastern Standard Time

4/19/2016 3:23:51 PM

HRS AASHTO

3100

**Complete Issue Information**

I verified rating factors greater than 0.00 for Span 1 and Span 6 Fascias using AASHTO LFR.

FROM: Matt Kolis DATE: 12/6/2012 9:26:53 AM Eastern Standard Time  
Verified in 6.4.1 Beta 2.

FROM: Creightyn McMunn DATE: 12/13/2012 9:09:51 AM Eastern Standard Time  
Verified rating factors greater than 0.00 for Span 1 & Span 6 fascias in v6.4.1 Beta 2.

Received e-mail:

=====

Herman

Last time, when we had encountered problems with the default Tolerance (for BentUp bars), you have suggested me to send you the problems encountered by us due to the Tolerance level set in our software.

4/19/2016 3:23:51 PM

HRS AASHTO

3101

**Complete Issue Information**

Attached is the Tolerance that is set as default when we installed in the machine.

(Embedded image moved to file: pic17039.jpg)

We have entered the data using this Tolerance only. There were no warning messages popped up during data entry.

(See attached file: 02 0157 EAE.xml)

When we analyzed the bridge using BRASS engine in Virtis 6.2, the following error popped up. (Embedded image moved to file: pic17113.jpg)

There is no error message popped up when we analyzed this bridge using Virtis Engine.

However, when we changed the Tolerance for "in" unit to 0.0001 then BRASS engine ran it successfully.

Could you please see whether this issue can be resolved within Virtis Data Entry? Also, could you please run it using AASHTO engine and see whether we have any issues, if w the tolerance level is lowered to 0.000001 (5 zero)

Brian: Could you please let me know whether this is due to BRASS alone or related to Virtis Database?

=====

I don't think the issue can be resolved within Virtis data entry. There's no gap in the web profile input. The MoveDistance domain function should be able to locate the web at the distance indicated in the error message.

I tested the G1 girder in 6.3 with the AASHTO Engine. The rating completed without problem.

FROM: Herman Lee DATE: 11/15/2011 4:10:56 PM Eastern Standard Time

Developer Note:

In CBrassCrossSections::FillBrassCrossSection, distance in inches is passed into GetSectionAtDistance. As a result, tolerance for inches is used when checking for gaps in MoveDistance. It's more reasonable to pass in feet since the distance is entered in feet in the user interface.

FROM: Brian Goodrich DATE: 11/29/2011 8:01:04 AM Mountain Standard Time

I logged this issue as BRASS Incident 231.

FROM: Herman Lee DATE: 4/12/2013 11:51:27 AM Eastern Daylight Time

Updated Status to Resolved per BridgeTech request.

Brian Goodrich email on 4/12/2013:

"Incidents 9321 and 11144 were resolved in the BRASS-GIRDER(LRFD) 2.1.3 released in June 2012."

RE: Save/Delete Problems with Agency Standard Gage Vehicles (use export: VehStdGageAgcy.xml in O:\Ratings\Unprotected\Souther\ v. 6.3)

When attempting to create a new Standard Gage Agency Vehicle, upon using the Save command a message comes up

Save operation failed: Vehicle  
09:42:46 AM - Line 493 in source file VehView.cpp.  
Assignment of data to recordset variables failed.  
09:42:46 AM - Line 787 in source file DmLibVehicleAxle.cpp.  
Key attribute AXLE\_ID in table ABW\_LIB\_VEHICLE\_AXLE is not set properly.  
09:42:46 AM - Line 1009 in source file DmObject.cpp.

This does not happen if no axle information is input for the vehicle. In either case, the named vehicle then appears in the Library list of Agency vehicles but with no axle information.

For an existing vehicle if any change is made and is saved, the previously existing axle information is eliminated. In addition, if any changes to axle information or vehicle name are attempted to be saved, the above "Save operation failed" message appears or the following message appears:

Unable to save Vehicle data!  
10:07:05 AM - Line 506 in source file VehView.cpp.

Some vehicles cannot be deleted. One example from the attached Library export is the vehicle named, "120K - 6 Axle". When I attempt to delete it the following message comes up:

Error deleting record from database record set.  
10:16:06 AM - Line 298 in source file DmLibVehicle.cpp.  
State:23000,Native:547,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]  
State:01000,Native:3621,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]  
State:23000,Native:547,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]  
State:01000,Native:3621,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

The DELETE statement conflicted with the REFERENCE constraint "R\_1552". The conflict occurred in database "RATINGS", table "dbo.abw\_results\_ll\_action", column 'll\_vehicle\_id'. The statement has been terminated.

The DELETE statement conflicted with the REFERENCE constraint "R\_1552". The conflict occurred in database "RATINGS", table "dbo.abw\_results\_ll\_action", column 'll\_vehicle\_id'.  
The statement has been terminated.

However, this is not consistent with all of the listed agency vehicles, some of which can be deleted.

=====

FROM: Bin Zhang DATE: 10/25/2011 8:53:31 AM Eastern Daylight Time  
I am able to import the VehStdGageAgcy.xml into the library successfully (Virtis6.3.0). I tried to delete, create, save the vehicles with and without the axle information. No problems have been detected so far. Further investigation on the SQL database is necessary to figure out the reasons.

FROM: Bin Zhang DATE: 10/26/2011 3:28:24 PM Eastern Daylight Time  
After we save the live load actions into the database, we also saved the information of the loading vehicle into the database. That's the reason why we could not delete that vehicle any more in the library.

FROM: Aaron Kemna DATE: 1/12/2012 2:42:02 PM Eastern Standard Time  
I am finding similar problems. I tried modifying some of our vehicles by clicking the LRFR check box. I could not save and got the error described above. Before 6.3 I deleted a bunch of vehicles without incident if that helps.

FROM: Aaron Kemna DATE: 1/12/2012 2:50:08 PM Eastern Standard Time  
OK, I shut down Virtis and Re-opens. I had no problems modifying the vehicles. I assume this is related to Zhang's comments because I had previously ran the vehicles before I tried to modify them.

FROM: Herman Lee DATE: 6/4/2012 4:20:22 PM Eastern Daylight Time  
Beta TAG May 2012 discussion:  
Error message should provide better description of the problem and provide workaround if available.

### Description

FROM: Load Rater Shannon Murgoitio DATE: 10/26/2011 3:36:17 PM Eastern Daylight Time  
Are there plans to incorporate the Lump Sum loss method capabilities into the AASHTO LRFR engine?  
Idaho uses the Lump Sum loss method for load rating prestressed girders in LRFR and the capability was in the BRASS LRFD engine.  
Thank you,  
Shanon Murgoitio

FROM: Herman Lee DATE: 10/26/2011 6:36:02 PM Eastern Daylight Time  
Currently there's no plan to incorporate the Lump Sum loss method capabilities into the AASHTO LRFR engine.

FROM: Load Rater Shanon Murgoitio DATE: 11/8/2011 4:58:21 PM Eastern Standard Time  
Idaho would like to request the AASHTO LRFR engine be enhanced to accomodate user input lump sum losses.

FROM: Herman Lee DATE: 6/4/2012 4:20:50 PM Eastern Daylight Time  
Beta TAG May 2012 discussion:  
The Beta TAG would like to obtain more information on the way Idaho uses Lump Sum Loss method for load rating in LRFR.

FROM: Herman Lee DATE: 6/5/2012 1:47:52 PM Eastern Daylight Time  
Attached additional information provided by Shanon Murgoitio, ITD.

FROM: Krisha Kennelly DATE: 10/17/2012 9:53:39 AM Eastern Daylight Time  
Code has been implemented for 6.4.1.

Geoff - please work with Srujana to get the engine help adjusted.

### Description

FROM: Dean Teal DATE: 10/27/2011 10:27:00 AM Eastern Daylight Time

In the Help Pulldown we need to add one item

Support

It would be helpful to have instructions on how to get support, steps to take, what to expect, first contact

It was high on the customer survey that users didn't know where to go for support. Support instructions come with the DVD and most likely never gets to the users.

FROM: Herman Lee DATE: 10/31/2011 1:32:32 PM Eastern Daylight Time

The one page support instructions come with the DVD are available in the BRIDGEWare Startup Guide.

We changed the Virtis/Opis Technical Support website information in the About box to a hyperlink in the 6.3 Service Pack (see attached file). Users can click on the link to open the Technical Support website. Please note that the support e-mail address is also listed in the About box. Is this adequate? Thanks.

FROM: Herman Lee DATE: 10/5/2012 1:49:47 PM Eastern Daylight Time

Task Force decided to add a Help topic for Support and provide a link to it from the Help menu. Enhancement for 6.4.1.

FROM: Herman Lee DATE: 10/11/2012 10:32:40 AM Eastern Daylight Time

Attached mockup for the link (Support Link.png).

FROM: Krisha Kennelly DATE: 10/17/2012 9:56:01 AM Eastern Daylight Time

Joe - please work with Herman to implement this. He has a document with the help topic.

FROM: Joseph Ihnat DATE: 10/25/2012 1:17:23 PM Eastern Daylight Time

Done for 6.4.1

FROM: Matt Kolis DATE: 10/30/2012 3:03:32 PM Eastern Daylight Time

The Base System License, Standalone End User description needs updated. See attached document.

FROM: Matt Kolis DATE: 10/30/2012 3:32:38 PM Eastern Daylight Time

Verified.

FROM: Srujana Thogaru DATE: 11/2/2011 9:04:28 AM Eastern Daylight Time  
Reason for the above error is that the PS strands in Span2 are not defined stand layout window.

Please define the PS strands in span2 in stand layout window and run the analysis, which completes without any errors.

A warning message will be added, if stands are not defined in the stand layout window for 6.4 release.

Krishna, can you please add a warning message if stands are not defined in the stand layout window.

FROM: Krishna Kennelly DATE: 3/6/2012 9:30:51 AM Eastern Standard Time  
Developer notes:  
Please add validation in the export to check for this.

in gui/abaxaashtoengine/ CAbxAashtoStdEngine and CAbxAashtoLrfdEngine both classes have a ValidatePrestressExport function. Both functions have a loop where they retrieve the PsBeamSpan. in those loops, add a check that the StrandLayout (which belongs to the BeamSpan) has more than zero strands. if they have zero strands, issue an error message and return FALSE.

FROM: Srujana Thogaru DATE: 3/6/2012 9:52:47 AM Eastern Standard Time

Message has been added for 6.4 Release.

FROM: Matt Kolis DATE: 5/4/2012 11:05:11 AM Eastern Daylight Time  
Verified in VO64 Alpha Build 4 the error message was added.

## Complete Issue Information

Dean I wasn't able to reproduce this issue.

I am wondering if you could send us 4 XML files for a bridge at different stages.

1 - XML file created from the Bridge Explorer

2 - XML file created in BWS right after the bridge is opened without making any changes.

3 - XML file after you change the name in the bridge description window and click OK to close the window.

4 - XML file after you click save which fails.

These information may help us understand what is going on.

Dean, we looked into this issue and have not found out why you are getting an error after you make a change to the structure name and save. We are not able to reproduce the error. We will need to get a copy of your database to be able to investigate this further.

I will send you an email with the information on how to send us the file.

Thanks,  
Mehrdad

I got a copy of your database and I am not able to reproduce the error. This is in debug 6.3 SP1. I will try it in 6.3.0 release build.

FROM: Mehrdad Ordoobadi DATE: 11/8/2011 12:47:38 PM Eastern Standard Time  
I am not able to reproduce the problem using the version 6.3 release software.

FROM: Mehrdad Ordoobadi DATE: 11/8/2011 1:49:07 PM Eastern Standard Time  
Dean,

I used your database and tried to reproduce the problem that you reported, but I wasn't successful.

I can think of two things:

- 1 – A problem with the ODBC driver
- 2 – A problem with permissions to Virtis/Opis tables.

Could you please send me the version of the ODBC driver that you are using? To find the driver information go to ODBC data source administrator and find the ODBC connection that you use and read the driver name in the Driver column. Then select the Drivers tab and find the item with matching name and read the version number from the version column.

Could you also ask your DBA to execute the following SQL commands in the SQL Plus while connected as a regular user (not the schema owner).

```
SET ROLE VIRTIS_USER_READ_WRITE_ROLE identified by READ_WRITE;  
UPDATE abw_overflow SET strucname = 'WWCC WB US-50 over Anderson Ave.' WHERE  
overflow_id = 4187;
```

And see if these succeed or fail.

Thanks,  
Mehrdad

RCTrainingBridge1 looks fine, but it only has Straight and Type 1 bar marks. Elizabeth's bridge has Type 3 bar marks. I sent Elizabeth's XML file to you earlier but I now see that it was blocked. I'll upload it to the FTP server as Elizabeth\_09242.zip in the Incoming\Virtis folder.

To: Brian Goodrich  
Subject: RE: Problem with rebar distances referencing top of girder

Brian,

GetVertDist should return the distance measured from the top of the structural top flange regardless of the "Consider structural slab thickness..." checkboxes. I tested both the cross section based and schedule based tee beam in RCTrainingBridge1. The numbers look ok. Could you check what GetVertDist returns in RCTrainingBridge1 in your development?

Herman

From: Brian Goodrich [mailto:Goodrich@BridgeTech-Laramie.com]  
Sent: Wednesday, November 09, 2011 11:12 AM  
To: Lee, Herman  
Cc: 'Elizabeth Befikadu'  
Subject: Problem with rebar distances referencing top of girder

Herman,

Elizabeth Befikadu submitted a problem regarding the location of rebar in an R/C tee beam. For bars measured from the top of the girder, the distances are including the actual top flange thickness rather than the just structural thickness. She has both "Consider structural slab thickness..." boxes checked. The BRASS export is using the domain function to generate cross sections from the schedule-based input and then using the GetVertDist function of IDoReinfConcreteCrossSectionReinfSetPtr. I have a note in the BRASS export that the "Rebar is measured from the effective flange thickness, not the actual." Furthermore, the Virtis help with respect to rebar input states "Top of girder is the top of the structural top flange."

Has this issue been reported and/or addressed already? Do you agree that the distance returned from GetVertDist should be measured from the top of the structural top flange?

Thanks,  
Brian

FROM: Krisha Kennelly DATE: 11/16/2011 10:43:09 AM Eastern Standard Time  
I have verified that this is a bug.

A work around is to reference the Type 3 bar marks relative to the bottom of the girder. This will work for the attached bridge since it has a constant web depth over the length of the beam. If the beam has a varying web depth, this work around would not work.

Code has been fixed for Version 6.4 (DoGirderMbrAlt.cpp)

timothy.souther@illinois.gov

FROM: Mehrdad Ordoobadi DATE: 11/30/2011 12:27:04 PM Eastern Standard Time  
It appears to be caused by having analysis results (corresponding to the structure definition that is being deleted) saved to the database.  
A work around is to remove the analysis results before deleting the structure definition and saving the bridge.

FROM: Tim Armbrecht DATE: 12/1/2011 9:19:40 AM Eastern Standard Time  
What is going to be the fix? Automatically delete the results when the structure definition is deleted?

FROM: Mehrdad Ordoobadi DATE: 12/5/2011 11:37:58 AM Eastern Standard Time  
Virtis/Opis currently removes the analysis results automatically when the whole bridge is deleted. It does not automatically delete the corresponding results when a structure definition or member or member alternative is deleted.

The ideal fix for this, as you are suggesting, is to automatically delete the results when the structure definition is deleted.

FROM: Mehrdad Ordoobadi DATE: 5/8/2012 9:40:21 AM Eastern Daylight Time  
Herman suggested an alternative fix for this issue is to pop up a message asking the user to first delete the analysis results before saving.

be greatly appreciated!

Thank you!

FROM: Herman Lee DATE: 11/16/2011 10:47:43 AM Eastern Standard Time  
Please attached a screen capture of the Debug error message to this incident.

FROM: Mehrdad Ordoobadi DATE: 11/30/2011 11:23:39 AM Eastern Standard Time  
I see two issues:

- 1 - The reason that the SET ROLE command fails is that your users should have been granted access to Virtis/Opis read-only and read/write roles. Please ask your database administrator to review the Virtis/Opis help file section "Adding Users to the Virtis/Opis Database".
- 2 - The error "Error opening database record set" maybe due to a bug in Oracle software if your Oracle software is older than version 10.2.0.3. Also make sure that you are using the Oracle ODBC driver and not Microsoft ODBC driver for Oracle, and the version of your ODBC driver matches your Oracle server's software version. Please let us know if this does not help and we would need a copy of your database to investigate this issue further.

Regards,  
Mehrdad Ordoobadi

- =====
- 1 – The users all have read/write access to the Virtis/Opis database.
  - 2 – Our version of Oracle may be an issue; I have requested that our DBA upgrade the database to a version of Oracle that exceeds 10.2.0.3.

Any other ideas would be greatly appreciated.

Thank you  
Chris

FROM: Herman Lee DATE: 12/5/2011 3:42:51 PM Eastern Standard Time  
E-mail from Chris Vaisa, NMDOT:

=====

Also,

This error does not pop up in the 64-bit version of Virtis/Opis no matter what user logs in utilizing the same databases and user rights (read/write permission) as the ones connecting with the 32-bit Virtis/Opis. The only thing different is the 64 and 32 bit version of Opis/Virtis that the client logs into.

E-mail from Chris Vaisa, NMDOT:

=====  
With the past few weeks being the holiday season, our DBA has not had a chance to update the database to 10g or greater. I was told that upgrading the database would solve this issue. However, I am not sure that is the case when I am having no complaints from users who are using Windows 7 64-bit hitting the exact same database with equal rights as those who are trying to access the same database working with 32-bit Windows XP or 7. I was also told that it was a permissions issue, which I also do not believe to be true as the same thing with the database is occurring. Anyone using Windows 7 64-bit has had not one complaint and only those with Windows XP or 7 32-bit has the issues. All users have the same rights in both of our databases but only experience issues when not using Windows 7 64-bit. Tech support has offered those 2 suggestions, since I have tested users rights and that does not seem to resolve the issue, I will remind our DBA to upgrade the database and will post something back when that is completed.

Thank you  
Chris

### Description

FROM: William Metcalf DATE: 11/22/2011 3:00:50 PM Eastern Standard Time

We have been having a problem for a long time with having difficulty saving trucks when we were inputting. We would have to fill in a name and save then close virtis and restart and then enter the truck information otherwise it would give an error when trying to save. Now for NSG truck we can not get it to save no matter what.

FROM: William Metcalf DATE: 11/22/2011 3:46:42 PM Eastern Standard Time

i have attached some pictures of 2 different error msg I got.

FROM: Mehrdad Ordoobadi DATE: 11/30/2011 12:18:19 PM Eastern Standard Time

**Complete Issue Information**

Is this for new trucks or existing trucks?

I verified in the 6.3.1 that I was able to create new NSG trucks and add axles and wheels and then save them. Then I was able to add new axles and wheel and save successfully.

FROM: William Metcalf DATE: 12/7/2011 4:46:01 PM Eastern Standard Time  
it is for new trucks. We can save them in the agency vehicles folder, which has many trucks. But we can save them in the "user defined" folder

FROM: Mehrdad Ordoobadi DATE: 5/3/2012 3:26:16 PM Eastern Daylight Time  
I am still not able to reproduce this issue.

FROM: Tim Armbrecht DATE: 12/6/2011 10:46:56 AM Eastern Standard Time  
From my consultant (Souther):

After certain modifications as indicated below the subject Virtis model produces an error when an attempt is made to save it. The error message is as follows:

Unable to save Bridge data!

04:55:42 PM - Line 886 in source file UiBWSDoc.cpp.

Delete process failed while deleting CDmSpngMbrDef (SaveOrder object 178).

04:55:41 PM - Line 494 in source file DmBridgeCache.cpp.

Error deleting record from database record set.

04:55:41 PM - Line 1310 in source file DmSpngMbrDef.cpp.

State:23000,Native:547,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

State:01000,Native:3621,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

State:23000,Native:547,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

State:01000,Native:3621,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

The DELETE statement conflicted with the REFERENCE constraint "C\_1278". The conflict occurred in database "Submittals", table "dbo.abw\_super\_struct\_spng\_mbr\_alt". The statement has been terminated.

4/19/2016 3:23:55 PM

HRS AASHTO

3126

**Complete Issue Information**

The DELETE statement conflicted with the REFERENCE constraint "C\_1278". The conflict occurred in database "Submittals", table "dbo.abw\_super\_struct\_spng\_mbr\_alt". The statement has been terminated.

The steps taken that resulted in this error are exactly as follows:

1. Copy Floorbeam Definition, "W21x44 (End)", from Superstructure Definition, "Span 4 (78') GFS", to Superstructure Definition, "Span 6 (78') GFS", using either drag and drop or copy and paste.
2. Rename the copied Floorbeam Definition in Span 6 so that it is called, "W21x44 (End)".
3. Under Span 6, link the Floorbeam Member Alternatives for Floorbeam Members Flbm01 and Flbm17 to Floorbeam Definition "W21x44 (End)".
4. Under Span 6, Delete the FLOORBEAM DEFINITION, "21CB58 (End)".
5. Attempt to save the model.

This problem is a specific example of something that has happened often on many different Virtis bridge models when I have done similar copy and paste modifications. This is the first time I have been able to reproduce an exact sequence that has resulted in the save error.

FROM: Aaron Kemna DATE: 12/8/2011 3:54:57 PM Eastern Standard Time  
We have recently upgraded to Virtis 6.3 with Service Pack 1- 32 bit. Don't ask what took so long. We are now running into this issue. My case involves deleting and copying an exterior girder. A similar action was performed for another girder without issue. The bridge was ran before I made the modifications if it has something to do with the Analysis Results. I'll attach the bridge (A7672) and an .mht file. I used a Windows recorder to create a file which shows the screen shots to replicate the error.

FROM: Mehrdad Ordoobadi DATE: 2/10/2012 4:03:38 PM Eastern Standard Time  
This maybe related to VI 11208 , 11233, 11166.

I have verified that this issue is not reproducible with version 6.4 development code.

FROM: Phil Litchfield DATE: 6/26/2012 4:55:13 PM Eastern Daylight Time  
Checked with 6.4 beta 1, and appears to be fixed.

### Description

FROM: Tim Armbrrecht DATE: 12/15/2011 12:09:39 PM Eastern Standard Time  
From my consultant (Staggemeyer):

I found an error with virtis when entering SN 003-0043.

I wanted to delete a load case description (FWS) but couldn't since it was referenced elsewhere in the model. This load case was being used in the structural typical section (in the parapet tab). I changed the load case from 'FWS' to 'Curb'. Then I went to the Load Case Description window and successfully deleted the 'FWS' load case. I tried to save these changes and got the following error message:

Unable to save Bridge data!  
Delete process failed while deleting CDmSuperLoadCase (SaveOrder object 148).  
Error deleting record from database record set.

