The prestress modeling method is set to "centerline of simple-span bearing," which affects the span lengths exported to BRASS. The bearings for interior supports are offset by 0.5 ft, which makes the lengths of spans one and two 64.5 ft and 74.0 ft, respectively. Therefore, there is a BRASS tenth point located at 138.5 ft. Incident 3141 has already been submitted to address the difference between the Virtis/Opis distances and the BRASS distances. Therefore, I am marking this incident as a duplicate.

### Description

FROM:smample DATE:Thursday, April 25, 2002 12:17:36 PM

I input values for the ASD factor: P/S Concrete Tension in the Member Alternative Description window. I find that the values are correctly included on the INVENTORY and OPERATING command lines in the BRASS data file. When I review the BRASS output, however, I do not see operating rating factors for this condition. Does BRASS perform P/S Concrete Tension calculations at operating levels? Also, when I review the OPERATING command in the BRASS help files, there are only 3 ultimate strength parameters and no allowable stress parameters listed.

I also reviewed the BWS Report and discovered that the value I entered in for the inventory P/S Concrete Tension parameter is reported for both the inventory and operating value in the report.

### Complete Issue Information

I have forwarded this issue to Dan Glandt for investigation.

FROM:bgoodrich DATE:Monday, May 13, 2002 3:25:43 PM

The syntax of the INVENTORY and OPERATING commands has changed. The current export of the OPERATING command does list some additional parameters (parameter 4, parameter 5, etc.) for prestress. However, these parameters are no longer used and will be removed in the near future.

FROM:bgoodrich DATE:Monday, May 13, 2002 3:27:05 PM

E-mail from Dan Glandt (5/13/02):

Only the first 3 parameters are valid for prestress on the operating command. According to the Manual for Condition Evaluation of Bridges only strength is used for operating and I have followed that.

FROM:kkennelly DATE:6/19/2002 9:58:31 AM

Brian, this incident is listed as resolved. Were any code changes required and if so what version of Virtis will they be in?

FROM:bgoodrich DATE:Monday, June 24, 2002 5:20:53 PM

I modified the LFD export (BrassStdFactors.cpp) to generate the OPERATING, POSTING, and SAFE-LOAD commands with only three parameters for P/S and R/C structures. Fixed for version released AFTER 4.2. The extra parameters on these commands were being ignored by BRASS, so this change will not affect any ratings.

### Description

FROM:bha DATE:Thursday, April 25, 2002 1:22:51 PM

The service pack 1 with new Brass engine 5.08.05 is good to calculate the shear strengths at default POI's (tenths points along span). But when we add user defined POI's, the calculated shear strengths at some points change that affect to the rating results.

Enclosed are two PS bridges: A-16-062 (deck beam) and O-06-041 (I beam).

\* Some different rating results from bridge A-16-062: Interior deck beam - Type A

- No user defined POI

\* Shear strengths at 1.0 \* L for bridge O-06-041: G8

- No user defined POI: Shear strength = 299.5 kips (Inventory) - Shear strength = 290.1 kips (Operating)

- With 2 user defined POI's at 26.75' and 0.45 \* L: Shear strength = 217.1 kips (Inventory) - Shear strength = 217.1 kips (Operating)

We have a lot of PS bridges to be rated by Virtis and waiting for a long time for the service pack 1, but it still exists the big flaw of shear category.

Please investigate and have the appropriate solutions as soon as possible.

FROM:bgoodrich DATE:Monday, April 29, 2002 12:06:05 PM

I performed a preliminary investigation and it appears there is something odd occurring in the engine. I have forwarded the BRASS data files to Dan Glandt for a detailed investigation.

FROM:bgoodrich DATE:Monday, June 24, 2002 5:34:08 PM

Dan Glandt has corrected this issue within the BRASS-GIRDER engine (Version 5.8.6). This engine will probably be included in the Virtis release following Virtis 4.2.

**Complete Issue Information**

I have also found some problems with the shear analysis. Many girders are being controlled by the shear due to a very low value of Vci. The correct equation is:  $V_{ci} = 0.6\sqrt{f''c}b'd + V_{dl} + V_{iMcr}/M_{max}$ . The only way that I can match the Brass output is to use  $V_{ci} = 0.6\sqrt{f''c}b'd + V_{dl} + V_i$ . Is this an issue that is addressed in Brass version 5.8.6?

FROM: bgoodrich DATE: Tuesday, August 13, 2002 1:20:10 PM  
Steve Mample's comments from July 25, 2002 are entered as a separate Incident (3826).

## Complete Issue Information

### Description

FROM:dteal DATE:Tuesday, April 30, 2002 9:34:39 AM

For the attached bridge, I am trying to delete "Grade 60-epoxy" from the Reinforcing Steel Materials list. I have deleted all references to this material and the program will not let me delete it. Can you figure why?

FROM:kkennelly DATE:5/1/2002 8:20:44 AM

The Grade 60-epoxy is showing up in the Points of Interest windows as the default shear reinforcement material. Even though you've chosen not to override the shear reinf at those points Virtis thinks the material is being used there and won't let you delete it. Everything on the shear tab should be blank if the override box is not checked (Stress Limit tab appears correctly).

FROM:dteal DATE:Wednesday, May 01, 2002 9:23:59 AM

I have deleted all User Defined POI's. I still can not delete the Grade 60-epoxy material? Updated bbd is attached.

The default shear reinforcement material in the POI window is something other than Grade 60-epoxy. You said this should be blank if the override schedule is not selected. I tried but I don't think you can blank this out when the Default Materials window is populated with something?? And I don't think you can change that to "blank" either??

The problem still remains, how do I delete the "Grade 60-epoxy"? The program seems to be not letting go of it?

FROM:kkennelly DATE:5/1/2002 11:07:11 AM

You can't blank out the reinf matl now but I fixed it for Version 4.2. What happens now is when you create a new point of interest, Virtis sets some POI defaults for you. One of the defaults is the reinf matl. Virtis looks at the reinf matl shown in the Mbr Alt Default Materials window and assigns that to the shear reinf in the POI window. That will no longer be done in Version 4.2. Do you have Grade 60-epoxy still set as the default steel reinf matl in the Mbr Alt Default Materials window? That would prevent you from deleting the material.

FROM:dteal DATE:Wednesday, May 01, 2002 11:11:17 AM

No, I checked again.

I sent an updated bbd with all User POI's deleted. I can't find anyplace that Grade 60-epoxy is used and I still can not delete it. What next?

FROM:kkennelly DATE:5/1/2002 1:29:43 PM

Members 3,4, and 5 are linked to members 1 and 2. If you unlink members 3,4, and 5 and open their Default Materials windows, you will see that they still have the grade 60-epoxy selected as the default stl reinf matl. Change the selection for the default stl reinf matl then re-link the members. You should now be able to delete the "Grade 60-epoxy" material.

When you link members in Virtis, we don't delete any of the data that was previously entered for the member so users can link and unlink without losing any of their data. We may need to enhance the message issued when the Delete material fails to give the user a better idea of where the material is being used. If you want the error message to tell you where the material is being used, please create a new incident for that so we can keep this incident for the bug that was fixed.

FROM:dteal DATE:Thursday, May 02, 2002 8:53:57 AM

When members are linked and a default material is entered in the "mother member" and later changed in the mother member, the child member default material never gets changed along with it.

Here is an example of this problem. I have a 5 girder system. 2 different concrete material where copied in from the library. Member #2 is completely defined and then #3 & 4 are linked to #2. The default material used in #2 is changed to the second choice during the design process. The engineer is now done with the design and deletes the first concrete material for clean up and eliminate confusion later but finds out that the first material can't be deleted because it is being used "someplace". The problem was found to be in the linked members. Once the members where linked, whatever the default material was when linked will remain even if the mother member got changed. The solution is to UNLINK the members, go into each member alternative, change the default material and then re-link the members.

I think that linked members (children) should follow changes 100% of what the mother member contains. I sent a lot of time trying to figure out why I could not delete a material that was no longer used or needed.

FROM:jduray DATE:5/6/02 8:50:52 AM

When two members are linked we simply use the properties of the "mother" when the children are referenced. We do not remove the properties of the children. We could add an option during the linking to remove the properties of the children. Otherwise, I don't think we should change the behavior.

**Description**

FROM:dteal DATE:Thursday, May 02, 2002 8:55:16 AM

When deleting materials (objects) you will run into this many times. "The attempt to delete this object has failed! This object is in use by another object in the Bridge Workspace. Remove all references to this object and try again."

Digging out all the object locations can be very frustrating. Can we add the locations of all the references to this object on this message? It would sure help.

FROM:jduray DATE:5/6/02 8:49:46 AM

This can be done but unfortunately it is not a trivial thing to do. I agree it would be very helpful.

### Description

FROM:dteal DATE:Thursday, May 02, 2002 2:12:55 PM

After a single span prestressed LRFD analysis go to the results graph. Select the "Concrete Stress – Rating Factors", it takes a very long time to populate the graph.

Now click the "x" to exit the window – this also takes forever.

I didn't see this slower operation in the previous versions, I think it has started with this version.

FROM:dteal DATE:Thursday, May 16, 2002 3:35:21 PM

I have had designers coming to me left and right complaining about the results graph. They all believed that the program had locked up. It didn't lock up, it was just that slow. Some of these guys are using 1.4 MHz PC's, they shouldn't be slow.

### Complete Issue Information

The first part of this is good (the concrete rating factors graph populates at a blazing speed)

The second part: clicking the "x" to exit the window takes a fair amount of time. Is this expected? Should it take this long?

If so, mark this as Accepted, if not, Assign it for fix'in

### Description

FROM: bgoodrich DATE: Tuesday, May 07, 2002 10:54:55 AM  
E-mail from Ken Teng (5/6/02):

I have a non-composite bridge (I do not input any shear connection data in the Deck Profile tab). From the BRASS output, it shows that the beam properties are all the same for construction stage 1, 2, and 3 which are correct because it is a non-composite bridge.

My question is why I got different rating results when I assigned my Railings to either DC1 (Non-composite, stage 1) or DC2 (Composite, stage 2) since the beam properties are all the same? Attached is the ddb file.

## Complete Issue Information

FROM:bgoodrich DATE:Tuesday, May 07, 2002 10:57:46 AM

You are getting different results for the condition you describe because the stage two distribution method is set to "Uniformly to all girders" (see the DL Distribution tab of the Superstructure Loads window), which is different from the "Tributary area" method set for stage one. For non-composite bridges in general, there should be no references to composite stages in the Load Case Description window.

FROM:bgoodrich DATE:Tuesday, May 07, 2002 10:58:45 AM

E-mail from Krisha (5/6/02):

I took a quick look at the attached email that Ken Teng sent to Dan and copied to me. It seems to be related to the export not BRASS. I think the difference in the ratings is due to the different ways the user has specified to distribute the stage 1 and stage 2 loads on the Superstructure Loads window. I've attached a version 4.1.1 bbd file of this bridge to this email. (Ken sent a version 4.1.0 bbd file with his email). Can you take a look at it and make sure the export is correctly generating the input file?

FROM:bgoodrich DATE:Tuesday, May 07, 2002 10:59:42 AM

Three e-mails from Ken Teng (5/6/02):

1. Thank you. Could you tell me what is different between those two loadings? The Barrier is continuous from beginning to end, so I guess that the loadings caused by barrier should be the same for my case. Please kindly let me know if I get the wrong direction.

2. Is it different because of tributary of the outer Girder/Beam?

3. I just found out that BRASS does not use this Barrier loads for inner (interior) Girder/beam of non-composite bridge. BRASS only applies those barrier loads on outer (exterior) Girder/Beam for non-composite bridge. Are those correct? Or is it a bug?

FROM:bgoodrich DATE:Tuesday, May 07, 2002 11:02:04 AM

For non-composite bridges (where there is only one stage of construction), all loads should be input in stage 1. The loads applied to each stage are distributed according to the dead load distribution method as specified by the user. Currently, there is no way to specify different distribution methods for loads applied in the same stage. Therefore, for your case, the slab and barriers are being applied using tributary area because that is the specified method. The barrier loads are located within the tributary width of the exterior girders, so the interior girders get no load from the barrier.

Also, the export is generating the BRASS commands based on the information supplied by the user. It is not making any assumptions in the case of dead load distribution. Likewise, BRASS is interpreting the input commands and not making any assumptions regarding dead load distribution. The user controls how all the loads within a stage are distributed. It would be better to be able to assign different distribution methods to each of the various loads in the same stage. This MAY be a future enhancement.

If you want the barrier (railing) to be uniformly distributed, there is a work-around. Set the railing load to zero. Then, determine the contribution of the railing load to each girder and input it on the Member Loads window.

FROM:bgoodrich DATE:Wednesday, May 08, 2002 12:24:51 PM

E-mail from Ken Teng (5/7/02):

4/19/2016 3:16:40 PM

HRS AASHTO

1260

### Complete Issue Information

I tried your suggestion #3 and set the railing to zero. Then, I input the railing on Member loads window. Guess what? I got all the same results no matter that I input DC1 (NON-COMPOSITE) or DC2 (COMPOSITE) to Member loads window. Besides, if I input the railing loads as composite loadings (stage 2), I also got the same results as those DC1 and DC2 have.

I'm kind of confusing. If I decide to distribute my railing to all beams, I can pick one of all three choices (DC1, DC2, or stage 2) for non-composite bridge. Do I follow your points? Let me know, please.

FROM: bgoodrich DATE: Wednesday, May 08, 2002 1:00:18 PM

I called Ken this morning and addressed his questions verbally. After our conversation, he had no further questions. This issue is resolved.

| 3729.11623 | Resolved      | Pontis Link              |

## Description

Louisiana out sources a large portion of the bridge rating work. The consultants utilize the Virtis software to perform the work. When a new version of Virtis comes out there are new idiosyncrasies that have to be figured out and compensated for or accepted. For example many consultants had structures that rated correctly in 4.0.4. Some of these structures did not rate the same in 4.1 without input manipulation. Other structures simply would not rate correctly in 4.1. In addition to investigating the above problems consultants also had to Re-burning CD's, Re-printing reports, etc. However they could not turn in work in 4.0.4 because 4.1 is not back compatible. We had several cases were consultants where at the end of two-year projects, then 4.1 was released creating lots unexpected extra work. The Virtis version update process creates lots of unforeseen extra work for these consultants therefore lots of extra expenditures and headaches for us. If we were able to accept work in 4.0.4 and import it into 4.1 much of this could be avoided. We are now beginning to have the same problem with 4.1 and 4.1.1. We foresee this as being a reoccurring problem.

To help resolve the problem we are requesting the following:

- 1) Develop a utility that can import .bbd files made in the previous release (previous few releases if possible but at least one release back).
- 2) Outline an upgrade schedule plan and do not deviate from it. This will allow us to plan for the inherent expenses involved with upgrading.
- 3) Improve the quality of upgrades prior to release to avoid introducing new errors or unexpected changes at every upgrade.

Any input or comments on this issue are welcome.

Thank you,  
William J. Metcalf Jr., E.I.T.  
Louisiana Department of Transportation and Development  
Bridge Rating Unit.  
ROM:snshah DATE:Thursday, May 09, 2002 4:37:08 PM

FROM:jduray DATE:5/14/02 11:20:40 AM

These are good suggestions...we will be addressing numnber 1 in a future release. Until then you can migrate the database to compatible versions prior to the bbd export/import.

The release schedule for major releases is announced usually a year in advance and is discussed at the user group meeting. For example, our next minor release is June 2002 (this release was not known at the User Group meeting) and our next major release is scheduled for Feb. 2003. I agree we can do a better job of informing the users of this schedule. Service Packs are not scheduled and are usually in response to problems in the software that must be fixed prior to a major release. Sometimes enhancements are included in Service Packs. We are working on posting our annual workplan on our web site so users are better informed of what is being worked on.

HRS AASHTO

1262

## Complete Issue Information

During the testing of 4.1.1 we developed a product validation feature. With this feature we can analyze hundreds or thousands of bridges and quickly compare the results for the current version with those from previous versions. We can then resolve the differences more efficiently. This feature is partially implemented in 4.1.1 but not available to users. We plan to further develop it and make it available to end users in 5.0 (Feb 2003 release). End users can then use the feature to evaluate the release (or service pack) prior to implementing it within the agency.

There are two enhancements in this incident:

- 1) Modify the export/import process to work for different versions
- 2) Product Validation

### Description

FROM:kkennelly DATE:6/4/2002 9:13:48 AM

Submitted on behalf of Richard Best via email:

>>> "Best, Richard M." <BESTRM@nt.dot.state.il.us> 06/03/02 03:37PM >>>

Hello Jim,

We are finding that on some composite I-beam bridges, that the VIRTIS rating actually improves if the deck slab reinforcement is left out of the model (deck slab profile). The attached bbd file illustrates this. The inventory rating factor for girder G2 with rebars specified in the deck is 0.966. The rating becomes 1.062 when the reinforcement tab is left blank. We are using version 4.1.1. Is this something that has already been reported? Is there a rule of thumb for modeling rebars for added composite strength?

FROM:kkennelly DATE:6/4/2002 9:20:18 AM

Incident 3354 had the same behavior as this incident.

FROM:bgoodrich DATE:Wednesday, June 05, 2002 12:22:17 PM

I generated BRASS-GIRDER data files with and without deck rebar. I forwarded the data files to Dan Glandt for further investigation.

FROM:bgoodrich DATE:Wednesday, June 12, 2002 1:17:43 PM

E-mail from Dan Glandt (6/12/02):

The shear depth changes from 40.82 to 38.04. The ratings are for the 110 which is over a support and handled as a plain reinforced section so the tool is used and the rebar affects the shear depth.

FROM:bgoodrich DATE:Friday, June 28, 2002 12:17:41 AM

Dan indicated that this issue is resolved based on his 6/12/02 comments.

After a default Analysis Settings Template has been selected there is no way to remove the default without deleting it, you can only select another one to be the default. There should be a 'None' selection. Right now you can only delete the template or select another one as the default.

FROM:jduray DATE:6/20/02 4:01:37 PM  
Email from Brian:

Is there any way to make references to the AASHTO specifications consistent? The on-line help states AASHTO 16th edition w/2000 interims, the LFD factors window says 16th edition w/1997 interims. I

4/19/2016 3:16:42 PM

HRS AASHTO

1270

## Complete Issue Information

know nothing has changed with the factors but it is confusing to users when trying to determine what spec to follow. Also, the BRASS output file states the following:

AASHTO SPECIFICATIONS:

THE ULTIMATE STRENGTH ANALYSIS (LFD) PORTIONS OF BRASS-GIRDER ARE CURRENT WITH THE AASHTO SPECIFICATIONS FOR HIGHWAY BRIDGES, SIXTEENTH EDITION - 1996, WITH INTERIMS. NO RECENT MAINTENANCE HAS BEEN PERFORMED ON THE WORKING STRESS SECTIONS OF THE CODE. WORKING STRESS RESISTANCE AND RATINGS WERE HELD AT THE AASHTO 1983 SPECIFICATIONS WITH INTERIMS THRU 1989. THIS IS A MANAGEMENT DECISION TO FOCUS LIMITED RESOURCES ON LFD METHODS.

What interims are being referenced in the output file???

The references to the ASD spec are also different.

From the on-line help:

AASHTO Specification

The Ultimate Strength Analysis (LFD) portions of BRASS-GIRDER\* is current with the AASHTO Specifications for Highway Bridges, Sixteenth Edition, 1996, with 1997, 1998, 1999, and 2000 Interims. For steel girders, the omnibus steel specification changes have been incorporated. It is anticipated that the omnibus steel girder design specifications will be available from AASHTO in 2001. The steel girder splice component of BRASS-GIRDER is current with the AASHTO Standard Specifications with 1997 and 1998 Interims. There were numerous changes for splice analysis in the 1999 Interims and these changes have not been incorporated. No recent maintenance has been performed on the Working Stress sections of the code. Working Stress resistance and ratings were held at the AASHTO 1992 Specifications with 1993 Interims. This is a management decision made in order to focus limited resources on LFD methods.

FROM:kkennelly DATE:6/24/2002 8:16:57 AM

We can update the LFD and LRFD library factors delivered with Virtis to the current specs for Virtis/Opis Version 5.0. The remainder of the incident pertains to the BRASS engines. Brian, please assign back to me when you are done so I can update the library factors in Version 5.0.

FROM:bgoodrich DATE:Monday, June 24, 2002 9:58:40 AM

I have forwarded the BRASS issues to Dan Glandt.

FROM:bgoodrich DATE:Tuesday, October 22, 2002 6:14:17 PM

Krishna, it's been months since I forwarded this issue to WYDOT and I'm not sure where they are with approving this issue. Please assign this back to me when you are finished with the library factors. In the mean time, I will find out what is being done on the BRASS side.

FROM:kkennelly DATE:1/24/2003 3:13:49 PM

Jim is going to ask the Task Force next week how they want the factors to appear in the library

FROM:kkennelly DATE:2/24/2003 9:45:00 AM

Task Force said to add Factors for current interim to Virits/Opis library.

### Description

FROM:mhasan DATE:Friday, July 05, 2002 1:14:21 PM

Structure F-10-D failed to perform a rating due to 'Stirrup-Schedule command' error(s). I have used Virtis/Opis 4.1.0 to model this 2-span prestressed girder structure. Structure F-17-IE, a 3-span Prestressed girder bridge - modeled using version 4.0.4, has rated okay without the 'Stirrup-Schedule error(s).

For both structures, I have used the PS2-3 span spread box example in your Support Center as a guide.

FROM:kkennelly DATE:7/8/2002 8:50:43 AM

I imported F10D into Virtis 4.1.0 and I am able to rate with no errors.

4/19/2016 3:16:43 PM

HRS AASHTO

1276

## Complete Issue Information

I imported F17IE and I get the following types of errors when I try to rate:

Member G2:

Preparing Load Case: Haunch load

WARNING (Medium):

The time of load application was not specified! This may affect the P/S losses computed using the PCI method.

ERROR - Unable to compute span where load is applied!

ERROR - Error preparing concentrated load for BRASS commands!

ERROR - Unable to get adjusted distance of load (P/S beams)!

On your Structure Definition window, the span lengths entered add up to 167.6773'. On your windows for the Deck Profile and Haunch Profile you have entered the lengths of these ranges as 167.680'. I think you may have a problem with the tolerances you are using. You should be consistent with the number of decimal places when entering lengths into Virtis. For example, if your structure definition length is 167.6773' on the Structure Definition window you should enter all lengths meant to represent the entire structure length as 167.6773' not 167.68'.

You can specify the tolerances you want to use in Virtis and the export to the BRASS files. Open the Configuration Browser and select System Defaults from the tree, then click the Tolerances tab. Here you can specify tolerances for Virtis and the export to BRASS to use when comparing if two lengths or two locations are the same. This tab has a Help topic to further explain the use of tolerances in Virtis. The tolerances set in the System Defaults window apply only to your pc. These tolerances are not saved with individual bridges nor are they exported when you create a bbd file. It is possible that the tolerances on your pc have changed from when you rated this structure in 4.0.

Please let me know if adjusting your tolerances does not solve your problem. If it does not, let me know what the tolerances on your pc are so I can try to reproduce the errors you get with F10D.

### Description

FROM:mordoobadi DATE:7/10/2002 9:34:08 AM

After Revert is selected in the BWS menu the Save button in the toolbar and also the Save menu item should be disabled if bridge has not been saved since BWS was opened for the bridge.

One more issue is that the bridge\_id (Bridge Tree Item) does not refresh in the BWS tree after the revert.

### Description

FROM:kobeidat DATE:Thursday, August 01, 2002 1:25:22 PM

The input of shear studs should be continuous over the pier otherwise OPIS will consider the section non-composite. For the same shear studs spacings you might get composite or noncomposite section over the pier depending on the way the stud spacing has been input.

### Description

FROM:dteal DATE:Monday, August 12, 2002 12:12:58 PM

When uninstalling Virtis Opis 4.1.1 from my laptop that has an XP operating system the shortcut on the desktop did not get removed.

FROM:jihnat DATE:8/12/2002 1:19:20 PM

Had you changed the text of the shortcut?

FROM:dteal DATE:Monday, August 12, 2002 3:38:00 PM

I may have renamed it to 4.1.1 so I knew what version it was?? Being the version is no longer changed with service patches.

FROM:jihnat DATE:8/15/2002 2:28:24 PM

The uninstaller will not uninstall things (e.g. shortcuts, files, etc.) that have been modified after installation.

**Description**

FROM:kkennelly DATE:8/12/2002 3:10:00 PM  
Submitted on behalf of Jeff Smith via email:

1. For interface shear transfer, although the spec check indicates the design passes, the detailed description window shows that in some locations it fails. (Example1.bbd)

FROM:kkennelly DATE:8/12/2002 3:12:24 PM  
Run BRASS LRFD, open Spec Check window. Stage 3 Span1 - 60' Strength I is an example of this behavior.

FROM:kkennelly DATE:8/12/2002 3:17:46 PM

### Complete Issue Information

FROM:bgoodrich DATE:Friday, August 16, 2002 4:59:29 PM

Mike Watters approved correcting this issue within the BRASS-GIRDER(LRFD) engine. His e-mail follows (8/16/02):

"...it sounds like an issue regarding passing values to Opis. In which case, go ahead and make the correction under the Opis Incident Number and not under a BRASS Problem Log number."

FROM:bgoodrich DATE:Friday, August 16, 2002 5:21:49 PM

I have modified the BRASS-GIRDER(LRFD) 1.5.2 engine, so the interface shear transfer specification check is assigned a pass or fail result code instead of being categorized as a computation. Fixed for Opis 5.0.

|                                                                                            |

Submitted on behalf of Jeff Smith via email:

2. Also for interface shear transfer, even though the boxes to indicate that the vertical shear steel extends into the deck are checked, the detailed description windows shows the area of steel, Avf, is zero. (Example1.bbd and Example2.bbd)

FROM:bgoodrich DATE:Friday, August 16, 2002 5:25:32 PM  
I have modified the export (BrassStirrupScheduleGroupCmd.cpp) to correctly determine the % Stirrup Area for Horizontal Shear parameter for BRASS-GIRDER(LRFD). The BRASS export file, BrassStifTranScheduleGroupCmd.cpp, contained similar logic, so I modified it as well. Fixed for Opis 5.0 and any patch after Opis 4.2.

mstudt@state.mt.us

Would like the capability to easily find and modify errors and failures that prohibit analysis or rating results. ie: If an effective flange width is omitted in the input, no output is generated. The time to find this missed input is significant.

**Solutions:**

1. See the BRASS-PIER error generator – double click to correct the error and jump to that input screen.
2. The BWS tree could highlight (red) the branch that was missing the information. Validation loop might be a spot to catch this export level.

### Description

FROM:kkennelly DATE:9/9/2002 8:59:13 AM  
Submitted on behalf of Richard Best via email:

The attached file is for a 3 span PPC I-beam made continuous for live load. Our LFD analysis was coming up with a rating of 0.0 with Ultimate Strength Shear controlling @ the 98.1% of Span2. We noticed that if we change our system default tolerance from 0.108 ft to 0.01 ft that it runs and gives a decent rating. Perhaps you can explain why this happens. In comment I would like to add that juggling system tolerances is very tricky. We can get it to work for some bridges and then other bridges that were previously rated will no longer work. Is there a way to specify the tolerances at the bridge level so as not affect the entire database? If not then perhaps an enhancement is needed.

FROM:kkennelly DATE:9/9/2002 9:13:42 AM

I ran the attached file using both tolerances specified by Richard in his email and I see that different Stirrup-Schedule commands are generated based on the tolerances. When the tolerance is set to 0.01', two Stirrup-Schedule commands are generated with a stirrup spacing of 0.5906". These commands were not generated when the tolerance was 0.108'(1.296") which is the expected behavior for the tolerances since 0.5906" < 1.296". But I can't figure out where the export gets the 0.5906" stirrup spacing, I think it is related to the prestressed modeling method and this area being between the CL of simple supports.

FROM:bgoodrich DATE:Saturday, January 25, 2003 5:07:34 PM

The P/S modeling method is set to centerline of simple span bearing. The 0.5906" stirrup spacing is computed because there is a stirrup located at 240mm to the right of the left end of span 3. Because the overhang length at the left end of span 3 is 225mm, the stirrup spacing is 15mm (0.5906").

FROM:bgoodrich DATE:Monday, January 27, 2003 6:42:45 PM

I attached the BBD files for Version 5.0 Beta 3 current and final. I modified a section of code that places stirrups in sequential order for determining the spacing exported to BRASS. This block used the user-defined tolerance, which prevented the locations from being put in sequential order. The export is fixed for Version 5.0 Beta 4.

Krishna - Please respond to the question regarding tolerances at the bridge level?

Please note that BRASS was modified to require deck rebar over the interior supports. This structure

4/19/2016 3:16:47 PM

HRS AASHTO

1298

## Complete Issue Information

must therefore be modified to run in the version of BRASS released with Virtis 5.0.

FROM:kkennelly DATE:2/10/2003 10:19:09 AM

There is currently not a way to set tolerances at the bridge level instead of the database level. An enhancement request should be submitted if this feature is desired.

## Description

FROM:rmbest DATE:Thursday, September 12, 2002 4:36:03 PM

One of the most frequent complaints from our users is that it is not easy to verify or document the computations from a VIRTIS analysis for a critical point. The Brass output files are bloated with repetitive and sometimes extraneous information and the specifics for a critical point are dispersed throughout hundreds of pages of output. The Brass output files are too verbose and the report writer doesn't give enough information about capacity and code checks. We would like to see the report writer

| 3889.11466 | Resolved      | Uable to verify database schema! |

### Description

FROM:pjensen DATE:Tuesday, September 17, 2002 6:42:07 PM  
I was trying to input diaphams into a bridge using the wizard. the structure is on a skew of 35°. when i put in the start offset and the spacing, it dose not compute the correct number for the muti span structure. attached is the bbd and it is atlt "xxx".

FROM:kkennelly DATE:2/24/2003 1:26:44 PM  
Looks like the Wizard was adding an extra perpendicular diaphragm at the end of span 1 and 2. This diaphragm's left mbr distance = end of span 1 length and right mbr distance was in span 2. Code fixed so that wizard now checks to make sure the left and right distances of a diaphragm are in the same span.

Fixed for Version 5.0, Beta 6.

### Description

FROM:gcolgrove DATE:Monday, September 30, 2002 11:35:18 AM

I am getting an error that says, "Unable to verify database schema! Please contact database administrator." when logging onto Virtis/opis with any username other than Bridgewater. I am able to log on using Bridgewater. I am also able to log on and successfully test the Oracle database. This is a clean install.

FROM:mordoobadi DATE:9/30/2002 4:36:42 PM

What kind of database are you using? Oracle? Sybase? MSDE?

FROM:jduray DATE:Wednesday, October 02, 2002 5:58:37 AM

FROM:gcolgrove DATE:Monday, October 21, 2002 9:30:19 AM

We reinstalled the usernames and it worked. The answer was Oracle.

### Description

FROM:kkennelly DATE:10/18/2002 9:59:16 AM  
Submitted on behalf of Ed Lutgen, MNDOT via email:

I have two bridge alternatives that are identical except one has a point of interest at 1.5'. The one without poi rates 0.921 ultimate shear at 52.26'. The other one with the poi rates .568 ultimate shear at 52.26'. This seems very puzzling to me. Why would a bridge rate nearly in half at the same point if you have virtis analyze another point? Is it the way it handles d or h at the abutment?

FROM:kkennelly DATE:10/18/2002 10:23:33 AM  
I attached a version 4.2 bbd file to this incident (pointofinterest 4\_2.bbd). Member in question is B2.

We get this error everytime we open a bridge from Opis/Virtis

File error while writting data.  
09:26:39 AM - Line 819 in source file D:\Virtis\data management\abmbche\DmBridgeCache.cpp.  
File exception!  
Error reading file [C:\Program Files\AASHTO BridgeWare\VirtisOpis41\Bridgeld\_3\_revert.bak]!  
The file could not be accessed.

**Complete Issue Information**

We are also having problems saving bridges that were modified

FROM:mordoobadi DATE:10/21/2002 1:13:06 PM

It is probably because of low free disk space. Please update this incident with the information about your free disk space on drive C:.

FROM:bmccaffrey DATE:Monday, November 04, 2002 3:31:48 PM

We used to get that message also in NY. It only started to happen when we went to Windows 2000 and installed Virtis/Opis on the C: drive. Users do not have priveleges to write to the C: drive here so we have to install the system on our D: drives (or whatever drive is set up for file use).

FROM:gcolgrove DATE:Wednesday, December 31, 2003 11:43:01 AM

This was the problem. Sice the IT people have opened the C drive and all has become well.

Thanks!  
George

| 3959.11396 | Closed        | Add structure types that can be imported from BARS to help |

## Description

FROM:bgoodrich DATE:Wednesday, October 30, 2002 11:22:45 AM

Entered based on phone conversation with Mac Hasan:

There is no documentation in the help for how (or even if) the diaphragm weight is applied to the structure. The Dead Loads topic in the help should be updated to include diaphragm weight.

FROM:bgoodrich DATE:Wednesday, October 30, 2002 11:22:45 AM

The diaphragm weight is divided between the supporting girders and applied as a concentrated load to the BRASS model.

FROM:kkennelly DATE:12/10/2002 3:11:36 PM

Resolved in the Virtis help for Version 5.0. Brian, you might want to add what BRASS does to the BRASSEngineHelp.

FROM:bgoodrich DATE:Friday, January 24, 2003 5:30:03 PM

I updated the engine helps for BRASS-GIRDER and BRASS-GIRDER(LRFD) accordingly. Fixed for Version 5.0 Beta 4.

### Description

FROM:dteal DATE:Thursday, November 07, 2002 3:12:17 PM

We have run into another bridge that the Administrator can not delete from the Deleted Bridges folder. We had this problem some time back (Incident #2823). At that time we solved it by using the "Microsoft ODBC for Oracle" driver. I tried that with this one and it did not work. Below is the error message I received.

Unable to delete bridge!

01:42:40 PM - Line 2979 in source file D:\Virtis\gui\abgdtop\UiDescDtopGridView.cpp.

Delete process failed while deleting CDmLrfdLs (SaveOrder object 127).

01:42:33 PM - Line 396 in source file D:\Virtis\data management\abmbche\DmBridgeCache.cpp.

Error deleting record from database record set.

01:42:33 PM - Line 917 in source file D:\Virtis\data management\abmbrdg\DmLrfdLs.cpp.

State:S1000,Native:2292,Origin:[Oracle][ODBC Oracle Driver][Oracle OCI]

ORA-02292: integrity constraint (VIRTIS.R\_2265) violated - child record found.

FROM:mordoobadi DATE:11/26/2002 8:42:13 AM

We should add to the function CDoBridgeManager::DeleteBridge(long IBridgeld) code to delete the analysis events before attempting to delete the bridge.

**Description**

FROM:dteal DATE:Friday, November 08, 2002 10:15:19 AM  
On the member Alt description we enter the end bearing locations, left & right. This will find the end of the beam in relation to the centerline of bearing. So now we have described the span length and the beam length. Two pair of abutment stiffeners have been added with one pair some distance from centerline of bearing on each side. This was done in the bearing stiffener location window using a pos.

4/19/2016 3:16:51 PM

HRS AASHTO

**Complete Issue Information**

and a neg. distance. When viewing the schematics profile for a steel beam, the beam is not displayed past the end of the centerline of bearing (span length). So the very outside abutment bearing stiffener will appear to be displayed past (not on) the end of the beam.

The beam should be displayed in it's entirety to the end of the beam and not just to the centerline of bearing. The way it is done right now makes the user think they have made a mistake by seeing the bearing stiffener hanging out there not attached to anything.

View the schematic for the wizard alternative of member 2 for an example (attached)

**Description**

FROM:kkennelly DATE:11/22/2002 3:53:46 PM  
User sent me attached bridge questioning moments from BRASS. I answered his question ok but while playing around with some input changes I noticed the following effects on the dead load moments produced by BRASS. Girder G7 has 2 member alts.

Member alt G07 has following:  
hinge data input in Virtis is as follows:  
Hinge at 5.32291' to the right of Support 2 ( = 7.1% into Span 2)  
Hinge at 5.33' to left of Support 2 which equates to 65.86' into Span 3 ( = 92.5% into Span 3)

point of interest data input in Virtis is as follows:  
a. 5.5432' into Span 2 ( = 7.4% into Span 2)

4/19/2016 3:16:53 PM

HRS AASHTO

1322

### Complete Issue Information

BRASS produces output for this point calling it Point No. 2.074 in the BRASS output.

b. 65.86' into Span 3 (=92.5% into Span 3)

BRASS produces output for this point calling it Point No. 3.925 in the BRASS output.

The following BRASS output was obtained for the Stage 1 dead load near hinges:

#### ACTIONS AND DISPLACEMENTS FOR GIRDER WEIGHT

| Point  | Moment                                                           |
|--------|------------------------------------------------------------------|
| 2.000R | -28.3                                                            |
| 2.074  | 1.1 Hinge is to just left of here, moment = zero like it should. |
| 2.100  | 10.4                                                             |

| Point  | Moment                                           |
|--------|--------------------------------------------------|
| 3.9000 | 7.4                                              |
| 3.925  | 0.0 Hinge is here, moment = zero like it should. |
| 3.100L | -24.7                                            |

That all looks ok but I noticed the following when I copied the member alt to G07 with POI to very left of hinge:

I added a poi at span 2 5.32', right and get the following moments from BRASS:

| Point  | Moment                               |
|--------|--------------------------------------|
| 2.000R | -99.1                                |
| 2.071  | -64.9 Hinge is to very right of here |
| 2.074  | -63.6                                |

| 3.100L | -25.7                                            |

The \*.dat files produced by the export are identical except for the additional POINT OF INTEREST and INTERMEDIATE OUTPUT commands.

FROM:bgoodrich DATE:Friday, January 24, 2003 6:03:11 PM

I suspect BRASS is replacing the hinge node with a point of interest node because they are so close together and the POI is located left of the hinge. BRASS should retain the hinge node above POI.

FROM:bgoodrich DATE:Tuesday, January 28, 2003 11:35:52 AM

WYDOT has assigned this issue to BRASS Problem Log 395.

FROM:bgoodrich DATE:Friday, January 31, 2003 1:03:33 PM

This issue has been addressed in BRASS-GIRDER 5.8.6, which will be released with Virtis 5.0. The DLL will be forwarded soon.

### Description

FROM:jduray DATE:11/27/02 12:12:30 PM

Paul Jensen called to report that Virits has problems running if the user has a secured account. The temporary and output files that BRASS creates and the report definitions cannot be written to directories where the exe's are stored because XP default security sets those directories to read-execute.

FROM:hlee DATE:7/14/2005 12:51:19 PM

Duplicate of Incident 648.

1325

**Complete Issue Information**

duplicate dll files.

FROM:jduray DATE:12/6/02 1:37:19 PM

I confirmed that this also occurred with 4.1. I suspect it has been there since 2.0. I think it is loading the dll the second time to get tlb info that is in the dll.

FROM:mordoobadi DATE:12/9/2002 10:18:26 AM

The following are my findings about this issue:

- (1) When an Object is loaded into memory the corresponding DLL is loaded twice and the two instances of the DLL stay in memory as long as the object is in memory.
- (2) After the object is freed one instance of the DLL is removed from memory and the other stays in memory until the system calls DllCanUnloadNow function inside the Dll. The DllCanUnloadNow is called from OnIdle function. If there are no other objects allocated inside the DLL the DLL can unload.
- (3) The two instances of the DLL are different. One is the actual DLL and the other one is smaller and is marked with an MM.
- (4) The instance of the DLL that unloads first is the one that is marked with MM. It probably contains information about objects that are allocated inside that DLL.
- (5) When a window with an ABxEdit control is opened the behavior is the same as the domain DLLs. Two instances of ABxEdit.ocx get loaded into memory. Then when the window is closed one gets unloaded and the other one stays in memory until the OnIdle function determines that ABxEdit.ocx is not needed.
- (6) One exception is the ABeData.dll. I only see one instance of the DLL loaded.

We concluded that this is the normal behavior and there is nothing to worry about.

### Description

FROM:mordoobadi DATE:12/20/2002 5:16:45 PM

The problem was reported first by Alabama DOT.

After they migrated from version 4.1.1 to 4.2.0 they were not able to see some 150 bridges that they used to see in 4.1.1.

We finally figured, it was because those 150 bridges were marked Design Bridges. The product that they use is VIRTIS only.

4/19/2016 3:16:54 PM

HRS AASHTO

1329

**Complete Issue Information**

We should have had the Design check box disabled in VIRTIS only product versions 4.1.1 and below (this is a bug).

There is a check in the program that prohibits viewing of Virtis only bridges in OPIS or Opis only bridges in VIRTIS. This check has caused the problem.

FROM:jduray DATE:2/4/03 12:27:08 PM  
Is this resolved?

FROM:mordoobadi DATE:2/26/2003 9:12:00 AM  
We discussed the issue in a meeting. We decided to add a technical note for this issue on the web site.

FROM:jduray DATE:3/10/03 9:05:53 AM  
Did we add the note? Can we close this incident?

**Description**

FROM:rpierce DATE:Thursday, December 26, 2002 4:01:40 PM

Prestressed Girder Shear Analysis codes. Currently, Virtis uses the 1980 Shear analysis engine. The 1979 method is used in Arizona. Brass girder can perform the 1979 method. The 1979 method can not be accessed from virtis. It would good if the system defaults could be changed to use the 1979 method.

### Description

FROM:kkennelly DATE:1/6/2003 1:49:53 PM

Should be able to select span length cells in Computed Span Length grid so user can see all of the numbers behind the decimal. Keep read only.

FROM:kkennelly DATE:1/8/2003 10:51:10 AM

This grid is behaving like our current grids with ranges. For example, in the Deck Concrete grid, the End Distance is read only and is displayed showing 2 #'s past the decimal place. User could have entered a start distance and length with up to 6 #'s past the decimal place but user doesn't get to see that in the End Distance cell. This could be frustrating when dealing with tolerances and precision. Would be nice to have cells read only but selectable so you could see more significant digits.

We should find a way to allow this in all of our current grids and then this new grid we added for 5.0 will work better.

FROM:jihnat DATE:2/6/2003 3:49:10 PM

Removing the .SetEnabled(FALSE) call for this column will give this behavior.

Be aware, however, that "selectable" means that cell will be a tab stop.

In the GUI, we've always tabbed over the readonly cells. Not sure what the ramifications will be by making this a wholesale change.

FROM:jduray DATE:2/7/03 8:57:23 AM

We need to test all grids that are getting this new behavior. Charge to maintenance.

FROM:kkennelly DATE:2/10/2003 8:25:14 AM

I removed the .SetEnabled(False) for the column on the Stringer Group Definition Geometry window.

FROM:jduray DATE:2/19/03 9:01:13 AM

This is going to require too much testing to do for this release. Change to Suspended and do for future release when we have time to properly test.

FROM:hlee DATE:7/10/2006 8:50:01 AM

Changed Project to Support Center.

**Description**

FROM:dteal DATE:Monday, January 13, 2003 4:23:19 PM

When I change the fonts from normal to extra large not all fonts get changed. The window header and the left side of the explorer window change to the larger font. The active GUI window doesn't change size (ever). This is OK with me, but I don't think it is supposed to work that way.

| 4219.13126 | Closed        | error trying to save a GENERIC APPURTENANCE |

### Description

FROM:kkennelly DATE:1/14/2003 12:11:16 PM

Submitted on behalf of Elizabeth Balcha, Bayside Engineering via phone and email:

Attached bridge, structure Spans 2-4, member G5. Span 1, 83.5' allowable shear computed by BRASS ASD doesn't match allowable computed by hand.

FROM:kkennelly DATE:1/14/2003 12:14:45 PM

1. The user has specified a point of interest at 83.5', right. The section properties I see in the BRASS output for the 5 tenths point of span 1 are actually for the section to the left of point 83.5'.

2. If I change the point of interest to the left of 83.5', I get the same section properties as when the poi was to the right of 83.5'. My hand calcs show the following should be the allowable shear stress to the left of the poi at 83.5'.

AASHTO 10.34.4.2

$$k = 5 + 5/(do/D)^2 = 5 + 5/(62.6/102)^2 = 18.275$$

$$7500*\sqrt{k}/\sqrt{Fy} = 7500*\sqrt{18.275}/(\sqrt{36000}) = 169$$

4/19/2016 3:16:56 PM

HRS AASHTO

1339

### Complete Issue Information

select the "No point of interest data will be generated" option on that window in order for BRASS LFD to use the data entered on the Point of Interest windows. If you select "No point of interest data will be generated" as the POI Control, you must enter all of the information on the Point of Interest windows. The export will not generate any data from other windows for items left blank on the Point of Interest windows."

So to use this work around you will need to:

1. Change the POI control option on the Member Alternative Description: Engine (BRASS ASD) to the 0 option (No point of interest data will be generated).
2. Create a point of interest at the points you want rated. (Your bridge is currently being rated for only 3 points of interest so the amount of work to use the work around for this member may not be a significant amount.)
3. At each point of interest, specify the stiffener spacing, lateral support, etc. data on each of the tabs of the Point of Interest window. Be sure to select "Account for combined shear and bending" on the ASD tab.

Integrity constraint violation: Index 'XAK1abw\_conc\_railing' for table 'abw\_conc\_railing' would not be unique

I HAD THE NAME 'NEW' FOR A MEDIAN APPURT AND USED THE SAME NAME FOR THE GENERIC. I CHANGED THE NAME FOR THE MEDIAN TO NEW1 AND THEN SAVED OK.

FROM:kkennelly DATE:1/14/2003 2:05:54 PM  
In the database, the parapets, medians and generic appurtenances are stored in the same table. I think that is the correct behavior you should get except you are able to save 2 concrete materials with the same name. Any ideas Mehrdad?

FROM:mordoobadi DATE:1/16/2003 8:21:09 AM  
The problem is the name. It should be unique among all of the appurtenances for a bridge. We have an alternate key on the bridge\_id and name.  
For bridge materials and shapes unlike library items we do not have any restrictions on uniqueness of the name. This was a requirement.

Maybe for bridge appurtenance windows when the user hits apply or OK we should check for uniqueness of names before applying the changes to the domain. By doing this we can avoid the error. Which could be confusing to the users.

FROM:mordoobadi DATE:1/30/2003 11:55:46 AM  
Code added to Appurtenance windows to validate the uniqueness of the name before Apply or OK.

FROM:gbarnhill DATE:Tuesday, February 18, 2003 3:36:14 PM  
In 5.0.0 beta 4 - PARAPET, MEDIAN and GENERIC check for duplicate names, but RAIL does not. I see by the discussion above, that RAILS are apparently not in the same situation as the others. Is that what's intended ??

4/19/2016 3:16:57 PM

HRS AASHTO

1343

**Complete Issue Information**

In the help for the Structure Framing Pan:Frame Connections, what is meant by Column Top Depth and Bottom Depth as shown below from the help file.

**Top Depth**

Enter the column depth at the top of the column. The depth is measured parallel to the structure definition reference line.

**Bottom Depth**

Enter the column depth at the bottom of the column. The depth is measured parallel to the structure definition reference line.

FROM:kkennelly DATE:2/10/2003 10:01:20 AM

The terms "Depth" and "Width" are used to describe the cross section properties of the column. If you look at the cross section of a rectangle it has a height and a width. We use the term "depth" instead of height to describe the column cross section because we thought it would be confusing for users to see "height" since the column we are describing also has a height. The structure definition reference line runs along the length of the structure (in the direction of traffic) and we use it as reference to determine which direction is the depth and which is the width.

### Description

FROM:rmullins DATE:Tuesday, January 14, 2003 4:47:31 PM

When placing shear reinf., if the spacing is incorrectly input such that the total length is greater than the beam length, then the left column goes to "0". At that point the summation of length is disconnected from the previous input.

FROM:jduray DATE:1/16/03 3:23:18 PM

Krishna - is this a new problem or has this been there in previous releases?

FROM:kkennelly DATE:1/16/2003 4:15:48 PM

FROM:kkennelly DATE:1/16/2003 4:16:50 PM

Randall showed me this problem. He said it was in previous versions also.

FROM:kkennelly DATE:1/16/2003 4:21:03 PM

I tested this in 4.2 and it was a bug then so I've changed the Project and version for this incident.

FROM:jduray DATE:4/12/2005 3:06:54 PM

Do not allow saving if stirrups are off the beam.

FROM:jduray DATE:4/12/2005 3:16:45 PM

Also fix other ranges similar to stirrups (stiffeners, diaphragms, floor systems, shear connectors).

FROM:jduray DATE:4/13/2005 3:30:07 PM

When the changed cell loses focus do not ripple the change if any item ends up off the beam. We will

**Description**

FROM:dteal DATE:Wednesday, January 15, 2003 10:16:08 AM

On PCITrainingBridge6 I changed the Structural thickness of the deck on the deck profile window to 20" and left the Total thickness on the Structural Typ. Section Deck (Cont) tab at 8". Validate gave no warnings, passed on to BRASS for analysis and ran to completion without any errors. Should it have done this or should it done a reality check first?

FROM:jduray DATE:1/22/03 9:53:32 AM

Add a check to the validation to warn the user if the structural thk is greater than the total thk.

FROM:kkennelly DATE:1/23/2003 2:52:04 PM

Other than verifying that there are no gaps or overlaps in things like flange ranges or deck ranges, etc. we don't do any reality checks anywhere in Virtis.

FROM:hlee DATE:4/30/2008 2:31:15 PM

### Description

FROM:bgoodrich DATE:Friday, January 17, 2003 5:49:58 PM  
E-mail from Timothy Laurence:

Sir,

Attached is the bridge file. The Design Load is an H-15. After my brief phone conversation with you this morning, I did think of another question, so...

My questions are:

1) After analyzing the bridge and selecting a Member Alternative, I view the charts. I select to

4/19/2016 3:16:58 PM

HRS AASHTO

1350

## Complete Issue Information

Deflection-Live Load-Non composite-H15 44-Axle-Positive. And this gives me a deflection close to what was actually measured and hand calculated. However, my question is about the Critical (LFD) max & min deflections under Inventory and Operating. Where do these values come from?

2) The load rating of the bridge is very close to what is calculated, 9.94 for Inv and 16.6 for Opr. However, it says that the limiting state is the Ultimate Shear Capacity not Moment like calculated. In the hand calculations, the shear reinforcing does not come in the equations for determining Load Ratings, so why is this the limiting state?

Thanks for your help.

Timothy Lawrence, EI

FROM:bgoodrich DATE:Friday, January 17, 2003 5:52:18 PM  
Timothy,

I have reviewed your bridge and the analysis results.

Issue 1: The max & min deflections under Inventory and Operating represent the sum of the dead and live load deflections from all stages of construction, which are multiplied by the appropriate inventory or operating beta and gamma factors. For inventory, these factors would be  $1.3 * 1.0$  for dead and  $1.3 * 1.67$  for live. This is why the inventory deflections are higher than the live load deflections.

Issue 2: If you wish for shear to be ignored in the rating, you need to check the "Ignore shear" checkbox (lower right corner of window) for LFD on each Member Alternative Description window (Description tab). This will allow flexure to control the rating. However, when I did this the flexure ratings increased quite a bit. This issue may require some more investigation if you do not agree with the flexure ratings.

Regards,

Brian L. Goodrich  
BridgeTech, Inc.

FROM:bgoodrich DATE:Friday, January 17, 2003 5:56:53 PM  
E-mail from Timothy Lawrence:

I have another question about Virtis that I was hoping you can give me a quick answer for.

Percent effective, can this be changed or is it automatically 100%? The numbers that I am outputting are consistent with 100% effectiveness for the concrete structure. Does Pontis export data concerning this to Virtis? I know Pontis generates a sufficiency percentage based on NBI inspection data. Any help on this would be great.

FROM:bgoodrich DATE:Friday, January 17, 2003 5:57:07 PM

The percent of concrete area effective for shear can be set, but it must be done for each point of interest under the member alternative level in the tree. Note that Pontis does not export this analysis

4/19/2016 3:16:58 PM

HRS AASHTO

1351

## Complete Issue Information

information to Virtis. If you want BRASS to consider the percent effective value, there are items that you need to modify in Virtis. For each point of interest, all the shear override fields must be completed. Any stirrup schedule you may have entered will not be used by BRASS. To get the point of interest overrides to take effect, you will need to change the engine properties in the member alternative window. For the BRASS LFD engine, set the POI Control drop-down to option 0, which means that no point of interest data will be generated from the stirrup schedules, i.e., it will all come from the point of interest overrides. Note that we are working to address the override issue.

Submitted on behalf of Ming Teng via email:

I got two questions (please see attached file). The first one is why the beam span length and flange transitions are different in the schematics? And second one is how could I remove the welds in the stiffener tab (I knew that it is "Not used by BRASS LFD")? Detailed pictures are shown in the attached file. Thank you very much.

Regards,

Ken Teng

### Description

FROM:dteal DATE:Monday, February 03, 2003 8:30:01 AM

How do you delete a User from the Users List? I have a User that has left. So in doing clean up I checked in all the bridges he had check out (3 bridges). Then I when to the all users list as the Administrator, highlighted the user name and selected delete for the pull down. The User name disappeared. I closed the Config Browser window and then reopened it, the user reappeared? I unchecked the users name from so he has no "check-out authorizations". User still reappears?

FROM:dkoenig DATE:Monday, February 03, 2003 12:31:24 PM

We have had this exact same problem in Missouri. I talked our IS people about several months back. I don't know that they ever talked with anyone about it at Michael Baker.

FROM:jduray DATE:2/4/03 12:16:19 PM

Mehrdad - please look at this resolve for beta 5.

FROM:jduray DATE:2/4/03 12:22:45 PM

I think this is the same as 3300.

FROM:mordoobadi DATE:2/19/2003 12:17:16 PM

The following is implemented:

Rules for deleting users:

- (1) A user cannot be deleted if he/she has events.
- (2) If a user owns private folders, those folders should be deleted before attempting to delete the user.
- (3) If a user has authorizations to check-out bridges, those authorizations should be revoked before attempting to delete the user.
- (4) A user is not allowed to delete himself/herself.
- (5) User Deletion Process
  - 5-a) Is user trying to delete himself/herself? If YES: Issue Error.
  - 5-b) Does user have any corresponding events? If YES: Issue Error. Recommend deactivating the user.
  - 5-c) Does user own private folders? If YES: Delete the folders.
  - 5-d) Is User authorized to check-out any bridges? If YES: Revoke authorizations
  - 5-e) Delete the user.

**Complete Issue Information**

FROM:dteal DATE:Friday, May 02, 2003 10:15:11 AM

I have a user that has retired – I have reviewed the “Rules for Deleting a User” – I am unable to delete this user because the user has events in the database. The error message suggested to deactivate the user instead of deleting him. Being this user has retired, are you telling me he is in our database forever??

How can I remove events in the database??

FROM:dteal DATE:Monday, May 05, 2003 2:14:33 PM

What are "events"? A search in the Help Topics turned up nothing?

FROM:mordoobadi DATE:5/23/2003 9:15:10 AM

Yes the user would stay in your database.  
The events record the changes made to bridges in your database.

One solution is to change the ID of the user in the event table to point to some other user. In order to do that you need to write SQL commands.

(1) SELECT person\_id, username FROM abw\_person;

PERSON\_ID USERNAME

-----

|   |               |                                         |
|---|---------------|-----------------------------------------|
| 2 | BridgeWare50s |                                         |
| 3 | VirtisUser    |                                         |
| 4 | VirtisMgr     |                                         |
| 5 | VirtisAdmin   |                                         |
| 6 | OpisUser      | <----- Transfer the events to this user |
| 7 | Virtis        |                                         |
| 8 | JohnSmith     | <----- retired user                     |

- (2) find the person\_id for the retired user from the results of step 1. (Here it's JohnSmith --> 8)
- (3) find the person\_id for the user that you want events be transfered to (suppose OpisUser here --> 6)
- (4) Write an SQL statement to transfer the events from RetiredUser to OpisUser.  
Like this:  
UPDATE abw\_event SET entered\_by = 6 WHERE entered\_by = 8;
- (5) COMMIT;
- (6) Start Virtis/Opis and delete the user.

If you are concerned about transferring the user events to some other user. You can create a new user account for all retired users and make it inactive then transfer the events of your currently retired user and all others who retire in the future to this retired users account. you do not need to add a database login for the retired users account.

FROM:dteal DATE:Friday, May 23, 2003 10:07:09 AM

FROM:mordoobadi DATE:5/23/2003 1:22:43 PM

I created incident 4618 to do this in the BridgeWareAdmin utility program.

### Description

FROM:pjensen DATE:Tuesday, February 04, 2003 6:36:50 PM

Reading TN008 on upgrade, the information is not consistent with the information that Sybase is publishing. The intent of the upgrade utility is for updating the JDK of the database. This utility will allow the opening of the database in some third party products (V/O being one of them). To properly upgrade the database for 7.x.x RDBMSs, the user will need to use the unload/reload utility. This will insure the security and file format is properly updated. The use of this utility is documented in the admin guide.

I found out the hard way that this was an issue when I was creating the combined P/V/O database and need to use Sybase Central. The database would not open until I ran the unload/reload utility on the database. I also confirmed when I followed the tech note procedure and the DB utility made me upgrade thier way before I could use it.

FYI

1363

**Complete Issue Information**

TN008 includes instructions on upgrading Sybase 5.5 to 8.0 not 7.0. I tried it. It works without any problems. I was able to open the upgraded database in Sybase Central (ASA 8.0). Paul If you have versions of ASA other than 8.0 you have to uninstall them and then install 8.0 as instructed in TN008. If you have more than one version of ASA (say 5.5 and 8.0), when you issue dbupgrad the system might execute the dbupgrad of the wrong version (SQL Anywhere 5.5). and the version of the DB file would stay unchanged.

Here is the description of DBUPGRAD in ASA help:

The dbupgrad command-line utility upgrades a database created with earlier versions of the software to enable features from the current version of the software. The earliest version that can be upgraded is Watcom SQL 3.2. While later versions of the database server do run against databases were created with earlier releases of the software, some of the features introduced since the version that created the database are unavailable unless the database is upgraded.

FROM:pjensen DATE:Monday, February 10, 2003 2:14:52 PM

If this is the case, when I opened the file in Sybase Central, the program asks me to upgrade by unload/load. It references the fact that it is still a 5.5 databse and not all of the fuctionality is available and it disconnects me from the database. The only way I was able to get into Central and admin the db was to use the unload/load utility.

FROM:mordoobadi DATE:2/13/2003 3:15:46 PM

Paul, do you have different versions of Sybase SQL Anywhere on your PC?

### Description

FROM:dteal DATE:Thursday, February 06, 2003 10:39:16 AM

Version 4.2.0 and 5.0 beta 3

If you enter a large number for Recent ADTT it will return a negative number. Not when you "Apply" or "OK" but you will only see it if you OK the screen and then open the screen back up again.

If you enter 32767 it will be ok.

If you enter 32768 it returns -32768.

If you enter 32769 it returns -32767.

If you enter 32770 it returns -32766 and so on.

We have well over 600 entered in Virtis. Many of these structures may have negative numbers in the ADTT field. When this is fixed, how will the existing structures in the database be fixed? Will the migration script for the database take care of this?

FROM:jduray DATE:2/6/03 11:31:04 AM

We need to determine if the data type in the database and C++ code is short or long. If it is a short then the true value is lost.

FROM:jihnat DATE:2/6/2003 11:41:29 AM

This is a short.

We should have -32768/32767 or 0/32767 (or something) for the min/max in the data dictionary (for all of our "short" items).

FROM:jduray DATE:2/7/03 8:39:56 AM

What is a reasonable limit for this value?

FROM:dteal DATE:Friday, February 07, 2003 8:46:46 AM

The answer to that question depends on how Incident #4322 is answered (ADT or ADTT)

FROM:kkennelly DATE:2/7/2003 4:15:25 PM

This value can be any number, it should be a long.

FROM:dteal DATE:Tuesday, March 28, 2006 3:24:47 PM

Accepted 5.4 beta 7

Issue ID: 4322

Subject: Recent ADTT and Percent Trucks

**Description**

FROM:dteal DATE:Thursday, February 06, 2003 10:40:02 AM

Is there an error here? The GUI calls for ADTT (avg daily truck traffic) and right below it ask for Truck PCT (truck percentage value used to compute the ADTT).

From the help it states:  
Recent ADTT

4/19/2016 3:17:01 PM

HRS AASHTO

1366

## Complete Issue Information

Enter a recent value for the average daily truck traffic (ADTT) in one direction on the bridge.

Truck PCT

Enter the truck percentage value used to compute the ADTT.

Shouldn't the GUI have Recent ADT and not ADTT?

And shouldn't the help state "average daily traffic (ADT)" instead of truck traffic. As it is the Truck PCT doesn't make sense.

One should be the Avg Daily Traffic (ADT) and the other should be the truck percentage used to compute the ADTT.

FROM:kkennelly DATE:2/7/2003 4:23:41 PM

Virtis and Opis have had the ADTT on the Bridge Description window since either version 2.0 or 2.1.

For Version 4.2 we added the truck percentage to this window based on the requirements for the integration with Pontis database. In reviewing the Bridgeware Integration document, it appears we may have missed including the ADT from Pontis on this window.

I think we should keep the ADTT since users may already have data entered. We should probably also add the ADT to this window and then the truck percentage could be used to compute the ADTT for the user.

However, I am not totally convinced that the pontis roadway.adtttotal we mention in the Bridgeware integration document can really be used to compute the ADTT since ADTT should be in one direction, from the name of the "roadway.adtttotal" I'm not sure it is one way (See incident 3836)

FROM:jduray DATE:4/12/2005 4:25:12 PM

Change the label to read: "Design ADTT"...note in the release notes. We have been using this value in the export to BRASS as the Design ADTT. BRASS uses this for fatigue.

FROM:sboukamp DATE:7/11/2005 3:15:38 PM

During LRFR Factor implementation the following was decided:

- new tab Traffic on Bridge window -> with input for TruckPCT, ADT, Directional PCT, Recent ADTT and Design ADTT

(-> this change removes the input for Recent ADTT and Truck PCT from Bridge Descr. tab)

- Truck PCT and ADT come from Pontis (if bridge is associated with Pontis).

- Recent ADTT can be computed for user = TruckPCT\*ADT\*DirectionalPCT

- Design ADTT is what we previously called Recent ADTT on Bridge Descr. tab.

Resolved for 5.4 Release

FROM:kkennelly DATE:7/27/2005 9:51:25 AM

I think we need a script for 5.4 to move the previously entered Recent ADTT to the Design ADTT field. Verify with Jim.

FROM:mordoobadi DATE:4/11/2006 3:10:01 PM

SQL scripts added to the Migration Scripts to move the recent adtt to design adtt. (5.4 Beta 8)

FROM:jihnath DATE:4/12/2006 11:09:06 AM

Sample bridges also should be using Design ADTT instead of Recent ADTT.

FROM:mordoobadi DATE:4/12/2006 1:17:24 PM

4/19/2016 3:17:01 PM

HRS AASHTO

1367

**Complete Issue Information**

Sample bridges updated.

FROM:dteal DATE:Wednesday, April 19, 2006 2:47:46 PM

Not sure if I understand what is supposed to happen here with the migration.

In 5.3.1 I have Recent ADTT as 20000

After migration to 5.4 beta 8 we have Recent ADTT as 0 and Design ADTT as 20000.

Why is recent ADTT set to zero with the migration? In 5.3.1 we don't have any of the ADT or the Directional PCT to arrive at the value for Recent ADTT , therefore this value will always be zero after the migration. Is this the way we want this to work?

FROM:dteal DATE:Monday, February 26, 2007 11:42:21 AM

In light of the changes that have been made to the "Traffic" tab I think we can close this incident, as Accepted.

two other incidents have been added (VI #7672 & 7673)

## Complete Issue Information

I have been trying to insert into the database PS-Tbeam desing. The units for this bridge is SI. When I have been trying to save the data to the database, V/O crashes. This happens for all of the of the typical section tabs. The workaround currently is to change the units to US and save. In addition, the strand layout screens are experiancing the same problem.

Additional to the program crashing, the schematic diagrams are not drawing correctly.

I have attached a BBD with the data to this point.

FROM:pjensen DATE:Thursday, February 06, 2003 11:03:59 AM  
BTW I tried this on both ASA 8.0.2 and Oracle 8.1.7.3 with Windows 2Ksp2.

FROM:mordoobadi DATE:2/6/2003 2:08:11 PM  
Paul, I do not understand. Could you please write down the steps I should take to duplicate the crash? Here is what I did:  
I imported the BBD file and saved. Bridge's system of unit was SI and structure def's system of units was US. Then I opened the bridge and changed structure system of units to SI and saved. No crash.

FROM:pjensen DATE:Friday, February 07, 2003 10:47:24 AM  
add a new record in the median tab using SI then save- I get a crash

FROM:mordoobadi DATE:2/11/2003 3:30:11 PM  
I was able to reproduce it.  
Krisha, the crash happens in the domain when validating.

Here is the code fragment at line 11411 of file DoGirderMbrAlt.cpp that causes the crash

```
for(int i = 1; i <= iNumSpans; i++)
{
    // Each span can have a different beam assigned to it.
    bDeckInc = FALSE;
    DoSpanPtr = DoPsPrecastTeeBeamDefPtr->GetSpan(i);
    dSpanEndDistance += pdArraySpanLengths[i-1];

    LPDISPATCH lpShapeDisp;
    lpShapeDisp = DoSpanPtr->GetPsShapeDef();           <----- Crash here
    IDoPsTeeShapePtr DoPsTeeShapePtr;
    ....
}
```

Before the crash the program ASSERTs at lline 11360

```
if(DoSupportDetailsSetPtr->MoveFirst())
{
    short iCount = 0;
    short iNumSupports = DoSupportDetailsSetPtr->GetCount();

    ASSERT(iNumSupports == iNumSpans + 1);           < ----- Asserts
    ....
}
```

4/19/2016 3:17:01 PM

HRS AASHTO

1369

**Complete Issue Information**

could you please investigate this.

FROM:kkennelly DATE:2/12/2003 10:16:49 AM

I can reproduce this problem in 4.2 for our steel training bridge 1. Open Structure Typical Section window, open Parapet tab, change units to SI, OK to close window. Save bridge. Open the G1 member window and see that it now has an extra span it.

Crash is new to 5.0 and that is fixed. Still working on why extra span added.

FROM:kkennelly DATE:2/12/2003 10:21:57 AM

FROM:kkennelly DATE:2/12/2003 11:25:42 AM  
Structure Typical Section fixed for Version 5, Beta 5.

I think the problem you experienced in the Strand Layout window was due to the geometry of the members being messed up by the actions on the Structure Typical Section window. I could reproduce a crash after saving after the Strand Layout window before I made the changes to the Structure Typ Section but I can't reproduce it after fixing the Structure Typical Section window. So I think the Strand Layout window issue is also resolved.

| 4345.13000 | Rejected by TAG | PS Beam Properties - Inconsistency between Help and what we compute for user |

### Description

FROM:dteal DATE:Friday, February 07, 2003 10:36:08 AM

In the attached bbd – highlight the Superstructure Definition “Design MEF” and select validate from the toolbar. You will get 1 error message on shear studs overlapping. Close the validate window and do it again, now you will get 3 error messages for overlapping shear studs. Shouldn't it give 3 error messages each time?

FROM:jihnata DATE:7/1/2005 2:44:52 PM

For future testing, I've attached a 5.3.0 version of the BBD file.

Fixed for version 5.4.0

(Not sure why you feel it should always be 3 error messages. How about zero?)

FROM:dteal DATE:Tuesday, March 28, 2006 4:31:38 PM

| 4349.12996 | Closed        | PS Beam Shapes St Venant torsional constant |

### Description

FROM:kkennelly DATE:2/10/2003 2:05:26 PM

PS Beam Propertis tab - For Half Depth Area for Pos. flex and Half Depth area for neg. flex the help says "Enter the area of longitudinal mild steel in the flexural tension side of the beam in the negative moment region. The flexural tension side of the beam is taken as one-half the overall depth of the beam." This would correspond to  $A_s$  in equation 5.8.3.4.2-1 in the AASHTO specs.

But when you use the compute button on the window we compute the half depth area of the concrete beam which corresponds to  $A_c$  in equation 5.8.3.4.2-3.

FROM:jduray DATE:Thursday, February 13, 2003 11:24:13 AM

FROM:jduray DATE:4/12/2005 4:37:34 PM

Check what the PennDOT programs and the spec need for this. Change accordingly. BRASS is not using this value.

**Complete Issue Information**

The process requires that the person that exchanged the data out is the one that exchanges the data back in. If the user as admin or manger privilege, that user should be able to bring back ANY exchange data. If this is not the case, the data admin will need to change the REPOSITORY by hand and risk limbo data.

Here is the resolution:

We add a feature to Virtis/Opis for user's with certain privileges (Administrators) to be able to impersonate another users. By doing this those users would be able to check-in a bridge that is checked-out by another user. They can also complete the exchange of a bridge that another user originated.

FROM:jduray DATE:12/2/2005 11:46:45 AM

This should be an option for the privilege that enables checkout for a user. It should function for both checked out bridges and bridges checked out for exchange. The current capability in the admin utility is too drastic plus it is desired the feature be implemented in Virtis.Opis.

FROM:jduray DATE:12/2/2005 3:24:22 PM

**Description**

FROM:dteal DATE:Friday, February 14, 2003 3:33:31 PM

When you "Save the Analysis Events" is there any way to save them locally? Or do they always get saved to the database? I wouldn't mind if a user filled up his own drive with saved data, but we can't have him filling up the database.

FROM:jduray DATE:2/18/03 10:14:05 AM

They always get saved to the db.

FROM:dteal DATE:Thursday, February 20, 2003 9:37:47 AM

Would it be feasible to consider this enhancement. Capability to save an analysis to your local drive instead of the database. We just can't give users the ability to save to the database – the size would become uncontrollable.

### Description

FROM:gbarnhill DATE:Thursday, February 20, 2003 5:32:57 PM

If I can use knee braces to indicate brace points for a "through" gfs, why can't I have them in a "deck" gfs.

For a non-composite member, I think it's normal to place a gusset type brace from the top of the floorbeam to the main girder web.

FROM:jduray DATE:2/21/03 10:35:51 AM

Can you provide a sketch of the knee brace for the deck gfs?

FROM:jduray DATE:2/21/03 11:35:22 AM

Need to be able to indicate where floorbeams provide lateral support for the girder. Perhaps on the Floorbeam Member Locations dialog.

FROM:jduray DATE:2/21/03 11:37:09 AM

Also may need a way to indicate points of lateral bracing for the floorbeams.

FROM:kkennelly DATE:3/7/2003 11:07:19 AM

Jim discussed proposed changes to Floorbeam Member Locations window in attached pdf for users to

## Complete Issue Information

### Description

FROM:dteal DATE:Friday, February 21, 2003 2:16:09 PM

In PS concrete beam design how are the values for "de" and "c" derived. I don't think the "de" that BRASS uses includes the slab like it should and I can't figure out where "c" comes from.

This question became important when looking at how many times the spec checker fails in ductility, over and under reinforced.

FROM:bgoodrich DATE:Friday, February 28, 2003 4:51:44 PM

WYDOT has assigned this issue to BRASS Problem Log 410. Incident 4316 will also be included in this problem log as it pertains to the same specification article.

FROM:bgoodrich DATE:Tuesday, October 21, 2003 6:30:40 PM

WYDOT authorized this issue on 10/16/03.

The "c" value is determined as outlined in the flexural resistance calculations (5.7.3.2). The "de" value is calculated as outlined in the maximum reinforcement calculations (5.7.3.3.1). BRASS performs the maximum reinforcement calculations for each stage. I wonder if you were looking at the non-composite stage when you suggest that the slab thickness is not considered. Please forward the appropriate BBD file, the name of the member alternative in question, and the POI you are reviewing. Note that Incident 4316 pertains to addressing possible problems in determining the area of prestress, which may be the same reason you are receiving fails for the maximum reinforcement checks.