I got this message while working from superstructure definition 'Span 3 WF' but this error occurs at

4/19/2016 3:23:56 PM

HRS AASHTO

3133

**Complete Issue Information**

every other superstructure definition as well.

If I save immediately after changing the load case from 'FWS' to 'Curb' and BEFORE deleting 'FWS' from the Load Case Description window then I do not get this error message.

I have attached the .xml file for SN 003-0034.

FROM: Mehrdad Ordoobadi DATE: 2/10/2012 3:53:44 PM Eastern Standard Time  
This maybe related to VI 11208 , 11233, 11166.

These are fixed in version 6.4.

FROM: Mehrdad Ordoobadi DATE: 2/10/2012 3:57:51 PM Eastern Standard Time  
Verified that this issue is not reproducible with the current 6.4 development code.

This issue is a duplicate of VI 11208 , 11233, 11166.

6.3.0

I was able to create a couple of NSG trucks today and I had another load rater create one. But now I can't edit and save any existing NSG trucks. And I can't create any new NSG trucks.

I'm trying to process an overweight permit but when one can't save or create NSG trucks, it's becoming a critical problem.

Not sure if anybody else has been having problems with this?

FROM: Todd Thompson DATE: 12/19/2011 5:00:42 PM Eastern Standard Time  
I tried to add a regular agency truck and I can't save either.

Not sure what has happend?

Did I max out the table size for truck definitions?

FROM: Todd Thompson DATE: 12/19/2011 5:01:40 PM Eastern Standard Time  
I also can not edit existing agency trucks.

FROM: Todd Thompson DATE: 12/21/2011 9:20:07 AM Eastern Standard Time  
Just exiting and restarting the Virtis Application did not work or help.

After rebooting my PC - I was able to finally able to edit or add trucks again.

But I'm not having problems now, so not sure what caused the problem.

FROM: Mehrdad Ordoobadi DATE: 2/10/2012 3:51:42 PM Eastern Standard Time  
Please let us know if you see this again.

FROM: Todd Thompson DATE: 9/7/2012 1:15:37 PM Eastern Daylight Time  
Let's go ahead and close this. It is intermittent and hard to reproduce.

### Description

FROM: Herman Lee DATE: 12/27/2011 1:27:41 PM Eastern Standard Time  
Submitted on behalf of Brian Goodrich, BridgeTech.

Received e-mail:

=====  
Herman,

I'm running TrainingBridge1 with Virtis/Opis 6.3 and the output is directed to the following directory:

C:\ProgramData\AASHTOWARE\VirtisOpis63\TrainingBridge1\SimpleSpanStructure\G1\PlateGirder

Spaces in the path are now being removed instead of being replaced with underscores, except for the analysis module names. However, the analysis module names like "Virtis LFD", "BRASS LFD", etc. have the space replaced with an underscore when creating the directory structure. I'm adding a new analysis module named "BRASS-GIRDER LFD" and the folder name is coming out as "BRASS-GIRDERLFD" when I'm expecting to be "BRASS-GIRDER\_LFD". This is the folder where the EngineFiles.LST and .LOG files are written by Virtis/Opis.

4/19/2016 3:23:57 PM

HRS AASHTO

3136

**Complete Issue Information**

To investigate this issue, I changed the analysis module named "BRASS LFD" to "JUNK LFD" and the folder name came out to be "JUNKLFD". This leads me to believe that something special is done for the older analysis module names, but I want to make sure. Is there some way that the analysis module export can dictate this folder name? I would like the folder names to be BRASS-GIRDER\_LFD, BRASS-GIRDER\_LRFD, and BRASS-GIRDER\_LRFR rather than having the space removed.

Thanks,  
Brian

=====

In Virtis/Opis 6.3, analysis files should be stored under the Analysis Output Folder specified in the Preferences dialog's Analysis tab.

**Developer Note:**

Need to modify RemoveInvalidCharacters in SysMiscFunctions.cpp to:

1. Compare the pass in string with the registered engine names in the database.
- Or
2. Have an optional parameter to indicate the pass in string is an engine name.

FROM: Joseph Ihnat DATE: 1/18/2012 3:18:46 PM Eastern Standard Time  
Fixed for 6.4, implemented a solution similar to option 2.  
New function declaration is "void RemoveInvalidCharacters(CString& sName, BOOL bSqueezeOutUnderscores = TRUE)".  
So for new engine names, call as "RemoveInvalidCharacters(sAnalysisModuleName, FALSE);".  
The old names are still hard-coded so as not to change program behavior (no other code was changed).

FROM: Matt Kolis DATE: 5/5/2012 5:24:41 PM Eastern Daylight Time  
Fix verified in VO64 Alpha Build 4.

### Description

FROM: Tim Armbrecht DATE: 1/4/2012 3:01:00 PM Eastern Standard Time  
Probably related to 11181. From my consultant (Souther):

When an attempt is made to replace the existing MEMBER ALTERNATIVE, "90"-138" WPG-Comp" in one Member "C - Centerline" with the one with the same name in another Member, "B - 1st E Int", within the Superstructure Definition, "9-Span Cont./Hinged WPG", and then attempt to save the model, it won't save and the following message is generated:

Unable to save Bridge data!  
Delete process failed while deleting CDmSuperStructSpngMbrAlt (SaveOrder object 245).  
Error deleting record from database record set.

To duplicate, follow this procedure...

- Copy MEMBER ALTERNATIVE, "90"-138" WPG-Comp" from Member, "B - 1st E Int", to Member "C - Centerline".
- Check the "Current" box for the just copied MEMBER ALTERNATIVE.
- Delete the former MEMBER ALTERNATIVE from Member "C - Centerline".
- Try to save the Virtis model.

FROM: Mehrdad Ordoobadi DATE: 2/10/2012 2:29:14 PM Eastern Standard Time  
A fix for VI 11067 has caused this issue. This issue is now fixed in version 6.4.

### Description

FROM: Amanda Jackson DATE: 1/23/2012 1:24:09 PM Eastern Standard Time  
Requesting an enhancement to the AASHTO engine to include the vertical legs of flange angles in built-up sections when determining section properties and girder capacity.

Because built-up sections are defined in Virtis as having angles for the top and bottom flanges, it shouldn't be too difficult to correctly calculate the web depth and other properties used in the spec checker. For example, AASHTO defines D as the "clear unsupported distance between flange

4/19/2016 3:23:57 PM

HRS AASHTO

3140

### Complete Issue Information

components” for most of the articles in chapter 10 of the 17th edition (2002). This should be calculated as the distance between the ends of the vertical legs of the flange angles. Using the distance from inside of flange to inside of flange is too conservative in many cases. Calculating the flange properties correctly will also make it possible to correctly calculate the web properties, and remove the issue of assuming the web is continuous to the top of the flange plates. The input information is already available in Virtis. The only thing that needs to be changed is the way the AASHTO engine calculates these values.

FROM: Herman Lee DATE: 6/27/2014 7:32:58 AM Eastern Daylight Time  
Same request in BRDRSUP-303 ("D" dimension for Rivet Plate Girders).

### Description

FROM: Jeff Olsen DATE: 1/26/2012 1:02:45 PM Eastern Standard Time

I am using the Report tool to create an output file of moment and shear demands. When the deadload tables are created, the stage 1 load cases 2, 3, and 4 are lumped into a table labeled Load case 4. All other tables are for individual load cases. Please revise this to break load cases 2, 3, and 4 into individual tables. An example report is attached.

FROM: Srujana Thogaru DATE: 2/4/2013 8:50:53 AM Eastern Standard Time

Can you please attach the bridge xml file for the above mentioned problem so that we can clearly address the issue.

FROM: Jeff Olsen DATE: 2/4/2013 10:38:55 AM Eastern Standard Time

I dont have the original file that I used, but created a different one that is giving the same error. I have attached the xml file of a sample prestressed bridge and a template (abr) to create a report. Analyze one of the beams in the file, then use the template to create a report using the report tool. You will see that for the non-composite deadload cases, the self weight and PS transfer forces are being reported individually, but the haunch and deck loads are being lumped in the same table which is labled as load case 3 (haunch). They should be broken out separately.

FROM: Srujana Thogaru DATE: 4/30/2013 2:15:57 PM Eastern Daylight Time

Haunch Load(load case 3) and Deck Load (Load Case 2) are combined in a single table in 6.4.1. In 6.5. release these two load cases are shown in separate tables. Fixed in 6.5 Beta 1

FROM: Subhadeep Ghosh DATE: 5/9/2013 11:16:53 AM Eastern Daylight Time

Verified for 6.5 Beta 1.

## Description

FROM: Creightyn McMunn DATE: 1/31/2012 5:16:01 PM Eastern Standard Time

We have encountered an error in Virtis on multiple structures.

Please see the attached screenshot for the error message. We have received this message on several structures when trying to delete member alternatives after copying superstructure definitions. If we try to delete a member alternative and then try to save the file we get the error message shown in the screenshot and are unable to save the file.

For an example, please see the attached .xml file for Task 38 (S01 of 39014) and perform the following steps for the Span 1 superstructure definition:

1. Change the link for Girder D to None
2. Change the links for Girders B, E, and F from Girder C to Girder D
3. Copy the member alternative from Girder C to Girder D

4/19/2016 3:23:59 PM

HRS AASHTO

3147

**Complete Issue Information**

- 4. Double click Girder C and uncheck the existing and current check boxes
- 5. Delete the member alternative for girder C.
- 6. Click the Save button on the toolbar

When we perform these steps we get the error message shown in the attached screenshot and are unable to save the file.

As a workaround, we have been able to redefine the superstructure definition and get it to work. However, this takes a decent amount of extra time. If there is a simpler workaround or fix that we are unaware of, please let us know.

FROM: Mehrdad Ordoobadi DATE: 2/10/2012 3:46:32 PM Eastern Standard Time  
This is a duplicate 11208 and 11233.

FROM: Creightyn McMunn DATE: 9/10/2012 3:50:51 PM Eastern Daylight Time  
Works in V6.4 Beta 4 for the attached xml.

FROM: Mehrdad Ordoobadi DATE: 9/10/2012 4:09:29 PM Eastern Daylight Time

### Description

FROM: Dean Teal DATE: 2/1/2012 1:53:48 PM Eastern Standard Time  
Herman - add this to the reports bucket if you feel it is of value

Comment from a designer:

General comment that could be passed along to the committee – the AASHTO engine seems very good in many ways, but a HUGE mark against it is that there is no “output” file... as in, a single file that echoes back the inputs (members and dead/live loads), shows intermediate computations, and report the analysis and summary of specification checks in a single file (i.e. for quality purposes – links the inputs to the outputs in such a way that the program “guarantees” that the specific inputs resulted in those specific outputs).

FROM: Herman Lee DATE: 2/2/2012 8:00:23 AM Eastern Standard Time  
Added to the Report bucket for consideration by the Report TAG.

To: Ambrecht, Tim A  
Subject: Virtis: Corrupted Bridge Model (Part 2)

The attached export file, "0162439a.xml" is similar to the one I just previously sent, except I isolated what appears to be the original event that prevented the model from being saved. It happened after deleting the Member Alternative (36WF135) under Member 12 - 4th N Int. The steps leading to the failure are as follows:

- Uncheck the "Current" box.
- Delete the Member Alternative.

The resulting debug error message is as follows:

Unable to save Bridge data!

02:40:57 PM - Line 886 in source file UiBWSDoc.cpp.

Delete process failed while deleting CDmSuperStructSpngMbrAlt (SaveOrder object 245).

02:40:55 PM - Line 494 in source file DmBridgeCache.cpp.

Error deleting record from database record set.

02:40:55 PM - Line 1099 in source file DmSuperStructSpngMbrAlt.cpp.

Sent: Wednesday, February 01, 2012 1:56 PM  
To: Armbrecht, Tim A  
Subject: Virtis: Corrupted Bridge Model

The attached export file was created when the source bridge model would not save. I don't have the message that occurred when that happened. After exporting the model I then closed it without saving. Then it was reopened and the export was brought in using the import procedure. The plan was to copy the superstructure Definition into the model but Virtis would not do that producing an error stating, "Copy of structure definition failed!" I then tried to import and save the export file into a different database (Submittals) but it could not be saved. Please ask Baker to investigate and determine the cause of this apparent corruption in the bridge model data. It should be emphasized that this is not an infrequent occurrence with Virtis that seems to occur when a large number of operations are performed. I also submitted two other generally similar incidents within the past few months.

=====

Herman,

I am entering a two span continuous girder-floorbeam system into Virtis 6.3. I am getting 17 errors (see attached). However, the bridge runs fine.

Any idea of what could be causing the errors and how to resolve them?

I know I can delete the haunches and manually enter a dead load, but I would prefer not to since this is

4/19/2016 3:23:59 PM

Received Bridgeware e-mail:

=====  
Ben,  
I got this xml file when I ran using AASHTO engine I'll get like50% (Interior beams ) less nominal moment capacity when I use the virtis engine. Somehow the engine is miscalculating the moment capacity of the section when it's an interior beams I don't have this problem with fascia ones. I've attached the file with the Michigan legal loads for you to check. The bridge alternative that I was using is the Superstructure # 3. you can change the engine to the AASHTO and see the interior beams.  
Thanks

Dan

Herman, has anyone already suggested schedule – based entry for steel in VI as an enhancement? If not, I'll propose it.

Timothy A. Armbrecht, P.E., S.E.  
Chief, Bridge Ratings & Permits Unit  
Illinois Department of Transportation

From: Souther, Timothy E  
Sent: Thursday, January 26, 2012 9:02 AM  
To: Armbrecht, Tim A  
Subject: Virtis Enhancement Proposal - Schedule-based Built-up Girders

The current cross-section based entry of steel built-up plate girders is unduly time-consuming and prone to data-entry error. In addition built-up girders cannot be reviewed utilizing schematic diagrams. I propose that a schedule-based option be developed. The benefit to users would be to increase productivity and confidence in Virtis model development.

### Description

FROM: Dean Teal DATE: 2/22/2012 9:53:36 AM Eastern Standard Time

In working with 3 installations I have found that the files created when a bridge is analyzed can not always be found.

XP - the files are in C:\Documents and Settings\teal\My Documents\AASHTOWARE\VirtisOpis63 see attached

Windows 7 64 bit Desktop - the files are in Libraries\documents\My documents\AASHTOWARE\VistisOpis63 see attached

Windows 7 64 bit LapTop - I can not find the files at all? This laptop had 6.2 installed in the root directory being W7 was not totally supported and this was a work around (if it makes any difference)

Questions:

1. Do I have any control as to where these files are located?
2. Where should I look for my files on my laptop?

FROM: Joseph Ihnat DATE: 2/22/2012 10:31:20 AM Eastern Standard Time

This was one of the enhancements in version 6.3. The default location is your "My Documents" folder,

4/19/2016 3:24:01 PM

HRS AASHTO

3159

**Complete Issue Information**

which is a different location on XP and Windows 7.

1) The Preferences window, Analysis tab, allows you to change this. Please see this window's Help for a little more info.

2) For version 6.2 and earlier versions, the files should be found under the folder where Virtis/Opis is installed.

When a bridge is checked out, it shows up in the bridge explorer as such

When a superstructure only is checked out there is no indicator that shows up at all. You have no way of knowing unless you actually open up the bridge file.

Am I missing something here?

Is there some way of knowing?

## Complete Issue Information

To make matters even worse, when you find one of these superstructure Definitions checked out, it doesn't tell you "who" has it checked out. You have to do a trial and error by authorizations to find out who!!

FROM: Mehrdad Ordoobadi DATE: 3/29/2012 1:56:23 PM Eastern Daylight Time  
This is not a new issue. This behavior is how it was implemented originally in early versions of Virtis/Opis.

This is not a critical bug and we would try to get a fix for it in version 6.4.

An approach to fix this issue is:

- \* show an icon indicating that at least one structure definition in the bridge is checked out. The name (s) of the user(s) who checked out the structure definition(s) in a bridge will not be displayed in the bridge explorer grid. If we want the bridge explorer to display the names of the users who have structure definitions checked out it would affect the performance of the bridge explorer.
- \* Add a new window that reports on bridge check-out status. A new bridge explorer pop-up menu item will be added to display selected bridge's check-out status.

FROM: Mehrdad Ordoobadi DATE: 5/9/2012 3:50:35 PM Eastern Daylight Time  
Added code to show bridge structure definition check out status.

FROM: Bin Zhang DATE: 8/29/2012 10:28:27 AM Eastern Daylight Time  
Verified for acceptance build.  
An icon to indicate a superstructure check out was added in the bridge workspace.

FROM: Dean Teal DATE: 11/15/2012 4:53:18 PM Eastern Standard Time  
This is working in 6.4.0

FROM: Mehrdad Ordoobadi DATE: 11/16/2012 9:42:28 AM Eastern Standard Time  
Accepted by Dean Teal.

FROM: Herman Lee DATE: 2/22/2012 11:56:02 AM Eastern Standard Time  
 Submitted on behalf of Tom Eberhardt (teberhardt@elrobinson.com), E.L. Robinson Engineering of Ohio Co.

Received Bridgeware e-mail:

=====

To whom it may concern,

I am relatively new to Virtis and was wondering whether this is the correct avenue to direct general modeling questions or if there is another email address or forum out there for that.

My question is whether there is a trigger in Virtis to not allow the program to assume that the bottom flange is braced at the CL bearing of a pier. In looking at the output in the spec check, it appears that it is assuming the CL bearing to be a brace point. In reality I only have a cross frame at location 142.703 and 157.703 and nothing at point 153.00 (the CL pier).

Steel Rolled Shape - At Location = 153.0000 (ft) - Left Stage 3

Section at Brace Point

4/19/2016 3:24:01 PM

HRS AASHTO

3162

**Complete Issue Information**

Moment Gradient Modifier, Cb, Calculation  
-----

INPUT:

Section Prismatic in Unbraced Length: Yes  
Section is Unbraced Cantilever: No

Left Brace Location = 142.7030 (ft)  
Middle of Unbraced Length Location = 147.8515 (ft)  
Right Brace Location = 153.0000 (ft)

Steel Rolled Shape - At Location = 153.0000 (ft) - Right Stage 3

Section at Brace Point

Moment Gradient Modifier, Cb, Calculation  
-----

INPUT:

Section Prismatic in Unbraced Length: Yes  
Section is Unbraced Cantilever: No

Left Brace Location = 153.0000 (ft)  
Middle of Unbraced Length Location = 155.3515 (ft)  
Right Brace Location = 157.7030 (ft)

I put a "point of interest" at the CL bearings and checked the "Override diaphragm schedule", and put in the left and right distances, but left the "Diaphragm at this location" empty. It gives the same results shown above.

Any assistance with this matter is greatly appreciated. Thank you.

Submitted on behalf of Vinacs Vinayagamoorthy, Caltrans.

Received e-mail:

=====  
Herman

We have several bridges where the girder splays and skew angle differ at each bent.

We tried to enter the variable LLDF along the girder to account for the variation. Since we cannot enter the linear variation of LLDF along the girder (for LRFD data entry), we are trying to enter it as "stepped" case.

4/19/2016 3:24:01 PM

HRS AASHTO

3164

**Complete Issue Information**

In this attached bridge, program fails to analyze. It says the LLDF is entered properly. I am allowed to enter only six digit number for the length. Even then, it says I did not enter the values properly.

As far as I could see, all the ranges for the LLDF for this girder is entered, yet the program gives error message.

Could you please check this for me?

Structure Definition: Testing Bridger  
Member Alternatvie G2 - Copy of Plate

(Embedded image moved to file: pic18949.jpg)

**Description**

FROM: Creightyn McMunn DATE: 2/29/2012 4:39:12 PM Eastern Standard Time  
 de is defined as the horizontal distance from the centerline of the exterior web of exterior beam at deck level to the interior edge of curb or traffic barrier (ft). When I looked at the LRFD dist calcs for the exterior beams of two different box beam bridges, AASHTO calculated de as the distance from the centerline of the exterior beam (not web) to the edge of the traffic barrier.

de for 46062 should be -0.92 ft instead of +0.92 ft. de for 82022 should be -1.63 ft instead of +0.52 ft. In both cases this resulted in overly conservative distribution factors.

See attached .xmls and output.

FROM: Creightyn McMunn DATE: 6/4/2012 3:05:20 PM Eastern Daylight Time  
 Is there an update regarding this issue?

4/19/2016 3:24:02 PM

Please work on this under FPMaintenance for version 6.5.

FROM: Xinmei Li DATE: 9/13/2012 1:19:40 PM Eastern Daylight Time  
Resolved for 6.5.

FROM: Herman Lee DATE: 11/21/2012 7:39:07 PM Eastern Standard Time  
The fix will be included in the 6.4 Service Pack (6.4.1) release.

FROM: Laura Volle DATE: 11/30/2012 2:36:56 PM Eastern Standard Time  
The attached bridges were imported into Virtis 6.4.1 and analyzed. The reports that are attached for comparison are not being produced after analysis.

FROM: Krisha Kennelly DATE: 12/3/2012 11:43:36 AM Eastern Standard Time  
Fixed for 6.4.1 beta 2.

Note the computed value of de for 82022 is -1.29 ft. See attached calculation.

FROM: Laura Volle DATE: 12/3/2012 2:48:50 PM Eastern Standard Time  
This has been tested in 6.4.1 beta 2 and is now properly working. Verified.

FROM: Creightyn McMunn DATE: 12/13/2012 2:45:06 PM Eastern Standard Time  
I verified that de is being calculated properly in v6.4.1 Beta 2.

It should be noted, however, that the program takes de as the distance from the centerline of the exterior web of the exterior beam to the start of the travelway. The code defines de as the distance from the centerline of the exterior web of the exterior beam to the "interior edge of curb or traffic barrier". I don't think this matters much because the two should coincide but wanted to point it out as the user could set the travelway to a location other than edge of curb of traffic barrier.

### Description

FROM: Chris Vaisa DATE: 3/7/2012 9:48:56 AM Eastern Standard Time  
Refer to the attached version 5.6 model, "07319\_AL.xml". Like many models of older bridges that are present in the NMDOT Virtis database, this model includes negative haunches. In previous versions (using the BRASS engine), the negative haunch was used to more accurately model the actual physical condition of an embedded top flange. However, in version 6.3.1, models with negative haunches cannot be analyzed; please see attached screen shot haunches.jpg:

FROM: Srujana Thogaru DATE: 3/9/2012 3:17:05 PM Eastern Standard Time

### Description

FROM: Christopher Laughlin DATE: 3/12/2012 2:03:39 PM Eastern Daylight Time  
Does Service Pack 1 address all previously released Technical Notes ? (TN 21, 22 and 23) or do we still need to apply separately ?

We are about to install the original delivered disk, apply service pack 1 and then technical notes 24, 25 and 26. Will this get us to to the latest release with all technical issues addressed ? or is there a better way ?

**Complete Issue Information**

Also, do I understand correctly that if we choose to continue using the BRASS engine, that we have to purchase a license from Wyoming ?

Thank you !

Chris Laughlin

FROM: Herman Lee DATE: 3/12/2012 3:40:47 PM Eastern Daylight Time  
- TN 21 is for the database migration from 6.2 to 6.3. Some agencies would like migration to the latest supported specification version. Please review the TN for more information.  
- TN 22 is for the optional scripts come with the 6.3 installation.  
- TN 24 is for the 64-bit Oracle ODBC Driver.

Service Pack 1 includes TN 23. After Service Pack 1 is installed, you need to apply TN 25 and 26.

For licensing the BRASS Engine, please contact WYDOT.

## Description

FROM: Tim Armbrecht DATE: 3/12/2012 3:46:28 PM Eastern Daylight Time  
Attached are two pages from the Virtis help section which shows that one should be able to replace an existing bridge with a new file (from a consultant export). However, when in the "Bridge Workspace" the File/Import is not available as an option (only File/Export). I have not noticed another way to do this. So either the help documentation is incorrect or Virtis has an issue when trying to do this.

FROM: Mehrdad Ordoobadi DATE: 3/29/2012 1:43:04 PM Eastern Daylight Time  
The import from Bridge Workspace was disabled a few years ago. The online help needs to be corrected.

FROM: Tim Armbrecht DATE: 3/29/2012 3:31:02 PM Eastern Daylight Time  
So there is no way to "replace" a file/record with a new one? Or need to use the Bridge Exchange feature?

FROM: Mehrdad Ordoobadi DATE: 3/29/2012 4:31:21 PM Eastern Daylight Time  
That's correct. The Bridge Exchange feature can be used only if the bridge originated from the same database. The original items cannot be modified when you use bridge exchange.

FROM: Geoffrey Trees DATE: 5/25/2012 1:25:30 PM Eastern Daylight Time  
Fixed for 6.4 release.

### Description

FROM: Christopher Laughlin DATE: 3/14/2012 8:39:46 AM Eastern Daylight Time  
Is there a migration wizard to go from 6.2 to 6.3 ? Our DBA tech has one that he said he used last upgrade, but I do not find it on any disk. File name is VirtisOpisDBMigrationWizard.exe

FROM: Christopher Laughlin DATE: 3/14/2012 9:06:40 AM Eastern Daylight Time  
Update: Looks like the migration wizard has not been in use since moving from 5.6 to 6.0. Correct ? If so, are there any step by step instructions or any scripts to migrate from 6.2 to 6.3 ? thanks and sorry for the duplicate issue I logged, I thought the first one did not go through, my bad !

FROM: Herman Lee DATE: 3/14/2012 9:10:54 AM Eastern Daylight Time  
The Migration Wizard is installed with the Virtis Software, in the C:\Program Files\AASHTOWARE\VirtisOpis63\Migration Wizard folder. You could access it through the Start Menu (please see attached MigrationWizard.png file).

FROM: Xinmei Li DATE: 4/10/2012 7:34:15 PM Eastern Daylight Time

Format: When this window is resized, it will be nice if the limit states selection control is resized, too, like the grid.

Tab: The grid control should be the first tab stop instead of the last.

Help: The first line for "All other limit states", it should be "service limit states, strength limit states, and extreme event limit states" instead of "service limit state, strength limit state, and extreme event limit state".

Behavior: The three drop down lists in the grid: default should be set if not selected by user yet.

When new factors are added or existing factors are revised a message should be sent to this tab if it's open so that it can be updated accordingly.

When user changes the selection for "Analysis Module" "Spec Version" or "Factors" in grid, he will lose the selections in limit state list, this information should be included in the warning message.

Copy from Library button: When use Copy from Library button to add new design settings, if the selected factor is not an existing factor a new factor will be added to the bridge but the limit states selections are not populated in the newly added factor.

FROM: Herman Lee DATE: 4/12/2012 3:17:18 PM Eastern Daylight Time  
Submitted on behalf of Vinacs Vinayagamoorthy, Caltrans.

Received e-mail:

=====  
Herman

Our engineer reports that the AASHTO LFD, AASHTO LRFR engines are not properly establishing the dead load of overhangs whenever the thickness of the deck at the end is smaller the deck thickness entered in the typical section. It appears to increase the load instead of reducing it.

We had this problem with BRASS engine in the past, It took some time to fix it with BRASS engine. I hope this could be fixed sooner.

His detailed comparison and the virtis file that is used to investigate this issue is attached,

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer

It would be helpful if Opis/Virtis had the capability to transform prestressing and mild reinforcement in prestressed girders. How hard would it be to add this feature? Conspan is able to do this, and if I choose to transform in Conspan, then I cannot get a comparable rating with Opis/Virtis.

FROM: Tim Armbrecht DATE: 4/20/2012 2:36:01 PM Eastern Daylight Time  
Currently Virtis only allows coverplates to be specified on the top of top flanges and the bottom of bottom flanges. Occasionally, steel wide flange beams and welded plate girders have been strengthened by adding coverplates to the "inside" faces of the flanges (bottom of top flanges and top of bottom flanges). Such beams can't be properly modeled in Virtis.

This proposal is to enhance Virtis so that coverplates may be specified on both top and bottom surfaces of steel beams.

 I submitted this enhancement incident on behalf of Vinacs from CalTran.  
 Currently AASHTO engine (LFR, LRFR, LRFD) does not compute the rolled girder properties based on its dimensions, it uses the properties information entered by the user. While CalTrans prefers the feature that AASHTO engine establishes Ix and A if it is NOT entered. The chain of e-mails and also the word file are attached to the incident.

The original email was listed below. Response e-mail is attached as a PDF file.

Herman

**Complete Issue Information**

How the data entered for the Rolled Shape significantly affects the rating of steel girder bridge.

For example, AASHTO LFD requires that the values of A, Ix and Iy be entered. In other words, if the user did not populate these field the AASHTO LFD and LRFD will not run. However, AASHTO LRFR will run the analysis by establishing the numbers based on dimensions given for the shape.

Plot thickens further: AASHTO LRFR ignores the values entered by the user. In other words, even if we enter the values for Ix, Iy and A, those values are NOT used, rather all the numbers used in the analysis is based on dimension given.

BRASS engine establishes the Ix and Iy and A, only when those fields were left Empty.

Full summary of behavior of Each engine is studied and listed in the word document.

We have modeled a lot of bridges using BRASS engine, where A, Ix, Iy, and Z entered. We think the approach taken by the BRASS engine was based on previous input from many State Engineers and should be duplicated by the AASHTO engines.

We would like to have the AASHTO LFD and AASHTO LRFR matches BRASS engine approach (as described in the attached document).  
(See attached file: Issue 5 Rolled Girder Properties in Virtis 6\_3\_1.docx)

FROM: Krisha Kennelly DATE: 10/8/2012 1:32:26 PM Eastern Daylight Time  
Subhadeep has done the coding for this enhancement for 6.4.1 for the AASHTO Std/LRFD/LRFR engines. If the A and I aren't entered on the Steel I Shapes: Properties tabs, these engines will compute the A and I based on the flange and web dimensions that are entered, fillets are ignored. If the A and I are entered on this tab, they are used by the engines.

Geoff - please revise the AASHTO engine help to read:

If the area and inertia are not entered, the engine will compute them based on the flange and web dimensions. Fillets are ignored.

## Complete Issue Information

FROM: Geoffrey Trees DATE: 11/2/2012 1:54:06 PM Eastern Daylight Time

The help documents were updated. Looks like they didn't make it into the alpha install for some reason. I will mention this to Joe.

FROM: Matt Kolis DATE: 11/7/2012 7:48:40 AM Eastern Standard Time

Verified in Alpha 2.

FROM: vinacs vinayagamoorthy DATE: 11/20/2012 9:54:06 AM Eastern Standard Time

This incident is to make the features available within BRASS engine also available within AASHTO Engines. Two of the features that are included in the BRAASS engine are considered in this fix. AASHTO engines are modified so that it uses the Area and Moment of Inertia given in the Property table, if they are available.

The third feature of the BRASS is NOT included in this fix is that the analysis engine utilizes the Z entered in the property table. AASHTO engine establishes Z using the member dimensions, this typically results in smaller Z. Can this be included also in this fix?

FROM: Krisha Kennelly DATE: 11/26/2012 10:20:06 AM Eastern Standard Time

the following rules were sent to Vinacs and he concurred with this implementation:

1. LRFD/LRFR spec articles will not be changed to use the user input Z. The LRFD Spec App D6.1 says to compute Z as the program is currently doing. This will match the BRASS LRFR engine implementation.
2. The LFD article to compute noncomposite plastic moment will be revised to compute  $M_p = F_y * Z$  user input Z and PNA at mid-height of the rolled section only if:
  - a. No cover plates exist
  - b. No rebar existsIf a and b aren't met, Z and PNA are computed as they are now.
3. The LFD article to compute composite plastic moment for negative moment will be revised to compute  $M_p = F_y * Z$  user input Z and PNA at mid-height of the rolled section only if:
  - a. No cover plates exist
  - b. No rebar existsIf a and b aren't met, Z and PNA are computed as they are now.
4. The LFD article to compute composite plastic moment for positive moment will not be modified since the slab has to be included in the PNA and  $M_p$  calculation.

Wayne - please modify the LFD articles in 2 and 3 as above.

Then assign to Geoff to revise the AASHTO Std Engine Help:

If the plastic section modulus,  $Z_x$ , is entered it will be used to compute the plastic moment capacity of non-composite sections not containing cover plates or slab reinforcement. If the value is not entered or if the section is composite or contains cover plates or slab reinforcement, the engine will compute  $Z_x$  based on the flange and web dimensions, ignoring fillets.

## Complete Issue Information

From my consultant (Shoup). I have attached his Word document with the list of errors. I'm also setting up a separate incident for enhancements.

In reviewing the bridge exchange feature in Virtis I don't think it will work for us (at least at this time). It is working for simple bridges but has issues with the TFS and GFS systems (see attached error list). This would be the majority of the structures that we would want to use this feature on.

I would set up an incident with Baker to fix the issues with all of the errors that I am getting. It looks like Virtis is locking out the stringers so that you can't run them even if you don't change anything. This appears to continue through to the floorbeams and girder or truss sections.

FROM: Mehrdad Ordoobadi DATE: 5/8/2012 10:24:48 AM Eastern Daylight Time  
A Floor System bridge cannot be analyzed when the bridge is not checked out or when it is being exchanged because the process requires stringer dead load reactions to be saved to the bridge description. When the bridge is not checked out, changes cannot be made to stringer dead load reactions.

FROM: Mehrdad Ordoobadi DATE: 5/11/2012 2:06:01 PM Eastern Daylight Time  
New stringer alternative or a new floorbeam can be created while the bridge is being exchanged. But when during an analysis the dead load reactions are written to the objects that existed and are not editable.

FROM: Tim Armbrecht DATE: 6/7/2012 12:12:17 PM Eastern Daylight Time  
Will there be responses to some of the other questions/comments submitted? (Such as making truss alternatives?)

Based on Mehrdad's response these structures are not ratable when they are out for Exchange. If that is the case, then why is the Exchange option offered?

We can understand your response, but if we want to make a new floorbeam alternative with deterioration then we cannot rate it because it will not allow the stringer dead load reactions to be calculated and written. Our consultants could make the modifications but would not be able to know what the actual rating is of the new member. This is unworkable. We feel there should be a way to set up a temporary save of the information so that the members can at least run and attain a rating value (without changing the original dead load reactions from the model). There needs to be a way around this in the Exchange option to make it viable to use. This can and should be a very useful tool as we evolve our practices to including consultant's work in our database.

FROM: Phil Litchfield DATE: 9/11/2012 5:09:24 PM Eastern Daylight Time  
Has any of these errors been resolved in the 6.4 beta? We can't test it with the beta sample database if there were.

## Complete Issue Information

Please review the incident 11396

Tim is asking for a better handling of the situation. That is being able to rate the floor system bridge when the bridge is being exchanged.

These are the solutions that I can think of:

1. Disable the floor system analysis when the bridge is being exchanged (as Tim is suggesting). The user will be able to copy the bridge and then try to do the rating of the copied bridge.
2. Add an option to Virtis/Opis application to "open the bridge for analysis" (or some other terminology). Then the user will be able to perform an analysis and review the results.
  - a. The domain will be editable but the save will be disabled.
  - b. The user needs to save and close the bridge that is being exchanged and has modified and then open it for analysis and do the analysis and review the results. The bridge explorer analysis should use this option during the analysis too.

The first option is much cheaper it just requires some documentation and disabling of the analysis when the bridge is not checked out or is being exchanged.

The second option is expensive. I will need to spend some time to see how much effort is involved in implementing this option.

Thanks,  
Mehrdad

Subject: RE: VI 11396

Another solution for evaluation:

When the stringer dead load reactions object is not editable, is it feasibility to use a temp object to continue the analysis? If "Automatically save the new computed stringer reactions" is selected in the Preferences, also need to tell the user that the stringer dead load reactions will not be saved.

### Description

FROM: Tim Armbrecht DATE: 5/1/2012 4:50:50 PM Eastern Daylight Time

From my consultant (Shoup). We would be interested in these enhancements sooner than later. Can I get a ballpark estimate as to the amount of effort it would take?

I would suggest that Virtis sets up an "alternate" for the trusses. Currently if a consultant was going to make changes on the truss section they would have to copy the whole "structure definition" and then change it. It might be easier to have an alternative to the main truss with the changes.

One enhancement that would make this feature better would be to have a "Verification" when bringing it back into the main database. I am thinking of a temporary condition where all of the changes are "highlighted" all the way up the layout tree. Then we could easily open up highlighted items until we get to what has changed and then easily approve it. Once we have been through the structure we could "approve" it and it would go back to the normal Virtis file.

One other issue we may have to look out for is the "Existing" check boxes on the alternatives. Usually we check these off except for the one we want rated. When I copied the alternatives and made the changes I wanted and then brought it back into our system it automatically check this alternative as "existing".

### Description

FROM: Tim Armbrecht DATE: 5/4/2012 1:16:30 PM Eastern Daylight Time  
Any idea what could cause this message? From my consultant (Chamberlain):

The XML page cannot be displayed  
Cannot view XML input using XSL style sheet. Please correct the error and then click the Refresh button, or try again later.

---

Access is denied. Error processing resource 'file:///C:/ProgramData/AASHTOWARE/VirtisOpis63/XslFiles/LRFDRReport.xsl'.

FROM: Herman Lee DATE: 5/4/2012 2:16:06 PM Eastern Daylight Time  
Please attached the XML and XSL files to this incident for us to determine whether the error is caused by the report files. Thanks.

FROM: Tim Armbrecht DATE: 5/9/2012 12:18:27 PM Eastern Daylight Time  
I have attached the .XML and .XSL report files from an analysis of just the (truss, West Outer) truss definition from structure 016-0158. Also included an export of the structure in question.

FROM: Herman Lee DATE: 5/9/2012 4:11:18 PM Eastern Daylight Time  
Report Tool's LFD Analysis Output and LRFD Analysis Output are not available for truss analysis. The Truss Rating Results Report can be access from the Analysis Output window.

Report Tool needs to provide better feedback to the user.

FROM: Bin Zhang DATE: 5/10/2012 2:10:41 PM Eastern Daylight Time  
A report tool warning message can be added for the truss, something like the "Report tool warning message for the Truss" attached in the document.

FROM: Tim Armbrecht DATE: 5/22/2012 10:15:43 AM Eastern Daylight Time  
Response from my consultant (Chamberlain):

Tim,

This may be correct for the reporting of trusses, however I am not running any trusses and I cannot

## Complete Issue Information

generate any.xml reports since the installation of the Windows 7 machines. It appears the problem is related specifically to LRFD reporting as I can generate an .xml report for LFD projects. The single span wide flange project I entered today will not generate any .xml reporting. I am attaching the file (090-0179.xml) for Baker to investigate. Seems like we had this problem a long time ago and I believe it had something to do with settings or permissions in internet explorer.

I get the following error, regardless of what machine and what file when trying to generate LRFD reports.

This has occurred since the installation of windows 7 and it happens with other users as well.

Error:

The XML page cannot be displayed

Cannot view XML input using XSL style sheet. Please correct the error and then click the Refresh button, or try again later.

---

Access is denied. Error processing resource 'file:///C:/ProgramData/AASHTOWARE/VirtisOpis63/XslFiles/LRFDReport.xsl'.

FROM: Bin Zhang DATE: 5/22/2012 12:38:10 PM Eastern Daylight Time

The LRFD report is only for the Opis LRFD design analysis, and it is not available for the Virtis LRFR rating analysis. I tried the LRFD analysis output report for the member alternative of G1 using the 090-0179.XML bridge, I didn't experience any issues. I attached the LRFD report here in the document. Please let me know if you still have an issue with the Opis LRFD report.

FROM: Tim Armbrecht DATE: 5/23/2012 12:14:38 PM Eastern Daylight Time

I'm not seeing your attachment? Yes, we know the report is for the Opis LRFD design analysis. We have been using it in this way until Win7 64-bit was installed on our machines. Now it won't generate the reports that we have been able to generate since the installation on Win7. I understand that it works for you and not for us. Please investigate possible and potential causes for this. Do we need to adjust our setting in IE? This seems to be a specific error, so I would think you can go to the Microsoft knowledge base and see if this has been reported before.

FROM: Tim Armbrecht DATE: 5/23/2012 12:23:33 PM Eastern Daylight Time

Look at VI 8013 & 8014. What did you do there?

FROM: Bin Zhang DATE: 5/22/2012 6:27:23 PM Eastern Daylight Time

1. Please check your C drive (C:\ProgramData\AASHTOWARE\VirtisOpis64) to see if the "Xsl Files" folder exist or not (figure 1).
  2. Please follow figure 2 and 3 to change the folder option if the "C:\ProgramData" folder is hidden on your computer.
  3. Copy the "Xsl Files" to the "C:\ProgramData\AASHTOWARE\VirtisOpis64" if it is missing.
- I am not sure if this is the problem, please let me know if it works or not. Thanks!

Please read the 11410.docx for the figures.

FROM: Aaron Kemna DATE: 6/4/2012 3:01:45 PM Eastern Daylight Time

We ran into the same problem here recently. A rater was trying to access the "Advanced Rating Results Summary Report" for a non-standard gauge rating and got the same error reported above. I will attach a screen shot of where the report was trying to be accessed. We already tried the above resolution, but the XSL File folder was there. I know I can get this same error outside of Virtis so this could be an operating system issue. Maybe a recent update?

FROM: Aaron Kemna DATE: 6/4/2012 3:28:27 PM Eastern Daylight Time  
I am attaching the bridge xml file and the truck xml file in case that helps. P0202 & House

FROM: Bin Zhang DATE: 6/7/2012 9:27:19 AM Eastern Daylight Time  
Aaron, I think the issue you experienced is different from the one above. I just created a new incident for you, the iuuse ID is #11628.

FROM: Joseph Ihnat DATE: 6/7/2012 2:29:37 PM Eastern Daylight Time  
The error message ("Access is denied. Error processing resource.") seems to occur when the xml and xsl files are in different domains (i.e. one or the other is on a network path). Similar to not being able to open a chm file on a network. This is a Windows security "feature" (for lack of a better word).

FROM: Herman Lee DATE: 6/7/2012 3:30:24 PM Eastern Daylight Time  
A workaround is to change the Internet Explorer "Access data sources across domains" setting to either "Enable" or "Prompt". (See attached IE Trusted Sites Zone Settings.png file)  
Please let us know whether this works for you.

FROM: Phil Litchfield DATE: 6/25/2012 4:24:09 PM Eastern Daylight Time  
Attached a screenshot of the Analysis tab on the Preferences window (View menu | Preferences).

FROM: Herman Lee DATE: 7/3/2012 9:01:24 AM Eastern Daylight Time  
Information Needed E-mail sent on 7/3/12.

FROM: Herman Lee DATE: 8/6/2012 2:58:52 PM Eastern Daylight Time  
Information Needed E-mail sent on 8/6/12.

FROM: Phil Litchfield DATE: 8/6/2012 3:25:51 PM Eastern Daylight Time  
This workaround does not fix the problem.

### Description

FROM: Jeff Ruby DATE: 5/16/2012 3:16:47 PM Eastern Daylight Time

Even though for the attached slab bridge we usually ignore shear, there is an inconsistency in the specification checks for 5.8.2.5 and 5.8.2.7. Attached Image 6.3.1\_release\_ScreenShot\_003.jpg shows the results for the shear spec check at 5.0245 ft left in span 1 for Superstructure Definition "SGB Design Check 5/16/2012". There is no shear reinforcement in this slab so the spec check fails for Load Comb. 1 and 2 max. Everywhere else, shear steel is not required. Now if you will notice the attached Image 6.3.1\_release\_ScreenShot\_004.jpg, the spec check fails at the locations that "DO NOT" require any shear reinforcement. Also, the 2 high shear locations are not checked to see if they meet the maximum spacing requirement.

Here is what I propose to clear up this inconsistency:

- 1) On checking article 5.8.2.7, forget about checking whether  $V_u > 0.5 \cdot \phi \cdot (V_c + V_p)$ , check 5.8.2.7 everywhere.
- 2) If shear steel isn't needed based on 5.8.2.5, then don't let the status of 5.8.2.7 "Fail" at this section.

FROM: Krisha Kennelly DATE: 5/29/2012 12:33:36 PM Eastern Daylight Time

I think the source of this problem is that 5.8.2.7 has a bug in it.

In 5.8.2.7, if  $V_u \leq 0.5 \cdot \phi \cdot (V_c + V_p)$ , then the article should Pass. Instead the article is checking s

against the max allowable spacing.

refer to the attached flowchart (11467.png) for this article. I think it is correct, the implementation of the article is not following the flowchart.

Mark - please revise the article to follow the flowchart for all versions of the spec.

After this fix is made, 5.8.2.7 and 5.8.2.5 should be consistent as to when the article should be evaluated.

FROM: Srujana Thogaru DATE: 9/19/2012 9:58:06 AM Eastern Daylight Time  
Error in checking  $V_u \leq 0.5 \cdot \phi(V_c + V_p)$  has been fixed in 5E and 4E of 5.8.2.7 article. 5.8.2.7 article is now in consistency with 5.8.2.5.

Fixed for 6.5 Release.