FROM:dteal DATE:Thursday, October 23, 2003 10:27:28 AM

The problem has been resolved. Refer to VI #3633: Can only use one rebar yield stress for the entire structure. We use one rebar yield stress for mild rebar in the slab and also use a much higher yield stress for the rebar that we can continuity steel. (To simulate extended strands). I have discovered that this doesn't work.

FROM:bgoodrich DATE:Thursday, October 23, 2003 12:48:23 PM

Dean indicated the incident has been resolved, so I am setting the stated to closed.

### Description

FROM:kkennelly DATE:2/25/2003 9:22:11 AM

The Compute button on the Deck Profile window does not correctly compute the effective flange width for PS I Beams with wide top flanges.

As per AASHTO 9.8.3.3, the third criteria for the effective flange width is (3) one-half the clear distance on each side of the effective web width plus the effective web width.

The compute button is currently evaluating criteria (3) simply using the 1/2 the beam spacing.

FROM:kkennelly DATE:2/25/2003 9:57:16 AM

Fixed for Version 5.0, beta 6.

**Complete Issue Information**

lanes in 18 ft roadway

**Description**

FROM:dteal DATE:Thursday, February 27, 2003 3:31:18 PM

When entering data for a rolled beam we as a rule enter Transverse Intermediate Stiffeners to be used as connector plates. Pairs on the interior girders and singles on exterior girders. On a rolled beam these are NOT intermediate stiffeners but only frame connector plates. The LRFD spec check is going to check them as intermediate stiffeners and fail them on the exterior girder line do to a low moment of inertia value. You can ignore the RED Fails on the Spec Check but it would be much cleaner if they never appeared. A rolled beam is going to fail in moment long before any shear needs to be checked.

If you leave the connector plates off the input data and run an analysis everything will work just fine. But now the structure is missing the size of the plates used for the connections. Somebody down the road will have to dig the plans out to look up this info.

The best solution would have been to call them stiffeners for welded plates and connector plates for rolled beams. And then use the Spec Check accordingly.

FROM:dteal DATE:Friday, February 28, 2003 8:29:02 AM

Don't you think there should be a check to see if Intermediate Stiffeners are needed first, if not needed why check them? Or, if using a rolled beam consider them as connector plates and not stiffeneres.

FROM:jduray DATE:2/28/03 9:17:33 AM

Perhaps there should be a check box on the stiffener ranges window to indicate the connnection plates should be ignored?

FROM:dteal DATE:Friday, February 28, 2003 1:48:09 PM

### Description

FROM:gbarnhill DATE:Sunday, March 02, 2003 7:39:46 PM

I appears the compute buttons cut off at 24 ft for 2 lane distribution factor calcs.

Per the Std spec 3.6.3, 20 to 24 ft should have two equal lanes.

Per the MANUAL FOR CONDITION EVALUATION OF BRIDGES 6.7.2.2, this should be further reduced to 18 ft.

FROM:jduray DATE:Monday, March 03, 2003 8:01:41 AM

We are working on this. Krishna prepared a description of what we have been doing for this and what you are proposing for the TF to review.

FROM:kkennelly DATE:3/7/2003 11:18:33 AM

Jim discussed with Ken and they decided to add a user preference to let the user pick if they want to follow AASHTO Std Spec 3.6.3 or the Manual for Condition Evaluation of Bridges 6.7.2.2. Won't be done for Version 5.0 initial release though.

FROM:gbarnhill DATE:Friday, March 07, 2003 12:34:04 PM

I agree with adding the Preference settings.

FROM:hlee DATE:6/11/2003 10:07:00 AM

In 5.0.1.

FROM:gbarnhill DATE:Monday, June 23, 2003 5:56:02 PM

5.0.1-beta-OK for Girder Systems

See Inc 4654 for Gird-FB-Str systems.

FROM:hlee DATE:7/10/2006 10:02:23 AM

Changed Project from Beta Testing/GUI/Bridge Workspace to Support Center.

## Complete Issue Information

I am writing to obtain a clarification on some of the results from a Virtis run used for a bridge rating. This bridge is two span continuous with 7 beams. All beams are symmetrical with respect to the support pier at the middle of the bridge with minor variation to the transverse stiffeners spacing on both sides of the pier. Engineering considerations lead to the selection of girders No. G2 and G7 for rating. The rating was performed at all the section transition points and at the 0.375 and the 0.75 of the spans.

Since the beams are symmetrical and the truck is run in both directions the rating of symmetrical points of interest are expected to be similar. For the ASD rating, all the symmetrical points of interest had similar ratings as expected. For the LFD rating, all the symmetrical points of interests got similar rating except for the two symmetrical points corresponding to the 0.75 of span 1 and 0.25 of span 2. The rating for these two points were considerably different and were controlled by shear stress for span 1 and flexural stress for span 2.

After examining the output files from the runs of these two points for girder G2, it became apparent that for the point of 0.75 of span 1 the controlling inventory R.F. (4.7482) was from the strength rating of shear under combined shear and bending interaction. For the point of 0.25 of span 2 the controlling inventory R.F. (6.5498) was from the strength rating of flexure without interaction of shear and bending. It was also observed that for the 0.75 of span 1 point "negative action" was considered when calculating the strength rating of shear under combined shear and bending. This resulted in the selection of the negative shear from the LL shear envelop (-48.67 kips) to be considered with the concurrent LL moment. When calculating the strength rating of shear under combined shear and bending for the 0.25 point of span 2, the "negative action" was also considered which again resulted in the selection of the negative shear from the LL shear envelop (-8.51 kips) to be combined with the concurrent LL moment. Obviously the absolute values of shears used for the rating of the two points are significantly different which may account for the fact that shear controlled for the first point but not for the second. The reason for considering "negative action" for the shear rating under combined shear and moment for both points is not fully understood.

As mentioned earlier, due to the symmetry of the beams and the fact that the truck is run in both directions, one would expect the rating of these two symmetrical points to be similar. Could you please clarify the reason for the difference of ratings for these two symmetrical points?

Thanks

**Complete Issue Information**

Summary of e-mail from Dan Glandt:

At this time, BRASS does not carry dual cross section properties to handle moment reversal for composite structures, which is on the list of BRASS enhancements. A work around that will show the symmetry is to run the analysis twice. Once with a Section Type code of 4 for both the 1.75 and the 2.25 and another with a code of 5 for both the 1.75 and the 2.25. This will also show that for moment, code 4 is more critical. 4.36 vs 7.0 for strength and 5.34 vs 7.30 for service. However, these values should not control the rating of the bridge.

The Section Type codes can be controlled from Virtis by adjusting contraflexure locations on the member alternative engine properties. The contraflexure locations are used to generate the STEEL-GIRDER-CONTROL command, which includes the Section Type code. Code 4 indicates a region where dead load moment is positive, while a code 5 indicates a region where dead load moment is negative. The BRASS export generates the Section Type code accordingly for the regions left, right, and in between contraflexure locations.

This issue has been suspended for now.

| 4465.12880 | Suspended     | BWS Tree - nails after deck window |

### Description

FROM:bha DATE:Thursday, March 06, 2003 1:38:28 PM

Bridge Section - MassHighway mostly use New England Bulb Tee not AASHTO-PCI Bulb Tee for bridge construction, the shapes of NEBT are different than AASHTO-PCI Bulb Tee so we are not able to use Dimensions tab to input the dimensions in order to be used by BRASS LFD engine for computing the section properties precisely. (The difference of section properties computed by BRASS LFD based on the dimensions entered on the Dimensions tab and the accurate computing methods are significant)

Because the BRASS LFD does not use any of the section properties entered on this tab, so we do not know how to solve the problems. I suggest we may use the input (by user) on the Properties tab to be used for analysis.

Enclosed is the NEBT drawing and the section properties (AutoCad drawing).

Please respond to this problem as soon as possible. Thank you

FROM:kkennelly DATE:3/6/2003 3:43:19 PM

The request to use the data on the Properties tab in Virtis has been made before and unfortunately I don't think it is going to be implemented any time soon. Maybe the following will help in the meantime.

The standard drawing for NEBT 1000 shows the following values

Area                      lx                      yb

## Description

FROM:kkennelly DATE:3/13/2003 11:29:16 AM

Submitted on behalf of David Koenig, Missouri DOT via email. David responded to an email I sent him in response to incident 4310. That incident was his db had appurtenances in it that had NULL for the appurtenance id. Following is part of his email:

For your benefit, we have had one previous problem with getting invalid data in our database. The other incident involved getting an invalid timestamp on structures. We traced this problem to a specific computer. We ended up updating some drivers on this machine to fix the problem. The timestamp issue was an Oracle problem.

Another thing that we have noticed on occasions is that data that has been selected in some windows will disappear. We have not reported this, but it may be related to the above problems. The main example of this happening has been on the windows where you put the plate sizes in for plate girders. It has happened in other situations, but I can't remember which windows they were. This problem only occasionally shows up. What happens is that a previously selected material for a plate will get blanked out. When you save, the program flags the error. If you go back to that window, the material that had been selected and saved will show as a blank. To get rid

4/19/2016 3:17:08 PM

HRS AASHTO

1394

**Complete Issue Information**

of the problem, we have to delete the plates and reenter them. This is something that has showed up in the last six months or so. I think the appurtenance window may have been one of the other areas where this was happening, but I am not one hundred percent sure on this.

Also, I was wondering if there would be some way to scan our database for invalid data. It may be that there is other data out there that we just have not found at this point. Doing this might offer some clues as to what is causing the incident problem as well as the other one mentioned above.

### Description

FROM:jparisian DATE:Wednesday, March 19, 2003 11:17:55 AM

I recently started to use VIRTIS for the first time and am running into some difficulty. I work for a consultant to the NYSDOT. They have an oracle database where they keep all VIRTIS data. We, as consultants, are required to choose our own database and then just export the .bbd files to send to the NYSDOT. My problem is that I've installed the MSDE for a stand alone workstation. Now when I initially log in, I'm not sure as to what SQL server I should be rating our bridges on. I'm not allowed to log onto a local server as any user. I can log on as an administrator, Virtis/virtis (Username/Password) to the other 2 choices but I'm not sure what the difference is between the Virtis42 or the Virtis42s SQL. Should I be creating a new database that will show up in the list of system DSN's with Virtis42 & Virtis42s to start rating our own NY bridges? If not then which DSN, Virtis42 or Virtis42s, should our NY bridges be rated in?

FROM:mordoobadi DATE:3/21/2003 11:10:55 AM

The difference between Virtis42 (Production database) and Virtis42s (Sample Database) is not much. Virtis42 has the same bridges as Virtis42s. But the bridges in Virtis42 are marked as template bridges. That means you can copy them and modify them so that they match the bridge description that you want.

You can pick either one of the databases to save your bridges in. Most of the people use the production database [Virtis42) to enter bridge information and use the sample database for testing.

Submitted via email:

I have experienced several problems with the program. I am like to know if the problems are because is a demo or not.

1. Unable to save agency vehicles or temporary vehicles. Vehicles are erased once I exit the program.
2. When using pre-stressed girder line system or girder system, once I

4/19/2016 3:17:09 PM

Attached bbd is in 4.1.0.3002 format.

Response e-mail:

=====

Hi Osiris,

Your request has been posted as VI 4504. Please refer to this number for further assistance.

I'm not able to reproduce the reported problems in the Demo version. Suggestions are listed below:

1. When creating a new vehicle, remember to specify whether the vehicle is for ASD/LFD rating and/or LRFD rating. Also, you have to hit the Save to Agency button in order to save the temporary vehicle into the Agency library.
2. Member alternatives 1B and 9D are defined as "PS Precast Box". The only PS shapes that you have created is an I shape. That's the reason why the drop-down box for the prestress beam in the Beam Details window is empty.

Let me know if you need additional information.

Regards,  
Herman Lee

**Complete Issue Information**

Bridge Section - MassHighway

We have rated a lot of PS AASHTO Beam bridges, the rating factors at harp points are OK except one bridge (.bbd file enclosed)the rating factors are all zero. But we exactly know the harp point location is not the control element for the rating.

We do not know the problem which belongs to tolerance issue or else? Please investigate and give us the solution. Thanks

FROM:kkennelly DATE:3/28/2003 11:25:08 AM

I ran member B1 and see in the BRASS output that at poi 103.987 (the harp point) the stresses printed out when checking AASHTO 9.15.2.2 are listed as "\*\*\*\*\*". I added points of interest to the very left and right of this harp point and the stresses printed out when checking this AASHTO spec appear ok. I don't know why the stresses can't be computed at the harp point.

FROM:bgoodrich DATE:Monday, April 07, 2003 10:41:59 AM

I have forwarded this issue to WYDOT.

FROM:bgoodrich DATE:Monday, April 07, 2003 12:31:25 PM

After running this bridge with the new version of BRASS-GIRDER released with Virtis 5.0, the stresses are now computed and rating factors greater than 1.0 are reported.

Import of the old library shapes take a long time and the user would not know whether the program is stuck or it is processing the import.

It would be nice if we show a progress meter and also process windows messages so that the Virtis/Opis application windows refresh themselves.

### Description

FROM:gbarnhill DATE:Thursday, March 27, 2003 9:29:43 AM

In the tree item for Stringer Member Alts and FB Member Alts, we need to show what Member Definition is assigned to the Alt.

This would look similar to the Structure Alt tree where the Superstruct Def is shown assigned to the Struct Alt.

### Description

FROM:kkennelly DATE:3/28/2003 8:18:22 AM  
Submitted on behalf of Ed Lutgen, Minnesota DOT via email:

I have a question that I think might need to be reported as an incident due to bug in BRASS LFD. It has to do with the Interim 2000 braced non-compact (10.48.2) and partially braced members (10.48.4). I have this attached 3 span steel bridge that over the pier has 19' unbraced tension flanges. The bridge was built in 1955 as this does not meet our

4/19/2016 3:17:10 PM

HRS AASHTO

1406

**Complete Issue Information**

current code for bracing. At the pier the bridge does not meet criteria for braced noncompact (10.48.2) so partially braced (10.48.4) applies.

The program then correctly follows the code until equation 10-103e. The program calculates 10-103e correctly but then limits the moment to My. The problem is that the program does not use My but the Mu it calculated from 10.48.2 equation 10-99 which is lower than My. So in effect the final Mu has two reductions for Rb, one from 10.48.2 equation 10-99 and the other from 10.48.4 equation 10-103a. As it turns out the yield strength of steel has no effect on critical rating calculations. Equation 10-99 controls design which is a function of dimensions and yield independent. I think I am interpreting the code and Virtis 4.2 correctly. If you have any questions just let me know. Thanks in advance.

### Description

FROM:kkennelly DATE:3/31/2003 10:57:47 AM  
Submitted on behalf of Elizabeth Bacha at Bayside Engineers via email:

I have the same problem for the shear rating for this prestressed beam (B-15-002(1V4)).

When we check the out put file the Vci(min) value is calculated as zero.

FROM:kkennelly DATE:3/31/2003 11:00:14 AM  
I rated the member alt for Member B-37 in structure NB Span 2. Shear rating at point 0 is 0. I added a poi at that point and see in the detailed BRASS output at that point that Av = 0 and s = 0, percent of concrete used in vertical shear = 0. Then Vci min =  $1.7(\sqrt{f'c})bd = 0$ .

If I change the first start distance for the shear reinforcement for this mbr alt from 0.26 ft to 0.25 ft, BRASS runs ok.

FROM:bgoodrich DATE:Tuesday, September 23, 2003 11:37:08 AM  
The export (BrassStirrupScheduleGroupCmd.cpp) was modified to use the GetTolerance function instead of the CSysUnits::GetTolerance function. This corrected the problem with the stirrup area and spacing. Fixed for Version 5.1.

## Description

FROM:bha DATE:Tuesday, April 01, 2003 1:54:25 PM  
Please mention this incident to Brian Goodrich and Dan Glandt.

Shear strengths are calculated by Virtis at the ends and other locations will vary (very significant) if we

4/19/2016 3:17:11 PM

HRS AASHTO

1409

## Complete Issue Information

increase the wheel advancement.

Enclosed are the .bbd file and the spreadsheet containing some rating results for comparisons.

I know that Mr. Glandt have fixed the shear problem for PS from my reported incident #3708 for the next version, but I suggest that you should investigate every aspect of the problem in computing the shear strengths for future release.

FROM:bgoodrich DATE:Monday, April 07, 2003 11:04:51 AM

This issue has been forwarded to WYDOT.

FROM:bgoodrich DATE:Tuesday, April 08, 2003 3:22:00 PM

E-mail from Binh Ha:

Through my own investigate, one of main factors that cause the shear strength problem for PS is the shear concurrent with max. mom. If you change wheel advancement.

Enclosed is my finished project file (.bbd) (the control element of rating is shear at H/2).

1. If you run with wheel advancement = 100 and 400 with POI control #3 (HS20) - Beam B1:

\* POI Control #3, Wheel advancement = 100  
Inventory RF = 1.454 - Operating RF = 2.166

\* POI Control #3, Wheel advancement = 400  
Inventory RF = 1.726 - Operating RF = 2.333

2. At location 0.15 span 1 - Beam B1: The RF differences come from the shear concurrent with max. mom.

\* POI Control #5, Wheel advancement = 100  
Inventory RF = 1.581 - Operating RF = 2.423

\* POI Control #5, Wheel advancement = 400  
Inventory RF = 2.138 - Operating RF = 2.967

The RF differences come from the shear concurrent with max. mom., with wheel advancement = 100 - shear concurrent with max. mom. = -0.51 K, with wheel advancement = 400 - shear concurrent with max. mom. = 16.61 K. Why?

3. At location 0.10 span 1 - Beam B1: The RF = 0.0 . Why?

And the problems continue...I do not have time to find more. I suggest you should consider all aspects of shear flaws for PS for the next Brass-Girder release. Thanks <<s-25-022 (1w6).bbd>>

### Description

FROM:kkennelly DATE:4/14/2003 2:26:24 PM

I created a new girder line structure def with a timber deck and created a steel plate girder cross section based mbr alt. I created a steel cross section and the CrossSectionDeckType is not being set in the database.

FROM:jihnmat DATE:4/24/2003 1:50:32 PM

Shouldn't the Domain be setting this? It knows what the deck type is. Doesn't seem right that the Gui should have to know that this needs to be set in the Domain. The Gui doesn't use it.

FROM:jduray DATE:4/28/03 8:11:12 AM

I agree with Joe, can it be set in the domain?

FROM:kkennelly DATE:4/28/2003 9:27:54 AM

I think the GUI should use it determine what deck tabs to display.

The domain can set it but that would mean the deck type for a cross section always has to match the deck type of the structure def. The GUI is set up that way now but it doesn't always have to be that way.

FROM:jihnmat DATE:4/30/2003 11:29:12 AM

Setting this in the Domain \*wouldn't\* mean the deck type for a cross section always has to match the deck type of the structure def, it only means that they would match initially (as they should).

FROM:kkennelly DATE:5/7/2003 1:27:51 PM

Fixed for Version 5.0 Service Pack 1.

4/19/2016 3:17:12 PM

HRS AASHTO

1413

**Complete Issue Information**

TESTING: Verify xsection deck type set for new steel cross sections.

Utility also needed to fix db's for users who have created new steel cross sections in 5.0 so this incident now assigned to Mehrdad.

FROM:mordoobadi DATE:5/21/2003 2:36:19 PM  
SQL scripts created for Sybase, MSDE, and Oracle databases to fix the missing cross section deck types in the database.

FROM:mordoobadi DATE:6/11/2003 8:56:11 AM  
Krisha noticed that the SQL scripts do set the XSection Deck Type for floorline bridges.

Floor lines can only have concrete decks right now so I think it's ok to just make them all concrete in this utility. We should probably add a deck\_type to the floor line struct def to make it similar to the other structure defs (in 5.1.0).

FROM:mordoobadi DATE:6/11/2003 12:09:57 PM  
Sybase/Oracle/MSDE scripts updated.

### Description

FROM:gbarnhill DATE:Tuesday, April 15, 2003 4:20:03 PM

This is an steel plate girder bridge - 3 span.

We have specified POI in order to obtain moment and shear output at those locations.

We ran an LRFD HL93 analysis for member 2.

In the analysis results dialog, we see moment output for POI 6.135m, but non of the other POI locations specified.

The results graph dialog shows 2 lines for 6.135, one with data, the other without. There are blank lines for the other POI specified.

There is a bottom flange change at 6.135. If I eliminate that change in the girder profile OR eliminate the POI for 6.135, then only one line of analysis results is displayed for 6.135 with values.

4/19/2016 3:17:12 PM

HRS AASHTO

1416

**Complete Issue Information**

This is also related to how close the POI is to a 10th point. For this member, 10th point is at 6.100m. If I move the flange change and POI to 6.235m, then the analysis output shows only one blank line for 6.235. My tolerance setting is at 0.01m.

FROM: bgoodrich DATE: Tuesday, April 22, 2003 4:19:10 PM  
By default, the actions are only output at tenth points. The engine properties accessed from the Analysis Settings window must be modified. Change the Action Output Level to "Print actions at all node points."

After doing this, I found a bug in the export (BrassLrfdOutput.cpp) when this parameter is written to the BRASS command. I have addressed this bug for the next release.

FROM: gbarnhill DATE: Thursday, June 19, 2003 9:21:13 AM  
I still get the same results in 5.0.1.

FROM: bgoodrich DATE: Wednesday, July 02, 2003 11:18:17 AM  
Unfortunately, the export modifications were not included in the first 5.0.1 build. Please try the next build.

FROM: gbarnhill DATE: Thursday, July 10, 2003 6:03:34 PM  
OK in 5.0.1 July 7 beta

### Description

FROM:gbarnhill DATE:Wednesday, April 23, 2003 9:11:03 AM

This bridge came from LA County.

It's a simple span PS box system. The strands are entered as P & CGS. The harp distances were entered as zero for both left and right.

The analysis runs but gives zero rating factor for moment. The calculated moment capacity is very low. I changed the harp distances to 1 and 62 (1 ft in from each bearing).

The analysis gives a reasonable rating factor.

According to the HELP for STRAND LAYOUT, I should leave the harp numbers blank for straight strands.

If I do that, then I get a BRASS error..

Error generating BRASS prestress commands!

Unable to create BRASS strand profile commands for P\*e method!

Error determining type of strand configuration!

FROM:bgoodrich DATE:Monday, April 28, 2003 5:35:58 PM

For STRAIGHT strands, leave the left and right harp point distances blank and leave the left and right CGS distances blank.

For HARPED strands, enter the left and right harp point distances and enter the left and right CGS distances. I added some additional text to the error message to help the use understand what needs to be entered. Fixed for Service Pack 1.

FROM:gbarnhill DATE:Thursday, June 19, 2003 5:11:55 PM

I still see the same error messages in 5.0.1

### Description

FROM:dteal DATE:Wednesday, April 23, 2003 12:23:45 PM

Attached are 2 identical structures. Doing an HL93 Design Review of the Wizard Alt of Member 2. In Version 4.2 run 90 seconds.bbd and it will take 90 seconds to complete. In Version 5.0 run 390 seconds.bbd and it will take 6 ½ minutes (390 seconds) to do the exact same thing. In version 5.0 when the analysis starts it runs fine, then all of a sudden it comes to a big slow down. I didn't see this slowed analysis process during the beta testing process.

I have our version 5.0 running on our test server. This way I can compare version before putting the new one on the production server.

I also see a slowed response time when bringing up the spec checker and when copying structures.

FROM:bgoodrich DATE:Monday, April 28, 2003 6:04:55 PM

I am able to duplicate Dean's findings. Note that the newer version corrected the calculation of the plastic moment, which may be where the slow-down is located. I will forward this issue to WYDOT.

FROM:dteal DATE:Tuesday, April 29, 2003 10:29:52 AM

Is there a possible work around?? Frustrations are being vented. Going from 1.5 to 6.5 minutes for the same analysis has gotten some user very hot!! It's like going back to a 8088 processor again.

FROM:bgoodrich DATE:Wednesday, May 07, 2003 4:14:36 PM

FROM:bgoodrich DATE:Friday, May 09, 2003 6:06:28 PM

WYDOT will assign this issue to BRASS Problem Log 432.

FROM:bgoodrich DATE:Monday, June 23, 2003 3:28:04 PM

BRASS-GIRDER(LRFD) has been modified to address this issue. The analysis time is now comparable to the version released with Opis 4.2. Fixed for version 5.0.1.

FROM:kkennelly DATE:7/24/2003 2:34:36 PM

Ran ok for me.

### Description

FROM:kkennelly DATE:4/30/2003 2:33:16 PM

For BID 13, add a top cover plate to Stringer Def1. Cover plate starts at 5' and is 20' long. Open the Stringer Mbr Alt window for any Stringer in the structure, enter a loss range for the top cover plate. Hit Ok to close Stringer Mbr Alt window, try to reopen the Stringer Mbr Alt Window and get error "Unable to initialize top cover plate tab!"

FROM:kkennelly DATE:5/1/2003 3:04:46 PM

Seems to be a problem calling GetCoverPlateObjectId() when building the grid.

FROM:kkennelly DATE:5/5/2003 11:28:36 AM

I think m\_wndGrid.iColumns should be 8 not 7 for the grid. (this doesn't totally solve the problem).

FROM:kkennelly DATE:5/6/2003 3:52:02 PM

FROM:jihnat DATE:5/28/2003 8:33:17 AM

7 columns looks right to me.

The view calls SetCoverPlateObjectId() with the correct object ID, but when it's reopened

GetCoverPlateObjectId() returns zero.

Krishna, please look into the Domain.

FROM:kkennelly DATE:5/29/2003 12:45:29 PM

My comment about the 8 columns not 7 pertains to UiMemberAltXSecCoverPlateLossDlg.cpp.

FROM:kkennelly DATE:5/29/2003 2:00:47 PM

DoMbrAltStlSchedCovPlateLossRangeSet GetCoverPlateObjectId() looks for a DmSteelAssembly for a specific StructDefId, SpngMbrDefId, and StlAssemblyId. The SpngMbrDefId is null for the loss range on a stringer mbr alt. So the Dm can't find a De object with a SpngMbrDefId = 0. Mehrdad, what should we do?

FROM:kkennelly DATE:6/3/2003 1:07:13 PM

The SpngMbrDefId now being set.

### TESTING INSTRUCTIONS:

Create schedule and cross section based stringer and floorbeam member definitions with cover plates. Assign these definitions to stringer and floorbeam mbr alts and enter cover plate losses. Make sure mbr alt window reopens; run analysis make sure loss is included, use Report Tool to create reports for mbr alts.

### Complete Issue Information

a while for Virtis/Opis to become active.

They noticed this problem right after they upgraded Virtis/Opis from version 4.1.1 to 5.0.0.

IDOT uses a Sybase ASA 7.0 database on a network as their database server.

The problem was not reproducible when using Sybase ASA 8.0.

I tracked the problem down to an OnUpdate...() function that makes 'Recent rating results' Toolbar button enabled or disabled.

The function queries the database to set the status of the toolbar button.

Since this query is time consuming we need to make the button enabled all the time and let the Recent Rating Results window open empty or close if there isn't any results to display.

I implemented the above changes to ABGDTOP project and sent the new ABGDTOP.DLL to IDOT to see if it has resolved the problem. They indicated that the problem was resolved after replacing the DLL.

This problem should be addressed in Patch 1 of version 5.0.

FROM:jduray DATE:5/22/03 11:27:41 AM

This problem also occurred in 4.2 as a result of the BRIDGEWare integration enhancements.

FROM:mordoobadi DATE:5/23/2003 10:49:08 AM

Fixed for 5.0.1.

FROM:mordoobadi DATE:5/23/2003 1:35:17 PM

Related to incidents 4597, 4598.

### Description

FROM:bha DATE:Thursday, May 01, 2003 2:02:14 PM

Please notify this problem to Brian Goodrich, Dan Glandt and Wyoming DOT.

I have checked article '9.20.2 Shear Strength Provided by Concrete' and some other references and softwares relating to the calculations of PS shear strength, I can not find down the assumption: "Mmax < Mcr, Eq. 9-27 not calculated, 9-29 used" as BRASS-GIRDER Version 5.08.06 used to calculate shear strength provided by concrete.

Because shear strength is a function of various variables, so by the way Brass-Girder uses above assumption (Mmax < Mcr) will cause a lot of problems to our previous PS bridge ratings (for example: S-25-22.bbd enclosed).

We would like to know where the assumption coming from?

And from equation  $V_{ci} = 0.6 * \sqrt{f'c} b'd + V_d + V_i * M_{cr} / M_{max}$  (AASHTO 9-27) - at two ends of the beam  $M_{max}=0.0$ , please explain how to use above equation (We can not find the explanation from AASHTO and other references).

And again this problem very serious and we are waiting for your response.

Thanks,

FROM:bgoodrich DATE:Thursday, May 08, 2003 4:24:49 PM

The origin of equation 9-27 is based on some 1960's work by MacGregor and associates at the

4/19/2016 3:17:14 PM

HRS AASHTO

1427

## Complete Issue Information

University of Illinois.

BridgeTech asked Dr. Maher Tadros to respond to several questions regarding this equation. Based on his responses, equation 9-27 was never intended to be applied to sections in which  $M_{max}$  does not exceed  $M_{cr}$ . Therefore, equation 9-27 is not applicable when  $M_{max}$  is zero, such as at the ends of a simple-span girder. One option may be to utilize equation 9-27, but restrict the ratio of  $M_{cr}/M_{max}$  to a maximum of 1.0.

Others may question this implementation as well, so we may develop a technical document on the BRASS implementation of equation 9-27. This would include some background on the subject.

Finally, I analyzed several of the members in the BBD file you sent and did not find any rating factors less than one. Shear was controlling, but the ratings were OK. What rating factors are you getting? Is there a specific member alternative where  $V_{ci}$  used to control vs.  $V_{cw}$ ?

FROM:bgoodrich DATE:Wednesday, May 14, 2003 10:36:40 AM  
E-mail from Binh Ha (5/13/03):

Actually I do not care much of our bridge rating numbers are greater or less than 1.0, I only care about the methods of analysis and ratings are right or wrong. For a long time we just used article 9.20 AASHTO to calculate the shear strength and never know or find something similar to the assumptions used in BRASS-GIRDER versions 5.08.05 and 5.08.06. I suggest you should use CONSPAN program to check the calculations of shear strengths. Enclosed are my S-25-023.bbd and the summary table of shear strength computations.

<<S-25-023.bbd>> <<SHEAR STRENGTHS.xls>>

FROM:bgoodrich DATE:Friday, June 13, 2003 4:15:42 PM  
WYDOT has assigned this issue to BRASS Problem Log 436.

FROM:bgoodrich DATE:Friday, June 13, 2003 4:16:39 PM  
E-mail from Binh Ha (6/13/03):

I would like to ask you about incident 4578, because our state has a lot of PS bridges to be rated and mostly the ratings controlled by shear (shear strengths calculated by Virtis based on the assumptions are not reflected by most existing references as my previous e-mail I have sent to you). And again the .bbd file enclosed will also enforce my concern (please go to the output and find the shear strengths calculated by Virtis, especially for G10)

FROM:bgoodrich DATE:Monday, June 23, 2003 3:05:24 PM  
BRASS-GIRDER has been modified to limit the  $M_{cr}/M_{max}$  term to 1.0 in the  $V_{ci}$  equation (AASHTO Eq. 9-27). This procedure is documented in an open forum article by Dr. Puckett and Dr. Tadros (University of Nebraska-Lincoln). See "Design for Shear in Prestressed Concrete Bridge Members" in the PCI Journal (May-June 2001). Fixed for version 5.0.1.

FROM:hlee DATE:7/24/2003 9:58:18 AM

**Description**

FROM:bmccaffrey DATE:Monday, May 05, 2003 11:28:00 AM

It appears that the effective flange width calculation wizard for fascia members is ignoring the 1/12th of span length criteria. See the attached .bbd file - see G1.

FROM:kkennelly DATE:5/9/2003 2:32:34 PM

The Compute button does not interpret AASHTO 10.38.3.2 to apply to exterior beams. That article specifies the 1/12 span length criteria "For girders having a flange on one side only...". Your exterior beam has a concrete slab on both sides of the web.

4/19/2016 3:17:15 PM

HRS AASHTO

1429

## Complete Issue Information

FROM:bmcaffrey DATE:Friday, May 09, 2003 2:50:14 PM  
What was fixed for incident 4366? The release notes state:

Incident 4366 - The "Compute Effective Flange Width" button on the Deck Profile window incorrectly computed the effective flange width for the right exterior girder when the overhang width controlled the computation

FROM:kkennelly DATE:5/9/2003 3:11:01 PM  
The right overhang width computed by the Compute button incorrectly had a negative sign. This resulted in an incorrect eff flange width being computed for right fascia girders where the girder spacing criteria controlled instead of the 1/4 span length or 12\*slab thickness criteria.

FROM:bmcaffrey DATE:Thursday, May 22, 2003 2:00:27 PM  
OK, I agree with you, but I think there is still something wrong in the calculation for some cases. I've attached the .bbd file for another bridge (1005130.bbd). Here are my numbers and logic for the fascia member G1:

Span length = 42.27'  
Overhang = 16.75"  
Beam spacing = 141.625"  
t eff = 12"

Left side of member;

$bE = 1/2(1/4)(42.27')(12"/') = 63.405"$   
 $bE = \text{overhang} = 16.75" \implies \text{controls}$   
 $bE = 6(12") = 72"$

Right side of member;

$bE = 1/2(1/4)(42.27')(12"/') = 63.405" \implies \text{controls}$   
 $bE = 1/2 \text{ beam spacing} = 70.8125"$   
 $bE = 6(12") = 72"$

Total bE = 16.75" + 63.405" = 80.155" (matches the LRFD eff. fl. width)

Virtis uses 87.6", which if you back calculate it = 16.75" + 70.8125", which is the overhang + 1/2 the interior beam spacing.

I am calculating the effective flange width based on 10.38.3.1 for both sides of the member and then I add the two lowest values together.

FROM:kkennelly DATE:6/2/2003 8:57:05 AM  
AASHTO 10.38.3.1 doesn't specify anything about checking the left and right side of the member but a user previously said we should since AASHTO 8.10.1.1 does. AASHTO 8.10.1.1 says to check the effective flange width overhanging on each side of the web against 6ts or 1/2 spacing. The 1/4 span length check in 8.10.1.1 does not get checked for each side of the web. (At least that's my interpretation.)

FROM:dteal DATE:Thursday, May 08, 2003 8:36:52 AM

When a hinge is present in a span – often there is a section (depth) change at the hinge. For example we are working on one that is a 72” depth on one side of the hinge and 48” on the other side of the hinge. We are getting an error message related to this and the schematic view is not drawn correctly.

What are the limits for a section change, I can't find any info in Virtis or BRASS help files.

FROM:dteal DATE:Thursday, May 08, 2003 9:08:03 AM

When in the Member 2 Girder Profile, if you select OK you get an error message that states:

“Adjacent web depths are not within tolerance in rows 1 and 2. Left web depth is 78” and right web depth is 48”. Do you want to re-enter a web depth?

These depths are correct – what tolerance is it referring to? The system tolerances set by the administrator or something else?

Also look at the schematic plan view for the bust at the hinge.

bbd attached for BID#811

FROM:kkennelly DATE:5/9/2003 11:50:51 AM

1. The Web Profile window issues the ".web depths are not within tolerance.." message using the System Defaults Tolerance. When we validate the window data before saving it, we check for adjacent web depths to be within this tolerance to help users when entering parabolically varying web ranges. I've added a check to this validation to first check if a hinge exists at the point where the web profile changes. If a hinge exists there, the validation will not issue the tolerance message. If a hinge does not exist at the web profile change point, the tolerance message will be issued.

2. Schematic is fixed.

Above changes are implemented for Version 5.0 Service Pack1.

### Description

FROM:dteal DATE:Thursday, May 08, 2003 10:55:46 AM

Please look at the Member 2 girder profile. The stiffener spacing dimension has many rows that didn't used to be there. The dimensions are not continuous and don't make a whole bunch of sense?? What has changed for 4.2 to 5.0? See .bbd

FROM:dteal DATE:Friday, May 09, 2003 10:44:29 AM

Some bridges have the Stiffener dimensions as they should be and some give several rows of meaningless dimensions. So it's not on every bridge.

FROM:jihnat DATE:5/9/2003 11:32:16 AM

It'll be on those bridges that have overlapping ranges. We had a problem when the ranges overlapped, the dimensions overlapped also and were unreadable. Now, a new line of dimensions is created whenever a range would overlap a range on the current line. The dimensions are not "meaningless".

**Complete Issue Information**

I defined 2 odd POI's that do not fall on a 10th point. In the Member Alt Description, Engine Tab, LRFD Properties, I requested "Generate at user-defined points" only. After an HL93 Design Review I checked Analysis Results for dead load actions. The only thing in the table are values at 10th points. I can not get my user defined points to appear in the analysis results table.

The user defined points where spec checked.

FROM:mordoobadi DATE:5/14/2003 9:41:06 AM  
This is probably related to incident 4554.  
Brian, could you please investigate.

FROM:bgoodrich DATE:Wednesday, May 14, 2003 10:43:07 AM  
This issue is a duplicate to Incident 4554. The issue has been corrected.

To get non-tenth points to be listed in the analysis results table, the Action Output Level must be set to "Print actions at all node points" (see the Analysis Settings window, Engine tab, LRFD Properties).

FROM:dteal DATE:Monday, June 02, 2003 8:23:40 AM  
Has been corrected for what release? Is there a work a round for this in the mean time?

### Description

FROM:dteal DATE:Tuesday, May 13, 2003 10:04:50 AM

When I highlight a bridge in the explorer window and click on the Recent Rating Results button on the tool bar it takes approximately 4 minutes to bring up the rating results window. Could this be an XP thing?

FROM:jduray DATE:5/22/03 11:40:43 AM

Similar to incident 4577.

FROM:mordoobadi DATE:5/23/2003 11:32:28 AM

The object IDoSysBridgeAnalysisEventsListPtr seems to have caused this problem. It performs badly because there is a very complex view behind it.

We need to get information from several less complex views and put the information together by using C++ code, this might help with the performance of IDoSysBridgeAnalysisEventsListPtr object.

FROM:mordoobadi DATE:8/22/2003 9:52:08 AM

A new domain object created for a better performance. The recent rating results summary window performed much better on my test database (Results for 18 bridges saved 12 times ) than before. I need to get Dean's database to continue the performance testing.

FROM:dteal DATE:Tuesday, May 13, 2003 10:05:28 AM  
I have a bridge that is defined as Opis Only by the Bridgeware Association button. I highlighted this

4/19/2016 3:17:17 PM

HRS AASHTO

1443

## Complete Issue Information

bridge in the explorer window and selected the Rate button from the toolbar.

The first thing I get is a System Error message as follows: "The following bridges could not be rated. They are either 'Template' or 'Opis-only' bridges" followed by the bridge description. After clearing that window Virtis appears to be locked up, if you check the task manager Virtis is reported as "Not Responding". But if you leave it alone it will eventually bring up a totally blank Analysis Progress window. Press OK to clear this window and the tiling of the windows gets all messed up and it appears to be hung. If your patient and wait a total of 9 minutes you will get rating results. Remember at the beginning, this is n Opis-Only structure. Could this be an XP thing?

FROM:mordoobadi DATE:5/13/2003 10:37:17 AM  
Are you using Sybase? If yes which version?

FROM:mordoobadi DATE:5/13/2003 10:43:34 AM  
This is probably related to Incident 4577.

FROM:dteal DATE:Friday, May 16, 2003 11:31:16 AM  
Oracle

FROM:dteal DATE:Friday, May 16, 2003 12:28:34 PM  
Oracle8i Enterprise Edition Release 8.1.6.3.0

FROM:mordoobadi DATE:5/23/2003 11:36:57 AM  
I beleive this has the same problem as incidents 4557 and 4597.

FROM:jduray DATE:8/18/2003 11:05:12 AM  
How is 4557 related to this?

FROM:mordoobadi DATE:8/19/2003 1:46:23 PM  
It is related to 4557 because in both cases the object IDoSysBridgeAnalysisEventsListPtr is used to get information about Bridge Analysis Events. To resolve incident 4557 we no longer query from IDoSysBridgeAnalysisEventsListPtr object. But to resolve the problems in incidents 4597, 4598 we need to improve the performance of the object.

FROM:jduray DATE:8/25/2003 11:13:42 AM  
I don't understand the connection. 4557 is "Remove access to IDoMbrAltSupportsDetailSet from Floorbeam and Stringer Mbr Alts". How is that related to "IDoSysBridgeAnalysisEventsListPtr"?

FROM:mordoobadi DATE:9/17/2003 3:36:16 PM  
Sorry I did not mean 4557 I meant 4577.

FROM:dteal DATE:Tuesday, October 26, 2004 11:48:49 AM

**Description**

FROM:dteal DATE:Tuesday, May 13, 2003 2:30:51 PM

I have several users that can not be deleted because of events (Incident #4311) I have unchecked the box to make them non-active. These users do not have any bridge check out authorizations. These users still appear in the listing for "Check Out Authorizations – By User". Should they still be there?

### Description

FROM:tthompson DATE:Wednesday, May 14, 2003 8:02:29 AM

When ever I use the report tool and try to generate the report, all I seem to get displayed is the style sheet. How do I get the report to display correctly? I'm not familiar with this XML stuff at all.

4/19/2016 3:17:18 PM

HRS AASHTO

**Complete Issue Information**

We are using IE 6.0.2600.0000 with NT 4 SP 6

I've attached a snap shot of a Report Tool generated report.

FROM:jihnata DATE:5/14/2003 8:39:01 AM

Two things to try:

- 1) Click the "Advanced" button in the report tool and make sure "Use user-defined XSL file" is not checked
- 2) Run the batch file "msxmlfix.bat", which is in the directory where Virtis is installed (just double-click on it)

FROM:tthompson DATE:Wednesday, May 14, 2003 9:11:24 AM

Check of 1) - was NOT checked

Check of 2) - registering these dll's worked.

On my Windows 2000 laptop, the xml reports worked without needing check 2)

You can close this request. Thanks.

### Description

FROM:bha DATE:Wednesday, May 14, 2003 10:29:24 AM

Virtis is not allowed to model the floorbeam which are parallel to the centerline of abutment (with a skewed angle)

Enclosed is a framing plan of girder-floorbeam system (AutoCad drawing). Can you help us to model the floorbeams FB1 and FB29 (parrallel to centerline of abutment)?

Thanks,

FROM:kkennelly DATE:5/14/2003 4:24:45 PM

For a floorbeam to be skewed in Virtis, the floorbeam must located along the support line of the main girder. It appears in your drawing that your end floorbeams are offset from the main girder's support lines by 1'-6" so you cannot skew the fb's. You should use the floor line approach to accurately model your structure.

Since your end FB's are offset by only 1.5', I wouldn't think there will be too much error introduced if you use the floor system approach and place your end fb's at the support lines of the girders.

**Description**

FROM:dteal DATE:Thursday, May 15, 2003 9:17:32 AM

I came across two bridges in our database that appear to have Identical Bridge ID's with different NBI numbers. Bridge ID's are unique, how can this happen. Am I not seeing something and the ID's are not in fact the same? They both appear to share Bridge ID: 030-092??

FROM:dteal DATE:Thursday, May 15, 2003 9:34:54 AM

4/19/2016 3:17:19 PM

HRS AASHTO

1449

**Complete Issue Information**

I found 2 more with duplicate Bridge ID: 061-089  
See attached

FROM:dteal DATE:Thursday, May 15, 2003 11:12:00 AM  
I just created 2 more bridges with the same "viewable" Bridge ID (attached). It appears that the validation can see unprintable control keystrokes, like the windows key and space bar, removes trailing spaces and saves it to the database – resulting in identical Bridges ID's?????

FROM:mordoobadi DATE:5/30/2003 3:17:24 PM  
This is related to the resolution of incident 2119.  
I think since CHAR data types are no longer used in table bridge (We have VARCHAR2 instead), we need to remove the code that we added (for incident 2119) to trim trailing spaces on bridge\_id and struct\_num.  
I also noticed that there is no UNIQUE constraint on the bridge\_id in the abw\_overflow table.  
So there are two things that needs to be done:  
(1) Delete the block of code in the file DoBridgeManager.cpp lines 380 thru 430.  
(2) Add a UNIQUE index to abw\_overflow table on bridge\_id.

FROM:mordoobadi DATE:6/11/2003 1:18:27 PM  
Fixed for 5.0.1.

**Description**

FROM:dteal DATE:Friday, May 16, 2003 4:06:31 PM

In config browser I am unable to name /rename a group. Logged in as system administrator, highlight "Users", select New, and a User Group called "New Item" is added tot he end of the tree. Now I want to rename this New Item to Rating administrator so I double click on the New Item, type in Rating Administrator and hit enter. It changes back to New Item.

I can not find a way to rename New Item, I can only create New Item and delete New Item??

FROM:hlee DATE:5/23/2003 1:58:21 PM

I cannot reproduce this incident.

Please see the attached bitmap for screen captures.

Information needed if steps to reproduce are different from those in the screen captures.

FROM:dteal DATE:Tuesday, May 27, 2003 8:43:06 AM

Beta testers can not download attachements from visual intercept.

FROM:hlee DATE:5/27/2003 3:00:29 PM

Attachment e-mailed to dean (teal@ksdot.org).

FROM:dteal DATE:Tuesday, May 27, 2003 3:15:00 PM

I did everything as you did in the GUI screen shots. When I hit enter as directed in the 5th screen shot mine returns to "New Item". Did you try this in XP or are you using NT?

FROM:hlee DATE:5/27/2003 3:22:07 PM

I tried in Windows 2000 Service Pack 2.

FROM:dteal DATE:Tuesday, May 27, 2003 3:46:27 PM

You need to try it in XP

FROM:hlee DATE:5/27/2003 4:48:14 PM

I cannot reproduce in Windows XP.

I tried in Windows XP Service Pack 1.

Are you using SP1? Can you rename a file in file explorer?

FROM:dteal DATE:Wednesday, May 28, 2003 11:59:33 AM

Yes, we are using SP1.

Oracle8i Enterprise Edition Release 8.1.6.3.0

Microsoft ODBC for Oracle 2.573.9030.00

FROM:hlee DATE:5/28/2003 12:08:50 PM

The incident can be reproduced with Microsoft ODBC for Oracle 2.573.9030.00 driver.

Work around: Tested OK with Oracle ODBC 8.01.75.00 driver.

=====

**Complete Issue Information**

Error updating the database.

11:48:41 AM - Line 554 in source file D:\Virtis\data management\abmcfg\DmUsersGroup.cpp.

State:S1015,Native:0,Origin:[Microsoft][ODBC Driver Manager]

No cursor name available

=====

FROM:hlee DATE:5/29/2003 9:53:13 AM

More information to reproduce the incident:

Driver Name and Version: Microsoft ODBC for Oracle 2.573.7713 driver

Driver ODBC Version: 2.50

ODBC Version: 3.52.0000

FROM:dteal DATE:Wednesday, June 04, 2003 1:31:38 PM

Our DBA Group just installed Oracle 9i ODBC 9.02.00.00 on my client workstation. I am now able to Name/Rename a group.

FROM:mordoobadi DATE:6/6/2003 11:33:48 AM

I think the problem is with ODBC Driver version. The Microsoft ODBC Driver for Oracle version is 2.50.

The documentation for Microsoft ODBC for Oracle states that Oracle8 has limited support. Oracle 7.3x is fully supported by the driver.

See <http://msdn.microsoft.com/library/default.asp?url=/library/en-us/odbc/hm/orcdrv sdk.asp>

The problem is recorded in Microsoft support site (Article 120511).

See <http://support.microsoft.com/default.aspx?scid=kb;en-us;120511>

We are not supporting Microsoft ODBC for Oracle and we suggest the users to use Oracle's ODBC driver.

### Description

FROM:jihnat DATE:5/19/2003 9:09:28 AM  
Reported via email by Connie Wong of Vollmer Assoc:

Attach is a screen capture of my VIRTIS window. Why is the girder spacing window so small? It wasn't like that in the previous versions.

FROM:jihnat DATE:5/27/2003 8:33:12 AM  
My emailed response to Connie:

The Girder Spacing grid was probably narrowed a bit in version 5.0 because a third grid was added to this window for Floor System. As you may have already discovered, when you enlarge the Framing Plan Details window the grids only grow vertically, not horizontally. If you narrow the columns on the Girder Spacing grid everthing will fit nicely.

Had you uninstalled version 4.2 before installing version 5.0? I wouldn't expect this to appear this way if version 4.2 had been uninstalled first.

And her reply:

4/19/2016 3:17:19 PM

HRS AASHTO

1453

**Complete Issue Information**

Thanks for the suggestion. I narrowed the columns and I was able to fit both columns together. Thank you.

I think the IT person did uninstall version 4.2 before installing 5.0 since its folders are not on the computer anymore.

### Description

FROM:bgoodrich DATE:Wednesday, May 28, 2003 2:19:46 PM

Jay Puckett and I were discussing the Analysis Progress window, which lists the various structure definitions, member alternatives, etc. with a box to the left of each tree item. The box can contain a check or X. Additionally, it can be left empty in the case of a floor system analysis where certain members are not included in the analysis. We suggest each analysis result be identified with a unique symbol:

1. Empty = Analysis not performed yet, but it will be.
2. Check = Successful analysis
3. X = Unsuccessful analysis
4. ????? = No member alternative assigned, which is OK
5. ????? = Member not considered in analysis, which is OK

An empty box may lead users to believe an analysis was not performed because some problem was encountered but not reported.

| 4638.12708 | Resolved      | Deck type not being set for new girder system structure defs |

**Description**

FROM:rmbest DATE:Wednesday, June 04, 2003 3:19:01 PM

In the attached file, the default units are set to SI/Metric. When the framing plan schematic is displayed, the system units toggle box says SI/Metric, but the schematic is displayed in English. Switching the toggle box to US Customary does nothing, but switching the toggle box back to SI/Metric displays the measurements then in metric. The framing plan measurements should be displayed initially in the default units.

FROM:bha DATE:Thursday, June 12, 2003 9:04:56 AM

We have been so eager to apply the new features Floor System Superstructure of Version 5.0 to rate one Floorbeam-Stringer bridge, the stringer ratings are OK but for floorbeams the Virtis has the message:

"Error generating LFD/ASD commands!  
 Error generating load group commands"  
 Error in the loads utility!  
 Error getting stringer dead load reaction!  
 Error preparing stringer dead loads reactions! "

We have been very disappointed with that result. Please find the enclosed .bbd file and give us the solution as soon as possible.

FROM:hlee DATE:6/17/2003 4:37:42 PM  
Fixed a bug in UiAnalysisProgressDlg.cpp for the above error message.

E-mail to Brian:

=====  
Hi Brian,

Please take a look at this incident. The bbd ("w-44-107\_5101.bbd") attached in the incident is in 5.1.0.1 format. Also, there is a capture of the engine dos window. When I tried to rate floorbeam2, seems like the engine got struck in an infinite loop. In order to start rating, I fixed a bug in UiAnalysisProgressDlg.cpp (attached) for the error message report in the incident.

Thanks,  
Herman  
=====

FROM:bgoodrich DATE:Wednesday, June 18, 2003 11:54:50 AM  
The floorbeam is quite long, so there are numerous combinations of lane positions that must be checked. In the floorbeam definition window (engine tab), I found that if I change the BRASS Lane Advancement Increment from the default of 1 ft to 4 ft, the analysis time is reduce to something reasonable.

FROM:hlee DATE:6/18/2003 1:08:30 PM  
To fix the tolerance problem in the original bbd file (w-44-107.bbd), change the lengths of the web, top flange, and bottom flange in Stringer Profile window to agree with the length in GroupDef1.

FROM:hlee DATE:6/19/2003 9:34:15 AM

FROM:hlee DATE:8/12/2003 8:53:11 AM  
Attached "ANALYSIS\_ERROR.xls" and "w-44-107.bbd" from Mr. Ha e-mail on 8/11/03.  
Renamed "w-44-107.bbd" to "w-44-107\_8-11.bbd".

FROM:bgoodrich DATE:Tuesday, August 12, 2003 11:21:05 AM  
For Floorbeam 1, the left cantilever of the floorbeam is 1.79 ft and the default of 100 is used for the BRASS wheel advancement denominator (see floorbeam def engine properties). This value must be changed to 15 for BRASS to successfully run.

### Description

FROM:kkennelly DATE:6/13/2003 10:05:25 AM  
Submitted for Vinacs via email:

Attached bridge is a reinforced concrete tee beam bridge. User wants the appurtenances to be distributed equally to all girders. BRASS only has 1 stage for reinforced concrete so appurtenances are distributed as Stage 1 loads by tributary area. Jim wants the export changed so that user can enter appurtenances as Stage 2 loads and then export computes additional member load due to appurtenances being distributed equally to all girders (if user has picked that for Stage 2 DL distribution). If user has picked a different type of stage 2 DL distribution, I guess the export will have to continue the way it works now because there is no way for the export to distribute the appurtenances by continuous beam.

Text from user email:

4/19/2016 3:17:22 PM

HRS AASHTO

## Complete Issue Information

...

Users tend to believe that the barrier loads are distributed to ALL girders (by default). However, it apparently is not true for Tee beam bridges. I don't know how many users are aware of this problem. Furthermore, this is an inconsistent behavior of Virtis.

This problem arises only on Tee beam bridges-becuae BRASS does not have the stage 2 condition for Tee beam bridges. BRASS will automatically treats the load identified with the stage 2 condition as a stage 1 load (see below).

### WARNING (High):

A load is being applied to Stage 2, which does not exist in BRASS for this structure type! The load(s) will be applied to the last allowable stage (Stage 1).

Why not we modify the Brass-export program and treat the barrier rail loads (if the user identify it as stage 2 load case) and distribute the loads as specified in the stage 2 condition first before applies to the last allowable stage?

Why do I like the automated method? Because it gives a lot of flexibility in the future.

1. If we identify another software that can distribute the loads evenly, then I need to revisit all the Tbeam bridges and remove the member loads that are placed to "work around" the problem.
2. In case, we upgrade the barrier rail on bridges, instead just update the barrier rail properties, I need to check each member and adjust the member loads to reflect the barrier upgrading
3. If the spec is modified and recommends the way we distribute the barrier rail, again, I have to revisit all the Tee beam bridges
4. Furthermore, as I mention earlier, this brings an inconsistency within Virtis. Users have to be told that barrier rail loads will not be distributed between girders for certain type of bridges and on.

FROM:bgoodrich DATE:Monday, June 23, 2003 3:09:10 PM  
I enhanced the export to generate member loads from stage 2 deck loads that are to be uniformly distributed for R/C members. Fixed for version 5.0.1.

FROM:hlee DATE:7/24/2003 11:13:50 AM  
Tested member G1 of span 2 struct def in the attached bbd.  
In 5.0.1, member loads of R/C members from stage 2 deck loads still use the DECKC-LODC command.

FROM:hlee DATE:7/24/2003 12:33:38 PM  
Member G1 of span 2 struct def is a steel member. Incident only apply for rc member.  
Patch test ok for span 1 struct def.

**Complete Issue Information**

We have discovered that Virtis is not checking the harped distances on prestressed girders correctly. On the attached example, these girders have a single harped point at the center of the girder. When this is entered for the first span, Virtis gives a message indicating that the sum of the harp distances exceeds the span length. We think that the program is using the span lengths to check the sum of the harp distances instead of using the end to end beam length.

The value we were trying to enter was 20.7083 with a symetrical harped layout. The end to end girder length on this structure is 41.4167' and the span length is 41.25'.

FROM:jihnna DATE:7/18/2005 3:14:00 PM

Changed to check beam length instead of span length, but note that for this example I still got error until I dropped foot tolerance to 0.01

Fixed for 5.4.0

For future testing, I've attached version 5.3.1 BBD file.

### Description

FROM:dteal DATE:Monday, June 30, 2003 3:44:12 PM

I got the following message from one of our raters. Can you explain the zero ratings in Version 5.0.0? bbd is attached.

Dean:

I am running new Ver. of virtis for steel girder and most of the beams I run I get zero rating at @ 2.3 I think there is something wrong with the program, because 2.4 and 2.5 has greater moment value than 2.3.

This is happening on some of the old files I have run previously and was getting good rating before and now the results has changed to zero.

Please check BID # 856, Bridge # 057(050) for checking, and let me know of the outcome.

Thanks a lot

Ahmad

FROM:bgoodrich DATE:Wednesday, July 02, 2003 11:49:24 AM

The problem stems from BRASS incorrectly calculating a negative yield moment. The same negative yield moment issue was already submitted in Incident 4649. This incident will be marked as a duplicate.

If I read this correctly we will not get a fix until version 5.1??? Meaning we can't rate many of our steel structures between now and then?? Is there a work around??

FROM:dteal DATE:Wednesday, July 02, 2003 4:13:13 PM

This is more than a zero rating issue - the critical rating is for the 2.3 point. This can never happen, it should be at the 2.5 or center of center span.

### Description

FROM:dteal DATE:Wednesday, July 02, 2003 4:22:20 PM  
Structure was created in SI units (system default is SI)

When you go to the Framing Plan, Schematics, the structure is shown in US units (why?), the pull down lists SI, the schematics is shown in US. Take the Units Pulldown and select SI, it never changes to SI. You have to first select US Customary and then select SI in order to get it to change.

Why is it shown in US when the default is SI and it was created as an SI structure?  
Why can't you change it back to SI with out first selecting US?

**Description**

FROM:kkennelly DATE:7/9/2003 11:47:18 AM

Attached pdf shows results of rating sample db in 5.0 Release for multi-lane and single lane. Single lane set by setting "single lane" check box on Vehicle Advanced Analysis Settings. Also shows results for Service Pack 1 enhancement for Permit Restrictions.

FROM:bgoodrich DATE:Thursday, July 10, 2003 9:57:47 AM

I did find a bug in the BRASS engine when the results were passed to the results object. I fixed that error.

Additionally, some of the floorbeams are such that the single-lane loaded case produces the critical actions and therefore the critical rating factor. In this situation, BRASS reports the same rating factors for the single-lane and multiple-lanes loaded cases. I spoke with Jay Puckett regarding this issue and he indicated that a vehicle should not rely on another vehicle being in another lane to be able to cross the bridge.

I will forward a new BRASS-GIRDER DLL to WYDOT, so they can forward it to you.

**Description**

FROM:kkennelly DATE:7/11/2003 1:13:05 PM  
Provide the ability for users to specify how the appurtenance DL should be distributed when the structure only has a non-composite stage. Seems reasonable to allow user to distribute appurtenance loads equally to all girders even if girders aren't composite (eg, timber deck on steel beams - all appurtenance DL currently goes just to exterior girders).

Vinacs (Caltrans) sent the following email and attached bbd file.

Q4. As you know, the girders are non composite girders. Therefore, we typically places deck weight based on tributary area and equally distribute the barrier rail weight to all girders. Since I have a on-composite girder bridge, we have just load case (Stage 1) defined. VIRTIS uses the tributary area method for Stage 1 and as a result, the Barrier Rail is not distributed among all girders, instead it is placed on Exterior girder. I have pointed out this earlier also in a different bridge. Do you think this will get resolved in the near future and a user will get an option to equally distribute the barrier load for non-composite girders?

**Description**

FROM:jduray DATE:7/25/2003 10:55:12 AM  
From A. Gugino 7/14/2003 by letter to Ken.

It is very difficult and time consuming to access non-controlling rating results from Virtis that reside in BRASS. Additionally, it is difficult to access member capacity for any rating results. We often utilize non-controlling rating results to determine if a permit load is acceptable. For instance, with steel girders we have found that the bearing stiffener rating sometimes controls. This is useful information for conventional vehicles, but for permit routing may not be as critical to us as flexure, shear and overload (provision) rating results. Additionally, we use flexure and shear design load (the loading that the bridge was designed for) rating results and member capacity results to assist in determining if the bridge is correctly modeled. As noted, this information is often difficult to obtain in that it is buried in reams of output. We sometimes spend more time accessing rating results than we do modeling the bridge. Basically, we want to easy access to all rating results - not just the controlling ones.

### Description

FROM:jduray DATE:7/25/2003 10:56:07 AM  
From A. Gugino 7/14/2003 by letter to Ken.

3-D modeling and field testing show that bridges with significant skews experience much higher shear demand at the exterior and first interior girder adjacent to the obtuse corners. Accordingly, Caltrans design specifications require that the dead load and live load shear demands be increased at these locations. Virtis does not provide for this. This is not a requirement in the AASHTO LFD design or rating specifications but is required in the LRFD design specifications.

FROM:jduray DATE:7/31/2003 10:23:23 AM  
Requires changes to BRASS.

FROM: Herman Lee DATE: 7/17/2014 10:30:54 AM Eastern Daylight Time  
Shear skew adjustment factors based on the LRFD spec are considered in the LL distribution factor calculations.

### Description

FROM:jduray DATE:7/25/2003 10:57:03 AM  
From A. Gugino 7/14/2003 by letter to Ken.

There are at least two features lacking in Virtis that are required to make it a versatile permit routing tool for Caltrans. The first is the capability to associate bridge elements with permit movements, so that only the elements that are associated with the movement are evaluated. Most California bridges carry at least two directions of permit traffic. Bridges that have on or off ramps may contain several permit movements. When evaluating bridges for a permit vehicle it would be ideal to rate the portion of the structures that pertain to the permit movement requested. For instance, if the permit truck is traveling in the southbound direction only the girders in the southbound direction should be evaluated. This becomes important in widened structures where different portions of the bridge have significantly different capacities.

Secondly, the girder framing plan and typical section should be enhanced to display the girder names

so that a person reviewing the rating results can easily determine where the controlling members are located. This is required to facilitate escorted permit vehicles, which can often be diverted around a "weak" bridge element.

### Description

FROM:jduray DATE:7/25/2003 10:57:49 AM  
From A. Gugino 7/14/2003 by letter to Ken.

In California steel girders were often used to accommodate odd layouts such as those encountered in tapered bridges, curved alignments, or on and off-ramp situations. As a result, many bridges have non-parallel (tapered) steel girders. Virtis allows tapered girders to be modeled using the Girders System method, but it will not load rate them when modeled using this method. It has therefore been necessary to model tapered girders using the girder-line method to obtain an analysis. We much prefer to use the girder system entry method and would like this feature to be fully functional.

FROM:jduray DATE:7/31/2003 10:23:45 AM

Estimate: 80 hours if all user-defined loads.

160 hours if loads are to be computed within the domain based on tributary area for DL1 and tributary area or equally divided between mbrs for DL2.

### Description

FROM:jduray DATE:7/25/2003 10:58:30 AM  
From A. Gugino 7/14/2003 by letter to Ken.

Widened bridges often have girder types that are different than those of the original structure. The Girder System method does not accommodate these structures well. Each widened structure (sometimes there are several widenings) that have dissimilar girder types must be defined with a separate structure definition. This leads to a multitude of structure definitions within the bridge and is a very inefficient way to model a bridge. We would like Virtis modified, so that a single structure definition can accommodate different girder types.

FROM:kkennelly DATE:7/31/2003 10:01:16 AM

Based on the attached email from Vinacs, the following enhancements are actually being requested:

1. Allow for discrete changes in the deck thickness across the width of the structure in the Structure Typical Section window.
2. Allow for longitudinal deck joints to be described in the GUI. Allow for the distribution of appurtenance DL to take into consideration the presence of these longitudinal deck joints.
3. Allow each span of the member to have a different type of member alternative. For example, span 1 and span 3 are RC tee beams and span 2 is a P/S I beam. The beams are made continuous for live load by pouring a continuous deck.
4. Allow user to add a girder anywhere within the structure typical section instead of current restriction of added members always placed on right side of structure typical section. (request originally made at Caltrans Dec 2002 training.)

**Description**

FROM:kkennelly DATE:8/6/2003 1:28:15 PM

The existing training example we have for timber , "TMBR1-SingleSpanTimberExample.pdf", should be revised since 5.0 version now has "Deck" in the BWS tree.

FROM:kkennelly DATE:8/7/2003 8:27:09 AM

The "Deck (Cont'd)" tab has also been removed from the Structure Typical Section window and the "Deck" details window is also different.

FROM:hlee DATE:9/4/2003 8:05:19 AM

"TMBR1-SingleSpanTimberExample.pdf" has been revised for 5.0 version.

### Description

FROM:kkennelly DATE:8/6/2003 1:40:41 PM

In 5.0.1, run an HS20 rating for BID 12, Timber Training Bridge, Member G2. View the analysis results window. For axle and lane, 3 rows are displayed. One row is As-Requested for Impact and Lane, one row is Multi-lane and the other row is Single Lane. All 3 rows display the same results. Should we have both the Multi-Lane and Single Lane rows displayed with the same rating factors? The Deck Rating Results window has the same issue.

FROM:bgoodrich DATE:Wednesday, August 06, 2003 3:22:28 PM

Bearing is controlling the rating. The reactions are determined using the "Shear at Supports" distribution factors. For this structure, the same "Shear at Supports" distribution factor (1.0) is entered in the 1 Lane and Multi-Lane fields. If different values are input, the ratings will be different.

The deck rating window should only have two records for the axle: As Requested and Single lane

4/19/2016 3:17:27 PM

HRS AASHTO

1491

### Complete Issue Information

Without Impact. These two will always be the same. There is no Multi-lane case reported for timber deck rating.

FROM:kkennelly DATE:8/7/2003 8:11:02 AM

I see what you are saying for the member alt rating results.

I didn't word the part about the Deck Rating Results correctly. The Deck Rating Results controlling limit states say "Flexure - Multi-lane" but the Lane is listed as Single.

FROM:bgoodrich DATE:Thursday, August 07, 2003 11:36:47 AM

For deck ratings, the lanes loaded was determined based on the travelway width. However, it should have been set to one lane. The export (MaderoAnalysisCtl\_ASD.cpp) was corrected accordingly. I forwarded the updated file to Joe. Fixed for Version 5.1.

**Description**

FROM:gbarnhill DATE:Friday, August 08, 2003 9:45:56 AM  
 VirtisOpis is installed in folder C:\VirtisOpis50 and runs.

I unzipped SP501 to folder C:\virtisopis\sp501

I started Setup.exe

I answered YES to the first dialog.

The attached error dialog comes up.

FROM:jihnat DATE:8/8/2003 11:37:20 AM  
 Similar to 3695. Gale told me he uninstalled 4.2 after installing 5.0.0. This probably wiped out a necessary Registry entry.  
 To resolve, reinstall 5.0.0, make sure you select "Don't configure an ODBC data source. Should then be able to install SP1.

FROM:gbarnhill DATE:Friday, August 08, 2003 12:24:51 PM  
 Per Joe's instructions, I reinstalled 5.0.0 and was able to execute SP501.

### Description

FROM:kkennelly DATE:8/13/2003 11:00:28 AM

Not working: I have the "Automatic save new computed stringer reactions" checked on my Preferences:Analysis tab. Open BID 13, sit on superstructure definition and rate. Computed Stringer Reactions and Floorbeam Stringer Reactions windows open with correct data. Close BWS, not asked to save changes. Reopen BWS, reopen the Computed Stringer Reactions and Floorbeam Stringer Reactions windows and they don't have any data. These reactions should have been saved.

Working ok: Uncheck the "Automatic save new computed stringer reactions" on Preferences. Open BID13, rate superstructure definition. Open Computed Stringer Reactions window, appears ok, get open to select reactions and hit OK to copy the reactions to the Floorbeam Stringer Reactions window. Close BWS, get asked to save changes, say yes. Reopen BWS, the Computed Stringer Reactions and Floorbeam Stringer Reactions show the reactions that were saved.

FROM:mordoobadi DATE:8/22/2003 10:52:43 AM

Code added to the Analysis Progress window to mark BWS document modified if necessary. Fixed for 5.1.0.

### Description

FROM:dteal DATE:Monday, August 18, 2003 10:20:45 AM

In version 5.0.1 the Analysis Setting, Advanced Button there used to be a box to force it to be a single lane. Now this box is for a tandem train. Where did the single lane only go?

Up through version 5.0.0 in our Analysis Settings Templates for the Vehicle Properties for a T130 and T170 truck we had single lane loaded checked. Now in 5.0.1 this column has been changed to tandem train and is unchecked. Did the service patch remove the option for single lane loaded and replace it with a tandem train? Did the service patch change the settings in this window without calling the users attention to it other than enhancement #1463? How do we analyze and rate with single lane loaded now?

FROM:jduray DATE:8/18/2003 11:27:01 AM

The "Single-lane Loaded" checkbox was remove at the direction of the TF when we implemented the Permit restrictions in SP1. Another enhancement for 5.0.1 added a column to indicate tandem train. The settings were changed and the only notice is the list of enhancements. How do you suggest we notify the users?

## Complete Issue Information

For an LFD rating how do I force a single lane?  
How do I analyze a single lane in phase const.(LRDF)?

FROM:dteal DATE:Wednesday, August 20, 2003 10:03:10 PM

We talked at the user group meeting and resolved this - please close this incident.

FROM:dteal DATE:Tuesday, September 09, 2003 2:48:35 PM

In Virtis the change has been OK, we can pick which output to look at. But in Opis, how can we force the design review to look at single lane only??

FROM:dteal DATE:Wednesday, September 10, 2003 1:02:30 PM

Does the removal of the Single Lane Loaded option in version 5.0 in the analysis settings over ride the Live Load Lanes in the Girder Line/System Superstructure Definition window? I don't believe that this Live Load lanes button had anything to do with the number of trucks but only the distribution factors?

FROM:dteal DATE:Thursday, September 18, 2003 8:25:57 AM

The single lane loaded option eliminates an opportunity for confusion when determining what the live load reactions are to use in a LRFD substructure design. How do we do this now??

FROM:bgoodrich DATE:Friday, November 07, 2003 5:39:46 PM

Track field marked with "Resubmit 9/9/03", so status set accordingly.

FROM:dteal DATE:Friday, January 30, 2004 1:32:18 PM

Without the single lane loaded option for design we have to play alot of games to do substructure designs!

FROM:bgoodrich DATE:Thursday, September 30, 2004 10:33:37 AM

This issue is related to Incident 5368.

FROM:dteal DATE:Thursday, September 30, 2004 11:13:27 AM

Okay, here's a real problem with the removal of the single lane loaded check box on the advanced tab of the vehicle properties window. When doing a batch rating, we would have 8 trucks in the list. Two of these trucks (T130 & T170) are to be single lane distribution.

Option #1 – Girder Line structure definition requires two runs, declare single lane loaded on the structure definition GUI, run it, then change it to multi lane and run it again. You would have to do this for each structure in your batch. Not a good solution – any suggestions?

Option #2 – Girder System definition completely eliminates batch ratings. In order to get the single lane distribution you have to enter a scale factor for these two trucks. To get the scale factor you divide the single lane Distribution by the multilane distribution. The problem is that this scale factor is not the same for all trucks. The Dist. Factor is based on girder spacing which may be different for every structure in your batch. Any suggestions for a work around?

When the TF directed you to remove this button I don't feel it was a well thought out plan.

| 4766.12580 | Suspended     | Shear Reinforcement Wizard |

## Description

FROM:dteal DATE:Wednesday, August 27, 2003 12:29:57 PM

Kansas has never allowed steel design to take advantage of plastic moments. Now in LRFD it is harder yet to ignore the section reduction resulting from plastic moment design.

Using the flow chart on page 6-67 of the LRFD AASHTO Spec book, is there anyway to work around Article 6.10.4.1.3 (always say NO). This is the second item in the flow chart? ie, never let the section go plastic, be non-compact in both pos and neg.

FROM:dkemna DATE:Thursday, August 28, 2003 2:10:34 PM

Missouri would like to design non-compact throughout, and I have not found a way to do it in OPIS.

FROM:bgoodrich DATE:Friday, October 24, 2003 1:09:36 PM

BRASS will analyze a section as non-compact if any of the following conditions occur at the point of interest being considered:

1. Yield stress > 70 ksi
2. Providing a longitudinal stiffener
3. Variable web depth

4/19/2016 3:17:29 PM

HRS AASHTO

1502

**Complete Issue Information**

However, I doubt any of these conditions occur in the design. Therefore, I believe a user controlled option would be beneficial for this issue. A parameter could be added to the STEEL-SPECIFICATION command for indicating if a non-compact analysis should be performed. BRASS already gives an option for controlling if the Q Formula is used or not, so this would be similar to implement. I will forward this issue to WYDOT for consideration.

FROM:bgoodrich DATE:Monday, October 27, 2003 10:48:37 PM

E-mail from Mike Watters:

I will add this to the enhancement list for consideration and prioritization by the BRASS users.

Micheal J. Watters, P.E.  
Bridge Engineering Systems Manager

FROM:bgoodrich DATE:Monday, October 27, 2003 10:49:10 PM

Changed status to 'Suspended'.

FROM:bgoodrich DATE:Wednesday, February 02, 2005 2:03:44 PM

WYDOT authorized this work under BRASS Problem Log 543. This work was completed for BRASS-GIRDER(LRFD) 1.6.1, but this option must be added to the engine data in Opis.

FROM:jduray DATE:4/14/2005 11:42:30 AM

When the BRASS work is complete assign to jduray so the Opis part can be completed.

FROM:bgoodrich DATE:Tuesday, May 31, 2005 2:19:24 PM

The export has been updated. Fixed for version 5.3 SP1.

FROM:jduray DATE:6/28/2005 9:08:26 AM

Engine data window should have an option for this.

## Description

FROM:dteal DATE:Thursday, August 28, 2003 3:27:46 PM

Is there any workarounds to accomplish partial tensioning of prestressed strands? We are working with inverted T's. We have to partially tension 2 strands in the top of the stem for constructability (control cracks). They only get tensioned to about 15 to 20 kN per strand, not much more than pulling the slack out.

FROM:kkennelly DATE:10/24/2003 8:43:36 AM

The only thing I can think of is to enter the Strand Layout using the "P and CGS" method instead of picking the actual strands in the beam schematic on that window.

## Description

FROM:dteal DATE:Tuesday, September 09, 2003 11:45:40 AM

In reviewing the LRFD analysis results for a prestressed beam bridge, an error was discovered in the output. This error is for the moment in the beam produced by the prestress force. The location of the error is at the beginning end point of the beam in the last span. In this particular 3 span bridge, that location is at the 3.000L pt. Within the Prestress output file, the program is using 0.000 mm as the centroid location of the prestressed beam at that location. The correct value is 533.436 mm. When calculating the moment, the program subtracts the prestressing strand centroid from the beam centroid

4/19/2016 3:17:31 PM

HRS AASHTO

1509

### Description

FROM:bgoodrich DATE:Tuesday, September 09, 2003 1:38:06 PM  
Entered for Lowell Johnson (MnDOT) (9/9/03):

We discovered a problem with the names of agency defined vehicles. Quotation marks are not accepted for more than one vehicle named at a time. We had three vehicle names that contained quotation marks which we had been using for a couple years or more. Everything worked after we removed the quote marks. This seems like a minor problem, but Dale Klossner suggested I inform you anyway.

These are the files as we have them now. They now work fine, as they did before, in v 4.2. The change we made was in the truck name. We took out the quotation marks.

|              |              |
|--------------|--------------|
| Present name | Former name  |
| Standard A   | Standard "A" |
| Standard B   | Standard "B" |
| Standard C   | Standard "C" |

## Complete Issue Information

One of these would run at a time. When we tried to run 2 or three of them at once, we got the following error message:

```
Message detail: Detail
Error generating LFD/ASD load commands!
Error preparing vehicles for export
  Unable to add vehicle to results object
Multiple instances of the same vehicle are not allowed
  Vehicle: STANDARD_"~1
-----
```

I'm not sure of those symbols at the end of that last line.

I recall a year or more ago there was a problem using some other symbol in the name of a vehicle (a dash ?) It worked when we changed that symbol to a slash.

I hope I have thoroughly described this problem. (Former problem) If you have any further questions, please call or email.

Lowell Johnson, PE  
Bridge Rating Engineer

FROM: bgoodrich DATE: Tuesday, September 09, 2003 1:45:43 PM

The quotation marks are not causing the problem with the export of the vehicle names. The following discussion outlines the problem.

BRASS only permits vehicle names to be 12 characters. Because each Virtis/Opis vehicle can consist of a truck, tandem, and lane, the export modifies the vehicle name by adding a suffix to the end of the Virtis/Opis name. For example, 'Standard "A"' becomes 'Standard\_"A"\_TRK', 'Standard\_"A"\_TAN', and 'Standard\_"A"\_LAN'. These generated names then have to be reduced to 12 characters. When the generated names are longer than the limit, the names are truncated to 10 characters and a new suffix is added indicating the number of the vehicle within the group (1 = truck, 2 = tandem, 3 = lane). The generated names then become: 'Standard\_"~1', 'Standard\_"~2', and 'Standard\_"~3'. This works fine when the first 10 characters in the Virtis/Opis vehicle names are all unique. Otherwise, the export generates the same vehicle names for several vehicles and groups.

The work-around is to keep the first 10 characters of the Virtis/Opis vehicle names unique.

We have tried to export as much of the name as possible, so the user could easily review the BRASS output file and recognize the vehicles. We need to determine how to address the issue. The best solution I can think of is to export the vehicle names with the ~ plus a number that is calculated as: (<Vehicle Number> - 1) \* 3 + <1, 2, or 3 for truck, tandem, or lane types>

The MnDOT trucks would then be exported as:

```
Standard "A" => Standard_"~1
Standard "B" => Standard_"~4
Standard "C" => Standard_"~7
```

**Complete Issue Information**

We should also add a discussion in the help on how the export generates vehicle names for BRASS.

FROM:jduray DATE:9/9/2003 2:18:45 PM

Brian - go ahead and make the change in the export. It will go in the first service pack for 5.1. The help discussion should go in the engine help.

FROM:jduray DATE:9/12/2003 2:01:44 PM

Perhaps we can get this into 5.1 since it has been delayed two weeks.

FROM:bgoodrich DATE:Monday, September 15, 2003 9:43:00 PM

I updated the vehicle export files in the BRASS export as described in my comments on 9/9/03. Fixed for Version 5.1.

### Description

FROM:dteal DATE:Wednesday, September 10, 2003 4:22:51 PM

In the attached bbd we ran into some problems with a floor system in version 5.0.1. Our rating engineer entered the top and bottom flanges for the girder member, girder member alternative, girder profile – SAVED the bridge – and then went to a view schematic. First came a run time error followed by an application error followed by Virtis closing.

Upon re-logging into Virtis – went to the girder member, girder member alternative, girder profile and the top and bottom flanges that where entered and saved are not there.

The girder member alternative – Haunche Platte Girder #1 – and selected view schematic (without entering anything) and virtis closed by itself.

**Complete Issue Information**

I'm getting the following error in member G8 of the attached Virtis v/5.0 model. It's telling me I can't have more than 50 stirrups in a member.

Error generating LFD/ASD schedule commands!  
09:00:39 AM - Line 214 in source file D:\Virtis\gui\AbxBrass\BrassStdSchedules.cpp.

No. of ranges per span = 65 (Maximum = 50)  
09:00:39 AM - Line 1013 in source file D:\Virtis\gui\AbxBrass\EngineExport.cpp.

Maximum number of schedule ranges exceeded for BRASS!  
09:00:39 AM - Line 1013 in source file D:\Virtis\gui\AbxBrass\EngineExport.cpp.

Error generating STIRRUP-SCHEDULE or STIRRUP-GROUP commands!  
09:00:39 AM - Line 833 in source file D:\Virtis\gui\AbxBrass\BrassStirrupScheduleGroupCmd.c

FROM: bgoodrich DATE: Monday, September 15, 2003 5:38:14 PM  
This issue is identical to Incident 3884. A maximum of 50 stirrup ranges is allowed in BRASS. BRASS requires consecutive stirrup ranges, i.e., the superimposed stirrup ranges in Virtis results in several small ranges when the superimposed stirrup spacing is not the same.

FROM: bmccaffrey DATE: Wednesday, September 17, 2003 8:55:26 AM

This doesn't make sense. Why did this work in previous releases then???

The user shouldn't have to worry about how the engine handles multiple ranges.

### Description

FROM:kkennelly DATE:9/16/2003 3:34:42 PM

Submitted on behalf of Kristen Cary, Edwards & Kelcey via phone call.

ASD rating - BRASS is incorrectly rating the deck in the region of DL contraflexure for tension capacity. Bridge rated ok in 5.0.

FROM:kkennelly DATE:9/17/2003 8:26:29 AM

I checked with Brian and he said there is no work around other than to have them load the BRASS DLL we had with Virtis 5.0 with Virtis 5.0.1 so they can use the new Virtis features with a BRASS DLL that works.

FROM:bgoodrich DATE:Wednesday, September 17, 2003 12:07:37 PM

This issue is the same as Incidents 4687 and 4772. I have forwarded this issue to WYDOT, so they are aware that this is the fourth user that has encountered this problem.

FROM:bgoodrich DATE:Thursday, September 18, 2003 12:28:52 PM

On 9/18/03, WYDOT again denied this request as it pertains to ASD.

FROM:bgoodrich DATE:Monday, October 13, 2003 12:38:20 PM

The correction that addressed Incident 4493 was undone, which prevents the incorrect ASD ratings from this incident. This incident will remain suspended.

## Description

FROM:dteal DATE:Wednesday, September 17, 2003 10:45:54 AM

When a steel rolled beam has a cover plate attached to the top flange plate, BRASS combines the top flange plate and cover plate into one equivalent flange plate. This equivalent flange plate has the same cross sectional area as the sum of the top flange plate and cover plate. However, I am not able to determine how BRASS determines the width and thickness of the equivalent flange plate. Can you explain the value BRASS comes up with?

FROM:bgoodrich DATE:Wednesday, September 17, 2003 12:23:33 PM

4/19/2016 3:17:33 PM

HRS AASHTO

1523

### Complete Issue Information

The equivalent area (A) and moment of inertia (I) are calculated for the group consisting of the flange and cover plate. For the equivalent rectangular flange plate,  $A=b*h$  and  $I=b*h^3/12$ , where the width (b) and height (h) are unknown. The moment of inertia equation is rearranged and solved for the height, i.e.,  $h=\text{SQRT}[12*I/(b*h)]=\text{SQRT}[12*I/A]$ . Once the height is known, the width can be found as  $b=A/h$ .

**Complete Issue Information**

Attached please find bridge file 904990. I am having problem getting the main girder to run, and have tried it as a system or line girder and seem to be having the same problem. Can you help. Thank you Osiris Quintana

FROM:hlee DATE:9/19/2003 2:50:37 PM  
E-mail to Osiris Quintana:

=====  
=====

The easiest way to locate the problems is to validate the structure definition. To validate "Spans 20, 21 and 22" system structure definition, select the definition in the Bridge Workspace and select Bridge/Validate from the menu.

The following are the error messages:

- 1. ERROR: Travelway not on structure typical section at end of structure.
- 2. ERROR: Member Girder 2 not located within structure typical section at end of structure.

These problems are illustrated in the Structure Typical Section schematic at the end of the structure (See attached bitmap). To fix these problems, open the Structural Typical Section window, click on the "Distance from right edge..." edit box and then click on the "Distance from left edge..." edit box, the "Distance from right edge..." will then copy to the end of the structure. Click OK to close the window.

Also, the following need to be fixed/checked for G1 to run:

- 1. Add a floorbeam at the beginning of the structure.
- 2. Assign stringer group definitions to all stringer units and define the stringer member alternatives for the stringer definition.
- 3. Double check the location of the sidewalks and generic appurtenances at the end of the structure.
- 4. Double check the girder web profile. Is it possible to have just one or two parabolic shapes in each span?
- 5. Change the location of the first stringer so it will not be the same as the main girder.

The "FS1 - Girder Floorbeam Stringer Example" under Contents/Tutorials in Virtis support web site (<http://aashto.bakerprojects.com>) shows how to enter a GFS system bridge.

## Complete Issue Information

The member alternative that generates the attached error message is G2 in "Spans 20, 21 and 22" structure definition.

There is no error message if the last parabolic web profile is changed to linear.

FROM: bgoodrich DATE: Tuesday, September 23, 2003 5:12:46 PM

I have tracked the problem to a domain function. The BRASS export calls CDoGirderMbrAlt::GenerateCrossSectionInfo function which in turn calls CDoGirderMbrAlt::FillCrossSectionData which calls CDoGirderMbrAlt::GetParabola which calls CDoSuperStructSpngMbrAlt::GetParabola(IDoSteelWebPlateRangeSetPtr& DoWebPlateRangeSetPtr, double dDistance, short iUnit). This GetParabola function throws an unhandled exception which is caught by the export. The DoWebPlateRangeSetPtr->GetDepthVariationType() line seems to be the culprit, but I am not sure why.

Krishna - Please investigate.

FROM: hlee DATE: 9/26/2003 1:26:20 PM

Fixed GetParabola() at end of RangeSet. This incident will be resolved in 5.1.0 SP1.

To Do: Update abognr\DoSuperStructSpngMbrAlt.cpp once "Virtis 5.1 Maintenance" is available in sourcesafe.

FROM: hlee DATE: 10/9/2003 12:20:34 PM

abognr\DoSuperStructSpngMbrAlt.cpp has been revised again for VI 4816.

## Description

FROM:dteal DATE:Wednesday, September 24, 2003 10:13:47 AM

In the attached bbd. I am attempting to delete the structure definition "OLD Voided Design Check DRT". The delete went fine but when I attempt to save the file I get the below error message. Can you tell me what it means and how to delete this structure definition?

Unable to save Bridge data!

Delete process failed while deleting CDmStructDef (SaveOrder object 69).

Error deleting record from database record set.

State:23000,Native:2292,Origin:[Oracle][ODBC][Ora] State:23000,Native:2292,Origin:[Oracle][ODBC][Ora]

ORA-02292: integrity constraint (VIRTIS.R\_2582) violated - child record found  
ORA-02292: integrity constraint (VIRTIS.R\_2582) violated - child record found

FROM:mordoobadi DATE:9/24/2003 2:40:00 PM

The error appears to be because you have the structure definition "OLD Voided Design Check DRT" checked-out.

If you have a structure definition checked-out (not the whole bridge) The database does not allow you to delete that structure definition. Because of data in some child tables (That store check-out info). GUI should verify that the structure definition that is being deleted is not checked-out then allow the user to delete it.

FROM:mordoobadi DATE:9/24/2003 3:13:05 PM

I talked to Dean Teal and verified that the structure definition was checked-out. After he checked-in the struture defintion and checked-out the whole bridge he was able to delete the struture defintion and save.

FROM:jduray DATE:Friday, September 26, 2003 1:21:41 PM

It seems we need to build a check into the gui or domain so the user gets a more meaningful message.

FROM:mordoobadi DATE:9/30/2003 2:08:06 PM

I think we need to do the following in the domain.

- 1 - If one or more structure definitions are checked-out by a user and the same user is checking out the whole bridge. Domain should check-in the checked-out structure defs and then check-out the bridge.
- 2 - When the user deletes a structure def, we should make sure that it is not checked-out.

## Description

FROM:dteal DATE:Friday, September 26, 2003 11:51:08 AM

Design of the cover plated rolled beam bridge. One of the checks that I believe should be made is the Width/Thickness ratio of the cover plates. BRASS LRFD combines the top cover plate with the top flange plate into a single equivalent flange plate. This equivalent flange plate is then used for all specification checks. For the bottom flange, all specification checks are for the bottom flange only. I can not find any specification check of the bottom cover plate. 6.9.4.2 LRFD ASSHTO Specifications covers the slenderness of plates to ensure the development of the yield strength is in compression before the onset of local bending. This is one possible specification that may need to be checked. Is it checked and I've missed it?

FROM:jduray DATE:Friday, September 26, 2003 1:37:12 PM

FROM:bgoodrich DATE:Friday, September 26, 2003 4:42:30 PM

BRASS-GIRDER(LRFD) does not support a top cover plate and composite slab in the same cross section. When this condition occurs in Opis, the export to BRASS merges the top flange and cover plate, so the composite slab can be included. In most cases, the cover plates are not independently checked. Cover plates are considered in determining the yield moment. Finally, BRASS-GIRDER (LRFD) does not check ASSHTO LRFD 6.9.4.2 for cover plates.

Dean - Please provide a list of specification checks you wish to see include the cover plates, so I can forward this request to WYDOT. Also, submit a BBD file with this type of structure.

## Description

FROM:bgoodrich DATE:Tuesday, October 07, 2003 4:56:57 PM

The Action Output Level in the engine properties of the Analysis Settings window must be set appropriately to get output at the user-defined point. The default is 10th points. The "Print Actions at all node points" option must be selected. Was this the case?

**Complete Issue Information**

FROM:bgoodrich DATE:Tuesday, October 14, 2003 11:48:13 AM  
I spoke with Jim and he indicated this issue came from the Virtis training Montana DOT during September. Jim agreed that the actions probably didn't show up in the graph or tabular report because the actions at 10th point option was specified by default. Therefore, this issue will be closed.

### Description

FROM:hlee DATE:9/26/2003 2:17:29 PM

The GetParabola(...) function in abognrl/DoSuperStructSpngMbrAlt.cpp returns the web depth at a given location along the spans. I don't understand the logic in taking into account the slope of adjacent web range (VI 3222). And I don't think the web depths exported to BRASS are correct.

The G2 girder member alt in the attached bbd has 3 spans (70', 110', 70'), the web profile is symmetrical about the mid-point of the structure. The exported web depth at 49' from the beginning of the structure is different from the exported web depth at 49' from the end of the structure. The web depths should be the same for symmetrical profile.

FROM:jduray DATE:Friday, September 26, 2003 3:19:25 PM

FROM:kkennelly DATE:9/30/2003 3:25:46 PM

The web depths weren't symmetrical due to a bug. That is fixed.

4/19/2016 3:17:37 PM

HRS AASHTO

1539

**Complete Issue Information**

The user has entered 2 adjacent parabolic web ranges but the parabolas are discontinuous. The domain assumes that consecutive parabolas are continuous. The UI does not let the user enter the data needed to describe adjacent parabolas that are discontinuous. Warn user and add restriction to help.

FROM:kkennelly DATE:10/2/2003 12:54:05 PM  
Validation added to Steel Web Profile windows and Steel Cross Section Ranges window to check that adjacent parabolic ranges are continuous. Also added validation that adjacent parabolic ranges are continuous to the GirderMbrAlt, FloorbeamMbrAlt and StringerMbrAlt classes. Validation performed when closing those windows or saving the bridge.

Check in and pin when Version 5.1 Maintenance is available in Sourcesafe.

FROM:kkennelly DATE:10/3/2003 4:23:56 PM  
All versions checked in and pinned.

Brian,  
The export should call ValidateSteelWebContinuousParabola() for DoGirderMbrAlt, DoStringerMbrAlt and DoFloorbeamMbrAlt that are steel plate or built up beams and issue a warning message similar to that issued by the domain if it returns false.

FROM:bgoodrich DATE:Wednesday, October 15, 2003 1:21:21 PM  
I updated the export (EngineExport.cpp) to call the ValidateSteelWebContinuousParabola function and issue a warning similar to the GUI if appropriate. Fixed for Version 5.1 SP1.

FROM:gbarnhill DATE:Tuesday, January 13, 2004 5:08:15 PM  
OK v 5.1.1 -- I get the warning messages in the GUI if I try to create parabolas in adjacent ranges. If I disregard the message, I get the same messages in the EXPORT.

FROM:bgoodrich DATE:Thursday, September 23, 2004 11:02:58 AM  
Track field marked with "gale OK". Accepted.

| 4823.12524 | Resolved      | Typ section schematic not drawing metric railing correctly |

### Description

FROM:jduray DATE:Friday, September 26, 2003 4:32:15 PM

It would be helpful for Opis to provide a tool for designing shear reinforcement. Perhaps the computations provided by the p/s design tool could be used as a start.

## Complete Issue Information

There is a bearing stiffener called "Pier # 3 & 4 Bearing Stiffeners". Looking at Member 2, Support 4 (which is pier #3) the pulldown list has the pier 3 & 4 stiffener listed, select it and OK the window. Reopen the window the name field will be blank.

You can not select this bearing stiffener for any support. It appears in the pulldown, it's there after an apply, when you leave and come back to the window it's gone.

FROM:jihnata DATE:10/6/2003 4:14:05 PM

The stiffener name has an extra space on the end. Remove the trailing space, then the stiffener can be selected in the support.

| 4834.12513 | Resolved      | LRFD Analysis Output Report in Report Tool does not report if the controlling moment/ shear is due to Tandem Train |

**Description**

FROM:dteal DATE:Thursday, October 02, 2003 12:06:49 PM  
5.1 Beta 3, same in 5.0.1, using Oracle

I have one bridge in my "Deleted Bridges" folder. Using the BridgeWare Admin Utility program logged in as the administrator, I selected the Empty Deleted Bridges Folder from the Database Cleanup area. I get the following error message – Unable to delete bridge from the database! I am able to empty the deleted bridges folder from inside Virtis with the same login.

If the folder was empty I get a message stating that Zero bridges where deleted.

FROM:mordoobadi DATE:3/11/2004 12:23:13 PM  
The "Empty Deleted Bridges Folder" does exactly what the GUI does. (calls CDoBridgeManager::DeleteBridge(IBridgeld) )  
I am not able to reproduce this problem.

### Description

FROM:kkennelly DATE:10/8/2003 1:26:14 PM  
Submitted by KKennelly on behalf of Vinacs via email:

Problem Statement:

Two different criteria are used to estimate positive moment capacity numbers at the 0.4th point of Span 1 of a 2 Span continuous prestressed girder bridge. (See below shown in blue color). It appears to us that the strength based on prestressed section criteria is used to estimate HS20 Truck rating, however, non-Prestressed section criteria is used to estimate HS20 Lane rating. Why? What is the difference?

Note that  $\Phi \cdot M_n$  of the value estimated yield the same value (4877.51 ft-kip).

Other Questions:

1. Program does not show the intermediate steps that is used (such as  $f'_c$ ,  $d_{ps}$ ,  $f_{pu}$ ) to arrive the capacity.

Bridge: 53C1011

Structure Alternative: Span 1and 2 (Model 1)

Girder: G2

Girder Alternative: Interior

Performing Rating Factor Calculations

Analysis Point: 104.01

Load Level : 1

Truck No. : 1 - Truck: AASHTO H 20-S 16 Loading, 1944 Ed

Load Factors:

Gamma = 1.30      Phi(flexure) = 1.00

Beta (DL) = 1.00      Beta (LL) = 1.67

Strength Rating Factor - Flexure (Positive Action)

**HRS AASHTO**

1557

**Complete Issue Information**

This issue was investigated and an error was found that affected the calculation of the moment capacity for all live loads except the first. The flag that identifies if a prestressed concrete section is considered mildly reinforced was not reinitialized for each flexure sense (positive and negative) for each live load. This is why the moment capacity for the first live load (HS20 Truck) was fine, but the moment capacity for the second was incorrect. This issue was corrected in BRASS-GIRDER 5.8.8. Fixed for version 5.2.0.

The lack of intermediate output for the moment capacity is due to the lack of a control option within the BRASS™ engine properties in the Virtis® user interface. This output can be enabled using the SYSTEM-1 command. This issue must be addressed in Virtis®. This issue is requested in Incident 4899.

FROM:vvinayagamoorthy DATE:Monday, December 01, 2003 10:18:13 AM

When I reported this incident, I thought, BRASS correctly estimate the capacity and incorrectly printout the header message "Strength based on Non-prestressed section". I thought control card was reset inadvertently.

However, your findings are some what puzzling.

Estimated Capacities of the section with different assumptions (ps tendons are treated as tendons in the first case, and prestressed tendons are considered as reinforcement in the second case) were found to be the same. These should be, in my opinion, different. The ultimate tendon stress is fsu (given by equation 9-17) when we treat the tendon as ps tenson. However, I believe, the ultimate stress will be f's when we treat the tendon as reinforcement. I am not sure how BRASS estimated the ultimate stress when it treated the tendons as reinforcement. Please check the intermediate steps and be sure BRASS estimate the capacity correctly.

If the intermediate results (f'c, fps, etc) are reported, user could verify the results.

**Description**

FROM:dteal DATE:Wednesday, October 08, 2003 2:55:14 PM

I would like to save analysis settings templates with different settings on the engine tab. One for Steel (Strength I, Service I&II and Fatigue), one for Prestressed (Strength I, Service I&III and Fatigue) and one for Reinforced Concrete (Strength I, Service I and Fatigue).

No matter what template I save the engine tab doesn't save with it. It comes up the way it was last used regardless of the saved template. Is this acting correctly? If it is – can this enhancement be added to our wish list.

FROM:jduray DATE:10/9/2003 8:40:48 AM

Mehrdad - Are we saving engine settings with the template?

FROM:jduray DATE:4/8/2005 1:54:06 PM

Engine properties are being saved properly.

| 4843.12504 | Closed        | Composite Steel Girder Positive Moment Capacity is wrong |

### Description

FROM:dteal DATE:Friday, October 10, 2003 9:17:50 AM

When the GUI for the dimensions shows a Single Tee , the GUI for the strand grid shows a double tee. It always shows a double tee. In the strand grid. Is this the way it was intended to be shown in the strand grid?

FROM:hlee DATE:10/13/2003 8:01:53 AM

The intend of the strand grid bitmap is to clarify the terms "Row No." and "Vertical Distance from bottom". For 1-void and 3-void PS box beam, the strand grid bitmap will show a 1-void box beam. For 1-stem, 2-stem, and 3-stem PS tee beam, the strand grid will show a 1 1/2 stem typical tee beam.

Dean, do you want to change this to an enhancement request?

FROM:dteal DATE:Monday, October 13, 2003 3:00:13 PM

All I wanted to know was if you intended on showing 1 1/2 stems in the strand grid GUI when the Dimensions GUI only showed 1 stem,?? If this is what was intended – fine. I just wanted to be sure. Not asking for an enhancement, just wanted to clarify.

FROM:hlee DATE:10/13/2003 4:59:52 PM

Showing 1 1/2 stems in the tee beam strand grid GUI when the dimensions GUI only showed 1 stem is what was intended.

**Description**

FROM:kkennelly DATE:10/13/2003 1:06:10 PM  
 Submitted on behalf of Vinacs via email received 10/10/03:

I am attaching a bridge that has 11 span and every other span has two hinges (or dropped-in span). This bridge is a composite steel girder bridge. The positive moment capacity with dropped-in span bridge is estimated wrong. Although the section is composite and capacity could be based on composite-compact section, program estimated the capacity based on first yield only. Please check this!

In order to verify this program, I created the dropped-in span bridge model as a simple span bridge and the program estimated the capacity based on compact-composite section details.

You could look at any of the Girder, however, I recommend you review the G5 (exterior on the right)

FROM:bgoodrich DATE:Monday, October 13, 2003 1:12:53 PM

Vinacs - I have been investigating Incident 4843, which pertains to BRASS calculating the flexural capacity of a composite steel bridge as the moment at first yield. Have you tried checking the "Compactness at the Pier" boxes for each span in the engine properties for the member alternative? If not, please review the window and associated help topic that discusses that this must be done for BRASS to consider AASHTO Equations 10-129b and 10-129c. This help topic also points to the STEEL-GIRDER-CONTROL command help topic.

FROM:bgoodrich DATE:Tuesday, October 14, 2003 2:43:23 PM

E-mail from Vinacs (10/14/03):

For your information: The girders at the bent location are not compact (BRASS calculations at bents confirms that). However as you suggested I checked the boxes for compactness over the piers. When I checked the boxes for the compactness at pier, program gave me the plastic moment capacity.

I understand the logic that you are suggesting. According to AASHTO specification, the section capacity can be taken as  $M_p$  only if the girder is compact at pier. If the sections at Pier is noncompact, the moment capacity will be  $M_y + A(\mu - M_s)$  (subscript: pier) and BRASS does not do the  $A(\mu - M_s)$  pier and as a result, it reports the capacity as  $M_y$ . Since I did not check the boxes for compactness at bent within the BRASS engine module, export program treated it as non-compact at piers. The question is whether the BRASS assumption is correct or not. For a typical continuous span steel girder bridge, this might be OK, but what we have is not a typical continuous span girder.

In this particular bridge, we have a drop in span where we have two hinges within a span, and I think, the compactness at the pier does not limit the ability of the drop-in span girder from reaching its full plastic capacity. Therefore, sections between the hinges within a span should be modeled using "section type 41."

Vinacs M Vinayagamoorthy  
916-227-8657

FROM:bgoodrich DATE:Wednesday, October 15, 2003 11:07:46 AM

Jay and I agree that the drop-in spans should be considered in the same manner as simple spans, i.e., using the "41" code between the hinges in each span with a drop-in. The BRASS engine isn't making the assumptions regarding the "4" or "41" codes - the export is. Therefore, this issue must be addressed in the BRASS export process. I will begin the necessary modifications ASAP.

FROM:bgoodrich DATE:Wednesday, October 22, 2003 4:11:53 PM

I modified the export (BrassSteelGirderControlCmd.cpp and BrassCmd.cpp) to add a cross section change at the hinges. When two hinges are detected in a span, as in the case of a drop-in span, the export exports the "41" code instead of the "4" code. Fixed for version 5.1 service pack 1.

FROM:gbarhill DATE:Tuesday, January 13, 2004 4:16:26 PM  
OK in v5.1.1 -- Using Vinac's file, I can verify the export sets STEEL-GIRDER-CONTROL command values to 41 for those spans with 2 hinges.

DO WE NEED TO ADD SOMETHING IN HELP OR MAYBE ADD A COMMENT TO THE EXPORT TO INDICATE THE ASSUMPTIONS VIRTIS IS MAKING ???

FROM:bgoodrich DATE:Thursday, January 15, 2004 4:07:53 PM  
I added the following comments to the exported data file:

COMMENT The section type for the following range is set to  
COMMENT 41 because a drop-in span was detected. The section  
COMMENT may therefore reach its full plastic flexural capacity.

I also added some new text to the "Member Alternative/Beam Definition Properties: Analysis" topic in the "Girder(LFD) Properties.hlp file". I added the following to the "Compactness at the Pier" section:

Exceptions:

1. Ranges within a simple-span will automatically be exported with Section Type 41.
2. Ranges between two hinges in the same span (i.e., a drop-in span) will automatically be exported with Section Type 41.

FROM:gbarhill DATE:Friday, January 16, 2004 4:38:02 PM  
OK 5.1.1 with Brian's new additions to EXPORT and Help.

Postscript: Does this also apply to the simple span created by a hinge in Span 1 ??

FROM:bgoodrich DATE:Friday, January 16, 2004 6:51:04 PM  
Gale made a good point regarding the case of a single hinge in an end span. Therefore, I modified the export and help accordingly. Fixed for Version 5.1.1.

FROM:bgoodrich DATE:Thursday, September 23, 2004 11:06:12 AM  
Track field marked with "gale OK". Accepted.

FROM:bgoodrich DATE:Thursday, September 23, 2004 11:06:33 AM  
Closed.

## Description

FROM:jihnat DATE:10/15/2003 3:04:32 PM  
Submitted via email:

I have created a Virtis file for a bridge that runs fine in Virtis. I then exported that file to a disk to send to the client. There were no error messages during exporting. However, when that bbd file is imported back into Virtis the client and I both got the following error messages:

Incomplete retrieval of data  
Incomplete retrieval of data  
Cannot set cross section data if structure def's deck panel doesn't exist

I have attached a copy of the bbd file in question. The Virtis version that I'm working on is 5.0.1. The structure is a simple span built-up steel girder bridge.

FROM:bgoodrich DATE:Monday, October 27, 2003 10:59:24 PM  
WYDOT assigned this issue to BRASS Problem Log 465.

FROM:bgoodrich DATE: 01/26/2004

I have determined that the secondary moments reported by BRASS are due to prestress losses applied to the continuous structure. Input losses were specified in which 18 ksi are taken on the non-composite simple spans, and then 17 ksi were taken after the structure becomes composite and continuous. If AASHTO losses had been specified, all losses would have been considered on the simple spans and no secondary moments would have been reported. Therefore, a secondary moment does exist when input losses are specified. However, for the purposes of calculating the flexure rating factor, Jay and I agree that this secondary moment should not be considered because it is due to the prestress losses and this is an ultimate strength check. If this secondary moment were to be removed from the flexure rating factor calculation, would this address your issue?

Subject: Virtis Incident 4847

Vinacs,

I have been instructed to start preparations for the next release of BRASS-GIRDER, which is scheduled for mid-March. I need to complete program modifications next week, so I was going to check in with you on Incident 4847. Please forward a response soon, so I can make any necessary modifications to this release. Otherwise, it will be a few more months before this correction will be available.

Thanks,

Brian L. Goodrich  
BridgeTech, Inc.

I e-mailed Vinacs today requesting a response to removing the secondary moment from the flexural rating calculation.

FROM:bgoodrich DATE:Monday, August 23, 2004 10:34:52 AM  
E-mail from Vinacs (Fri 8/20/2004 1:12 PM):

Brian

I am not expert on prestress girders that are made continuous for live load. The prestress design committee is looking into this question. Although I tend to agree with you and Puckett, Caltrans do have OKd it yet.

At this point, I would say release BRASS Girder without fixing this incident.

### Description

FROM:dteal DATE:Thursday, October 16, 2003 11:35:44 AM

One every PC that Virtis is installed on a directory for the migration wizard also gets installed. This directory is 78 meg. We have it installed on 50 PC's that don't need it. Does this directory have to get installed? Shouldn't it be optional like the file bridgewareadmin.exe and only put the directory and files where needed? We can always delete the directory after installation but that's one more email with instructions sent to all users.

FROM:jduray DATE:10/23/2003 5:43:58 PM

Joe - can we make it optional during the installation?

**Description**

FROM:dteal DATE:Friday, October 17, 2003 12:37:56 PM  
 In the attached bbd, do a HL93 Design Review for interior girder line #2 of "Design CK MEH, Let Feb 2004". The attached Results Graph shows me two problems, see attached .jpg.  
 1. I have requested Design Ratios but the left side of the graph says it's a Rating Factor??  
 2. At the 11.7 and 29.1 m distance there appears to be no value?? The text table also has no value.  
 When doing a design review and then looking at the spec. check for stage one, there are very low design ratios, like at the 3.1 point. But the graph is void of any values.

When this structure was run under version 5.0.1 there where no sub standard design ratio for stage 1. (As reported to me by the designer)

## Complete Issue Information

FROM:dteal DATE:Friday, October 17, 2003 1:29:20 PM  
Ignor the the very last sentence above!! Values are same as 5.0.1

FROM:hlee DATE:10/20/2003 8:58:31 AM

Notes:

1. For Concrete Stress | Design Ratios, the y-axis of the graph should say "Design Ratio []", not "Rating Factor []".
2. At 11.7m and 29.1m, all design rations are greater than 5 in the table. The design ratio graph will only plot values between 0 and 5. Values that are greater than 5 are indicated by the asterisks at the 5.0 mark. Help needs to be updated with this information.
3. Point of interest 301 is located at 1170mm on Span 3. The design rations are in the table and graph. There is a row between point of interest 300 and 301 in the table that has no values.

FROM:hlee DATE:10/20/2003 11:08:08 AM  
Spoke to Jim, status changed to On Hold.

FROM:gbhanushali DATE:8/16/2006 1:02:40 PM

Comments:

1. Rating Factor lable needs to be changed to Design Ratio while viewing design ratio results.
2. I reproduced your results as in attached jpeg. There are lots of points of different shapes being displayed over each other. There are also lots points at the top line which is 5.0 value which is because as herman said above that values equal or greater than 5.0 are capped to 5.0 line . Jpeg you have attached is actually a view that is showing lots of different items together. If you uncheck Top Flange or Bottom Flange under (DL + PS Only) Final you can see the values related to certain categories. When you see the Bottom Flange results alone you would see the values at 11.7 and 29.1 points at 5.0 graph line. We have to take the layers off to separate each categories on the results which get shown superimposed.

Let us know if above comments are helpful and acceptable.

FROM:dteal DATE:Friday, August 25, 2006 7:37:16 AM  
Yes - they clear things up for me - thanks

FROM:dteal DATE:Thursday, September 21, 2006 10:24:01 AM

FROM:jduray DATE:4/25/2007 2:57:51 PM

Looks to me as though we have to modify the label for Rating Factor to Design Ratio if results are for an LRFD analysis.

No problems, just a clarification needed:

Exactly how are metric ratings values (in metric tons) being calculated from the rating factor??? I can come close by hand but not exactly. English units are not a problem.

4/19/2016 3:17:44 PM

HRS AASHTO

1577

**Complete Issue Information**

FROM:bgoodrich DATE:Friday, October 24, 2003 12:19:30 PM  
BRASS-GIRDER only supports US units, so all SI input from Virtis is exported in US units for analysis. Once the results are returned to Virtis, the ratings are displayed in SI units. I rated a bridge with the HS20 vehicle and was able to duplicate the ratings reported in Virtis.

HS20 => 72 kips = 36 tons  
Conversion Factor: Tons to Metric Tons = 0.9072  
36 tons \* 0.9072 = 32.6592 metric tons  
Inventory Rating Factor = 1.084  
Rating = 1.084 \* 32.6592 = 35.40 metric tons

Virtis Rating = 35.41 metric tons

By: Jeffrey S. Ruby, P.E.  
KDOT Bridge Section

Bbd attached, using Structure Def: Preliminary Superstructure Small End Span and Girder 2

AASHTO LRFD Specification Article 6.10.3.1.4a in the Commentary gives the formula for determining the depth of the web in compression. It appears that Virtis/Opis is using this equation that is in the commentary to calculate the  $D_c$ . The problem comes in when the equation gives a value that is out of bounds of the total depth of the girder. If you notice scan1.jpg, you will see that the calculated  $x$ -bar using similar triangles is -351.221 inches. That value is invalid. So there needs to be some guidelines to determine what an appropriate value should be. Let's examine the last paragraph of the Commentary in Article 6.10.3.1.4a. (See scan2.jpg. Could it be any easier?) It states, "At sections in negative flexure, using  $D_c$  of the composite section consisting of the steel section plus the longitudinal reinforcement is conservative."

OK. What would the Depth to the compression flange value of the steel section plus the longitudinal reinforcement be? (See scan3.jpg) From the elastic section property calculations a conservative value of  $D_c$  is, is, is, (the suspense is killing me) way! less than the total depth of the web section!

4/19/2016 3:17:44 PM

HRS AASHTO

1579

## Complete Issue Information

Bottom Line: I propose that, instead of defaulting to the total Web depth for the Dc when the above calculations are out of bounds (See scan4.jpg and scan5.jpg), use the conservative value of the elastic Dc for the steel section plus the longitudinal reinforcement in 'Negative Flexure'

FROM: bgoodrich DATE: Friday, October 24, 2003 12:52:17 PM

This issue is a duplicate. This issue has already been addressed as described in Incident 3605.

### Description

FROM:dteal DATE:Tuesday, October 28, 2003 3:03:26 PM

In incident #3976 I pointed out how the schematic view was misleading at the ends of the beams. This is the same problem except I need to know how BRASS is treating the stiffeners. The schematic shows the left stiffener off the end of the beam. The actual GUI description has the stiffener on the beam. Is the stiffener being considered in BRASS?

This example (see attached jpg) has the beam bearing location 230 mm from the end of the beam. There are 2 pairs of stiffeners, 200 mm left and 200 mm right of the beam centerline of bearing.

FROM:kkennelly DATE:10/29/2003 7:43:31 AM

The export to BRASS LFD will provide the following type of message for the case of 2 stiffeners at a bearing:

INFO - The bearing stiffener thickness for Group 1 was multiplied by 2 pairs of stiffeners because BRASS does have an input for the spacing between bearing stiffeners, i.e., the offset.

Review the log file created by the export to see if such a message exists for your bridge to determine if BRASS is considering your stiffeners.

FROM:dteal DATE:Thursday, October 30, 2003 11:59:26 AM

What about the export to BRASS Girder LRFD?

FROM:kkennelly DATE:10/31/2003 3:52:00 PM

Check the "STIF-BEARING" command generated by the export. This command should contain the number of stiffeners as 2 and the distance between them.

**Description**

FROM:hlee DATE:10/29/2003 8:58:28 AM  
For uniform floorbeam definition loads:

1. Open BID 13's "Floorbeam Def 1" window.
2. Check Cantilever and enter 5 ft for both left and right cantilevers. Click OK.
3. Open Floorbeam Definition Loads window, add a uniform load on Span 3. Click OK.

4/19/2016 3:17:45 PM

HRS AASHTO

1584

**Complete Issue Information**

4. Open the window again, the uniform load is now on Span 1.

Same bug for uniform stringer definition loads. The bug is in determining span in the window.

FROM:jihnat DATE:11/3/2003 11:18:50 AM  
The "Span" column should not be visible for Floorbeams and Stringers.  
Fixed for 6.0, 5.2 and 5.1

FROM:hlee DATE:11/17/2003 10:17:27 AM  
I think there's a bug in determining whether the load is uniform or distributed.

1. Open BID 13's "Floorbeam Def 1" window.
2. Check Cantilever and enter 30 ft (just want to match the span length) for both left and right cantilevers. Click OK.
3. Open Floorbeam Definition Loads window, and
  - a. Add a uniform load.
  - b. Add the following three distributed loads.

| Start Distance | Length | Load Start | Load End |
|----------------|--------|------------|----------|
| 0              | 30     | 0.1        | 0.1      |
| 30             | 30     | 0.2        | 0.2      |
| 60             | 30     | 0.3        | 0.3      |

4. Click OK.
5. Open the window again, all loads are on the uniform load tab.

FROM:jihnat DATE:11/18/2003 9:37:41 AM  
Fixed. This should get thorough testing.

FROM:hlee DATE:11/18/2003 10:31:28 AM  
When a member load is not start at a support, the load should be on the distributed load tab.

1. Open BID 8 G2's "Girder Member Loads" window.
2. Add the following distributed load (Length of load = Span 1 length) :

| Support Number | Start Distance | Length | Load Start | Load End |
|----------------|----------------|--------|------------|----------|
| 1              | 50             | 110    | 0.2        | 0.2      |

3. Click OK.
4. Open the window again, the distributed load is on the uniform load tab.

FROM:jihnat DATE:11/18/2003 1:48:43 PM  
Fixed.

### Description

FROM:dteal DATE:Friday, October 31, 2003 2:50:21 PM

In the attached bbd we have a non-composite bridge (no slab, rebar or studs)

When I rate the bridge and check the Input/output log for BRASS we see

# 310 ANALYSIS 1, 0, 4, , 0.000650, 1, 0

The Analysis card shows a 4 for composite instead of a 3 for non composite?? What has changed – I don't think in version 5.0 it did this??

FROM:bgoodrich DATE:Monday, November 03, 2003 12:09:03 PM

The sequence ID of 4 indicates that the structure will be analyzed in 3 stages that may or may not be composite depending on the presence of XSECT-C and XSECT-G commands. Because you have specified no slab or rebar, the structure is considered non-composite. The export looks at the stages that are defined in the Load Case Description window. The highest stage determines which sequence is exported. This is necessary because the automatic dead load distribution may be performed differently for each stage even though the structure is non-composite throughout. I deleted the stage 2 load cases, analyzed the bridge in one stage, and BRASS gave the same ratings as for three stages.

### Description

FROM:dteal DATE:Monday, November 03, 2003 10:19:01 AM  
I get a application error that closes Virtis every time in Oracle.

Highlight a bridge in the explorer window and select Recent Rating Results from the toolbar. The window will come up without any results. As soon as you select the radio button for SI or USC you will get the application error message I attached. This happens on our oracle production and test servers. When I try this on my stand alone local Sybase database it works fine.

I have contacted our DBA that manages or oracle servers – they report no problems. As far as I can tell everything else is working fine.

FROM:mordoobadi DATE:11/10/2003 10:30:01 AM  
Dean, when you tried Sybase database were you using the same machine?

FROM:dteal DATE:Wednesday, November 12, 2003 11:54:49 AM  
Yes

FROM:dteal DATE:Tuesday, November 25, 2003 10:02:54 AM  
Could there be any relation of this problem with VI #4598?

FROM:mordoobadi DATE:3/11/2004 1:04:18 PM  
I haven't been able to duplicate this problem. I tried this on both Sybase and Oracle databases.

FROM:dteal DATE:Thursday, April 15, 2004 2:24:08 PM  
I just tried it with 5.1.1 and got the same error, message attached.

FROM:dteal DATE:Tuesday, October 26, 2004 10:39:53 AM  
I can not reproduce it either - please close

FROM:jihnmat DATE:10/26/2004 3:09:59 PM

I have a bridge (see attached bbd) that I have rated girder line #2 in Virtis. The HS20 Inventory rating

4/19/2016 3:17:48 PM

**HRS AASHTO**

1597

### Complete Issue Information

is 0.88 with shear controlling in span 4 at the 3/10th pt. First off, shear can't be the controlling factor at a 3/10 pt – shear should be low there.

I had our rating guy run this rating on BRASS. He came up with an inventory rating for an HS20 of 1.11 with flexure controlling. I have included the BRASS input and output files. This is a reasonable rating.

There are some small differences between the two input files. The BRASS file doesn't take into account the overlay and the 15% extra DL for the cross frames/diaphragms. I removed these from the Virtis file and found that it only made a small change in the rating results.

Can you tell me why we get a 23% lower rating with shear controlling in Virtis?

FROM:jduray DATE:Monday, November 10, 2003 8:48:37 PM

FROM:bgoodrich DATE:Tuesday, November 11, 2003 10:14:30 AM

The BRASS data file (b057061.dat) does not have the 403 POI specified. After adding it, the critical rating decreased and was much closer to that of the rating reported by Virtis. Next, I found that the manually created data file has a slab at the 403 POI, while the data file exported by Virtis only contains rebar. Therefore, the structural analysis results (shears) will be slightly different. The shear capacity at the 403 POI is nearly that of an unstiffened web. When compared to the factored shear, the rating is definitely less than 1.0.

FROM:dteal DATE:Wednesday, November 12, 2003 12:57:25 PM

I don't follow. You stated that the file exported by Virtis only contains rebar at the 403 point. The Deck Concrete Tab of the Deck Profile window has continuous concrete from abutment to abutment. The start and length distances were populated by the compute button.

FROM:bgoodrich DATE:Wednesday, November 12, 2003 3:46:07 PM

Dean - You are correct about the information entered into Virtis. However, BRASS-GIRDER only permits the slab OR rebar to be present in any one cross section. The composite regions on the Deck Profile window and the contraflexure locations on the engine properties window for the member alternative are used to help determine the ranges over which the slab applies and the ranges over which the rebar applies. The rebar is basically considered only over the interior piers by BRASS in this structure. Additionally, when the 403 POI is checked for flexure, shear, etc., BRASS uses the cross section (next to the node point) with the lowest moment of inertia, i.e., the cross section with the rebar in this case.

The left abutment is fixed, so the contraflexure locations for span 1 should be adjusted accordingly.

f'c, dps, fpu) to arrive the capacity."

The lack of intermediate output for the moment capacity is due to the lack of a control option within the BRASS engine properties in the Virtis user interface. This output can be enabled using the SYSTEM-1 command. This request is for users to be able to turn on intermediate output for prestress moment capacity calculations.

### Description

FROM:jduray DATE:12/2/2003 3:54:29 PM

Paul Jensen called to ask about the BRIDGEWare Admin Utility and how it purges events from abw\_event. Montana is using the system quite heavily and generated 100,000 events in the past month. He ran the utility to purge them and it took more than 8 hours to run. He would like to purge on a daily basis.

FROM:mordoobadi DATE:12/3/2003 12:48:27 PM

Another alternative:

We can do the event clean-up when a user saves a bridge. We would use event clean-up settings in abw\_sys\_database table when a bridge is saved to delete the unwanted events.

We need a new column in abw\_sys\_database table: automatic bridge event clean-up indicator.

FROM:mordoobadi DATE:3/11/2004 11:36:29 AM

Jim I am assigning this to you. I was wondering if you would like the above resolution implemented.

FROM:mordoobadi DATE:6/8/2004 9:21:49 AM

Options:

- (1) Events are cleaned up when a bridge is saved.
- (2) Scheduled event clean-up

### Complete Issue Information

Virtis is assuming that only one lane will be on this structure. If you look at the shear and moment distribution factors on the interior girder (G2), you will notice that they are less than the one lane factors. This should not happen. They should always be greater than or equal to the one lane factors.

On the second structure definition, we changed the travelway width to 23'. Virtis should be picking this up as a two lane roadway. If you look at the two lane distribution factors, Virtis is using two lane formulas for the shear, moment, and deflection. The user indicates that Virtis is using a one lane factor for the multi lane shear at supports distribution factor. The user calculated a shear at supports multi lane factor of 1.3333. If this is correct, then Virtis is not being consistent.

The bbd file is attached below.

FROM:kkennelly DATE:12/31/2003 1:23:28 PM  
Service Pack 1 for Version 5.0 should fix the problem. This service pack lets the user specify on the Preferences:Bridge Workspace tab if they want to follow the AASHTO Std Spec 3.6.3 or the AASHTO Manual for Condition Evaluation of Bridges 6.7.2.2 when Virtis determines the number of lanes on the bridge when it computes the LL distribution factors.

### Description

FROM:kkennelly DATE:12/11/2003 8:13:45 AM  
Email received from Steve Mample, Idaho 12/8/2003:

Hello, Krisha.

I am trying to use Virtis to analyze a simple 1 span non-composite steel girder bridge with transverse laminated timber deck. I have defined the left exterior (G01) and 1st interior girder (G02), and have linked the remainder of the girders to these two. I do not get any errors messages when I save the data. For the analysis I am just using the H15 vehicle. For the member alternatives G01 and G02, on the engine tab, I have entered BRASS LFD and entered the properties for non-composite analysis. The analysis progress display says "Data file successfully exported" and "Analysis complete".

I am getting the following System Error ;

Please open member alternative window and select an analysis module for the type of analysis you are trying to do.

Analysis Module is not selected Unable to configure event for selected analysis method!  
No rows returned from data base when expecting one row.

I have been able to successfully analyzed composite steel girder with reinforced concrete deck bridges. Can you tell me what I am doing wrong?

Thank you, Steve.

## Complete Issue Information

Attached is a Virtis model of a bridge in Bibb County. The bridge was built in 1927 but the main thru girders and floor beams were donated by the rail road. They came from a bridge built in 1898. I am still waiting on plans from the rail road on the main girders but had details on the floor beams because the angles making up the top flange were replaced. Anyway, when I rate the floor beam by LF, the HS 20(oper) = 2.5 tons but when I rate it ASD, the HS 20(oper) = 36 tons. I have done some hand calcs to verify why the ratings vary so much and I came up with HS 20 (oper) = 41 tons ASD and 42 tons LF ( this includes offset of 11.5"). When using the same lengths as Virtis I calculated the same LL moment but higher DL moments than Virtis. I then started checking the stringer shears and found that with the exception of stringer 3 the stringer dead load moments and shears were low. What is worse is that stringer one did not match stringer 5 and stringer 2 did not match stringer 4. I then made up a main girder and got the following error:

```
Error generating LFD/ASD load commands!  
Error generating load group commands!  
  Unable to compute average dead load of stringer unit!  
Error in the loads utility!
```

Anyway, attached is the file along with a couple of pictures of the bridge.

FROM:kkennelly DATE:12/18/2003 2:51:15 PM  
Reply sent via email: (note: attached bbd file is Version 5.0.1)

Problem 1: Dead load moments in stringers 1 and 5 are not the same.

Reason: There is a bug in the export from Virtis data to the BRASS input file in Virtis Version 5.0.1. (See Incident 4774 on the Technical Support website.) The export did not correctly generate the BRASS DECKC-GS command which locates the stringers under the deck. This problem was fixed for Virtis Version 5.1. I ran your bridge under Version 5.1 and the dead load moments are the same for the stringers. I don't think there is any work around to fix this problem in Version 5.0.1.

Problem 2: Error generating dead load for girder analysis.

Reason: Your superstructure span length is entered as 105.8125' on the Superstructure Definition window. Your floorbeams are entered with the following spacings: 21.875/21.1667/21.1042/21.1667/21.8175. If you add up these spacings, the last floorbeam is at 105.8126'. When Virtis tries to compute the dead load of the stringer unit, it uses the geometry of the reference lines which represent the girders and floorbeams. Virtis tries to find the intersection of the last floorbeam (at 105.8126') and the girder (which ends at 105.8125') and these lines don't intersect. If you change your span length to 105.8126' on the superstructure definition window and change the length on the Cross Section Ranges window to 105.8126', the girder can be analyzed.

(The tolerances you enter into Virtis deal with gaps or overlaps when entering data like lengths of steel flanges, etc. Those tolerances do not apply to the internal geometry of the girders, stringers, floorbeams composing the structure. Virtis requires the geometry of the system to fit together perfectly.)

Problem 3: Drastically different ratings for ASD and LFD rating of the floorbeam.

Reason: I haven't found the exact reason but I do see the following message in the BRASS LFD output:

4/19/2016 3:17:50 PM

HRS AASHTO

1608

**Complete Issue Information**

**\*\*Warning\*\*** BRASS will not analyze steel girders with yield strengths less than 33 ksi as compact sections using the Strength (LFD) method.

I suspect the large difference in ratings is due to compact/non-compact results.

**Description**

FROM:rmbest DATE:Thursday, December 18, 2003 3:23:06 PM

From Tim Armbrecht:

Could you please verify that Virtis uses AASHTO 8.10.1.1 (referenced from 9.8.1.1) to calculate the effective flange width for PPC I-Beams? When I go to deck profile, put the cursor in effective flange width (Std) and click "Compute from typical section", it computes 90 inches for a beam with 96 in. beam spacing, 7.5 in. slab thickness, 6 in. web and 82.25 ft. beam length. If this were a steel section, 90 inches is correct, but 8.10.1.1 specifies:

"The effective flange width overhanging on each side of the web shall not exceed six times the thickness of the slab..." Therefore, the total EFW should be the smallest of 1/4 span length, 12 \* slab thickness + web thickness or beam spacing. The correct result should be 96 inches.

4/19/2016 3:17:50 PM

HRS AASHTO

1609

## Complete Issue Information

Note that when using "Compute from typical section" for effective flange width (LRFD) the result is correct - 96 in.

FROM:kkennelly DATE:12/31/2003 2:39:01 PM  
AASHTO 8.10.1.1 is used in the computation for Versions 5.0 and later. If you are running such a version, please export your bridge to a bbd file and attach it to this incident so we can investigate further.

FROM:tarmbrecht DATE:Thursday, January 08, 2004 5:00:06 PM

The file is attached

FROM:kkennelly DATE:1/9/2004 8:28:44 AM  
Virtis does not interpret 8.10.1 to say that the web thickness should be added to the effective flange width so Virtis computes the effective flange width as the min of(20.56',90",96"). The attached document contains the assumptions and interpretations Virtis makes when computing the effective flange width. We will be posting this document on the Virtis/Opis Technical Support website.

FROM:kkennelly DATE:1/20/2004 10:24:03 AM  
The PS I beams in the attached bridge have "Narrow" top flange types. If these beams had "Wide" top flange types, AASHTO 9.8.3 would be followed and the web thickness would be added to effective flange width.

FROM:kkennelly DATE:1/22/2004 10:07:13 AM  
Fixed for 5.1.1. The web thickness is now included in the std. eff. flange width for PS I beams with Narrow top flanges. It is not included for PS Box beams, steel beams or PS I beams with Wide Top flanges (Article 9.8.3 is followed for Wide Top Flanges).

Hi,

I am requesting that the example list in the Web Site be updated to include the many new examples that have been created in the recent past. Also please include the older ones that have been updated. There are many Floore system examples that has been made, but not included on the tutorial list for example. It is rare to see any updates on the web site, it would be nice to see more activity there.

Thanks!

George

### Description

FROM:gcogrove DATE:Friday, January 02, 2004 8:07:21 AM

This question is in regards to the entry of LRFD Distribution Factors for a member. The three different cases are Deflection, Moment and Shear. Now the LRFD code does not have any provisions for distribution factors for deflection per se. It does for moment and shear. However for fatigue design, you need to look at the factors you calculate for moment and in certain circumstances divide out 1.2 for values calculated from the tables in chapter 4. Therefore from my understanding, the three cases for load distribution in LRFD are Fatigue, Moment and Shear. Is this what was intended in the LRFD tab of the Live Load Distribution Dialog box? According to some of your PCI examples, this is somewhat implied. If this is the case, is it possible to change the name of the cases to Fatigue, Moment and Shear. Thus, changing Deflection to Fatigue. Also, since Fatigue design only involves a single lane loaded, is it also possible to "grey" out the entry for multiple lanes loaded under Deflection/Fatigue case?

It is unclear as to what is expected in the Deflection case for these values otherwise. If my

interpretation of this is wrong, what references in AASHTO will guide me in calculating the Deflection Load Distribution Factors?

Thanks,  
George

FROM:kkennelly DATE:1/5/2004 8:33:27 AM

The AASHTO LRFD Article C2.5.2.6.2 provides guidance on computing the LRFD Deflection distribution factors.

As for fatigue vehicles, I believe the 1.2 factor that you refer to is the multiple presence factor for 1 lane found in Table 3.6.1.1.2-1. As per Article 3.6.1.1.2, when investigating the fatigue vehicle, which is loaded for 1 lane, the distribution factors from Chapter 4 are divided by this 1.2 factor. The BRASS LRFD engine takes this requirement into account for vehicles selected as Fatigue Loads in the Opis Analysis Settings window so you do not have to enter separate Fatigue load distribution factors in Opis.

Also, the BRASS LRFD engine will compute all of your LRFD distribution factors for you if you leave them blank in Opis.

## Complete Issue Information

### Description

FROM:kkennelly DATE:1/9/2004 8:59:38 AM

File attached to incident 4913 "0450082.bbd" is a version 5.1 file. Import into Virtis and most of the members don't have any data below the Member window in the tree. Even if mbr alts don't exist the members should have Supports, Member Loads show up in tree.

FROM:mordoobadi DATE:6/22/2004 11:48:00 AM

Nothing is shown under some members because those members are linked. GUI hides the tree items for Member Loads and Supports of linked members. I think this has always been this way.

FROM:kkennelly DATE:6/23/2004 10:39:31 AM

### Description

FROM:tarmbrecht DATE:Friday, January 09, 2004 2:15:13 PM

This incident is a follow-up to incident 4913.

I request that the current Virtis interpretation for 8.10.1.1 be re-evaluated. I am only suggesting this because I believe the LRFD specifications interpreted 8.10.1.1 the same way Illinois does, which is to add the web thickness to 12 times the slab thickness as one of the limiting criteria to determine the effective flange width for a slab on beam configuration. We interpret "overhanging on each side of the web" in 8.10.1.1 as the amount of slab not over the web. Unless LRFD did some new research that confirmed the web thickness dimension should be added to 12 times the slab thickness, I'm assuming that the LRFD specs carried the criteria over from the Standard specs, and clarified the intent. In Illinois, we ignore the thickness of the web of a steel beam, but include it for the thicker PPC I-beams.

I would also be curious to know how other states interpret 8.10.1.1.

If it is determined that the interpretation remains as-is, I would request that something be added to the preferences that would allow us to calculate the effective flange width for LFD the same way that it is calculated for LRFD. Thanks,

TAA

**Complete Issue Information**

FROM:kkennelly DATE:1/16/2004 9:18:02 AM

I would like to get a consensus from some of the other states as to how they interpret these specs. Some of the other users who have submitted incidents regarding the eff. flange width computations are: Brian McCaffery, NY; Dean Teal, KS; Dave Koenig, Missouri; Robert Fulton, AL; Gale Barnhill, NE.

FROM:kkennelly DATE:1/16/2004 9:21:20 AM

FROM:kkennelly DATE:1/21/2004 8:09:21 AM

Note that for PS I Beams with "Wide" top flanges, Article 9.8.3 is followed by Virtis and the web thickness is included in the eff. flange width calcs. For PS I Beams with "Narrow" top flanges, Virtis uses Article 8.10.1.1.

FROM:kkennelly DATE:1/22/2004 10:08:58 AM

Fixed for 5.1.1. The web thickness is now included in the std. eff. flange width for PS I beams with Narrow top flanges. It is not included for PS Box beams, steel beams or PS I beams with Wide Top flanges (Article 9.8.3 is followed for Wide Top Flanges).

FROM:gbarnhill DATE:Monday, January 26, 2004 10:13:36 AM

OK in 5.1.1 with 23 Jan updates. I checked steel girders, PS I wide and narrow flanges and PS Box.

FROM:tarmbrecht DATE:Wednesday, January 28, 2004 3:39:25 PM

I checked a number of configurations for a PPC I-beam. With the update, appears to be calculating the EFW per my request. Looks good. Thanks,  
TAA

### Description

FROM:jihnat DATE:1/12/2004 11:12:03 AM

Found this while investigating 4944.

When a POI is copied for a FloorLine FloorbeamMemberAlt or a FloorLine StringerMemberAlt, the copied POI is not shown correctly in the BWS tree right after the copy (i.e. it's always 0.0), but it's OK after the tree is refreshed or when the BWS view is reopened.

The code in CBridgeWorkSpaceView::DoPaste() at around line 26835 needs to be changed, probably to check the type of structure definition.

We get the DoBmDefSteelAnalysisPointList from the Member Alt, but when we call the list's GetParent () function we always get the Beam Def. It doesn't look like that was what was expected when the DoPaste() code was written.

FROM:hlee DATE:1/20/2004 5:39:50 PM  
 Unable to save BID 1046 and BID 1047 in IDOT's RatingSubmittals database.

=====

=====  
 Unable to save Bridge data!  
 05:35:07 PM - Line 841 in source file C:\VIRTIS\_5.1\GUI\ABGBRDG\UiBWSDoc.cpp.

Saving New and Modified objects failed while processing CDmStructDef (SaveOrder object 69).  
 05:35:07 PM - Line 431 in source file C:\VIRTIS 5.1\data management\abmbche\DmBridgeCache.cpp.

Unable edit and update recordset.  
 05:35:07 PM - Line 1012 in source file C:\VIRTIS 5.1\data management\abmbrdg\DmStructDef.cpp.

=====

=====  
 FROM:mordoobadi DATE:2/6/2004 11:01:25 AM  
 Debugging of the code did not reveal what causes the save operation to fail.

- Here what I have done so far:
- exported bridges 1046 and 1047 to bbd files.
  - created a copy of rating submittals database then removed the 1046 and 1047 bridges and imported the bbd files from previous step into the database with BIDs 1046 and 1047.
  - compared the contents of the original and the copied databases to make sure that the databases match. As expected, the differences were in event and timestamp fields.
  - tried to reproduce the error with the copied database. I was not able to duplicate the save problem.
  - made the copied database contents to exactly match the original database.
  - tried again to reproduce the save problem with the copied database. But it did not happen again.
  - validated the original database by using Sybase's Validation Utility but it did not find any problems.

I think the problem is an internal database issue. It could be a corruption of data.

In order to verify that, Herman is going to Unload/Reload the Original database to see if that has any effect on the save problem.

4/19/2016 3:17:52 PM

HRS AASHTO

1621

## Complete Issue Information

FROM:hlee DATE:2/9/2004 8:14:56 AM

Unload/Reload the Original database has no effect on the save problem.

FROM:mordoobadi DATE:2/9/2004 11:50:42 AM

The problem is because of a special character in the description field in abw\_struct\_def for BIDs 1046 and 1047 in Rating Submittals database.

The update throws an exception because the record to be updated is not found. This is because the current cursor has a WHERE clause with every field filtered. For some reason Sybase ODBC creates a where clause that does not correspond to the original record in the database (probably because of the existence of a special character in the description field).

I think we need to make the ABxEdit control validate the text fields before attempting to set a value in the database.

This is a big issue, because after a user enters a BAD value and saves, he/she would not be able to change a part of the bridge. And I don't think that it is only limited to description field of a structure definition. It could happen to any table that has a text field.

FROM:mordoobadi DATE:2/9/2004 1:44:45 PM

SQLRowCount() returns 0, this causes an exception to be thrown. The CDBException error code is AFX\_SQL\_ERROR\_NO\_ROWS\_AFFECTED.

FROM:mordoobadi DATE:2/9/2004 1:49:07 PM

I just found the source of this problem.

As indicated in the Sybase ASA 8 documentation under change of behavior, starting from version 8 Character set translation is enabled by default. It was turned off by default in the previous versions. After turning character set translation off the save problem was resolved.

In order to turn the Character Set Translation off in an ODBC connection, the start line field in the ODBC Configuration window should be set to something like this.

"C:\Program Files\Sybase\SQL Anywhere 8\win32\dbeng8.exe" -ct-

See <http://www.sybase.com/detail?id=1027346> section 5.2.1.

We need to implement this in the installation.

FROM:mordoobadi DATE:3/11/2004 2:51:29 PM

Joe I assign it to you so that you implement it in the installation of the next release of Virtis/Opis.

FROM:jihnat DATE:7/16/2004 10:29:02 AM

Installation updated for 5.2.0 Alpha Build 2 and above.

This should be tested further for Sybase 8 and Sybase 9.

### Description

FROM:dteal DATE:Monday, February 02, 2004 9:46:32 AM

Currently our office is using the 1998 Specification with 2003 Interim. Virtis 5.1.1 is using the 98 Spec with '99 Interims. When will the software be updated??

FROM:jduray DATE:2/4/2004 3:42:08 PM

There is an enhancement request submitted to Wyoming to update BRASS. I don't know when the work will be authorized or completed.

**Complete Issue Information**

FROM:kkennelly DATE:8/9/2004 8:43:08 AM

We need to add a new LRFD factor to the library for 1998 with 2003 interim even though the spec didn't change with the 2003 interim.

FROM:kkennelly DATE:9/13/2004 3:30:04 PM

Ignore what I said on 8/9. new LRFD factor in library should be 2004, 3rd edition. This spec also has a new limit state that needs to be added, Service IV.

FROM:mordoobadi DATE:10/5/2004 10:38:58 AM

Based on the discussion with Brian Goodrich, we need to create a new LRFD factor for 2004, 3rd edition.

The BRASS currently does not handle limit state Service IV.

FROM:mordoobadi DATE:10/7/2004 1:24:42 PM

Jim decided to do this for the next version (6.0).

FROM:kkennelly DATE:2/8/2005 1:23:45 PM

FROM:mordoobadi DATE:3/4/2005 3:32:11 PM

A new library LRFD factor added to the database for 3rd edition 2004 spec.

FROM:dteal DATE:Monday, April 18, 2005 12:54:04 PM

FROM:mordoobadi DATE:2/6/2006 4:41:01 PM

Accepted by Dean Teal 4/18/2005.

### Description

FROM:dteal DATE:Monday, February 02, 2004 10:49:27 AM

In the attached bbd, after doing a opis analysis (HL-93 design review) – the spec checker calls out 6 rating factor failures for LL deflection. When I go to the results graph, I can not find any “RED” or failures for rating factors. Shouldn’t there be??

FROM:hlee DATE:2/6/2004 5:00:51 PM

Dean, I cannot find the attached bbd.

FROM:dteal DATE:Monday, February 09, 2004 8:36:47 AM

Attached

FROM:hlee DATE:3/11/2005 2:12:35 PM

LL deflection rating factors are not stored in abw\_results\_... tables. The factors are not in tabular analysis results. They are available in the form of comments in abw\_lrfd\_spec\_check\_comment. In order to display the minimum rating factors in Results Graph, we need to make them available to the tabular analysis results first.

Attached Dean's bbd in 5.2 format.

FROM:jduray DATE:4/8/2005 2:58:58 PM

I think the analysis engine should report rating factors based on limit state. The results graph would have to be modified to display rating factors (or design ratios) based on categories such as LL deflection.

Request retracted

FROM:bmccaffrey DATE:Wednesday, February 11, 2004 9:44:18 AM

I got the section property issue resolved. However, there was one other problem on this bridge - In Superstructure Definition 1 (Loc\_001) member G1, I cannot get more than one shape on the 'Beam Shape' pull down tab, even though I have several different shapes defined.

FROM:kkennelly DATE:2/12/2004 3:54:57 PM

Your member alternative G1 is a PS Box member alt so the Beam Details window only lets you pick beam shapes that are boxes. If your member alt was an I beam, you would only be able to pick I beam shapes in the Beam Details window.

FROM:bmccaffrey DATE:Friday, February 13, 2004 8:48:47 AM

Thank you Krishna - I should have figured that one out.

### Description

FROM:jcarney DATE:Thursday, February 12, 2004 10:36:41 AM

I am back-checking a PS butted deck beam structure and am getting a different value for the ultimate moment capacity of the beam by hand calculation than is listed in the virtis output. Virtis provides a value of 602.2 ft-k and I am getting 692.4 ft-k by hand calculation. In performing the manual calculations I used a value of 229 ksi for  $F_{su}$  (using AAHSTO formula 9-17) and used AAHSTO formula 9-13 for calculation of the ultimate moment capacity. The PS strands are 270k, stress relieved strands. Attached is a copy of the exported .bdd file. Can you please look over and let me know if you see a reason for the difference in the capacity.

FROM:bgoodrich DATE:Friday, February 13, 2004 12:00:05 PM

I have investigated the ultimate moment capacity issue and I believe I have found a problem within the BRASS-GIRDER engine. I turned on the output for the ultimate moment capacity calculations to help with my investigation. Note that these calculations cannot be turned on within Virtis at the present time.

I found that BRASS is using one value for  $p^*$  (0.010405) in the calculation of  $f^*s_u$  (9-17) and a different value for  $p^*$  (0.005627) in the moment capacity calculation (9-13). The  $p^* = 0.010405$  is determined on an incremental basis for each row of strands, which appears to be the source of the difference in  $f^*s_u$ . When this  $p^*$  value is used,  $f^*s_u$  is 194 ksi instead of 229 ksi.

I will forward this issue to WYDOT for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Friday, February 27, 2004 9:19:58 AM

WYDOT has assigned this issue to BRASS Problem Log 488.

### Description

FROM:jihnat DATE:2/16/2004 11:09:49 AM  
Received via email:

Hello, I have two questions I could use your help on:

1)

I have a question about inputting mild reinforcing into a prestressed beam cross section. Our Virtis output gives a warning "Web section over-reinforced". Currently there is no mild reinforcing placed in the cross section, but I think this might eliminate the over-reinforced condition. The output file prints out the area of mild reinforcing and the vertical location of the rows, and it also refers to the BRASS xsect-g command, but we cannot figure out how to place this steel in the cross section via the Virtis input screens.

2)

Can you help me with how Virtis/BRASS computes the ultimate moment capacity of a prestressed beam for an LFD rating? The output file suggests that BRASS uses  $0.9 \times f_y^*$  for the strand stress at ultimate capacity. Why does it use this and not calculate  $f_{su}^*$ ? Is there a way to get a detailed output so I can see all the factors BRASS is using in its moment capacity equations?

Thanks for your help.

FROM:bgoodrich DATE:Wednesday, February 25, 2004 8:29:13 PM

Issue 1:

Currently, Virtis does not support input of mild reinforcing steel along the length of a prestress beam. However, over interior supports, the support continuity reinforcement is passed to the BRASS engine. I believe this issue has already been submitted, but I cannot find the incident.

Issue 2:

BRASS performs the calculation described in the following message from the output file:

4/19/2016 3:17:54 PM

HRS AASHTO

1633

**Complete Issue Information**

\*\*Note, BRASS calculates the positive moment strength of the section based on 90% of the yield point stress in the prestressing steel nearest the extreme tension fiber of the member. However, it does not use this value, + 1113.0 k-ft in calculating the operating rating. If the user is rating a section which has widely dispersed tendons, strength based on the 90% limit may be input using the PRESTRESS-2 command and the program rerun and the value input will be used in the determination of operating rating.