FROM: Srujana Thogaru DATE: 11/21/2012 1:36:24 PM Eastern Standard Time  
Above fixes are applied for 6.4.1 release.

FROM: Jeff Ruby DATE: 11/26/2012 11:15:29 AM Eastern Standard Time  
My Spec versions in 6.4.1 Beta 1 have:  
LFRD 4th 2008i  
LFRD 4th 2009i  
LFRD 5th  
LFRD 5th 2010i  
LFRD 6th

I am assuming it needs to be fixed in all of these? Above only mentions 5E and 4E.

FROM: Matt Kolis DATE: 11/30/2012 3:29:05 PM Eastern Standard Time  
Verified change in Virtis 6.4.1 Beta 2.

FROM: Krisha Kennelly DATE: 12/3/2012 2:16:49 PM Eastern Standard Time  
Jeff - it is fixed in all versions of the spec. The interims are derived from the base class (4E and 5E) if there were no changes in the interim. The 6E is derived from the 5E as well.

Verified

FROM: Jeff Ruby DATE: 12/10/2012 3:44:22 PM Eastern Standard Time  
Accepted in 6.4.1 Beta 2

FROM: Jeff Ruby DATE: 12/10/2012 4:12:09 PM Eastern Standard Time  
Ooops! spoke too soon. In the substructure module (should be the same as the superstructure module), the  $V_u > 0.5 \cdot \phi(V_c + V_p)$  comparison doesn't handle negative shear correctly for 5.8.2.7. (See the beta 2 screenshot 001).

For the -104.9 and the -95.9, the check whould be "TRUE" and the resulting calculations should take the absolute value of the  $V_u$ .

But, for 5.8.2.5 it does.

FROM: Herman Lee DATE: 5/18/2012 1:20:28 PM Eastern Daylight Time  
Submitted on behalf of Theresa Bergquist, Parsons. (Theresa.Bergquist@parsons.com)

Received Bridgeware Support E-mail:  
=====

**Complete Issue Information**

I am currently rating a simply supported prestressed girder bridge in Virtis 6.3 (LRFR) and do not get the same result as Virtis for the calculation of loss due to elastic shortening. I think Virtis is pulling the wrong em value into eqn AASHTO LRFD C5.9.5.2.3a-1. Per the code, em is defined as the average prestressing steel eccentricity at midspan. This has been defined for my beam as 15.5853in, the calculation of fpES shows an em as 20.5853inch which is the distance from the NA to the bottom of the beam.

This change results in a significant increase in loss and lowers my inventory rating to 1.003, which is lower than expected.

I've attached a copy of the .xml file for reference.

Can you please take a look and let me know your findings.

Thanks for your help,  
Theresa Bergquist  
Engineer I

User should have option of importing/exporting analysis events including trucks. If this requires writing over the existing truck library this might still be the preferred option.

FROM: Jim Duray DATE: 6/6/2012 11:32:14 AM Eastern Daylight Time

Exporting the trucks with the Analysis Settings template is not included in the scope of this task. The difficulty with doing this that needs to be worked out is the vehicle ids in the database are specific to that database. It is not feasible to "write over the existing truck library" because vehicle ids are used by other items in the database and that reference would be altered by an overwrite.

One approach is to include the vehicles in the export and during the import search the target db for the vehicles in the template (by comparing each vehicle). Assign the proper id if a match is found and import the vehicles if no match is found.

FROM: Herman Lee DATE: 10/9/2012 4:09:05 PM Eastern Daylight Time

Changed Folder from Beta Testing to Support Center.

FROM: Herman Lee DATE: 3/27/2015 2:53:02 PM Eastern Daylight Time

Exporting and importing analysis templates including vehicle information has been implemented in the 6.7 release.

Enhancement Request

All of our precasters use WWF for reinforcement and some of the precast culverts use a combination of WWF and rebar for reinforcement.

So - 100% of our precast culverts use WWF  
I'm not confident on the % of precast culverts that have WWF and rebar.

We really need WWF to be able to use Virtis Opis for Precast Concrete Culverts.  
One could come up with a quasi equivalent area of resteel to substitute for WWF but your service checks may not be accurate.

**Description**

FROM: Tim Armbrecht DATE: 5/30/2012 3:43:51 PM Eastern Daylight Time  
Currently, under Member Alternative, Lateral Support may only be applied to top flanges as a continuous restraint over a specified length. In cases where a top flange is not in contact with a deck, such as with some main girders and floorbeams, the top flange lateral support is provided at point locations, which cannot currently be modeled.

Maybe related to 5416 and 8858. We would need this for the AASHTO Engine.

FROM: Herman Lee DATE: 4/25/2013 8:50:26 AM Eastern Daylight Time  
Resolved for 6.5 release.

### Description

FROM: Tim Armbrecht DATE: 5/30/2012 3:53:27 PM Eastern Daylight Time

Provide the capability to indicate that a Deck Truss directly supports the deck in a Truss Floor System model. This is similar to the check-box indicating whether or not a Main Girder supports the deck in a Girder Floor System model.

Such models with deck trusses that directly support the deck may currently be modeled but inconvenient workarounds must be employed. These workarounds can also result in confusion for those who must work with the model in the future.

**Description**

FROM: Beckie Curtis DATE: 5/31/2012 9:25:14 AM Eastern Daylight Time  
a very small negative moment is being generated at the end of this skewed prestress beam, and the capacity is set at 0. there are even draped strands, so if this even needs to be checked it shouldn't be close to 0 for the capacity and therefore the rating.

FROM: Jim Duray DATE: 6/11/2012 2:45:31 PM Eastern Daylight Time  
I added a check for harped strands when the applied moment is negative. For negative moment, if there are harped strands at the location or there is mild steel, the negative capacity is computed. Otherwise, the capacity is set to zero. Previously we only checked for mild steel (in anticipation of the

**Complete Issue Information**

mild steel enhancement).

FROM: Subhadeep Ghosh DATE: 8/31/2012 1:12:03 PM Eastern Daylight Time  
Checked the issue with 3 span PCITrainingBridge5, using harped strands at the supports. The analysis was executed for Analysis Type: Line Girder; Rating Method: LFD and Rating Vehicles: HS 20-44 for Member: G2. The Flexure Rating when checked for Stage 3 Span 2 1 ft (as shown in the screenshot: Support Flexure Rating) reflected zero capacity for negetive live load moments. Hence, I believe the above fix did not apply.

FROM: Subhadeep Ghosh DATE: 9/4/2012 1:43:29 PM Eastern Daylight Time  
Reinvestigated the incident with attached single span bridge for 3-D AASHTO LFD, to generate small negative moment at the support. Found the capacity to be zero inspite of using harped strands. Checked the detailed report and found the harped strands are being ignored. Attached is the detailed report for 0.00 (Support)

FROM: Jim Duray DATE: 9/5/2012 10:34:27 AM Eastern Daylight Time  
Because we are using the strands in computing the capacity we are using the phi factor for P/S (1.0).

FROM: Herman Lee DATE: 9/5/2012 10:39:28 AM Eastern Daylight Time  
Changed Folder from Beta Testing to Support Center.  
Resolved for 6.4 release.

FROM: Subhadeep Ghosh DATE: 9/26/2012 3:25:13 PM Eastern Daylight Time  
Verified for Beta 5

**Description**

FROM: vinacs vinayagamoorthy DATE: 5/31/2012 1:10:03 PM Eastern Daylight Time  
 We have quite a few Xframes that utilizes double angle standard shapes. However, we will not be able create this type of shape, since Double Angel Steel shapes cannot be created.

In order to do the above scenario, Virtis needs to add one of the following option  
 (1) Option to add multiple shapes to the same member (so we could enter the same angle twice)  
 (2) Option to add "Double angle" shape

FROM: Jim Duray DATE: 6/1/2012 8:26:58 AM Eastern Daylight Time  
 It appears from the mockups that we did not plan for double angles.

FROM: Herman Lee DATE: 6/4/2012 9:24:50 AM Eastern Daylight Time  
 I checked the comments we received for the mockups. Supporting double angles was not discussed or requested.  
 Vinacs, do you want to change this incident to an enhancement request?

FROM: Herman Lee DATE: 6/7/2012 12:58:05 PM Eastern Daylight Time  
 E-mail from Vinacs Vinayagamoorthy:

=====  
 Herman

I reviewed some of the older plans to see whether they had been using double angles in the cross frames. The steel bridges built prior to 1958 has the double angles. It is being used on for all members (top, bottom and diagonal). So, I would place it as an enhancement.

I also notices that they replaced the double angle to Structural Tee after 1958.

I beleve we could trick the double angle and find and an equivalent Structural Tee, if necessary.

Vinacs M Vinayagamoorthy  
 Senior Bridge Engineer

**Description**

FROM: Amjad Waheed DATE: 6/1/2012 11:15:33 AM Eastern Daylight Time  
It seems like it is possible to create duplicate bark mark definitions in the Culvert module. I believe that should not be the case. (see attached).

FROM: Herman Lee DATE: 6/4/2012 10:06:35 AM Eastern Daylight Time  
Since an item in the Bridge Workspace is identified by its unique id instead of its name, it's possible to create duplicate items in the Bridge Workspace. For example, two concrete materials with the same names or two superstructure definitions with the same names. Above suggestion for unique item name should be considered when we redesign the UI.

4/19/2016 3:24:11 PM

3218

## Complete Issue Information

FROM: Amjad Waheed DATE: 6/4/2012 11:27:01 AM Eastern Daylight Time  
I believe, if duplicate bar types will be allowed in the Bar Mark Definitions, it will be confusing to the user at the time of assigning reinforcement which bar is which.  
Also the Bars shall be sorted out by BAR MARKS in the Bar Mark Definitions. At present, it is not possible to sort them by any order. Thanks.

FROM: Herman Lee DATE: 6/4/2012 12:24:32 PM Eastern Daylight Time  
I consider above suggestions as enhancements since the way the bar mark definitions implemented in culvert is consistent with the way implemented in reinforced concrete member.

I changed the Category to Enhancement for further discussion.

FROM: Amjad Waheed DATE: 10/4/2012 3:02:34 PM Eastern Daylight Time  
Herman: I do not think this is enhancement. It is confusion that two different bars can have same names under the Bar Mark Definitions. How would the user know out of two same Bar names, which one will get assigned.

FROM: Herman Lee DATE: 10/4/2012 4:11:22 PM Eastern Daylight Time  
I agree it will be confusing if the user entered two different bar marks using the same name. We could add checking for duplicate name when user click OK or Apply.

FROM: vinacs vinayagamoorthy DATE: 6/6/2012 10:40:40 AM Eastern Daylight Time  
Typically, user make mistake in counting the number of spaces or spacing during data entry. They may want to go back and modify/correc the mistake. I am a reporting a case user is trying modify a value that is already reported. When a user modify either number of spaces or spacing in a row, the start distance reported in the subsequent rows should be automatically reestablished, provided that the user allowed the software auto populate the cell.

This behavior is allowed within RC-Shear Reinforcement GUI.

FROM: Joseph Ihnat DATE: 6/11/2012 10:25:13 AM Eastern Daylight Time  
May, this window originally had this capability, but it was commented out in Jan 2009 for VI 3855

## Complete Issue Information

(Stirrup Wizard enhancement). Do you remember why?

FROM: Xinmei Li DATE: 6/19/2012 10:23:57 PM Eastern Daylight Time

I don't remember why those code was commented out. I tried to uncomment it and everything works fine for me. So I just uncomment it now.

FROM: vinacs vinayagamoorthy DATE: 7/18/2012 9:34:00 AM Eastern Daylight Time

When I tested this with Beta 2, it works for many cases, however, it did not work for one bridge, where the shear layout is generated using the wizard. We utilized the symmetry by even scenario to generate the layout. The first start distance after the symmetrical point remain the same for some reason.

Attached is the bridge example. Super: Span 1 MDL1 of 1 (Data Entry), Girder G5.

Similar shear reinforcement pattern is entered for G1 and G2 manually. (you could use to regenerate using wizard). For these girders, changing a value (# of stirrups or spacing) automatically adjusts the end distance.

I believe this error is due to tolerance. I have tried a few cases, where addition of distance exactly matches the girder length. In this example, I am off by 0.00001 inches.

FROM: Xinmei Li DATE: 8/30/2012 11:12:02 AM Eastern Daylight Time

I tested with the attached bridge, Super: Span 1 MDL1 of 1 (Data Entry), Girder G5 in Beta4. I entered shear reinforcement for G5 by using stirrup wizard, see attached file for data entry. The first start distance after the symmetrical point is 53.291533 which looks fine to me. I tried to change a couple spacing and number of spaces, the end distance is adjusted fine.

Comparing G5 to G1/G2, G5 is generated by using even number of spaces, G1/G2 is using odd number of spaces. Other than that everything looks the same.

FROM: vinacs vinayagamoorthy DATE: 9/6/2012 3:14:52 PM Eastern Daylight Time

For some reason, I still have problem with this one. I am able to duplicate this. Attached word document PS Wizard.doc has the screen shots that shows the problem.

I am resubmitting to check this one more around. See whether you could duplicate the problem

Please note that the current stirrup GUI is far better than that is available within 6.3. Therefore, in case we cannot find the source of the error, I am willing to accept this improved GUI.

FROM: Xinmei Li DATE: 9/6/2012 4:05:05 PM Eastern Daylight Time

I'm able to reproduce the bug reported in the attached document. The problem is the row number was not set correctly when recalculating the distance after data entry was updated. This bug is resolved when new dll is available.

FROM: Joseph Ihnat DATE: 9/26/2012 3:20:56 PM Eastern Daylight Time

Verified in Beta 5/Acceptance Build.

FROM: Krisha Kennelly DATE: 10/1/2012 11:10:25 AM Eastern Daylight Time

Found during investigation for11901.

BID9, open the PS Shear Reiforcement Range window.

Hit Apply.

FROM: Herman Lee DATE: 6/7/2012 7:55:05 AM Eastern Daylight Time  
Submitted on behalf of Dan Staton, Bureau of Land Management (dstaton@blm.gov).

Bridgeware e-mail:

=====  
I'm reviewing the Standard AASHTO Type 3S2 truck that is defined in the library. I have not seen the Wheel Contact Widths that are listed before. Widths of 11.1804" and 13.9195" are defined. Similar strange widths are entered for the Type 3 and Type 3-3 trucks. What is the basis for these wheel contact widths? Can you provide me the AASHTO LRFD or MBE reference?

Thanks,

Dan Staton  
Civil Engineer  
Architecture and Engineering Branch  
National Operations Center  
Bureau of Land Management  
=====

Krishna, AASHTO LRFD C3.6.1.2.5 has a equation to calculate tire width. Is there any other equation or reference we used for the contact widths in the library vehicles?

FROM: Herman Lee DATE: 6/11/2012 7:35:45 AM Eastern Daylight Time  
Bridgeware e-mail from David Wolfe, Moffatt & Nichol (DWolfe@moffattnichol.com):

=====  
Bridgeware – On your support site Issue ID 11626, I believe the source for tire width given in the VIRTIS library is based on the contact area given in older versions of ASSHTO Standard Specifications (Section 3.30 found in AASHTO Std. 16th Ed. 1996 for example).

15.5 kip axle for Type 3S2 = 7,750 # wheel = 77.5 sq. in. contact = 5.5678 in. long x 13.9194 in. wide (=sqrt(2.5x77.5 sq. in.)) for 1:2.5 aspect ratio.

Respectfully - DW

=====  
FROM: Krishna Kennelly DATE: 6/14/2012 1:14:42 PM Eastern Daylight Time  
AASHTO Std Spec article 3.30 was used to compute the contact widths.

**Description**

FROM: Phil Litchfield DATE: 7/6/2012 4:44:25 PM Eastern Daylight Time  
From consultant (Staggemeyer):

Not all of the diaphragms are showing up in the schematic when using the diaphragm wizard ("Structure Framing Plan Details" window - Diaphragms tab). When using the wizard, if I choose the skewed plan with staggered diaphragms perpendicular to the girders (the one in the lower right) and check "Enter groups of equal spacing" and "Right girder" and set the diaphragm spacing to 1 @ 25ft, 1 @ 25ft, 1 @ 25ft, the first set of diaphragms do not show up on the schematic. If I set the spacings to 3 @ 25ft then all of the diaphragms show up. I have attached a word document with screenshots that will hopefully describe the issue better.

### Description

FROM: Aaron Kemna DATE: 7/13/2012 11:51:09 AM Eastern Daylight Time  
Incident 10279 was addressed, but P/S Deck Beams are very similar. For adjacent construction w/o a composite deck where the beams are not sufficiently connected to act as a unit, the distribution factor equations are different. Appears that Virtis always assumes a sufficient connection between beams.

FROM: Krisha Kennelly DATE: 7/13/2012 12:33:56 PM Eastern Daylight Time  
What type of beam shape are you referring to? Adjacent box beams?

FROM: Aaron Kemna DATE: 7/13/2012 1:24:10 PM Eastern Daylight Time  
Adjacent Box Beams. Type G cross-section in AASHTO.

### Description

FROM: Todd Thompson DATE: 7/16/2012 1:44:38 PM Eastern Daylight Time

During design, we normally ignore designing/checking bi-axial flexure since it is "more conservative" to do so.

Is there a way to turn off the bi-axial flexure, like in the Control Options?

Including it for load rating is probably fine all the time, but might be nice to have a control option for LF also.

**Complete Issue Information**

FROM: Jim Duray DATE: 7/17/2012 10:58:38 AM Eastern Daylight Time  
I'm investigating this now. Hopefully you recall that culvert (for the most part) is the WisDOT culvert program so I don't know why biaxial was used. The WisDOT program uses the AASHTO spec-check module. So it is using a WisDOT modified version of the Opis biaxial column routine. There is no uniaxial routine.

FROM: Jim Duray DATE: 7/19/2012 8:54:56 AM Eastern Daylight Time  
I coded a uniaxial routine based on the biaxial routine that does not iterate to find the angle of the neutral axis (since we know it's orientation because there is moment about only one axis). It is producing the same results but is slightly faster since it doesn't have to iterate to find the angle of the NA.

FROM: Todd Thompson DATE: 7/19/2012 3:10:00 PM Eastern Daylight Time  
I guess what I should have said - can we do the walls and other members as only bending/shear and ignore any axial effects?

FROM: Jim Duray DATE: 7/23/2012 10:28:22 AM Eastern Daylight Time  
That would be an enhancement.

FROM: Todd Thompson DATE: 3/21/2013 8:18:38 AM Eastern Daylight Time  
Please revise the status so it reflects an Enhancement to make the enhancement list.  
Thanks,  
Todd

FROM: Herman Lee DATE: 3/25/2013 8:47:22 AM Eastern Daylight Time  
Changed Category to Enhancement.

### Description

FROM: vinacs vinayagamoorthy DATE: 7/18/2012 4:56:16 PM Eastern Daylight Time  
The AASHTO software is not considering a bar that is made "fully developed" by using the overriding feature availabel within point of interest.

I believe the source of the problem comes from the development length calc routine. This routine (attached in the word file) concludes this bar is data entry error and ignored the bar entirely. As a result, this bar was not available for rating at all. This should not happen.

This bar though is not long enough to fully develop, but can handle partial loading. Please check this and correct.

Structure: Span 1-3; Girder G2; Analysis point Span2 1.25ft from support.

FROM: Herman Lee DATE: 7/19/2012 2:59:13 PM Eastern Daylight Time  
Vinacs, could you attach the bridge file to this incident? Thanks.

FROM: vinacs vinayagamoorthy DATE: 7/23/2012 2:30:24 PM Eastern Daylight Time  
Herman. I have added the required files for you.

FROM: Herman Lee DATE: 8/31/2012 1:24:17 PM Eastern Daylight Time  
Attached e-mail dicussion related to this issue.

FROM: Subhadeep Ghosh DATE: 10/5/2012 12:10:59 PM Eastern Daylight Time  
Put in checks to export bars based on POI override at start and at end development length. Fix going into 6.5.

FROM: Subhadeep Ghosh DATE: 11/27/2012 9:35:31 AM Eastern Standard Time  
Checked in the codes for 6.4.1 Beta 2. Fix going into 6.4.1 patch.

FROM: Matt Kolis DATE: 12/6/2012 2:34:31 PM Eastern Standard Time  
Verified in Virtis 6.4.1 Beta 2.

FROM: vinacs vinayagamoorthy DATE: 12/12/2012 1:04:57 PM Eastern Standard Time  
Original problem got fixed, however, I noticed another issue. Please see the attached document for more information.

FROM: Subhadeep Ghosh DATE: 12/12/2012 2:37:28 PM Eastern Standard Time  
The check boxes for any POI for any set of bars are taken into consideration ONLY if the "Development" tab "Override Schedule" is checked. So if the bar set is deemed NOT fully developed and the "Override Schedule" is not checked, then the bar sets are NOT considered automatically as

4/19/2016 3:24:14 PM

HRS AASHTO

3234

**Complete Issue Information**

developed. This is irrespective of whether an individual set of bar is checked or unchecked in POI. This can be verified from the Tensile Capacity of the bar for the POI under consideration for Set 1 and Set 2 as Fully and NOT Fully developed (POI window remaining unchanged). The check boxes for a bar set in POI window appears by default, only if the bar set in that region is marked as "Fully Development" in the reinforcement definition under "Girder Profile" at the instance of its creation.

FROM: vinacs vinayagamoorthy DATE: 12/17/2012 9:34:28 AM Eastern Standard Time  
Yes, I agree with your statement. Therefore, I am going to consider this issue resolved

## Description

FROM: Dean Teal DATE: 7/27/2012 3:25:57 PM Eastern Daylight Time  
Am I correct that we do not have any items in the General Preferences for culvert?

FROM: Herman Lee DATE: 8/6/2012 10:29:43 AM Eastern Daylight Time  
Yes.

FROM: Herman Lee DATE: 8/6/2012 10:39:39 AM Eastern Daylight Time  
The items available in General Preferences are based on what available in 6.3.

FROM: Matt Kolis DATE: 8/20/2012 1:39:44 PM Eastern Daylight Time  
No change.

FROM: Dean Teal DATE: 9/5/2012 1:16:15 PM Eastern Daylight Time  
Should there be?  
Should Culvert be excluded?  
Do we need a bid item on every new feature/enhancement estimate so we can keep the General Preferences feature up to date?

FROM: Herman Lee DATE: 9/5/2012 4:08:18 PM Eastern Daylight Time  
Some culvert inputs (e.g. control options) should make available in General Preferences.

Each estimate has line items for Report Tool, NSG, Help, API, Test Scripts and 508 Compliance. I think we need to add a line item for General Preferences in all future estimates.

Dean, how would you like to move forward with this issue? Thanks.