However, the user must input this moment manually on the engine properties window for each point of interest. BRASS does calculate f\*su and uses it to calculate the ultimate moment capacity. Unfortunately, the output control option for turning this output on is not currently implemented in Virtis. This request has already been made in Incident 4899, which is currently suspended.

FROM:bgoodrich DATE:Thursday, February 26, 2004 3:16:42 PM  
I asked Jim Duray if this incident should be suspended. His reply follows:

From: Jim Duray [mailto:JDURAY@mbakercorp.com]

| 5002.14338 | Suspended     | Concrete slab being rated for negative moment |

**Description**

FROM:hlee DATE:2/16/2004 1:12:49 PM

Hit Apply on the Structural Framing Plan Details window will give the following message:  
"Support skew and girder spacing result in unequal span lengths for linked members!..."

FROM:hlee DATE:2/16/2004 1:36:21 PM

Ref: VI 4989

FROM:kkennelly DATE:2/24/2004 8:52:50 AM

Framing plan window is not checking the span lengths of the actual linked girders, it is checking that all girders in the superstructure have the same length.

FROM:jduray DATE:2/26/2004 9:11:35 AM

Should be checking that the linked members have the same span lengths. Should not check unlinked members.

FROM:jihnat DATE:8/4/2005 10:57:21 AM

Fixed for 5.4.0

For testing, a version 5.3.1 BBD file is attached.

**Description**

FROM:kkennelly DATE:2/16/2004 3:23:08 PM  
 Submitted on behalf of Elizabeth Balcha, Bayside Engrs via email:

We are working on a bridge and the rating for the HS-20 truck governs at 50% of span 3 for beam "S2". The Brass Output report indicates a governing rating factor(1.05) which is based on the flexure composite slab limit state.  $(1200 - 28)/1112 = 1.05$   
 It seems as though the allowable concrete compressive stress of 1200 psi is being compared to the negative moment tension stress of 1112 psi at the top of the section.

Could you also tell us how virtis came up with the value (1112 psi) flexural negative moment stress at

4/19/2016 3:17:55 PM

1636

**Complete Issue Information**

level one ?

I have attached the bbd file of the bridge (N-11-013 (2TC)) the steel structure part is the one which says span1-3.

FROM:kkennelly DATE:2/16/2004 3:24:52 PM

Reply sent via email:

It does appear that BRASS is rating the concrete slab for negative moment at the 50% of span 3 in your bridge. I've entered your problem as incident 5002 on the Virtis/Opis Technical Support website.

The 1112psi stress is computed by  $(131.kft)(12 in/ft)*(40.86in - 29.76in)/15700 in^4$

(I ran this member using the BRASS dll --> BRASS-GIRDER - Version 5.08.07 - Oct. 13, 2003 \*\* BRASS Export Version 5.1.0.3001)

My response:

I haven't been able to reproduce this problem.  
Please double-check that your userid appears under administrators, and  
that the Access Privileges for Parameters are set.  
A workaround would be to log in using virtis/virtis. This should  
always work.

Customer's reply:

We are using an Oracle database. Unsure if this applies, but worth  
mentioning since we have had numerous issues with Cambridge Systematics  
where they test our problems in Sybase and it works fine, but when they  
switch to Oracle, they can reproduce.

Attached is my account and group info. I am a member of the Administrators  
Group. Is there something else ? I am trying to get our virtis/virtis  
account setup in our Oracle test environment. It exist in Virtis and  
appears to have the same attributes as my account. I will let you know the

results after I get it fully defined in Oracle.

(See attached file: Parameters Editing 2.doc)

FROM:jihnmat DATE:2/17/2004 8:44:28 AM

More today from the customer:

We have confirmed that all privileges are set and the virtis/virtis account produces the same results. Please advise. Thanks !

FROM:mordoobadi DATE:3/5/2004 11:32:31 AM

The reason that you cannot edit the Parameters is most likely because of the fact that you have an INTEGRATED Virtis/Opis/Pontis database.

In this case parameters can only be edited through Pontis software.

### Description

FROM:jihnat DATE:3/2/2004 9:57:26 AM

Move the "Transfer This License" function from the Tools menu onto the login dialog.

This would be useful on those (rare) occasions when the user cannot login to the DB to transfer their license, such as VI 5024.

We would also need to change the Help under "Program Activation Required" and adding an explanation on the Help for the login dialog.

FROM:hlee DATE:7/19/2006 10:07:45 AM

Changed Project to Support Center.

### Description

FROM:bgoodrich DATE:Tuesday, March 09, 2004 12:18:38 PM  
Entered for C.J. Riley (WYDOT):

Brian:

We have been using Virtis/Opis to generate BRASS datasets for an NCHRP project. In doing so it appears that the longitudinal stiffener placement is not being placed in the GIRDER(LRFD) files (it is given a value of zero) but it is making it into the GIRDER files. Specifically, it is the 4th parameter in the STIF-LONGITUDINAL command that is not being transferred from the Opis UI. I thought you might want to initiate a Virtis/Opis incident for this.

C.J. Riley, EIT  
Engineer Analyst  
Wyoming Department of Transportation, Bridge Program  
307-777-4745  
charles.riley@dot.state.wy.us

FROM:bgoodrich DATE:Tuesday, March 09, 2004 12:20:34 PM  
I imported the BBD file and noticed that no value is entered for the distance to the longitudinal stiffeners at any of the points of interest. The default distance for BRASS-GIRDER is 20% of the web depth, which the export calculates. There is no BRASS-GIRDER(LRFD) default, so zero is exported. I added a line of code to issue an error when no distance is specified for BRASS-GIRDER(LRFD) only.

FROM:bgoodrich DATE:Tuesday, March 09, 2004 12:23:42 PM  
I checked into why a default was not implemented for BRASS-GIRDER(LRFD) and found the following. The LRFD specification suggests a distance of  $2D_c/5$  (C6.10.8.3.1). Because  $D_c$  can vary depending on the applied loads, it was determined that the user would be responsible for determining this value.

FROM:bgoodrich DATE:Tuesday, March 09, 2004 1:28:39 PM  
E-mail from C.J. Riley:

That makes sense. I've been modifying the data files produced by Virtis/Opis and have been putting

**Complete Issue Information**

In attempting to analyze an edge beam for a RC slab. I didn't enter any distribution factors for multi-lane so I could only have one lane next to the rail. Opis doesn't allow this – you must enter DF for both single and multi-lane.

So after the single lane loaded was removed from the Analysis Settings Advanced tab, how do I analysis a single lane on the edge of a deck?

Related to 4731

FROM:kkennelly DATE:4/23/2004 8:38:26 AM  
Select "Single lane" for the Live Load Lanes on the GirderLine Structure Definition window then the export will not require you to enter the multi-lane df.

Subject: Re: Fwd: bbd of typical scanner problem bridge.

Paul

Can you send the 5.1.0 bbd file?

Jim

>>> Herman Lee 03/11/04 01:48PM >>>  
The bbd that Paul attached is in 5.1.1 format. There are 2 error messages when I validated the bridge. The first one complains about the framing plan and the second one about G1's girder profile. These problems can be fixed by hitting the OK button on the framing plan and typical section windows. I don't think these problems exist in 5.1.0. If we have the 5.1.0 bbd, we can tell what the real problem is.

Herman

>>> Jim Duray 3/11/04 12:35:47 PM >>>  
check this bbd file Paul is having trouble with.

=====

E-mail reply to Jim Duray:

=====

I performed the following steps on Paul's 5.1.0 bbd:

1. Imported the bbd to a 5.1.0 db.
2. Validated the bridge (Validation.txt), G1 member has 2 errors.
  - ERROR: Beam shape not defined over entire length of member alternative.
  - ERROR: Haunch range not defined for entire length of member alternative.
3. Ran Scan utility (ScanAngleConversion20040311151401.log), Scan complains the following:
  - Unable to set girder member spacing.
4. Opened Framing Plan schematic (FramingPlanSchematic.bmp), G1 seems to have an extra span.
5. Opened G1 Member window (G1MemberWindow.bmp), confirmed G1 has an extra span.
6. Hit OK on both Framing Plan and Structural Typical Section windows and saved the bridge.
7. Validated the bridge again, no more error message.
8. Ran Scan utility again, Scan complains the same thing.
9. Opened the abw\_super\_struct\_mbr\_span table (abw\_super\_struct\_mbr\_span.bmp), the extra span is still there after the save.

This is related to VI 5001. The codes that update the span length table in SetGirderMbrSpacing() failed.

### Description

FROM:tarmbrecht DATE:Tuesday, March 23, 2004 9:31:55 AM

Please verify the calculation of  $V_{ci}$  for prestressed I-beams. It appears that for  $V_{ci} = 0.6 \cdot \text{SQRT}(f'c) \cdot b'd + V_d + V_i \cdot M_{cr}/M_{max}$ ,  $M_{cr}/M_{max}$  has an upper boundary of 1.0. If this is the case, where is the reference? I can't find it in AASHTO or ACI. File is attached. Thanks.

FROM:bgoodrich DATE:Tuesday, March 23, 2004 9:52:13 AM

The  $M_{cr}/M_{max}$  ratio is limited to 1.0 in AASHTO 9-27 ( $V_{ci}$ ) as documented in an open forum article by Dr. Puckett and Dr. Tadros. See "Design for Shear in Prestressed Concrete Bridge Members" in the PCI Journal (May-June 2001). I will request permission from WYDOT to add this reference to the intermediate output.

FROM:tarmbrecht DATE:Tuesday, March 23, 2004 10:47:29 AM

Thanks Brian,

With all due respect to Jay and Dr. Tadros, since this is not documented in AASHTO, I think there need

4/19/2016 3:17:57 PM

HRS AASHTO

1650

## Complete Issue Information

to be some sort of switch to turn this reference on if desired, defaulted to off. Illinois currently hasn't adopted this policy. Thanks again.

FROM:bgoodrich DATE:Wednesday, March 24, 2004 10:36:05 AM  
WYDOT has assigned this incident to BRASS Problem Log 436. I have already added the article reference to the intermediate output. This is all that WYDOT has authorized at this point. I forwarded Tim's latest comments to WYDOT regarding a user option for considering this article. Therefore, this incident will remain open.

FROM:bgoodrich DATE:Wednesday, March 31, 2004 11:09:43 AM  
See: Puckett, J.A., and Tadros, M.K., Design for Shear in Prestressed Concrete Bridge Members, Open Forum, PCI Journal, May-June 2001, Vol. 46, No. 3, P90-93.

FROM:bgoodrich DATE:Wednesday, March 31, 2004 11:10:25 AM  
Brian McCaffrey submitted the same issue in Incident 5065.

FROM:bgoodrich DATE:Tuesday, April 20, 2004 5:03:20 PM  
WYDOT will be replying to Tim Armbrecht and Brian McCaffrey. I will add that response to this incident when it is received.

FROM:bgoodrich DATE:Thursday, June 03, 2004 10:46:59 AM  
E-mail from WYDOT:

From: Micheal Watters [mailto:Micheal.Watters@dot.state.wy.us]  
Sent: Thursday, April 15, 2004 2:38 PM  
To: Armbrecht, Timothy A.; BMCCAFFREY@dot.state.ny.us  
Subject: Mcr/Mmax Ratio

Brian and Tim:

Yesterday, Keith Fulton, Jay Puckett, and others discussed your concerns about BRASS-GIRDER potentially computing the shear resistance incorrectly for some prestressed girders. By ignoring the  $V_{ci}$  term (Eq. 9-27) when  $M_{max}$  is less than  $M_{cr}$ , the  $V_{cw}$  term controls, which may give a higher resistance than users were getting in previous versions. The correct procedure of limiting the  $M_{cr}/M_{max}$  term to 1.0 in the  $V_{ci}$  equation is documented in an open forum article by Dr. Puckett and Dr. Tadros (University of Nebraska-Lincoln). See "Design for Shear in Prestressed Concrete Bridge Members" in the PCI Journal (May-June 2001).

Though this limitation is NOT in the AASHTO Specifications and is conservative, we at WYDOT agree with Dr. Puckett and Dr. Tadros in limiting the ratio to 1.0 and will make no changes to BRASS. You do have the option in BRASS to increase the  $\Phi$  factor to compensate for this if you desire. Also, if you want, you can bring this item forward to the user group as an enhancement request.

Micheal J. Watters, P.E.  
Bridge Engineering Systems Manager

**Complete Issue Information**

>>> "Armbrecht, Timothy A." <ARMBRECHTTA@dot.il.gov> 4/22/2004 9:06:06 AM >>>  
Mike,

Thanks for your response. I certainly appreciate the fact that BRASS is a WYDOT program and you have the right to modify it as you see fit. I also respect Jay's work, and know that his argument to limit Mcr/Mmax is based on sound engineering principles. My concern is that a program that is licensed nationally doesn't even have an option to follow the current AASHTO Specifications. Therefore, please consider this reply as a request for an enhancement to be brought before the users in July - that the user has the option to calculate Vci with no limitations on Mcr/Mmax, as specified in the AASHTO Standard Specifications. Thank you for your consideration.

Tim

FROM:bgoodrich DATE:Tuesday, October 05, 2004 6:54:56 PM  
WYDOT authorized an option to be added to BRASS-GIRDER for controlling if the Mcr/Mmax ratio is limited to 1.0 or not. This will not be ready for the upcoming 5.2 release, but it should be in the following release.

The necessary modifications have been made to BRASS-GIRDER 5.9.1, which is scheduled for release in 2005. The export needs to be modified to generate the appropriate code on Parameter 7 of the ANALYSIS command. Additionally, the engine properties need to be modified to allow the user to set whether or not the ratio is to be limited. This affects AbxBrass, AbxBrass2, and AboBrass projects.

FROM:bgoodrich DATE:Tuesday, May 31, 2005 2:13:22 PM  
AbxBrass, AbxBrass2, and AboBrass have been updated. Fixed for version 5.3 SP1.

FROM:kkennelly DATE:6/16/2005 1:02:30 PM  
We interpreted Brian' comments about the default value for this parameter. SP1 beta 1 is setting the ignore shear to true (1) when really the user hasn't checked the Ignore Shear on the Mbr Alt window.

FROM:sboukamp DATE:6/17/2005 8:51:54 AM  
Resolved for SP1 release

| 5071.14271 | Duplicate     | Problem with shear capacity |

### Description

FROM:bha DATE:Thursday, March 25, 2004 2:53:02 PM

We have a RC slab bridge built 1929,  $f'c = 2$  ksi,  $f_y = 33$  ksi (reinforcement). Based on Manual for Condition Evaluation of Bridges, we input  $n = 15$  (page 66). When we get vehicles and analyze, Virtis did not use the input value of  $n$ , but it used the default value ( $n = 8$ ) for analysis, therefore the moment capacity of concrete was so small to compare to the moment capacity of concrete if we use  $n = 15$  (calculated by by hand).

We have rated a lot RC bridges, mostly tension steel or stirrup control the rating. But this bridge concrete compression controls the rating and we have involved to this problem. Please investigate and fix the problem.

Thanks,

FROM:kkennelly DATE:3/26/2004 11:59:29 AM

Member " 12" wide rc slab - 32 degree skew". The export generates Properties-RC command with 3rd parameter = 8 and the Properties-RCB command with 2nd parameter = 15 which is what user entered on Cross Section window for  $n$  value.

FROM:bgoodrich DATE:Friday, March 26, 2004 12:20:51 PM

HRS AASHTO

1653

### Complete Issue Information

BRASS-GIRDER permits a modular ratio for the top flange and another for the rest of the girder. For an R/C slab cross section, the engine is using the modular ratio of the top flange instead of that for the girder. This issue is only a problem in the BRASS-ASD engine, so WYDOT will not authorize a fix. Therefore, I modified the export to set the top flange modular ratio to that of the girder (only for an R/C slab). Then parameter 3 on the Properties-RC command and parameter 2 on the Properties-RCB command will be the same, 15 in this case. Fixed for Version 5.2.0.

### Description

FROM:tarmbrecht DATE:Monday, April 05, 2004 4:59:26 PM

I appear to be getting conflicting shear capacities at basically the same point at a support for a 96" plate girder structure. Please see attached, member name is A2 - 1st N Int of Unit 1 (4 span continuous), alternative name is 60" - 96" WPLG-Comp. The shear capacity  $\phi V_n$  at point 310 appears to be 331.9 kips and at point 400 appears to be 858.8 kips. Am I missing something? Thanks,

Tim

I ran your bridge with the current version of BRASS-GIRDER and some prior versions as well. However, I'm not able to reproduce your results. The shear capacity at the 310 and 400 points are consistently 858.8 kips. Please send me the BRASS input and output file (.DAT and .OUT) along with where you are finding the discrepancy in the file.

FROM:bgoodrich DATE:Wednesday, April 07, 2004 4:36:52 PM

E-mail from Tim (4/7/04):

Brian,

Here you are. In the output file, the phi\*Vn for 310 is on page 261 and for 400 on page 264. Note that this is controlling the rating which is why we're concerned. Thanks,

Tim

FROM:bgoodrich DATE:Wednesday, April 07, 2004 4:41:41 PM

This issue actually resides in the export process, so I changed the incident category accordingly. The reason I couldn't duplicate this problem is because I analyzed the bridge with Virtis 5.1.1, which contained an export modification that addressed Incident 4837. Basically, there was a small gap in the transverse stiffener schedule (exported to BRASS) at the end of the span 3, which caused the 310 POI to be considered unstiffened, thereby reducing the shear capacity. I have marked this incident as a duplicate of 4837.

### Description

FROM:dteal DATE:Thursday, April 08, 2004 9:16:04 AM

For Calvin Reed, KDOT Bridge Designer

The bridge in question is 130-56-0.23 Welded Pate Girder, .bbd attached. The faulty errors come from the second alternate titled "3-Span Alternate (testing for code error)". The girder "G1 (Exterior)" has been modeled as a 64" deep Welded Plate Girder which meets the requirements for a compact section as stated in Section 6.10.4.1.2. Since it meets compact section requirements, it must pass the ductility requirements as stated in Section 6.10.4.2.2b. For the sections at Span 1 (104 ft), Span 2 (28.5 ft, 88.5 ft, and 99.75') and Span 3 (28.5 ft) a Fail flag has been triggered for this specification, as well as "Design Ratio Computations" and "Rating Factor Computations". This fail flag is triggered for the Service I, Service II, and Strength I load cases for Stage 3 construction. The flag states the following:

AASHTO REFERENCE: 6.10.4.2.2b Ductility Requirement

EQUATION NO. : 6.10.4.2.2b-1

Input Parameters:

Dp = 36.433 in D' = 7.000 in

Calculated Value:  $Dp / D' = 5.205$

AASHTO Limit : 5.000

Result Code : FAIL

After looking through the output for the 108.000 point for Stage III construction, I determined that indeed the girder does not satisfy Equation 6.10.4.2.2b-1. However, one of the criteria for the ductility requirements spec. is that "the moment due to the factored loads results in a flange stress that exceeds the yield strength for either flange." This is obviously not the case for any of these sections since they are all near the dead load inflection points, and thus the moment is relatively low. The following data cut from the output for the 108 point shows that the stresses in both flanges during Stage 3 construction are well below yield.

### Description

FROM:ghutter DATE:Tuesday, April 13, 2004 2:59:17 PM

I have a rolled girder member alternative with a bottom flange cover plate with section loss. I copied this alternative to another member without a bottom flange cover plate and deleted the cover plate from the girder profile. I attempted to open the deterioration window to delete the section loss and I got an error. I attempted to save the bridge an again received an error.

The first error was "Unable to initialize Top Cover Plate tab."

FROM:ghutter DATE:Tuesday, April 13, 2004 3:07:16 PM

I attached the error messages and the bbd file.

FROM:kkennelly DATE:4/14/2004 8:19:08 AM

After you copy your original mbr alt, try deleting the cover plate section loss first and then delete the cover plate.

FROM:kkennelly DATE:4/14/2004 8:30:21 AM

Should the window check if the cover plate is assigned to a deterioration range before we let the user delete the cover plate?

**Complete Issue Information**

FROM:ghutter DATE:Wednesday, April 14, 2004 2:57:09 PM

I know I could delete the section loss first and then delete the cover plate. I thought it would be beneficial to either receive a warning that you can't delete the cover plate before the section loss or allow the program to delete the cover plate and then the section loss. I just don't believe that users should be losing data they have not saved just because of this error.

FROM:kkennelly DATE:4/16/2004 7:58:19 AM

I agree that we should check if the cover plate has deterioration before we delete it. We'll need to check all steel shapes, plates, cover plates and cross sections for deterioration before we let the user delete them.

Hello,

We are having a problem with this structure in Opis. I personally have not used Opis before and neither has anyone else in our office, but one of our engineers is trying to learn and she is having trouble with this structure. It looks like the self-weight of the deck is not included in the Opis analysis. I checked it in

### Description

FROM:tarmbrecht DATE:Thursday, April 22, 2004 3:26:26 PM

One of our designers entered a 2 span precast prestressed concrete deck beam (aka multiple adjacent box beam) bridge into VIRTIS (see attached bbd file). For multi-span structures, as in this case, there is no reinforcement in the top for continuity over the pier, so we analyze these structures as simple spans. When he tried to analyze, he got this message:

The loading sequence indicator is missing or invalid!  
Error setting global engine properties!  
A deck and shear reinforcement must be defined for multiple-span members to achieve continuity over interior supports!  
Error setting global engine properties!

I'm guessing that VIRTIS assumes all multiple span structures are continuous over the pier. If that is the case here, is there a way to specify continuous or simple spans that I'm not aware of? Or do we just have to enter each simple span as a separate unit? Thanks,

Tim

FROM:jduray DATE:4/23/2004 8:00:12 AM  
Each simple span must be a separate structure definition.

**Description**

FROM:tarmbrecht DATE:Tuesday, April 27, 2004 2:02:51 PM

A bit of a puzzle here (file attached):

I analyzed the West Unit (W Unit (3-Sp Cont PSI), member 3- 2nd W Int, memb alt 1219mm (48") PSI) without the 4" wearing surface by going into Structure Typical Section and "Not Assigning" a load case to the wearing surface. The result is 0.649 RF Inventory and 1.084 RF Operating. If I assign the 4" wearing surface to the load case "Wearing Surface", the results are 1.138 RF Inventory and 1.901 RF Operating. Why would more load increase the rating?

Furthermore, when I go into Superstructure Loads and change the Stage 2 DL distribution to "User-defined Dead Loads", I get rating factors of zero. Does choosing the user-defined option override something? Thanks,

Tim

FROM:bgoodrich DATE:Tuesday, April 27, 2004 3:35:46 PM

The distance to the rebar on the Continuity Diaphragm Reinf. tab of the Beam Details window is 1905 mm, which is deeper than than the cross section. Once this input is corrected, the ratings increase as

the load is reduced.

FROM:bgoodrich DATE:Thursday, April 29, 2004 12:37:53 PM  
E-mail from Tim Armbrecht:

Brian,

Thanks for your insight. It appears that we were flipping between metric and English and somehow, instead of a three inch wearing surface (75mm), a 75 inch (1905 mm) wearing surface got entered. Not sure if it was a user input error or if something didn't get translated properly in Virtis, but we're unable to duplicate it, so I would say it's probably input error and the concern is addressed. Thanks again,

Tim

## Complete Issue Information

Received from Christopher Laughlin via email to BridgeWare:

I tried to work on another bridge (360029) and ran into a new problem. Under Beam Details for G1, I had entered the beam projection for the left end and right end for the Span Detail and then tried to enter the Stress Limit range length. At this point Virtis asked if I wanted to correct the beam length so it would be consistent with the length I had entered under the Girder System Structure Definition. Realizing that I had the incorrect length entered under the Girder System Structure Definition I chose not to change the length at the Stress Limit but went back to GSSD to change the length there. Well from there on Virtis crashed several times. Each time I went back to the bridge I tried to enter the correct length but the program kept crashing without saving the new data as soon as I clicked on OK in the Stress Limit box.

Finally I somehow entered a length (length is not quite correct but close enough to keep going) without Virtis crashing but now Virtis cannot save it. The message is: Unable to save bridge data. Saving new and modified objects failed while processing CDmConcRailing (SaveOrder object 105). Error updating database record set.

It seems that Virtis has a problem with the concrete railing which as far as I can tell has nothing to do with the length problem. Perhaps I really had two problems of which one was eliminated and now only one remains. However, I would like to know how to correct an input mistake without Virtis crashing, and how to exit a bridge without losing all the data input even if some of it is incorrect.

BBD file is attached.

FROM:kkennelly DATE:4/28/2004 3:58:03 PM  
I think most of the problems with this bridge are related to incorrect data entered on the Structure Typical Section window. On this window, the end width of the deck is entered as zero.

In Virtis, the geometry of the superstructure is built off of the location of the Superstructure Definition Reference line. The girders and the edges of deck are all located with respect to that reference line. This reference line is located on the Superstructure Typical Section window. This bridge has 0 entered for the distance from this reference line to the left and right edges of the deck at the end of the structure. The data presently entered on that window describes the deck as being 76.25' wide at the start of the superstructure and 0' wide at the end of the superstructure. The left overhangs are also entered as negative numbers on that window. This bad data causes the Superstructure Definition Reference line to be located incorrectly and then all of the girder locations become incorrect since they are positioned relative to this reference line.

## Complete Issue Information

Ideally Virtis should not crash when bad data is entered however there may be instances where it cannot recover this from bad data. I suggest entering the correct data on the Structure Typical Section window and using the following tools to identify any other problems that may exist.

There are several tools you can use in Virtis to locate bad data. You can select "Bridge/Validate" from the menu when the name of your superstructure definition is selected. This will open a window listing warnings and errors related to your data. You can also open schematic windows while the "Framing Plan Detail" or "Structure Typical Section" labels are selected in the Bridge Workspace tree by selecting "Bridge/Schematic" from the menu.

As for your email regarding entering the length of the stress limit range on the beam details, there is an important distinction between the span length entered on the Girder System Superstructure definition window and the length of the stress limit ranges. The span length on the Girder System Superstructure Definition window is measured to the centerline of bearings for a simple span structure and to the centerline of the pier for multi-span ps beams made continuous for live load. Open the Virtis help by selecting the F1 button when this window is open to see a description and a sketch of how the span lengths are defined.

Stress limit ranges however, are applied over the physical length of the ps beam which is not the same as the span length of the beam. Use the F1 button when the Stress Limit Range tab is open to open the Virtis help topic which describes how these stress limit ranges are described using the "beam model" and select the "Prestressed Member Modeling Methods" link in that help topic window for a sketch.

### Description

FROM:kkennelly DATE:5/4/2004 8:38:35 AM

Attached bbd file is TrainingBridge 1 with the second support skew set to zero. When you try to run BRASS-LRFD for girder G1 get the following message:  
Error generating LRFD control commands!

All support skews are not equal. Therefore, the skew angle must be overridden on the Structure Definition engine properties.

The distribution factor schedule may also be overridden.

Error generating DIST-CONTROL-LL command!

I did enter my own LRFD Dist factor range and I still get the error message. (We removed the Structure Definition engine tab a while back.)

FROM:kkennelly DATE:5/4/2004 10:11:47 AM

Attached bridge is version 6, you won't be able to import it. But you should be able to create the same bridge by changing the second support skew to zero, adjust mbr alt ranges for new mbr length and then try to analyze G1.

FROM:bgoodrich DATE:Wednesday, May 19, 2004 11:59:24 AM

I was able to duplicate the problem. The export always tries to generate the distribution factor control command (DIST-CONTROL-LL) for a girder system because there is currently no way to tell it not to. Therefore, the error message leads you to believe that entering the schedule will get rid of the error. We have a couple options to address this issue. We will need to modify the error message for both.

Option 1. When varying skew angles are detected, the export would set the skew angle (used by BRASS) to zero, so a valid DIST-CONTROL-LL command would be generated. However, the user would be required to enter the distribution factor schedules.

Option 2. Move the lanes loaded and skew engine fields (that were on the structure def engine properties window) to the member alternative engine properties window and adjust the export as necessary.

4/19/2016 3:18:00 PM

HRS AASHTO

1666

### Complete Issue Information

Option 3. Reinstate the Structure Definition engine tab.

If I were a user, I would prefer to have the capabilities in Option 2 (at a minimum) because BRASS would still calculate the distribution factors for a given skew angle as it once did prior to the removal of the Structure Definition engine tab.

FROM:bgoodrich DATE:Wednesday, May 19, 2004 12:32:16 PM

FROM:jduray DATE:4/13/2005 9:39:10 AM  
Investigate reinstating the Structure Definition engine tab.

FROM:bgoodrich DATE:Monday, December 05, 2005 11:43:41 AM  
Khalid Obeidat (Minnesota DOT) reported this same issue today. There is no work-around. His file is attached as B27v68.bbd.

FROM:bgoodrich DATE:Tuesday, February 28, 2006 7:55:45 PM  
The Structure Definition engine tab was reinstated in version 5.4.

### Description

FROM:snsah DATE:Friday, June 18, 2004 2:28:57 PM

Is it possible to input a girder into Virtis/Opis with multiple strand sizes (diameters) in the same cross section?

FROM:kkennelly DATE:6/21/2004 3:53:46 PM

Prestressed girders cannot handle multiple strand sizes in the same cross section if you are using the "Strands in rows" description type to enter the location of each strand in the Strand Layout window. If you want to mix strand sizes in a beam, you can try using the "P and CGS method" to enter the prestressing data in the Strand Layout window. However, since you assign a Prestress Property to your PS beam and the Prestress Property contains only one strand size, you should review the output carefully as I am not sure if this type of model will have any adverse affects on your rating.

## Description

FROM:tarmbrecht DATE:Wednesday, June 23, 2004 10:40:39 AM

We're getting these error messages when we try to run a beam line analysis for the attached file:

Error converting Virtis/Opis steel cross sections or schedules to 'general' cross sections!

4/19/2016 3:18:01 PM

HRS AASHTO

1670

## Complete Issue Information

Error retrieving data for generated cross section at -0.37 ft  
Unable to DoSteelWebPlateRangeSetPtr->MoveDistance in FillCrossSectionData!  
Error getting web plate from steel web plate ranges to right of -0.3750000 ft!  
Current tolerance for ft is 0.0100000.

I know we're missing something. Any ideas? Thanks,

Tim

FROM:kkennelly DATE:6/25/2004 11:35:36 AM

This error is due to a missing Point of Contraflexure on the Member Alt: Engine tab. Open the Member Alt window, select the Engine tab and then select "BRASS LFD" and the Properties button. The BRASS LFD engine properties window then opens. There is no data entered for the point of contraflexure in the first span. The export to BRASS then erroneously returns a negative number when it tries to find the point of contraflexure in Span 1.

Entering a value for the point of contraflexure in span 1 will fix your problem but we should probably issue an error message that the data was not defined before trying to run BRASS.

FROM:tarmbrecht DATE:Friday, June 25, 2004 3:29:55 PM

Thanks Krisha,

Actually, the point of contraflexure is not missing, but in fact does not exist. Span 1 is so short compared to the rest of the structure, that it is always in negative moment. We know it's unusual, but unfortunately, it is how we're trying to model a flared structure with a beam popping up between two continuous beams. If we set the contraflexure to something near the end, like 0.1, would that work?

FROM:kkennelly DATE:6/25/2004 3:57:31 PM

You can try that. If you hit F1 while the Engine Properties window is open, the Help for this BRASS Engine Properties window opens and you can see what BRASS uses this point of contraflexure for. It looks like it is used to generate the BRASS Steel-Girder-Control command which specifies if the section is composite and if it is in positive or negative bending. You can enter a small value for the point of contraflexure and then review the BRASS input file to see if the section properties are computed properly. Note that if you make the point of contraflexure too small, you might get an "Element too small" error from BRASS. If that occurs, try making the point of contraflexure a little bigger.

FROM:bgoodrich DATE:Friday, July 02, 2004 3:05:48 PM

Mehrdad produced a 5.2 BBD file (0820382X-TES.bbd), which is attached.

The AboBrass file (DoBrassStdMbrAltParser.cpp) was modified to detect two null contraflexure locations. The error no longer occurs. Fixed for version 5.2.

| 5197.14146 | Closed        | Error message for floorbeam/stringer system |

**Description**

FROM:tarmbrecht DATE:Wednesday, June 23, 2004 11:59:13 AM

The two attached files are supposed to be similar, with one just a bit wider than the other. Our puzzle is that the stage 1 dead load moments don't match for span 1 member 3rd S int for 0990063 and span 1 member 2nd N int for 0990062. Since the beam spacing is the same around these two members and we have dead load based on tributary area for dead load 1, we expect the moments to match. We checked our beam and deck inputs, but can't find the difference. Any ideas where we might be missing it? Thanks,

Tim

### Description

FROM:ttompson DATE:Tuesday, June 29, 2004 9:49:11 AM  
I'm getting the following error:

Error generating LFD/ASD load commands!

08:53:03 AM - Line 241 in source file F:\Virtis\gui\AbxBrass\BrassStdLoadControl.cpp.

Error generating load group commands!

08:53:03 AM - Line 427 in source file F:\Virtis\gui\AbxBrass\BrassLoadControl.cpp.

Unable to compute average dead load of stringer unit!

08:53:03 AM - Line 1014 in source file F:\Virtis\gui\AbxBrass\EngineExport.cpp.

Error in the loads utility!

08:53:03 AM - Line 829 in source file F:\Virtis\gui\AbxBrass\LoadsUtility.cpp.

When I rate the system. The Stringers and Floorbeams appear to rate ok, but it errors out when it starts the Girders. (there is no brass files created (or at least saved to the hard drive).

**Complete Issue Information**

I can't seem to figure out why I'm getting this error. Not sure if there is a bug in Virtis or if I don't have something filled in correctly.

- 2 girders at 27 ft spacing (42-6 span)
- 3 stringers at 6-9 spacing (between main girders) (14-2 span)
- 4 floorbeams at 14-2 spacing (27-0 span)

I've attached the export file.

FROM:bgoodrich DATE:Tuesday, June 29, 2004 6:05:36 PM  
 The problem is associated with Stringer Unit 3. The domain appears to be the source of the error though. The export calls the CDoGfsFloorSystemStructDef::ComputeGirderStrUnitAveDeadLoad function (for unit 3), which in turn calls the CDoReferenceLine::FindIntersection function. Within that function, some conditionals are checked (in particular, t = 12.9540003048 is compared to dLength1 = 12.9540000000). A fixed tolerance is used in these comparisons. The user-defined tolerance should probably be utilized.

FROM:kkennelly DATE:7/1/2004 8:52:37 AM  
 Temporary work around is change how the floorbeam locations are entered on the Floorbeam Member Locations window. Instead of referencing the fb locations from the previous fb, enter the locations as:

|     | ref dist | offset    |
|-----|----------|-----------|
| fb1 | 0.0      | 0.0       |
| fb2 | 0.0      | 14.166667 |
| fb3 | 0.0      | 28.333333 |
| fb4 | 0.0      | 42.50     |

The problem is due to the trailing 6's and 3's cause the last fb location to be at 42.500001'. The girder length is 42.5 so the FindIntersection() fails. I can't change FindIntersection() to use user defined tolerances because we use our hardcoded tolerances when it comes to geometry (spans/girder lengths/etc.). The user defined tolerance is only to help users with gaps/overlaps when entering things like flange plates, etc. I'm afraid using the user tolerance in FindIntersection() may have very bad effects on the rest of the system.

FROM:kkennelly DATE:7/1/2004 4:26:10 PM  
 Validation is being added to alert user when this case exists. Window also being modified to show more significant digits.

FROM:tthompson DATE:Friday, July 09, 2004 10:06:40 AM  
 Temp workaround works, but when you go through creating your FB locations, it didn't seem to give you a chance to enter them that way. So you need to change them afterwards.

Submitted on behalf of Stacy Weaver, FTS Inc. via email:

>>> Stacy Weaver <SWeaver@fstinc.com> 7/6/2004 11:59:10 AM >>>

Hi Krisha,

Thanks for your quick response to my train loading inquiry. I have another question about Virtis, concerning the cross section properties. I am currently rating a 4 span continuous steel stringer bridge. The stringers are rolled shapes with top and bottom cover plates.

A portion of one of the beams has reduced section properties due to collision damage. I have

## Complete Issue Information

-Stacy Weaver

FROM:bgoodrich DATE:Sunday, August 01, 2004 12:50:43 PM

I revised the export to include the web depth in the cross section comparison algorithm for rolled beams with no deterioration. Now Span 3 in the user's bridge is exported with the correct web depth. Fixed for Version 5.2.

am getting two different d distances. See attached file.

FROM:kkennelly DATE:7/19/2004 12:35:46 PM  
I ran member G2 and get d = 46.5 at POI 100 and d = 44.5 at POI 105

FROM:bgoodrich DATE:Monday, July 26, 2004 5:43:50 PM  
The submitted bridge did not have any Beam Projections entered on the Span Detail tab of the Beam Details window, which are used as the starting point for prestress transfer lengths. The effective strand stress at the beam end was zero because this point was at the start of the transfer length. The shear depth is generally taken as: beam height + haunch thickness + deck thickness - PS distance. If I add 6 inches as the beam projections (left and right), a shear depth of 44.5 inches is calculated at the beam ends.

| 5270.14074 | Resolved      | Tapered loads due to varying deck width not handled by BRASS |

### Description

FROM:xli DATE:7/30/2004 3:47:14 PM

Double click LRFD factor, create a new LRFD factor, give a name and then close it, open this LRFD factor again, copy an LRFD factor from library and hit Ok, it makes virtis crash. It happens in both virtis 5.1.1 and virtis 5.2.

### Description

FROM:kkennelly DATE:8/4/2004 3:53:14 PM  
Submitted on behalf of Vinacs, Caltrans via email:

I am working on a bridge that is on a radius. Though the bridge is on radius, girder are parallel. Because of this configuration, overhang changes along the girders. Initially I modelled without varying the overhang width (using average overhang width along the girder). Unfortunately the rating factor came about to very low.

As a result, I tried to vary the deck width and haunch width along the (exterior girder). BRASS engine doesn't like the input file created by the BRASS export program.

FROM:kkennelly DATE:8/4/2004 3:56:21 PM  
When I analyze "Varying deck+Haunch width "C", I get the following error:

\*\*\*\*ERROR\*\*\*\* A tapered load was input that does not start or stop at a node point. Review input instructions for the UNIFORM-DL1 command, parameter 1. The HINGE and/or TRANSFER commands may be used to add additional node points. Program stopped

BRASS requires tapered loads to start/stop at the BRASS internal node pts. The problem is we have no way of knowing in Virtis where these node points are. This problem has been previously entered in Incidents 4968 and 2631. The solution is to add points of interest in Virtis at the points where the tapered loads stop/start. In the "Modified 10-0053California.bbd", I've made a copy of the girder in question and named it "Krisha's copy of...". I first changed the Haunch Profile Range data to exactly match the Deck Profile data (there was slight differences in 3rd and 4th decimal places). Then I added points of interest at the points where the BRASS UNIFORM-DL1 commands were generated. After doing all that, I am still getting the same error message as before.

FROM:kkennelly DATE:8/4/2004 3:58:47 PM

FROM:bgoodrich DATE:Thursday, August 05, 2004 11:10:05 AM  
Vinacs,

I located the source of the problem reported in Incident 5270. BRASS generates nodes based on cross section changes, points of interest, and contraflexure locations. The second contraflexure location (for span 2) entered for the "Varying Deck+Haunch width "C"" member alternative was 85.599998%, which resulted in a node point being placed at 99.129 ft. For the deck dimension entries, a change was specified at 99.167 ft. Because the distance between these two points is less than the

4/19/2016 3:18:04 PM

HRS AASHTO

1688

**Complete Issue Information**

0.12 ft small element length permitted by BRASS, only the first point was added. After I changed the contraflexure location to 85.632744%, I was able to run the member alternative successfully. Please let me know if this solution works for you.

This was a difficult problem to solve and I could not have done it without getting into debug mode in the BRASS engine. At the very least, the BRASS error message should be revised to include the load information (distances and magnitudes), so a user has some idea where to start looking for a solution.

Regards,

Brian L. Goodrich

## Complete Issue Information

### Description

FROM:kkennelly DATE:8/5/2004 12:39:23 PM

We have a lot of grids and read only edit controls that show items like computed end distances. The computed values are read only but the user can only see the # of significant digits in our display string. They need to see more significant digits to be able to find problems with their input. We should make all read only fields in Virtis/Opis be selectable so user can see more significant digits.

Submitted in response to following portion of email from Vinacs:

.....

We tried to match the inflection point to the hinge location in the span. Hinges are at 16.638 (14.36725 %pt) and 99.167 (85.63274 %pt). Instead of entering the data to the 4 decimals, I rounded it to 14.4 and 85.6. If I had entered the data in the Deck Concrete GUI, so that the start or end point within the data matched the location of the hinge, this error could have been prevented. Unfortunately, since the "End Distance" in the Deck Concrete GUI is reported to the second decimal only. It will be difficult to know actual end distance to compare. Is there any way I could view the exact end distance?

.....

FROM:kkennelly DATE:10/7/2004 4:42:11 PM

Email received from Richard Best, Illinois DOT about same topic:

- In "grayed-out", or non-updatable fields under the Reinforcement tab of Girder Profile for RC members, the values can be expanded to see the precise decimal value (out to 6 decimals) and copied (tho, of course, not changed). Why have not all such fields throughout the Virtis data been made to operate like this? It often would be a help when data must be revised, etc. to just copy and paste the exact value. For example: In a steel structure when the bracing is input, the start point of a range is created as exactly the same as the end of the previous range. When range lengths are revised, the following range start points are not automatically corrected and must be changed manually or the ranges must be entirely deleted and re-entered. It would sometimes be helpful to be able to just copy the end point of the previous range and paste it into the start point of the following range.

### Description

FROM:rfulton DATE:Friday, August 13, 2004 9:59:51 AM

It would be good to be able to see the reinforcing in the girder profile veiw (even if the reinforcement is not dimensioned) as a way for users to check their data entry.

FROM:kkennelly DATE:8/13/2004 10:49:37 AM

We are going to add a new schematic for the reinforcement profile. It will be shown in a plan view very similar to the sample plans you sent me a few weeks ago(ic2827s3.pdf). We just got the ok to add it last week at the Task Force meeting so hopefully it will be in the next beta build.

If there is a T-girder bridge, the input has to be schedule based. If you are putting in an I-girder, the input has to be cross-section based. Shouldn't there be an option for which type of input you want to use?

For:Stephen G. Burnett

Dean, I have noticed what I consider an error in the BRASS calculations for the Flange Forces in steel girders at Brace Points. If the brace point is at the point of interest the calculation is correct. If however the brace point is not on a point of interest the software uses the section moduli for Stage 3 for all stages. I have shown the two calculations below. bbd is attached

## Description

FROM:rfulton DATE:Thursday, August 19, 2004 5:31:13 PM

The type 1 definition has the option of putting a hook at the end of a bar but this is not used as a point of development. This is the best place to tell the software to consider the bar fully developed and it allows for someone to develop only one end of a bar. This same option could be applied to Type 2 and 3 definitions as well. The straight bar definition is redundant as it is covered in the type 1 definition. In a large structure definition, the POI location for development length is very difficult to know which bars you intend to be developed as it requires the user to jump to the girder profile window.

4/19/2016 3:18:06 PM

HRS AASHTO

1698

**Complete Issue Information**

A second option would be to allow the user in the girder profile window to fix the development of the left and/or the right ends verses fixing both as it is now.

Option three: have the ability to input straight bars without defining them in the bar mark definitions. Just put bar size, number of bars, weather or not to consider developed or not developed at either the left and right ends, distance from top or bottom of the girder, starting location and length. Although I am not a programmer, I believe having Option 3 should allow for an easier conversion of the database.

**Description**

FROM:rfulton DATE:Friday, August 20, 2004 12:04:36 PM

It would be nice if the RCDG module was done similar to the Prestressed module in that the entire girder is defined to include the section past the center line of bearing so that the user does not have to fudge stirrup spacings and bar lengths.

FROM:kkennelly DATE:8/20/2004 1:04:20 PM

If you enter the End Bearing Locations on the Mbr Alt window, you can then enter your bars in the Girder Profile window to project into that extension. Stirrups still have to be defined from cl brg to cl brg.

You should enter a value for the End Bearing Location and then start your bars in that projection so the export will determine the bar is partially developed at the CL brg. If you don't have any bars developed at the CL of brg, 0 bars will be exported into BRASS and your shear rating at the CL brg will be zero because the d value is zero if there are no bars.

FROM:rfulton DATE:Friday, August 20, 2004 2:35:23 PM

That explains one problem, thanks. My model has been bombing for shear at the supports.

| 5304.14040 | Resolved      | Generation of steel cross sections for exterior girders should use Y1 dimension instead of average haunch thickness |

### Description

FROM:kkennelly DATE:8/20/2004 1:41:30 PM  
Submitted on behalf of Vinacs, Caltrans via email 8/9/2004:

BRASS seems to overestimate the dead load when I enter the haunch detail. In order to help investigating the issue I created two alternatives for member "GDR C - per drawing" and reduced the deck thickness as 0 and eliminated the diaphragm weights.

1. Free End deck thickness 6" Girder"C"

Deck over the girder is 13.5 inches thick (deck thickness is 8.75inch). At the Free end of the deck, deck is only 6". So I entered the value of 7.5 inches for Y2. (In other words, the deck thickness reduces from 13.5 inches to 6 inches)

When I look at the moment due to Haunch, I got a moment demand of 197.7 kip-ft. (It seems high, in order to check I created the another model described below)

2. Free End Thickness 13.5 inches "C"

FROM:kkennelly DATE:8/20/2004 2:10:36 PM  
Submitted on behalf of Vinacs, Caltrans via email 8/5/2004:

Another question in the same bridge model

When I rate this bridge using ASD method (that is the method used to design this bridge), I am getting lower inventory rating factor than previously estimated by another program.

4/19/2016 3:18:07 PM

HRS AASHTO

1703

## Complete Issue Information

When I looked at the 2.5 pt location. "Varying Deck+Hauch width "C" Alternative, I noticed some results that were questionable.

1. At this location, Deck thickness is 8.75 inches and fillet over the flange as 4.75 inches (in the Haunch details, I entered Y1). When I calculated the distance to centroid of the concrete section from top of steel flange, it came about to be 8.218 feet. However, BRASS estimated it as 6.12 feet. This resulted in smaller composite section property - that may affects the overall rating of this bridge.

2. Same thing with the rebar location. Area of the rebar reported correct. However, the distance to the bar from top of the flange is overestimated by little.

Could you please check that for me?

Reponse from Brian Goodrich 8/16/2004 via email:

Because the girder associated with this problem is exterior, the domain is populating the haunch thickness for the steel cross section with the average haunch thickness, i.e.,  $(Y1+Y2)/2$ . This is done in the CDoGirderMbrAlt::FillCrossSectionData function. What are your thoughts here?

FROM:kkennelly DATE:9/1/2004 12:18:33 PM

The average haunch  $(y1+y2)/2$  is used as a result of Incident 3194. Making such a change now in how the haunch depth is computed will result in section property changes in existing bridges which may be undesirable (haunch depth is used to position slab above beams).

One option is to add an option on the Haunch Profile window for exterior members letting users pick if they want the haunch depth to be computed the old way (which is  $(y1+y2)/2$ ) or new way which is just  $y1$ .

Estimate about 3 days to add this option to db, dm, de, do, GUI, help, export of cross sections. Need TF direction.

FROM:kkennelly DATE:9/1/2004 12:36:28 PM

FROM:kkennelly DATE:9/10/2004 3:42:19 PM

We're not going to add the option of using old/new method. Revise domain and export to use Y1 as the haunch depth for Version 5.2.

FROM:kkennelly DATE:9/13/2004 10:00:02 AM

Domain fixed for 5.2 Beta 3 and 6.0.

Brian, I think the export code also needs changed.

FROM:bgoodrich DATE:Tuesday, September 14, 2004 3:50:44 PM

Export revisions complete. Fixed for Version 5.2.

### Description

FROM:tarmbrecht DATE:Tuesday, August 24, 2004 4:15:25 PM

Please review and verify the error message we're getting. The description and bbd file are attached. Thanks.

Tim

FROM:kkennelly DATE:9/1/2004 11:13:13 AM

Fixed for Version 5.2. The problem was the ext beam's eff flange width is a function of the adjacent beam's eff flange width. The adjacent beam's deck profile ends at about 47' but the beam was about 74' long. So the calcs tried to get the adjacent beam's deck eff thickness at 74' to compute its eff flange width and the error when the deck wasn't found wasn't being handled properly. If the adjacent beam doesn't have an effective deck thickness entered, the calcs use the eff thickness entered on the dialog that appears after you hit the Compute button.

I would like to pose this as an enhancement request.

For steel structures, the member alternative description / engine tab / the BRASS LFD section requires you to input the points of contraflexure for a structure. It defaults to the 0.7 and 0.3 point of the span for continuous structures. This is not correct for most structures. It can result in significant error in the calculated moment for a structure. In the extreme case where there is a relatively short span in a structure (a 1:2 span ratio, for instance) which would be in negative flexure for its whole length, the

4/19/2016 3:18:07 PM

HRS AASHTO

1706

## Complete Issue Information

reported results will show positive moment where none exists. This can easily result in unrealistically low structure ratings.

The work-around solution for this problem is to evaluate these structures with another piece of software to determine the contraflexure points and input the correct value into VIRTIS/OPIS. We would like VIRTIS/OPIS to calculate this value so that the results are technically accurate, and save the additional labor by our staff and our consultants to double check most structure output.

To be honest, I'm not completely clear as to why the contraflexure points are required input. I'm not aware of other analysis programs requiring these numbers as initial input.

Thanks, Tim

FROM:bgoodrich DATE:Monday, August 15, 2005 12:36:33 PM

Here's some background on the issue. BRASS-GIRDER only allows a composite slab or rebar in the same cross section. The contraflexure locations tell the export when to generate the section to include the composite slab in positive flexure regions or to include the rebar in negative flexure regions. Additionally, BRASS-GIRDER requires that the user define how a region or point of interest is to be analyzed, i.e., for positive or negative bending. The contraflexure locations are necessary because in Virtis, the user enters the actual bridge geometry regardless of the engine. The stand-alone BRASS user has always had to perform this translation to the mathematical model and input the appropriate commands in the data file. This requirement was revised in the BRASS-GIRDER(LRFD) engine by always generating the structural analysis model based on positive bending properties. Then, for specification checks and resistance calculations, the section properties corresponding to the factored moment were used. Finally, this issue will be automatically be addressed in the merger of the BRASS engines.

### Description

FROM:tarmbrecht DATE:Thursday, September 02, 2004 12:17:26 PM

This is a hybrid plate girder with 70 ksi flanges. Could you please investigate why the allowable yield stress for the flanges appear to be less than 70 ksi at the piers? We input 70 ksi, but it's calculating capacity with 67.48 ksi at the 300 point and 68.03 ksi at the 400 point. I'm not aware of AASHTO requiring a reduction for this. File attached. Thanks,

Tim

FROM:bgoodrich DATE:Thursday, September 09, 2004 11:32:03 AM  
I believe the output you are referring to is:

Serviceability Rating Factor - Steel (Negative Action) - TOP OF SECTION  
Yield Stress Steel = 67.48 (ksi)  
Section Modulus = 1758.01 (in<sup>3</sup>)  
Unbraced length factor (rkr) = 1.0000  
Dead Load Moment = -3788.01 (ft-kips)  
Live Load Moment = -723.43 (ft-kips)  
Yield Moment , My = 9886.29 (ft-kips)

4/19/2016 3:18:08 PM

HRS AASHTO

1709

## Complete Issue Information

$$\text{R.F.} = \frac{[(0.80 * \text{Phi}(\text{flexure}) * \text{My}) - (\text{Gamma} * \text{Beta}(\text{DL}) * \text{DLM})]}{(\text{Gamma} * \text{Beta}(\text{LL}) * \text{LLM})}$$

$$\text{**R.F.} = 3.4111$$

The rating factor equation uses moments instead of stress, so the calculation of My is necessary per Equation 10-148b. BRASS calculates the yield moment (My) as Fy\*S\*R. However, when BRASS writes the output for this calculation (shown above), it calculates an intermediate stress that includes the hybrid factor. Fy(interm) = Fy\*R = 70\*0.964 = 67.48 ksi. I reviewed BRASS and found that this intermediate stress is only used for output purposes. Do you agree with the yield moment calculation?

FROM:bgoodrich DATE:Tuesday, September 14, 2004 3:53:50 PM  
E-mail from Tim Armbrecht (9/9/2004):

AASHTO 10.53 (hybrid girders) refers to AASHTO Art. 10.57.1 (overload) which says maximum overload flange stress shall not exceed 0.8 Fy for noncomposite sections. We do not find anything in Article 10.53 to indicate that the hybrid reduction factor should be applied to Fy in making this check for the overload stress. In fact, 10.53.1 (non-composite) and 10.53.2 (composite) specifically uses the words "maximum strength" of a section when applying the hybrid reduction factor. We think that the calculation of My needed by BRASS for this overload stress check should be based on Fy\*S even for hybrid girders, and ask WYDOT to consider a switch to allow us to not include the hybrid factor in serviceability checks.

Subject: Re: Virtis Incident 5327

Brian and Tim:

Pul Huck, our senior engineer, and I discussed this matter in great depth. We looked at the LFD code and decided it was not clearly written and certainly open to interpretation. We decided to look at the LRFD Specifications to see if the commentaries would shed any light on the proper interpretation. The LRFD Spec states that the Service II Load Combination "corresponds to the overload provision for steel structures in past editions of the AASHTO Specifications." Thus, going to Article 6.10.4 of the LRFD Spec, Service Limit State, section 6.10.4.2.2, the equations use both 0.95/0.80 AND the hybrid reduction factor. As Tim pointed out, the use of both seems to be conservative. In fact, AASHTO notes this also in the adjacent commentary "Eqs. 1 through 3 address the increase in flange stresses caused

4/19/2016 3:18:08 PM

HRS AASHTO

1710

**Complete Issue Information**

by early web yielding in hybrid sections by including the hybrid factor R. It is recommended that the value of R applied in the strength limit state checks at the section under consideration be conservatively applied in these equations."

For this reason, we will not change BRASS-GIRDER.

**Description**

FROM:dteal DATE:Tuesday, October 05, 2004 9:34:09 AM

I am using the BridgeWareAdmin utility for event cleanup. I can launch the utility just fine, the Microsoft hourglass is displayed indicating it's running – BUT – when I check my Microsoft task manager it indicates that it's not responding – so I have to have our DBA periodically check the oracle server to see if it's running and when I can kill the BridgeWareAdmin utility on my local pc.

So, what we need is for my local pc to indicate if it's still running. And not have the task manager state that it's not responding.

FROM:mordoobadi DATE:10/5/2004 9:50:57 AM

If you have many events in the event table. The event cleanup could take a long-long time. You should be patient.

FROM:dteal DATE:Tuesday, October 05, 2004 10:31:56 AM

I was concerned about the "Not Responding" from the task manager - but I beleive that this not responding is my local pc waiting on the completion of the utility. So, I'll just sit back and wait a long-long time, okay.

FROM:dteal DATE:Wednesday, October 06, 2004 8:33:52 AM

The utility finally responded after it got done doing it's thing some 40 hours later!! Everything worked as it's supposed to, Please close this incident.

## Description

FROM:dteal DATE:Wednesday, October 06, 2004 12:59:06 PM

Why isn't a compute button for distribution factors provided for RC (both LFD and LRFD)?

FROM:kkennelly DATE:10/8/2004 10:22:21 AM

We do have LFD compute buttons for girder system rc members. We don't have any compute buttons for girder line members because we don't have enough info to compute the dist factors. Compute buttons aren't provided for LRFD because the BRASS engine will compute them for you.

FROM:dteal DATE:Monday, October 11, 2004 7:56:16 AM

I don't beleive that BRASS computes LRFD dist factors for RC?? BRASS only computes girder system dist factors.

It is cumbersome to have to have a spreadsheet handy to find LFR and LRFD dist factors. If we don't

4/19/2016 3:18:09 PM

HRS AASHTO

1714

**Complete Issue Information**

or can't provide a compute button then we could provide a small wizard that required the following input, for LRFD (section width, span lengths, deck width & number of loaded lanes) and LFD only requires (span length and section width).

I think this was requested in an earlier incident but I can't seem to find it right now.

In a nut shell – to do a RC slab type structure we need a spread sheet for Dist. Factors & slab surface to centroid of rebars. I would just like to help the user and give them tools they need without having to rely on tools/program outside of VirtisOpis.

A symmetry check box is needed in RC when entering both Girder Profile/Web and Girder

4/19/2016 3:18:09 PM

HRS AASHTO

1715

**Complete Issue Information**

Profile/Reinforcement. The web isn't too bad but the reinforcement is tedious. 100% of the RC slab plans we produce only show the left half of the structure. Entering both half's in a repetitive time consuming task which opens the door for input errors. BRASS utilizes symmetry in the BRASS Girder Span-Copy command.

So, help us save some time here and reduce input errors.

FROM:dteal DATE:Wednesday, October 06, 2004 2:28:59 PM

If you had a particular bar with a hook at one end and not the other or any other variance between the two ends, you have to have 2 Bar Marks to correctly enter the bar, The plans call out the bar with one bar mark but in Virtis we will have two bar marks - so now the bar list on the plans vary from what's in Virtis. A symmetry option would eliminate this.

### Description

FROM:dteal DATE:Wednesday, October 06, 2004 3:20:48 PM

All designers know the clear distance to there rebar like 2.5" top and 1" bottom clear. Measuring the distance to the bar centroid requires the designer to have a spreadsheet or calculator handy. This is convenient for programming but not for the designers, it's time consuming. Lets let the computer do what it does best. Crunch numbers.

This also bites us in the butt when reviewing data input. The reviewer will see some decimal inch value like:

A #10 bar has a clearance diameter of 1 7/16"(1.4375") so for a 2.5: cl we would have 1.4375 Divided by 2 + 2.5 = 2.7188", that would be the distance we would enter. Now when you see 2.5" you know you have 2 1/2" clear to the bar. When you see 2.7188" you wonder what the heck is that, and with several iterations (guesses) you calculate that to 2.5".

We already use a clearance value in the side cover on the same GUI. This I believe is measured to the bar face and not it's centroid, correct.

Lets make this easier for the designers and load raters!!

FROM:dteal DATE:Wednesday, October 06, 2004 3:36:41 PM

With entering distance to centroid of the bar, during the iterative design process, you may change a bar size. If clearance to the bar was entered you would not have to do anything else. But with distance to the centroid you have to remember to go from the Bar Mark Definitions GUI to the Girder Profile Reinforcement GUI and change the distance value due to the bar diameter change.

HRS AASHTO

1717

**Complete Issue Information**

Now, see how easily it can happen – I screwed up my example calculations above, I'm only human. It's not 2.7188", it should have been 3.2188". I bet the computer would do it right every time!

FROM:jduray DATE:10/8/2004 8:36:58 AM  
It is too late to implement this for 5.2. There are other places in the UI and data in the db that would have to be changed if it is decided to implement this.

FROM:dteal DATE:Friday, October 08, 2004 9:53:52 AM  
Too late!! When I first reviewed the GUI mockups I returned the same comments - my copy is dated June 9, '04.

### Description

FROM:kkennelly DATE:10/7/2004 4:35:36 PM  
Submitted on behalf of Illinois via email from Richard Best:

- User override for development length should be included since use of current AASHTO specs. will result in extremely low ratings for concrete structures built prior to approximately the mid-70's (and not justified by experience with these structures). It should be made so that the user can specify development and lap lengths based on a bar diameter multiplier as in AASHTO specs. prior to the mid 1970's.

| 5420.13924 | Resolved      | Low LFD rating factor for stringers |

### Description

FROM:tarmbrecht DATE:Wednesday, October 13, 2004 3:51:04 PM

Entered floorbeam spacing as 19.1198, 21.1179, 21.1179, 21.1179, 21.2, 21.2, 21.2, etc. After clicking "OK" and re-opening the Floorbeam Member dialogue, the floorbeam spacings displayed as 19.000000, 21.000000, 21.000000, 21.000000, 21.000000, 21.000000, 21.000000, etc. Is there a reason for the rounding?

Also, a floorbeam was entered with lateral restraints at each location where a stringer bears on it (as is the actual case). Each lateral restraint length was 7½" long, and spaced at 6.6042' on center. The bridge, originally designed HS20, was analyzed with the following results:

LF – RF(inv.)=0.206

AS – RF(inv.)=1.166

When lateral restraint was input as continuous for the entire length of the floorbeam the following

4/19/2016 3:18:11 PM

HRS AASHTO

1724

## Complete Issue Information

results were obtained:

LF – RF(inv.)=1.020

AS – RF(inv.)=1.166

Are these the expected results?

File attached. Use the second one and delete the first one. The second one is more current and reflects the second part of this incident. Thanks,

Tim

FROM:kkennelly DATE:10/14/2004 9:10:02 AM

Problem 1 regarding the floorbeam spacing not showing values behind the decimal point is fixed for Version 5.2, Beta 4.

Problem 2 regarding the differences in rating factors:

I ran BRASS once for the bracing ranges every 6.6' and once for the top flange braced over its entire length. When I compare the output at the 11.06' poi I notice the following:

Top flange continuously braced,  $M_y = M_u = 3081.70$  kft.

Bracing range every 6.06',  $M_y = 3081.7$  kft but then  $M_u = 761.42$  kft but there's no explanation in the output as to why there is such a large reduction. All of the output values shown up to this point are the same.

FROM:bgoodrich DATE:Monday, October 18, 2004 1:29:10 PM

For this structure, BRASS thinks the base unbraced length for any point is 52.8 ft. The lateral support ranges input override this unbraced length and indicate that any point that is located within the lateral support range has an unbraced length of zero. This is why entering a lateral support range over the entire floorbeam causes a better rating. The Lateral Support window is intended to supplement the bracing locations, but not to identify the actual unbraced lengths. But, for a floorbeam, an input window for bracing locations is not provided. The gaps in the lateral support ranges are not translated into unbraced lengths by the export or the engine.

The only work-around is to change the member alternative engine properties POI Control field to 0 - No point of interest data will be generated. Then, for each point of interest, you will need to override the Bracing information on the Point of Interest window. You will also need to override any other schedule data (stiffeners, etc.).

Jim - We need some way to identifying bracing locations for a floorbeam, which are where the stringers are located. It would be a bad idea to convert the lateral support data into bracing data because that is not the intent of that window. Can we add the Bracing window, but rename the Diaphragms tab to something applicable to floorbeams, such as Stringer Locations?

FROM:kkennelly DATE:10/23/2004 1:18:35 PM

I don't think we should make the users enter the Stringer locations again, they've already described the geometry of the bridge. Attached file contains code you can use to find where the stringers are along the floorbeam.

FROM:bgoodrich DATE:Tuesday, November 02, 2004 3:52:11 PM

I agree with Krishna that the user should only have to input the stringer locations one time. The stringer locations may be specified for a Floor System, but this issue is for a Floor Line.

4/19/2016 3:18:11 PM

HRS AASHTO

1725

**Complete Issue Information**

FROM:jduray DATE:1/20/2005 1:27:38 PM  
Do we need more data for floor line?

FROM:kkennelly DATE:1/21/2005 11:39:57 AM  
Yes we need more data for a floor LINE.

1. Change name of window from "Lateral Support' to "Bracing Ranges".
2. Add tab "Stringer Locations". This window will have a grid where user can enter the distances from the left end of the floorbeam to where stringers provide bracing to the floorbeam.
3. Put current Lateral Support on a tab on this new window.

This may be related to part 2 in incident 5416 - it's the same bridge.

Analysis of the stringers in this Girder/Floorbeam/Stringer system returns LFD RF's of .529/.887 at the first interior pier support from the left. They were originally designed HS20. The controlling AASHTO BARS LFD RF's are .932/1.554 (I/O) at the same span location. The Virtis ASD RF's are 1.007/1.490

**HRS AASHTO**

1726

## Complete Issue Information

(I/O), also at the same span location. It would appear that the LFD rating is in error. Is this the same issue as the one I reported in 5416? Thanks,

Tim

FROM:bgoodrich DATE:Tuesday, November 02, 2004 4:39:46 PM

This issue pertains to a stringer analysis in which the flexural capacity is reduced because the bracing criteria are not satisfied. I reviewed the output at the 205 POI and it looks reasonable given the unbraced lengths. Can you confirm the flexural capacity that BRASS is calculating?

Incident 5416 also relates to unbraced lengths, but that incident is different in that the correct unbraced lengths are not used because there is no place in the UI in which to enter the stringer locations for a Floor Line structure definition.

FROM:bgoodrich DATE:Tuesday, November 09, 2004 10:52:30 AM

E-mail from Tim Armbrecht:

Brian,

Thanks for the response. We concur that we're getting good results for the 205 point. Both BARS and Virtis/BRASS load factor produce consistent answers. The problem is the 110/200 point. It appears that Virtis/BRASS is using the entire span length for unbraced length, thus  $M1 = 0$  and  $Cb = 1.75$ . I think BARS assumes the unbraced length goes from the 110 point to the contraflexure point, thus producing higher ratings. Since the bottom flange is not in compression for the entire length of the span (from the contraflexure point to the end of span), it seems ultraconservative to consider the entire span as unbraced. Could you please verify that this is what is happening? Thanks,

Tim

FROM:bgoodrich DATE:Tuesday, November 09, 2004 10:53:22 AM

BRASS does not calculate a shorter unbraced lengths based on the contraflexure locations. BRASS-GIRDER does not even calculate the contraflexure locations. The only work-around would be to enter "diaphragms" at the contraflexure locations. I did this for spans 1 and 2 and the rating increased at the 200 POI.

FROM:bgoodrich DATE:Wednesday, November 10, 2004 10:59:56 AM

E-mail from Tim Armbrecht:

That's exactly what we ended up doing. Thanks for the insight,

Tim

FROM:jduray DATE:1/20/2005 1:22:50 PM

Is this a bug or just a question that has been satisfactorily answered?

FROM:jduray DATE:4/13/2005 10:09:23 AM

Discuss this issue at the UG mtg.

Report to Wyoming that BRASS is not handling the unbraced length correctly (should be between

### Description

FROM:dteal DATE:Wednesday, October 20, 2004 8:48:58 AM

I don't know of any other way to do this.

A user has a bridge checked out, user leaves the state for a (higher paying job) without checking BID's back in. Computer Services disables a users login the day they leave for security reasons. How do you check the bridge back in -??

I have to call our oracle database administrator and have them reinstate a user ID/Password so I can log in as them and check the bridge back in. Then log out and call the DBA again to disable the ID/Password. To many steps.

The Virtis Opis administrator should have the power to check these bridges back in without going through all these steps. Or is it possible and I need to be enlightened?

### Complete Issue Information

Dean, please use BridgeWareAdmin.EXE to transfer events from the user who left to somebody else. By doing this all of the user's events including check-in/out events would be transferred to a new person.

In order to do this please follow these instructions.

- (1) Start BridgeWareAdmin.EXE and login as the owner of Virtis/Opis tables.
- (2) Locate the Transfer Events group box on the screen and select the username of the person who left your company in the From combo box. (Person 1)
- (3) Select the username of the person who you want to transfer the events to in the To combo box. (Person 2)
- (4) Click Transfer Now button.
- (5) Click Cancel to close the window.

Now you can login as Person 2 and check-in the bridge that was previously checked-out by Person 1.

### Description

FROM:dteal DATE:Thursday, October 21, 2004 9:05:43 AM

Importing the attached BRASS dataset to Beta 4 produces the following error.

STIRRUP-SCHEDULE 1, 1, 3.0, 0.00000, 0.91667, 100, , , 1, ,

The following messages apply to the above imported command:

ERROR: Virtis requires that the schedule length divided by the spacing  
be a whole number. (parameter 3)

ERROR: Required parameter missing. (parameter 8)

WARNING: Feature described by this command not currently supported. (parameter 6)

WARNING: Feature described by this command not currently supported. (parameter 7)

WARNING: Feature described by this command not currently supported. (parameter 9)

WARNING: Feature described by this command not currently supported. (parameter 10)

WARNING: Feature described by this command not currently supported. (parameter 11)

The first error (parameter 3) – about a Virtis requirement – The BRASS dataset runs fine – so their may be a problem with the export?? There is nothing in the BRASS Version 5 command descriptions (manual) about this??

The second error – (missing parameter 8), BRASS Version 5 command description states that a 1 is entered to ignore shear. Nothing else is stated. I think Virtis is looking for a zero here but that's only a guess. Instructions don't say enter (lets say a zero) to consider shear?? But note #4 is a little bit of conflicting instructions, here it talks about the zero value to consider shear but only when ignoring shear over a range. Here again the BRASS dataset runs just fine in BRASS (I think 5.8), the export may be incorrect here also. Here

FROM:jduray DATE:10/25/2004 10:34:29 AM

Dean

Were you able to import this file into 5.1?

FROM:dteal DATE:Monday, October 25, 2004 12:00:59 PM

Nope

FROM:jduray DATE:10/26/2004 4:44:21 PM

I suspect this is an enhancement to the import. We have not maintained the import utilitie as BRASS commands have changed. The assumption is that all BRASS files have already been imported and maintenance of the utility to keep up with BRASS changes is not necessary. Perhaps this is not appropriate. Since this is not related to the 5.2 release and seems to be an enhancement I am changing the status and category to Enhancement.

FROM:dteal DATE:Friday, October 29, 2004 9:32:45 AM

If we don't maintain and support BRASS Import, then why is it included on the install CD.

4/19/2016 3:18:13 PM

HRS AASHTO

1733

**Complete Issue Information**

What about agencies or consultant firms that are currently BRASS users and just purchased the product? We would have to assume that there BRASS datasets are coming from a current version of BRASS?

FROM:jduray DATE:10/29/2004 10:31:46 AM

You make a good point...

We need to discuss this with the TF. The decision goes back several years. As I recall there are no plans to enhance the import utilities to support new or modified commands. We do fix bugs etc. as needed.

### Description

FROM:dteal DATE:Thursday, October 21, 2004 12:43:26 PM

I think all the windows work this way? When the window is full of rows (things like reinforcement or stirrups), you select new, the new row is add to the bottom but it is not visible, the screen never scrolls up, you manually have to scroll the window up every time you enter a new row when the window is full of rows. Selecting New should add the row and scroll the window up one! For users that have to enter a lot of data this is a real pain in the butt.

FROM:jduray DATE:10/27/2004 9:07:14 AM

Joe - Is this how all windows work?

FROM:jihnat DATE:10/28/2004 11:14:49 AM

Yes. The new row is not automatically scrolled into view.

FROM:jduray DATE:10/29/2004 8:39:27 AM

Since all windows work this way it would be an enhancement to make the change and we should do it for all windows. Changing the Category to Enhancement and the Project to Support Center

FROM:dteal DATE:Tuesday, February 15, 2005 7:55:07 AM

I do realize that this is considered an enhancement request – I strongly feel it is a bug in the original window behavior.

For the user that is entering only one bridge very so often it's not a big deal. For the power users that are entering data for many bridges this is a real pain in the tush! Multi spanned bridges with lets say many cross frames or web stiffeners will make the user take his hands off the keyboard for every new entry just so he can scroll the window and see the bottom line – very annoying and should be fixed.

FROM:jduray DATE:4/14/2005 3:41:45 PM

### Description

FROM:dteal DATE:Friday, October 22, 2004 8:02:29 AM

The check box is available for the HL-93, this is good. But why have it for the Fatigue Truck. Isn't the fatigue truck always single lane? Shouldn't it be grayed out like the tandem train is for the fatigue truck?

FROM:dteal DATE:Tuesday, October 26, 2004 1:33:08 PM

The export to BRASS is by default going to be a single lane loaded and uses a scale factor of 0.833 to remove the multiple presence factor of 1.2 ( $1.2/1.0=0.8333$ ). See exert from BRASS output file below.

12-4.3 LOAD-LIVE-DEFINITION 5, FAT\_LRFD\_~30, FAT, D, 100.0000, 0.8333, ONE, NO

1. Live Load Number :5
2. Live Load Code :FAT\_LRFD\_~30
3. Live Load Type : FAT
4. Design/Rating Procedure :D
5. % of Dynamic Load Allow.:100.000
6. Scale Factor : 0.833
7. Lanes Loaded : ONE
8. Notional Load Control : NO
9. Dynamic Load Allowance :
10. Special Trk/Lane No. :
11. Variable Axle Spacing :

So what is the purpose of having a check box for single lane on the fatigue truck. This may/will confuse some users – they may enter a scale factor and check the single lane loaded box, now they would end up with a scale factor of 0.6942. They would still end up with lane loaded but with the wrong scale factor. See exert form BRASS output file below when the user did what I just explained.

12-4.3 LOAD-LIVE-DEFINITION 5, FAT\_LRFD\_~30, FAT, D, 100.0000, 0.6942, ONE, NO

1. Live Load Number : 5
2. Live Load Code : FAT\_LRFD\_~30
3. Live Load Type : FAT
4. Design/Rating Procedure : D
5. % of Dynamic Load Allow.: 100.000
6. Scale Factor : 0.694
7. Lanes Loaded : ONE
8. Notional Load Control : NO
9. Dynamic Load Allowance :
10. Special Trk/Lane No. :
11. Variable Axle Spacing :

Single land loaded needs to be grayed out for the fatigue truck just like the tandem train is!

**Complete Issue Information**

You may want to reread VI # 2754.

FROM:hlee DATE:7/10/2006 8:55:01 AM  
Changed Project to Support Center.

FROM:hlee DATE:3/15/2007 1:37:19 PM  
Updated the Vehicle Properties window to disable the Single Lane Loaded checkbox if the vehicle is in the Fatigue Loads category.  
Resolved for 5.6 Beta 2.

FROM:xli DATE:3/15/2007 2:48:49 PM  
Verified single lane loaded is greyed for fatigue truck.

FROM:dteal DATE:Tuesday, June 19, 2007 3:36:56 PM  
Accepted 5.6 beta 3

## Description

FROM:dteal DATE:Monday, October 25, 2004 10:01:50 AM

I am not getting any data in Rating Results or Recent Rating Results windows. Here's what I'm doing:

1. Open a bridge, perform a rating, and save the results using the Save Analysis Results button on the tool bar.
2. Close the bridge, and select Manage Analysis Events from the tool bar, a window opens with the heading Analysis Events Summary. The bridge I just rated is listed in the window.
3. At the bottom of the window is a button to View Rating Results, when I select it the Bridge Rating Results window pops up, it is blank – the bridge I just rated is not listed, nothing – it's blank
4. Closed the bridge rating results and analysis events summary windows.
5. With the same bridge selected in the bridge explorer window I selected the rating results button from the tool bar – it came up blank.
6. Selected the recent rating results button from the tool bar – this window came up blank also.
7. The View Structure Rating Results button at the bottom of the Rating Results window does nothing either.

FROM:jduray DATE:10/25/2004 10:50:43 AM

Relative to 5 through 7...the rating results button on the toolbar is for viewing ratings done from the bridge explorer.

Is there any mechanism for cleaning up old events in the database, are they there forever? Is the only way to delete them is to select and delete them from the Analysis Events Summary window

FROM:mordoobadi DATE:10/25/2004 10:52:31 AM

There are two ways that you can delete an analysis event.

- 1) Open the 'Analysis Events Summary' window and select the analysis events that you would like to delete and click Delete button
- 2) Open BWS and select the member alternative that you wish to delete its events and then select Bridge/Analysis Events in the menu. Select the events that you want to delete and click Delete button.

We do not have an automated way to delete analysis events. The analysis events can be cleaned-up manually.

### Description

FROM:dteal DATE:Monday, October 25, 2004 10:03:33 AM

What is the average size file saved to the database for a design review? Lets say a girder system structure definition that is a standard 3 span, 5 girder line structure?

When a second "save design event" is executed, does it over right the first? Or is the only way to remove the first saved event by going into the Manage analysis events window and select/delete it?

4/19/2016 3:18:14 PM

HRS AASHTO

**Complete Issue Information**

FROM:jduray DATE:10/25/2004 10:37:14 AM

I don't know the size except to say that for LRFD the analysis results are very large. When you save a design event previous events are not deleted. You may delete them.

FROM:kkennelly DATE:10/28/2004 12:25:02 PM  
Your floorbeam definitions are missing information in the database table that stores where the fb supports (main girders in this case) are.

A workaround to fix your problem is to open the Floorbeam Member Definitions window for 36WF170 (Int) and 36WF150(End), re-enter the 32' span length (you have to re-type the values so Virtis recognizes that the data in the grid changed and needs to be saved) and then you can rate the floorbeams.

I can reproduce this problem when I copy a good fb member definition.

FROM:kkennelly DATE:10/29/2004 10:55:41 AM

### Description

FROM:tarmbrecht DATE:Monday, November 08, 2004 12:16:45 PM

Problem with Girder-Floorbeam-Stringer System (SN 082-0141) – file is attached

For Virtis BID 0820141-TEs two attempts at coding Superstructure Definition “Sp A5-A7 (Cont. 2-Girder System)” have produced two anomalous errors:

For the first [Sp A5-A7 (Cont. 2-Girder System)(1)], the Girder Member “A1 - N Girder” gets the following error message when run...

Error generating LFD/ASD load commands!  
Error generating load group commands!  
Unable to compute average dead load of stringer unit!

4/19/2016 3:18:15 PM

HRS AASHTO

1744

## Complete Issue Information

Error in the loads utility!

That Sup. Def. was duplicated/re-entered as "Sp A5-A7 (Cont. 2-Girder System)(2)". For this, the Girder Member runs fine but the floorbeams won't run, giving the following error message...

Error generating LFD/ASD load commands!  
Error generating concentrated load commands!  
Review input for items included in Load Case: Stringer DL Reactions from Stage 1  
Unable to get adjusted distance of load (P/S beams)!  
Error preparing concentrated load for BRASS commands!  
Unable to compute span where load is applied!  
Error in DoBeamDef::FindSpanByDistance(!  
Distance is 480.000000000 in!  
Stringer Definition length is 384.000000000 in!  
Current tolerance for in is 0.125000000.  
Error generating BRASS span commands!  
No supports are defined!  
Error preparing supports for BRASS!

In addition, after opening a Floorbeam Member Alternative (e.g., Flbm 12) and then clicking <OK> or <Apply>, a dialogue box appears, which I have attached in a Word document.

We checked and double-checked the input, and are not quite sure what we're missing as far as data entry is concerned. Thanks for your help.

Tim

FROM:kkennelly DATE:11/8/2004 3:07:22 PM

I think this may be the same problem as in Incident 5461. Copied floorbeam definitions are missing some data. Try the following workaround:

Open the Floorbeam Member Definitions window and re-enter the span length (you have to re-type the values so Virtis recognizes that the data in the grid changed and needs to be saved) click OK and then you can rate the floorbeams. (Don't forget to save this change to your db)

FROM:kkennelly DATE:11/9/2004 2:49:17 PM

Problem rating Girder Member "A1 - N Girder": This is due to a small difference in the location of the last floorbeam and the end of the girder. Due to significant digits, last fb is being placed a tiny bit beyond the end of the girder. (See Incident 5199 for related incident and warning message that will be issued in 5.2.0 to warn user of this problem.) In 5.2.0, the following messages are printed out:  
ERROR: Flbm33 at 246.323100 ft does not intersect A1 - N Girder  
ERROR: Flbm33 at 246.323100 ft does not intersect A2 - S Girder

Girder span lengths add up to 246.323'. Virtis does not use the user tolerance when checking framing plan geometry, it only uses user tolerance to check for things like overlapping or gaps in plate descriptions.

Work around is to enter the length of span 3 of the girder as 74.8439' instead of 74.8438' to resolve this small difference.

## Description

FROM:dteal DATE:Monday, November 08, 2004 3:51:59 PM

Is there a way to model steel or prestressed beams that are embedded into the abutment. In the case of a steel beam the only way I now is to create fictitious bearing stiffeners to eliminate spec check failures at the abutment.

If there isn't a current method/workaround then add this to the enhancement request list.

Would a filter that lets you check a box to ignore the bearing stiffener spec checks work? A previous enhancement request was made to let users check what specs they want considered when rating.

FROM:dteal DATE:Wednesday, January 19, 2005 2:13:33 PM

I think that might work – I would want to see the check box on the Bearing Stiffener Location GUI so the user can check the box when entering bearing stiffener information. If it's located as a filter elsewhere the user may miss it.

This check box is not only for Rating but it is also for Design.

FROM:dteal DATE:Thursday, February 01, 2007 10:19:10 AM

In Opis LRFD design review we can simply ignore the failure.

When we start using LRFR and rating the same structure we will have no way to ignore and more on to the next controlling point.

Right now, in preparation for implementing LRFR the only solution is to “dummy” the design and put in some heavy abutment bearing stiffeners.

## Complete Issue Information

### Description

FROM:dteal DATE:Monday, November 08, 2004 3:52:48 PM

The attached bbd is from 5.1.1. Looking at member 2. The bearing stiffeners for Abut #1 and Abut #2 are 16mm and 20mm respectively. Each abutment has 2 pair of stiffeners. The BRASS output file for STIF-BEAR-GROUP only indicates the area of one pair is used instead of 2 pair. ie: at Abut #1 we have 4 stiffeners, the area should be 4x16mm but only 2x16 is shown. At Abut #2 we have 4 stiffeners, the area should be 4x20mm but only 2x20mm is shown. The same is true at the piers – they have a pair of 20mm thick stiffeners but what is shown is only the area of a single pier stiffener. Below is taken from the BRASS output file in Virtis.

```
COMMENT Stiffener Group 1: Abut #1
COMMENT      + Support 1 Geometry
COMMENT BRASS clip is sum of inside clip and part of outside clip,
COMMENT which results in the correct area for bearing resistance.
STIF-BEAR-GROUP 1, 6.6929, 1.2598, 0.9843, 50.04
STIF-BEAR-SCHEDULE 100, 1
COMMENT Stiffener Group 2: Piers
COMMENT      + Support 2 Geometry

COMMENT Stiffener Group 3: Abut #2
COMMENT      + Support 5 Geometry
COMMENT BRASS clip is sum of inside clip and part of outside clip,
COMMENT which results in the correct area for bearing resistance.
STIF-BEAR-GROUP 3, 6.8898, 1.5748, 0.9843, 50.04
STIF-BEAR-SCHEDULE 410, 3
```

FROM:bgoodrich DATE:Tuesday, November 09, 2004 11:57:27 AM

The STIF-BEAR-GROUP command is used to describe the bearing stiffener on one side of the web. Internally, BRASS knows there are bearing stiffeners on both sides of the web and doubles the area accordingly for the calculations.

## Description

FROM:dteal DATE:Monday, November 08, 2004 4:23:07 PM

In the attached bbd looking at member #2 – I tried to compare the input in Virtis to the BRASS data file created after the run and found some discrepancies. I also attached the output file and a pdf of the girder layout. Below is a segment of the output file text. I put a line number in front of several lines for reference.

#1 – Listed as Group #1 sh/be Group #2  
#2 - Listed as Group #2 sh/be Group #4  
#3 - Listed as Group #3 sh/be Group #4  
#4 – A double transverse stiffener is placed here where a double pier stiffener should go  
#5 thru 9 - Listed as Group #3 sh/be Group #4

FROM: bgoodrich DATE: Friday, May 13, 2005 4:57:03 PM

The BRASS transverse stiffener commands are used to specify a stiffener group and spacing over a range, not the physical locations of stiffeners as in Virtis. The export of the stiffeners is working as described in the help (Stiffener Ranges: Transverse Stiffener Ranges (BRASS LFD)), where the stiffener group with the smaller area is exported when adjacent stiffeners are different sizes.

When selecting File: Print we have the option of selecting Portrait or Landscape. Other windows programs like Excel would allow you to condense the output and "Fit" it to one or more pages wide or one page tall. See attached jpg from Excel. This would be a very handy feature especially when printing a Rating summary report.

When you select a bridge to check out – select check out from the pull down, then the screen refreshes and you have to go back or resort to find the bridge you wanted to open up and edit. This is annoying behavior, can it be changed so after the bridged is checked out it stays on the screen and you don't have to go find it again?

FROM:dteal DATE:Tuesday, February 15, 2005 8:03:12 AM

I realize that this has been suspended and placed on the future enhancement list – but I believe that this is a bug and not an enhancement.

For a user that only has to search for a bridge now and again it's no big deal. But for the user that uses this software day to day finds this search and refresh behavior very annoying and time consuming. Every time the user searches for a bridge, finds it, uses the pull down to check it out – now the user will

## Description

FROM:dteal DATE:Friday, November 12, 2004 1:12:17 PM

In the attached PS structure (70-94-70) I am placing a permanent diaphragm at the center of span #2. Using the wizard I have selected to us "equal number of spaces per span" and for span #2, the 94 foot span I enter the value 2 for 2 equal spaces and select finish. What happens is there are now 2 diaphragms placed. One at mid span and another at the end of span #2. This is verified by both the diaphragm GUI window and in the schematics view.

How I can enter only one diaphragm at mid span using the wizard? I get the same results whether I had selected equal spacing per span or equal number of spaces.

FROM:kkennelly DATE:11/15/2004 7:57:39 AM

You cannot use the wizard to enter only 1 diaphragm.

FROM:dteal DATE:Monday, November 15, 2004 9:03:16 AM

FROM:dteal DATE:Friday, November 12, 2004 1:13:54 PM

Don't know if this is supposed to work this way or not. When I put a single diaphragm at the center of span #2 (70-94-70) - I used 47 feet for the spacing, which is the center of span #2 - when I review the .dat input file I see that the diaphragm was placed at 46.1667' which is half the support to support distance (94' span less the 10" on each end for the support distance). Is this correct behavior or should it have used the 47 feet which is half the span distance?

FROM:kkennelly DATE:11/15/2004 8:07:30 AM

I think that since on the Mbr Alt Engine Properties tab you've chosen the CL of simple span prestress modeling method, the export is using the simple span lengths which results in 46.1667' being the cl of span and not the 47' that is the middle of the centerline of final supports span length. Maybe Brian can verify this.

FROM:bgoodrich DATE:Wednesday, April 13, 2005 11:32:04 AM

Krisha's explanation is correct.

**Description**

FROM:dteal DATE:Friday, November 12, 2004 2:26:56 PM

In the attached file I have set the PS beam stress limit in LFD for Final Allowable Tension to zero ksi. After an analysis I viewed the Data File, near the end is the Inventory card. The inventory card parameter #7 is to set allowable tension. The data file is using the BRASS default of 6.0 sqr root f'c when it should be using zero as entered in the Wizard PS Stress Limit GUI.

FROM:kkennelly DATE:11/15/2004 7:58:38 AM

BRASS LFD does not use the values entered on this screen. Refer to the Engine Help for this window.

4/19/2016 3:18:17 PM

HRS AASHTO

## Complete Issue Information

FROM:dteal DATE:Monday, November 15, 2004 9:37:31 AM

I read the engine help that states "BRASS doesn't use any of the data on this window" – so how does one set the stress limits for Inventory and Operating being BRASS is populating these two cards with defaults?

FROM:dteal DATE:Tuesday, November 16, 2004 7:33:00 AM

Being BRASS is the only engine for LFD ratings – don't you think that having a grand Stress Limits GUI and then not using it in the only engine available for PS in Virtis is asking too much of the user to go two clicks deep to find in the engine help that all your LFD data is ignored (not used).

Setting Final Allowable Tension in the PS Concrete to zero instead of the default of 6 square root is not unique to KS – this is used by several state agencies.

Member Alt Factors Tab for ASD – is setting the P/S Concrete Tension for INVY to zero here the proper work around? If this is so – then there is a lot of confusion built in here.

BRASS ignores all values entered in the stress limits GUI under LFD – so you enter the zero tension for LFD under the factors tab in the ASD table. This table has two rows, INVY and OPER, BRASS uses the values in the INVY column but not the OPER column. How is a simple designer supposed to keep this straight??

We only have one engine and most likely will only have one engine to handle PS LFD in Virtis – we should address user confusion here with the one engine we use.

Okay, I'll get off my soap box now!

FROM:kkennelly DATE:11/16/2004 7:53:04 AM

I guess this is an enhancement request to enhance BRASS LFD to use these values because I'm sure if it could use user input values now it would.

FROM:bgoodrich DATE:Thursday, November 18, 2004 2:51:48 PM

I have forwarded this issue to WYDOT.

Subject: Stress Limits for Prestress

Dean:

BRASS-GIRDER currently does not support a schedule of stress limits for prestress. Opis and BRASS-GIRDER(LRFD) both support a schedule of stress limits. We realize this is a discrepancy between the programs. We currently are in the process of merging the LFD and LRFD engines into a single engine which will take care of this problem. However, it will take a while to complete this process.

4/19/2016 3:18:17 PM

HRS AASHTO

1757

**Complete Issue Information**

The LFD export has never done anything with the stress limits. For Virtis users, the stress limits are for service and can be set on the ASD factors window, which has been the work-around since we implemented the prestress export (several years ago).

We are working on the solution and ask that you be patient.

Micheal J. Watters, P.E.  
Bridge Engineering Systems Manager

I deleted a bridge from the database, now I want to import a bridge with the same bridge ID but Virtis tells me that it is not a unique ID. How can I import this bridge?

FROM:kkennelly DATE:11/16/2004 7:58:00 AM  
When you delete a bridge it is placed in the "Deleted Bridges" folder as a safeguard to help users in case they really didn't mean to delete the bridge. Select the "Deleted Bridges" folder in the Bridge Explorer and then select the deleted bridge and then Edit/Delete from the menu to really delete it from your database.

### Description

FROM:jtriezenberg DATE:Tuesday, November 16, 2004 8:59:20 AM

Your resolution for my inability to import a file with the same bridge ID as one that was deleted was to look in the deleted folder. However I also noticed that this folder was there and deleted the bridge from the deleted folder. Here is the sequence of events:

1. I exported the bridge .bbd file
2. I deleted the bridge from the database
3. I deleted the bridge from the deleted folder
4. I want to import a bridge with the same bridge ID but I can't

FROM:kkennelly DATE:11/16/2004 3:18:17 PM

Are you also running Pontis? If this bridge is already in the database for Pontis select the "BridgeWare Association" button on the Bridge window that appears when you import the file. Then you can select the Pontis bridge that you want to associate this Virtis bridge with.

If you are not running Pontis, you should be able to import the bbd file once it is completely deleted from the database after deleting from the Deleted Bridges folder. If you are sure that your database does not have a bridge with this bridge id and your db is small in size you can send your db to our ftp server and we can investigate. Let me know if you need instructions on sending your db.

Please make your response in this incident. Thank you.

FROM:jtriezenberg DATE:Wednesday, November 17, 2004 1:28:04 PM

Pontis is not installed on this computer, so that can't be the problem. I have loaded a copy of the database into your ftp server under the Alfred Benesch folder. With it is the .bbd file that I have been trying to add.

-JT

FROM:mordoobadi DATE:11/18/2004 8:49:34 AM

We looked at your database and noticed that there are many-many (thousands) rows in the bridge table. This table is used by pontis to store bridge information. The database seems to be an integrated Pontis/Virtis/Opis database that has a few of Pontis tables (not all of them). The reason why you cannot import the bridge is that there is a bridge in the bridge table that has the same bridge\_id as the

4/19/2016 3:18:18 PM

HRS AASHTO

1760

## Complete Issue Information

imported bridged. The database is like a database that somebody did experiment with. It is not a complete Virtis/Opis/Pontis database. Did you receive this database from MDOT?

In order to resolve this issue you have two options:

(1) If you do not care about the PONTIS bridges that are stored on the database please follow these steps:

- a) Start Sybase Interactive SQL and Login as the owner of Virtis/Opis database.
- b) In the Command window type  
DELETE FROM bridge;  
COMMIT;  
and execute the command.

(2) If you want to preserve the Pontis bridges:

When you import the bridge, in the bridge description window, provide a different bridge ID and NHS Indicator.

FROM:jtrizenberg DATE:Thursday, November 18, 2004 11:50:04 AM

Yes, we did receive the database from MDOT. If we follow step 1 above, will that delete any information that we will use for Virtis? Will this step change the information we will be able to give to MDOT when we deliver our bridges to them?

FROM:mordoobadi DATE:11/19/2004 3:50:14 PM

Jeff, In your database almost all of the bridges are linked to a pontis bridge. So my suggestions above would corrupt your database. Sorry about this. I should have verified that the Virtis/Opis bridges are not linked to pontis bridges. Any way, Please do not follow my instructions above, or you lose data.

This is what you can do.

(0) Shut-down Virtis

- (1) Locate the executable file BridgeWareAdmin.EXE. (If you are at version 5.1.0 get it from 5.1.0 CD, if you applied SP1 it should be in your Virtis/Opis folder)
- (2) copy the file to the Virtis/Opis folder (i.e. C:\Program Files\AASHTOWare\VirtisOpis51) If it is not already there
- (3) double-click on the file BridgeWareAdmin.EXE.
- (4) login and connect to the database as database owner.
- (5) Check the check-box "Pontis and Virtis/Opis share this database"
- (6) Select the OK button to close the window.

Now you can link to the Pontis bridges.

Now if you want to create a new bridge, a new window (BridgeWare Association) will pop up and would let you choose the pontis bridge that you want to link to.

There is a radio button that controls whether you want to link to pontis or not. Select Yes radio button then If you find the bridge ID that you are looking for in the list of pontis bridges, then select it in the grid, otherwise select the No radio button (no link to pontis). Now Select OK to close the window. The bridge will be created.

4/19/2016 3:18:18 PM

HRS AASHTO

1761

## Complete Issue Information

If you want to import a BBD file, then do the import. Bridge Description window opens. Select the BridgeWare Association button in that window, Select Yes radio button then If you find the bridge ID that you are looking for in the list of pontis bridges, then select it in the grid, otherwise select the No radio button (no link to pontis). Now Select OK to close the window. The bridge will be created.

### Description

FROM:jtrizenberg DATE:Wednesday, November 17, 2004 4:14:25 PM

AASHTO says that shear reinforcement need not be designed for shear greater than the shear at H/2 from the support. Is there any way to get Virtis to treat this point as the maximum shear? I can put a point of interest at H/2 but Virtis still thinks the most shear occurs at the support.

FROM:bgoodrich DATE:Thursday, November 18, 2004 2:50:35 PM

This is a duplicate of Incident 3143. There is currently no way to get the BRASS engine to consider the shear at H/2 as the maximum shear between the support and H/2.

When a 4.2 girderline timber bridge is migrated to 5.0, the deck type set in the structure definition

4/19/2016 3:18:19 PM

HRS AASHTO

1767

**Complete Issue Information**

should be timber. Currently, the deck type is set as concrete.

FROM:mordoobadi DATE:3/4/2005 9:57:47 AM

After a discussion with Krisha, we decided that we cannot write a migration script that is full-proof.

Suppose a user who created a Girder-Line Timber bridge with concrete deck, he/she wouldn't like his/her data to be changed.

We released V/O 5.0.0 in April of 2003, and the users should have noticed this problem by now (March 2005).

If they noticed the problem and wanted to fix it they probably:

- 1) called us and asked us for help (like Colorado DOT)
- 2) created another structure definition with timber deck and used it

Krisha and I think that we should address these kinds of issues on a case-by-case basis. If a user notices this problem and contacts us, we should get their database and prepare SQL scripts to fix the bridges that have problem.

FROM:mordoobadi DATE:3/7/2005 2:11:02 PM

After a discussion with Jim we concluded that there are the following solutions:

- (1) Write a utility program that allows a user to change the deck type for a girder-line structure definition from concrete to timber.
- (2) Change the GUI to allow changing deck-type from concrete to timber (not the other way around) for a Girder-Line structure def.
- (3) Investigate whether deck-type can be eliminated, or the design can be modified to resolve this issue.

FROM:jduray DATE:4/13/2005 10:52:28 AM

Users must have fixed their bridges by now...rejected by tag.

FROM:jduray DATE:4/13/2005 11:09:11 AM

Add a technical note stating this happened and user workaround.

### Description

FROM:jtriezenberg DATE:Tuesday, November 30, 2004 12:43:15 PM

An analysis of the attached bridge shows a RF of 0. A review of the BRASS output file shows that all the section properties of the beam are 0 at the second tenth point and only at the second tenth point. All the other points of interest give section properties and therefore can generate a rating. Can you please tell me why this is happening?

Jeff T.

FROM:kkennelly DATE:12/1/2004 2:54:49 PM

I ran member G1. BRASS reports the Section Type as "I or Box" at all of the analysis points except for the 102 point. There it lists "Rectangular" as the type and the dimensions are all zero.

FROM:jtriezenberg DATE:Wednesday, December 01, 2004 3:44:40 PM

But why should it list "Rectangular" at point 102 and list "I or Box" for every other point? How can I make Virtis use the same section properties for the entire length of the span?

FROM:bgoodrich DATE:Monday, December 06, 2004 12:16:03 PM

This issue appears to be the same as that from Incident 5435 (BRASS Problem Log 554). The distance of debonding plus transfer length is located just to the left of the 102 POI at the 101.987 POI. The two points are too close together, so the section properties at the 102 point never get set. Until the

4/19/2016 3:18:19 PM

HRS AASHTO

1769

**Complete Issue Information**

problem can be addressed in the engine, the work-around is to increase the transfer length from 25" to 26.4", so the debonding plus transfer length coincides with the 102 POI.

FROM:jtrizeenberg DATE:Friday, December 10, 2004 10:36:28 AM  
thanks

FROM:bgoodrich DATE:Thursday, January 27, 2005 4:21:28 PM  
This issue has been addressed in the BRASS-GIRDER 5.9.1 engine to be released in May 2005.

**Description**

FROM:dteal DATE:Thursday, December 02, 2004 9:53:30 AM  
When you enter some Poi's (not 10th points), is there anyway to view the deflection and moment/shear data at that point? I am looking for it in the view analysis report table. The only place I seem to be able to find it is in the view latest BRASS results, this is view is cumbersome and time consuming.

FROM:bgoodrich DATE:Monday, December 27, 2004 3:53:29 PM  
In the engine properties for the Analysis Settings, you need to change the Action Output Level field to turn on output at all node points. Output at tenth points is the default. When this is done, the actions

4/19/2016 3:18:19 PM

### Description

FROM:dteal DATE:Friday, December 03, 2004 9:17:14 AM

How does one know what version of the LRFD Spec is being used for a design review? Where can the user verify this?

FROM:kkennelly DATE:12/6/2004 1:10:08 PM

I think if you look on the first page of the BRASS output file where it lists BRASS in really big letters it also lists the spec edition.

FROM:dteal DATE:Wednesday, December 08, 2004 11:48:25 AM

I have some major confusion here. Yes, BRASS does state in the output where you said it would be that it's using the 2004 3rd addition. For our Factors our only option is 1998 2nd edition. Why are they different? I know the purpose of the factors if I want to modify one of them, but why doesn't I modify factors in the 3rd edition, that's the one that is being used???? Can you straighten me out?

FROM:kkennelly DATE:12/9/2004 4:15:50 PM

I think this is a duplicate of 4978. As per that incident, Opis will not deliver the LRFD factors from the 3rd edition until the March 2005 release. The factors can be entered by hand until then. Isn't the default in BRASS what is in the spec? If it is, then you don't have to create any Factors in Opis at all.

**Description**

FROM:dteal DATE:Friday, December 03, 2004 9:37:18 AM

In the attached bbd – look at the schematic view of the structure typical section. For the outside girders the haunch profile width (Z1 & Z3) is much wider on the outside of the girder than on the inside. By reviewing the haunch profile input data I see that the Z1 and Z3 values are always equal – I think the schematic has generated the wrong Z3 value.

### Description

FROM:jtriezenberg DATE:Friday, December 03, 2004 11:23:17 AM

I have a beam spacing of 10.47 ft with a 9 inch deck. In the Deck Profile tab, clicking the Compute button gives an Effective Flange width of 10.47 ft but I believe the width should be 6 times the slab thickness each side of the beam [AASHTO 8.10.1.1]. Is there a reason why Virtis uses the beam spacing for the flange width?

FROM:kkennelly DATE:12/3/2004 11:41:56 AM

Please refer to the "Effective Flange Width Computation Method.pdf" found on the Tutorials page of the Virtis/Opis Technical Support website for background on how Virtis computes the effective flange width.

I am getting error message when I open "haunch profile". It automatically kicks me out and said " Exception: access violation (0xc0000005). address:0x5f404789. Please see attached file: 29021B01.

Thanks.  
Wanley

FROM:jihnata DATE:12/23/2004 10:31:53 AM  
BBD file is from version 5.1.0

FROM:jihnata DATE:12/23/2004 10:42:00 AM  
My email reply to Wanley:  
I imported your BBD file but I was unable to reproduce the error. I was able to open the Haunch Profile window successfully.  
Because the BBD file was from version 5.1.0, I recommend that you upgrade to a more current version and see if that fixes your problem.  
Service Pack 1 for version 5.1 is available from our web site, and version 5.2.0 was shipped last month. Keep in mind that you cannot migrate directly from 5.1.0 to 5.2.0. You must first install Service Pack 1.

## Description

FROM:jtrizeenberg DATE:Tuesday, December 07, 2004 4:51:30 PM

I often get this message in the validation window.

Horiz Shear (Vertical Shear Reinforcement Definition)

Warning: Reinforcing steel material not defined for shear reinforcement.

Warning: Reinforcement bar size not defined for shear reinforcement.

I don't understand what it is referring to. Virtis seems to think that "Horiz Shear" is the Vertical shear definition and it seems to think there is no bars picked for this definition.

FROM:kkennelly DATE:12/8/2004 8:16:47 AM

The horizontal shear reinf def has null for the vert rebar and material in the db like it should. Virtis is validating these vertical attributes when it shouldn't be.

FROM:kkennelly DATE:2/9/2005 9:41:28 AM

Fixed for version 5.3

**Description**

FROM:kkennelly DATE:12/20/2004 1:32:42 PM  
Submitted on behalf of Anurag Upadhyay of Chas. H. Sells via email:

## Complete Issue Information

Sir/Madam,

This is the first time that we are using the GIRDER-STRINGER-FLOORBEAM utility in Virtis 5.1 at Chas. H. Sells, Inc. During the modeling of one bridge, we came across this problem related to modeling cantilever part of the floorbeams.

The span has three girders, which are supporting three floorbeams and there are stringers supported by floorbeams. Floorbeams have cantilever part on both sides of the girders. When the span is modeled in Virtis, the framing plan does not show the cantilever part of the floorbeam and error dialogue box is generated while analyzing girders which says "Unable to compute the dead load of floorbeam".

It will be very kind of you, if you can guide us, whether this is the Virtis 5.1 module problem/limitation or there is more information that is required to be inputted in the virtis bbd file. The bbd file and the word file showing the plans, that may give you clearer picture about this span is attached in the email. Please feel free to call us if you need more information regarding this matter.

Yours Sincerely,  
Anurag Upadhyay  
Chas. H. Sells, Inc.  
914-747-1120 (o)

FROM:kkennelly DATE:12/20/2004 1:37:51 PM  
Response sent via email:  
Hi Anurag,

Virtis is unable to compute the dead load of the floorbeams acting on the girder and thus you are unable to analyze the girders in your bridge due to a bug in Virtis.

The following workaround will allow you to analyze the girders:

1. In the Cross Section windows for your floorbeam definition, you have checked the box to "Enter angle descriptions in table" to describe the dimensions of the angles in your section. A bug in Virtis is preventing Virtis from being able to compute the dead load of the dimensions described in this table. Virtis is only able to compute the dead load of angles specified by picking an angle shape on this window.
2. As a workaround, create a steel angle shape in your bridge that contains the dimensions and properties of the angles that you are describing in the Cross Section window.
3. On the Cross Section window, don't check the "Enter angle descriptions" checkbox. If that box is not checked, you will be able to select the steel angle shape you created. Select that shape to describe the top and bottom flanges and be sure to specify the correct Horizontal Leg dimension on the lower right corner of the window.
4. Do that for all of your cross sections for the floorbeam definition and you will be able to analyze your girders.

(As a side note, I noticed on your Cross Section Ranges window that your last range is specified as "FB Right End" for both the start and end sections but the web is specified to vary linearly. That seems inconsistent and you may want to review.)

=====  
FROM:jduray DATE:1/20/2005 12:42:49 PM  
I think we should change these to use the feet tolerance.

We also need to investigate the impact of changing the tolerance to be a single value instead of different depending on the units.

FROM:jduray DATE:4/13/2005 11:33:39 AM  
Brian M. will investigate what happens if the tolerance is set to a single value (converted to consistent units).

Where is the Rail Load??

I used TrainBridge1 and ran Opis. When I went to the view analysis report, there is no DC2 Parapet Load. I believe there should be?? I attached TrainBridge1

FROM:dteal DATE:Tuesday, January 04, 2005 10:01:40 AM

More info:

I took this structure and removed the rail. Re-ran Opis and compared all the DL midspan moment values and found no change between the 2 runs.

FROM:hlee DATE:1/7/2005 10:45:09 AM

E-mail to Brian Goodrich:

Brian,

Please take a look at the this incident.

I compared 5.1.1 and 5.2 export data, the following lines are missing in 5.2.

```

=====
COMMENT DC2
LOAD-DEAD-DESCR 2, DC, 2, DC2
COMMENT Parapet: Jersey Barrier
DECK-LOAD-LINE 2, 0.0421, 7.8801
COMMENT Parapet: Jersey Barrier
DECK-LOAD-LINE 2, 0.0421, 562.1199
=====

```

I checked the export. The fixes in BrassLrfdLoadControl.cpp for Incident 5086 asked not to export deck loads but DoGirderMbr is included in the comparison.

```

=====
// For line members, set flag to export deck loads to FALSE.
if (
    IsInterfaceKindOf(m_lpMemberDisp, __uuidof(IDoGirderLineMbr)) ||
    IsInterfaceKindOf(m_lpMemberDisp, __uuidof(IDoGirderMbr)) ||           <=====
    IsInterfaceKindOf(m_lpMemberDisp, __uuidof(IDoFlrLineFloorbeamMbr)) ||
    IsInterfaceKindOf(m_lpMemberDisp, __uuidof(IDoFlrLineStringerMbr))
)
{
    m_bExportDeckLoads = FALSE;
}
=====

```

Please let me know whether deleting the DoGirderMbr comparison is the fix for this incident. I can make the changes to Sourcesafe after your confirmation.

Thanks,  
Herman

Herman - I agree with removing the DoGirderMbr line from the conditional.

FROM:hlee DATE:1/24/2005 11:03:34 AM  
Fixed for 5.2 service pack and 6.0.

FROM:dteal DATE:Wednesday, February 09, 2005 3:29:45 PM

FROM:dteal DATE:Monday, March 14, 2005 10:16:37 AM  
Checking for 5.2 updated BRASS dll and 5.3 beta 5  
I thought this was fixed but I think we still have a problem here. It is my understanding that rail loads in a girder type structure has it's load equally distributed over all girders across the deck. I didn't check out what Opis did prior to Version 5.2 – but in checking the updated BRASS dll provided for 5.2 and in 5.3 beta 5 I see that the total rail loading is being applied to the exterior girders and no load is being distributed to the interior girders.

To check this I used Training Bridge1 which has a barrier rail weighting .505 K/ft over a 161 foot span. Looking at DL reactions at the abutment #1 of this simple span.  
G1 – Sh/As 40.67 Kip Sh/Be 20.33 Kip  
G2 – Sh/As zero kip Sh/Be 20.33 Kip  
G3 - Sh/As zero kip Sh/Be 20.33 Kip  
G1 – Sh/As 40.67 Kip Sh/Be 20.33 Kip

FROM:dteal DATE:Monday, March 14, 2005 10:39:34 AM  
Let me clarify what I believe to be correct about rail load distribution  
Non-Composite – load carried 100% by exterior girder  
Composite – load carried equally by all girders across the deck

TrainingBridge1 Is a composite structure

FROM:dteal DATE:Monday, March 14, 2005 11:00:01 AM  
To make things even more interesting, in TrainingBridge1, the rail load (DC1) that is applied to G1 is listed as 100% non-composite load with no loading being applied to the composite section. This example bridge has the connector ID on the shear connectors tab of the deck profile GUI set to "Composite"

When checking a welded plate with studs, the loads got applied properly.

**Description**

FROM:ghutter DATE:Friday, January 14, 2005 1:44:40 PM

I have a question about the live load distribution factor for thru girders in a girder-floorbeam-stringer bridge.

The bridge I am working on has a travelway of 18 ft, so according to MCEB there should be two equal design lanes of 9 ft each. Virtis calculates a single-lane factor of 1.364 which I agree with. This is computed by placing the truck wheel 2 ft from the edge of the travel way.

Virtis calculates a multi-lane factor of 1.409 which I do not agree with. I compute a factor of 2.000. This

4/19/2016 3:18:23 PM

HRS AASHTO

1790

**Complete Issue Information**

is computed by centering the two trucks in the design lanes. The wheel is 1.5 ft from the edge of the travelway.

Through some checking I think Virtis may also be placing the trucks in the same location but is calculating the single-lane factor. The 1.409 factor is the factor I calculated with one truck centered in its' design lane.

I will attach the bbd file.

Thank you,  
Greg Hutter

FROM:hlee DATE:1/25/2005 3:59:41 PM

There's a logical error for placing multiple trucks in a bay for left and right exterior girders. It is not MCEB dependent.

Resolved for 5.2 service pack and 6.0.

FROM:hlee DATE:3/2/2005 10:27:32 AM

Detailed explanation of the incident:

When calculating multi-lanes distribution factor for left (or right) exterior girder, Virtis checks to see how many trucks can fit in the travelway. The checking assumes the distance from the right wheel of a truck to the left wheel of another truck is equal to the gage. This is not true when the width of the lane in the exterior bay is between 20 ft and 24 ft for Standard Spec and between 18 ft and 20 ft for MCEB. This mistake causes the second truck to be thrown out and not used in the simple beam factor calculation.

**Description**

FROM:jtriezenberg DATE:Monday, January 17, 2005 9:19:30 AM

I have 2 bridges with the same problem. When I run the analysis, the program stops or freezes when it is calculating the rating factors. I don't know if I'm inputing something incorrectly, but the validation doesn't show any unusual warnings or errors. Please take a look at it

-JT

FROM:kkennelly DATE:1/17/2005 1:10:07 PM

I also see the BRASS dialog pause for an extended time when computing the rating factors. BRASS does run to completion but it seems to take a very long pause.

(I did not investigate the data to determine if the input is causing this and Jeff did not indicate if he is getting results different from what he expects.)

FROM:bgoodrich DATE:Thursday, January 20, 2005 3:31:29 PM

I may have found one input error. In the generic appurtenance named "Bridge Railing Classic" has a barrier load of 429.6 kips/ft. Should this be 0.4296 kips/ft? Even after changing this load, BRASS still takes a good deal of time to complete the analysis. The inventory rating for truck 1 is zero as well. This does warrant further investigation. Therefore, I have forwarded this issue to WYDOT for assignment to a BRASS problem log.

FROM:jtriezenberg DATE:Monday, January 24, 2005 7:36:36 AM

When I run the B03 file, it takes about 35 min. on my 500 MHz Pentium. After changing the barrier load to 0.4296 kips/ft, my operating rating factor for an HS 20-44 truck is 1.902 (Axle load). However the inventory rating factor for an axle load is 0.0. I do get a lane load inventory factor of 1.414, but I was wondering if you had any ideas about why there is no axle load inventory rating factor.

**Complete Issue Information**

FROM:bgoodrich DATE:Wednesday, February 09, 2005 11:02:38 AM  
WYDOT assigned this issue to BRASS Problem Log 564. I suspect there is a problem with calculating the moment capacity in BRASS. WYDOT recently authorized work on this issue, so I will be investigating this issue sometime in February.

FROM:bgoodrich DATE:Tuesday, February 22, 2005 5:55:11 PM  
Incident 5881 is exhibiting the same problem with the moment capacity.

FROM:bgoodrich DATE:Monday, March 14, 2005 3:29:14 PM  
I investigated the issue and found that BRASS is not obtaining a valid moment capacity for negative bending. Part of this problem was due to a bug in the BRASS engine. The other part is due to the lack of deck reinforcement over the second span. I extended the rebar range over the BRASS 2/10 point of span 2, i.e., by another 0.05 meters. BRASS was trying to calculate a negative bending moment capacity for various points in span 2, but there was no deck rebar present. All the prestressing strands are located in the bottom of the beam, so no capacity could be determined. The engine is fixed for Virtis version 5.3.1.

Also, WYDOT did not authorize any work to speed up the analysis.

**Description**

FROM:dteal DATE:Wednesday, January 19, 2005 7:40:25 AM  
For: Michael ingalls

Specification Check 6.10.4.2.2 limits the compressive stress in the web to the minimum of an equation or the yield strength of the web. The calculations do not limit the allowable stress to the yield strength of the web. So, you can have, say, an allowable stress of 737.088 MPa and a Design Ratio of 21.715. If your compressive stress happens to be 350 MPa this could lead to problems. The Design Ratio would still be greater than one and the code check would still pass, but you would have yielding in the web.

FROM:bgoodrich DATE:Thursday, January 27, 2005 4:37:20 PM  
AASHTO LRFD Article 6.10.4.2.2 applies only to the flange stresses. The flange resistances (0.8\*Rh\*Fyf or 0.95\*Rh\*Fyf) include the hybrid factor, which addresses the condition of early yielding in the web. The specification is permitting yielding in portions of the web.

### Description

FROM:ghutter DATE:Wednesday, January 19, 2005 4:22:26 PM

I am performing a load rating for a client who is requesting that we report ratings for not only the critical points of the beams but also for specific points of interest. I have an example that shows print-outs from the View Analysis Report window of specific points of interest. I am unable to produce this report. I can not find anywhere in Virtis where it allows me to choose what ratings are reported.

I believe all of this information is reported in the BRASS output but I would like to produce the same report as is in the example. How do I choose what points Virtis will report ratings for?

Thank you,  
Greg Hutter

FROM:jduray DATE:1/20/2005 12:10:01 PM

Virtis reports the critical rating. You have to look at the BRASS output file to view the ratings at other locations.

FROM:ghutter DATE:Monday, January 24, 2005 8:37:42 AM

That's what I thought until I saw the example I have in front of me. The print outs are from the View Analysis Report and are of non-critical ratings. They have many points of interest printed out.

## Description

FROM:kkennelly DATE:1/21/2005 3:45:57 PM  
Email from Glen Mullings via Bridgeware:

Attached is the ".BBD" file for a bridge that I am performing a load rating analysis on. The bridge is of the Deck Girder / Floorbeam / Stringer configuration on a 9 degree skew, and I having a problem with modeling the superstructure framing system.

Whenever I input the end stringer unit, I get an error message regarding the location of the floorbeams. Is this due to the significant figures (round-off error) in the unit spacing, or is it a more complicated problem? I am currently working with six significant figures.

Thank you for your assistance.  
Glen A. Mullings

Email reply from Mehrdad:

Glen,

I investigated the problem that you reported. But I haven't been able to find the source of the problem. However I was able to create a similar Super Structure Definition and I was able to assign all of the Stringer Group Definitions in the Floor System Geometry window for my example. I am going to ask one of my colleagues to investigate this further.

Regards,  
Mehrdad Ordoobadi

FROM:kkennelly DATE:1/21/2005 3:49:55 PM  
reply sent:

Hi Glen,

Mehrdad asked me to look into the problem you are having with this bridge. It appears that some of the geometry stored in the database for this structure is slightly off causing you to be unable to assign a Stringer Group Definition to the end unit. This was probably caused by precision problems with the Floorbeam Member Locations window in Version 5.1. (These precision problems were fixed in Version 5.2.)

I have been unable to find a way to fix your data using the Virtis user interface so I have manually changed the location of your end floorbeam that is stored in the database. (It was a very slight change that should fix your precision problem.) I have attached a bbd file containing this corrected version of your bridge. Please review the bridge after you import it.

Please let me know if you need additional information.

Regards,  
Krisha Kennelly, PE

## Description

FROM:dteal DATE:Tuesday, January 25, 2005 2:32:48 PM  
For Eric Anderson:

The XML output file Virtis/Opis 5.2.0 generates is not following standard syntax in its reference to its buddy xsl file.

As copied per MSDN documentation [http://msdn.microsoft.com/library/default.asp?url=/library/en-us/xmlsdk/html/xslt\\_hdi\\_reference\\_data\\_values.asp](http://msdn.microsoft.com/library/default.asp?url=/library/en-us/xmlsdk/html/xslt_hdi_reference_data_values.asp)  
To specify the XSLT file to use with the XML file

In your HTML or text editor, open the Sales.xml file (if not already opened).  
Locate the following code:

```
<?xml version="1.0"?>
```

After this line, add the following code:

```
<?xml-stylesheet type="text/xsl" href="transform.xsl"?>
```

-----  
The syntax of vertis/opis output for the 2nd line of the xml file is using a colon instead of a dash.I.E.:<?

4/19/2016 3:18:25 PM

HRS AASHTO

**Complete Issue Information**

xml:stylesheet type="text/xsl" href="LRFDRReport.xml" ?>  
Internet explorer doesn't seem to care about using a colon instead of a dash but when programming with the .NET framework and using the XmlTextReader class it throws an error.

A pop-up box called "PreCollect" has the following message:  
'xml:stylesheet' is an invalid name for processing instruction. Line 2,position 3.

If I manually modify the xml file by substituting line 2 with...<?xml-stylesheet type="text/xsl" href="LRFDRReport.xml" ?>the .NET XmlTextReader is happy.

FROM:hlee DATE:1/25/2005 3:22:01 PM  
We should change that to xml-stylesheet. W3C specifies the use of a dash instead of a colon (<http://www.w3.org/TR/xml-stylesheet/>).

**Description**

FROM:kkennelly DATE:1/27/2005 7:42:30 AM  
Submitted on behalf of Francis Karyadi via email:

Currently I am rating a 4-span-continuous prestressed deck beam- (under SDL and LL). You can view the "Framing Plan Detail" and the "Structure Typ. Section" of the bridge under THE APPROACH SPANS (8 THRU 11).

When I ran the "BM 4 (TYPE A)", and checked the output (H20 truck), I noticed that the Moment Capacity at the controlling points were 36.14 ft-kips (for Inventory), and 0.0 ft-kips (for Operating). I attached also the cut and paste output (see the Word.doc attachment) at that location.

I found the results are a little bit odd, since usually the RF (Operating) is 1.67 x the RF (Inventory). I checked my input several times but could not find what I have missed or done wrong. Your help is greatly appreciated.

Thank you...

<<S-24-030(15B).bbd>>

### Description

FROM:kkennelly DATE:2/1/2005 7:44:26 AM  
Submitted on behalf of Vinacs, Caltrans via email:

We rate all of our bridges at every 10th points, however, when it comes to a point that falls at the support, we rate the bridge at the face of the support using demand at the face of the support. This is quite true when the structure is a framed structure.

Currently, it appears that we need to identify the face of the support as a point of interest in order to obtain rating. That is alright. However, we find it very difficult to deselect a point of interest already created in the default. When we select option 1, it rate the bridge at every 10th point, including the point over the support. We wish that this point could be deselected when there is a framed structure description is available.

We could minimize the work, if we could copy ALL the point of interest and paste them under another girder.

## Complete Issue Information

FROM:vvinayagamoorthy DATE:Tuesday, February 01, 2005 9:40:00 AM

I prefer to have an option where an option is introduced thereby Virtis automatically rates (for the moment) at the face of the support point when a point of interest falls at the support point. And rates for shear at a distance d from the support face. (BEST SOLUTION)

If this is too difficult, my next preference would be where user could deselect any 10th point, that is created in the BRASS option. This will eliminate unnecessary data entry. Image that a 4 span bridge with several girders and user has to enter point of interest for each member alternative at every 10th points--It would be 40 times number unique girders. If the deselect option is provided, it eliminate all of these entries.

Least favorite solution: Allow user to copy a batch of point of interest and paste to other member. This can be used only if girders have the same length;

FROM:dteal DATE:Wednesday, February 02, 2005 10:04:56 AM

In the Trans. Stiffeners Ranges GUI we have a wizard to apply stiffeners at Diaphragms. When selected we have the options to apply "End Diaphragms and Diaphragms at Piers" and "Interior Diaphragms".

The interior diaphragms pulldown one is okay but in the Bearing stiffeners pulldown needs to be added to. We can only select one Bearing stiffener, this bearing stiffener will be added at both the abutments and the piers. It has been my experience that abutment and pier diaphragms are never the same. So the user has to select one or the other then go in and edit the Bearing Stiffeners Location window to get the correct one at abutments or piers for each unlinked member.

We should have 2 pulldowns, one for the abutment and one for the pier.

### Description

FROM:dteal DATE:Wednesday, February 02, 2005 10:06:32 AM

In the Deck Profile GUI for a steel girder system structure we have on the Deck Concrete tab the Compute button to calculate the Eff Flange width for LFD and LRFD. The values calculated may be different for each specification. When entering your rebar count on the next tab you enter the number of bars that are present within the effective width. Many times the effective width between the two specifications vary enough to account for a one bar different count.

When this happens, which count should be used, the larger or the smaller?

Should this be addressed in the help?

Should the reinforcement tab have another column to allow for more accurate input?

FROM:jduray DATE:2/2/2005 2:15:09 PM

I suppose we should add another column.

FROM:kkennelly DATE:2/8/2005 9:53:09 AM

Yes it would be more correct to have another column. Things we'll have to do to add this column:

1. Change db, dm, de, domain.
2. Change window
3. Change help
4. Change report tool
5. Change domain generation of cross sections for export
6. Change export

With the current version (5.2) in the Spec. Checker filter – on the tab for Spec Articles I unselected all (clear all) – the window still gets filled with specification it checked. The specification numbers listed where not one of those that you can turn off?? These must have been new spec's added with the 3rd edition and the spec checker filter wasn't updated??

### Description

FROM:dteal DATE:Wednesday, February 09, 2005 9:30:27 AM

We got the single lane loaded option added back to the LFRD analysis settings/vehicle properties – but it has never been added back to the LFD analysis settings/vehicle properties. Is there a reason for this?? This is needed for LFD rating of T-130 and T170 permit trucks.

FROM:dteal DATE:Wednesday, February 09, 2005 9:34:00 AM

Never Mind!! It's automatically in the rating results report.

Please close this incident.

### Description

FROM:dteal DATE:Wednesday, February 09, 2005 10:56:09 AM

In an Opis design review you may set in the advanced button of the vehicle properties to run a particular truck as single lane with reduced impact. Two problems exist.

1. After you do a design review you will find that the single lane loaded option you checked is no longer checked – if you need to make a second run, you will have to go back and reselect this option.
2. Sporadically, which means not every time, you have selected the single lane loaded option and changed the impact factor, after the run I looked at the BRASS LRFD data set card #5 (% of dynamic load allowance) and card #7 (lanes loaded) don't always follow what your input on the advanced vehicle properties window showed.

FROM:jihnat DATE:3/9/2005 1:34:10 PM

1) is fixed for version 5.3.0 (as of Beta Build 5)

2) I wasn't able to reproduce this, but it may have been caused by #1. Resubmit if this is still occurring.

Right overhang start and end are calculated values, which cannot be entered by user. Report Tool can be enhanced to output these calculated values.

FROM:jduray DATE:7/19/2006 4:45:44 PM

I don't know if this is a bug or enhancement. The database does not store the right overhang width so that is probably why the report tool does not report it. It can be handled as a special case in the report tool so that is why I think it is an enhancement.

From Eric Anderson:

Another small quirk. I appreciate the indentation in the xml file when viewing it in notepad it makes looking at the raw file more understandable. It looks like the child element

4/19/2016 3:18:30 PM

HRS AASHTO

1818

**Complete Issue Information**

"<Total\_Deck\_Thickness\_UNITS>" needs indented further to keep the children nodes all lined up.

Here is a section of the xml report I get that looks like the indent could be tweaked:

```
<Concrete_Deck_Gs>
  <Width_Left_Start>6.400</Width_Left_Start>
  <Width_Left_Start_UNITS>m</Width_Left_Start_UNITS>
  <Width_Left_End>6.400</Width_Left_End>
  <Width_Left_End_UNITS>m</Width_Left_End_UNITS>
  <Width_Right_Start>6.400</Width_Right_Start>
  <Width_Right_Start_UNITS>m</Width_Right_Start_UNITS>
  <Width_Right_End>6.400</Width_Right_End>
  <Width_Right_End_UNITS>m</Width_Right_End_UNITS>
  <Left_Overhang_Start>0.900</Left_Overhang_Start>
  <Left_Overhang_Start_UNITS>m</Left_Overhang_Start_UNITS>
  <Left_Overhang_End>0.900</Left_Overhang_End>
  <Left_Overhang_End_UNITS>m</Left_Overhang_End_UNITS>
  <Deck_Type>Concrete</Deck_Type>
  <Deck_Concrete_Name>Grade 30 (AE)(SW)</Deck_Concrete_Name>
  <Total_Deck_Thickness>220.0</Total_Deck_Thickness>
<Total_Deck_Thickness_UNITS>mm</Total_Deck_Thickness_UNITS>
  <Deck_Crack_Control_Parameter_Z></Deck_Crack_Control_Parameter_Z>
  <Deck_Crack_Control_Parameter_Z_UNITS>N/mm</Deck_Crack_Control_Parameter_Z_UNITS>
  <Modular_Ratio_Sustained_Factor>2.000</Modular_Ratio_Sustained_Factor>
  <Modular_Ratio_Sustained_Factor_UNITS> </Modular_Ratio_Sustained_Factor_UNITS>
</Concrete_Deck_Gs>
```

FROM:hlee DATE:2/15/2005 8:46:59 AM  
Also fixed <Total\_Deck\_Thickness\_UNITS> tag in floor system.  
Resolved in 5.3 or 5.2 service pack if there is one.

### Description

FROM:dteal DATE:Tuesday, February 15, 2005 8:04:01 AM

As we all know the single lane loaded option was removed from the advanced tab of the analysis settings. The single lane rating value could then be found by selecting the "Detail" radio button in the Results window in Virtis and Opis was left with no option for single lane loaded.

After much lobbying the single lane option got added back into Opis in 5.1.1 or 5.2 or something like that.

You need to re-think the decision for removing the single lane loaded option in Virtis.

First off:

When you view the Results Window after a rating the last column in the report has the heading "Lane". The values in the column will always be "as requested". There is no way to REQUEST anything other than multi lane, so why doesn't it say "Multi Lane" then?

Second and most importantly:

In order to view results for single lane you have to select the detail button. We run ratings for several trucks at one time – 8 trucks every time a rating is performed – most of these trucks are multi lane but at least 2 of them are permit vehicles which are to be evaluated for single lane. The only way I know of to extract these single lane values is to select the "Detail" button and get 4 printed pages of output with each truck populating 5 lines in the report. You have to search these pages to find the correct single

## Complete Issue Information

lane value with the correct impact applied – time consuming work!

It would very prudent and usable to be able to print out a rating results that are actually “as requested”. The single lane loaded option needs to be restored to it’s original function.

FROM:dteal DATE:Tuesday, February 15, 2005 8:14:47 AM

And to add insult to injury – when you print out this “detailed” report, in order to get your inventory and operating factors (columns 6 & 7) that correspond with correct impact and lanes loaded (columns 14 & 15) you have to print out your report in landscape, lay one page over the other to line up the rows and in many cases use a straight edge to keep you on the correct line, then read across the columns. Viewing them on the screen is an option- BUT – like many agencies the bridge hard copy file requires this paper copy to be present.

FROM:dkoenig DATE:Thursday, February 24, 2005 1:28:29 PM

I would generally agree with Dean's comments. However, I would still want the option to be able to view the detailed results. Maybe it can be changed so that you can specify a lane to do what Dean wants or leave it blank to do it as it currently does.

FROM:dteal DATE:Wednesday, March 29, 2006 2:53:40 PM

This has been on hold for a long time??

Back in Aug '05 the TF discussed this - Agenda Item VO-03 - what was the outcome?

FROM:hlee DATE:1/25/2007 9:21:22 AM

This enhancement involves the following:

1. Add "Single Lane Loaded" option back to the Vehicle Properties window in Virtis.
2. Update BRASS, Madero, Virtis Std, Truss exports to check for this option.
3. Update Help.

Item 1, 2 (except Truss export), and 3 are done.

FROM:gbhanushali DATE:3/13/2007 3:02:36 PM

FROM:hlee DATE:5/16/2007 2:51:17 PM

Item 2 (Truss export) is done. Resolved for 5.6 Release.

FROM:xli DATE:6/14/2007 11:31:09 AM

Tested fine with Beta 3.

FROM:dteal DATE:Tuesday, June 19, 2007 3:31:20 PM

5.6 Beta 3

I am not able to find the Single Lane Loaded option after selecting the advanced button for the Virtis vehicle properties. It is mentioned in the help but not displayed in the GUI??

Where we sent a different version than the one tested above?

FROM:hlee DATE:6/20/2007 2:32:45 PM

The version tested above is the same version you received.

Have you uninstall Beta 2 before installing Beta 3?

FROM:dteal DATE:Wednesday, June 20, 2007 4:53:55 PM  
Yes I did

FROM:dteal DATE:Thursday, June 21, 2007 8:46:56 AM  
It's been so long since we had a Single lane loaded button for rating – maybe I don't know where it should be or how to get there?? Can you direct me?

FROM:hlee DATE:6/21/2007 9:14:10 AM  
The Single Lane Loaded option is located in the same window as the one you tested for Incident 5449. It's in the Advanced Vehicle Properties window (see attached VehicleProperties.bmp file).

If you couldn't find the Single Lane Loaded option in that window, it must be related to multiple Virtis/Opis installations in your machine. Please follow the instructions below to delete the grid settings for that window.

1. Select Run... in the Windows Start Menu.
2. Type in "Regedit" and click OK to open the Registry Editor.
3. Delete both Grid0 and Grid3 as shown in the attached Regedit.bmp file.

FROM:dteal DATE:Thursday, June 21, 2007 4:23:38 PM  
Question: Does this mean that I can't have multiple versions (beta and a production) and/or Opsi sub living on the same drive??

FROM:hlee DATE:6/22/2007 10:52:23 AM  
We don't support multiple versions installed in the same machine. Although switching version can be done by re-registering Virtis/Opis libraries, the registry settings is for each product (Virtis, Opis, Virtis/Opis, ...).

FROM:dteal DATE:Friday, June 22, 2007 12:08:40 PM  
Yes - I am aware of that.  
What I meant was, even with re-reigistering the product before using it - will the user have to jump through these hoops to get the single lane loaded column available?

FROM:hlee DATE:6/22/2007 12:24:54 PM  
No, user doesn't need to manually cleanup the registry. The uninstall process will cleanup Virtis/Opis registry settings.

FROM:dteal DATE:Friday, June 22, 2007 1:32:24 PM  
Accepted in 5.6 beta 3

FROM:dteal DATE:Monday, November 19, 2007 9:23:43 AM  
Did anybody else run into what I have described below??

Single Lane loaded  
Reference VI #6050, I have marked as Re-Open

As you can see – there is no Single Lane loaded column

4/19/2016 3:18:30 PM

HRS AASHTO

1822

## Complete Issue Information

(See attached Word File, Office 2007)

I reviewed VI #6050

This incident stated that being my button wasn't there in 5.6 beta3 – it must be because I have multiple versions of the software loaded. To resolve this I must go in and edit the registry

This is what Herman told me to do back then:

If you couldn't find the Single Lane Loaded option in that window, it must be related to multiple Virtis/Opis installations in your machine. Please follow the instructions below to delete the grid settings for that window.

1. Select Run... in the Windows Start Menu.
2. Type in "Regedit" and click OK to open the Registry Editor.
3. Delete both Grid0 and Grid3 as shown in the attached Regedit.bmp file.

I was assured that user would never have to do this.

Well, wrong!!

My production pc doesn't have multiple versions – each version upgrade was preceded by an uninstall, just like all the rank and file users. In fact I loaded this on my test pc which has multiple versions including Opis Substructure and the single lane loaded column was visible. So this doesn't follow the rule of multiple versions??

So to fix the problem for our now Production database, I had to run Regedit like described above. Grid0 was deleted, Grid3 was not present. I did this and restarted my pc. The single lane loaded button is now available BUT -

On two of my Vehicle Properties Templates – each one containing 8 trucks – all were all set to single lane loaded (every one of them) –

This for Girder Bridges: (See attached Word File, Office 2007)

This is for Slab Bridges: (See attached Word File, Office 2007)

Now notice that the template for slab bridges has LRFR columns?? In the Analysis setting, my templates used the LFD Rating Method. My Girder Bridges template retained this rating method but my Slab Bridges template got changed to the Member Alt. rating method – I have no idea why??

So in a nut shell, I had to go modify my templates to correct all these things got changed.

Now for the real question – being I have 2 pc's, I had to edit the registry on one and not the other – how many out there need to have this adjustment done to them?? I'm at 50% just checking my pc's.

FROM:dteal DATE:Monday, November 19, 2007 9:29:43 AM

FROM:jihnat DATE:11/21/2007 8:53:52 AM

The program should have ensured that the Single Lane column was visible instead of relying on the Uninstall to remove the Settings. I've fixed this for the next version. I've broken out the other two issues into separate incidents (8286, 8287).

FROM:hlee DATE:1/29/2008 12:43:54 PM

It will be beneficial to users if we can find out why Uninstall works on some pc but not others.

## Description

FROM:jihnat DATE:3/16/2005 12:28:23 PM  
>>> "Steve Mample" <Steve.Mample@itd.idaho.gov> 03/15/05 3:26 PM >>>  
I am working on a continuous three span reinforced concrete tee beam girder bridge. I am getting the following error message, "ERROR: Reinforcement profile Set 28 not on member alternative."

The distance from support 2 to support 3 is 50.00'.

4/19/2016 3:18:31 PM

HRS AASHTO

1827

### Complete Issue Information

Start distance of Set 28 from support 2 is Right 49.75'.  
Set 28 length is 12.5'.  
Therefore the distance from support 3 to the Right end of Set 28 is 12.25'. The distance from support 3 to support 4 is 12.5'.

How can there be any error, there is 3" from the Right end of Set 28 to support 4?

The beam is symmetrical. I was able to input the mirror image of the reinforcement Set 28 without error.

Span 1 & 3 are cantilevered. There is a massive end wall (diaphragm) at the abutment ends of spans 1 & 3. When I input a dummy Set 28 that the program will accept, and rate the bridge. The results show that rating trucks inv. and opr. capacity is zero Tons for shear analysis at support 4. Shear failure at the support is not physically possible. Support 1 & 4 are at the ends of the spans. Changing the location of support 4 may solve the problem. There is probably a way to adjust the location of the supports without changing the length of the girder but I can not remember how to do it.

FROM:kkennelly DATE:3/17/2005 8:39:44 AM  
Please attach a bbd file of your bridge

FROM:kkennelly DATE:3/17/2005 10:55:46 AM  
Email received from Steve:  
Hello, Krisha.

I bypassed the problem. The re-bar set that caused the problem was longitudinal steel of the reinforced concrete girders in the negative moment area at the fixed supports 2 & 3. There is a right hand pair and a left hand pair of the re-bar set at the supports 2 & 3. Each pair has a horizontal straight section 12.5' long, and one end bent down to reach the bottom of the girder. The straight section of each pair overlaps 6" at the centerline of bearing. I substituted a single straight re-bar set for the pair, that was centered on the support centerline.

Since I have changed the file, I would have to rebuild it to send you a copy. Is this problem something that is important enough for you to spend your time on? If so, I will send the file.

FROM:kkennelly DATE:3/17/2005 10:56:15 AM  
Email sent back to Steve:

If you are satisfied with the work around you found you do not have to rebuild the bridge and send it to me. Your problem was entered as incident 6166 on the Virtis/Opis technical support website. I will mark that incident as resolved. Please let me know if you need any additional help.

### Description

FROM:dteal DATE:Wednesday, March 23, 2005 10:49:34 AM

In the attached .bbd file, running Opis on girder line #2, I get the following error:

Internal Errors (600) – Unable to compute Kg for use in the distribution factor equations.

This particular bridge both a barrier curb and a pedestrian rail – Can you help me decipher the error message and fix my problem?

FROM:bgoodrich DATE:Wednesday, April 06, 2005 12:16:17 PM

I tried reproducing this with Member 2 (Wizard Alternative) and Member 1 (Wizard Alternative) too. Kg appears to be computed fine. Krisha - Are you able to reproduce this? This error occurs when Kg is calculated as a negative value, which can only happen if incorrect properties are used. There was a recently discovered error in BRASS where the incorrect section properties were being retrieved. I

suspect this is the same problem as Dean is reporting, but I cannot reproduce it with the bbd file provided.

FROM:dteal DATE:Thursday, April 07, 2005 9:03:27 AM

I can repeat it every time I run this file. I get error when doing an opis run with standard HL93 loads on the Wizard Alternative of Member #2.

I have reattached the bbd file incase that was the problem in recreating the error.

I have attached a jpeg of the error message and also copied it below for the BRASS error file and the System error message.

System Error Message:

Internal Errors (600) - Unable to compute Kg for use in the distribution factor equations  
07:55:38 AM - Line 2349 in source file .\DoMemberResults.cpp.

Unable to compute Kg for use in the distribution factor equations.

----- End of Contents of BRASS Error File -----

FROM:kkennelly DATE:4/7/2005 10:11:46 AM

I imported "Distribution Factor Error.bbd" into Virtis/Opis version 5.2, picked the HL93 Design Review template on the Analysis Settings window and analyzed the member alt for G2 and I was able to reproduce this error. Member 1 ran fine but Member 2 gives the error. The first time I ran was without the abxbrass service pack released in Feb, I ran again with the abxbrass service pack and still get the error.

FROM:bgoodrich DATE:Wednesday, April 13, 2005 1:04:03 PM

I still cannot reproduce with debug or release versions using the September version of BRASS-GIRDER(LRFD).

FROM:bgoodrich DATE:Friday, April 22, 2005 12:05:43 PM

I requested that Krisha send me the exported BRASS data file.

FROM:bgoodrich DATE:Friday, April 22, 2005 1:35:03 PM

The export did not generate some of the bracing commands that Krisha's and Dean's files had, which affected the nodes in the model. I suspect this is due to the tolerances. BRASS is in error and I have forwarded this issue to WYDOT for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Friday, April 22, 2005 5:57:52 PM

FROM:dteal DATE:Wednesday, March 23, 2005 12:10:18 PM  
Below is an error message generated in Opis from the attached .bbd file – looking at girder line #2. I have the feeling that there is an internal SI/USC conversion thing going on here with this heavily skewed structure. Girder line #1 runs just fine and as far as I can tell all the member lengths are identical.

FROM:ttompson DATE:Tuesday, March 29, 2005 12:29:15 PM  
Enhancement Request

I would like to request a change in the way the shortcuts are located in Start, programs, AASHTOWARE, Virtis-Opis.

Currently the Virtis, Opis and VirtisOpis shortcuts are at the level under AASHTOWARE. I believe they would be better placed under Virtis-Opis.

The Pontis start is located under Start, Programs, AASHTOWARE, Pontis.

I think the only things that should be under AASHTOWARE and bridgeware integrated type items. Not the individual applications.

FROM:jduray DATE:3/31/2005 10:12:15 AM

We can make the change as you suggest. It seems there isn't a standard. We are consistent with the Microsoft placement of tools and executables.

FROM:hlee DATE:7/10/2006 10:04:10 AM

Changed Project from Beta Testing/GUI/Installation to Support Center.

### Description

FROM:jtrizenberg DATE:Thursday, March 31, 2005 9:50:16 AM

I'm analyzing this 4 span prestressed concrete bridge and I think Virits is generating higher than normal moments and shears. For example, Virits gets a live load moment in span 1 of 2352 kip-ft, but I believe that the maximum moment for a 100 ft simple span should only be 1122 kip-ft.

FROM:kkennelly DATE:4/4/2005 1:24:45 PM

FROM:kkennelly DATE:4/4/2005 1:30:06 PM

FROM:kkennelly DATE:4/4/2005 1:33:14 PM

1. Live load moment is computed based on the final 4 span continuous arrangement not the 100 ft simple span.

2. I analyzed G2 for HS20 loading and see in the BRASS output at point 104 the truck 1 moment is 2352.4 kip-ft. Is this value that you believe to be incorrect? This value is the factored HS20 truck moment, using the 2.17 factor used in the rating equation. The HS20 truck moment including

4/19/2016 3:18:33 PM

HRS AASHTO

1840

## Complete Issue Information

distribution factor and impact is listed in the BRASS output file as 1083.5 k-ft. Do you disagree with the 1083.5 k-ft?

FROM:jtriezenberg DATE:Friday, April 29, 2005 8:29:37 AM

Thank you. One more question concerning this bridge, in the brass output under the section "\*\*\*\* Summary of Actions for Calculating Shear Capacity" The shear strength calculations are computed several times "For Point 305.000 Node Point = 44" Is there any way to find the shear strength calculations for tenth points? I'm also unsure why it is calculating the shear at this particular point.

FROM:jtriezenberg DATE:Friday, April 29, 2005 11:54:16 AM

An independant check has been done on this beam which shows much higher shear capacities than Virtis. I did a hand calc for the shear capacity for span 1 at point .3L. This hand calc also shows much higher shear capacities than Virtis.

I have 3 similar bridges which are all relatively and have large prestressed concrete girders and Virtis gives all of them an IR of about .800. This seems like a low rating given the new condition of the bridges. I'm just wondering if there is a way to check the shear capacity in virtis.

FROM:kkennelly DATE:4/29/2005 12:25:12 PM

If you create a point of interest at the location where the rating factor is low, the BRASS output file will contain a detailed listing of the calcs it performed to compute the rating factor. You can review this detailed output to determine the source of the discrepancy.

FROM:jtriezenberg DATE:Tuesday, May 03, 2005 3:49:59 PM

When I create a point of interest at one of the tenth points, the shear capacity drops significantly. e.g. if a point is created at the 3/10 point of span 1, the Vn drops from 179 to 121 kips.

FROM:kkennelly DATE:5/4/2005 7:50:50 AM

That sounds very similar to incident 3911 which was resolved for Virtis 5.0.

FROM:jtriezenberg DATE:Tuesday, May 10, 2005 3:25:09 PM

It is similar to 3911, but in this case, this change in shear capacity is at the point of interest. I don't think the shear capacity drops at any Virtis generated points.

FROM:bgoodrich DATE:Thursday, May 12, 2005 10:01:30 AM

BRASS calculates the shear capacity at every point of interest entered (unless shear is to be ignored) regardless of its location along the girder. Because the shear capacity is load-dependent, several blocks of the calculations are provided. The truck number and rating level (inventory/operating) are listed at the top of each block. I am not able to see any difference in the shear capacity when the 103 POI is added. The output shows 179 kips with or without the 103 POI for Truck 1 Inventory. The 104 POI shows 121 kips for Truck 1 Operating. After reviewing the intermediate output for the 103 POI, did you determine why your hand calculations and BRASS differed? We need some more information to investigate this issue further. Please attach the two output files and note the BRASS page number on which the differences are located.

1841

## Complete Issue Information

It may be that I am just not looking in the correct place for the information that I need, but I have attached the latest BRASS output which is dated today. On page 74 (a very long page) the individual calculations are shown for user-defined POI 103.02. Here  $V_u$  ranges from 120.6 to 122.5 depending on load type and load level. On the top of page 83, at Virtis-defined POI 103,  $\phi * V_u$  varies from 141 to 179 kips. I am also unsure why  $V_u$  is being multiplied by  $\phi$ . Which  $\phi$  is this?