FROM: Herman Lee DATE: 9/28/2012 11:39:37 AM Eastern Daylight Time  
The Task Force decided to implement preference items for 6.4 new features in 6.4.1 (6.4 Service Pack 1).

FROM: Herman Lee DATE: 10/25/2012 9:35:38 AM Eastern Daylight Time  
Implemented General Preferences for 6.4 new features in 6.4 Service Pack (6.4.1).

**Description**

FROM: Brenda Crudele DATE: 8/1/2012 8:57:47 AM Eastern Daylight Time

This is an enhancement request for 3D analysis. Currently if you run a 3D analysis on one member alternate the program analyzes the whole bridge and then you get spec check results for that one girder. If now you want to do a spec check on another girder you have to completely rerun the whole analysis again. This can take a long time if you have a large bridge. It can also take a long time to completely run the whole bridge.

Request would be to add the ability to reuse a previous 3D analysis and run a spec check for another girder based on a previous analysis.

### Description

FROM: Dean Teal DATE: 8/8/2012 2:35:10 PM Eastern Daylight Time  
I added 8 structures to by importing them (attached in a zip file)  
These structures have numeric names for the bridge ID  
When I sort the Bridge ID in the root directory of the bridge explorer they sort just fine (ascending/desending)  
I created a new directory to put them in  
I dragged them into that directory  
The sort order is now all messed up and I cannot sort them assending/desending like I can in the root

FROM: Dean Teal DATE: 8/9/2012 7:45:09 AM Eastern Daylight Time  
FYI - Notes worth mentioning  
The structures I attached in my zip file came from my 6.3.1 oracle data base  
When copying them in to 6.4 I first imported, then I highlighted the group and copied them into a new directory I created  
As another test, I created a new directory, then I copied them in one at a time. The sort order both ascending/descending stayed correct until I copied in structure ID 001-037, from that point on they were screwed up. I then deleted them all and started over again, one at a time skipping 001-037 and

4/19/2016 3:24:15 PM

HRS AASHTO

3241

**Complete Issue Information**

copying 001-046, no change.

FROM: Joseph Ihnat DATE: 8/13/2012 12:45:07 PM Eastern Daylight Time  
Changed folder to Support Center. I imported them into 6.3.1 and see the same behavior.

FROM: Dean Teal DATE: 8/16/2012 10:43:57 AM Eastern Daylight Time  
Can you think of any work around that will sort on my Bridge ID?  
This has been really crippling our efforts in working with our new bridge overload/routing capabilities.

FROM: Joseph Ihnat DATE: 9/12/2012 11:18:19 AM Eastern Daylight Time  
I don't know if this a suitable workaround for you, but i noticed that if I added another bridge to the list (e.g. TrainingBridge1) then it sorted OK.  
This appears to be an issue with the grid software that we use. I've opened a support incident with the vendor.

FROM: Joseph Ihnat DATE: 9/18/2012 2:08:37 PM Eastern Daylight Time  
Fixed for version 6.4

FROM: Krisha Kennelly DATE: 9/26/2012 2:38:48 PM Eastern Daylight Time  
Verified for the acceptance build. I imported each of the 8 attached bridges into the 'all bridges' folder. then I created a new folder with the 'list' type. then I right clicked to copy all of the bridges from the Bridge Explorer and pasted them to the new folder I had created. then for this new folder, I double clicked on the 'bridge id" column to get them to sort. they sorted correctly numerically within the new folder.

### Description

FROM: Amjad Waheed DATE: 8/9/2012 10:28:29 AM Eastern Daylight Time

Hi,

We have started getting a very strange error. I open the library explorer, export everything to a XML file; close the library explorer; go back to library explorer; try to import the same XML file and I get an error.

I have attached XML file and error screen shot both.

FROM: Todd Thompson DATE: 8/9/2012 11:23:41 AM Eastern Daylight Time

Amjad - check VI 11528 - I had same problem. It's a problem from 6.3/6.3.1

FROM: Geoffrey Trees DATE: 8/9/2012 3:02:49 PM Eastern Daylight Time

Thanks Todd. I was thinking the same thing but I am going to investigate this to make sure it is not a different issue.

FROM: Geoffrey Trees DATE: 8/10/2012 3:11:39 PM Eastern Daylight Time

I confirmed that this is a duplicate of issue 11528 as Todd mentioned above. I have attached a fixed version of your file. This issue affects exports from 6.3 and 6.3.1. I have fixed this export issue in 6.4 but exports from 6.3 and 6.3.1 will still be affected.

FROM: Amjad Waheed DATE: 8/13/2012 8:01:19 PM Eastern Daylight Time

Geoffrey,

Does it mean that this issue will remain un-fixed for 6.3.0 & 6.3.1 users? It will be a problem as several of our consultants who have just acquired 6.3.0/6.3.1 can not use the Virtis Opis program as we cannot pass on Ohio library to them.

Is there a work around? Can some one tell if it is possible to safely import certain library items if not the complete library?

FROM: Amjad Waheed DATE: 8/13/2012 8:21:19 PM Eastern Daylight Time

I realized later that there is a Virtis\_library-fixed.XML file. I imported it into 6.4 Beta and it worked. I hope it will work in the V6.3.0 also. Thanks for the help.

FROM: Amjad Waheed DATE: 9/7/2012 3:32:12 PM Eastern Daylight Time

Has this issue be fixed in 6.4.0?

FROM: Geoffrey Trees DATE: 9/7/2012 4:38:32 PM Eastern Daylight Time

Amjad, this issue has been fixed for 6.4 but is not fixed in 6.3. You are right, people who have 6.3 will not be able to import their library into 6.4 when exporting everything. The work around for this is to export everything with the exception of the LRFD Substructure items. Please ask that they just don't export those items and the import/export will work fine from 6.3 into 6.4.

### Description

FROM: Load Rater Shanon Murgoitio DATE: 8/9/2012 5:16:26 PM Eastern Daylight Time  
This is just a question on multimedia links for Virtis v6.3.1. Somehow all I have for options under version name are beta options.

4/19/2016 3:24:16 PM

HRS AASHTO

3245

**Complete Issue Information**

ITD is moving the location of the files that have multimedia links in Virtis. I was just going change all the fileloc in the dbo.multimedia table to the correct location, but I thought I would check to see if fileloc is in any other table. I don't want to break something. I thought I would ask someone at Baker if they knew so I don't have to open all the tables and look through them.

Thanks for your time.  
Shanon Murgoitio  
208-334-8547

FROM: Herman Lee DATE: 8/10/2012 7:16:47 AM Eastern Daylight Time  
In the options table, the MULTISERVER optionval stores the location of the Multimedia Server Folder (e.g. "C:\"). Changing the Multimedia Server Folder input in the Configuration Browser's System Defaults window will change the MULTISERVER optionval.

In the multimedia table, the fileloc location is base off of the Multimedia Server Folder (e.g. "[MULTISERVER]Region1\"). The resulting path to the file is "C:\Region1\". Currently, the only way to change fileloc through the user interface is to relink the file.

Please resubmit if you need additional information.

### Description

FROM: Jeff Ruby DATE: 8/13/2012 2:35:02 PM Eastern Daylight Time  
When you hover the cursor is in a box, there are no units as a tool tip. When working with these (not used to) units, it would be nice to see a confirmation that 2755222.044 kg/m3 is about 27000 KPa/m or that 172 kcf is about 100 pci.

FROM: Jim Duray DATE: 8/14/2012 10:17:09 AM Eastern Daylight Time  
The hover works on my PC.

FROM: Jeff Ruby DATE: 8/14/2012 4:31:41 PM Eastern Daylight Time  
Step 1) click soil tab on Foundation Type Drilled Shaft.  
Step 2) in the soil profile window, click on a layer or add one if it doesn't exist.  
Setp 3) hover over the box for k or c or Saturated Density. If you acidently click on something, click somewhere else so you can hover.

Report what units show up in the hover. I get nothing.

FROM: Jim Duray DATE: 8/23/2012 7:52:59 AM Eastern Daylight Time  
So are you seeing an empty hover tooltip or is there no response to hovering?  
I don't think any of the grids provide hover capability. I checked several others under member alt and none of them provide hover capability. I'm changing this to an enhancement request.

**Complete Issue Information**

FROM: Herman Lee DATE: 10/9/2012 4:17:08 PM Eastern Daylight Time  
Changed Folder from Beta Testing to Support Center.

FROM: Jeff Ruby DATE: 5/9/2013 11:06:03 AM Eastern Daylight Time  
See VI 12501

As discussed at the Beta Tag meeting, incorporate additional hover capability for "data grids".

**Description**

FROM: Amjad Waheed DATE: 8/20/2012 4:58:12 PM Eastern Daylight Time  
Attached bridge is a prestressed concrete side by side composite box beams. It has a sidewalk on the left side of the deck. Complete G1, G2 and part of G3 is under the sidewalk. G1 should not be carrying

4/19/2016 3:24:17 PM

**HRS AASHTO**

3252

**Complete Issue Information**

live load just like any exterior beam when it is under the sidewalk.

When LRFD Moment Distribution factors are calculated for G1 using "Compute from Typical Section, program calculated the LL DFs for G1 and populated the windows for Moment, Shear and Deflection. When calculations are reviewed, lever rule calculations show that the truck wheels do not contribute LL to G1.

FROM: Krisha Kennelly DATE: 8/22/2012 9:22:18 AM Eastern Daylight Time  
The lever rule does produce zero distribution factors for G1 but when the AASHTO equations are evaluated they do produce distribution factors.

The user can override the computed values with zero's if they feel Virits is too conservative.

FROM: Amjad Waheed DATE: 9/7/2012 3:30:56 PM Eastern Daylight Time  
The issue is the program incorrectly rates the bridge very low based on the rating of the beam under the sidewalk which is naturally supporting lots of dead load and Virtis incorrectly distributes live load to that beam too. The logic in the program needs to be corrected.

FROM: Krisha Kennelly DATE: 9/7/2012 7:47:18 PM Eastern Daylight Time  
I think we need to run this by the TAG for direction. These distribution factors are also used for design and I don't think designers would want their exterior beams designed for zero live load.

### Description

FROM: Krisha Kennelly DATE: 8/22/2012 3:31:48 PM Eastern Daylight Time  
Found this while testing fix for 11191.

BID 9, G2. Member alt has POI's at 110', 111', 111.7'. These POI's have the Override Shear Schedule checked but no shear reinforcement entered. The AASHTO engines consider these points to be noncomposite and no slab dimensions are exported but the deck reinforcement is exported. Rebar referenced from the top of slab is incorrectly exported to be in the beam instead of the deck.

FROM: Krisha Kennelly DATE: 8/24/2012 3:49:19 PM Eastern Daylight Time  
Fixed for 6.4 beta 4 build.

FROM: Krisha Kennelly DATE: 9/6/2012 1:53:11 PM Eastern Daylight Time  
Backed off the original fix of not including the rebar in noncomposite regions. It is a common practice to not extend the shear reinforcement into the deck in the pier region but user still wants composite action in that region. (the AASHTO engines determined composite regions for PS based on shear stirrups extending into deck or horizontal shear reinforcement ranges defined.)

Fix has been changed to check the if the region immediately adjacent (within 1') to the simple span bearing is composite. If it is, then the region between simple span bearings at a pier is considered composite. The deck rebar and effective slab is then correctly exported.

If the point being analyzed is not within the continuous pier region and the section is not defined as composite by shear stirrups or horizontal shear ranges, then neither the deck or rebar is exported.

## Description

FROM: Luis Vargas DATE: 8/23/2012 8:36:56 AM Eastern Daylight Time  
Attached is the file for which we are having the following issues.

1.The program is not able to compute distribution factors properly with box beam bridges (cross-section f or g in AASHTO Table 4.6.2.2.1-1). Errors I saw in the computation output were the use of the lever rule which is not applicable for these sections and when the beam inertia is below the value noted in the AASHTO tables the shear distribution factor was not being set to the moment distribution factor as instructed in AASHTO section 4.6.2.2.3a. Also, I noticed in the calculations that the computation for the St. Venant's torsional inertia was not correct.

4/19/2016 3:24:18 PM

HRS AASHTO

3255

**Complete Issue Information**

2.The program is not computing losses with the AASHTO approximate loss method when selected. In the program output only elastic losses are accounted for when this option is selected. There appears to be no way to manually calculate the losses and input them by hand for LRFR analysis. Can this type of feature be added?

FROM: Krisha Kennelly DATE: 8/23/2012 9:56:48 AM Eastern Daylight Time  
Split out #2 to issue 11881 since it is not related to #1.

FROM: Krisha Kennelly DATE: 8/23/2012 10:22:25 AM Eastern Daylight Time  
a. It is a bug that section 4.6.2.2.3a is not being considered. If that section is considered then the lever rule wouldn't be used. (Note - We always show the lever rule computations even if they don't get used.)

b. St. Venant's torsional inertia is computed using equation C4.6.2.2.1-2 (as documented in the Method of Solution manual). Please provide hand calculations for your value and identify what beam you are analyzing.

FROM: Herman Lee DATE: 8/31/2012 1:43:07 PM Eastern Daylight Time  
Incident 11889 also reported that 4.6.2.2.3a is not being considered.

FROM: Herman Lee DATE: 8/31/2012 2:07:51 PM Eastern Daylight Time  
Incident 10643 also reported that 4.6.2.2.3a is not being considered.

## Description

FROM: Krisha Kennelly DATE: 8/23/2012 10:17:31 AM Eastern Daylight Time  
Split out from issue 11879:

The program is not computing losses with the AASHTO approximate loss method when selected. In the program output only elastic losses are accounted for when this option is selected. There appears to be no way to manually calculate the losses and input them by hand for LRFR analysis. Can this type of feature be added?

FROM: Krisha Kennelly DATE: 8/23/2012 10:20:05 AM Eastern Daylight Time  
The ability to enter lump sum losses for LRFR will be available in Version 6.4.1 which is scheduled to be released later this fall.

Please provide some more details about the incorrect losses being computed so we can investigate.

**Complete Issue Information**

Stress Limit Ranges follow "Beam Model" (as documented in Help)  
Hence, 0 start distance of stress limit range starts at the left end of the beam (as documented in help).

For End Supports:  
Speck location 0' starts at the left (first span) / right (last span) bearing. .... (X)

Stress limit point nodes take in to account the overhang portion of the beam.

First range is 0' - 83.28'.

Left beam projection (overhang) is = 25.0866" = 2.09'

Point for first stress limit range 81.19' (= 83.28' - 2.09') is present in the speck check (capture that is attached).

For intermediate support (support 2):  
Speck check location 0' starts from CL of pier. .... (Y)

Distance from center line of pier to bearing = 4.181'  
Left beam projection (overhang) = 1.4834'

Distance from CL of pier to left face of the beam = 2.7'

First Stress limit range end entered for span 2 = 0' - 18.71' ----- (A)

Location of (A) from CL of pier = 18.71' + 2.7' = 21.41' exists in speck check results.

No code change was necessary for resolution of resubmit .

Ideally, (X) and (Y) above and other such rules/details should be in user help if not already exist.

**Description**

FROM: Bin Zhang DATE: 8/27/2012 3:12:52 PM Eastern Daylight Time  
 The Virtis program used the lever rule to calculate the live load distribution factor for shear for interior beams when the I (moment of inertia) check failed. Based on the LRFD Section 4.6.2.2.3a, third paragraph stated that "For concrete box beams used in multibeam decks, if the values of I or J do not comply with the limitations in Table 1, the distribution factor for shear may be taken as that for moment".

The bridge model was attached in the document, please use mem alt of G2 to reproduce this issue.

I submitted this issue on behalf of Hanh Nguyen from MassDOT, part of the email was listed below.

\*\*\*\*\*  
 \*\*\*\*\*

I have noted that the program used the lever rule to calculate the live load distribution factor for shear for interior beams. Based on the LRFD Section 4.6.2.2.3a, third paragraph stated that "For concrete box beams used in multibeam decks, if the values of I or J do not comply with the limitations in Table 1, the distribution factor for shear may be taken as that for moment". See attached for details.

FROM: Herman Lee DATE: 8/31/2012 1:54:11 PM Eastern Daylight Time  
Duplicate of Incident 11879.

FROM: Krisha Kennelly DATE: 4/15/2013 10:34:38 AM Eastern Daylight Time  
Since 11879 contains other issues, this issue will be the one for using the moment DF when I/J are outside the range.

FROM: Krisha Kennelly DATE: 4/15/2013 10:50:14 AM Eastern Daylight Time  
Fixed for Version 6.5.0.

Alpha tester should also verify issues 11879, 10643 produce correct results since those issues are duplicates of this issue.

FROM: Krisha Kennelly DATE: 4/15/2013 3:05:16 PM Eastern Daylight Time  
Note shear in ext beams for structure type F in the LRFD spec: if I and/or J for the adj int beam is outside the range and the moment DF is used for shear for the adj int beam, this case is not addressed by Tables Table 4.6.2.2.3a-1 or Table 4.6.2.2.3b-1. So the ext beam shear DF will equal the lever rule as per Art. 4.6.2.2.3b.

Submitted on behalf of Vinacs Vinayagamoorthy, Caltrans.

Received e-mail:

=====

Herman

This is an interesting bug.

We have a three span bridge, where we have a drop in span in the Span 2. The drop in span (between hinges in span 2) is composite. Rest of the girders are non composite. We noticed a bug in the way the haunch weight for exterior girder is calculated when we model the girder in two ways. Attached are the models.

(This is based on the results found for the Left Exterior Girder G1=G-3(AB) girder model.)

4/19/2016 3:24:19 PM

HRS AASHTO

3263

## Complete Issue Information

(1) In one model, we did not enter the effective flange width for the non composite portion

(Embedded image moved to file: pic23981.jpg)

The software established the uniform dead load for "haunch" as -0.111 kip/ft (Embedded image moved to file: pic28885.jpg)

(2) in the second model, we entered beffective for the non composite region was entered as ZERO.  
(See below)

(Embedded image moved to file: pic19822.jpg)

The software established the uniform load for the "haunch" as -0.281 kip/ft (attached is the screen shot of the results) (Embedded image moved to file: pic32101.jpg)

Note that The weight of the haunch is about 0.281 kip/ft and therefore, entering the non composite region as zero is necessary?

Virtis, Deck Profile with Partially  
Composite Deck(Document link:  
Murugesu Vinayagamoorthy)

Hi, Vinacs!

As we discussed, I had different results from Virtis depends on whether I entered Beff=0 for Non-Composite portion of the deck or I leave it completely out.

FROM: Krisha Kennelly DATE: 9/6/2012 1:00:22 PM Eastern Daylight Time  
Fixed for version 6.4 the build after beta 4.

For the haunch load, if there is no deck entered on the Concrete Deck Profile window, the program will try to get the concrete density from the concrete assigned to the deck in the Structure Typical Section window. Code fixed for girders, floorbeams and stringers.

FROM: Herman Lee DATE: 9/26/2012 3:49:45 PM Eastern Daylight Time  
Verified that haunch load in both models is 0.281 kip/ft.

FROM: vinacs vinayagamoorthy DATE: 10/4/2012 9:37:55 AM Eastern Daylight Time  
This bug is fixed and therefor I accept the fix

Subject  
Fw: staff meeting - this Monday 9am  
FM1 room 102 A&B.

Vinacs,

Here's an apparent technical issue with VIRTIS:

The "compute..." button for lane position within Structure Typical Section appears to encounter some problems if the model has more than one appurtenance, and more than one appurtenance overhangs the edge of deck.

Here are some Virtis spanshots that illustrate some of the weird things that happen:

(See attached file:  
WeirdIssuesWithComputeLanePositionDueToAppurtenanceNotCompletelyOnDeck.docx)

Here's the xml file that exhibits the issue, from which I discovered the issue:

(See attached file: 2AppurtenancesOverhanging\_ProblemWithLanePosition.xml)

The model is symmetrical, yet the compute problem appears to occur asymmetrically, which could help indicate the source of the coding error.

 The following email was received through the bridgeware@mbakercorp.com email account.  
 This problem was reported by Daniel Adams from Utah DOT "UDOT" on September 4 2012.

-----  
 From: Daniel Adams [mailto:danieladams@utah.gov]  
 Sent: Tuesday, September 04, 2012 5:03 PM  
 To: Bridgeware,  
 Cc: Arlan Freeman; Zachary Boyle  
 Subject: Problems with Virtis

Hello,  
 We are having difficulty emptying the Deleted Bridges area in our database. I am using Version 6.3.0.  
 We get the following error message:

Unable to save Bridge data!  
 01:33:49 PM - Line 886 in source file UiBWSDoc.cpp.

Saving New and Modified objects failed while processing CDmBridge (SaveOrder object 19).  
 01:33:49 PM - Line 489 in source file DmBridgeCache.cpp.

Unable edit and update recordset.  
 01:33:49 PM - Line 664 in source file DmOverflow.cpp.

The update or delete operation did not affect any rows.

Would you give us your opinion as to what we should do?  
 Many thanks,  
 Dan

Daniel R. "Dan" Adams, CBI, CPM  
 Bridge Database Manager  
 UDOT Structures Division

FROM: Mehrdad Ordoobadi DATE: 9/11/2012 9:57:00 AM Eastern Daylight Time  
We requested a copy of UDOT's Oracle database and we were able to reproduce the problem.

When a bridge is deleted or the values in the bridge description page are changed and the bridge is saved the Virtis/Opis gives an error:  
Unable to save Bridge data!  
01:33:49 PM - Line 886 in source file UiBWSDoc.cpp.

Saving New and Modified objects failed while processing CDmBridge (SaveOrder object 19).  
01:33:49 PM - Line 489 in source file DmBridgeCache.cpp.

Unable edit and update recordset.  
01:33:49 PM - Line 664 in source file DmOverflow.cpp.

The update or delete operation did not affect any rows.

I have tracked this down to the values that are stored in the latitude and longitude fields in the overflow table. When the CRecordset reads the values for the two fields which have Number(8,2) and Number(9,2) data types, the values that are read into C++ are slightly different for example 45.85 may be read as 45.849999999999 when the record is being updated or deleted through the recordset the original record is not found and the save or delete operation fails. We have seen this before but this happens for 73 bridges that Utah has. I remember that MDOT had a similar problem two years ago or so. We ended up suggesting to them to set the values in the latitude and longitude fields to null before deleting a bridge.

The solution that I have found is to use a float data type and DDX functions in the recordset, use IDeFloat in the CDoOverflow class and correct the rest of the source code for these changes. I have verified that this works and I was able to remove all of the bridges that they had trouble removing from the database.  
Note that we have seen these sorts of issues only when using an Oracle database.

The fix for this issue is checked into version 6.4 source code.