Thanks  
-JT

FROM: bgoodrich DATE: Wednesday, May 18, 2005 11:49:29 AM  
Regarding the phi factor in the following output:

Shear Summary:

$$V_c = \text{MIN}(V_{ci}, V_{cw}) = 79.6 \text{ kip (AASHTO 9.20.2.1)}$$

$$V_n = V_c + V_s = 134.6 \text{ kip}$$

$$V_u = \phi * V_n = 121.1 \text{ kips (AASHTO 9-26)}$$

The phi factor is the strength capacity reduction factor from AASHTO 9.14. This is located on the Resistance Factors tab of the Factors - LFD window. Your bridge doesn't have any override factors set, so the LFD factors from the library are used.

You indicated that the shear capacities at the 103.02 POI and the 103.00 POI are different. These are two different points of interest. Page 84 has the summary output for the 103.02 POI. The 103.02 POI was generated based on the prestress model exported to BRASS from Virtis, which was "Centerline of simple-span bearing" as set in the member alternative engine properties. The span length exported to BRASS is shorter than that used to specify the points of interest in Virtis. To get the output for the 103 POI, enter a POI at 9.2826 meters. The reason the shear capacity differs between the two POI is because of the shear concurrent with the maximum moment ( $V_i$ ).

FROM: jtrizeenberg DATE: Thursday, May 19, 2005 9:58:17 AM  
Although I realized that there was a difference between POI 103 and POI 103.02, I didn't think this small increment in distance could produce a 58 kip difference in Shear strength.

Also, just to be clear, when  $V_u$  is shown to be multiplied by  $\phi$ , that  $\phi$  is a user defined factor and is left at 1 if no extra factors are defined by the user. Is this correct?

FROM: bgoodrich DATE: Monday, May 23, 2005 12:50:32 PM  
The default phi factor for prestressed concrete shear is 0.9. See the Factors - LFD - Standard tree item in the Library Configuration Browser, i.e., the "Library - Factors - LFD" window.

The shear capacity issue is the same as in Incident 5042. The process used by BRASS to incrementally move the truck across the bridge uses linear interpolation when an axle is between influence ordinates, which leads to this particular difference. I increased the wheel advancement denominator (as discussed in the other incident) to 300. The shear capacities at the 103.02 were much closer to those at the 103.00. WYDOT is aware of this issue and has added this issue to the enhancement list as discussed in the other incident.

I am marking this incident as a duplicate of Incident 5042.

**Description**

FROM:dteal DATE:Tuesday, April 05, 2005 9:14:57 AM

For Staff engineer, Steve Burnett

A prestressed Girder analyzed in Opis 5.2.0 – reviewing output at POI's one of our designers found a possible error. (.bbd attached)

Continuity steel was entered, As part of the specification checks, the flexural resistance is calculated at each POI for both the positive and negative sense. At the POI located at each beam end at the piers, the continuity diaphragm reinforcing is included in the calculations. That is correct. However that same continuity diaphragm reinforcing is included in the calculations at the first tenth point into the span. I believe that is incorrect. The program does not include the continuity diaphragm reinforcing in the calculations at the ninth tenth point into the span. I believe that is correct.

FROM:bgoodrich DATE:Monday, April 18, 2005 5:56:21 PM

The longitudinal length of the continuity steel is never defined in Virtis/Opis, so the export process

4/19/2016 3:18:34 PM

**HRS AASHTO**

1843

**Complete Issue Information**

assumes it extends to the first tenth point. The issue with the 9/10 point not including the continuity steel and the 1/10 point including it is due to the BRASS engine choosing the section on the left side of the point when the moments of inertia are the same. Incident 5381 was recently completed, so the engine will compare the rebar area as a secondary check. The side with the smallest rebar area would be exported. For the structure in this incident, the 9/10 and 1/10 points would therefore not include continuity steel. This change was made to BRASS-GIRDER 5.9.1, which is scheduled for release with Virtis 5.3 Service Pack 1.

**Description**

FROM:dteal DATE:Tuesday, April 05, 2005 9:16:49 AM

In the past we where told that BRASS only uses one yield strength (fy) per structure. Ie: you can't have both 40 and 60 ksi bars in the same structure, it will use the fy of the first one it comes across for the entire structure.

Is this still true or did it get changed?

FROM:dteal DATE:Tuesday, April 05, 2005 9:27:24 AM

After some research – am I correct when I say that BRASS takes second yield strength rebar and converts it to an equivalent number of grade 60 bars?

FROM:bgoodrich DATE:Monday, April 18, 2005 5:05:43 PM

Yes, the export scales the number of bars by the ratio of the yield stresses for all the materials after the first detected by the export. This issue was addressed in Incident 2899.

FROM:dteal DATE:Tuesday, April 19, 2005 9:10:17 AM

Question: Does it make any difference which grade of rebar appears first in the list under Materials:Reinforcing Steel in the Virtis/Opis GUI?

| 6331.15004 | Closed        | POI Wizard Generating Points Not Requested |

### Description

FROM:dteal DATE:Tuesday, April 19, 2005 3:51:24 PM

The POI wizard generates the following points based on 5.11.1.2.1 which determines where the bar is no longer required to resist flexure, max of (effective depth of member, 15db, 1/20 clear span) from start or end of the bar.

The wizard is missing, 5.11.1.2.3. Which states that 1/3 of the total tension reinforcement provided for negative moment at a support shall have an embedment length beyond the point of inflection not less than effective depth of member, 12db, 1/16 clear span.

What that is saying is that 1/3 of your top area of steel required that extends over a pier into a span has to extend beyond the DL + LL inflection point by maximum of (effective depth of member, 12db, 1/16

1855

**Complete Issue Information**

clear span).

The point I explained above is a very important point for design – it tells you where you can terminate your top steel. This is the same criteria for LFD and LRFD.

FROM:jduray DATE:Tuesday, November 15, 2005 1:25:55 PM

This is not a bug.

Change to an enhancement...investigate handling this type of issue in the export after the analysis is complete. The export could append to the spec-check calcs.

FROM:jduray DATE:Tuesday, November 15, 2005 1:41:42 PM

FROM:dteal DATE:Thursday, November 17, 2005 2:04:12 PM

how could this not be a bug - the wizard completely misses a point that is required by code for design?

FROM:jduray DATE:11/21/2005 11:57:27 AM

An analysis is required to determine the location of the inflection point...it was not in our scope for the wizard to compute this location. The engine (BRASS) cannot compute it because it does not know about a bar schedule or embedment lengths. The export is the only place this can be computed so we (with TF approval) changed this incident to an enhancement. We would do supplemental spec-checking after the analysis (outside the analysis engine) and append the results to the engine spec-check results.

.bbd attached

Looking at the second Superstructure Def. – I used the POI Wizard to generate points at “Location of Change of Girder Properties” only. The wizard generated POI’s at the end locations of Span 1, 2 & 3. none of these locations where a change of section depth – so I don’t think it should have created POI’s at the following

- Span 1 - 48.00 Left
- Span 2 – 64.00 Left
- Span 3 – 48.00 Left

Below is a definition from the online help for RC:Schedule Based:Girder Profile:Reinforcement

**Fully Developed**  
Check this box to indicate that the reinforcement set as entered is fully developed. If this box is checked, the export to the analysis engine will not compute the required development length for the reinforcing steel. The export will consider the bar as entered to be fully developed.

Every time I read this I tend to get confused – I know I confuse easily but if one person doesn't understand then there surely are others being confused.

The text I would like added to the help is a simple example that states – When inputting bars from construction plans, DO NOT check the box for Fully Developed. Bars from the construction plans are not developed at their ends and checking this box would mean that they are. Leave the box unchecked and Virtis/Opis will compute the point where these bars have reached 100% development. If a cross

**Complete Issue Information**

section is generated between the end of the bar and the development length, a percentage of the bar will be exported to BRASS.

### Description

FROM:dteal DATE:Monday, April 25, 2005 8:51:44 AM

In the attached bbd I have a 5 span concrete deck girder type structure (it's only partially defined, not completed yet) I wanted to apply diaphragms at the 4 interior supports. In the process I noticed that in the Framing Plan Diaphragms tab under Support number, the pulldown contains support 1 thru 5 but is missing the support number 6 ( the right end abutment) – this doesn't seem normal??

FROM:hlee DATE:5/3/2005 4:28:29 PM

4/19/2016 3:18:38 PM

HRS AASHTO

1864

**Complete Issue Information**

Support Number 6 is not needed to define diaphragms, so it is not included in the Support Number pulldown.

FROM:dteal DATE:Wednesday, May 04, 2005 1:30:26 PM

I guess I don't understand why abutment 1 is needed and abutment 2 isn't. I would have assumed all or none??

FROM:hlee DATE:5/4/2005 3:23:51 PM

The location of a diaphragm is defined based on a reference point to the left of the diaphragm. If there is a diaphragm at abutment 2, the diaphragm can reference the support line to the left of abutment 2. That's why abutment 2 is not needed. Abutment 1 is needed to defined diaphragms that are located to the right of Abutment 1.

### Description

FROM:pjensen DATE:Thursday, April 28, 2005 3:37:25 PM

The review of the deck lam help shows something that is not consistant.

excerpt from help is:

Nominal thick

Enter the nominal thickness of the deck plank or lamination. The thickness is the measure of the smaller dimension of the board.

Nominal width

Enter the nominal width of the deck plank or lamination. The width is the measure of the larger dimension of the board.

Nominal thickness might not be the small dimension as discribed but could be the larger (ie 2X4 the nominal thickness is 4"). If you use the information on the help screen, the DF will not be the expected.

FROM:jduray DATE:10/27/2005 3:13:48 PM

Address by modifying the UI (switch labels on the bitmap) and in the help...do not mess with the db!

FROM:kkennelly DATE:8/14/2006 4:06:26 PM

### Description

FROM:mordoobadi DATE:5/2/2005 5:09:11 PM

Dean Teal reported this problem.

After Migration version 5.3.0, not able to open 7 of the bridges.

FROM:mordoobadi DATE:5/2/2005 5:20:21 PM

The problem appears to have been caused by the single quote (') characters that exist in the bridge\_id of those 7 bridges. This is what is happening.

The migration generates a DOCREFKEY to be used for MULTIMEDIA attachments. It is generated by adding bridge's bridge\_id and the current timestamp.

So generated DOCREFKEYS have single quote (') characters in them. In the Dm code when we want to retrieve multimedia records for a bridge, we use the DOCREFKEY that is stored in the abw\_overflow table (or could be in bridge table as well) to filter the records in the MULTIMEDIA table. DOCREFKEY has single quote characters in it, when bridge is retrieved we retrieve the records in MULTIMEDIA table with a filter like:

```
WHERE docrefkey = '60'-96'-60' Rolled Beam'
```

In SQL this is an illegal WHERE clause. The filter should change to:

```
WHERE docrefkey = '60"-96"-60" Rolled Beam'
```

4/19/2016 3:18:39 PM

HRS AASHTO

1867

**Complete Issue Information**

to avoid the error. This requires some minor changes to abmbrdg.DLL. This means we need to issue a patch for this and I think this is very urgent. Because in this situation the bridges that have bridge\_ids with 's cannot be opened.

FROM:jduray DATE:5/3/2005 8:12:13 AM

The single quote within the name is also problem in the Find Bridge dialog. We should probably not allow the single quote since all SQL queries will have this problem. Perhaps that is too restrictive??? For now let's just fix the DOCREFKEY. We will probably be issuing a service pack with the substructure release and also when Wyoming releases BRASS at the end of May. Wait until then to issue a service pack.

FROM:jduray DATE:5/3/2005 8:22:32 AM

The time for fixing this should be charged to CalTrans Service Unit , not Maintenance or Support.

FROM:dteal DATE:Tuesday, June 28, 2005 9:00:29 AM

Accepted in 5.3 SP1 Beta 1

### Description

FROM:dteal DATE:Wednesday, May 18, 2005 8:22:34 AM

If you look at the attached PDF file you will see what the Microsoft SQL Server Desktop Engine popped up. This happened on all our pc's that have a standalone test version of opis sub installed.

The bottom information box in the PDF file states that I need to set a password??

This message will create quit a stir with a user that knows nothing about database servers??? (like myself)

I tried to cancel, pressed ok, I even tried yelling at it but the message kept popping back up, couldn't get rid of them. The only way I found to remove the message and continue was to stop the SQL Server Service by using the icon from the system tray. When I rebooted my PC the message didn't come back

(yet).

FROM:mordoobadi DATE:5/20/2005 10:15:58 AM  
Dean, could you please give us some more information:  
Were you installing Opis/OpisSub when you got the error?  
If you weren't installing:  
    Did the pop-up happen by itself?  
    When did the pop-up show up? During startup? ...

If you were installing:  
    Did you have any of Virtis/Opis/OpisSub products on the PC prior to the installation?  
    Was MSDE/SQL Server software/database installed on the PC prior to the installation.

FROM:dteal DATE:Monday, May 23, 2005 12:28:58 PM  
I was not installing it nor was I running opis. It just popped up on my display when my pc was sitting idle. It happened all by itself. The SQL Server was/is running and has an icon in the system tray.

FROM:mordoobadi DATE:5/23/2005 3:45:34 PM  
Did this happen only once or does it happen frequently?  
What's the operating system of the PCs?  
If it is Windows XP, is service pack 2 installed?

FROM:dteal DATE:Monday, May 23, 2005 4:18:51 PM  
XP with service pack 2  
Has happened only one time - on each of the pc's that opis sub is installed on. But like I said every pc with opis sub running the stand alone server had it happen!

FROM:jduray DATE:5/25/2005 10:53:50 AM  
Since this seems to be unrelated to Opis substructure I am reassigning this to Virtis Support. We will continue to investigate but will not delay the release of Opis Sub.

### Description

FROM:jduray DATE:5/18/2005 9:54:14 AM

1. Option for having no limit on Mcr/Mmax in Vci equation (Incident 5054) - LFD only

2. Option to produce a Camber Summary in the BRASS output (Incident 3295) - LRFD only

3. Option for controlling if plastic analysis is allowed or not for steel structures (Incident 4756) - LRFD only

4. Option for transverse continuous-beam dead load analysis - LRFD only (LFD already addresses this)

5. For continuous-span prestressed concrete girders, added the capability to ignore beam stresses at interior support points of interest. (Incident 6146)  
By default, this could be automatically determined based on the prestress modeling method. A user-override would be provided as well.

6. For continuous-span prestressed concrete girders, expanded the capability to ignore the flexure rating due to positive moment, negative moment, or positive and negative moment for points of interest at interior supports. Virtis/Opis currently supports ignoring the positive moment case, but BRASS now allows negative moment to be ignored as well. (Same as VI 7900).

FROM:sboukamp DATE:5/26/2005 3:10:39 PM

Option 1-5 are resolved on Virtis/Opis side. BRASS engines needs now to be updated.

FROM:jduray DATE:12/13/2007 8:38:48 AM

Item 6 is the same as 7900.

**Description**

FROM:mordoobadi DATE:5/26/2005 9:25:16 AM  
Requested by David Koenig: MODOT

>>> <David.Koenig@modot.mo.gov> 05/23/05 4:05 PM >>>  
Jim, we upgraded our production server to Virtis 5.3 today. We have been getting errors when we are saving a structure and are not able to successfully save a structure. This is a major issue for us, because it basically means we can't do much with structures that were in Virtis prior to Version 5.3. If this is a software issue, then it will need to be addressed ASAP because it will basically shut down any work on structures that existed in Virtis prior to Version 5.3. Below are some of the scenarios that we have encountered.

Scenario #1

4/19/2016 3:18:42 PM

HRS AASHTO

1881

## Complete Issue Information

The user took the structure below and removed one of the structure alternatives, structures, and structure definitions. When he tried to save the bridge, it gave him the first error message shown in the attached Word document. When he tried to save again, it gave him the second error message in the attached Word document.

### Scenario #2

We have been working generally in various structures and have encountered similar errors when we have tried to save the structures. The following are the instances we have encountered at this point.

Changes to any field in the structure "Description" screens could not be saved.

Changes to the name or description field in the "Bridge Alternative" screen could not be saved.

Changes to the name or description field in the "Superstructure" screen could not be saved.

Changes to the name or description field in the "Superstructure Alternative" screen can at times be saved but sometimes gives an error.

A Superstructure Definition can be copied and saved, but can't be deleted.

When you copy a structure, it appears that you can make changes and save them, but Superstructure Definitions still can't be deleted.

The error messages we get when we try to change things on the description tab are shown in the attached Word document.

If you need anything else in relation to the above problems, please let us know. Also, I had a question about an unrelated matter. We have noticed that the program now requires you to input span lengths on the

### ERROR Descriptions:

The error descriptions are shown below. The first two happen when we are trying to remove the structure definition and save the bridge. You get the first one on the first save attempt and the second one on the second save attempt. The third one is the message that we get when we make any of the changes as listed in the email and then try to save them.

set pagesize 0;
set linesize 200;
SELECT ROLE, OWNER, TABLE_NAME, PRIVILEGE FROM ROLE_TAB_PRIVS WHERE ROLE
LIKE 'VIRTIS%' ORDER BY ROLE, OWNER, TABLE_NAME, PRIVILEGE;
spool off;
```

FROM:mordoobadi DATE:6/3/2005 1:41:49 PM  
#3: I found what is causing the problem that you reported. Some values in the abw\_bridge\_ref\_line table have such a high precision that can not be handled in the software. It happened when bridge reference lines where adjusted in 5.3 migration. The problem is that the values in the database have more precision than the values read into recordset variables and when a record is updated the where clause that finds the record that is being updated cannot find that record. I prepared SQL scripts that trims off extra digits for values stored in the abw\_bridge\_ref\_line table. I have verified that the resolution works for BID 554 in your Oracle database

Please make a backup copy of your database before applying the scripts (just to be safe) then run the scripts and let me know if this resolves the problems.

FROM:mordoobadi DATE:6/3/2005 1:45:57 PM

### Description

FROM:jihnat DATE:6/15/2005 3:23:04 PM

Submitted via email by Chad Clancy. I don't think it says which version of Virtis:

We are currently doing a Virtis LFD rating for a continuous 4-span P/S girder bridge with plans dated October 2000. Virtis computes a HS20 shear rating of approximately 0.69. As it turns out, I get a shear inventory rating factor of 1.0 by my hand (i.e, spreadsheet calculations). These hand calcs use the shear and moment envelopes (maximums) rather than concurrent values. The rating factor of 1.0 leads me to believe that my calculations are in line with what was done in the design of the shear stirrups.

The PCA Manual (Section 9.3.11: Bulb Tee Design example) says that it is conservative to use the maximum values but when you look at the equations and the way that BRASS applies them, this is not the case. If you look at the BRASS output for the controlling point to me (see below), BRASS is using a concurrent live load shear of -1.11 kips (this is the live load shear concurrent with the maximum moment at this section). The problem is that when this very low live load shear is used to calculate  $V_i$ , you end up with a very low capacity,  $V_{ci}$ . While it appears that BRASS is attempting to conservatively use the concurrent shears, doing so ends up conservatively estimating the shear capacity as compared to what the capacity is when the maximum shears and moments are used.

The value for  $V_i$  (defined as the factored shear force at a section due to externally applied loads occurring simultaneously with  $M_{max}$ ) is computed by BRASS as:

$$V_i = V_{mu} - V_d$$

4/19/2016 3:18:43 PM

HRS AASHTO

1889

## Complete Issue Information

where  $V_{mu}$  is the total factored shear and BRASS uses the live load shear that is concurrent with the maximum moment at that section

$V_d$  is the factored dead load shear

The calculation of  $V_{ci}$  per eqn. 9-27 is directly related to  $V_i$  so a lower value of  $V_i$  results in a lower concrete shear capacity. As such, using a small value for the live load shear as calculated by the above equation reduces the capacity. Equation 9-27 appears to be taking into account the amount of flexural cracking at any given section. However a brief review of the above equations shows that it is not more conservative to use the simultaneous shear. It is difficult to ascertain which is the correct approach as there is no commentary to explain the rationale behind these equations.

To: Clancy, Chad M.  
Subject: S15 of 41064

Chad,

Upon the advice of the Virtis people, I increased the wheel advancement denominator to 300. This should give more accurate live load moments and it does affect our rating. Virtis now shows the lowest rating to occur in span 2, 19.602 m from the pier, or 50.749m from the bearing at ref line A. I have included the shear calculations for this point.

\*\*\*\* For Point 207.834 Node Point = 29

Dead plus pos live load shear = -36.28 kips  
Calculate shear capacity based on sign of total shear which is

## Complete Issue Information

kip  
fd = 705.84 psi Vi = 116427.1  
lbs  
Mmax = 1185.04 kip ft

### Shear Computations:

$$d \geq 0.8h = 75.276 \text{ in}$$

$$\begin{aligned} M_{cr} &= (I / Y_t (6 * \text{SQRT}(f'c) + f_{pe} - f_d)) / 12000 \quad (\text{AASHTO 9-28}) \\ &= 3656.07 \text{ kip ft} \end{aligned}$$

$$\begin{aligned} V_{ci} &= 0.6 * \text{SQRT}(f'c) b'd + V_d + V_i * M_{cr} / M_{max} \quad (\text{AASHTO 9-27}) \\ &= 186.3 \text{ kip} \end{aligned}$$

$$V_{ci}(\text{min}) = 1.7 * \text{SQRT}(f'c) b'd = 63.1 \text{ kip}$$

$$V_{ci} \geq V_{ci}(\text{min}) \Rightarrow V_{ci} = 186.3 \text{ kip}$$

Note:  $M_{max} < M_{cr}$ , so  $M_{cr}/M_{max}$  limited to 1.0 as discussed in "Design for Shear in Prestressed Concrete Bridge Members" in the PCI Journal (May-June 2001).

$$\begin{aligned} V_{cw} &= (3.5 * \text{SQRT}(f'c) + 0.3f_{pc}) * b'd + V_p \quad (\text{AASHTO 9-29}) \\ &= 217.8 \text{ kip} \end{aligned}$$

$$\begin{aligned} V_s &= A_v * f_{sy} * d / s = 57163.2 \text{ lbs} \quad (\text{AASHTO 9-29}) \\ V_s(\text{max}) &= 8 * \text{SQRT}(f'c) b'd = 296735.5 \text{ lbs} \end{aligned}$$

$$V_s \leq V_s(\text{max}) \Rightarrow V_s = 57163.2 \text{ lbs}$$

### Shear Summary:

$$V_c = \text{MIN}(V_{ci}, V_{cw}) = 186.3 \text{ kip} \quad (\text{AASHTO 9.20.2.1})$$

$$V_n = V_c + V_s = 243.5 \text{ kip}$$

$$V_u = \phi * V_n = 219.2 \text{ kips} \quad (\text{AASHTO 9-26})$$

### Notes:

=> The  $\text{SQRT}(f'c)$  term has been multiplied by the Lightweight Concrete

Factor per AASHTO 9.20.2.5(b).

=> The term  $b'd$  term has been multiplied by the % of Concrete Used in Vertical Shear.

517.482.7180 (F)

FROM: bgoodrich DATE: Tuesday, June 21, 2005 10:48:11 AM

Please attach the BBD file. Also, did you try increasing the wheel advancement denominator? If so, did you get a better rating?

FROM: bgoodrich DATE: Tuesday, June 21, 2005 2:58:43 PM

BBD file for version 5.2 is attached.

FROM: bgoodrich DATE: Tuesday, June 21, 2005 4:03:11 PM

Jeff Triezenberg increased the wheel advancement denominator, which resulted in a higher rating factor, but not enough to get the rating above 1.0.

FROM: bgoodrich DATE: Tuesday, June 21, 2005 4:03:26 PM

analyzed the BBD file for "S15 of 41064" with Virtis 5.2. The critical HS20 Inventory rating for shear was 0.81 (lane). This was with a wheel advancement denominator of 300. I changed it back to the default of 100 and received a critical HS20 Inventory rating for shear of 0.78 (lane). In the original issue description, Chad reported that the critical rating was 0.69, but I cannot reproduce this result with Virtis. I tried this with both the interior and exterior girders for the structure definition. Either way, the BRASS ratings are still not at or above 1.0 as was listed in the original design.

BRASS calculates the shear capacity per the current AASHTO spec, which indicates to use the concurrent shear in the Vci calculation. There is no override to use the maximum envelope shear instead. The BRASS engine does have another option for determining the shear capacity using the 1979 AASHTO specification, however, this method is not currently exposed in Virtis. We hope to have this implemented in the Virtis 5.4 release scheduled for this December.

I forwarded this issue to WYDOT.

FROM: bgoodrich DATE: Wednesday, July 20, 2005 10:20:40 AM

E-mail from C.J. Riley (WYDOT):

From: Charles Riley [mailto:Charles.Riley@dot.state.wy.us]

...BRASS conservatively follows the spec while using the maximum envelope shear provides a greater capacity and would therefore be less conservative. The Spec is very clear that the Vi term is the factored shear occurring concurrently with the maximum moment; this is what BRASS does. While his design assumptions may have used the maximum envelope shear, this is not spelled out anywhere in the spec. I don't think this necessitates a change to BRASS.

FROM: bgoodrich DATE: Wednesday, July 20, 2005 10:22:05 AM

E-mail from Jay Puckett:

I think that BRASS LFD uses the coincident moment and shear approach. This is per the specification. It is correct that using the envelope for the applied actions is conservative. A common error is to consider only the maximum shear with coincident moment, this is likely not critical. The usual critical case is max M- (most negative) with coincident shear. Note that the coincident moment with max shear is about one-half the value of the most critical moment. When the moment is critical, the shear does not drop off much. Without seeing the file, etc. I can not really comment more, however this max shear with coincident moment is a typical error that I have seen.

**Complete Issue Information**

FROM:bgoodrich DATE:Wednesday, July 20, 2005 10:22:44 AM  
 Based on the directive from WYDOT, no changes will be made to BRASS. However, I believe this issue may be related to Incident 6549, in which the concurrent shears may be incorrect in some cases. We should recheck this incident when 6549 is addressed.

FROM:bgoodrich DATE:Friday, November 11, 2005 12:39:23 PM  
 WYDOT assigned this issue to BRASS Problem Log 626. Chad indicated that he would provide more information.

### Description

FROM:jihnat DATE:6/15/2005 3:26:30 PM  
Submitted via email:

We have a steel girder bridge for which the bearing stiffeners are controlling the design. It appears as though Virtis is using factored loads to do the LFD ratings of these stiffeners. However, the LFD specifications on bearing design point back to the ASD allowables. The Rating Manual shows allowables (for service loads) of  $0.8F_y$  and  $0.9F_y$  for inventory and operating ratings, respectively.

Typically when the LFD spec does not have a revised equation or allowable stress for LFD we use the ASD equations with service loads. Please look into this and let me know if you concur with this assessment.

## Description

FROM:pjensen DATE:Monday, June 20, 2005 6:15:59 PM

I was trying to run the upgrade wizard on two different Oracle databases and got different results.

Oracle 10.1.0.4 - the wizard hung (after it validated the the data structure) it never returned with a script to run for update. the database was 5.3.0. I was able the create/update/delete bridges. I was able the run the script to migrate it forward. I did not recieve any errors from the script.

Oracle 9.2.0.4 - the wizard select the correct script and ran to completion.

With both migrated databases, I was able to create/update/delete bridges from the inventory.

We have a structure that was copied from a previous structure. The user worked through the bridge and updated the span lengths etc.. If you look at Structure Definition 2, it has a span length of 56.17 feet. On the Structure window for Structure 2, it has the same span length. Both of these values were entered. If you go to Structure Alternative 1 for Structure 2, it shows a span length of 36.17. On this window, it is greyed out and can't be changed. This can't be correct. The bbd is attached.

**Complete Issue Information**

FROM:kkennelly DATE:6/30/2005 8:22:29 AM

The data for your structure def is ok. There is a bug in what this window is displaying, it will not affect your data or analysis.

Notes for programmer:

RefreshStructDefsCB() is looping through the list of structure defs and the ref line for the last structure def is the ref line being stored as a member variable even though it does not belong to the structure def assigned to the superstruct alt. When BuildGrid() is called, the correct reference line is used to populate the grid. At the end of AttachData(), RefreshGrid() is called again for read only status and the grid gets refreshed with the wrong reference line data.

FROM:xli DATE:7/1/2005 9:24:08 AM

Fixed.

When refresh grid, call RefreshStructDefsCB() instead of RefreshGrid() , so that correct reference is used.

## Description

FROM:jhnat DATE:6/27/2005 10:14:29 AM  
Received via email:

I am attaching the bbd file (span42nb\_43nb.bbd) for your review. This is the 2-span bridge floor stringer system model. Stringer is simply supported for each span. After I ran the analysis, all stringers went through fine. But when it's time to analyze floor beams, I got the following messages:

Unable to convert steel beam to BRASS cross sections!  
Error generating BRASS cross section commands!  
Unable to get cross section dimensions!  
A slab must be defined at all locations above a haunch!  
Unable to retrieve concrete density of slab concrete!  
Error computing haunch selfload!

I reviewed the framing plan detail and structural cross section detail and didn't find any error. What could cause above problems?

**Description**

FROM:tarmbrecht DATE:Wednesday, June 29, 2005 2:45:52 PM

I'd like to see global preferences set up for a couple of situations

1) Currently the user can select "skip operating rating based on serviceability" form the POI properties window. I think most raters will want to use this option globally because they may not assign points of interest to a particular member and they may not know which point controls the rating, let alonw which

4/19/2016 3:18:45 PM

HRS AASHTO

1903

**Complete Issue Information**

member. This check box should apply to entire bridges, not POI.

2) I greatly appreciate the option (in 5.3.1) to not limit Mcr/Mmax to 1 for prestressed bridges. Again, I would like to see that this option apply to the entire bridge as a global preference instead of one member (and not making it so difficult to find as it is located in the engine tab/properties button for one member alternative). Also, I would prefer that the user have the option to set the default instead of making us have to select this option each time. As it stands right now, we'll have to go into each of our prestressed bridges (future or currently in the database), and select this option for each member.

FROM:jduray DATE:6/30/2005 8:23:47 AM

The UI TAG should review this and determine how we should address these two items and perhaps identify others that should have global values. I think we should consider adding an engine-data tab to the system defaults where the user can specify the engine-data default values. These values would be the default values for the new member alt, poi and analysis event engine data.

I know that BRASS has a limitation of 40 x-section ranges in schedule base – but when I have only entered 20 POI's and have set the engine properties to "User Defined Points Only" – why should the analysis terminate and give me a message that I have exceeded 40?? .bbd attached

FROM:kkennelly DATE:7/13/2005 2:33:03 PM

The error message that you receive states that the number of cross section ranges has exceeded 40. Entering 20 poi's doesn't mean you will get only 21 cross section ranges. Points of interest in Virtis means you will get rating factors at those points, not that you are defining cross section ranges based on these points.

I'm pretty sure BRASS is currently being changed to allow more cross section ranges.

## Description

FROM:dteal DATE:Tuesday, July 12, 2005 11:33:24 AM  
Attached is a bbd for a PS structure (using the last superstructure definition.

When a design review is done on this PS structure, the Spec. checker on stage 1 is failing 5.7.3.3.1 (Ductility). This should never be checked for stage 1 (non-composite) according to Puckett and Barkers book, page 449 section 7.7.4.

### Description

FROM:jihnath DATE:7/13/2005 10:22:47 AM

In BID 14, get the following error when trying to copy the Stringer Group Def:

Copy of Stringer Group Def failed!

10:16:57 AM - Line 174 in source file .\UiBWSTreeStringerGroupDefLabelItem.cpp.

Invalid object id assigned.

10:16:57 AM - Line 261 in source file .\DoStringerGroupDefTemplateList.cpp.

Works OK in BID 13, though.

FROM:jihnath DATE:3/6/2006 3:42:16 PM

If I create a new one I can copy it.

FROM:kkennelly DATE:5/10/2006 3:29:23 PM

I've fixed this so that you can copy the Stringer Group Def within the structure def in BID14. This problem only exists in BID14 because that Stringer Group Def has a Stringer Group Def Template. BID13 doesn't have a stringer group def template.

You will still get the same error if you try to copy the Stringer Group Def from BID14 to another structure def. I cannot fix that problem because that would require creating stringer mbrs in the structure def being copied to and we can't do that. I think we should not allow Stringer Group Def's to

4/19/2016 3:18:47 PM

HRS AASHTO

1910

**Complete Issue Information**

be copied to different structure definitions. The Stringer Group Def contains references to floorbeams and stringer mbrs that only pertain to the structure def in which it was created.

If you copy the Stringer Group Def in BID13 to BID14, the copy will work but when you open the window in the UI you will get error messages that the floorbeams aren't right.

FROM:jihnmat DATE:5/24/2006 7:19:56 AM  
The Copy/Paste is now restricted to the same structure def.  
Fixed in 5.5.0

REPORTED BY:Dean Teal

### DESCRIPTION:

We need a way to update the path to multi-media links when the project is completed and the plans/documentation is archived to a different drive/server/path.

Here is the scenario in KS. All plans/documentation/ect. Get put in a working directory. After the project is finalized these plans/documents/ect. Get moved to an achieved directory. Our multi-media link fails once this move happens. We need a way to update these links without too much pain.

REPORTED BY:Dean Teal

DESCRIPTION:When doing a prestressed concrete structure and filling in the Member Alt. Description GUI – In the lower left corner there is two data input fields for the Top & Bottom of beam Crack Control Parameter. Virtis Opis help tells the user to enter the required information with no mention of the Z factor.

The BRASS engine never uses a crack control parameter for PS beams (not that I know of anyway). I know that data in the GUI is not engine specific. In this case we are using BRASS LFD and LRFD. If you look at the engine related help for either engine you will NOT be told that BRASS doesn't use the

4/19/2016 3:18:48 PM

HRS AASHTO

1915

## Complete Issue Information

"Z" factor.

Shouldn't BRASS be telling us that in the engine help?

### COMMENTS:

FROM:dteal DATE:Wednesday, August 10, 2005 11:33:53 AM

I checked with LEAP, there PS program doesn't use the crack control parameters either. Does anybody? Does PennDot?

FROM:smample DATE:Thursday, August 11, 2005 11:56:38 AM

The various analysis engines have and are being built around the current and future design and load rating specifications, without regards to the actual practices of the individual state transportation organizations. The engines are not flexible enough, to allow variations from these specifications. A prime example of this lack in the current engines is the inability to control tension stresses in prestressed concrete girders and thereby insure that prestressed concrete girders are not subject to concrete cracking at the operating level. It is for this reason that Idaho still uses the old BARS program in issuing over legal truck permits

FROM:bgoodrich DATE:Friday, August 12, 2005 12:55:08 AM

BRASS LFD does not support input of the Crack Control Parameter, so the engine help should be updated accordingly. BRASS LRFD does support the beam Crack Control Parameter, however, only the value for the bottom of the beam is exported. I think the top of beam field was added after the original export work was done. Both the top and bottom Crack Control Parameters should be exported.

The output files will not contain any beam crack control checks because Opis does not allow mild reinforcement to be defined in the prestress beam itself. We might think about adding this information to the BRASS LRFD engine help.

FROM:bgoodrich DATE:Friday, November 11, 2005 5:09:30 PM

The crack control section of the LRFD specification has been reworked and the Z parameter is no longer needed. For all we know, the value could be brought back, so I don't think the fields should be removed. However, we should update the helps accordingly.

FROM:bgoodrich DATE:Thursday, March 02, 2006 7:28:56 PM

The engine help files have all been updated. Fixed for version 5.4.

FROM:dteal DATE:Tuesday, March 07, 2006 10:33:44 AM

The BRASS help files have been updated to reflect the 3rd edition, but does not include the 3rd edition w/'05 interims. I think we are supposed to be checking Opis against the '05 interims. If that's the case I think we should leave this unresolved until those interims are implemented.

FROM:kkennelly DATE:8/15/2006 7:39:03 AM

Assigned back to Brian so he can evaluate Dean's comments on 3/7/06.

FROM:bgoodrich DATE:Tuesday, September 05, 2006 1:39:10 PM

The 2005 interims were implemented for the BRASS LRFD engine released with Opis 5.4. The

### Description

FROM:dteal DATE:Saturday, August 13, 2005 9:58:47 AM  
REPORTED BY:Dean Teal

DESCRIPTION:On the analysis tab of the superstructure definition window we have the ability to choose if the effective slab thickness is to be included in a rating or in a design. We overlooked one item that should also be here.

We should have the ability to include/exclude the Future Wearing Surface (FWS) from both design and rating just like the effective depth is done.

When a new structure is designed it will more than likely be designed to carry a FWS. But when it comes to rating that new structure it is analyzed "as built". The FWS does not get applied in most cases for many years. Right now the rating engineer has to check out the structure and navigate to the structure typical section/Wearing Surface tab and under load case select "Not Assigned".

Our work around for this involves having 2 superstructure definitions for every new structure that was designed to carry a FWS. The first structure definition is the "As Designed" which has the FWS included. The second Structure Definition is the "As Built/As Rated" with the FWS not assigned. At some point in the structures future this wearing surface will be applied and at that point the As Rated structure definition will be updated.

Do you know of any other work around for this problem? When rating our existing inventory this is never a problem – but when doing the initial ratings for new structures it is a big headache.

### COMMENTS:

FROM:jduray DATE:12/21/2006 8:59:10 AM  
Need and estimate of the cost for the TF before we begin dev.

FROM:jduray DATE:1/19/2007 3:56:25 PM  
TF authorized us to implement this enhancement.

FROM:kkennelly DATE:1/22/2007 8:14:09 AM  
This enhancement involves the following:  
- Add "Wearing Surface" groupbox to Superstructure Def: Analysis tab.  
- Group box will contain 2 checkboxes, "Consider wearing surface for rating", "... for design"  
- Default is for both checkboxes to be checked.  
- Migration will set both checkboxes to checked for existing data

Mehrdad:  
1. Add db, de, dm, do for 2 new attributes on the Superstructure Definition: Analysis tab (for all superstructure definition types):  
- Consider wearing surface for rating  
- Consider wearing surface for design

2. Migration to set both attributes to TRUE for existing data.

May:  
3. Add "Wearing Surface" group box to the Superstructure Definition: Analysis tab (for all superstructure definition types) with the 2 checkboxes.

Herman:  
4. Add attributes to Report Tool.  
5. Implement attributes in export to VirtisStdEngine, BRASS LFD, BRASS LRFD and Madero.  
6. Add to Virtis Help.

FROM:mordoobadi DATE:2/20/2007 9:26:34 AM  
New attributes added to the database. Db, De, Dm, and domain classes updated. Everything is in sourcesafe.

FROM:xli DATE:2/21/2007 11:26:48 AM  
#3 is done

FROM:xli DATE:2/21/2007 2:22:47 PM  
Mehrdad:  
Please make both check boxes default to be checked.

FROM:mordoobadi DATE:2/21/2007 4:43:56 PM  
Fixed. Affected project abognrl.  
Also updated the sample database to have both flags checked for all structure defs.

May, please get abognrl.dll and verify that it works. Then assign to Herman.

4/19/2016 3:18:48 PM

HRS AASHTO

1920

**Complete Issue Information**

FROM:xli DATE:2/22/2007 1:00:45 PM  
Verified.

FROM:hlee DATE:2/22/2007 2:22:55 PM  
The Analysis tab in the Superstructure Definition window is too big for the view.

FROM:hlee DATE:2/26/2007 9:27:20 AM  
#6 (Add to Virtis Help) is done.  
This enhancement should be available to system superstructure definition only. Truss system should also be included.

FROM:hlee DATE:2/26/2007 10:38:00 AM  
#4 (Add attributes to Report Tool) is done. Attached AddAttributes.SQL to be used to populate the 5.6 database. Also updated all installed system superstructure definition abr files.

FROM:hlee DATE:3/2/2007 2:57:21 PM  
Finished implementation for VirtisStdEngine, BRASS LFD, BRASS LRFD, MADERO, and VirtisTruss.

TO DO:  
May - Remove attributes from GUI line superstructure definition windows. Fix the Superstructure Definition window (See comment on 2/22).  
Mehrdad - Remove attributes from database, db, de, dm, and do line superstructure definitions. Populate Report Tool attributes (See comment on 2/26).

May, please assign to Mehrdad after you are done.

FROM:xli DATE:3/6/2007 1:49:28 PM  
Attributes are removed from GUI line superstructure definition windows. Super def window is fixed.

FROM:mordoobadi DATE:3/6/2007 3:19:03 PM  
Fixed for 5.6 Beta 2.

FROM:gbhanushali DATE:3/15/2007 11:58:39 AM  
Alpha tested Beta 2.

FROM:dteal DATE:Tuesday, June 19, 2007 1:53:48 PM  
Accepted 5.6 beta 3

## Description

FROM:dhorton DATE:Monday, August 15, 2005 3:41:23 PM  
REPORTED BY: A. Zickler

DESCRIPTION: User suggested that all mandatory items be color coded or marked in some manner in order to help new and existing users make sure they input all necessary data.

COMMENTS: This should reduce the number of errors and trials that users, especially novice, run into when trying to get structures input. It would also be very beneficial for imported files where all of the necessary data may not be in the import file (such as stiffeners for steel girders). we are using 5.2, but this applies to all versions.

This proposed enhancement is directly related to the Override data color code enhancement.

FROM:dhorton DATE:Monday, August 15, 2005 3:43:15 PM

FROM:jduray DATE:8/16/2005 9:22:04 AM

We started to do this (the blue italic is our attempt at do this) and realized each analysis engine and each specification has different requirements for data. We have attempted to address this issue by providing the engine-related help for each help topic. That way the engine developer can provide a help file that informs the user of the data required.

4/19/2016 3:18:49 PM

HRS AASHTO

1922

**Complete Issue Information**

A more sophisticated solution would be to enhance the "blue italic" approach and drive the display with an engine-related resource file that controls the appearance of certain key static text labels.

**Description**

FROM:dhorton DATE:Monday, August 15, 2005 3:52:55 PM  
REPORTED BY: A. Zickler

DESCRIPTION: During analysis, it is very difficult to determine what values are default and which are overrides. This is especially a problem when reviewing or using input done by another user. Color coding the overrides would make them obvious to the user.

COMMENTS: Although very difficult to program, it would be very beneficial to have some sort of marker attached to the output as well. This is separate from this somewhat, but along the same general line of thinking.

This proposed enhancement is directly related to the Mandatory Input Color coding.

### Description

FROM:awaheed DATE:Thursday, August 18, 2005 12:22:55 PM

Live Load moments tables in the Results Graph window do not specify if the column is for truck or lane loading. One has to turn truck and lane on and off to figure it out as both column headings are same, e.g., "MLL(+)-s1 H20-44D."

FROM:jihnmat DATE:7/24/2006 1:43:38 PM

6947 is a duplicate of this incident.

The problem was that only the first letter of the vehicle type was used in the label, so "Design Truck" and "Design Lane" were indistinguishable.

Changed the code to use the entire vehicle type name.

Incident specified Moment Live Load, but also fixed Shear Live Load, Axial Live Load and Deflection Live Load.

Fixed in version 5.5.0 (Beta 3).

**Complete Issue Information**

FROM:awaheed DATE:Thursday, August 18, 2005 1:14:40 PM

When I tried to save an imported bridge after editing county name, I got an error (see attached document).

FROM:awaheed DATE:Thursday, August 18, 2005 1:25:14 PM

This error seems to be consistent with some of the older bridges in our database.

FROM: Mehrdad Ordoobadi DATE: 9/24/2009 8:38:26 AM Eastern Daylight Time

There is not enough information in this incident to reproduce the problem.

If you still have these kinds of issues, could you please provide XML export of the bridges that you have problem with.

FROM: Jim Duray DATE: 10/6/2009 1:36:37 PM Eastern Daylight Time

Requested info from the users but no response.

Closing this incident. If the problem occurs again we can open another incident.

## Complete Issue Information

These issues were discovered and suggested during the Virtis training for Virginia DOT in August 2005.

Example STL1:

Page 6: f'c shown as 4 ksi in screen shot but 4.5 ksi shown in Material Properties description at the beginning of the example.

Pages 13-16: Move Bridge Alternative screen shots to end of example so we don't have to say to skip these pages, which are not discussed until the second day of training.

Add reference lines to the schematics in the handouts. (JDuray - I don't think this is necessary)

Page 40: The Start Distance and Length columns show a different number of digits past the decimal. They should be consistent because we ask the users to be consistent with their input to avoid tolerance problems.

Page 48: The values shown in the End Distance columns (147.59 and 156.16) are different from those calculated during input, which are 147.58 and 156.17, respectively.

Page 33: The table lists a weight for SIP forms of 0.078 klf for the exterior girder for Example "c" and "d". This should be 0.039 klf.

The LFD ratings did not match the pages in the manual so they should be checked.

Example PS1:

Page 25: The Multi-Lane deflection distribution factor (Standard) computed as 0.9, but manual shows 1.0.

FROM:jduray DATE:8/19/2005 10:22:53 AM

To do this work we should get he bridge Jason input a few months ago and start with that data.

FROM:xli DATE:9/6/2005 9:07:37 AM

All above issues are fixed except the last one. The 1.0 is computed atomatically according to the typical cross section.

### Description

FROM:tarmbrecht DATE:Friday, August 26, 2005 3:44:11 PM  
REPORTED BY:

#### DESCRIPTION:

One of our engineers is working on a built up plate girder with double angle bearing stiffeners on each side of the web. The bearing stiffeners are full depth of the section, and there is a fill plate the thickness of the flange angles between the web and the stiffener angles on each side. It seems like the section to check as a column for AASHTO 10.54.1.1 would include the stiffener angles, web, and the fill plates. Also, in this case the fill plate sandwiched a section of the web that was larger than  $18 * tw$ . We feel the entire section of the web between the fill plates to be part of the column under consideration. What is the Virtis and/or BRASS policy governing this? Could the fill plates and/or full web section between the fill plates be considered? See attached file for reference.

**Complete Issue Information**

COMMENTS:

FROM:kkennelly DATE:10/6/2005 1:49:42 PM  
This would be an enhancement to both Virtis and BRASS LFD.

- 1. Virtis does not currently have a way for user to input a fill plate between the bearing stiffeners and web. It would be an enhancement to add that data to Virtis.
- 2. BRASS LFD does not have an input for the spacing between bearing stiffeners. It would be an enhancement to add that input and then to consider it in the computations in BRASS.

### Description

FROM:jihnath DATE:9/1/2005 12:18:07 PM  
From the website or from Virtis? What exactly is happening?

FROM:jduray DATE:9/2/2005 2:04:09 PM  
This was submitted for Doug Horton.  
From Virtis. User is notified that s RoboHelp dll is missing, after clicking Ok the help file is opened and seems to work properly.

FROM:jihnath DATE:9/9/2005 1:33:00 PM  
I think the file is roboex32.dll. This isn't a file that we install (or ever have installed). On my system it's in the Windows\System32 directory.  
Krisha, any idea why the FAQ Help wants this file but the regular Help doesn't?

FROM:kkennelly DATE:9/12/2005 2:52:20 PM  
New FAQ help file compiled that should now work without issuing error message. Fixed for 5.4

FROM:jihnath DATE:9/13/2005 7:26:18 AM  
The latest FAQ help still complains if I remove RoboEx32.dll from my Windows\System32 directory.

FROM:kkennelly DATE:9/13/2005 10:42:49 AM  
Latest files in sourcesafe open ok without Roboex32.dll. (RoboHelp isn't the most stable product so I had to remove the links to the internet pages to get this version of the help to work. Doesn't seem like opening the internet depends on roboex32.dll but I kept getting error about technical error in help file (1024) when I tried to access the internet link.)

FROM:gcolgrove DATE:Friday, September 02, 2005 8:13:55 AM  
REPORTED BY: Hiram Salls, VTrans Structures, via George W. Colgrove III, VTrans Structures

DESCRIPTION: Problem with Bearing Stiffeners with no delete privilege.

COMMENTS: Hiram did not have delete privileges under Bridge Description. This was preventing him from deleting part of the bridge - as it is supposed to do. However in his attempt to delete bearing stiffeners from the Bearing Stiffeners Location tree under support 1 and 2, more would appear in the tree. If he had 2, and deleted them, when he opened the window again, there would be 4, then 6 then 8 then 10 and so on. So not only was it not deleting the stiffeners (as it should) it was adding more by an increment of two and storing them. I changed his privileges to be able to delete parts of bridges, thus solving the problem for him. But I thought you should know of this behavior never the less.

FROM:gcolgrove DATE:Friday, September 02, 2005 8:13:55 AM

FROM:jihnata DATE:12/1/2005 8:09:38 AM  
Fixed for version 5.4.0. (This window requires Delete privileges as well as Write privileges to work correctly, or else it will be readonly.)

## Complete Issue Information

### Description

FROM:dteal DATE:Friday, September 09, 2005 9:57:54 AM  
REPORTED BY:Dean Teal

DESCRIPTION:When (what version) will the LRFD 2005 Interim Revisions be incorporated?  
Some, like AASHTO 5.7.3.4 (crack control) will require both GUI and engine changes.

FROM:jduray DATE:9/14/2005 1:25:26 PM  
Brian - after you respond please assign to Krisha for her to evaluate the UI changes.

FROM:bgoodrich DATE:Friday, November 11, 2005 9:45:26 AM  
We are planning on having the interim changes implemented for the upcoming BRASS-GIRDER (LRFD) release that will be included in Opis 5.4. Dean is correct about the crack control check requiring changes. The transverse spacing of the rebar in each section will be required now. Within the engine, we plan to calculate the spacing based on existing information and also provide a user override. The correct spacing may be difficult to determine because the rebar may not be evenly spaced, especially in the deck, which is why a user-defined spacing will be provided. The crack control check also requires a different modulus of rupture than other places in the spec. Other changes include two AASHTO prestress loss methods: approximate and refined. It appears that the approximate loss equations are only applicable to precast, pretensioned members.

FROM:dteal DATE:Tuesday, November 15, 2005 10:44:45 AM  
Regarding the PS loss methods - KDOT has made a policy decision on this - We use the approximate method for 99% of our PS structures. The only time we could make use of the refined method is for RC Post Tensioned slabs. We do have a handful of them through out the state. If we did any segmental, that would require the refined method - but we don't do any of those.

FROM:kkennelly DATE:12/2/2005 3:25:28 PM  
We've evaluated the entire Virtis/Opis system for changes required to bring it up to the current specs. We're waiting for feedback from Task Force on what to implement.

FROM:kkennelly DATE:12/13/2005 2:42:10 PM  
Summary of changes to update to current specs is in attached file. Task Force has authorized us to update to LRFD 3rd Edition, 2005 interims.

- |                                                                   |                      |

Jim to send attached "2005 Spec Update Mockups.pdf" to Superstructure TAG and Brian Goodrich for review.

Mehrdad - db, dm, de, do changes for new attributes to be added after the mockups are reviewed.

Somebody(?) to implement remaining item in number 2 above, item 3, item 5 and item 6 once attributes are added.

FROM:dteal DATE:Wednesday, March 01, 2006 10:41:04 AM

Is this all to be included in 5.4 - In beta 5 we don't have the new crack control exposure factor??

FROM:bgoodrich DATE:Wednesday, March 15, 2006 12:27:55 PM

In addition to the exposure factor, there are now two AASHTO loss methods: Approximate and Refined. For the 5.4 release, the exposure factor will be defaulted to 1.0 and the AASHTO loss method will be defaulted to the approximate method.

FROM:dteal DATE:Thursday, March 16, 2006 11:43:54 AM

Is the GUI going add the exposure factor so agencies in cold climates that use a lot of deicing salts can code in the more extreme exposure condition for corrosion?

FROM:jduray DATE:3/16/2006 12:35:52 PM

This enhancement was approved by the TF during a conference call on Dec. 12th. It is scheduled to be included in the June release.

FROM:jduray DATE:Monday, March 27, 2006 10:05:01 AM

Some of the changes accidentally made it into Beta 5 and 6. They have been removed from Beta 7 and the 5.4 release. They will be included in the alpha, beta and release builds for 5.5.

FROM:dteal DATE:Monday, March 27, 2006 12:41:33 PM

Can you itimize/list what got removed?

FROM:dteal DATE:Wednesday, March 29, 2006 10:57:52 AM

FROM:dteal DATE:Wednesday, March 29, 2006 10:57:52 AM

I am somewhat confused with pages 3, 4 & 5 of the GUI Mockups that you have attached.

I am referencing the placement of the Crack Control Parameter (Z) and the Exposure Factor.

Page 3: Member name: gline slab

GUI has Deck Z factor and Deck exposure factor. Slabs don't have decks. Slabs hve no flanges, they are slabs with a wearing surface (sacrificial wear or separate wearing surface). Girders have flanges and decks.

When it comes to a girder line slab – both Z factors and exposure factors should be on the same GUI like on page 5.

Page 4: Now we are correctly calling out the Z factor and exposure factor at the bottom of the slab

4/19/2016 3:18:55 PM

HRS AASHTO

1950

**Complete Issue Information**

instead of the deck. But – we are missing the top of the slab (being this is a gline GUI).

Page 5: This GUI is for a PS beam. But this is exactly the way it “should be” displayed for a slab girder line. The only change required to rename Top of beam: and Bottom of beam to Top and Bottom of SLAB.

Please review VI #5382, it is very related

FROM:kkennelly DATE:6/13/2006 8:22:03 AM  
Opis UI has been modified for 5.5 for the items listed on 12/13/05.

Note: Brian's comments on March 15, 2006. Virtis/Opis has always used the AASHTO Refined Method. Selecting "AASHTO" as the loss method on the Prestress Properties window means the user is selecting the AASHTO Refined Method.

Dean's comments on March 29,2006 are a duplicate of incident 5382.

### Description

FROM:hlee DATE:9/12/2005 12:45:13 PM  
Submitted on behalf of Ken Teng, RQAW Corp.

Attached error message and truck files.

Run-time error when total axle loads exceeds 2000 kips in input (999.999 kips/wheel line in truck.lby).

FROM:hlee DATE:9/12/2005 4:16:05 PM  
Attached another truck file (127.92' Long truck.xml) with total axle loads exceeds 2000 kips in input, but no run-time error for this truck.

FROM:bgoodrich DATE:Friday, November 11, 2005 12:43:46 PM  
The BRASS truck library is a fixed-format file. The axle weight is written to an f7.3 format, so the maximum wheel line weight is 999.999 kips. The solution may be to bypass the truck library all together by generating the SPECIAL-TRUCK and SPECIAL-LANE commands. This needs to be discussed by the development team.

FROM:bgoodrich DATE:Friday, December 09, 2005 11:35:58 AM  
A workaround would be to separate the 2000 kip axle into two axles in the library and position them at the same location.

FROM:bgoodrich DATE:Thursday, January 05, 2006 12:16:42 PM  
The export was revised to no longer transfer vehicles to BRASS using the truck library. The SPECIAL-TRUCK and SPECIAL-LANE commands are now used. Wheel line weights larger than 999.999 kips are now supported. Fixed for version 5.4.

### Description

FROM:awaheed DATE:Monday, September 12, 2005 3:56:36 PM

I can not figure out how to have two different PS strands in a beam. I have come across a bridge which has different pre-tensioned and post-tensioned strands used. Both strands have different diameters. I can not assign different strands in the strand layout screen.

FROM:jduray DATE:9/14/2005 1:21:32 PM

Correct, P/S beam definition is limited to one strand type/material per beam. If you feel this is a common situation an enhancement incident can be added to the list for the User Group to consider in the balloting process.

FROM:awaheed DATE:Sunday, September 18, 2005 10:34:40 PM

It is common practice in several bridges in Ohio. Other states should be polled too.

REPORTED BY:

DESCRIPTION:

COMMENTS:

FROM:pjensen DATE:Monday, September 19, 2005 11:30:49 AM  
This is an enhancement request for the product.

Since the NSG project is becoming a reality, there is a need for a spec checker for the FE engine (superstructures). This would be a good time to begin this process since truss is expected to use the same FE engine for analysis. This would also eliminate the need for the use of a girder line analysis engine for NSG and when the design or rating engineer wants to use a "more refined" analysis.

**Description**

FROM:gcolgrove DATE:Monday, September 19, 2005 11:41:12 AM  
 REPORTED BY: George Colgrove

DESCRIPTION: 5.8.3.3 Vc Calculation going to zero due to tensile axial load - even when the axial load is zero

**COMMENTS:**

I've been having a problem with the spec check for shear resistance at the end of the beam. It reports that since there is a tensile axial load in the beam, the shear resistance of the concrete is zero. Since there should not be any axial loads in the structure, there seems to be an error in the program. I suspect this error could come about due to very small values that developed in the axial load holders or that the program sees a "positive" zero as tension. One end had negative zeros (indicating very small numbers are being calculated).

See Documents

FROM:bgoodrich DATE:Friday, November 11, 2005 12:56:50 PM  
 BRASS should consider a tolerance on axial force with respect to "zero" tension. I have forwarded this issue to WYDOT for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Monday, November 14, 2005 9:00:52 PM  
 WYDOT assigned this issue to BRASS Problem Log 640. BRASS-GIRDER(LRFD) was corrected to use a tensile axial force tolerance. Fixed for Opis version 5.4.

 REPORTED BY: George Colgrove

DESCRIPTION: Prestress Design with Various strand pulls

**COMMENTS:**

In checking a conspan run, I've noticed that there is no way to use various strand pulls in the section. ConSpan will allow for different percent pull forces for different strands. For example, I want the top two strands to be pulled only at a tight 4 to 5 kips just enough to hang the reinforcing on. I have a row roughly 5 inched up from the bottom I want to be pulled at 25% with all the strands at the bottom layer being pulled at the specified 75%. Conspan allows for this and it makes a big difference in the camber calculations. V/O only allows for a single strand type to be used throughout the section. This should be modified to allow for multiple strand pull percentages.

In the attached bbd, using the second superstructure Def. "Schedule Based Input", selecting the Analysis Tab I have Un-checked Consider effective slab thickness for rating. Clicked OK and saved the changes. I went backing to the analysis tab and verified that the changes remained (unchecked). Then I exited the structure and reopened it. The effective slab thickness for rating was now checked again. I did this several times. It appears that I can't save this structure with this Un-checked. Is there a reason for this?

FROM:jihnat DATE:10/7/2005 10:16:12 AM

The GUI appears to be updating the Domain, but this doesn't get saved to the db when the BWS is saved. (Can reproduce in our TB1 and TB2 also)

FROM:mordoobadi DATE:10/14/2005 4:03:47 PM

This happens for both controls:

- (1) Consider effective slab thickness for rating
- (2) Consider effective slab thickness for rating

FROM:mordoobadi DATE:10/14/2005 4:14:46 PM

After saving to the database correct values go to the database.

I think somewhere in the domain we are specifically setting those values to TRUE when bridge is opened.

FROM:mordoobadi DATE:10/14/2005 4:43:32 PM

The code in DoSuperStructDef.cpp (create function) sets these values every time a bridge is created or retrieved.

FROM:mordoobadi DATE:10/14/2005 4:50:09 PM

Fixed in 5.4 Alpha 3.

FROM:dteal DATE:Wednesday, October 26, 2005 10:20:25 AM

Will I have to go back and check/verify every structure in our database or will the database migration do anything for me?

FROM:mordoobadi DATE:11/2/2005 8:05:15 AM

The code had a bug that caused this problem. It set the check-boxes to checked every time a bridge was retrieved from the database. So if you opened a bridge and saved it again, the values that go to the database may not be right. The migration will not know what's the right settings. Unfortunately, you should go back and check/verify the settings for every super structure definition after you get the next release.

FROM:dteal DATE:Tuesday, November 08, 2005 7:57:56 AM

This is an item that needs to be brought to the attention of all the users – not just buried in the release notes. I have about 1000 structures in my database that may be effected by this and will have to be verified.

Copy of email from Jim - decide to post the attached pdf of a technical note on the support website: No need to email user, just post on the website.

Dean

Attached is a technical note we are planning to post on the web site. We will also add a note on the Home page about this. Perhaps we should also send an email to all users alerting them of this problem??? We usually do not send an email to all users for issues such as this.

Jim

COMMENTS:

FROM:dteal DATE:Friday, September 30, 2005 3:40:07 PM

I was checking the .log file for LRFD Reinf. Development Length Calcs. The top of the page states that it is using the Design Specs from 1998 with 2003 interims. This would be from the Second Edition.

Are we or are we not using the 2004 Third Edition?

Using the second edition has a large penalty when it comes to calculating modifications to the basic development length. Specifically in the second edition, 5.11.2.1.2 (second item)  
"for bars with a cover of db or less or with a clear spacing of 2db or less, mult. By 2"  
This was removed in the third edition.

FROM:kkennelly DATE:12/13/2005 1:41:45 PM

Task Force directed us to update Virtis/Opis to 3rd edition with 2005 interims.  
Fixed for 5.4.0

DESCRIPTION:

COMMENTS:

FROM:dteal DATE:Friday, September 30, 2005 3:57:34 PM  
In the attached bbd, look at the reinforcement schedule, the end distance for the 4th and 6th lines. They are zero. I think they should be 45 ft not zero.

What we have here is a 45' single span. On the 4th line we start 13.458' left of abutment #2 (support #2) and go 13.458'. Shouldn't the end distance be 45 feet and not zero??

4/19/2016 3:18:58 PM

HRS AASHTO

1963

**Complete Issue Information**

Same on the sixth line?

FROM:kkennelly DATE:10/7/2005 8:34:46 AM

Since the bars are input as referenced from Support 2, the end distance displayed is referenced from that same support. Therefore, they end 0' from support 2. If they were input as being referenced from Support 1 with a start distance of 31.5417', then the end distance displayed would be 45' from support 1.

### Description

FROM:dteal DATE:Thursday, October 06, 2005 2:05:27 PM  
REPORTED BY:

DESCRIPTION:

COMMENTS:

In Library-Vehicle, Truck Tab we can enter the wheel gage in feet. I can not find it anyplace where it tells the user that no matter what value you enter, BRASS will use 6' (AASHTO standard gage).

FROM:bgoodrich DATE:Friday, December 09, 2005 11:42:06 AM

I'm not sure if the request is to simply add a description to the help. I doubt it. This sounds more like a BRASS-LRFD issue with the distribution factor calculations. Would you please clarify your request?

FROM:dteal DATE:Friday, December 09, 2005 12:14:30 PM

The whole point here is that Virtis has a field in the GUI to allow the user to enter a wheel gage. The user is lead to believe that the value they entered for wheel gage is going to be used. The user is never told that no matter what value they enter in this field - it is never used. They are never told that this GUI is for Standard Gage only. We need to populate this field with 6' and grayed it out. I'm not to sure why this got assigned to BRASS? I thought it was a GUI issue?

**Complete Issue Information**

FROM:jihnat DATE:12/9/2005 12:29:58 PM  
This incident is probably a moot point after 6832 is completed.

FROM:bgoodrich DATE:Monday, February 13, 2006 11:49:24 AM  
I am assigning this to Joe as this is not a BRASS issue. Also, FYI - I cannot view Incident 6832.

FROM:jihnat DATE:2/13/2006 12:48:18 PM  
6832 was to enforce 6' in the GUI for standard gage vehicles. Use NSG for anything else.

Hello Michael Baker,

I asked our Virtis contact person, Binh Ha, to forward this to you.

I work in IT and we recently began having problems running Virtis/Opis 5.3.1. We upgraded to this version in July without any problems. Now some of the users are beginning to get the error message "unable to create instance of system" and cannot open Virtis. I have attached a screen shot of this error. We have upgraded some other applications on these user's PC's but Virtis is running off a network drive, not the C drive. However, another random user can log onto this same PC and run Virtis successfully. Can you tell us what this error means

Thank you,  
Carole Donovan

| 6798.14542 | Closed        | Unable to save bridge after copying Structure Def |

**Description**

FROM:jihnat DATE:10/18/2005 10:33:35 AM

This looks the same as 6543, but customer requests explanation.

Reported by Chris Jackman, Fisher Associates

I am running a different bridge with the same style-thru girder-floorbeam stringer and I am getting the following error:

Error generating LFD/ASD load commands!

04:21:34 PM - Line 243 in source file .\BrassStdLoadControl.cpp.

4/19/2016 3:19:00 PM

HRS AASHTO

**Complete Issue Information**

Error generating load group commands!  
04:21:34 PM - Line 445 in source file .\BrassLoadControl.cpp.

Error in the loads utility!  
04:21:34 PM - Line 741 in source file .\LoadsUtility.cpp.

Error getting stringer dead load reaction!  
04:21:34 PM - Line 1124 in source file .\EngineExport.cpp.

Error preparing stringer dead load reactions!  
04:21:34 PM - Line 3438 in source file .\LoadsUtility.cpp.

Is it something specific to this bridge? The other skewed-end girder floorbeam bridge that I input last week ran ok.

 REPORTED BY:

DESCRIPTION:

COMMENTS:

I wanted to run a permit truck for a NSG analysis, no inventory rating, operating rating only. In analysis settings, vehicle summary, I select operating rating so that the command button says "add to operating". I then select my vehicle and click the "add to operating" command button. It adds the vehicle to both inventory and operating.

FROM:tarmbrecht DATE:Tuesday, October 25, 2005 3:18:20 PM  
 Also when I try to remove the truck from inventory by selecting the truck in inventory and "remove from analysis" command button, it removes the trucks from both inventory and operating.

FROM:jduray DATE:10/31/2005 12:42:21 PM

FROM:kkennelly DATE:11/2/2005 7:59:05 AM  
 We need to change the functionality of this window since it seems reasonable that users will want to only do an Operating rating for the NSG vehicle.

Allow user to select/unselect the vehicles for Operating or Inventory only. Still need to restrict user to 1

NSG vehicle (can't have vehicle A for inventory and vehicle B for operating).

FROM:sboukamp DATE:11/2/2005 10:12:23 AM  
Resolved for Beta 2.

FROM:tarmbrecht DATE:Wednesday, December 21, 2005 3:05:42 PM

It now allows me to select a vehicle to add to operating. Could you please verify that the "Adjacent Lane Vehicle" branch shown is for the user to add another vehicle to accompany the NSG on the bridge? However, it adds that branch for an adjacent lane vehicle even if I specified no accompanying vehicle with my NSG in the vehicle path tab under bridge alternatives/superstructure. Is that a conflict? I tested a little further and added an HS20 from the standard vehicles and it added an adjacent vehicle branch. It also won't let me add a HS20 to inventory and a different standard vehicle to operating like it does when I select the standard analysis type instead of the advanced. I agree with Krisha above that we wouldn't use two different NSG, but I think we should still be allowed to select two different standard vehicles for inventory and operating, therefore I'm resubmitting this incident for consideration.

FROM:jduray DATE:1/3/2006 9:57:24 AM

Item 1) The "Adjacent Lane Vehicle" branch should be independent of what you specify for the bridge. No conflict - behavior is as designed.

Item 2) Tim states the following: "I tested a little further and added an HS20 from the standard vehicles and it added an adjacent vehicle branch." - this is as designed.

Item 3) Tim states the following: "It also won't let me add a HS20 to inventory and a different standard vehicle to operating like it does when I select the standard analysis type instead of the advanced." - this is as designed (refer to mockups page 8 "Only one Non-Standard Gage vehicle and one adjacent lane vehicle can be selected for an analysis.")

Tim is correct - this is a design flaw...changing Category to "Enhancement".

REPORTED BY:

DESCRIPTION:

COMMENTS:

FROM:rfulton DATE:Wednesday, October 26, 2005 2:53:30 PM  
Tried to define a vehicle (both std and NSG) from bridge explorer and copy button was not activated. The button is activated if the vehicle is defined in the vehicle library.

FROM:jduray DATE:10/27/2005 9:26:34 AM  
This is when creating a vehicle from the Analysis Settings dialog. The previous release behaved this way.

FROM:jihnat DATE:11/3/2005 8:34:37 AM  
User wants Copy toolbar button to be enabled. But the button would not be reachable because the active dialog is modal.  
Program has always had the current behavior.  
The grid cells can still be copied/pasted using ctrl+c, ctrl+v.  
As an enhancement, a handler could probably be added to the dialog to enable the buttons, but they still could not be clicked.

### Description

FROM:dteal DATE:Thursday, October 27, 2005 12:54:28 PM  
REPORTED BY:

DESCRIPTION:It is my understanding that Virtis Std Engine checks both axle and lane rating but it never reports which controls. Us along with many other states don't rate for lane – we need to know which is controlling. We need these broken out as axle rating and lane rating.

Or better yet – the “as requested” to actually be “as requested” - let us request what we actually want.

FROM:jduray DATE:Monday, March 27, 2006 9:33:36 AM  
This requires modifications to the StdEngine. Our current task is to implement BAR7 "as is". This request should be added to the list of StdEngine enhancements.

| 6911.14429 | Suspended     | Enhance Std Engine to apply varying selfweight for haunched girders |

**Description**

FROM:bgoodrich DATE:Friday, November 11, 2005 1:26:26 PM

Based on the discussion from Incident 6239, there needs to be a way for the engine to communicate information back to the GUI. My thinking here is for a messages object to be added to the results object. The engine could write any number of warnings or informational messages to this object, which would then be available once the analysis is complete for the user to review. There would have to be some mechanism for conveying to the user that warnings/messages exist, especially for rating several

4/19/2016 3:19:02 PM

HRS AASHTO

1982

**Complete Issue Information**

bridges at once. For example, if a bridge has not been analyzed since a specification change was made; a previously "clean" run could contain warnings that should be reviewed. Varying levels of importance could be assigned to each warning (like in the export), so low level warnings do not trigger the flag indicating that the user should review the warnings. Maybe the user could have some control over which warning levels should trigger a review.

FROM:jduray DATE:11/14/2005 12:48:15 PM  
Do these differ from the messages we send to the Analysis Progress Dialog during the export?

It seems to me that a log file is required but to me that is the same as the log that is created during the export.

|                                                                              |

**Description**

FROM:dteal DATE:Tuesday, November 15, 2005 2:36:09 PM  
Beta 2  
For a simple comparison I took RCTrainingBridge1, schedule based definition (4 span), used an HS20 truck for analysis. The rating factors where not even close. The controlling points for the rating where in different spans and at different % locations.  
So I wanted to see what did compare favorably so I started with Dead Loads. The reactions at the

4/19/2016 3:19:03 PM

HRS AASHTO

1983

## Complete Issue Information

abutments and the piers did not match up. I summed up all the reactions, for the BRASS run and got 444.2 kips and for the Virtis run I got 375.6 kips. Either the virtis run is 69 kips light or the BRASS run is 24 kips heavy. In either case the most simple check, total dead load from the girder doesn't match up. BRASS had 3 separate load cases and Virtis had only 1. Nothing else on it compares favorably either.

I checked the single span definition in RCTrainingBridge1 and found that when checking the dead loads there were oddities also.

The BRASS DL output consisted of 3 separate DL cases that summed up to 74 kips. The Virtis DL consisted of one DL case called DL1 and it totaled up to 61 kips.

FROM:kkennelly DATE:11/16/2005 10:27:52 AM

I've entered incident 6916 which is probably the cause of these discrepancies. BRASS and Virtis Std used to produce the same output for RCTrainingBridge1 so something must have gotten broken recently.

FROM:kkennelly DATE:11/17/2005 1:01:05 PM

Please revisit this problem with the new Virtis Std Engine dll's being sent out today.

FROM:dteal DATE:Friday, November 18, 2005 9:00:03 AM

Using the beta2update2 dll that was sent on 11/18/05

The DL reactions for the Virtis engine balanced but –

The summation of the DL's in virtis = 513 k and the summation of the DL's in BRASS = 444 k – so the static summation of the DL's still don't add up.

With the DL comparison being non-equal, the ratings don't compare either, with the HS20 Inv. Truck rating factor in Virtis = 0.499 and BRASS = 1.411.

Referring to VI#6921 – with the virtis engine in viewing the analysis output all DL's are lumped into one value making it difficult to see which particular DL's don't compare.

FROM:xli DATE:11/18/2005 5:36:48 PM

I created a Staad model for BID 11, the dead load reactions match Brass output.

I also noticed that Brass is using 72" as top flange width while computing girder self weight, VirtisStd is using OVERHANG OR SPACING 8.5'.

FROM:kkennelly DATE:11/21/2005 8:32:59 AM

Virtis has user enter "Tributary width" for top flange for rc tee beam. This is similar to 6926, discuss with Jim.

FROM:xli DATE:11/22/2005 5:09:02 PM

This bridge has parabolic girder profile, Virtis Std is using uniform load instead of parabolic load for girder selfweight, it makes 10% difference. Do we accept this difference?

If we use a couple linear distributed loads to simulate parabolic loads, we can get very accurate results.

FROM:hlathia DATE:Tuesday, January 31, 2006 8:42:38 PM

StdEngine is calculating and applying average uniform load due the weight of parabolic haunched girder. This is how it has always been done by BAR7. The dead load (DL1) results will be different for the uniform and trapezoidal loads..

Until StdEngine is revised to calculate and apply non-uniform loads for girder weight for haunched

4/19/2016 3:19:03 PM

HRS AASHTO

1984

**Complete Issue Information**

girders, Virtis Export can calculate average unifrom load due to hauched girder and pass it on as a negative unifrom load and also pass on a series of trapezoidal loads for actual girder weight, both as user defined Girder Dead Loads. This should produce accurate results.

My recommendation is to wait unit Virtis StdEngine is revised for calculating and applying trapezoidal loads due to the weight of a haunched girder.

Beta 2

In the Virtis Std Engine, when viewing Analysis results for dead loads. All loads are lumped into one value. In BRASS we can view the Dead Load contribution from the Girder, slab, haunches, rail, overlay all in separate tables. Now in the Virtis Std engine all these loads are lumped in to one value – can we get them in separate tables or is this it?

When trying to compare output from one engine to the other, when the DL's don't match up, you know where to look first being they aren't broken apart?

FROM:kkennelly DATE:11/16/2005 3:42:57 PM

### Description

FROM:hlee DATE:11/29/2005 10:27:09 AM

1. For girder line steel member alternative, both schedule and cross section based total slab thickness is entered in the member alternative level. For girder system steel member alternative, schedule based total slab thickness entered in the typical section only; and cross section based total slab thickness can be entered in both typical section and member alternative level. For reinforced concrete member alternative, total slab thickness is entered in the member alternative level.
2. For girder line cross section based rc slab member alternative, integral wearing surface cannot be entered or calculated. For girder line schedule based rc slab member alternative, integral wearing surface is entered. For steel member alternative, integral wearing surface can be calculated.
3. Typical section has deck concrete materials. Member alternative profile (or cross section) also has deck concrete material.

FROM:jduray DATE:12/2/2005 9:14:36 AM

Comments on (1):

For girder-line steel - both schedule and cross section based is as it should be.

For girder system steel - schedule based is as it should be.

For girder system steel - cross section based total slab thickness should not be on the member alt window.

For girder line r/c - total slab thickness should be on the member alt window.

For girder system r/c - total slab thickness should not be on the member alt window.

Comments on (3):

Probably should not have the material on the member alt windows for girder system.

It is good to be aware of these inconsistencies...but I'm not sure we should change anything. We should discuss this with the TAG. Maybe we could investigate the databases we have received for support and see how these values are being input by the users.

## Complete Issue Information

### Description

FROM:jihnat DATE:11/29/2005 1:05:19 PM  
Entered on behalf of John Rohner:

I'm having problems getting a newly designed bridge to rate. The bridge was designed in Conspan. Conspan only accommodates skews up to 60 degrees (rotation amount from a line perpendicular to layout line) but Virtis will accommodate larger skews which are actually present in this bridge. This may be one reason for a lesser rating.

One other problem, if the sketch indicates what is being applied, is the haunch on the tub girders. It looks as if the haunch thickness is being applied across the outside-to-outside width from flange tip to flange tip. There is no haunch in the middle section. I've attached a picture to clarify this. But, in deleting the haunch completely, it only raised the rating factor from 0.365 to 0.89 for the inventory concrete tension condition. I did a hand check of the stresses output by Virtis and verified Virtis' rating factor. I then took the Conspan stresses and rated the bridge by hand for concrete tension and got a rating factor of around 1.148.

I'm not sure what the difference is. The superimposed dead loads applied to each model are similar but the Virtis model has slightly less which should help, not hurt. Another thing which should help not hurt is the fact that the LL stresses at bottom are calculated to be less in Virtis than in Conspan. I'm just trying to see if I'm missing anything here.

Thanks for all the help.

FROM:jduray DATE:12/2/2005 9:28:17 AM

FROM:bgoodrich DATE:Wednesday, December 07, 2005 8:41:21 PM  
Some of the differences in the stresses are due to differences in section properties and possibly the moments calculated by BRASS and CONSPAN. The stresses reported by BRASS appear to be correct given the moments and section properties. Even if I use the Virtis section properties, the rating still does not get above 1.0. Do you or any of your engineers have any ideas?

The user's issue with the haunch may need to be added as an enhancement. The haunch is applied over the entire top flange width regardless of the beam type. For a tub, an upward uniform load should be added to the Member Loads window to counteract any unwanted haunch load between the top

flanges on each wall. Should more geometry be added to the haunch window for a tub, so the user can customize the haunch as needed by the user?

FROM:bgoodrich DATE:Thursday, December 08, 2005 5:27:39 PM

E-mail from John Rohner:

As far as the tubs go, in my opinion, the Virtis software needs to be corrected. Yes, you can apply an upward force to alleviate the improper loading situation resulting from the haunch but there is still the composite section properties affected. I should have taken a little more time to review and compare the section properties of Conspan with that of Virtis as well as the DL moments but I had a deadline and I've now moved on from the project. I would like to take a glance at the comparisons but have another deadline and won't have a chance for a while to look at this. I have included the Conspan section properties and loads for your review. Hopefully, you'll be able to take a look at this. According to CDOT, other consultants are running into problems with Virtis and tub ratings so hopefully this information will help in resolving issues with my project as well as any agencies using tubs. Thanks a lot.

FROM:bgoodrich DATE:Monday, December 12, 2005 11:46:03 AM

I found an error in the cross section export that occurs for the CDOT U72 U-beam. The top fillet was not being exported due to a negative fillet height being determined. Note that this error does not occur for the Texas U-beams on which the cross section conversion was based. The export has been corrected. These changes still did not increase the rating significantly.

FROM:bgoodrich DATE:Friday, March 03, 2006 6:16:15 PM

The difference between the CONSPAN and BRASS ratings for concrete tension is due to differences between the various stresses used to calculate the rating factor. After correcting the export to generate more accurate section dimensions, the moment of inertia and c.g. depth were much closer to the CONSPAN properties. This leaves the moments as the reason why the stresses are different. The BRASS stress and rating factor calculations are sound. The moments may be different because due to assumptions made by CONSPAN and BRASS on span lengths, i.e., centerline of bearing, centerline of final supports, etc.

The request for enhancing the haunch geometry for a box beam remains.

## Description

FROM:hlathia DATE:Thursday, December 01, 2005 9:35:58 AM

Add user defined analysis points to report results in BAR8. Currently there is no provision in BAR8 for separate input of user defined analysis points. BAR8 reports results at 10th points and range points for which the user has entered ranges for the cross section properties. If the user wants to see the results at points other than defined above, Virtis can pass these points as additional ranges so BAR8 will report results at these points also.

Alternately, a new input line can be added in BAR8 where the user can define these additional points of interest.

FROM:kkennelly DATE:12/8/2005 10:53:19 AM

Estimate given to the Task Force for the Dec 12 conference call is for the following work in the export:

After the export calls ResetChangePointGeneration(), call AddChangePoint() and pass in the location of the user defined point of interests. Then when the export calls GenerateCrossSectionInfo(), the additional ranges will automatically be generated. Comment out the section of code where we check for duplicate cross sections and delete those cross sections in VirtisStdSteelCmd.cpp.

The text output file for Virtis Std Engine will contain the output for the user defined points of interest. Incident 6965 deals with the problem of results at change points not being sent back to Virtis Analysis Results.

FROM:hlee DATE:12/28/2005 9:46:56 AM

Received via email:

Once again, I am running into getting Virtis produce rating results for a new bridge. This one is for a bulb-tee girder bridge. It is an LRFD designed bridge. The shear stirrup arrangement meets the LRFD design

4/19/2016 3:19:07 PM

HRS AASHTO

2005

**Complete Issue Information**

but does not get over a 1.0 rating factor for the inventory results.  
Does Virtis take into account the vertical uplift from draped strands?  
This is the only thing I can think of as to why it is not working.  
Thanks.

If it does, I guess we're just going to have to find a shear arrangement  
Virtis approves of and use this in the design.

John Rohner, P.E.

jrohner@ch2m.com

FROM:bgoodrich DATE:Wednesday, December 07, 2005 8:42:07 PM  
BRASS does consider the uplift caused by harping the strands. Also, note that BRASS calculates the factored shear at the support and then uses that shear for rating calculations at that support. Please attach the BBD file and indicate the method that CONSPAN used to calculate the shear resistance.

FROM:bgoodrich DATE:Thursday, December 08, 2005 5:26:38 PM  
E-mail from John Rohner:  
Thanks for getting back to me. I'm attaching the BBD file for the bulb-tee incident. The controlling point is at the 0.29L distance of the span which is kind of weird. If BRASS doesn't take into account the prestressing uplift, it's going to affect the rating. CONSPAN calculates the capacity as  $\phi(V_c + V_s + V_p)$ . Without  $V_p$ , not including the vertical uplift of the draped strands decreases the shear capacity as well as the rating.

FROM:bgoodrich DATE:Sunday, March 05, 2006 2:18:46 AM  
Incident 6549 was addressed, which impacted the shear capacity. The critical rating is still shear, but it is now greater than 1.0. BRASS-GIRDER 5.9.2 will be released with Virtis 5.4.

### Description

FROM:kkennelly DATE:12/2/2005 10:42:35 AM

Run G1 in Training Bridge1 using the Virtis Std Engine. This member has cross section change points at 36.67' and 124.33'. Text output file for VirtisStdEngine shows section properties, DL and LL forces and rating factors at these change points. But the Analysis Results window in Virtis doesn't show these points, it only shows tenth points.

FROM:mordoobadi DATE:12/5/2005 10:18:35 AM

Hasmukh, while investigating this incident, I noticed that VirtisStdEngine does not create nodes (analysis points) at cutoff points (change points). It only creates nodes at 10th points. The engine reports dead and live load moments and shear forces at cutoff points by using interpolation.

I was wondering what it would take to make the cutoff points as analysis points in VirtisStdEngine. By doing this the results will be more accurate and we can report the results to Virtis much more easily.

HRS AASHTO

2007

## Complete Issue Information

FROM:mordoobadi DATE:12/5/2005 11:32:51 AM

Deflections are not reported at cutoff points in the text output file.

FROM:jduray DATE:12/7/2005 9:59:29 AM

Changing to an enhancement since modifications to StdEngine are required.

FROM:hlee DATE:12/28/2005 9:46:30 AM

In "Virtis StdEngine Enhancement Estimates 12-08-05.xls", Hasmukh estimated 224+ hrs to:

Revise CBA to calculate influence lines and load effects at cutoff (section property range) points in addition to the 20th points and do not use interpolation to calculate effects at non-twentieth analysis points. Also, revise Virtis StdEngine to report deflections at cutoff points in addition to the 10th points.

"This revision will require major overhaul of PENNDOT's CBA program that is used as an engine in Virtis StdEngine. Currently CBA generates influence lines at 20th points along the span of a continuous beam and calculates load effects at these points. It interpolates between 20th points to obtain results at other desired points such as points where section properties change, brace points or other locations. It uses parabolic interpolation for calculating moments, deflections and rotations at non-twentieth points and uses straight line interpolation for calculating reactions and shears. It also uses interpolation to get concurrent effects at non-twentieth points. Virtis StdEngine reports deflections only at 10th points. For these revisions the following will have to be done.

Introduce an option in CBA to use interpolation (as it is currently being done) to calculate effects at cutoff points or to generate influence lines for all analysis points including cutoff and other points.

Let CBA use the 20th points as nodal points for solving the flexibility equations as it is currently being done. Generate influence lines for all effects at 20th points, cutoff points and other points as required. Each influence line will consist of an effect at a given analysis point with ordinates at every 20th point of the span. This will require generating and storing more influence lines (influence line for every effect at every analysis point) and then analyzing each influence line for a given loading (static dead loads or moving live loads). The influence lines for deflections will only be generated at 20th points. The deflections at cutoff points will be calculated using interpolation between 20th points. This will also require either eliminating or by-passing the calculations of interpolated results. Virtis StdEngine uses concurrent effects to calculate moment-shear interaction ratings. These concurrent effects are also obtained by interpolation. It will also require calculating the concurrent effects at non-twentieth points by analyzing the influence lines at these points.

These modifications will also require major testing efforts since the method of obtaining results will be changed. It will also require a thorough review of CBA source code.

These revisions will give more accurate results at cutoff points, but the difference in results may not be significant. The deflections at cutoff points will still have to be calculated by interpolation as deflection influence lines are generated at 20th points since the influence lines for deflections are the byproduct of flexibility method of analysis.

If influence lines are to be generated at non-twentieth points, it will require complete revision of the flexibility method solution (additional 80 hrs effort).

(200 hrs for CBA routine revisions as suggested above for coding , unit and alpha testing; 24 hrs to calculate and report deflections at cutoff points.)

If PENNDOT agrees to make these revisions, the cost for Virtis StdEngine can be cut by 2/3rd.

PENNDOT seems to be agreeable to make these revisions, but the schedule will

4/19/2016 3:19:07 PM

HRS AASHTO

2008

**Complete Issue Information**

have to be negotiated.

FROM:hlee DATE:12/28/2005 10:06:00 AM

Option 2 (56 hrs): From Hasmukh - Currently in BAR7 and Virtis StdEngine, the deflections are calculated and reported at the 10th points only. The deflections at cutoff points will be calculated from the 10th point deflections using the parabolic interpolation as it is done for calculating the moments at cutoff points. If we make only the above revision for incident 6965, it will take 24 hours to revise Virtis StdEngine.

Mehrdad estimated additional 32 hrs to collect and pass back change points results.

FROM:hlee DATE:7/10/2006 10:10:06 AM

Changed Project from Beta Testing/analytical tools/Std Engine (BAR7) to Support Center.

### Complete Issue Information

The above support incident provided no help, but I found an Objective Grid knowledge base document (000710-060) that was helpful. I had to move the context menu code from OnRButtonDown() to OnRButtonUp() to get this to work correctly (but this is how Windows XP works anyway). Fixed for version 5.6

FROM:xli DATE:2/5/2007 3:13:52 PM  
Works fine for 5.6 beta 1.

FROM:tambrecht DATE:Thursday, March 15, 2007 10:18:51 AM

Right-clicking now selects a bridge in Bridge Explorer. However, after selecting multiple bridges (by holding the Shift or Ctrl keys while selecting), right-clicking to bring up the menu (for Checking Out, Checking In, Rate, etc.) now de-selects all but the record over which the cursor is located. This is not how it worked previous to v. 5.6 Beta 1 where after selecting a group of bridges, right clicking with the cursor over one of the selected files brings up the menu to be applied to the entire group of bridges that was previously selected. Note: A temporary workaround to enable application of the right button menu commands to a group of selected bridges is to hold the Ctrl key down while right clicking one of the bridges in the group.

FROM:jihnati DATE:3/20/2007 1:28:31 PM  
Backed this out in Beta 2.

FROM:tambrecht DATE:Tuesday, June 26, 2007 10:53:44 AM  
Tested in beta 3 - Accept

FROM:jihnati DATE:11/14/2007 8:11:02 AM  
Tim accepted that the change was backed-out. The original issue is still open.

### Description

FROM:tarmbrecht DATE:Monday, December 05, 2005 10:28:20 AM

Could I get clarification on how Virtis handles stage 2 dead load for non-composite members?

For non-composite steel superstructures, loads that should be distributed equally to all beams must be manually computed and input as a Member Load for each member. Virtis applies Stage 2 loads as Stage 1 stating, "A load is being applied to Stage 2, which does not exist in BRASS for this structure type! The load(s) will be applied to the last allowable stage (Stage 1)", which means that the load is applied using its tributary area even though it was intended to be applied uniformly to all girders.

If this is the intent, could Virtis be modified so that, when "Uniformly to all girders" is selected, Stage 2 dead loads such as parapets, medians, wearing surface, etc. are handled in such a way that the analysis engine uses them as intended, just like it does for composite type structures?

**Complete Issue Information**

FROM:kkennelly DATE:12/6/2005 9:48:51 AM

For this case, the export to the BRASS program needs to compute the Stage 2 loads based on how the user has specified them on the Virtis Superstructure Loads window and then apply those loads to the girder in the Stage 1 load case in the BRASS input file.

Brian, DoGirderSystemStructDef has some new functions that you can use to compute the appurtenance loads on a girder:

```
ComputeAppurtLoadOnGirder(long IRailLocObjectId, long IGirderMbrId, double FAR*
pdLoadPerUnitLength, short FAR* piStageld, const VARIANT FAR& vaLoadUnit)
ComputeWearSurfLoadOnGirder()
ComputeSidewalkLoadOnGirder()
```

These are only available for Girder Systems, not floor systems.

## Complete Issue Information

FROM:dteal DATE:Wednesday, December 07, 2005 12:05:28 PM

Beta 2

Every RC slab bridge that has been imported from a BRASS dataset – flat slabs and parabolic haunched slabs – as many as 2,000 imported structures are effected by this.

The above mentioned RC structures never had a Distribution Factor entered for shear. We NEVER check shear in a slab bridge. Therefore the imported datasets leaves the 2 Dist. Factors for Shear and Shear at Supports blank. The checkbox for "Ignore Shear" has NOT been checked either, VI #6913. The end result is that none of these 2,000 structures that can be analyzed by the BRASS engine can not be analyzed by the Virtis Standard engine without modifying the input.

FROM:jduray DATE:12/7/2005 3:47:31 PM

Hopefully the TF will approve the enhancement request to add an "ignore shear" option to the StdEngine.

There are some things we may be able to do to address the problem descibed regarding imported BRASS files. First, if the utility is still being used we should fix it so the checkbox is checked. As far as the data that has already been imported we may be able to address that in the StdEngine export:

Option 1) automatically set the ignore shear to true (after that enhancement is made to the StdEngine) if the shear distribution factors are NULL and if it is a slab bridge.

Option 2) another option that might work is to check the member alternative to see if it was imported. Do option 1.

Option 3) perhaps we could write a script to be run against the db that would set the ignore shear to true for all slab member definitions.

I believe this problem has occured because the BRASS import utility was written before the Ignore shear option existed and was not updated when the option was added. Looks like ignore shear was added for version 4.0.

Each of the options concerns me for the following reasons:

Options 1 and 2 assume that you do not want to rate for shear. Is that valid for everyone using Virtis? Option 3 is less of a concern if you are sure you know your bridges and do not want to rate for shear. This is the best approach since we are not forcing anything on the users and each agency can choose to run the script or not.

FROM:dteal DATE:Thursday, December 08, 2005 10:26:29 AM

FROM:dteal DATE:Tuesday, March 28, 2006 11:41:29 AM

Why can't this work with the Ignore Shear check box? If the box is checked there is no need for shear distribution factors.

Virtis currently restricts floorbeams to be perpendicular to the superstructure definition reference line. The Help for the Floorbeam Member Locations window lists the following:

**Skew**

Displays the skew angle of the floorbeam member. If a floorbeam intersects the superstructure definition reference line at the same location as a support line for the main members, the floorbeam is assumed to be at the same skew angle as the support line. Otherwise, all floorbeams are assumed to be perpendicular to the superstructure definition reference line. If your structure has floorbeams that are skewed and are not located at a support line, you should use a floor line superstructure definition to describe your structure.

I am not able to determine what exactly caused save to fail. It is probably because copying of a Floor System structure definition had problems in 5.3.

### Description

FROM:tambrecht DATE:Monday, December 12, 2005 2:50:29 PM

The check box "Skip operating rating based on serviceability" under a Point of Interest's Engine tab/BRASS LFD/Properties (Miscellaneous tab) does not appear to work. When selected along with POI Control selection "5 – Generate user defined points of interest only" for a steel Member Alternative for which serviceability otherwise would control for operating rating, the result still is that serviceability controls. Attached file.

FROM:bgoodrich DATE:Wednesday, January 04, 2006 12:04:22 PM

The engine properties are not exported when a "generate" option is selected. The engine-related help topic for the Points of Interest window states:

"BRASS LFD will not use the override data entered in the Point of Interest windows if the POI Control on the Member Alternative Description: Engine (BRASS LFD) window is selected as a "generate" option (Options 1, 3, or 5). Selecting a generate option on that window means that the points of interest will be generated from the schedule data that you have entered in other windows. You must select the "No point of interest data will be generated" option on that window in order for BRASS LFD to use the data entered on the Point of Interest windows. If you select "No point of interest data will be generated" as the POI Control, you must enter all of the information on the Point of Interest windows.

4/19/2016 3:19:09 PM

HRS AASHTO

2018

**Complete Issue Information**

The export will not generate any data from other windows for items left blank on the Point of Interest windows."

Note that in the new engine merger, this option is being moved to the member alternative level, so it can be set once for each analysis.

**Description**

FROM:jihnat DATE:12/13/2005 1:04:14 PM  
Received via email from Steve.Mample@itd.idaho.gov

I am load rating a simple three span composite steel and concrete girder bridge. BRASS may be using the wrong shear equations for this particular bridge. The shear capacity of the girders appears to be too low. The shear analysis is controlling the load rating. I think the moment analysis should control. Is there a way to turn off the shear analysis? Attached is the ddb file.

FROM:bgoodrich DATE:Wednesday, January 04, 2006 1:51:53 PM  
I did run some of the members in the file and the shear rating is controlling, but it is not significantly

4/19/2016 3:19:09 PM

HRS AASHTO

lower than 1.0. Some shear ratings are even above 1.0. The BBD file you sent only has 1-span structure definitions. Your description mentioned a 3-span girder. Is the 12315.bbd file the correct file?

Please let me know which structure definition and member to specifically investigate. Also, please attach any additional information that lists what you calculate the shear capacity to be.

Finally, there is currently no way to turn off the shear rating for steel.

FROM:bgoodrich DATE:Friday, January 06, 2006 3:50:05 PM

E-mail from Steve Mample:

We can close this incident. The problem was with my input data on the stiffener spacing window. Which we did not notice until Mary Walker happened to take a real close look at the G10 member girder schematic, and noticed that the first transverse stiffener was not shown. I had failed to put in the first stiffener at 0.00" spacing. Having corrected that data input error, BRASS correctly computes the shear capacity of the girders at the point of bearing. Another crash landing due to pilot error.

One thing, I was only concerned about shear at the point of bearing and I knew that Virtis would automatically give a load analysis at that point, I assumed that the program would give all output data. I did not realize until yesterday that I need to enter a point of interest to get all the output data at the point of bearing.

I tried increasing the shear resistance factor in the factor window. I did not see any change to the shear load capacity. I may not be doing it correctly.

FROM:bgoodrich DATE:Friday, January 06, 2006 3:50:55 PM

Make sure you assign factors you modified to the structure definition. See the Analysis tab of the Superstructure Definition window.

Closed incident.

### Description

FROM:jihnat DATE:12/13/2005 2:49:23 PM  
Received via email from KMilligan@ammann-whitney.com

Hello, I'm working on NYS Thruway load ratings, and have a problem you may be able to help.

The bridge is 3 span continuous, with four main girders and floorbeams framed into the girders in each bay with multiple stringers resting on top of the floorbeams. I'm inputting the info as a floor system definition structure.

Because the Piers are skewed and the FB's are at right angles to the girders, I cannot locate the floorbeams in the framing plan. The FML tab gives an error saying the FB does not intersect G1. The FB's at the beginning of the bridge are only in the first bay, not across the whole bridge because of the skew. Can a floorbeam be input only between girders (say G1 and G2) and not across the whole bridge? Also, if I use the floobeam wizard, it won't allow me to change the start distance, it is always 0.00'.

**Complete Issue Information**

Thanks for your help if possible.

If this is not clear, please call me at 212-627-7158.

FROM:kkennelly DATE:12/16/2005 10:55:43 AM  
Floorbeams must span across the whole bridge, they cannot span partially across between just a couple of the girders.

FROM:kkennelly DATE:12/16/2005 1:25:41 PM  
The problem with the Floorbeam Wizard forcing the start distance to be zero appears to be a bug in the UI.

**Description**

FROM:dteal DATE:Tuesday, December 13, 2005 5:13:51 PM  
In all of our BRASS datasets for steel bridges we have set the allowable fatigue stress to 16 or 21 KSI using the STEEL-4 command in BRASS. Those original old datasets have just a handful of POI's analyzed. Now when we enter this bridge in Virtis we don't set any specific POI's, we tell it to do all the 10th points. The BRASS default for the 6th parameter of the STEEL-GIRDER-CONTROL command is 1x10E10 ksi.

**Complete Issue Information**

How do we set the allowable fatigue stress to 16 or 21 KSI for all these points.

FROM: bgoodrich DATE: Wednesday, January 04, 2006 12:14:48 PM

I don't know of any way to set the allowable fatigue stress globally. For now, you will have to set the POI control option to 0, enter all desired points of interest, and manually set the allowable fatigue stress at each point of interest. I know this will be an unacceptable work-around even in the short-term.

I don't see anywhere in the Virtis/Opis that we can even enter the allowable fatigue stress globally or on a schedule basis. Therefore, we have no way of exporting anything to BRASS. This issue could be addressed in a couple ways:

- 1. Add an allowable fatigue stress schedule to Virtis/Opis and revise the export accordingly.
- 2. Add a default allowable fatigue stress to the member alternative engine properties and use this on the STEEL-GIRDER-CONTROL command.

Option 2 could be implemented more quickly and with less funds than Option 1.

FROM: Herman Lee DATE: 6/9/2011 2:54:08 PM Eastern Daylight Time

As requested by the TAG (April 2011), change this request from BRASS Engine to AASHTO Engine.

| 6998.14342 | Closed        | Non- Composite Stage 1 Live Load for a Slab |

### Description

FROM:spatel DATE:Tuesday, December 20, 2005 9:36:09 AM

I am using 48 x 33 in. box beams on the adjacent box beam arrangement for a bridge superstructure (Deck Superstructure type "g") . The J value listed in the properties tab of the beam is 209,955 in<sup>4</sup>. The Live Load Distribution output uses J value of 39620 in<sup>4</sup>. This results into a distribution factor for moment in interior beam for one lane = 0.316 vs. 0.214 (calculated using actual J of 209,955 in<sup>4</sup> in the AASHTO LRFD formula from Table 4.6.2.2.1-1) and a distribution factor for moment in interior beam for two lanes = 0.315 vs. 0.295

FROM:jduray DATE:12/21/2005 4:39:46 PM

BRASS does not use the section properties from the cross section definition.

### Description

FROM:tarmbrecht DATE:Wednesday, December 21, 2005 11:44:55 AM

Virtis will not do a save of the attached model (a 4-Span cont. Girder-Floorbeam-Stringer system). When performing an analysis of Flbm 16 Virtis crashed. After starting Virtis again and then doing a Restore of the model, the save was attempted with the following result...

Unable to save Bridge data!

Saving New and Modified objects failed while processing CDmBridgeDesignParam (SaveOrder object 393).

Record found in database for data marked as new.

If it's possible to recover the attached file and email it back to me, I'd really appreciate it. Thanks, Tim

FROM:jduray DATE:12/21/2005 4:50:01 PM  
Investigate why Virtis crashed.

## Complete Issue Information

When I tried to import the attached bbd, I got the following message.

```
=====
Incomplete retrieval of data.
01:39:20 PM - Line 1117 in source file .\DoSuperStructDefList.cpp.