FROM: Geoffrey Trees DATE: 9/26/2012 4:18:22 PM Eastern Daylight Time  
This appears to be resolved. I cannot reproduce the problem in 64B5. I am marking this as Verified.

**Description**

FROM: Brian Goodrich DATE: 9/13/2012 3:19:06 PM Mountain Daylight Time  
We recently implemented the export of circular web profile codes for BRASS. However, the web depths sent to BRASS are based on a parabola. See G2 member alt in the attached bridge.

The commands are generated as:

```
COMMENT Span 1  
SPAN-GENERAL-LENGTH 1, 1932.0000  
SPAN-GENERAL-SEGMENT 1, 69.0000, E-, 440.0004, 60.5234  
SPAN-GENERAL-SEGMENT 1, 60.5234, E-, 1492.0008, 49.0891  
SPAN-GENERAL-SEGMENT 1, 49.0891, E-, 1932.0000, 48.0000
```

BRASS gives the following error message:

```
-----  
Error No.: 1203  
Type   : Input Error  
Location : prop_gen.for (property_generate)  
  
A web depth on span 1 was computed based on parabolic or elliptical equations,  
however, it is not equal to the web depth input by the user at this location.  
This error occurs at the junction of two "continuous" parabolic or elliptical segments.  
Distance = 440.000 (in,mm)  
Web depths (in,mm): Computed = 55.658474 Input = 60.523399  
  
----- End of Contents of BRASS Error File -----
```

The computed value above is based on an ellipse, while the input value is based on a parabola.

FROM: Brian Goodrich DATE: 9/13/2012 3:49:09 PM Mountain Daylight Time  
The error occurs only when BRASS LRFD is run.

FROM: Krisha Kennelly DATE: 9/14/2012 11:06:42 AM Eastern Daylight Time  
Please see the attached file for the circular equations used to compute the web depth.

FROM: Brian Goodrich DATE: 9/14/2012 10:10:47 AM Mountain Daylight Time  
Now I see that Virtis is using a circular arc while BRASS is using a general ellipse equation. These are simply two different shapes. Thanks for the clarification.

perform the analysis. If I set the tolerance to 1/8" the file will rate but we hesitate to change the tolerance because it may affect other files in our database. I thought the tolerance was just for aligning/smoothing gaps, I am not sure why the tolerance would overrule a structural section dimension.

**Description**

FROM: Bin Zhang DATE: 9/25/2012 9:33:21 AM Eastern Daylight Time  
John W. Gregory from CO DOT asked why the different rating factors between Brass and AASHTO LFR engine. I looked into it and found Virtis may have an error in computing the capacity. Please use Girder1-> member alternative G01-Old-INT to reproduce this issue. Please check the negative moment capacity at the critical location(span 1, 16 ft). Please read the attached figure for details (RC capacity).

FROM: Krisha Kennelly DATE: 10/12/2012 11:00:23 AM Eastern Daylight Time  
When the AASHTO engine exports the data from Virtis, it assumes the rebar is parallel to the portion of the girder (ie, Top of girder or Bottom of girder) that the rebar is measured from. Since the rebar is defined as being measured from the top of the girder, the vertical location of the bars near the bottom are assumed to vary linearly over the length of the cross section ranges. if you want the bar to follow the parabolic curve of the bottom of beam, the rebars should be referenced from the bottom of the girder. See attached '11935 rebar change.png' for an example of how the rebar should be input. I revised the rebar to referenced from the bottom of the girder and I get ratings similar to BRASS in 6.2. See attached '11935 ratings with modified rebar.png'.

I also noticed that Section G0103 of your input has rebar outside of the cross section depth. See attached '11935 error in g0103 cross section.png'.

FROM: Bin Zhang DATE: 10/12/2012 11:11:05 AM Eastern Daylight Time  
The investigation result was forwarded to CO DOT on 10/12/2012.

### Description

FROM: Bin Zhang DATE: 10/10/2012 2:44:04 PM Eastern Daylight Time

I submitted this issue on behalf of Jessica Terry from CO DOT.

Please use mem alt of Cbc Top Slab to reproduce this issue, AASHTO LFD engine, HS20 vehicle. I am able to reproduce this issue in VO63 and VO64 too.

FROM: Krisha Kennelly DATE: 10/12/2012 9:49:51 AM Eastern Daylight Time

The program is having a problem with the Type 3 bars not containing dimensions for all portions of the bar.

A workaround is to input very small values (like 1") for the bar dimensions that really should be zero. See the attached '11964 rebar workaround.png' for revisions to the 'V2\_LeftLow' bar. Similar changes should be made to the 'V2\_RightLow' bar.

After making these changes, after you do an analysis you will get errors that the V4 and V2\_RightLow bar are outside the beam. I think you have incorrectly input the vertical location of these bars.

See the help for the Girder Profile: Reinforcement window for sketches that show that the vertical distance to the bar is defined at the start of the bar.

Since V4 is inverted, the vertical distance of 1.4375" at the start of the bar places the C dimension of the bar below the beam. V2\_RightLow is similarly placed too close to the bottom of the beam and the E dimension is below the beam.

We will continue looking into the problem for resolution.

FROM: Bin Zhang DATE: 10/12/2012 3:29:27 PM Eastern Daylight Time

The workaround was forwarded to CO DOT on 10/12/2012.

FROM: Bin Zhang DATE: 1/10/2013 11:24:36 AM Eastern Standard Time

Dongzhan (Jenny) Zhou, PE from Baker IN office has experienced the same issue, this workaround was forwarded to Jenny on 1/10/2013.

FROM: Krisha Kennelly DATE: 4/15/2013 9:02:06 AM Eastern Daylight Time

Fixed for version 6.5.0

FROM: Steve Salata DATE: 4/23/2013 1:23:56 PM Eastern Daylight Time

Verified that analysis will finish when D, E, A2 (V2\_LeftLow) and A, B, A1 (V2\_RightLow) are set to zero.

4/19/2016 3:24:22 PM

HRS AASHTO

3283

**Complete Issue Information**

There still is a problem locating the bar within the beam when a bar has bar dimensions that are zero. In the attached job, Bar V2\_LeftLow and V2\_RightLow are exactly the same bar. However, bar V2\_RightLow will generate this System Error:

Bar V2\_RightLow is located 0.54 ft below the bottom of the beam at distance XX.XX ft

But V2\_LeftLow does not generate the same error. Workaround is to detail both bars as V2\_LeftLow bars.

FROM: Krisha Kennelly DATE: 4/24/2013 11:02:51 AM Eastern Daylight Time  
They aren't the same bar. As I noted on 10/12, the user has input the bars such that V2\_RightLow is outside the beam.

As noted in the Help, the vertical distance to the bar is defined at the start of the bar. V2\_LeftLow has an A dimension defined. This A length is located 1.4375" above the bottom of beam. So the C length ends up correctly in the beam. V2\_RightLow does not have an A length defined. So when the user says that bar is located 1.4375" above the bottom of beam they are positioning the C length 1.4375" above the bottom of beam. This results in the E length being below the beam. The user should mark V2\_RightLow as 'Inverted' so the E length will be inside the beam.

### Description

FROM: Richard Pickings DATE: 10/12/2012 4:08:00 PM Eastern Daylight Time

In Virtis/Opis:

- 1 Load the attached export file.
- 2 Open the Strand Layout Dialog for G1 (only one SS def)
- 3 Note that the strand locations for row 4 look odd (bug 1) see attached image
- 4 don't close strand layout dialog
- 5 Open the strand layout tab for the TxDOT U40 beam shape dialog.
- 6 Change the vertical location of row 4 to 8.2 in. - click apply, then Yes.

Program will crash (bug 2)

Question: For my translator, I need exact X,Y coordinates for strand grid locations in order to map strands from PGSuper. These are not available from the API? (I'm pretty sure no). What is the algorithm to layout the strand locations? It appears that the outer column of strands follows the slope of the U beam web?

FROM: Herman Lee DATE: 10/12/2012 4:12:32 PM Eastern Daylight Time

Both X and Y coordinates are based on the strand grid input in the beam shape. Below layout algorithm is copied from the Virtis/Opis Help's Strand Layout topic.

=====  
U Beam Strand Positioning Method

4/19/2016 3:24:23 PM

HRS AASHTO

3286

**Complete Issue Information**

The first row (measured from the bottom of the cross section) grid positions are centered about the centerline of the cross section. The first row is assumed to be in the bottom flange. The available grid positions are spaced horizontally based on the input spacing. The first row establishes the boundary for all rows below the top flanges. The first and last spacing of grid positions in other rows located in the bottom flange are based on the input spacing of the first row, the vertical distance to the first row, and the outside wall slope. Grid positions located in rows located in the top flanges are centered about the boundary established by the first row.

=====

Richard, please attach the bridge XML file to this incident.

FROM: Richard Pickings DATE: 10/12/2012 5:01:38 PM Eastern Daylight Time  
I thought it uploaded, but I guess it didn't. Now it is.

Sorry, I'm kind of thick. Is there a picture anywhere that goes with the following explanation?

"The first row establishes the boundary for all rows below the top flanges. The first and last spacing of grid positions in other rows located in the bottom flange are based on the input spacing of the first row, the vertical distance to the first row, and the outside wall slope."

I get a 0 rating for shear on this reinforced concrete tee beam bridge when I cantilever spans 1 and 4 (supports 1 and 5 are free). Not sure what is going on.

FROM: Amanda Jackson DATE: 10/12/2012 5:21:10 PM Eastern Daylight Time  
AASHTO engine.

FROM: Bin Zhang DATE: 10/15/2012 5:02:45 PM Eastern Daylight Time  
There is no reinforcement defined at the 2 ends of the RC Tee beam. That's the reason why a 0 rating for shear was presented.

Fully Development checkboxes for Set 1 and Set 8 could be checked to make sure there is effective reinforcement at the 2 ends of the beam. Please read the figure "11968FullyDevelopment.png" in the document for details.

Fatal error occurred while processing specification checks.  
Error - Error performing LRFR specification checking!

Error - Analysis failed!

I was wondering if there was something I need to change in the model, or a way around the error?

Thanks in advance,  
Josh

Joshua Colella, PE | Structural Engineer | Michael Baker Corporation |  
=====

**Developer Note:**

Looks like Virtis has problem matching up analysis points. Changing the shear connector ranges to just one "Composite" range for the whole span will allow the rating to complete.

FROM: Girish Bhanushali DATE: 2/8/2013 1:49:58 PM Eastern Standard Time

Issue has been fixed to be verified in next release (6.5).

Rating Analysis and design review were successful without any errors. No changes were made to user posted bridge.

Test runs are attached.

FROM: Melanie Berry DATE: 4/18/2013 4:23:28 PM Eastern Daylight Time

Verified that the girder runs with no errors.

FROM: Phil Litchfield DATE: 10/15/2012 3:52:45 PM Eastern Daylight Time

I'm trying to find out how many models contain information within the Deterioration Profile. Is there a script that can be run to get that number?

FROM: Geoffrey Trees DATE: 10/16/2012 9:43:00 AM Eastern Daylight Time

Phil, I am looking into producing a script for you right now. Are you interested in getting the bridge id or are you interested in any specific type of bridge? Or are you just interested in a single number for all

4/19/2016 3:24:24 PM

HRS AASHTO

3291

**Complete Issue Information**

bridges?

FROM: Phil Litchfield DATE: 10/16/2012 10:22:23 AM Eastern Daylight Time  
I'm interested in getting the total number of structures that have any deterioration modeled in them.

FROM: Geoffrey Trees DATE: 10/16/2012 10:33:15 AM Eastern Daylight Time

Here are two scripts for you to run against your database. The first will give you the count as you requested. As a side-effect of creating this script I also was able to easily make a list of bridge ids as well. Please let me know if these don't give you the results you need.

This script will give you the count of structures:

```
SELECT COUNT (*) AS struct_count FROM
(SELECT bridge_id FROM abw_stl_beam_loss_range
UNION
SELECT bridge_id FROM abw_mbralt_stlbn_loss_range) bridge_list
```

This script will give you the list of bridge\_ids:

```
SELECT bridge_id FROM abw_stl_beam_loss_range
UNION
SELECT bridge_id FROM abw_mbralt_stlbn_loss_range
```

## Description

FROM: Srujana Thogaru DATE: 10/16/2012 11:39:01 AM Eastern Daylight Time

From: Yalda, Daniel (MDOT) [mailto:YaldaD@michigan.gov]  
Sent: Tuesday, October 16, 2012 9:03 AM  
To: Bridgeware,  
Subject: Virtis 6.4 beta for culvert

Hi,

I was trying to use C bar type in other wall/ slab locations (not only as corner bar) but it seems the way that the virtis is dealing with those type of bar is incorrect at least the schematics. Please see the attachment. The other thing is how the virtis calculating the reinforcement area and capacity of the section ( $Tensile\ Capacity = A_s * F_y$ ) for the bottom slab at 0.00 ft or 2ft point? When I am at mid-span of the bottom slab 10ft I get the correct tensile capacity. Thanks

FROM: Srujana Thogaru DATE: 10/18/2012 3:22:37 PM Eastern Daylight Time

1. Changing "AS L or R/IW" bars in the attached Xml file from straight to Cbars , program should be deleting the bars under Wall tab because wall tab only accepts straight bars. Program is not doing that, instead it is considered as straight bar when creating schematic. This is bug.

2. In Cbars bottom horizontal bar is not being retrieved in bottom slab, which is a bug.

Both the above errors have been fixed for 6.4.1 release.

FROM: Srujana Thogaru DATE: 10/19/2012 9:57:20 AM Eastern Daylight Time

Above details were informed to Daniel Yalda through email on 10/19/2012

FROM: Bin Zhang DATE: 10/22/2012 10:11:02 AM Eastern Daylight Time

I verified both of two issues using VO640 release version with the DLL updates today.

FROM: Herman Lee DATE: 10/22/2012 3:08:40 PM Eastern Daylight Time

6.4.0 patch DLLs sent to Brad Wagner (Michigan DOT) on 10/22.

FROM: Brad Wagner DATE: 10/23/2012 11:37:53 AM Eastern Daylight Time

The patch is fixing and retrieving the Cbars correctly BUT appears that the Cbars being placed on

## Description

FROM: Christopher Gilbertson DATE: 10/16/2012 3:02:56 PM Eastern Daylight Time

While running the migration wizard (6.3 to 6.4), the wizard encountered an unexpected error and had to close.

The sample database migrated correctly but while migrating the the production database this error occurred. We restored the database and then tried the migration again but had the same problem.

We've got a database backup and the log file, but are unable to get the database migrated successfully.

FROM: Mehrdad Ordoobadi DATE: 10/17/2012 1:30:06 PM Eastern Daylight Time

Geoff, Please investigate this 6.4 issue. The problem seems to be in the Migrate63To64 step.

FROM: Geoffrey Trees DATE: 10/18/2012 9:15:11 AM Eastern Daylight Time

Christopher, I setup a virtual machine running windows xp 32-bit, with 32-bit Virtis 6.4 installed. I restored your database and I had a successful migration. Can you please tell me which version of Windows, SQL Server and Virtis (32 or 64 bit) you are using so I can test your exact setup? Thanks.

I'm responding with additional information on Chris Gilbertson's behalf - IncidentCustom 11977

This error occurred on a machine with:  
Windows 7 Professional with 64-bit operating system  
SQL Server 2008 10.0.2531  
Virtis 64-bit

As a work-around, would it work for you to just send us a backup of the database you were able to migrate successfully?

Thanks,  
Mary Crane

-----  
FROM: Geoffrey Trees DATE: 10/18/2012 2:12:09 PM Eastern Daylight Time  
Mary,

I ran your database under the same conditions as you have below. I noticed that if you don't run as administrator that it won't be able to connect to the database properly. Can you try again but right-click the migration utility and click "Run as Administrator". Please let me know if this works either way so we can inform other users if they have this issue.

FROM: Geoffrey Trees DATE: 10/26/2012 3:53:45 PM Eastern Daylight Time  
Christopher or Mary, any luck with this?

FROM: Geoffrey Trees DATE: 10/31/2012 9:24:41 AM Eastern Daylight Time  
We migrated one database which was successfully restored by the client. The second database was from an unsupported version of SQL Server. This issue is resolved.

### Description

FROM: Wayne Skow DATE: 10/17/2012 9:55:31 AM Eastern Daylight Time  
This is a problem originally identified in issue 11974.

When this model is imported into v6.3.1, the RPG member's 4" leg is horizontal in the cross-section dialog and the cross-section properties are consistent with that in LFR article 10.48.4.1.Mr. However, when it is imported into v6.4, the cross-section shows the 6" leg horizontal, but the cross-section properties in 10.48.4.1.Mr still show as if the 4" leg is horizontal.

FROM: Mehrdad Ordoobadi DATE: 10/17/2012 12:49:48 PM Eastern Daylight Time  
I imported the XML file that was attached to your email/incident and saved it in 6.4.1 application. I checked the saved values in the database and I see that the horizontal leg for top and bottom angles are both 4" long. See attached screenshot of the database contents. Note that the values are in millimeters.

I think that the User interface is not selecting the correct value in the Horizontal Legs drop down lists. Even if I change the top and bottom Horizontal Legs drop down lists to 4 inches then save the bridge and close and reopen the Cross Sections window OI still see the 6" Horizontal legs are selected.

Joe, Could you please ask someone to look into this issue.

FROM: Joseph Ihnat DATE: 10/25/2012 10:14:05 AM Eastern Daylight Time  
I think the window will save the data correctly, but when the window is reopened it is initializing incorrectly. Appears to be caused by the fix for 10832 in 6.4.0.

FROM: Joseph Ihnat DATE: 10/25/2012 10:36:11 AM Eastern Daylight Time  
Fixed in 6.4.1

FROM: Richard Pickings DATE: 10/17/2012 9:09:32 PM Eastern Daylight Time  
Look at the attached image showing locations of strands in a SIII-48 box beam shape. The locations do not seem to match what the documentation says they should. My interpretation is that they should match the lower figure.

To recreate: Create a new precast box beam shape and copy the SIII-48 data from the library. Then create a member alternate in order to view the strand locations

FROM: Herman Lee DATE: 10/18/2012 10:42:01 AM Eastern Daylight Time  
For SIII-48, the strand grid has 23 strands with 2" spacing. With 2" cover on each side, it should

To reproduce, open TrainingBridge1, analyze the G1 member alt, open the charts (Results Graph) window.

Select the chart view by clicking in the top pane, then open File/Print Preview.

Close the Print Preview window by clicking the "X" close button. Then try to close the bridge workspace, program will crash.

Works OK if you use the "Close" button instead of the "X" close button.

## Description

FROM: Todd Thompson DATE: 10/24/2012 4:17:15 PM Eastern Daylight Time

Not sure if this is an education issue - but I have C bars and Corner bars that go in the Exterior walls. The C bar goes in exterior side of exterior walls and the corner bars goes in the corners of the Exterior walls and Top/Bottom Slabs.

I have the bars defined and it allows me to place them - but I then get a warning/error message that Location Left and Wall 1 definition not allowed.

My C bar and Corner bars are the only bars that even show up in my resteel selection drop down window.

See attached screen shot and bridge XML

4/19/2016 3:24:25 PM

HRS AASHTO

## Complete Issue Information

I guess the work around is to define the bars as straight and make them fully developed on the ends?

FROM: Srujana Thogaru DATE: 10/25/2012 8:39:50 AM Eastern Daylight Time  
For C bars or Corner bars Left, Top left and Bottom Left would mean bar facing left (Horizontal bar projecting left direction) and Right, Top Right and Bottom Right mean bar facing Right(Horizontal bar projecting right direction). Left, Top left and Bottom Left are not allowed in Left exterior wall. Right, Top Right and Bottom Right are not allowed in right exterior wall. Please enter bars as shown in the attachment for correct procedure.

FROM: Todd Thompson DATE: 10/26/2012 10:14:17 AM Eastern Daylight Time  
Thanks - had things twisted around - Education issue.

## Description

FROM: Todd Thompson DATE: 10/26/2012 3:40:59 PM Eastern Daylight Time

I remember we had some similar issues during earlier Beta versions and this has appeared to show up again.

I have a culvert that I load rated with good results.

I have another culvert - that is similar, so I attempted on the bridge explorer to COPY and then PASTE - but I get an error when I do this.

Error occurred while saving the bridge data!

02:36:44 PM - Line 4879 in source file UiDescDtopGridView.cpp.

Saving New and Modified objects failed while processing CDmCulvdefRcboxSegReinprof (SaveOrder object 473).

02:36:44 PM - Line 492 in source file DmBridgeCache.cpp.

Error updating database record set.

02:36:44 PM - Line 985 in source file DmCulvdefRcboxSegReinprof.cpp.

State:23000,Native:547,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

State:01000,Native:3621,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

The INSERT statement conflicted with the FOREIGN KEY constraint "R\_5186". The conflict occurred in database "Virtis64s", table "dbo.abw\_culvert\_bar\_mark\_def". The statement has been terminated.

I am using the Sample DB along with the attached XML bridge/culvert definition that I was trying to copy.

FROM: Geoffrey Trees DATE: 11/1/2012 4:26:30 PM Eastern Daylight Time

This is a duplicate of 11988. I fixed a few issues regarding this but there is still one left. I am going to leave this open until the other is resolved and then mark this as a duplicate.

3306

### Complete Issue Information

Moments, Shears and Axial loads -

Ideally also being able to get graphs for each member.

While this data is somewhat available in the detailed output - in takes considerable effort and diligence to dig and find. And then one can create their own Excel spreadsheets and then graphs - it sure would be much nicer if the application would pull that data and put it into tables and graphs for the user.

FROM: Herman Lee DATE: 10/31/2012 2:23:41 PM Eastern Daylight Time  
Submitted on behalf of An Tran, CO DOT.

Part of the Bridgeware e-mail received on 10/31/2012:

=====

4. steps to reproduce the issue of water load:

Copy "Culvert Def 1" (water unit load = 62.4 pcf, water height = 0), Paste to CULVERT DEFINITIONS and rename it as "Culvert 100ft Water 1248 pcf", Under "Culvert 100ft Water 1248 pcf", open Culvert Loads, change water unit load to = 1248 pcf, Under "Culvert 100ft Water 1248 pcf", CULVERT ALTERNATIVES, CULVERT SEGMENTS, open RC Box Culvert Loads, change water height to = 100 ft.

Run the same analysis for "Culvert 100ft Water 1248 pcf" as for "Culvert Def 1" (no water) and compare the results.

=====

Reply e-mail:

=====

When making a copy of the culvert definition, the "Use NCHRP 647 LL Distribution" control option didn't get copied over. If you select to use this option in the copied culvert definition, the ratings will be the same as the one without water. Since water load is not included in the load rating equation, same ratings are expected.

=====

FROM: Geoffrey Trees DATE: 11/2/2012 10:14:37 AM Eastern Daylight Time  
Resolved for 6.4.1. This applied to all copied control options. If a culvert def was copied and the bridge was closed, the copy was OK. However, if there was a copy made and then the def window was opened and closed by pressing OK, the proper values were being over written with the defaults. I added code to handle this case and now everything looks good.

FROM: Matt Kolis DATE: 12/6/2012 2:45:16 PM Eastern Standard Time  
Verified in Virtis 6.4.1 Beta 2.

FROM: Christopher Laughlin DATE: 11/1/2012 12:23:42 PM Eastern Daylight Time  
Question on BridgeWare Association when creating new bridge. Please reference PDF attachment.

FROM: Christopher Laughlin DATE: 11/2/2012 1:50:46 PM Eastern Daylight Time  
Is 6.4 compatible with Pontis 4.5 ? According to the Virtis Help, it sounds like if any version of Pontis is installed on the same server/workstation when you install Virtis, the ability to link to Pontis bridges during new bridge creation should be in place. Can you confirm ? If this is the case, are there any other steps we can take to resolve ? (i.e. look for a specific registry entry, etc.)

FROM: Mehrdad Ordoobadi DATE: 11/5/2012 11:52:21 AM Eastern Standard Time  
I think the behavior changed when Pontis Link and Multimedia import/export enhancement in 6.3 was implemented.

**Complete Issue Information**

Fixed in 6.4 SP1.

FROM: Mehrdad Ordoobadi DATE: 11/8/2012 1:03:58 PM Eastern Standard Time

This bug has just been fixed in version 6.4 SP1 that is still being developed. The Service Pack is going to be released in a few months.

In the meanwhile you could use this workaround when creating a new bridge that you would like to link with Pontis:

- 1 – Create the bridge without linking with Pontis.
- 2 – Save and Close the bridge.
- 3 – Open the bridge. Open Bridge Description window. Click on BridgeWare Association window and link to a Pontis bridge.

FROM: Joseph Ihnat DATE: 12/6/2012 10:40:32 AM Eastern Standard Time

Verified in 6.4.1 Beta 2. The BridgeWare Association window appears when a new bridge is created.

From: Magnuson, Bob [mailto:BMAGNUSON@indot.IN.gov]  
Sent: Monday, October 29, 2012 1:07 PM  
To: Bridgeware,  
Subject: RE: Bridge Rating ASD LFD to AASHTO

Hi Mehrdad,

A test database was migrated from 6.3 to 6.4. I then tried to run the scripts and got the errors.

Thanks,  
Bob

From: Bridgeware, [mailto:Bridgeware@mbakercorp.com]  
Sent: Monday, October 29, 2012 12:54 PM  
To: Magnuson, Bob; Bridgeware,  
Subject: RE: Bridge Rating ASD LFD to AASHTO

Hi Bob,

What version of Virtis/Opis application are you using. The error suggests that you are probably using Virtis/Opis 6.2 or older. The scripts are developed for version 6.3 or later and cannot be applied to older versions.

Regards,  
Mehrdad Ordoobadi

To: Magnuson, Bob  
Subject: RE: Virtis Std to AASHTO

Bob,

There was a change that caused these scripts not to work. I have corrected the issue and attached updated scripts. Please let me know if you have any further issue. Sorry for the inconvenience.

Thanks,  
Geoffrey Trees

From: Magnuson, Bob [mailto:BMAGNUSON@indot.IN.gov]  
Sent: Friday, November 16, 2012 10:22 AM  
To: Bridgewater,  
Subject: Virtis Std to AASHTO

Hi Mehrdad,

The ASD-Switch-Virtis-Std-to-AASHTO and LFD-Switch-Virtis-Std-to-AASHTO scripts have an error with version 6.4 because the migration from 6.3 to 6.4 changes the abw\_struct\_def table. Do the scripts need to be changed or does the migration need to be changed? Will the application run properly if the scripts are applied to 6.3 and then the database is migrated to 6.4?

Thanks,  
Bob

When attempting to update our Oracle database using the attached script included in Technical Note

**Complete Issue Information**

21, we get an error. A screen shot of the error and the insert are attached.

Thanks,  
Richard

FROM: Richard Withers DATE: 11/19/2012 10:01:26 AM Eastern Standard Time  
Has anyone looked into this issue? MDOT is trying to update to 6.4 and this issue is holding up the entire process.

Thanks,  
Richard

FROM: Mehrdad Ordoobadi DATE: 11/20/2012 9:22:39 AM Eastern Standard Time  
Please review the technical note 21 documentation (Part of it displayed below)

**Resolution**

1. This resolution can only be applied when the Virtis/Opis database is at version 6.2.0 or earlier and HAS NOT BEEN migrated to version 6.3.0.
2. Download the TN0021 package from the Virtis/Opis Technical Support website (<http://aashto.bakerprojects.com/virtis/>) and extract the contents of the package into the folder where Virtis/Opis 6.3.0 is installed. The full path to that folder is typically one of the following:
  - o C:\Program Files (x86)\AASHTOWARE\VirtisOpis63\
  - o C:\Program Files\AASHTOWARE\VirtisOpis63\
3. Start Migration Wizard to migrate your database to Version 6.3.0.

The script was intended for a database this is at version 6.2. Also the script is supposed to be ran from within the Virtis/Opis Migration Wizard.

Please recover your database from the backup.

If the version of the database that you are upgrading from is 6.2 or older you can just use the Virtis/Opis 6.4 Migration Wizard to upgrade your database. The Technical Note 21 fix will be applied. If your database is at version 6.3 then please just perform the Migration using the Migration Wizard. The Technical Note 21 fix will not be applied. If you previously migrated your database to version 6.3 without applying the Technical Note 21 fix then we could look into how to implement the corrections included in Technical Note 21 on your 6.4 database.

## Description

FROM: Phil Litchfield DATE: 11/7/2012 5:11:50 PM Eastern Standard Time

The culvert model gives an error when it is running in our network database (See attached screenshots.). But if I import it into a local database it will running slowly but without error.

FROM: Herman Lee DATE: 12/5/2012 3:42:23 PM Eastern Standard Time

Phil, do you still have this problem? Thanks.

FROM: Herman Lee DATE: 12/6/2012 8:23:17 AM Eastern Standard Time

**Complete Issue Information**

=====  
Phil,

Is the problem reproducible with any culvert models running in your network database or reproducible only with the culvert model attached in Incident 12032?

Thanks,  
Herman

From: Litchfield, Phillip R  
Sent: Wednesday, December 05, 2012 4:35 PM  
To: Lee, Herman  
Subject: RE: AASHTO Virtis/Opis - Michael Baker Jr., Inc. - priority requires additional information.

Yes, we are still having this problem.

Thanks,

Phillip Litchfield, P.E.

Illinois Department of Transportation  
Bureau of Bridges & Structures

=====

FROM: Herman Lee DATE: 12/7/2012 11:30:18 AM Eastern Standard Time  
Phil's reply:

=====

Yes, the problem is reproducible on another model also.

Thanks,

Phil

=====

FROM: Phil Litchfield DATE: 12/27/2012 3:28:19 PM Eastern Standard Time  
Error still occurring in 6.4.1. Any ideas?

FROM: Herman Lee DATE: 12/27/2012 7:05:23 PM Eastern Standard Time  
We don't have any ideas for the cause of the problem. Did you get the same error messages as those attached for the other model the problem is reproducible? Are you using Oracle or SQL Server for the network database?

FROM: Phil Litchfield DATE: 12/28/2012 3:11:57 PM Eastern Standard Time  
Yes, I'm getting the same message with a newly entered model also. We are using SQL Server network databases.

FROM: Herman Lee DATE: 12/29/2012 6:54:11 AM Eastern Standard Time  
Thanks for the additional information. We will try to reproduce the problem using a SQL Server network database.

Geoff, could you setup a Virtis 6.4 SQL Server network database in the Lab's Windows 7 machine?

### Complete Issue Information

Please reassign this incident back to me after you are done. Thanks.

FROM: Phil Litchfield DATE: 1/7/2013 5:28:47 PM Eastern Standard Time  
We can get it to run in LRF design review on the network without an error. And see the rating factors in the summary output but still having problems with LRFR.

FROM: Herman Lee DATE: 1/17/2013 9:49:43 AM Eastern Standard Time  
The problem was caused by agency defined LRF and LRFR library factors in migrated database.

This issue has been fixed. After verifying the fix, we will provide an updated 6.4.1 DLL for fixing this issue.

FROM: Bin Zhang DATE: 1/17/2013 1:33:26 PM Eastern Standard Time  
Verified for version 6.4.1 with the DLL updates.

FROM: Phil Litchfield DATE: 1/18/2013 3:55:47 PM Eastern Standard Time  
New DLL update resolved this issue.

### Description

FROM: Dean Teal DATE: 11/8/2012 11:51:09 AM Eastern Standard Time

In my 32 bit XP system

I created and saved a template in General Preferences

I exited the feature and then returned to it and verified it saved my selections

I opened the saved template again, added an item to it, hit save template, answered Yes to overwrite existing.

Exited the feature and reopened General Preferences, Opened the saved template and the new item I added was not their.

This works on my 64 bit W7 pc I used for testing and is connected to our test database.

This does not work on my XP 32 bit production pc

FROM: Krisha Kennelly DATE: 11/8/2012 3:48:23 PM Eastern Standard Time  
reponse sent via email Thu 11/8/2012 3:48 PM:

Hi Sita,

We have identified your error as a bug and logged it as Issue 12035 on the Technical Support website.

A workaround for you is to enter the skew values as zero, use the distribution factor compute button, review the computed distribution factors and adjust them for the skew correction factor, enter these adjusted distribution factors into Virtis, change the skew values back to their correct values and save your bridge.

Regards,  
Krisha Kennelly, PE

## Complete Issue Information

Input by Bryan Silvis, VDOT, on behalf of Shiwei Luo of Parsons Brinkerhoff (Test.zip file is attached in the documents):

We tested the issue 12022 on Virtis 6.4.1 Beta 2 with structures #00602 and #06235. There is one mistake in LRFD LLDF calculations for exterior beam. Based on AASHTO LRFD 6th Edition, "de" in Table 4.6.2.2d-1 shall be the horizontal distance from the centerline of the exterior web of exterior beam at deck level to the interior edge of curb or traffic barrier. However, the horizontal distance from the edge of the slab to the interior edge of curb or traffic barrier has been used as "de" in Virtis 6.4.1 Beta 2.

Attached is the test results showing the comparison between Virtis 6.3.1 and Virtis 6.4.1 for LRFD LLDF Calculations.

List of files:

- 1) Folder "Virtis 6.3.1" includes the calculations run by Virtis 6.3.1:
  - a. LRFD LLDF for structure #00602 G1 (exterior) and G2 (interior), de value is in Page 3.
  - b. LRFD LLDF for structure #06235 G1 (exterior), G2 (interior), and G15 (exterior), de value is in Page 3.
- 2) Folder "Virtis 6.4.1" includes the calculations run by Virtis 6.4.1:
  - a. LRFD LLDF for structure #00602 G1 (exterior) and G2 (interior), de value is in Page 4.
  - b. LRFD LLDF for structure #06235 G1 (exterior), G2 (interior), and G15 (exterior), de value is in Page 4.
- 3) Schematic view of structure #00602 typical section
- 4) Schematic view of structure #06235 typical section
- 5) Screenshots of AASHTO LRFD 6th Edition Section 4.6.2.2
- 6) Original XML files of #00602 and #06235 (Virtis 6.0)

FROM: Herman Lee DATE: 12/7/2012 3:54:14 PM Eastern Standard Time  
Resubmitted for Bryan Silvis.

FROM: Krisha Kennelly DATE: 12/10/2012 2:29:48 PM Eastern Standard Time  
Just so I understand what you want, please pick one of the 2 options presented in the attached '12035 question.pdf' to compute de. Thanks.

FROM: Bryan Silvis DATE: 12/12/2012 9:21:26 AM Eastern Standard Time  
For the purposes of LL DF's, Option 2 (center of the voided slab to interior edge of curb/barrier).

FROM: Krisha Kennelly DATE: 12/12/2012 1:35:51 PM Eastern Standard Time  
Ok, thanks. That is what I will implement.

FROM: Krisha Kennelly DATE: 12/17/2012 9:03:33 AM Eastern Standard Time  
Fixed for 6.4.1.

Exterior beams for 00602 now produce de = -0.17 ft which matches 6.3.1.  
G1 for 06235 now produces de = 0.33 ft, G15 produces de = -9.17 ft which match 6.3.1.

FROM: Subhadeep Ghosh DATE: 12/18/2012 1:23:40 PM Eastern Standard Time  
Verified for 6.4.1 Beta 3.

## Complete Issue Information

| Name | Current State | Summary |
|------|---------------|---------|
|------|---------------|---------|

### Description

FROM: Jeff Ruby DATE: 11/9/2012 9:31:45 AM Eastern Standard Time  
KDOT noticed 3 bridges didn't convert very well from 6.3 to 6.4. I can import the bridge and save it, but then I can't open it again. I attached the error and one of the bridges that caused this hiccup.

FROM: Jeff Ruby DATE: 11/9/2012 9:43:48 AM Eastern Standard Time  
I can't delete the bridge either. Screenshot\_002 shows that error.

FROM: Mehrdad Ordoobadi DATE: 11/21/2012 1:34:43 PM Eastern Standard Time  
The error "General error: Unable to write to file buffer" is issued by the ODBC driver when reading from the database. The error indicates that there is not enough hard disk space available to write to a temporary file.

Please make sure that you have free disk space available.  
Please let us know what you find out.

FROM: Jeff Ruby DATE: 11/26/2012 9:33:03 AM Eastern Standard Time  
Can't be a disk space problem. It has to be a disk "cache" problem with a database setting maybe? All I know is that it fails for MS SQLexpress and Oracle.

I can watch it create the "tmp" file in the subdirectory until it crashes.

FROM: Jeff Ruby DATE: 12/19/2012 1:58:55 PM Eastern Standard Time  
Still broke in 6.4.1 Beta 3

FROM: Jeff Ruby DATE: 12/19/2012 2:00:50 PM Eastern Standard Time  
Have you tried importing the bridge, saving it, and then trying to open it again?

FROM: Mehrdad Ordoobadi DATE: 12/19/2012 2:19:08 PM Eastern Standard Time  
I am able to reproduce this issue in 6.5 Debug code except for the fact that I get a crash instead of an error message.  
I have tracked this down to retrieving records from abw\_anal\_pt\_component that has 1056 records for the attached bridge.

Here are my observations:

- \* When the table is being read a file is created by the ODBC software called something like CTTFC76.tmp in the user's temp directory that has a size of zero in the beginning (CTTxxx.TMP).
- \* Then the records are read from the database and the size of the file grows.
- \* While reading the 409th record the temp file size reaches 2 GB and the program crashes.
- \* For each record the size of the TMP file increases by a little bit more than 5 MB.

FROM: Jeff Ruby DATE: 12/20/2012 12:33:14 PM Eastern Standard Time  
Thanks for finding this bug!  
Accepted in 6.4.1 Beta 3 with the new dll's sent 12/20/2012.

FROM: Mehrdad Ordoobadi DATE: 12/20/2012 1:01:18 PM Eastern Standard Time  
Fixed for Virtis/Opis 6.4 SP1 Final Release.

### Complete Issue Information

I noticed when I'm working with a Precast Concrete Culvert that the schematic wants a horizontal joint and even though I leave that field blank - the schematic shows a horizontal joint at 0.

I think for a precast culvert - the horizontal joint should be greyed out and not shown on the schematic. And of course not considered anywhere in the analysis.

### Description

FROM: Aaron Kemna DATE: 11/13/2012 10:29:31 AM Eastern Standard Time

The POIs displayed in the spec check do not match the POIs requested. I attached a sample xml. In

4/19/2016 3:24:31 PM

HRS AASHTO

3328

**Complete Issue Information**

addition, when copying a POI and changing the location, the location display does not update after closing the window. You have to close the file and open back up to see the correct location request. Also, the override options do not copy over.

FROM: Srujana Thogaru DATE: 11/16/2012 12:58:54 PM Eastern Standard Time  
Above mentioned issue was tested with the attached bridge and found that the Point of interest at 13ft for top slab 1 and at 0ft for bottom slab 1 are missing during the analysis. An additional 0.60ft for Top slab 1 was considered during analysis. This is a bug.

FROM: Srujana Thogaru DATE: 2/1/2013 2:47:32 PM Eastern Standard Time

Error for Missing POI is fixed. Additional analysis locations are for shear analysis which is not a bug. Also default 0.0 ft for " Distance from left edge of cell or bottom of wall" in POI window has been updated., which was empty before the fixed, is also cause for the bug - missing POI during analysis. There was also a bug in updating the label in POI tree when the distance in POI window changed.

All the above errors are fixed for 6.5 release. For Internal testing fixed for 6.5 Alpha build 1.

FROM: Bin Zhang DATE: 4/24/2013 5:31:53 PM Eastern Daylight Time  
Verified for version 6.5 beta 1.

FROM: Aaron Kemna DATE: 5/15/2013 2:57:10 PM Eastern Daylight Time  
I am still getting the POI tree not to update when I copy over a POI and change the distance.

FROM: Srujana Thogaru DATE: 5/21/2013 9:24:43 AM Eastern Daylight Time  
When we copy and Paste POI and change the distance in POI, tree is not updated with the changed distance. Geoff, can you please look into it.

FROM: Geoffrey Trees DATE: 5/29/2013 9:19:47 AM Eastern Daylight Time  
Joe, I think this is an issue in the GUI. The value of the copied POI is being saved to the domain but is not being reflected in the GUI. If you copy a POI, change the value, save the bridge then reopen the bridge, you will see the correct value. For some reason the GUI isn't updating the label for copied POIs but regular POIs are OK.

FROM: Joseph Ihnat DATE: 5/29/2013 11:20:42 AM Eastern Daylight Time  
Fixed for version 6.5.0 (Beta 3).

FROM: Aaron Kemna DATE: 6/21/2013 3:55:07 PM Eastern Daylight Time  
Looks Good for Beta 3. Accepted

## Description

FROM: Krishna Kennelly DATE: 11/13/2012 1:05:50 PM Eastern Standard Time  
the following 2 changes are required as part of the Errata which are attached.

1. Article 5.7.3.4 Revise 'de' to 'dl' in the check for maximum spacing of the long. skin rebar as per the change listed for LRFD Spec page 5-46 in the attached document. I'm pretty sure it is only a text labeling change but please verify if that is correct.

4/19/2016 3:24:31 PM

HRS AASHTO

**Complete Issue Information**

2. Article 5.8.4 Revise Eq. 5.8.4.2-2 as per the change listed for LRFD Spec page 5-84 in the attached document. I'm pretty sure it is only a text labeling change but please verify if that is correct.

Changes are to be made for 6.5 in the 6th edition of the spec. If articles are currently derived from the 5th edition, copy that version to the 6th edition folder and make the changes in the 6th edition.

FROM: Srujana Thogaru DATE: 12/17/2012 1:16:55 PM Eastern Standard Time  
Above mentioned changes are implement in 6th edition articles by copying articles from 5th edition. No computational changes implemented.

FROM: Subhadeep Ghosh DATE: 5/7/2013 1:37:18 PM Eastern Daylight Time  
Tested with BID 20. The 6th edition still shows "de" in the output for Article 5.7.3.4 (a). Attached is the article screenshot.

FROM: Srujana Thogaru DATE: 5/17/2013 8:56:15 AM Eastern Daylight Time  
Above mentioned error fixed for Beta 2

|------|---------------|---------|

### Description

FROM: Richard Withers DATE: 11/14/2012 4:30:21 PM Eastern Standard Time  
When running an analysis of a double 12' x 12' culvert, there are the following issues:

1. Bars C are the Bent Bar type. The program locates the bar as a straight bar at the specified clear distance. It does not account for the bend in the bar.
2. The program adds an extra #6 bar spaced at 13.5" ( $A_s = 0.39\text{in}^2/\text{ft}$ ) in the top of the slab over the interior wall and in the bottom of the slab under the interior wall.
3. The  $A_s$  per foot is 1/2 what it should be in the walls.

All of this was found using the Specification Checker function.

I have checked and rechecked my input. I am almost positive it is correct. However, there are so many errors I may be doing something wrong. Please look at the attached culvert export and plans and determine if I am in error or the program is.

Thanks,  
Richard Withers

FROM: Srujana Thogaru DATE: 11/16/2012 11:25:28 AM Eastern Standard Time  
CG and end distances of Bent bars (Bar C) computation have errors. This issue is expected to be fixed for 6.4.1.  
Workaround for this issue is to define straight bars at the required locations.

FROM: Richard Withers DATE: 11/19/2012 9:59:53 AM Eastern Standard Time  
Have you had a chance to look into the issue with the area of steel in the walls?

Richard

FROM: Srujana Thogaru DATE: 11/21/2012 1:26:02 PM Eastern Standard Time  
Can you please send me the location and area of steel you are getting for walls.

FROM: Srujana Thogaru DATE: 11/28/2012 9:17:36 AM Eastern Standard Time  
Information provided through email. Email attached to the incident.

FROM: Srujana Thogaru DATE: 11/29/2012 1:00:53 PM Eastern Standard Time  
Wayne can you please check the P-M Interaction Diagram curve is producing the correct results.

FROM: Wayne Skow DATE: 11/30/2012 7:05:29 AM Eastern Standard Time  
I investigated the 6' location of ext. wall 1. It looks like the diagram is correct. I checked the rating results and they also look correct. Attached is a pdf file showing the interaction diagram and one of the rating points plotted on the diagram. The spreadsheet containing the data is also attached if one is interested in a closer look. It appears the wall is underreinforced on the inside for the loads applied.

**Description**

FROM: Brian Goodrich DATE: 11/14/2012 2:30:10 PM Mountain Standard Time  
On the Control Options tab of the Member Alternative Description window for a P/S member alt, one of the LRFR options reads: "Consider legal load tensile concrete stress." However, the API function for obtaining this value is named "GetLrfrConsiderLegalLoadTensileSteelStressInd." I think the function should be named "GetLrfrConsiderLegalLoadTensileConcreteStressInd" instead.

**Complete Issue Information**

FROM: Geoffrey Trees DATE: 11/27/2012 4:18:38 PM Eastern Standard Time  
Brian, we agree. That has been like that since 2008 or 2009. We decided as opposed to changing the name, which would break any code already using that function, that we would add an additional function with the correct name and deprecate the old one in a few versions. Thanks for bringing this to our attention. The fix will be available in 6.4.1.

I submitted this issue on behalf of Phil Austin from Parsons Brinckerhoff. Part of the communication email was listed below.

\*\*\*\*\*  
\*\*\*\*\*

2) Again, with pre-stressed voided box beams, we have some models that will run, originally created using Virtis 6.2. Curiously, the first time we try to rate an individual member, we get low rating for BP90 and BP-115. Without making any changes, if we run the same member again, we get different, higher ratings. An example bridges attached, 09304.xml. For example, if you import 09304.xml, expand IR012011-o and rate G2 for BP-90 and BP-115 , you get 13kips and 16kips respectively. Without changing anything, if you run that same member again, you get 25kips and 32kips.

Hope you can assist or provide suggestions for the above.

Regards

Phil Austin

Please use petmit vehicle BP90 and BP115 to reproduce this issue. Both the bridge model and the vehicles were attached in the document.

I took a look at G2. There are 2 POI at the same location 49.75 ft, Left and Right. The Left one has an override schedule for shear capacity and the other one does NOT. Virtis may use Left or Right POI each time I run it. So I get different RF for each analysis. For example, this time I run Virtis, it used the 49.75Right, next time it would use 49.75Left. Also, this system defect applies to both interior and exterior girders. It also applies to both permit and design rating. I am able to reproduce this issue in Version631 and Version 641 development environment.

I sent a workaround to the user:

"I have a workaround for you. You can define a POI at a location that is very close to the POI location other than use exactly the same number. For example, you can use 49.751 ft for your POI location, and delete one POI at 49.75ft. Just make sure you don't have duplicate POI at the same location."

 Subject: user defined beta and theta for LRFR shear computation

Greetings,

I am entering user defined beta and theta for computing shear resistance for PS concrete I beams under points of interest under member alternatives. When I look at the spec check at the particular point of interest where I manually entered a beta and theta, the shear capacity comp is not referencing my user defined values. It is still computing a beta and theta for shear capacity comps for LRFR. Can I define a beta and theta for LRFR shear ratings????

### Description

FROM: Todd Thompson DATE: 11/19/2012 1:26:25 PM Eastern Standard Time

I've had this happen several times now.

I create or work on a culvert structure. Save my work. Close the application. NO problems, or errors or issues.

Next time I launch VirtisOpis and try to open my culvert, I am prompted to open from last backup or from DB.

I will attempt to isolate it down to more than working on a culvert, but it's happend probably 1/2 dozen times while testing Beta 1. I don't recall this happening with 6.4.0

FROM: Herman Lee DATE: 11/28/2012 9:54:28 AM Eastern Standard Time

I'm not able to reproduce the problem. Are you using Beta 1 in Citrix? Is Beta 1 installed locally in C:\Program Files and Analysis Output Folder set to "C:\Work"? Thanks.

FROM: Todd Thompson DATE: 11/28/2012 11:57:05 AM Eastern Standard Time

Not using Citrix

Yes - installed to c:\Program Files

Yes - c:\Work

Windows 7 - 32 bit version

It happened a lot the first day I had Beta 1 installed and now I have not seen it happen this week.

## Complete Issue Information

Installed Beta 2 of 6.4.1  
Created a new culvert - analyzed it (LRFR and LFR)  
Saved all my work  
Exited from Virtis Opis

Open Virtis Opis  
and tried to open new culvert - prompted to restore backup or open from data source...

So - for some reason this problem is popping up again. (See attached screen shot)

FROM: Herman Lee DATE: 12/12/2012 8:26:39 AM Eastern Standard Time  
I'm able to reproduce the problem but not all the time.  
Virtis/Opis backups the Bridge Workspace every 15 mins to a bak file. I suspect there's a problem in locating the bak file for removal during normal exiting the application.  
I changed the Folder from Beta Testing to Support Center.

FROM: Todd Thompson DATE: 12/12/2012 3:22:14 PM Eastern Standard Time  
Possible issue

I created a new culvert today, saved it, exported it, closed it and was sitting at the Bridge explorer.  
Reported VI 12100  
Opened up this new culvert and was prompted again.

I suspect that since this only happens with culverts and never with bridges - the application is sometimes failing to remove that bak file correctly and since culverts are new in 6.4 - it probably is still under warranty and not a support issue.

Hopefully we can track this down and get fixed in 6.4.1

FROM: Joseph Ihnat DATE: 12/18/2012 7:45:32 AM Eastern Standard Time  
Found a possible cause of the problem (not related to culvert). Fixed in 6.4.1 (beta 3).

FROM: Subhadeep Ghosh DATE: 12/18/2012 1:50:40 PM Eastern Standard Time  
Verified for 6.4.1 Beta 3

FROM: Todd Thompson DATE: 12/19/2012 1:39:27 PM Eastern Standard Time  
Nope - this is still occasionally happening with Beta 3.

I had imported a bridge from 6.3.0 DB  
Analyzed  
Exited (successfully) from Virtis Opis 6.4.1 Beta 3

When I started up Virtis Opis the next time and went to open that structure - I was prompted again.

So evidently there is more to this issue than the item that was fixed.

FROM: Joseph Ihnat DATE: 12/19/2012 3:19:14 PM Eastern Standard Time  
Can you try disabling your antivirus software and see if the problem still occurs?  
What is your backup interval set to? (View, Preferences, Bridge Workspace tab)  
Is checkin/checkout enabled?

4/19/2016 3:24:34 PM

HRS AASHTO

3345

### Complete Issue Information

FROM: Todd Thompson DATE: 12/19/2012 3:26:01 PM Eastern Standard Time  
Disabling Virus Software would be IMPOSSIBLE...  
Backup Interval is set for 5 minutes  
I'm using the SQL Server Sample DB as installed with the product.

Previously - it was only happening after entering a new culvert.  
Today with Beta 3 - it happened after I imported a bridge.

It does seem to only happen once on any given structure and it seems to happen after the initial import or structure creation.

I've learned to ALWAYS choose Data Source - I never lose any data if I know I exited normally. I learned too many times in previous versions of choosing backup source and then losing all my work.

I don't recall ever seeing this until 6.4.1

I was doing a culvert LF analysis

HS 20 Truck

Alt Mil

3 SD Trucks

and when I view the rating summary results - I get an error message.  
See attached screen shot.

FROM: Todd Thompson DATE: 11/20/2012 11:31:56 AM Eastern Standard Time

I was looking at Spec Check Results today and I got the same/similar error message. I'll attach this screen shot to this incident as I don't think it's a separate issue.

screen shot is called - Another\_SpecCheck\_Error.png

FROM: Herman Lee DATE: 11/28/2012 9:08:11 AM Eastern Standard Time

Todd, I'm not able to reproduce the problem. I set the Analysis Output Folder to "C:\Work" and tested the Rating Results Summary and Spec Check Detail using the attached bridge and vehicles. Also tried performing culvert LF analysis multiple times.

Are you able to reproduce the problem every time you open the Rating Results Summary and Spec Check Detail?

Is there any special setup for the "C:\Work" folder?

When this happen again, could you check whether the file "C:\Work\AASHTOWARE\VirtisOpis64\11091022\3-8x6\SideBox\triplebox\AASHTO\_Culvert\_LFD\Data\CulvertSpecCheckResults.SpecCheckResults" is there?

FROM: Dean Teal DATE: 11/21/2012 11:28:36 AM Eastern Standard Time  
6.4.0 on Oracle 11g

My Bridge Explorer focus was on (anything below "All Bridges")

I clicked on (put focus on) "All Bridges"

Note – No bridges in the right pane have been highlighted, only the "All Bridges" in the left pane

From the tool bar, select Bridge, Check out Authorizations, By Bridge

(if you select by User all is well)

At this point you have locked up the program and will have to bail using the red X in the upper right and then restart BrDR.

FROM: Mehrdad Ordoobadi DATE: 12/3/2012 11:06:23 AM Eastern Standard Time

Dean. I think this is taking a long time because you have a lot of bridges in your database. Because it goes through all bridges' authorizations for all users and it takes a long time.

We are going to look into this issue to improve its performance.

FROM: Mehrdad Ordoobadi DATE: 1/8/2013 9:01:57 AM Eastern Standard Time

Improved the performance of the Check out authorizationby bridge window by utilizing a map data structure to store the data that can be retrieved quickly.

Also now showing correct icon for bridge checkout status (Checked out, Protected, Being Exchanged, By user or onother user, ...)

Note that if there are several thousand bridges in the database the window will take some time to open (for example fot 5000 bridges it may take 15 to 30 seconds to open).

### Description

FROM: Todd Thompson DATE: 11/28/2012 1:18:44 PM Eastern Standard Time  
Could somebody double check that this control option is working correctly.

I had it unchecked and it looks like it used 647 to modify the DF

I checked it and it used straight AASHTO LRFD DF

FROM: Todd Thompson DATE: 11/28/2012 2:53:30 PM Eastern Standard Time

I think maybe it is correct, but it would be nice if the output stated:

- (1) Which Live Load controlled and was used
- (2) Stated whether NCHRP 647 was used (or not used)

The only way I can see to know - is to calculate by hand the NCRHP 647 method and see if one of those numbers shows up in the output somewhere.

FROM: Todd Thompson DATE: 11/28/2012 4:29:42 PM Eastern Standard Time

After much review - I think the Control Options works.

But I don't think the live load moments are always correct.

I created a spreadsheet to evaluate the areas, pressures, widths and those all look good and as expected.

With 647 LLDF - there is no discrete change at 2 ft like with LRFD code having two different equations at this break point.

So I was not expecting Virtis to have a discrete change in LL Moments when I used the 647 DF method.

But there is a very distinct change in live load moments at 2 ft.

Since the output is not clear on what is used - I'm not sure what is going on.

4/19/2016 3:24:35 PM

HRS AASHTO

3351

## Complete Issue Information

For my triple barrel 8 ft x 6 ft box - I created a spread sheet with varying fill depths from 0 to 7 ft.  
All of my widths in spreadsheet match Virtis Culvert  
All of my pressures match my spreadsheet  
But the live load moments are definitely wrong around the 2 ft fill depth and less.

It might be similar to the issue that the LF Analysis appears to be wrong at the 2 ft and less depth of fill.

I'll attach my spread sheet and my culvert I used for testing.

FROM: Srujana Thogaru DATE: 12/4/2012 9:16:59 AM Eastern Standard Time  
I have gone through the attached spread sheet calculation and found that for depth of fills under 2ft LLDF used in the spread sheet are computed by Thru Fill method but which should be actually using LLDF computed by Eqv Strip Width which are shown below Thru Fill method in the detailed output.

To avoid this confusion virtis has updated to display only its respective method of computation output depending on the depth of fill. This has been fixed for 6.4.1 Beta 2.

FROM: Todd Thompson DATE: 12/4/2012 10:41:29 AM Eastern Standard Time  
Did I misunderstand the NCHRP 647 method?  
When I read the document - I thought there was only one method to use - regardless of fill depth?  
If that is correct - then Virtis is doing it wrong.

if I mis-read the document - and there is a break point and two different equations are used - then Virtis is correct.

Can you confirm that the NCHRP 647 intended there to be the break point at 2 ft of fill and let me know where that section is in the document - maybe scan and place a copy of that page.

FROM: Srujana Thogaru DATE: 12/4/2012 1:59:36 PM Eastern Standard Time  
Current virtis code for NCHRP 647 LLDF computation is based depth of fill. For depth of fills 2 ft and greater Dist rate of 1.15 and Dist. Width =  $\text{Dist.Width}(E) + 0.06 * \text{InsideSpanWidth}$  is applied. But for depth of fill less than 2ft only Dist.rate of 1.15 is only applied.  
In NCHRP 647 report at page 26 "Comparison with past practice" says "For depths less than 2 feet of fill, there is no change in the load calculation".

As current virtis LRFD/LRFR analysis of culvert is inherited from WisDot further investigation need be done to determine correct method of LLDF computation.  
Current virtis code for NCHRP 647 LLDF computation is based depth of fill. For depth of fill 2 ft and greater Dist.rate of 1.15 and Dist. Width =  $\text{Dist.Width}(E) + 0.06 * \text{InsideSpanWidth}$  is applied. But for depth of fill less than 2ft only Dist.rate of 1.15 is only applied.  
In NCHRP 647 report at page 26 "Comparison with past practice" says "For depths less than 2 feet of fill, there is no change in the load calculation" and "At depths greater than 2 feet, the proposed calculation method is reduced slightly from the current LRFD"

As current virtis LRFD/LRFR analysis of culvert is inherited from WisDot further investigation need be done to determine correct method of LLDF computation.

Subject: negative epsilon conservatively taken as 0 in Virtis for general procedure shear design

Greetings,

I am wondering if there is a way to have Virtis take epsilon (net longitudinal tensile steel strain) as negative when computing shear resistance of prestressed sections using the General Procedure of AASHTO 5.8.3.4.2. It appears that Virtis is taking epsilon conservatively as zero when negative as allowed per 5.8.3.4.2. However, the beams were not designed this way and hence do not work when run in Virtis.

I know I could manually input all the tenth points with user defined betas and thetas under points of interest but I am trying to save this work since there is about 4 spans and 15 beams per span.

Thanks

Jacob Reneson, P.E./ S.E.

## Description

FROM: Mark Mlynarski DATE: 11/30/2012 11:26:43 AM Eastern Standard Time

When entering the user defined Vertical Shear Reinf on the 'Shear' tab of the 'Point of Interest' window, Virtis automatically calculates the area of Shear by multiplying by the number of legs as per the help (see attached document). When the value gets passed to the shear specification articles, however, it appears to multiply it again by the number of legs (see attached document). For shear areas coming from the POI window, Virtis should not multiply the Area value again by the number of legs.

When two legs are input on the Shear Reinforcement Definition window, the number of legs is multiply by the area of the bar and the correct value is passed to the shear articles (see attached document).

FROM: Herman Lee DATE: 11/30/2012 12:42:15 PM Eastern Standard Time

Srujana, if this is confirmed to be a bug, please see whether you are able to fix it for 6.4.1. Thanks.

FROM: Srujana Thogaru DATE: 12/3/2012 10:01:00 AM Eastern Standard Time

## Complete Issue Information

Error deleting record from database record set.

09:23:35 AM - Line 298 in source file DmLibVehicle.cpp.

State:23000,Native:547,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

State:01000,Native:3621,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

State:23000,Native:547,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

State:01000,Native:3621,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

The DELETE statement conflicted with the REFERENCE constraint "R\_1552". The conflict occurred in database "RATINGS", table "dbo.abw\_results\_ll\_action", column 'll\_vehicle\_id'. The statement has been terminated.

The DELETE statement conflicted with the REFERENCE constraint "R\_1552". The conflict occurred in database "RATINGS", table "dbo.abw\_results\_ll\_action", column 'll\_vehicle\_id'. The statement has been terminated.

FROM: Mehrdad Ordoobadi DATE: 12/4/2012 11:06:37 AM Eastern Standard Time

The detailed debug description of the error indicates (as you suspected) that there are analysis results saved for the truck that you are trying to delete.

In order to delete the truck you should first remove the analysis results that are saved to the database that reference the truck. Then you should be able to delete the truck.

FROM: Phil Litchfield DATE: 12/4/2012 6:09:58 PM Eastern Standard Time

How do you locate and delete analysis results for a specific truck?

FROM: Mehrdad Ordoobadi DATE: 12/14/2012 10:39:21 AM Eastern Standard Time

This cannot be done from inside Virtis/Opis.

You can ask someone who has access to your database to run a query like shown below to get a list of bridges that have analysis events and the vehicles that they reference.

```
SELECT DISTINCT ALV.name vehicle_name, ASMAE.bridge_id BID, AE.event_timestamp,
AE.event_id
FROM abw_spng_mbr_alt_events ASMAE
INNER JOIN abw_event_vehicle AEV ON ASMAE.event_id = AEV.event_id
INNER JOIN abw_event AE ON AEV.event_id = AE.event_id
INNER JOIN abw_lib_vehicle ALV ON AEV.vehicle_id = ALV.vehicle_id
WHERE ALV.library_type NOT IN (22901, 22903)
ORDER BY ALV.name, ASMAE.bridge_id
```

This will return a table like shown below:

| vehicle_name | BID | event_timestamp         | event_id |
|--------------|-----|-------------------------|----------|
| HS 20-44-2   | 1   | 2012-12-14 17:13:53.000 | 3482     |
| HS 20-44-2   | 10  | 2012-12-14 17:15:09.000 | 3483     |
| HS 20-44-2   | 10  | 2012-12-14 18:00:58.000 | 3485     |

You can go through the list looking for the truck name that you want to delete and find out which bridges (in the BID column) are referencing that vehicle.

Then you can select those bridges in the bridge explorer and then select Bridge/Manage Analysis Events in the menu and delete those analysis events with matching timestamps (Time Stamp matches event\_timestamp in the results from the SQL query).

FROM: Herman Lee DATE: 12/3/2012 10:07:24 AM Eastern Standard Time  
Rating Summary doesn't have this problem.

To reproduce the problem in the Spec Check Viewer:

1. Rate the culvert alternative with HS20 LFR analysis.
2. Open the Spec Check Viewer for the first and last segments in the culvert alternative.
3. The Spec Check results should be different for the the two segments.

### Description

Michigan DOT reported a problem deleting bridges in their database. After investigation the issue it was determined that the problem is happening for bridges that have large values stored in longitude and/or latitude field. Pontis application expects latitude and longitude values as DDDMMSS.ss where DD is the degree part, MM is the Minutes part, and SS.ss is the seconds part of the value for latitude and longitude.

FROM: Mehrdad Ordoobadi DATE: 12/4/2012 1:35:06 PM Eastern Standard Time

Cause:

When the Virtis application reads a value like 123456.78 from the latitude or longitude (numeric(8,2)) field database into the C++ code, it reads it into a float C++ data type as 123456.00 because a float has only six significant digits.

Previously there was another problem with reading and writing to latitude and longitude columns that Utah DOT reported that was caused by too much accuracy for the double precision value that is bound to the latitude or longitude. To fix that problem the data type for the bound fields were changed from double precision to float.

Resolution:

In order to fix this issue the values should be read from the database into Text C++ fields.

When the values for these fields are read from the database they are read as text then converted to double precision numbers that Virtis/Opis uses.

When the values for these fields are saved to the database the double precision numbers should be

4/19/2016 3:24:38 PM

Copy Bay To... Button and associated pop up open even when there are no diaphragms for source Bay

Under this scenario - Button should be disabled and so that bay selection dialog can't be opened.

This issue also applies to StringerGroupDefinition - Diaphragms Tab

**Description**

FROM: Dean Teal DATE: 12/12/2012 2:08:44 PM Eastern Standard Time  
In the attached structure, when doing a design review with the AASHTO Engine I will get a Spec Failure (6.10.3.3 Constructability Shear)

Web Shear Capacity Constructability Requirement:  
6.10.3.3 Constructability – Shear

The stiffened shear capacity is shown as inadequate (at locations where the final factored shear exceeds the shear-buckling capacity) during construction stages prior to making the deck composite.

The AASHTO Engine is incorrectly calculating the appropriate factored loads for use in Eq. 6.10.3.3-1. The shear-buckling resistance exceeds the factored components (essentially DC1)

The requirements of section 6.10.3.3 shall only be applied during the construction stages (prior to the hardening of the deck and composite action). The AASHTO Engine is incorrectly applying live loads

4/19/2016 3:24:39 PM

HRS AASHTO

3371

**Complete Issue Information**

applied to the non-composite section should be included in the factored loads. (when the tension-field resistance is disallowed per the commentary)

FROM: Krisha Kennelly DATE: 4/25/2013 11:53:41 AM Eastern Daylight Time  
Fixed for version 6.5.0. 6.10.3.3 is now only called in stage 1.

FROM: Subhadeep Ghosh DATE: 5/9/2013 1:12:09 PM Eastern Daylight Time

### Description

FROM: Jeff Ruby DATE: 12/12/2012 5:04:19 PM Eastern Standard Time

Shear stud problem. I entered the studs in by hand. When you import the bridge, open the "Deck Profile" for G2-1720, go to the "shear connectors" tab and hit apply. You will get the first "weird" error. I say, "yes fix it" to make V/O happy. But the screenshot shows the error I get when I try to run it.

FROM: Jim Duray DATE: 12/13/2012 10:40:30 AM Eastern Standard Time

If this is new to 6.4.1 (i.e. not in 6.4.0) we should fix now. If it also in 6.4 it can wait for the 6.5 release.

FROM: Jeff Ruby DATE: 12/13/2012 2:02:28 PM Eastern Standard Time

Actually, take a look at VI 10340. It says it was implemented in 6.4.0. This issue is related. Since 10340 was never "accepted" for 6.4.0, I don't know where this would "fit" in the big scheme of things. But I think it should be addressed soon.

FROM: Girish Bhanushali DATE: 2/7/2013 9:54:56 AM Eastern Standard Time

Good Morning Jeff,

Thank you very much for posting this issue.

We have resolved the issue (VI#12101) and fix has been added for testing in next version (6.5).

Errors that you encountered are resolved and design review successfully completes.

Our testing was done using the bridge that you have provided.

Based on our experience during the development of the fix, I would like to point out that while testing this you may need to use x64 bit build since the bridge is very long and you may encounter errors during the design review indicating insufficient memory while writing the spec checking results.

Kindly note that issue 10430 has been forked in to VI#11792, VI#11930.

- VI# 10430 has been resolved by implementing the enhancement in 6.4 release.
- VI# 11792 has been resolved and fix is added for testing in next release (6.5).
- VI# 11930 is planned to be resolved for next release (6.5).

Please let us know should you have any other questions or concerns.

Regards

FROM: Creightyn McMunn DATE: 12/18/2012 1:11:04 PM Eastern Standard Time  
We are receiving the attached error when running any of the girders in "Span 1 thru Span 6 (Girder 2 thru Girder 6)" of the attached email. We cannot figure out where the issue may be and it appears as though the sections are correct.

FROM: Bin Zhang DATE: 1/21/2013 9:33:00 AM Eastern Standard Time  
AASHTOWare verify that user has entered continuous adjacent parabolas in the Cross Section Ranges window. AASHTOWare compute the web depth at each range point entered by the user and compare the computed web depth to the user input depth.

For example, the table below showed the web depth differences between the user input numbers and the computed numbers.

| User Input Number (inch) | Computed Number Based on Parabolic Curve (inch) |
|--------------------------|-------------------------------------------------|
| 56.8750                  | 57.1433                                         |
| 46.7500                  | 47.03454                                        |
| 52.5625                  | 52.517                                          |

A tolerance was added when comparing the computed web depth to the user input depth. The system default tolerance was applied to serve as the tolerance here.

This fix will be available for version 6.5. The user will be able to use the system default tolerance to control this web depth verification.