Data management object unavailable.
01:39:20 PM - Line 2492 in source file .\DoGirderMbr.cpp.
=====
```

Mehrdad, is there anything we can do to recover the attached bbd?

FROM:mordoobadi DATE:12/28/2005 4:09:24 PM  
No. I get the same errors.

FROM:mordoobadi DATE:12/28/2005 4:32:28 PM  
The error indicates that there is something wrong with the reference lines.

FROM:hlee DATE:12/29/2005 8:02:31 AM  
I entered and analyzed a 4-span continuous girder-floorbeam-stringer system. I was not able to reproduce the problems.  
Since we are not able to reproduce the crash or the saving problem, I changed the status to "Not Reproducible".

FROM:tarmbrecht DATE:Friday, December 30, 2005 12:23:26 PM  
Herman, the saving problem seems to happen when we copy a superstructure and then do a paste in order to create an identical superstructure definition. This is also happening in 5.4 beta 2. When we save the model, Virtis returns an error message...

Unable to save bridge data!  
03:00:43 PM - Line 867 in source file .\UiBWSDoc.cpp.

I've attached another file (beta 2 xml) for the same structure where we're having this save problem and resubmitting for review.

FROM:hlee DATE:12/30/2005 3:38:38 PM  
I changed the status to "Resubmit" since Tim provided more information to reproduce the problem.

FROM:hlee DATE:1/4/2006 8:55:51 AM  
The Computed Stringer Reactions and Floorbeam Stringer Reactions are not completely copied to the new superstructure definition.  
I don't think there's a work around since user cannot clear the computed reactions.

FROM:mordoobadi DATE:1/31/2006 9:36:31 AM  
The save problem is related to incidents 6544, 5461, 7057. The problem is now fixed. (5.4 Beta 5)

FROM:mordoobadi DATE:1/31/2006 9:56:46 AM  
I verified that the computed stringer reactions are copied correctly when copying a bridge and a structure definition.

## Complete Issue Information

FROM:mordoobadi DATE:3/20/2006 8:58:53 AM

Comments From Tim Ambrecht:

-----  
3. Incident 7006: (See GFS-SDCopyProb.xml.) Problem w/saving seems to be fixed, but a copy of a Superstr. Def. (SD) does not function properly.

1) First, CSR do not copy from the source SD to the new SD copy (contrary to mordoobadi, 1/31/06).

2) Second, when analyzing from the SD, an error occurs w/the stringer analysis, "Unknown error initiating member analysis!" (same error happens when analyzing from the STRINGER MEMBER ALTERNATIVES). Correct results seem to be produced for the stringer, but analysis stops before getting to the floorbeams & main girder.

3) Third, while the FSR are copied correctly, the Up To Date boxes are not checked and an attempt to analyze the floorbeams (fr/FLOORBEAM MEMBER ALTERNATIVES) generates an error,

Error generating LFD/ASD load commands!

Error generating load group commands!

Error in the loads utility!

Error getting stringer dead load reaction!

Error preparing stringer dead load reactions!

New Feature that is supposed to compute Recent ADTT does not work., and no results are generated. To get the floorbeams to properly analyze, the Override Computed boxes must be checked and the correct User Defined Reactions must be recorded. This may be tested by copying the SD, "Spans S1-S3 (GFS)".

FROM:mordoobadi DATE:3/21/2006 1:31:17 PM

The issues (3/20/2006 8:58:53 AM) are reproducible when you copy a structure definition and don't save it to the database and use the SD. If the bridge is saved and reopened, the above issues are not reproducible.

FROM:mordoobadi DATE:3/27/2006 9:35:24 AM

The problems with copied stringer dead load reactions while the bridge is still open are now resolved. (5.4 Beta 7)

FROM:jduray DATE:Monday, March 27, 2006 10:29:25 AM

FROM:tarmbrecht DATE:Tuesday, March 28, 2006 4:46:51 PM

Mehrdad, in our beta 7 testing, we note that what you mention in your 3/21 comments is usually true, but not always. If you save, close and reopen, it runs. If you save and then run it, it doesn't consistently work. If you don't save and then run it, it doesn't consistently work. We don't necessarily feel you should have to save after copying it to get it to work. Note though, that in every case, the program will not use the system-computed floorbeam stringer reactions. We note that you have to check the "override computed" box to get the floorbeams to analyze.

2031

**Complete Issue Information**

FROM:mordoobadi DATE:3/30/2006 9:59:03 AM

Tim, I suggested the saving of the bridge and reopening it (3/21/2006) just as a work around until the issue is addressed.

Please note that in beta 7 you should be able to see stringer dead load reactions after an analysis and without saving.

FROM:tarmbrecht DATE:Monday, April 24, 2006 10:22:30 AM

In 5.4.0 Beta 8, a copy of the superstructure definition now appears to function properly. We can make a copy and when analyzing from the SD, the error no longer occurs for stringer analysis. However, the floorbeam issue still seems to be there, i.e. "that in every case, the program will not use the system-computed floorbeam stringer reactions. We note that you (still) have to check the "override computed" box to get the floorbeams to analyze."

We could close this incident and start a new one that addresses the floorbeam situation specifically. If that is agreeable, then I can "accept" the resolution of this incident.

FROM:mordoobadi DATE:5/12/2006 2:41:51 PM

Tim, yes you can accept the incident and enter a new one for the up-to-date flag issue.

| 7020.16312 | Duplicate     | Low Prestress Shear Rating due to using shear at CL brg? |

### Description

FROM:dteal DATE:Wednesday, December 21, 2005 11:55:49 AM

This week the following has happened on our production side using 5.3.1

An engineer was analyzing a welded plate structure in Opis. Could only get stage 3 DL output. The Analysis Progress window had the following command line

Output-Stage Off, Off, On

At first I thought it had something to do with the Analysis Event Properties not using "select all". But that wasn't the case. I reinstalled virtis on that PC and everything was fine – now the OutPut-Stage command is On, On, On like it should be.

2 days later another engineer came to me with a PS structure. Yesterday he got stage 1 & stage 3, today he gets stage 3 only. I reviewed his input to see if he had selected stage 3 only but all 3 stages had been requested. I ran the analysis on my PC to verify what he was saying – my PC only gave stage 3 also. (OutPut-Stage Off, Off, On)

I went to his PC, reinstalled Virtis like I did 2 days earlier on another PC, then it worked correctly with stage 1 & 3 (OutPut-Stage On, On, On)

When I returned to my PC, his bridge was still in my workspace, I ran it again so I could make a hard copy of the Analysis Progress window – I hadn't changed a thing – remember the bridge was still in my workspace. – now it gave stage 1 & 3 like it should have and I didn't change anything??

Any idea what's going on?

I attached a .bbd of a bridge that didn't give stage 1 & 3 and now it does??

FROM:bgoodrich DATE:Wednesday, January 04, 2006 1:47:14 PM

This appears to be a duplicate of 6693 (and 6784). Got resolved for the next 5.3 Service Pack.

| 7024.16308 | Resolved      | floorbeam location wizard keeps start distance from discarded floorbeam spacing description |

## Description

FROM:pszustak DATE:Wednesday, December 28, 2005 11:57:31 AM

In a similar situation to that reported by Mr. Islam in incident 6972, I have just run into a similar problem comparing BRASS's prestress shear rating with PENNDOT's PS3.

In looking into it, I found differences in the way BRASS and PS3 rate the member at the ends. PS3 assumes that you can follow AASHTO 9.20.1.4 and rate for the shear at a distance h/2 from the support, rather than using the shear at CL brg. It seems to me that BRASS is rating the bridge using the forces at the 100 POI, which seems unnecessarily conservative. Is there a way to force BRASS to rate the ends of the girder using the shear at a distance of h/2 away from the support, consistent with AASHTO 9.20.1.4?

## Description

FROM: tarmbrecht DATE: Friday, December 30, 2005 12:08:43 PM

File (0820201x(531).bbd) attached. In the Floorbeam Location Wizard entry of floorbeam spacing, Virtis retains a discarded start distance and will not even allow it to be corrected manually. (Note: Also checked in v. 5.4.0 (Beta2) w/same result.)

Example: A new line is added by using "Duplicate", then is noticed that "Number of Spaces" for the previous line is incorrect, so, the new line is deleted and the correction is made. Now, the correct "End Distance" is displayed for the corrected line. But, when this line is duplicated, or the "New" button is clicked, "Start Distance" for the new line is not the same as "End Distance" for the corrected line. Further, if the same procedure is repeated, the new Start distance is even greater.

4/19/2016 3:19:12 PM

HRS AASHTO

2035

**Complete Issue Information**

Also, when the "New" button is clicked instead of "Duplicate", "Start Distance" is greyed out. However, in either case "Start Distance" cannot be permanently changed manually.

This can be tried in any GFS superstructure definition w/in the subject model.

I also attached a word document that contains this description and a screen print from the floorbeam location wizard.

### Description

FROM:dteal DATE:Thursday, January 05, 2006 9:37:39 AM

In the attached bridge, (member 2), I have defined all the shear studs. In order to avoid failure of specification 6.10.10.4 in the spec checker I have coded the range over the top flange splice plates as composite with the studs in between these splice plates. Two problems have arisen.

1. When I apply the studs GUI I get a message that my end distance and my beam length are not equal – As near as I can tell they are equal and opis is generating an erroneous message.
2. When I save and validate this structure I am given a message that I have 5 overlapping shear stud ranges. When I simply use the validate button (without saving) I get 8 overlapping shear ranges. These should give me the same number of error messages shouldn't it?? I don't believe this is true, the ranges appear to be ok anyway??

These may be related to each other to the way I entered shear studs over ranges with composite sections over the splice plates.

When you have splice plates, these areas do not have shear studs for obvious reasons. Do you know of any other way to enter shear studs leaving no studs over the splices plates and not get spec failure flags?

FROM:dteal DATE:Thursday, January 12, 2006 2:53:17 PM

On the two jpg's I attached – No Overlapping Ranges .jpg and Overlapping Ranges.jpg. there is no difference as far as I can tell with the stud locations. The No Overlapping Ranges one starts row two with start distance of zero with the length of 0.400 for one space. The Overlapping Ranges one starts row two with start distance of 0.400 for zero length and 1 space. They say the same thing.

4/19/2016 3:19:13 PM

## Complete Issue Information

When you validate – the returns overlapping ranges and the other doesn't.

FROM:dteal DATE:Thursday, January 12, 2006 4:20:58 PM

In the attached .bbd (Overlapping Ranges.bbd)

Go to unit #2, Girder D, Wizard alternative. With the wizard alternative highlighted select the button to Validate – No overlapping ranges, close the validation window and do it again, you will (I do) get overlapping ranges – nothing has changed. Sometimes if you open and close the shear stud tab on the deck profile, and then go to validate – you may 0,1,or 2 overlapping ranges ????

FROM:jduray DATE:Monday, January 16, 2006 6:06:34 PM

FROM:kkennelly DATE:5/3/2006 1:55:56 PM

Problem 1. "When I apply the studs GUI I get a message that my end distance and my beam length are not equal – As near as I can tell they are equal and opis is generating an erroneous message."

Answer:

You are getting this message for the following row:

| Support | Start Dist | Length | End Dist |
|---------|------------|--------|----------|
| 5       | 20.5       | 2.0    | 22.5     |

Virtis is reporting that the end distance of 22.5 m is not quite the end of the beam at 22.55m.

Duplicate of 3017. In the grids in the gui, if the end distance for an item is within 1' or 300 mm of the end of the beam, we issue a message to ask the user if they want the gui to change the length or spacing for them so the end distance matches the end of the beam. We did that because users previously requested help entering data particularly for skewed members that might have slightly different beam lengths. Since items can be entered in the grid in inconsecutive order, we do this check on every row in the grid, not just the last row.

Incident 3017 is an enhancement request to scan the grid for the rightmost data and check that only that rightmost data is on the beam. In order to be consistent, we have to make this change to a lot of windows in the UI not just this window.

Problem 2. "When I save and validate this structure I am given a message that I have 5 overlapping shear stud ranges. When I simply use the validate button (without saving) I get 8 overlapping shear ranges. These should give me the same number of error messages shouldn't it?? I don't believe this is true, the ranges appear to be ok anyway??"

Answer:

There is 1 overlapping range in your member due to the following last 2 rows:

| Support | Start Dist | Length | End Dist |
|---------|------------|--------|----------|
| 5       | 20.5       | 2.0    | 22.5     |
| 5       | 22.25      | 0.3    | 22.55    |

The last row starts at 22.25 but the previous row goes from 20.5 to 22.5 so this is where the overlap occurs.

Duplicate of 4327. This problem of inconsistent validation messages was fixed for 5.4. In version

5.4.0 I consistently get the 1 validation message.

Problem 3. "When you have splice plates, these areas do not have shear studs for obvious reasons. Do you know of any other way to enter shear studs leaving no studs over the splices plates and not get spec failure flags?"

Answer: I don't know. Maybe Brian knows.

FROM:kkennelly DATE:5/3/2006 2:27:08 PM  
Brian, can you answer #3?

FROM:bgoodrich DATE:Thursday, May 18, 2006 2:15:02 PM  
If studs are entered, BRASS LRFD will perform the checks. The only way around that is to specify the region as composite. The side effect this this is that the stud checks are turned off within BRASS. The only way for BRASS do not

In the attached bridge, (member 2), after an Opis analysis, View Latest Analysis Output/  
BRASS\_LRFD/Shear Connector File – it has no data, this shouldn't be blank – is this related to VI  
#7027

FROM:bgoodrich DATE:Tuesday, January 31, 2006 12:03:49 PM  
The shear connector file is blank because the AASHTO 6.10.10.4 calculations could not be performed.  
Several regions in the shear connector schedule were marked as "Composite." Therefore, BRASS  
could not count the number of shear connectors in those regions. If any region along the length of the  
girder is marked as "Composite," BRASS will not perform these calculations.

I will check with WYDOT about adding a message to the intermediate output file.

FROM:dteal DATE:Wednesday, February 01, 2006 10:34:53 AM  
this may be related to VI 7027

FROM:bgoodrich DATE:Monday, February 13, 2006 11:33:30 AM  
WYDOT assigned this issue to BRASS Problem Log 653. A note has been added to the shear  
connector file to explain why it is empty. Fixed for version 5.4.

### Description

FROM:tarmbrecht DATE:Monday, January 09, 2006 3:42:31 PM

In the attached model (Superstructure Definition "Sp. 13-15 (Double Girders)", a 3-span parabolic haunch, the graphic of the beam shows the middle span with the haunch reversed from what it should be. i.e., its curvature is convex rather than concave. The 1st & 3rd spans appear to be normal.

Also, when clicking <Apply> or <OK>, a warning message appears (shown in attached ParabolicHaunchErrors.doc).

Upon checking and rechecking the web input, no discontinuity can be found.

FROM:hlee DATE:1/12/2006 9:20:36 AM

Please see whether the attached screen capture (WebProfile.bmp) and calculation (AdjacentParabolicWeb.bmp) answer your questions.

FROM:tarmbrecht DATE:Tuesday, January 17, 2006 10:58:45 AM

Herman, the calculations appear to be correct, though the screen capture had very poor resolution - I'll

**Description**

FROM:tarmbrecht DATE:Monday, January 09, 2006 3:46:38 PM

1. In the attached mode, a 3-span parabolic haunch (center span approximated as linear due do parabolic haunch error previously submitted), the profile view graphic shows the longitudinal stiffeners as discontinuous, which they are not.

2. The "Y" dimension for the location of the longitudinal stiffeners on the web is to be based on a %

4/19/2016 3:19:13 PM

HRS AASHTO

2042

**Complete Issue Information**

from top or bottom flange. For this model, when 20 is coded as the % value the longitudinal stiffeners are placed off of the beam. In the Longitudinal Stiffener Ranges Help, Virtis directs the user to enter this value in "% units" ("% of Web – Bottom(Top) Flange – the Y distance is measured from the top of the bottom flange and is entered as a percentage of the web depth (with units of percent)). In reality the value must be entered as a decimal to get the desired result.

FROM:hlee DATE:1/12/2006 10:59:27 AM

#1 is entered in Incident 7029.

#2 is a bug. Virtis Help states that Y should be entered as a percentage when "% of Web ..." is selected, but the value must be entered as a decimal (0.2) to get the effect of percentage (20%).

FROM:tambrecht DATE:Tuesday, January 17, 2006 10:54:54 AM

Herman, #1 uses the same file as incident 7029, but here we're indicating discontinuities in the longitudinal stiffeners, not the haunch as in 7030. Are the discontinuities in the stiffeners (7030) related to the discontinuities in the haunch (7029)?

FROM:hlee DATE:1/19/2006 9:08:39 AM

#1 need to be reconfirmed once it is assigned.

FROM:jihnata DATE:5/3/2006 7:55:19 AM

#1 is fixed in version 5.4.0

FROM:jihnata DATE:5/10/2006 9:41:09 AM

#2: Schematic is fixed for version 5.5.0. The percentage should be entered as a number between 0 and 100.

### Description

FROM:jihnat DATE:1/11/2006 7:31:10 AM  
email from Gary Turnquist, Hedrick & Assoc.

I am trying to load-rate a three-span precast, prestressed concrete box girder bridge. The center span has 7 side-by-side box girders (6'-2" centers), while the end spans have 4 spread box girders (12'-4" centers-picture the 7-girder section minus girders 2, 4, and 6).

Should I code this as a bridge alternative with 3 separate structures (4-girder system, 7-girder system, 4-girder system)? Does each "structure" (ref. Help Figure 1) have to be the same for a particular bridge alternative? Is there a way to first code 7 girders for all three spans, then eliminate 3 of the girders in the 2 end spans?

Thanks in advance for any directions or suggestions.

Gary R. Turnquist, P.E.  
Hedrick & Associates, LLC  
2455 West Main Street  
Littleton, CO 80120  
Tel: (303) 798-9445

FROM:hlee DATE:1/12/2006 8:48:58 AM

Each "structure" (ref. Help Figure 1) doesn't have to be the same for a particular bridge alternative. For example, the first bridge alternative from the top in Figure 1 has 4 structures (3 unique structure definitions). The bridge alternative has 2 one-span structure, 1 two-span structure, and 1 three-span structure. Virts requires a girder to span the whole length of the structure, so first codes 7 girders for all three spans and eliminates 3 of the girders in the 2 end spans will not work. If the spans are not made continuous for live load, you may create a bridge alternative with 3 structures (2 unique structure definitions). The first one represents the mid-span, and the second one represents the end span.

### Description

FROM:ttompson DATE:Thursday, January 12, 2006 1:18:55 PM

It seems like we are missing some important information for NSG Trucks.

We aren't providing the total weight of the vehicle like we do in Std Gage Trucks.

We aren't providing the total length of axle spacing (longitudinally) like we do in Std Gage Trucks.

And since we don't provide a graphic view of what the truck looks like from any direction, it's almost impossible to see if one has entered one's truck correctly. To check if one has the total weight correctly, one needs to manually add each WHEEL load. We should provide a summary for each axle weight by summing up the wheel loads. And we should sum up all the axle loads.

I don't see any easy way to verify that one has entered the truck correctly. Not sure how we missed this during the GUI mockup review, but we did.

Another item would be on the wheels side of the screen, is the ability to copy/duplicate entire axles. Typically on these large NSG trucks, the axle loads are all the same (or extremely similiar). Currently it is very tedious entering the same data over 10 times instead of just duplicate. The GUI screen mockups had a duplicate, but at the time I thought it would duplicate the entire axle. I now see it just duplicates a wheel.

FROM:ttompson DATE:Thursday, January 12, 2006 1:26:19 PM

FROM:jduray DATE:1/16/2006 9:34:11 AM  
You can duplicate an axle if you have axles that are the same or similar.

As far as the total length and total weight go I agree that would be useful. I will check how much effort is required to do that. If an hour or so we will go ahead and do it, otherwise it will have to be an enhancement.

The influence loading output files contains a description of the vehicle.

FROM:jduray DATE:1/16/2006 10:42:20 AM  
Joe's estimate is 12 hours. Change to an enhancement request.

FROM:hlee DATE:7/10/2006 9:21:30 AM  
Changed Project to Support Center.

FROM:ttompson DATE:Wednesday, July 19, 2006 1:16:16 PM  
Duplicate axles is VI 6819.

FROM:jduray DATE:7/27/2006 11:24:14 AM

FROM:jduray DATE:1/19/2007 4:17:29 PM  
TF authorized us to implement this enhancement.

FROM:jihnatt DATE:1/25/2007 10:00:50 AM  
Done for version 5.6

FROM:xli DATE:2/5/2007 3:17:53 PM  
Total load of each axle, total load of truck, total length of axle spacing, duplicate wheel button are added and works fine for 5.6 beta1.

FROM:ttompson DATE:Wednesday, February 28, 2007 9:22:32 AM  
Checked - total weight per axle, total weight of truck, and total axle length

### Description

FROM:pszustak DATE:Sunday, January 15, 2006 10:28:22 AM

I am trying to analyze a 3-span, continuous for LL, PS voided slab bridge. Is it possible to enter a different PS initial tension for different strands within the same cross-section? It appears that you can only define one set of PS properties per span.

Peter Szustak  
BSC Group  
pszustak@bscgroup.com

FROM:jduray DATE:Monday, January 16, 2006 6:00:57 PM  
Correct, one set of properties for all strands within the beam.

Received via email:

**Complete Issue Information**

When I print an LRFD Report for my girder, everything seems fine until I get to the "Final Stress Under Dead Load and Prestress". Here the Allowable and Actual Stresses are all zero. This also occurs for "Final Compressive Stresses-Design Loads", "Final Tensile Stresses-Design Loads", and "Final Stresses in Slab". Is there a button that I do not have checked causing these values to not be tabulated?

FROM:dteal DATE:Monday, February 06, 2006 2:33:45 PM  
Randall,  
This is what I do  
Use find and replace of any text editor  
Find: regsvr32  
Replace All: regsvr32 -s  
There is a space between the 2 and the -

FROM:jduray DATE:2/8/2006 10:10:49 AM  
I think we should modify the register.bat.

FROM:jihnata DATE:2/23/2006 2:06:30 PM  
I've added the option to run in silent mode from the command line, i.e. "register /s". This is the option that I discussed originally with Randall.  
I didn't want to register silently by default because we sometimes use this as a diagnostic tool, to ensure that Virtis is installed correctly.  
To hardcode silent mode (in Beta 5 and later) replace all "%1" with "/s".  
Fixed for Beta 5, and changed project to Support Center.

FROM:dteal DATE:Monday, March 27, 2006 3:29:44 PM  
In Beta 7  
"%1" does not appear in the Register.bat file  
Did I misunderstand when you said:

(in Beta 5 and later) replace all "%1" with "/s".  
Fixed for Beta 5

FROM:dteal DATE:Monday, March 27, 2006 3:32:39 PM  
Nevermind - I was looking at a 5.3 register.bat file  
The 5.4 beta 7 has the %1 like you stated

FROM:dteal DATE:Wednesday, April 19, 2006 3:19:54 PM  
Works for me

FROM:dteal DATE:Wednesday, September 06, 2006 10:06:57 AM  
Accepted in 5.4

| 7081.16251 | Discard       | Structure Typ Section: Add Sidewalk/Curb Definition & Compute Pedestrian Load |

### Description

FROM:gcolgrove DATE:Friday, February 03, 2006 9:54:16 AM

1.If the units are not set in the "Bridge Description" dialog for a bridge, then the program freezes when opening the "Impact / Dynamic Load Allowance" dialog. Any subsequent dialog requiring the units to be previously defined should check to see if it has been done. If it hasn't it should direct the user back to the description dialog to get it done.

2.We would like to see the sections of the "Impact / Dynamic Load Allowance" dialog changed to read:

- a. "Standard Impact Factor (LFD/ASD)" rather than "Standard Impact Factor"
- b. "Dynamic Load Allowance (LRFD)" rather than "LRFD Dynamic Load Allowance"
- c. This change should be made to both the Bridge and member dialogs.

FROM:jduray DATE:2/6/2006 9:50:33 AM

Joe - please resolve 1. Then mark as enhancement with status of suspended for 2.

FROM:jihnata DATE:2/6/2006 10:35:34 AM

It shouldn't be possible to create a new bridge without the system of units being set. I haven't been able to reproduce that. How did you create the bridge?

## Description

FROM:gcolgrove DATE:Friday, February 03, 2006 9:58:55 AM

1. With regards to sidewalks and curbs:

a. We would like the tab in the "Structure Typical Section" that currently reads "Sidewalk" be changed to "Sidewalk/Curb".

i. This would give a clear place to enter curb data. It would allow us to define curbs as we do with sidewalks. V/O would place the railings on top of either the sidewalks or curbs. This gives a visual confirmation that data was entered correctly.

ii. This will eliminate the need to include the curb with the railing load/configuration. The benefit being the rail definitions could be calculated easier.

iii. This should not change how people historically entered this information. People who choose to enter the rail definition with the curb should continue as they always have.

b. We offer this suggestion as a stepping stone to a feature that would calculate sidewalk loads automatically. With a separated definition of a curb/sidewalk and a rail we feel the software could then intelligently determine if the element is a sidewalk, thereby determining the necessity of a pedestrian load. If the software determines a sidewalk is necessary, then it would apply the load as prescribed by the LRFD manual

### Description

FROM:tarmbrecht DATE:Wednesday, February 15, 2006 2:50:06 PM

The attached model contains a 2-Span continuous superstructure w/48" PS concrete I-beams having LR strands & 7ksi concrete and a simple-span superstructure w/36" PS concrete I-beams having SR strands & 5ksi concrete. In both cases, BRASS determines that the ratings are controlled by "Concrete Tension". Based on the AASHTO Std. Specs., we don't believe this to be the case.

The difference between the two analyses appears to be due to a significantly lower final bottom fiber compression stress from the prestressing strands computed by BRASS. Unfortunately, all that can be gleaned from the BRASS output is the final (after losses) stress due to prestress. These values for the bottom fiber follow:

|                  | Initial (psi) | Loss  | Final (psi) |
|------------------|---------------|-------|-------------|
| 2-Span Cont. 48" | BRASS ?       | ?     | 2,471       |
| IL DOT           | 3,365         | 19.4% | 2,712       |
| 1-Span 36"       | BRASS         | ?     | ?           |
| IL DOT           | 1,428         | 11.1% | 1,269       |

4/19/2016 3:19:17 PM

HRS AASHTO

2062

**Complete Issue Information**

This difference for the 2-Span 48" beams is partially explained by the fact that BRASS appears to be using .7 f's for the initial strand stress instead of .75 f's as specified by AASHTO for low relaxation strands (9.15.1). The Initial stress should be  $.75 * 270 \text{ksi} = 202.5 \text{ksi}$ , not 189ksi as indicated by the BRASS output (below). 189ksi would be the value if the strands were stress-relieved.

PRESTRESSING STRAND PROPERTIES (2-Span Continuous 48" beams)

| Strand Code | Strand Type                   | Yield Point Stress (ksi) | Ultimate Strength (ksi) | Modulus of Elasticity (ksi) | Initial Stress (ksi) |
|-------------|-------------------------------|--------------------------|-------------------------|-----------------------------|----------------------|
| 1           | LOW RELAXATION - PRETENSIONED | 243.0                    | 270.0                   | 28500.                      | 189.0                |

By increasing f's to 289ksi, in order to obtain the desired initial stress, the final bottom fiber compressive stress from the prestress is increased to 2637psi, which is still 75psi less. It is assumed that there are also some differences in loss computation. (When this is done, the Strength rating for positive moment is also affected. Therefore this is not a suitable workaround, unless the strength rating has also been adversely affected by the erroneous Initial Stress value.)

The strand properties for the 36" beams w/stress-relieved strands printed in the output is correct.

The question is what accounts for the differences between BRASS & AASHTO?

FROM: bgoodrich DATE: Friday, March 03, 2006 2:15:51 PM

For both structure definitions, the jacking stress is set to 0.7 in the Prestress Properties. BRASS is just using the value that was input. I believe this explains why the initial stress is lower than expected for the 2-span structure.

To determine the concrete tension rating factor, you can use the intermediate output for the 9.15.2.2(b) and 9.15.2.2(c) checks. For the 1-span structure "N. Vault Appr. Span PSI", member "2A - 2nd W Int", member alt "36" PS I-Beam", BRASS provides the following output:

\* At point 105.000

AASHTO Serviceability Check 9.15.2.2(b)

Stage 1 DL stress in top of beam = -1077. psi  
 Stage 2 DL stress in top of beam = -6. psi  
 Stage 3 DL stress in top of beam = 0. psi  
 Stage 1 DL stress in bot of beam = 802. psi  
 Stage 2 DL stress in bot of beam = 30. psi  
 Stage 3 DL stress in bot of beam = 0. psi  
 For Stage 2,  
 Stress in top of beam due to prestress = 16. psi  
 Stress in bot of beam due to prestress = -1149. psi  
 0.4 fc prime = 2000. psi  
 sqrt fc prime = 71.  
 End Serviceability Check 9.15.2.2(b)

AASHTO Serviceability Check 9.15.2.2(c)

**Complete Issue Information**

Factor for fc prime = fct = 0.40  
 Live Load stress in top of beam = -143. psi  
 Live Load stress in bot of beam = 760. psi  
 1/2 dead load & prestress stress in top = -533. psi  
 1/2 dead load & prestress stress in bot = -158. psi  
 fct \* fc prime = 2000. psi

Using 6\*SQRT(f'c) for the tension limit with f'c = 5000 psi and the stresses in the bottom of the beam from the above output, the rating factor is calculated as:

$$RF = [6 * \text{SQRT}(5000) - (802 + 30 - 1149)] / 760 = 0.975$$

FROM:bgoodrich DATE:Tuesday, March 07, 2006 3:33:41 PM  
 E-mail from user:

Yep, it looks like when we changed from low-relaxation to stress-relieved strands, the jacking stress didn't automatically change and we weren't aware of it. That appears to be the cause of our problem. Thanks,

Tim

### Description

FROM:tarmbrecht DATE:Wednesday, February 15, 2006 2:52:21 PM

Use file for incident 7105

When a POI between .992 & 1.008 of Span 1 is specified, Virtis/BRASS does not recognize it. If other POI's &/or tenth points are specified, there is simply no detailed output for it in the BRASS Output file. If analysis is requested to be restricted to only between .992 & 1.008 of Span1, the analysis is halted and an error message produced.

FROM:bgoodrich DATE:Friday, March 03, 2006 2:22:55 PM

I entered a POI at 81.75 ft and received the following message in the Analysis Progress dialog. This message can also be reviewed in the LOG file.

WARNING (Medium):

The point of interest specified at a distance of 81.750 (in,mm) is being IGNORED because it is located outside the span lengths used in the BRASS P/S model. This is a restriction of the 'Centerline of Bearing' P/S modeling method.

I corrected the units in the note which should be in feet.

### Description

FROM:tarmbrecht DATE:Wednesday, February 15, 2006 2:55:22 PM

In the attached model for Superstructure Definitions, "Spans 16-17 - 17-18" & "Spans 23-24 - 25-C", when attempting to bring up the View Schematic for the Member Alternative, an error message is returned (Invalid Argument) and the schematic does not appear except for a few marks. However, when a new view magnification is selected, the graphic of the girder appears but w/o the labeling and dimensions. For the other Superstructure Definition, "Spans 18-19 - 19-20", this function works properly. All of the Superstructure Definitions were copied from other ones and modified.

Same thing for 0810114x.bbd except that the results are also in error. The 3-Span continuous welded plate-girder structure (3-Sp Cont WPG(Bad)) is nearly symmetrical, yet, the dead-load moments vary widely from the 1st span to the 3rd span. At corresponding locations, e.g., supports 2 & 3; .4 of Sp. 1

4/19/2016 3:19:18 PM

HRS AASHTO

2066

**Complete Issue Information**

& .6 of Sp. 3, where moments should be close to the same, they are not. The same configuration was assembled from scratch w/o copying from another superstructure definition and the results were as one would expect (see 3-Sp Cont WPG(Good)).

FROM:jihnat DATE:2/16/2006 1:10:24 PM

The problem with the schematic looks like the same as 6138.

It appears that the members at one time had two additional spans. When the spans were decreased the Bearing Stiffener Locations were not deleted.

The workaround for the schematic problem is the same as for 6138:

1. Increase number of spans by two on the Member window. Enter span lengths. Hit OK.
2. Open the new Bearing Stiffener Location windows. Enter 0 for "Pairs of bearing stiffeners at this support". Hit OK.
3. Decrease number of spans by 2.
4. You should be able to see the girder profile now.

FROM:jihnat DATE:2/16/2006 1:41:56 PM

For 0810114x, I rated both bridges then diff'ed the DAT files.

I noticed that Bad had a hinge that Good did not have.

When I removed the hinge from Bad, the dead load moments came out more symmetric(al).

FROM:mordoobadi DATE:3/20/2006 9:23:13 AM

Accepted by Tim Armbrecht:

2. Incident 7107: Appears to no longer retain unwanted data from source of copied Superstructure. (e.g., Bearing stiffeners that had been specified for Support #5 of a 4-span superstructure in what is made into a 3-span superstructure.)

|                                                                 |

### Description

FROM:tarmbrecht DATE:Wednesday, February 15, 2006 2:58:07 PM

In the input table for Deck Concrete under Deck Profile for steel line girder models there is no column to indicate the Span. (In this table, the Start Distance entry is the location within a subject span, not the distance from the beginning of the structure.) It is essential that the Span number be listed. See attached Word document for graphic. I also attached the bbd file for reference.

FROM:jduray DATE:2/16/2006 8:19:49 AM

Joe - please investigate.

Based on Tim's description I agree the span column should be there like it is for GS. Any idea why it isn't?

FROM:jihnat DATE:2/16/2006 11:00:41 AM

The attached bridge is a Girder System structure def and the Support Number (column 2) is visible when I open the Deck Profile window.

Regardless, it sounds like the saved column width in the registry has gotten set to zero.

Try deleting the entry from the registry: "HKEY\_CURRENT\_USER\Software\AASHTOWare Virtis\Opis\Virtis\Opis\Settings\UiDeckConcreteDlg\_Grid0" (and \_Grid1)

It would probably be a better idea to delete "HKEY\_CURRENT\_USER\Software\AASHTOWare Virtis\Opis\Virtis\Opis\Settings"

Be aware that deleting all the Settings will remove all of your saved Virtis window positions, window sizes and grid column widths.

FROM:jihnat DATE:2/16/2006 11:39:57 AM

I think I found the cause of the problem.

After opening this window for a Floor Line floorbeam or stringer member (which hide the Support Number column), the column was no longer visible for Girder Line members.

Fixed for 5.4.0

FROM:mordoobadi DATE:3/20/2006 9:24:23 AM

Accepted By Tim Armbrecht:

3. Incident7108: Support column now visible for steel Line-Girder superstructures.

FROM:jihnat DATE:3/20/2006 9:46:14 AM

Since this was a bug in the previous release, I've added this to the 5.4.0 release notes.

**Description**

FROM:tarmbrecht DATE:Wednesday, February 15, 2006 3:14:58 PM

Please see attached Word document for illustration.

Is it necessary to require entry of the PS concrete being used in two separate places for a Member alternative? First it is specified under Stress Limits for the Superstructure Definition, then it is entered in two separate places under Member Alternatives/Beam Detail.

## Complete Issue Information

Since the Girder Material (under the Span Detail tab) and the Name (under the Stress Limit Ranges tab) should always be the same, it seems that only one entry, say under the Span Detail tab, should be necessary.

Apart from the inconvenience of redundant entry, a problem that can occur (and has) is that the Concrete Material can be changed in the item under Stress Limits w/o changing the Girder Material (as should be done). This can result in unexpected and erroneous results.

FROM:jduray DATE:2/16/2006 8:25:51 AM

The stress limits are a function of the concrete material so that is why it must be specified on the Stress Limit Set window. I think it is ok to specify the concrete material on the Span Detail tab so we know what the material is for the entire beam. We filter the stress limits on the Stress Limit Ranges tab so only the stress limits for the concrete material specified on the Span Detail tab are available. We don't allow the window to be closed if the concrete material is changed on the Span Detail tab without correcting the assignment of stress limits on the Stress Limit Ranges tab. It doesn't seem possible to have a mismatch between the stress limits and the concrete material. I don't see it as duplicate data entry. The concrete material for the beam is only specified once - on the Span Detail tab. Stress limits that correspond to the concrete material are selected on the Stress Limit Ranges tab.

FROM:tarmbrecht DATE:Thursday, February 16, 2006 12:53:45 PM

Jim, it is possible to get different values between the "Girder Material" under the Span Details tab and the "Name" under the Stress Limit Ranges tab. My consultant was able to do it:

1. Set up your model, e.g. - 0450082(PSAnalysisProblems).bbd (see incident 7105).
2. Changing nothing, select the Member Alternative under one of the Members (say, 48" PS I-Beam under 3 - 2nd W Int/) and analyze it.
3. In the BRASS Output File, under AASHTO Serviceability Check 9.15.2.2(b) find/check the values for 0.4 fc prime (2800. psi) and sqrt fc prime (84.), which are as they should be for  $f'c = 7000$  as specified in the Stress Limit Set for the Superstructure Definition.
4. Close the output file, go back to the model, call up the defined Stress Limit Set and change the Concrete Material from its current concrete material reference ( $f'c = 7000$  psi in the referenced model) to a different one (say,  $f'c = 6000$  psi).
5. Changing nothing else, analyze the same Member Alternative again and check the same values in the output. You will find that they are the same as before. For  $f'c = 6000$  psi, the values should be, respectively, 2400. psi & 77.

So, effectively, the values for  $f'c$  under the Span Details & Stress Limit Ranges tabs are different. This should not be possible.

The duplicate entry/redundancy is not so much with having to enter a Stress Limit Set and also to specify it under the Member Alternative. We understand the necessity of that. It is, however, duplicate entry when, under the Beam Details, we must enter the Girder Material (w/reference to Materials/Concrete) in addition to the Name of the Stress Limit Set, which already must contain a reference to the same Concrete Material for the applicable span of the Beam. If the Girder Material and the Concrete Material for the named Stress Limit Set must always match, why do we have to manually enter the Girder Material? The system should automatically use the Concrete Material specified for the applicable Stress Limit Set. If this were done, there would obviously be no need for the Girder Material field under the Span Details tab to be editable, tho', if desired, it could still be displayed as a non-editable field. If the Girder Material was automatically generated according to the "Name" entered under the Stress Limit Ranges tab, this probably wouldn't be an issue.

**Complete Issue Information**

Removal of Girder Material selection from window is an enhancement request to change the UI. Incident 7197 deals with some validation to help with this problem.

FROM:kkennelly DATE:5/2/2006 9:23:23 AM

Also note that BRASS LFD does not use the allowable concrete stresses on the Stress Limit window, it computes them based on the concrete material assigned to the girder.

**Complete Issue Information**

**Description**

FROM:snshah DATE:Wednesday, March 15, 2006 2:21:07 PM

I entered a steel plate girder into Virtis/Opis and it doesn't seem to be analyzing the web bend buckling correctly.

In LRFD code, AASHTO 6.10.1.9.2 Webs with Longitudinal Stiffeners the term ds is the distance from the longitudinal stiffener to the compression flange. However, in the positive moment region of my girder (amongst other locations), BRASS is calculating ds from the longitudinal stiffener to the bottom flange.

In the LFD code, AASHTO 10.48.6 Longitudinally Stiffened Girders it specifies that the longitudinal stiffener shall be placed at a distance of D/5 from the compression flange. However, in the positive moment region, it is again calculating depth of the longitudinal stiffener to the bottom flange.

I have attached the bbd file. Am I doing something wrong?

FROM:bgoodrich DATE:Monday, April 24, 2006 1:38:19 PM

Your longitudinal stiffener input looks fine. I am not able to exactly duplicate the results shown in the Output.jpg file. I was able to run the exterior girder, and some places in the output show the distance to the longitudinal stiffener as 120.375 inches. Please attach the following files to this incident:

- Exterior\_Girder.DAT
- Exterior\_Girder.OUT
- Exterior\_Girder(105.000).OUT

On a side note, F-Shape Barrier (PL-2) is defined as having a unit weight of 150 kcf instead of 0.15 kcf.

FROM:snshah DATE:Tuesday, April 25, 2006 2:59:02 PM

I updated the parapet unit weight to 0.15 kcf and re-ran the girder. I am still getting the errors. I have attached the files you have requested for your review. Thanks for your help.

FROM:bgoodrich DATE:Friday, June 16, 2006 11:21:04 AM

After reviewing the output files, it was determined that the issue of the longitudinal stiffener distance was corrected in a previous release of BRASS. Your GUI input is fine. Upgrading to Opis 5.3.1 or 5.4 will correct the problem.

### Description

FROM:snsah DATE:Wednesday, March 15, 2006 2:38:57 PM

I entered a steel plate girder into Virtis/Opis and the longitudinal stiffeners are not shown correctly on the schematic.

Over the second support, the longitudinal stiffener should extend along the bottom of the girder as specified in the longitudinal stiffener tab.

I have attached the bbd file and a few screen shots.

FROM:jhnat DATE:3/16/2006 9:14:21 AM

The screen shot shows plate stiffeners, but there are also angle stiffeners defined. Is this the intent?

FROM:snsah DATE:Thursday, March 16, 2006 10:52:46 AM

There are both plate stiffeners and angle stiffeners along the length of the girder, however over the second support there should be a plate stiffener which goes from the termination of the two angle stiffeners at the point of contraflexure in the second span to the start of the two angle stiffeners at the point of contraflexure in the third span. In the schematic, however, it shows the plate stiffener

4/19/2016 3:19:21 PM

HRS AASHTO

2078

**Complete Issue Information**

terminating at approximately 35 feet from the end of the two angle stiffeners located in the second span.

FROM:jihnmat DATE:4/4/2006 8:40:02 AM

This has already been fixed for version 5.4.0. Probably the same as incident 6430, item #2.

**Description**

FROM:mordoobadi DATE:3/20/2006 9:16:30 AM

From Tim Armbrecht:

Other suggested issues that should be addressed w/program enhancements.

1. When specifying modified LFD Load Factors, the Resistance\* Factors must be manually coded or they are assumed by Virtis to be 0.0. When any of the available load or strength reduction factors are left blank, they should be assumed to be unchanged from the AASHTO specification. \*This term should be changed to Strength Reduction in accordance with AASHTO LFD specifications since "Resistance" is not used there at all.
3. Utilization of rebar development length not possible in the analysis of concrete structures using

4/19/2016 3:19:21 PM

HRS AASHTO

2079

**Complete Issue Information**

BRASS.

4. For non-composite structures Stage 2 loads cannot be specified as uniformly distributed. AASHTO specifies that superimposed dead loads (SDL's) such as parapets & wearing surface are distributed uniformly to all beams w/o regard to composite or non-composite beam action. Virtis should be modified to allow system computation of uniformly distributed SDL's for non-composite structures.

| 7247.16085 | Resolved      | Filter list of bridges based on attribute texts should perform the same for different databases. |

## Description

FROM:bgoodrich DATE:Friday, April 07, 2006 10:44:18 AM

The following issues were found during the Florida training (April 4-7) in the training manuals:

1. The BWS tree needs to be updated under the BRIDGE ALTERNATIVES folder, so it says SUPERSTRUCTURE instead of STRUCTURE. See pages STL1-20, RC2-7, PS1-12, and RC5-6.
2. The concrete material window on page PS1-5 needs to match the corresponding window in the LIB1 example on page LIB1-5.
3. On page PS1-32, the text at the top of the page discusses a "Modify" button that no longer exists. The text also says to enter the harp point location and close the window prior to selecting the Left button and selecting the strand layout. The harp point location is only saved to memory when one or more strands are harped.

FROM:jduray DATE:4/10/2006 9:39:29 AM

We should fix these issues when we update the examples for 5he 5.5 release.

FROM:xli DATE:3/2/2007 3:29:57 PM

| 7256.16078 | Resolved      | Analysis Settings Template window doesn't respond to arrow keys |

### Description

FROM:hlee DATE:4/12/2006 4:36:18 PM  
Currently, rating will not be performed.

Unable to build the list of components to be analyzed.  
- Please assign a Structure Definition to Structure Alternative.  
No Structure Definitions assigned to Structure Alternative.

FROM:mordoobadi DATE:7/5/2006 12:26:35 PM  
Fixed for 5.5 Beta 3.

FROM:jihnat DATE:8/29/2006 8:37:28 AM  
What was the original intent of this request? Now the rating does not continue and no error message is displayed.

FROM:jduray DATE:9/1/2006 7:56:10 AM  
If there is a superstructure without a superstructure alt or without a structure definition assigned to the alt the analysis should issue a message (to be displayed when finished with all analyses) and continue to analyze other completed superstructures. The tree on the left of the progress dialog should show all of the components that should be analyzed. Those that were successful should be shown with a checkmark and those unable to be analyzed should be shown with an x.

FROM:mordoobadi DATE:9/6/2006 10:17:00 AM  
Implemented Jim's suggestion above.

### Description

FROM:jihnat DATE:4/17/2006 10:08:45 AM  
Received via email from Robert Kelley <KELLEYS@michigan.gov>

When modeling a side by side prestressed concrete box beam superstructure, I had Virtis compute the live load distribution factor. I used S/11 distribution and I could not verify that using the 16th edition of the AASHTO Std. Specs. I would have used the formulas in 3.23.4.3 and got something much different.

Question 1: May we assume that for side by side box beam superstructures, that we will have to compute the distribution factors manually and input them? I believe that answer would be yes, else how would Virtis differentiate between the side by side design vs. spread box beams?

Question 2: Will Virtis be revised for the 17th edition of the Std. Specs?

4/19/2016 3:19:24 PM

HRS AASHTO

2096

### Complete Issue Information

FROM:kkennelly DATE:4/17/2006 12:53:00 PM

Question 1: Virtis can only determine spread vs. adjacent boxes if you have member alternatives created for all of your girders and a ps box shape assigned to each member alternative in the Beam Details window.

If you don't have all of your member alternatives created or don't have a ps box shape assigned in each member alt's Beam Details window, Virtis assumes that the boxes are spread and uses AASHTO 3.28 to compute the distribution factor.

Incident 7219 addresses this problem. Version 5.5 will check if the mbr alts on either side of the girder in question have ps box shapes assigned to them when the distribution factors are computed. If the adjacent mbr alts don't exist or don't have beam shapes assigned to them, Virtis will issue a message that it cannot determine if spread or adjacent boxes exist and the dist factor will not be computed.

Question 2: Version 5.5 of Virtis will follow the 17th edition of the Specs. However, in our review of the Virtis user interface we did not find anything that actually has to be updated for the 17th edition. Is there a particular item in Virtis that you think must be updated for the 17th edition?

**Description**

FROM:dkoenig DATE:Thursday, April 20, 2006 9:44:48 AM

We have stumbled onto a problem with the girder schematic for plate girders. When entering longitudinal stiffeners, one of the options is to enter the location as a percentage of the web depth. The number should be entered as a percentage (i.e. whole number). When you enter the value as a whole number, the schematic does not display the stiffener correctly. In the attached bbd file, notice that over the intermediate supports, the longitudinal stiffener is showing on the schematic as way above the girder. The first longitudinal stiffener was input using a distance from the flange, and it displays correctly. This can be found on the first member alternative in the attached file.

FROM:jihnath DATE:5/2/2006 2:55:51 PM  
Similar to 7030?

FROM:jihnath DATE:5/3/2006 7:35:05 AM  
The workaround is to enter the percentage as a fraction between 0 and 1.

FROM:jihnath DATE:5/3/2006 7:44:44 AM  
Same as 7030 (#2).

FROM:dkoenig DATE:Tuesday, May 09, 2006 2:17:55 PM  
All this workaround does is make the schematic look correct. If you do it, then the BRASS export file will not produce the correct location for the longitudinal stiffener. This could lead to analysis errors. Because of this, the workaround should probably not be used. The code that is creating the schematic for these situations needs to be corrected so that it will properly display the stiffener.

FROM:jihnath DATE:5/9/2006 3:40:23 PM  
My bad. You are correct. Don't use the workaround.

### Description

FROM:jihnata DATE:5/4/2006 2:29:04 PM

- 1) Open BID 13 and BID 15
- 2) Copy Floorbeam Def "Floorbeam 1" from BID 15 to BID 13
- 3) The Floorbeam Definition Load does not get copied (Uniform, SIP Forms)

FROM:jduray DATE:5/8/2006 10:58:40 AM

Is this new or did this problem exist in 5.3 and earlier?

FROM:kkennelly DATE:5/10/2006 8:56:34 AM

This existed in version 5.2

FROM:kkennelly DATE:5/10/2006 10:39:19 AM

Fixed for version 5.5. The problem was the assignment manager for the load cases was not being called in the UI before the floorbeam and stringer defs were copied.

FROM:jihnata DATE:5/31/2006 3:52:36 PM

OK in 5.5.0 Alpha Build 1.

### Description

FROM:tarmbrecht DATE:Friday, May 05, 2006 9:34:49 AM

In the attached model, the rating factors drop substantially when the point of DL contraflexure in span 1 is set to 76.62 (compared to 76.6, 76.61 or 76.63). The controlling rating factor when the value is 76.6, 76.61 or 76.63 is 1.638. When the value is set to 76.62 (and only that value), the rating factor is 0.995.

FROM:bgoodrich DATE:Monday, January 29, 2007 2:43:56 PM

I ran this bridge with version 5.3.1 and 5.5 with the various contraflexure percents for span 1. I get the same controlling rating factor (~1.6) for all cases, which is for the design lane. Is this problem still

**Complete Issue Information**

occurring? If so, please attach the BRASS data files that are generated.

FROM:tarmbrecht DATE:Tuesday, February 27, 2007 5:06:32 PM

Brian, we still appear to run into the same problems as before. I have attached a new xml file and the data output files.

FROM:bgoodrich DATE:Wednesday, February 28, 2007 4:25:46 PM

Tim's tolerance settings are:

|      |           |
|------|-----------|
| Unit | Tolerance |
| ft   | 0.01      |
| In   | 0.125     |

Using these tolerances, I was able to duplicate Tim's low rating. Based on the BRASS files, it is clear that the source of the problem is in the generation of the STEEL-GIRDER-CONTROL command for one of the ranges. The use of the tolerances in the export is affecting how the export determines if one of the ranges is composite or not. For the above tolerances one of the ranges is non-composite when it was composite in previous versions.

FROM:bgoodrich DATE:Wednesday, March 14, 2007 1:12:39 PM

The export creates an array of internal cross section change points. Shear connector ranges and contraflexure locations are among the items that make up this array. The end of the shear connector range was 202.5938 ft and the contraflexure location at 76.62% of span 1 was 202.604044 ft. One tolerance was used to determine if these points were essentially the same point and one of the points was removed. Another tolerance was used to determine if a range was in a composite region or not. The export was revised to use the same tolerance for both. Fixed for version 5.6.

The 76.62% was probably supposed to be exactly where the shear connector range ended, but the percentage was just rounded. The longer the span, the more accurate the contraflexure location percent must be.

### Description

FROM:jihnat DATE:5/5/2006 12:17:40 PM  
Received via email:

We here at the Tennessee DOT are experiencing a problem with the subject software as described below:

1. We are getting failure of shear connectors for a steel girder bridge which is a 2-span bridge, each span = 125.65 feet. When checking the specification check detail for the failure, the input value for  $E_c$ , the modulus of elasticity of concrete, is shown as 2.93 ksi for the exterior girders and 293.82 ksi for the interior girders. We input  $E_c$  as 3320.56 ksi. The low values of  $E_c$  that the program is using is resulting in an exceptional number of stud shear connectors required, as many as 2485 connectors over a distance of about 75 feet.

2. A second problem has been encountered which also has to do with the stud shear connectors. We tried entering a concrete strength different than what was used in paragraph 1 above. In paragraph 1  $f'_c$  was entered at 3.0 ksi. When we tried  $f'_c$  at 5.0 ksi, the specification check detail showed  $f'_c$  at 3.0, ignoring the 5.0 ksi entry. And again  $E_c$  was shown 2.93 ksi.

Attached is the file created by Opis/Vertis. Thank you in advance for your help on this matter.

**Complete Issue Information**

1. BRASS LRFD does not accept the modulus of elasticity of the deck concrete as an input value. The following warning message is issued in the log file created when the Opis data is exported to the BRASS input file:

WARNING (Medium):

For steel structures, there is no BRASS command parameter for directly inputting Ec for the deck. BRASS computes Ec as Es / n. The modular ratio could be set accordingly to obtain the correct Ec.

The modular ratio for the deck is entered on the Deck Profile window. For member G1, the first modular ratio entered on that window is "9897". That n value is why the Ec is computed as 2.93 ksi. For member G2, the first modular ratio is entered as "98.7". That is why its Ec is computed as 293 ksi.

2. I am not able to reproduce the problem of the 3 ksi being used instead of the 5 ksi. The Ec of 2.93 ksi is due to the value of n as described in item 1.

### Description

FROM:dteal DATE:Tuesday, May 09, 2006 12:04:56 PM

With both Virtis / Opis Superstructure and Opis Substructure installed on one PC it is tedious to say the least switching back and forth (register.bat)

We need three things added (fixed)

1. A more elegant way to register/re-register either piece of software.
2. The default in register.bat should be "/s" and not "%1"
3. The register.bat file should have an icon assigned to it (not a yucky windows default one) and placed on workspace just like the other program icons

FROM:jduray DATE:5/15/2006 11:17:57 AM

I will see what we can do to make this more friendly. Keep in mind though that we are asking that they not be installed on the same PC as V/O Superstructure. We don't want users confused by having to register.

FROM:dteal DATE:Monday, May 15, 2006 2:36:16 PM

That is exactly the problem – user will be confused.

How many designers have more than one pc available to them? I bet not very many. Every one of our designers have one pc and only one pc. If they are to make use of V/O superstructure and Opis substructure they have to co-exist on one pc -

FROM:hlee DATE:7/10/2006 9:22:56 AM

Changed Project to Support Center.

### Description

FROM:bha DATE:Friday, May 12, 2006 3:33:54 PM

According to Article 10.34.4.2 when the stiffener spacing exceeds the maximum spacing which is  $3 * D$  ( web depth) the allowable shear capacity should be calculated based on equation 10-25 instead of equation 10-26 of AASHTO 10.34.4.1.

For example girder G5 of spans 6&7 (attached .bbd file), at 1.0 tenths point the transverse stiffener input spacing is 177.5" > 171" (= 3D (max. spacing)), then the allowable shear stress computed from equation 10-25 with value of 7138 psi (not 10347 psi from equation 10-26).

Please investigate.

FROM:bgoodrich DATE:Friday, June 16, 2006 1:49:41 PM  
This issue has been forwarded to WYDOT for consideration.

FROM:bgoodrich DATE:Monday, March 05, 2007 5:47:49 PM  
E-mail from Mike Watters (WYDOT):

Since this is an ASD problem, we do not want to expend funds for this issue. If we get funding to fix any ASD problems, we will address it then.

Micheal J. Watters, P.E.

### Description

FROM:hlee DATE:6/7/2006 10:43:16 AM

1. Same window shouldn't be able to open more than one time. For example, double-click on System Defaults will open a System Defaults window. If you double-click on System Defaults again, it will open another System Defaults window. It should set focus on the first System Defaults window instead.
2. When you close Configuration Browser, child windows should also be closed. For example, if you close Configuration Browser window when the System Defaults window is opened, the System Defaults windows will still be there after Configuration Browser is closed.

FROM:jhnat DATE:8/15/2006 2:42:29 PM

Fixed in 5.5 and 5.6 code.

For consistency, I made #2 change to Library Explorer also.

### Description

FROM:jihnmat DATE:6/7/2006 3:10:52 PM  
Received via email:

In saving a bridge description, I get the following warning for each defined beam:

Warning: LRFD live load distribution factors not defined.  
Warning: LRFD live load distribution factors not defined.

QUESTION ONE: I thought that the underlying BRASS engine calculated the distribution factors from the described beam, deck, and haunch.

--Why is Virtis/Opis warning me about the absence of LRFD Live Load Distribution Factors input?

QUESTION TWO: Previous savings had only reported this LRFD warning in ONE LINE. Now, the system repeats it (twice for every beam).

--Is this evidence there is some kind of inadvertent duplication somewhere or is it a minor bug?

**Complete Issue Information**

Krishna, could you please respond to this incident.

FROM:kkennelly DATE:6/28/2006 8:04:17 AM

QUESTION ONE:

--Why is Virtis/Opis warning me about the absence of LRFD Live Load Distribution Factors input?

ANSWER: The BRASS LRFD engine does compute the live load distribution factors for you but Virtis/Opis warns you of their absence because other engines may be hooked up to Virtis/Opis in the future and they may require these distribution factors. The Virtis/Opis user interface is meant to be independent of the analysis engines hooked up to it.

QUESTION TWO:

--Is this evidence there is some kind of inadvertent duplication somewhere or is it a minor bug?

ANSWER: I think the repeated warning is a minor bug. We will investigate.

FROM:kkennelly DATE:6/28/2006 8:31:07 AM

QUESTION TWO will be resolved as part of incident 7472 for the 5.5 release later this summer.

**Description**

FROM:dteal DATE:Tuesday, June 13, 2006 12:16:58 PM  
Xml attached  
Using the POI Wizard to generate all POI's. Analyzed at the generated POI's plus 10th points. Opis (brass errors) tells me I have duplicate commands.  
Virtis is OK with the same input file.

FROM:dteal DATE:Tuesday, June 13, 2006 1:16:02 PM  
In LRFD I found that it is generating POI's too close causing some errors.

FROM:dteal DATE:Tuesday, June 13, 2006 1:31:26 PM  
If I delete POI's that appear very close - Opis will run to completion

FROM:jduray DATE:6/13/2006 1:37:36 PM  
Seems we need to look for POI too close (need a tolerance and it may differ between engines)

4/19/2016 3:19:29 PM

HRS AASHTO

2116

## Complete Issue Information

FROM:kkennelly DATE:7/12/2006 9:41:15 AM

1. I don't think the Wizard should use a tolerance from an engine when it generates the points of interest. The wizard should simply follow the spec when it generates the POI's. The bridge data should be independent of the engine being used. Each engine should use its own tolerance when generating the commands for its input file.

2. Currently when Virtis/Opis generates the cross section ranges, it merges adjacent ranges based on the user tolerance input on the Systems Default Window. That is working correctly in this example.

3. The problem is the CONC-FATIGUE, CONC-AXIAL-LOAD and OUTPUT-INTERMEDIATE commands generated by the BRASS LRFD export for this problem. The export generates these commands for distances to the fourth decimal place but then BRASS LRFD complains that commands are repeated for distances using the second decimal place.

Partial commands generated by export:

CONC-FATIGUE 101.5312,  
CONC-FATIGUE 101.5318,

Then the following error is issued:

\*\* ERROR: The CONC-FATIGUE command has already been entered for Point of Interest 101.53.

Check the input file for a duplicate command.

FROM:kkennelly DATE:7/12/2006 10:44:38 AM

Project changed from beta testing to Support Center since this an existing bug.

FROM:bgoodrich DATE:Thursday, October 12, 2006 11:15:38 AM

The export was revised to ignore duplicate points of interest that were generated by Virtis/Opis. If user-defined duplicates are detected, an error is still issued. The attached bridge is successfully exported and analyzed for both LFD and LRFD. Fixed for 5.5.

### Description

FROM:tarmbrecht DATE:Tuesday, June 13, 2006 2:59:35 PM

It would be a good idea to store the influence lines and surfaces. Once they are generated, they should be good for that bridge until there is a change (like deterioration). The next time a user wants to run a superload over the bridge, the analysis should go a lot faster. Since it can take up to an hour to analyze a superload over a 5 span bridge, a user would probably be willing to put up with this kind of delay once.

FROM:hlee DATE:7/10/2006 9:27:28 AM

| 7446.15888 | Suspended     | truss deck def needs to include timber decks |

### Description

FROM:dteal DATE:Thursday, June 15, 2006 11:42:46 AM

We have to enter the number of spans and span lengths "again". With a very long structure this can be tedious. Would like to see maybe a check box to select one of the structures you have already entered, similar to the pulldown on the next window (superstructure alternative).

Robert F. has a very good example of how tedious this extra input is.

FROM:jduray DATE:6/16/2006 8:11:13 AM

We need to address this for the 5.5 release if possible. We may need to get TF approval and charge to TF Directed for this work since it is an enhancement, not a bug.

First step is to brainstorm some ideas and then give the TAG and TF some mockups. Should try to have a plan for the TF to review before the July 12th TF meeting so they can discuss and approve.

### Description

FROM:dkoenig DATE:Friday, June 16, 2006 11:50:35 AM

We have been getting an error when running structures. The error indicates and error loading BRASS DLL. A screen shot of the error message is showing below. We have not been able to find any consistency in producing this error. It is happening randomly. Things will work fine for a while, and then we will start getting the error message when we run a structure. It doesn't always happen on a structure. It may run fine one time and then give the error message the next time. The bbd file of a structure that it has happened on is attached.

FROM:jihnmat DATE:6/16/2006 12:43:20 PM

Can't see the contents of the Analysis Progress dialog, but an Error Code = 8 would indicate insufficient memory to load BRASS.

Try increasing the maximum size of virtual memory by about 400 MB.

What version of Windows are you running?

FROM:dkoenig DATE:Friday, June 16, 2006 3:53:01 PM

The error code is as you suspected.

4/19/2016 3:19:31 PM

HRS AASHTO

2127

**Complete Issue Information**

Data file successfully exported!  
Error loading BRASS DLL! (Error Code = 8)

We are running Windows 2000 5.00.2195 Service Pack 4.

My machine has 256 MB Ram. My virtual memory appears to be in the range of 340 to 400.

Did you mean to increase the virtual memory size to 400 or increase it by 400? If you meant to increase it, then are you wanting something in the 700 to 800 range based on my apparent machine settings?

FROM:jihnat DATE:6/19/2006 7:12:27 AM  
In the virtual memory settings (Control Panel, System, Advanced, Performance Options, Change) there is an Initial size and a Maximum size.  
What is the current Maximum size? Try increasing it by 400 (don't forget to click Set).  
I think it needs to be in the 750-800 range if Virtis is the only application running.

FROM:dkoenig DATE:Monday, June 19, 2006 8:50:17 AM  
I found the virtual memory settings that you were looking for. The initial size is 384 and the maximum size is 768. All of the users that have had this error have the same settings. Based on your comment above, the maximum already appears to be within the range that you think is needed. Do you still want us to increase the maximum size of the virtual memory?

FROM:dkoenig DATE:Monday, June 26, 2006 10:02:03 AM  
We reinitialized the virtual memory settings per your discussions with our computer person. This eliminated the error for several days. We recieved the error again on Friday on a machine that had been adjusted based on your feedback. We will keep you updated.

FROM:jihnat DATE:7/5/2006 10:52:41 AM  
Spoke to John Gahagan this morning (573-526-4435). He gets error on a Windows 2000 system with 1 GB RAM.  
Virtual memory is set to 1524/3048 (initial/maximum) and pagefile does not appear to be fragmented. Permissions seem to be set correctly.

FROM:jihnat DATE:7/7/2006 2:55:06 PM  
John got all the available Windows Updates this morning and now it's working OK.  
There's an Update Rollup 1 for Windows 2000 SP4.  
(In the interim, we had sent them a BRASS DLL that used less memory, which also worked OK but was a special build of 5.9.3 Beta 3.)

## Description

FROM:dkoenig DATE:Friday, June 16, 2006 11:57:48 AM

We updated to Version 5.4 this week. We have an Oracle setup on our database. We have noticed a tremendous difference in the performance of the program since we updated it. It takes a long time for the program to open up. It is also taking significantly longer to analyze a structure. I don't know if there is a problem with our installation. Based on the testing that was done prior to release, should it be expected that there will be significant differences in the performance of the program? If not, then we need to try and figure out what is causing our problems.

FROM:jduray DATE:6/19/2006 10:20:21 AM

BRASS-Girder takes significantly longer to initialize each time and analysis is run. I believe WyDOT will have an update that addresses the problem. We are not aware of any other performance issues with the 5.4 release. Other than running BRASS, are there other issues? If so, please provide details so we can investigate.

FROM:dkoenig DATE:Monday, June 19, 2006 10:58:19 AM

The analysis time is the biggest issue. We have also noticed that it seems to take longer for the program to load and bring up the database. We can open the program up and it takes 3 to 4 minutes for the program to retrieve the bridge list. It doesn't seem to matter how many structures you are

## Description

FROM:rwithers DATE:Wednesday, June 21, 2006 11:57:13 AM  
Mississippi is currently updating from Virtis version 5.2.0 to 5.4.0. We are using an Oracle 9.2.0.6.0 database. We ran the migration wizard to migrate the database from 5.2.0 to 5.4.0 and afterwards I load rated a bridge in our inventory and tried to save the new rating to the database. I got the following error:

Error updating database record set.  
10:57:08 AM - Line 434 in source file .\DmResultsLIAction.cpp.  
State:22003,Native:1426,Origin:[Oracle][ODBC][Ora]  
ORA-01426: numeric overflow

It will allow me to make changes to the bridge properties and save them, just not the rating data.

We then backed up and migrated from 5.2.0 to 5.3.0, which worked fine. We next stepped from 5.3.0 to 5.3.1, which also worked fine. However, when we went from 5.3.1 to 5.4.0, the same error occurred.

What do I need to do to fix this? If you need more information, tell me what you need and I will get it to you.

FROM:mordoobadi DATE:6/23/2006 8:46:51 AM

In order for us to be able to find out what's causing the problem we will need a copy of the bridge that you rated and wasn't able to save. Please export the bridge to an XML file and e-mail us at [bridgeware@mbakercorp.com](mailto:bridgeware@mbakercorp.com).

FROM:mordoobadi DATE:6/26/2006 3:42:14 PM

Fixed in 5.4.0 and later. AboRslt.dll posted on Support web-site.

## Description

FROM:dteal DATE:Thursday, June 22, 2006 8:24:48 AM

In the attached RC flat slab (RCB) I have two models set up. The rebar extends from left support to right support.

In the first model I did not hook the rebar ends but checked the box in the girder profile reinforcement tab for Fully Developed.

In the second model I hooked the rebar ends and then did not check the Fully Developed box.

In my eye, I think that the two should arrive at like results. In the model that has the hooked bars I believe that Virtis doesn't consider this bar developed out to the end and therefore fails the rating due to zero capacity at the first 10th point.

FROM:kkennelly DATE:6/26/2006 9:06:55 AM

As discussed in the "Export of Schedule Based Reinforced Concrete Members" help topic:

"When Virtis/Opis computes the percent development of a hooked bar at a point within the development length of the bar, Virtis/Opis assumes the bar is developed 0% at the start of the bar and 100% at the end of the development length. Hooked bars are actually developed more than 0% at the start of the bar due to the hook, but this percentage of development is not computed by Virtis/Opis."

The AASHTO specs don't give any guidance to computing the percent the hook is developed in the actual hook part of the bar and I couldn't find any textbooks that give an equation for this either. Since the AASHTO specs do give equations for the development length of a hook, Virtis doesn't assume the hook is completely developed at the start of the hook.

FROM:dteal DATE:Monday, June 26, 2006 9:39:42 AM

OK - Thanks

### Description

FROM:xli DATE:7/11/2006 9:24:00 AM  
To reproduce:  
1 Open BID8, analyze G2 with Virtis std engine  
2 Make a copy of BID8, do not close the original BID8  
3 Open the copied bridge, analyze G2 with Virtis std engine  
4 Close the copied bridge  
5 Open framing plan schematics window in the original BID8

Got system errors as follows:

4/19/2016 3:19:33 PM

HRS AASHTO

2134

## Complete Issue Information

Unable to retrieve Framing Plan data!

09:23:49 AM - Line 484 in source file c:\virtis\gui\abgbrdg2\schematicfrmplnview.cpp.

FROM:xli DATE:7/11/2006 9:29:09 AM

I tried other windows under the member alt, can't open any.

FROM:hlee DATE:7/11/2006 9:57:34 AM

I got a debug break when I switched to the original BID8 in Step 5.

CBridgeWorkSpaceView's OnUpdateTool called DoMemberAltPtr->GetSpngMbrDefId() and GetSpngMbrDefId() failed.

FROM:xli DATE:7/11/2006 10:39:21 AM

I tried to use Brass engine to do analysis, it breaks at step 4.

FROM:jihnat DATE:7/14/2006 2:45:38 PM

Reproduce without analyzing:

- 1 Open BID8
- 2 Make a copy of BID8, do not close the original BID8
- 3 Open the copied bridge, open then close Framing Plan Schematic
- 4 Open framing plan schematic window in the original BID8

FROM:jihnat DATE:7/14/2006 3:43:34 PM

This is probably related:

- 1 Open BID8
- 2 Make a copy of BID8, do not close the original BID8
- 3 Can't open BridgeAlt window in the original BID8

FROM:jihnat DATE:7/14/2006 3:47:24 PM

Export the original and the copy, compare the xml files.

FROM:mordoobadi DATE:7/14/2006 3:57:12 PM

This sounds like extra release(s) of domain dispatch(es).

FROM:mordoobadi DATE:7/14/2006 4:41:37 PM

This happens in 5.4. Also happens in 5.0.

FROM:mordoobadi DATE:7/14/2006 4:51:48 PM

I think we should disable copying a bridge when it is open.

The copy can be different from the original version of the bridge that the user wants to copy.

FROM:mordoobadi DATE:7/19/2006 9:10:36 AM

Joe, please disable copying of a bridge that is open in BWS.

FROM:jihnat DATE:7/19/2006 9:45:48 AM

Changed project to Support Center since this existed in prior versions.

FROM:jihnat DATE:9/7/2006 8:55:09 AM

Open bridges can no longer be copied.

Fixed in 5.5 (Beta 5) and 5.6

| 7504.15830 | Suspended     | Ability to define a entire bridge/structure definition for RC Slab bridges |

### Description

FROM:mordoobadi DATE:7/17/2006 9:27:43 AM  
Submitted via email by Bruce Woogen: Chas Sells 07/12/06 10:55 AM

We have been having a lot of problems with this specific bridge. I have been trying to delete both of the interior connection plate from transverse stiffener definition and The Dummy from bearing stiffener definition and I failed. Please take a look at it and let me know what to do at your most convenient.

FROM:mordoobadi DATE:7/17/2006 9:30:57 AM  
I found what is happening. I think the bridge used to have more girders (probably 3) then number of girders were reduced to 2. There was a bug in older versions of the Virtis/Opis application that when you removed a girder the software left behind some pieces of data in the database that will no longer be viewable in the application. For this reason the application detects that both the transverse and bearing stiffeners are in use.

One work around is to just remove the stiffeners from the "Stiffener Ranges" and "Bearing Stiffener Location" windows. You will not be able to remove the existing Stiffener definitions. You will be able to reuse the stiffener definitions, by renaming the existing stiffeners and changing their properties.

Krisha,

Can you please look at the attached file ?

Please try rating "G2" in structure "Span 2". It gives the following message.

4/19/2016 3:19:34 PM

HRS AASHTO

2141

## Complete Issue Information

"Splayed girders and/or tapered overhangs are not allowed! Error generating deck commands!"

If you notice the framing plan, there no splayed girders!! Neither are there any tapered overhangs in Cross section.

please let me know what can we do to be able to rate the girder.

Thanks,  
ALKESH PARIKH

Subject: Re: Virtis Project

Hi Alkesh,

Your structure has tapered overhangs due to the data entered on the Structure Typical Section: Deck tab. The total deck width at the start of the structure is  $44.82825 + 44.82825 = 89.6565'$ . The total deck width at the end of the structure is  $44.796627 + 44.796627 = 89.59325'$ .

So the deck width and thus the overhangs vary. The left overhang at the start is  $0.166667'$  and at the end is  $0.166538'$ . Virtis abbreviates these values as  $0.17'$  to make them easier to read as previous users have requested. You can view all of the decimal places when you select the cell where this data is entered. Virtis uses all of the significant digits that are entered when it performs its computations. You should adjust your entries as necessary if you do not intend the deck width to vary over the length of the structure.

Hi Krisha,

is there any way we can ask Virtis to use only two decimal digits ?

>>> "Alkesh Parikh" <AParikh@fstinc.com> 07/19/06 1:53 PM >>>

Krisha,

If I enter 89.6565 at the end of structure as well, it gives me incorrect value of "right overhang"

Here is my data

Left support has no skew. centre to centre of exterior girders at left support = 89.6565 ft out to out of deck at left support = 89.989833 (2" overhang on either side)

Right support has a skew of -2.1522 center to center of exterior girders at right support = 89.6565 ft out to out of deck at right support = 89.989833 (2" overhang on either side)

If I enter "distance between superstructure reference line and left end of deck" = 44.994917 (at start & end) and "distance between superstructure reference line and right end of deck" = 44.994917 (at start & end) and "left overhang" = 0.166667 ft (at start & end)

I get different numbers for "right overhang" at start & end !!!!

thanks,  
Alkesh

FROM:hlee DATE:7/28/2006 2:45:27 PM  
E-mail replied to Alkesh.

=====  
Alkesh,

I'm investigating the subject incident. After I entered your data described in Incident 7507 to the bridge that you sent to Krisha (see attached), Virtis computed right overhang matches my hand calculation.

Data in Structure Framing Plan Details window:  
Girder bay orientation is along support.  
Skew @ End = 2.1522 Deg.  
Girder Bay 1 @ End = 2.8915'  
Girder Bay 2, 3, ... , 17 @ End = 5.2500'  
Girder Bay 18 @ End = 2.7650'

Data in Structure Typical Section window:  
Left edge of deck to superstructure definition reference line @ End = 44.99492'  
Right edge of deck to superstructure definition reference line @ End= 44.99492'  
Left overhang @ End = 0.166667'

4/19/2016 3:19:34 PM

HRS AASHTO

2144

**Complete Issue Information**

Calculated right overhang  
= 44.99492' + 44.99492' - 0.166667' - (2.8915' + 16 \* 5.2500' + 2.7650') cos (2.1522)  
= 0.229917'

Please let me know if you have any questions.

Regards,  
Herman

after the install of 5.4 on all our system. We (MDT) need to repackage the installer to us it with our software delivery system. This was very painfull. Our systems person was wondering if the product is setup for a response file so that the install can be automated. If there is not, then we are requesting that all future installers have the capablility to run a response file with the installer for automated and silent installs.

| 7537.15797 | Resolved      | Virtis/Opis Help Bridge Description Figure 1 should use terms that matches the BWS. |

**Description**

FROM:hlee DATE:7/20/2006 4:25:32 PM  
Attached 2 files from the e-mail.

Bridgeware,  
In modeling in Virtis/Opis a cover plate that is tapered at both ends, we tried describing it as shown in the attached "VO Message" file.

When we put it in as the rectangular section starting EXACTLY at the end of the tapered section (both at 46.75 feet from the support), we get the error message shown.

If we enter the LENGTH of the taper as 2.99 or 2.999, it accepts the input.

I thought the taper allowance was to model just THIS SORT of cover plate (see drawing "Cover Plate"). Are we SUPPOSED to just shorten the taper part (or alternatively the rectangular section) a small amount like we did ...

OR is this a minor bug?

Steven Maberry

FROM:hlee DATE:7/28/2006 9:49:10 AM  
This defect is also in beam definitions.  
Resolved in 5.5 Release.

Reply e-mail to Danny Wampler:

=====  
Danny,

We checked the bridge that you sent us. Please make sure all Type 3 bar mark definitions (801c, 901c, 801ca, and 901ca) are located inside the depth of the slab. I have attached two screen captures of some of the input items that cause the error.

Let me know if you have more questions.

Regards,  
Herman Lee, PE

=====

FROM:hlee DATE:8/10/2006 4:39:22 PM  
PopulateAbaReinfDevBarData in DoGirderMbrAlt.cpp trys to get the slab's concrete material by DoCrossSectionPtr->GetTopFlangeConcreteDef().

I think rc slab should always get it by GetConcreteDef.

FROM:kkennelly DATE:8/16/2006 11:29:36 AM  
After discussion with Herman, I've added a check for the case where the bar is referenced from the bottom of the girder and the bar ends up being outside of the beam. An error message is then issued. This solves this user's problem by issuing a more descriptive error message of why the development length can't be computed.

| 7589.15746 | Resolved      | TrainingBridge3 bridge description is "Training bridge 2" |

**Description**

FROM:dteal DATE:Thursday, August 31, 2006 3:41:55 PM  
I can define a distributed load as a live load. I can run Opis. The load doesn't show up in the list of Live Loads in the tabular data – Does Opis not allow this?

FROM:bgoodrich DATE:Tuesday, September 19, 2006 7:59:33 PM  
Can you clarify how/where you are entering the distributed load as a live load, i.e., which windows. I don't quite understand the issue. Please attach your bridge if you think it will help.

FROM:dteal DATE:Wednesday, September 20, 2006 2:12:33 PM  
The program was being used to model a paving machine crossing a bridge. We wanted to use the live load short term factoring instead of dead load factoring.

In the example bridge I attached (taken from TrainingBridge1) has a LL load case for a paving machine, short term stage 3. In girder line 2 we have defined the LL distributed load case. For simplicity I haven't modified any distribution factors.  
After an Opis analysis, I wanted to find the moment/shears/reactions from this load case. The analysis results window doesn't contain any results for this load.

FROM:bgoodrich DATE:Friday, September 22, 2006 11:56:41 AM  
Now I understand the loading. However, BRASS LRFD only uses types D,DC and D,DW as stated in the engine help topic for the Load Case Description window.

If the paving machine is moving along the entire length of the bridge, I think you could model it using a truck with several axles spaced closely together.

### Description

FROM:jihnat DATE:9/7/2006 2:13:35 PM

Received via email:

After entering in information for a bridge with multiple spacings and a few splayed girders, I was unhappily confronted with error messages informing me that BRASS doesn't accept splayed girders. I'm assuming that since splayed girders can be entered in Virtis that there is a method to get around this. Could you please let me know what that is? I had already entered the live load distribution factors manually.

Thanks,

FROM:hlee DATE:9/7/2006 2:53:41 PM  
Reply e-mail to Beckie:

=====  
Beckie,

Splayed girder is not supported in Virtis 5.4. Although you may use girderline description, distribution factors cannot be entered in ranges. Splayed girder will be supported in Virtis 5.5 and only Virtis Std Engine will support this feature.

### Description

FROM:tarmbrecht DATE:Friday, September 08, 2006 5:11:37 PM

RE: 086-0040x.xml

In the attached model, after setting "Method used to determine Vci" to "no limit on Mcr/Mmax" reverts to the (non-AASHTO) default setting of "limit Mcr/Mmax to 1.0" unexpectedly. This will happen in the following sequence of events...

- set the value to "no limit on Mcr/Mmax", click <OK>
- click <Apply>
- under "Shear computation method", select the "Ignore shear" box for LFD, click <Apply>
- unselect the "Ignore shear" box for LFD, click <Apply>
- review the Engine Properties, where "Method used to determine Vci" has now been changed to "limit Mcr/Mmax to 1.0".

FROM:hlee DATE:9/11/2006 9:51:18 AM

Mcr/Mmax is used in the shear computation. When switching from not ignore shear to ignore shear and back, the default method (limit Mcr/Mmax to 1.0) to compute the Vci is set again.

FROM:jduray DATE:9/11/2006 11:22:28 AM

Should it be changed back to the default...sounds like Tim doesn't think it should be.

FROM:tarmbrecht DATE:Monday, September 11, 2006 1:39:22 PM

I would prefer that it is not changed back to the default, especially if I'm taking the time to change it from the default in the first place.

FROM:kkennelly DATE:9/12/2006 9:04:55 AM

Fixed for 5.5 beta 5. We no longer set the Mcr/Mmax limit to 1 when user switches Ignore Shear selection.

FROM:tarmbrecht DATE:Tuesday, October 17, 2006 9:49:14 AM

Tested in beta 5. Accepted.

## Description

FROM:tarmbrecht DATE:Friday, September 08, 2006 5:14:58 PM

My consultant discovered this:

RE: 086-0040x.xml & 086-0041.xml (also see the BRASS Shear calculation outputs in 086-0040 Shear Output.doc & 086-0041 Shear Output.doc).

In 086-0041.xml, a 3-Span (29.83'-43'-29.83') continuous PS I-beam structure, the controlling Inv/Opr

4/19/2016 3:19:38 PM

HRS AASHTO

2159

**Complete Issue Information**

rating factors are 1.074/1.817 @ .7 of Span 2 with shear controlling. After slightly modifying the model to create 086-0040.xml, a similar 3-Span (28.83'-43'-28.83') bridge with an identical center span, the Inv/Opr rating factors at the same point (.7 of Span 2) were 1.815/2.959. Upon further investigation I found that the BRASS calculated/reported corresponding live load shears concurrent with maximum moment (used to calculate Vi & Vci) vary widely and are the reason for the large variation in the rating factors.

For Truck 1, the live load shears concurrent w/max. moment were -3.16 kips for 086-0041 and -29.91 kips for 086-0040. It is obvious that, like all other loading forces for these two bridges, these values should be very close to each other. Why are they not? Which one is in error?

FROM:bgoodrich DATE:Wednesday, December 27, 2006 3:36:42 PM

The accuracy of the any concurrent action is dependent on the live load positioning. I increased the "Wheel advancement denominator" from 100 to 200 in the member alternative engine properties, which allows the truck to be moved along the influence line in shorter increments. This change results in more comparable concurrent actions and rating factors.

FROM:tarmbrecht DATE:Friday, September 08, 2006 5:22:37 PM

From my consultant:

RE: 0100021-Bracing-Stiff.xml

In the attached example, for Member 3 – 2nd N Int, the Virtis Standard Engine (VSE) returns the following error message after the connection plate stiffeners are added to the model:

Error - The number of lateral brace points and stiffener spacings lines exceeds the maximum (15) allowed!

Error - Unable to generate Lateral Brace Points and Stiffener Spacings!

Is the 15 limit for both bracing & stiffeners combined, or for each separately? Is it for the entire girder length or per span?

The example only has stiffeners applied to the bracing points and there 57 of them for a 3-span, 594' long girder. On a similar length girder with stiffeners between bracing points there could be 3 to 5 times that number.

Also of note is the fact that prior to the addition of the stiffeners, the analysis ran w/o error. There are 60 bracing points total w/18 in Spans 1 & 3 and 24 in Span 2, all exceeding the stated "maximum (15) allowed". (The controlling condition was stated as Critical Moment-Shear @ 100% of Span 2.)

Regardless, this is an extremely restrictive limitation. Will it be increased in the near future?

FROM:hlee DATE:9/12/2006 1:05:46 PM

From Has Mukh Lathia:

"The limit on stiffener spacings and lateral brace points is by the number of ranges (groups with equal spacing) for each. That limit is 150 (number of maximum spans times 10). There is no limit per span and there is no limit on the number of stiffeners and brace points. For a given analysis point, it determines the spacing by pointing to a ranges and getting a value for it."

I have updated the export to reflect the 150 limit.  
Resolved for 5.5 release.

### Description

FROM:tarmbrecht DATE:Monday, September 11, 2006 1:45:33 PM

Maybe this has been asked in another incident, but why is Mcr/Mmax = 1 the default setting? Since Mcr/Mmax with no limit comes from AASHTO Std. Specs, shouldn't the default reflect the bridge code, and if someone wants to deviate from AASHTO, they can switch from the default by limiting Mcr/Mmax = 1? Seems like the default settings in the Virtis/Opis program should reflect the current bridge code.

FROM:kkennelly DATE:9/12/2006 8:15:46 AM

Brian, Do you have any input on what the default value for limiting the Mcr/Mmax to 1 should be for the BRASS LFD Engine? Incident 5054 contains the original request for adding the feature to let the user control this. The incident doesn't specify what the default should be and I can't find any email that specifies it either.

FROM:tarmbrecht DATE:Tuesday, September 12, 2006 9:20:58 AM

Krishna/Brian, I guess I don't understand what BRASS has to do with the question. I'm referring to the

4/19/2016 3:19:39 PM

HRS AASHTO

2162

**Complete Issue Information**

setting in Virtis/Opis under Member Alternative (for a prestress beam) miscellaneous engine properties (BRASS LFD) with "ignore shear" unchecked. The radio button defaults to Mcr/Mmax = 1. I'm suggesting that for every new prestressed member alternative, this radio button should default to "no limit" when "ignore shear" is unchecked.

FROM:kkennelly DATE:9/12/2006 12:52:45 PM

Tim, In the past we have set the defaults for these engine data values based on what BRASS used as a default when the option to select the value was not available in Virtis. If we change the default value to something different from what BRASS was using, when everyone runs BRASS now they will get different values. We try to follow the rule that if you want the analysis run a different way you have to make a change (like changing the switch to not limit Mcr/Max).

FROM:kkennelly DATE:9/12/2006 1:40:18 PM

We'll have to discuss this with Jim. If we change the default for new ps mbr alts users will get a different type of analysis for existing and new mbr alts.

FROM:tarmbrecht DATE:Wednesday, September 13, 2006 10:11:35 AM

I understand your point, but isn't the point of Virtis to be universal so that more engines can tap into the database, not just BRASS? Shouldn't a new user entering data into Virtis for the first time expect the program defaults to follow the AASHTO Standard Specs and not the policies of the Wyoming DOT? Did the task force OK the rule to adjust Virtis to default to each of a third party's non-AASHTO defaults? If so, I can take this up with them.

FROM:jduray DATE:9/18/2006 8:46:54 AM

Email setn to TAG requesting instructions for how to handle this.

FROM:bgoodrich DATE:Tuesday, September 19, 2006 7:38:53 PM

The standard procedure that we have used for the engine properties is to set them according the engine defaults, which may or may not follow the AASHTO specification. I understand Tim's issue of having to go set this information every time a new member alternative is created. Note that the defaults for the engine properties are set in the database, but this information is not exposed to the user. I suggest that the configuration browser be enhanced to allow the user to edit the engine property defaults on a global basis. This would allow an agency to set these engine properties however they see fit. Comments?

## Description

FROM:jihnat DATE:9/18/2006 11:22:49 AM  
Received via email:

WHEN I try to do anything with the STRAND LAYOUT under "DESIGNED" MEMBER ALTERNATIVES (G2) it crashes.

Steven Maberry  
NMDOT

FROM:jihnat DATE:9/18/2006 11:43:57 AM  
More from Steve:

"Anything" is from STRAND LAYOUT, click to select or change on an 'x' (no strand) or a "o" (stand there).

Example: >>SUPERSTURCTURE DEFINTIONS; >>MEMBERS; >>G2; >>MEMBER ALTERNATIVES; >>DESIGNED; >> STRAND LAYOUT; >> SPAN 1 ... click to select ANY dot or x ... results: "VirtisOpis Application has encountered a problem and needs to close. We are sorry for the inconvenience."

"Inconvenience" is an understatement since VO just closes; saving nothing. And I am completely stopped from working on rating this bridge ... ever.

I suspect a "corrupted file." But have no idea how it got that way or what to do about it to salvage the existing file.

FROM:jihnat DATE:9/26/2006 3:14:56 PM  
I was able to reproduce the crash, after clicking around a little. Then I noticed if I opened the Strand Layout window and clicked the "Left end" radio button, a series of messages appeared:

4/19/2016 3:19:39 PM

HRS AASHTO

2164

## Complete Issue Information

"The harped position, column 1 in row 28, for the strand in column 1 of row 6 is not valid and there is not a valid strand position in row 28 above column 1 in row 6! The harping will be removed."

After answering OK for each of these messages (sixteen in all) I was no longer able to reproduce the crash.

FROM:jihnmat DATE:9/27/2006 7:53:48 AM

Perhaps the strand pattern was changed after the strand layout was set?

I fixed a bug in the schematic that was causing the crash, but this will not fix the data. (Fixed in version 5.5.0)

An enhancement would be to detect the bad data in the validation, or to compare timestamp of strand layout to timestamp of strand pattern.

FROM:jduray DATE:7/23/2007 10:36:21 AM

What do we do if the user changes the strand grid after defining the starnd layout? We should delete the strand layout. I think in the window where the strand grid is defined we should check to see if any mbr alts use the cross section being changed. If so, the user should be asked (for each one) if the strand layout should be deleted. A better approach would be to validate the strand layout using the new strand grid. If the layout is no longer valid ask the user if the layout should be deleted. Provide a way to cancel the changes to the grid.

FROM: Herman Lee DATE: 10/15/2011 7:41:45 PM Eastern Daylight Time

It is reasonable for user to change the strand grid after or during defining the strand layout. For example, user wants to adjust the vertical locations in the strand grid.

## Description

FROM:bgoodrich DATE:Thursday, September 21, 2006 11:20:22 AM

During the Utah DOT training, it was pointed out that some of the training examples were out of date with the latest version. Several windows now have additional fields for LRFR and NSG. See LIB1 and RC5 specifically. The vehicle tree in the Library Explorer is another place.

Also in RC5 (page 23), some of the depths are incorrect for the "Parabolic" variation. See rows 4, 6, and 8 where the depth is the same at the left and right of the parabolic range.

FROM:hlee DATE:9/22/2006 4:22:31 PM

Some users selected Apply instead of OK for those Bar Mark Definition windows since those screen captures show Apply focused and there's no text description for the process. As a result, they created only one bar mark definition.

|------------|---------------|-----------------------------------------|
| 7625.15710 | Assigned      | Invert bitmap when selected in list box |

### Description

FROM:bgoodrich DATE:Thursday, September 21, 2006 11:26:10 AM

Open the Girder Profile window for a schedule-based R/C member alt to the Web tab. In the grid, the "End Depth" cell is not being updated when tabbing out of the "Depth Vary" dropdown when it is open. When "Paraboic" is selected, the "End Depth" cell should be enabled, but it is not. Likewise, when "None" is selected, the "End Depth" cell should be disabled and set automatically to the "Start Depth". See RC5 training example. Also, there was some confusion at the Utah DOT training regarding the depth to be entered on this window. This dimension is missing from the graphic on the Section tab. Based on the training manual, it looks like the total section depth is to be entered, which is confusing given the tab is titled "Web" and the help says to look at the sketch.

FROM:jihnat DATE:9/27/2006 12:58:38 PM

Were you using the keyboard for navigation? This is a longstanding issue with the grid software we are using.

Works OK when the mouse is used for navigation.

FROM:bgoodrich DATE:Wednesday, June 11, 2008 12:30:12 PM

I tested this using 6.0 beta and the "End Depth" is enabled/disabled as expected for both keyboard and mouse navigation.

### Description

FROM:bgoodrich DATE:Thursday, September 21, 2006 11:35:20 AM

In the Haunch Profile window, it is difficult to see which bitmap is selected for the Haunch Type. Can this control be reworked to invert the bitmap that is selected rather than just putting a blue rectangle around it? At the Utah DOT training, one of the users was receiving a very low rating and it took a good deal of time to track down the problem, which was having selected the wrong haunch type.

FROM:bgoodrich DATE:Wednesday, December 06, 2006 11:55:22 AM

The bitmaps in the structure definition wizard are inverted when selected.

### Description

FROM:bgoodrich DATE:Thursday, September 21, 2006 11:42:54 AM

Utah DOT had the following suggestion for an input enhancement:

When entering components such as bar mark definitions, shear reinforcement definitions, stiffener definitions, etc, the input would go faster if these windows contained another button called "OK/Next", which would OK the window that is open (close and save data to memory) and then open a new window for the next definition and already be populated with the content from the previous window.

FROM:jduray DATE:7/23/2007 9:44:01 AM

Sounds like a wizard to me. Probably a good idea.

### Description

FROM:hlee DATE:9/29/2006 8:26:46 AM

Bridgware e-mail from Steve Yip, J.F. SATO AND ASSOCIATES:

To Whom it may concern,

JFSA & Associates in Colorado just leased the Virtis/Opis software from AASHTOWARE four months ago.

I have two questions of deflections of Prestress when comparing with Conspan and Virtis program.

Since we do not have Conspan program, the output from Conspan and Vptis are from different project.

My questions are as below.

Conspan output from one of my old project. (single span)

CAMBER / DEFLECTION: (PICK Design Handbook - 4th Ed.- Table 4.6.2)

0.5 x L = 47.50 ft

: Release Mult Erection Mult Final

Prestress : 4.357 1.80 7.843 2.20 9.586

Self Wt. : -1.677 1.85 -3.103 2.40 -4.025

Deck + Haunch : -1.216 2.30 -2.797

Supplemental : 0.000 2.30 0.000

DL-Prec. (DC) : -0.303 3.00 -0.910

Diaphragm : 0.000 3.00 0.000

DL-Prec. (DW) : 0.000 3.00 0.000

DL-Comp. (DC) : 0.000 3.00 0.000

DL-Comp (DW) : -0.279 3.00 -0.837

DL-Supp. (DC) : 0.000 3.00 0.000

DL-Supp. (DW) : 0.000 3.00 0.000

Vptis output from any project (single span)

**Complete Issue Information**

Span Distance Y Deflection  
1 62.5 -6.3215

Questions:

1. What is the Y deflection for Prestress load - long term or short term?  
2. Comparing the Conspan output and Vptis:  
Conspan - long term deflection is more than release (forgot about the sign now) Camber increase with time  
Vptis - initial deflection is more than deflection of Prestress Load. (forgot about the sign now) Camber decrease with time  
Conspan and Vptis have different sign convention.  
Why two programs come out different behavior of deflection?  
I left two message in your voice mail this morning. I think that I should e-mail this and provide more information so you can understand the questions more?  
Please call me at (303)797-5050 EX 1130, if you need more information.  
Thanks for your help

FROM:hlee DATE:9/29/2006 10:37:14 AM  
Bridgware e-mail from Steve Yip, J.F. SATO AND ASSOCIATES:

We have opis and virtis 5.4.0.  
Actually the information below is from opis; I compared deflection between opis and Conspan, not virtis.

FROM:hlee DATE:9/29/2006 11:38:23 AM  
Attached bridge xml files.

FROM:jduray DATE:10/3/2006 8:24:17 AM  
Steve - your consultant license includes limited support for installation. Your primary support is through the DOT you are doing work for. I suggest you contact them with your request for a comparison between LEAP Conspan and BRASS. We will provide an answer to your question about the y deflection for the prestress load.

FROM:bgoodrich DATE:Tuesday, October 03, 2006 10:33:24 AM  
The prestress forces/moments are applied to the structure using the load-balancing method and then solved using the direct stiffness method, resulting in moments, shears, and deflections. These would be considered short-term deflections. If AASHTO losses are used, the losses are applied to the structure opposite the initial prestressing, which results in deflections that are long-term (due to the nature of the LRFD formulas) but oppose the earlier deflections. BRASS denotes a downward deflection as a positive.

### Description

FROM:dteal DATE:Friday, September 29, 2006 12:33:46 PM

See attached jpg and xml export, RC slab structure in 5.4

I thought we fixed this??

Entering rebar in schedule based RC slab, the top mat of steel is made up of several different sizes of rebar making the distance to the centroids slightly different. In this case 3.5 mm. The rebar is truly in one layer but it is being shown in multiple layers. Was this fixed earlier?

**Complete Issue Information**

Works OK when the member alt is US. Not so good for SI.  
Fixed for version 5.5.0

FROM:dteal DATE:Friday, October 27, 2006 9:53:26 AM  
Still reporting layers when it's not a layer.

The bottom steel consists of bars ranging form #13 SI to #36 (SI). All bars in the bottom in the bottom mat have a 30mm clearance to the deformed diameter of the bar. When they are measured to the centroids vary from 37 mm to 50.5 mm.

So even though the centroids vary by 13.5 mm, the bars deformed surface is still 30 mm from the bottom. The tolerance used to define layers has to be greater than 13.5 mm difference in centroids.

FROM:jihnat DATE:10/31/2006 7:39:34 AM  
Please attach your bridge(s). The schematic of the attached bridge (Rebar in layers.xml) shows a single layer in Beta 6.

### Description

FROM:dteal DATE:Tuesday, October 03, 2006 9:43:54 AM

I thought we fixed this some time ago? Maybe it's an SI thing?

Structure exports to BRASS then fails stating that at several points the change point located at centerline of pier is within 0.99 feet of another node point.

At the places BRASS states I have a change point – nothing changes at this point??

Xml attached

BRASS error file attached

FROM:dteal DATE:Tuesday, October 03, 2006 12:40:10 PM

This exports and rates in the STD engine. With ignore shear checked and changing the end supports for Fixed/Fixed to Pinned/Roller. I haven't verified the values the Std engine displayed, only stating that

it runs.

FROM:bgoodrich DATE:Tuesday, October 03, 2006 2:55:30 PM

The cross section ranges input do not change at the 0.0057 ft location, but the development length for some reinforcement is changing at that point. The Virtis domain returns the cross sections and ranges and the BRASS export generates the commands. When the BRASS-GIRDER engine detects a cross section range that is too close to an existing node point, it replaces the existing node point rather than ignoring the range as is done in BRASS-GIRDER(LRFD). In this case, the nodes that were replaced at the left end of spans 3, 4, and 5. I will forward this issue to WYDOT.

FROM:bgoodrich DATE:Friday, October 20, 2006 11:37:44 AM  
WYDOT assigned this issue to BRASS Problem Log 710.

FROM: Brian Goodrich DATE: 12/8/2009 12:06:25 PM Mountain Standard Time  
BRASS-GIRDER(STD) 6.0.3 was revised so nodes are no longer shifted during the creation of the model. Fixed for version 6.2.

**Description**

FROM:jihnat DATE:10/6/2006 7:06:16 AM  
Received via email:

I've looked for a definitive answer in the HELP files (like under MEMBER LOADS, >> "Dead Loads") and cannot find a confirmation or denial of this question:

When Virtis Opis passes the description of a steel beam bridge to the underlying engine (e.g., BRASS), are the weights of the stiffners included?

NOTE: There is enough geometric information to calculate the weight of the stiffners IF Virtis Opis refers back to the MATERIAL: Steel.\

Steven Maberry, NMDOT

FROM:hlee DATE:10/6/2006 10:38:33 AM  
Reply e-mail to Steven:

The Dead Load (BRASS LFD) Help topic summarizes the dead load components used by BRASS (see attached).

### Description

FROM:dteal DATE:Friday, October 20, 2006 10:27:36 AM

On the traffic tab we have ADT which is used to calculate the Recent ADTT.

What we are missing is the "Design" ADT which would be used to calculate the Design ADTT.

I think all the fatigue calc's in LRFD are based on Design ADTT and not Recent ADTT.

What we have right now, the designer has to go find the design ADT and do the calc's to populate the field.

If this field isn't populated, ( I think) the LRFD code uses the maximum of 20,000?

FROM:kkennelly DATE:10/23/2006 11:40:32 AM

Changed to Support since this data was implemented for version 5.4. Data was reviewed and tested for version 5.4 so changing this to an enhancement request.

FROM:dteal DATE:Thursday, October 26, 2006 8:52:33 AM

Can we at least add this to the help to give designers direction on how to calculate this?

## Description

FROM:dteal DATE:Friday, October 20, 2006 10:28:07 AM

When following the LFRD code we need to look at the # of trucks going one direction. If we have an interstate or other multi-laned divided travelway, of lets say 3 or more lanes going in one direction. We have % of trucks going in one direction but according to table 3.6.1.4.2-1 we are to use a multiplier of 0.80 to reduce the % of trucks in a single lane.

I think this field should have been included.

FROM:kkennelly DATE:10/23/2006 11:37:32 AM

Changed to Support since this data was implemented for version 5.4. Data was reviewed and tested for version 5.4 so changing this to an enhancement request.

FROM:kkennelly DATE:10/23/2006 11:40:00 AM

FROM:dteal DATE:Thursday, October 26, 2006 8:50:56 AM

Can we at least add this to the help to give designers direction?

Issue ID: 7680

Subject: The name of the engine files created by NSG analysis may need to append to the EngineFiles.LST.

### Description

FROM:hlee DATE:10/26/2006 10:23:34 AM

For a standard analysis, the engine will create Plate\_Girder.dat, Plate\_Girder.log, and Plate\_Girder.OUT.

For a NSG analysis, the engine will create Plate\_Girder - NSG\_(Centered)\_-\_ADJ\_(None).dat, Plate\_Girder - NSG\_(Centered)\_-\_ADJ\_(None), and Plate\_Girder - NSG\_(Centered)\_-\_ADJ\_(None).OUT.

Since the name of the files created by NSG analysis (Plate\_Girder - NSG\_(Centered)\_-\_ADJ\_(None)) is different than standard analysis (Plate\_Girder), there may have 2 set of engine files in the same folder. The EngineFiles.LST should also have 2 set of engine files so the files can be properly deleted.

Is there a reason why the name of the files created by NSG analysis is different than standard analysis? Both the file deletion process and view latest analysis output window use EngineFiles.LST.

4/19/2016 3:19:43 PM

HRS AASHTO

2185

### Complete Issue Information

There will be a problem if the names are different.

FROM:jduray DATE:10/26/2006 2:07:43 PM

The NSG can be run for multiple paths per analysis. Filenames distinguish the path evaluated.

FROM:hlee DATE:10/26/2006 3:39:01 PM

The EngineFiles.LST file, view latest analysis output window, and the file deletion process need to be enhanced to handle different file names.

FROM:jduray DATE:10/27/2006 8:20:15 AM

When this window and mechanism was designed and implemented the intent was to only work with files associated with the latest analysis. The process needs to be reviewed and possibly modified if we want it to work for multiple analysis events.

FROM:jduray DATE:12/13/2007 11:07:39 AM

Discussed with TAG...delete the files that are listed in the LST file and the LST file prior to an analysis.

4/19/2016 3:19:44 PM

HRS AASHTO

2186

## Complete Issue Information

In the schematic of the rebar, look in the upper left corner. The text is being overwritten, even at 400% zoom

FROM:jduray DATE:10/27/2006 11:13:18 AM

In resolving this situation it would be useful to know if this is this new to 5.5 so we know if we broke something since the last release.

FROM:jduray DATE:10/27/2006 11:53:59 AM

We need to determine if this overlap is occurring because it is a situation for placement that was not included in the design/implementation or a bug in the code that should handle this situation.

FROM:dteal DATE:Friday, October 27, 2006 12:00:23 PM

Sorry – I can't tell if this was prior problem. In 5.4 the rebar was displayed in layers. Now in 5.5 beta 6 the layer display is partially corrected bunching all the text together.

FROM:jihnat DATE:10/31/2006 8:16:21 AM

You can type in a higher zoom than what's in the droplist, say 600 or 800.

FROM:dteal DATE:Tuesday, October 31, 2006 10:39:12 AM

At a 500% typed in zoom resolution the text isn't overwriting itself.

FROM:jduray DATE:11/2/2006 7:46:12 AM

Significantly more logic is required in the code to check for overlapping objects. Therefore I'm changing this to an enhancement.

FROM:bmccaffrey DATE:Thursday, November 09, 2006 9:24:02 AM

This is a programmers oversight, not an enhancement. I'm putting this on the 'bug' list. Fixing a display glitch is not an enhancement.

FROM:jduray DATE:7/23/2007 10:01:17 AM

It is not a display glitch. The schematics do not contain logic for detecting overlapping text and repositioning the text to avoid overlaps.

FROM:dteal DATE:Wednesday, February 13, 2008 12:16:28 PM

The attached bridge and schematic shows three lines of text on top of each other. I zoomed it to 1000% (one thousand percent) and it didn't change anything (just made it big and wrong).

The line on the right in the schematic should read:

S1 Right

S2 Right

S3 Right

FROM: Herman Lee DATE: 6/10/2009 10:28:43 AM Eastern Daylight Time

Beta TAG comment: See if moving bar mark text to the dimension line helps.

### Description

FROM:jihnat DATE:11/1/2006 7:23:07 AM  
received via email:

Dear Bridgeware,

I am responsible for oversight and auditing of bridge rating in New Mexico. I sometimes struggle to figure out what other engineers have done to trigger odd outcomes. This is a case on point ... however, since the identical thing has occurred with two different engineers, I suspect it has something to do with the nature of the bridge and how it is described in Virtis Opis.

This bridge consists of two PARALLEL bridges with the oddity of a non-continuous construction joint

4/19/2016 3:19:44 PM

HRS AASHTO

2188

**Complete Issue Information**

between the two—hence there is no continuity of force effects across the joint. The joint is then covered with a median. The cross section is shown in the figure below.

When we do this, and try to get a “Compute from Typical Section” in the LIVE LOAD DISTRIBUTION, we get the message shown below. Of course, the resulting “Zero” distribution factors prevents anything from running (fortunately—otherwise, one engineer would have actually thought that was an accurate bridge model).

We have modeled one other half-bridge like this before. The differences in the model were: 1) It was a steel bridge; 2) the cross section was entered as a mirror image of what you see in the illustration below.

Can you explain how VO came to the conclusion that the deck acts as a simple span between members—resulting and Distribution Factors of zero?

Thanks,

Steven Maberry, P.E., Ph.D. [NMDOT]

FROM:jihnat DATE:11/2/2006 1:09:18 PM  
Attached documents.

FROM:kkennelly DATE:11/6/2006 9:36:02 AM  
Virtis uses the travelway as defined by the user to determine where to place the wheel lines to compute the simple beam distribution factors. The first wheel line is placed 2' from the edge of the travelway as per AASHTO Figure 3.7.7.A. That places the first wheel line to the right of girder G2 and thus there is no contribution to girder G1 when computing the simple beam DF. If you want Virtis to compute simple beam DF for girder G1 for you, you should revise the travelway on the Structure Typical Section: Lane Position tab. Otherwise you have to compute the simple beam DF to girder G1 yourself.

| 7693.15642 | Rejected      | Date Modified and Modified By should be populated once the file is linked in Bridge Multimedia Attachments window. |

### Description

FROM:bmccaffrey DATE:Thursday, November 09, 2006 9:10:32 AM

This area needs to be fixed ASAP before 5.6. If there are data items that are not used by any of the engines then it needs to be explicitly shown directly on the window that it is not used. This goes for other windows that have no use - either explain their purpose directly in the window or remove them altogether - P/S Stress Limits; Slab Interface; Shrinkage etc.

FROM:jduray DATE:11/9/2006 1:30:45 PM

These items are explained in the help for each engine. It has been that way for years. What you suggest can be done but the user would have to select the engine for which the items are to be displayed (or indicated). This would require each engine provide a file (or database entries for a new set of tables) that could be used by the UI to determine the items to display (or their format). I don't think this is difficult, but it is tedious because we have over 25000 data items. The file would be huge (although the proper way to do it would be to indicate the items not to display -an exceptions file).

## Description

FROM:dwhittemore DATE:Thursday, November 16, 2006 9:44:30 AM

I am getting the following error while running the BRASS LFD and ASD module in Virtis/Opis. If anyone have the clue to sort out this problem, I will appreciate.

Error No.: 1886  
Type : Input Error  
Location : Input Data File

**\*\*ERROR\*\*** On the BRACING-SCHEDULE command, the Spacing must be evenly divisible into the Range Length +/- 0.01 ft.

Thanks,

FROM:kkennelly DATE:11/20/2006 7:58:18 AM  
Please export your bridge to an xml file and attach it to this incident so we can investigate. Thanks.

Any insight on how to do this would be appreciated. Every time we install a new version of V/O we get the same meggage that a previous version is installed even though I uninstall all old versions and delete the folders.

### Description

FROM:smample DATE:Monday, November 27, 2006 3:55:38 PM

I have two questions regarding output:

1. In the analysis output report, what field in Virtis populates the "Structure No." field?

Idaho Transportation Department

Page 1

Date 11/27/2006

Structure No. Bridge Name: 03020J 002.42

Member: 13785 - G1 Ext - RC - over UPRR

Continuous 3 span reinforced concrete tee beam .

2. How do I get rid of these warnings? What do these warnings refer to?

WARNING (Low):

There are no structure definition component sets defined!

The BRASS engine properties for the structure definition have not been specified!

WARNING (Low):

There are no member alternative component sets defined!

The BRASS engine properties for the member alternative have not been specified!

FROM:kkennelly DATE:11/29/2006 10:12:28 AM

Brian, can you answer #1?

1. I cannot find any command in the BRASS LFD help that corresponds to the "Structure No." title in the BRASS output file. Maybe Brian can answer this question.

2. These warnings refer to the settings you have specified on the "Engine" tab located in several places in Virtis (for example, the Engine tab on the Member Alternative window). If you have not specified any settings on the Engine tab for BRASS LFD then the default Engine settings are used for BRASS LFD and this warning appears in the export to the BRASS LFD program. There is no way to turn off these warnings. I think you can just ignore these warnings.

FROM:bgoodrich DATE:Monday, December 18, 2006 4:40:23 PM

The "Structure No." field should be populated by the NBI structure ID. The BRIDGE-NAME command is written to the data file, but it is not transferred to the report header within the BRASS engine. I'll forward this issue to WYDOT.

**Description**

FROM:jihnat DATE:11/29/2006 7:14:37 AM  
received via email:

Every time my bridge engineer tries to run the review report option he receives the attached error. Any/all files, Virtis 5.4, Winxp pro/SP2.

Frank Jagla, CH2M Hill

FROM:jihnat DATE:11/29/2006 8:22:02 AM  
I've confirmed this to be a bug in Virtis, for PS U beam bridges. Version 5.5 also crashes with this particular bridge. The workaround is to use the Report Tool, Open the file "BWS Report for ps girders.abr", and Generate the report.

FROM:jihnat DATE:11/29/2006 9:30:56 AM  
Fixed for version 5.6.0  
Also fixed a similar bug in Report Tool (missing units under Interior Diaphragms of PS U beams).

FROM:xli DATE:2/5/2007 2:38:22 PM  
It works fine for 5.6 beta 1.

## Description

FROM:dkoenig DATE:Tuesday, December 05, 2006 3:03:22 PM

We stumbled onto an issue about what Virtis is using for the phi factor in the check of negative moment capacity at the intermediate supports on continuous P/S bridges. Based on our review of some structures, Virtis is exporting a phi factor of 0.90 to BRASS for it to do the analysis. If you look at the standard AASHTO factor libraries in Virtis, this is what it has as the phi factor for flexural capacity of nonprestressed elements. We have always used a phi factor of 1.0 for design of the negative moment steel. We have reviewed some PCA examples, and they do it the same way.

In AASHTO, Article 9.7.2.3 states that negative moment reinforcement should be designed with the load factors in accordance with Article 9.14. In Article 9.14, it specifies a phi factor of 1.0 for factory produced prestressed concrete members. Based on these two articles, it is our opinion that AASHTO is clearly specifying to use the phi factor of 1.0 for negative moment checks at the piers on continuous P/S structures and that the phi factor of 0.90 in the standard library is incorrect. We would request that

Users at the New Mexico training made suggestions regarding the structure definition wizard.

1. Add an option for specifying a non-composite structure, i.e., no shear connectors at all.
2. Another suggestion was having the wizard calculate the effective flange width when the structure definition is finished rather than having to visit the Deck Profile window to select the Compute button.

### Description

FROM:bgoodrich DATE:Wednesday, December 06, 2006 2:38:31 PM

A user at the New Mexico training found the following issue. Pressing Enter key when New button has focus does not create new row. For the following windows, it closes the window:

1. PS Haunch Profile (Example PS1)
2. Cross Section Ranges (Example RC2)
3. Interior Diaphragms

For the following windows, it does nothing at all:

1. Beam Details - Continuity Diaphragm (PS2)

It would be a good idea to test every New button to verify it creates a new row.

FROM:jihnat DATE:1/9/2007 1:10:03 PM

Fixed in version 5.6

FROM:xli DATE:2/5/2007 1:56:33 PM

Checked the following windows, problem is fixed for 5.6 beta 1

**Complete Issue Information**

FROM:bgoodrich DATE:Wednesday, December 06, 2006 3:34:05 PM

On the Beam Details form Continuity Diaphragm tab, when a new row is added, certain cells are only enabled/disabled when the Span Number dropdown is selected using the mouse. If the keyboard is used to specify the span number, the cells are not updated.

FROM:kkennelly DATE:5/21/2007 12:27:49 PM

I think this is a duplicate of incident 77. Problem is with the Stingray grid. Work around is to hit the span number twice with the keyboard.

TOP STEEL : AREA4 = 0.000 DIST FROM TOP D4 = 0.000

AREA5 = 0.299 D5 = 1.938

AREA STIRRUPS, Av = 0.000 (in<sup>2</sup>)

STIRRUP SPACING = 0.000 (in)

**Complete Issue Information**

FROM:jduray DATE:12/15/2006 4:46:24 PM  
Does this problem exist in 5.5 Release?

FROM:xli DATE:12/19/2006 11:29:20 AM  
5.5 has exactly the same problem.  
Bottom reinforcement development length is from -0.5ft to 2.66ft. BRASS bottom reinforcement area at 1.2ft and 1.25ft are same, which should be varied linearly.

FROM:bgoodrich DATE:Tuesday, February 27, 2007 5:39:52 PM  
The cross section range at 1.25 ft is within the small element distance from the range at 1.2 ft. Therefore, a node point cannot be added at both locations. Then, when BRASS processes the cross section ranges to assign section dimensions and rebar to the structural analysis elements, there is a discrepancy between the ranges and nodes, which is the source of the error. This issue is not limited to reinforcement. General section dimensions are a problem too; however, they are generally constant, so errors have not been seen. I will forward this issue to WYDOT.

FROM:bgoodrich DATE:Monday, March 05, 2007 5:46:42 PM  
WYDOT assigned this issue to BRASS Problem Log 710.

FROM: Brian Goodrich DATE: 3/5/2009 1:29:14 PM Mountain Standard Time

Vinacs reported the same issue:

>>> Murugesu Vinayagamoorthy <murugesu\_vinayagamoorthy@dot.ca.gov>  
>>> 3/3/09 10:45 AM >>>

Attached is the bridge that has variable depth.

Bridge Model: MVV Span1-3 MDL 1of 1 (This bridge is symmetrical and therefore all the details of 108 and 302 should be identical)

We have entered the rebar from top of the deck. (BRASS is used to analyze the member)

The depth of bottom rebars estimated at 1.08 pt and 3.02 pt are different.  
It should have been 1.75. The depth reported for 302 is 1.51 inches.

Why is that?

## Complete Issue Information

FROM: Brian Goodrich DATE: 12/8/2009 12:29:47 PM Mountain Standard Time

Regarding the issue with TestVirtisStdVaryRebarEnhance.xml:

1. The cross section change point at 1.25 ft is never added because it is too close to the existing node point at 1.2 ft.
2. BRASS ignores the cross section range at 1.25 ft.
3. BRASS interprets a cross section range starting at 1.2 ft and ending at 2.6623 ft. Starting Cross Section = 1; Ending Cross Section = 4.
4. When the 100.42 POI is analyzed, there is no node point at this location, so the nearest node is found, i.e., the 100.40 POI.
5. Section properties at this node are found by choosing the side of the node with the smallest moment of inertia or if they are the same, then the side with the smallest rebar area.
6. In this case, this is the left side of the node at 1.2 ft, which is why the rebar area is not as expected.

FROM: Brian Goodrich DATE: 1/26/2010 12:00:21 PM Mountain Standard Time

This issue has been addressed in BRASS-GIRDER(STD) 6.0.3. When a point of interest cannot be added as a node point because it is too close to an existing node point, BRASS now does the following when obtaining the section properties for said point of interest.

1. Locates the closest node point.
2. Determines which side of the node the POI is located.
3. Gets the section properties from the element end on the same side as the POI rather than checking for the smallest moment of inertia and smallest rebar area.

Also note that there is a slight difference in the properties due to BRASS interpolating at the element end. There is a slight offset between the node location and the ends of elements. Fixed for version 6.2.

FROM: Herman Lee DATE: 5/7/2010 9:44:20 AM Eastern Daylight Time

Tested the TestVirtisStdVaryRebarEnhance.xml file in this incident.

Verified in 6.2 Beta 1.

**Description**

FROM:hlee DATE:12/15/2006 1:41:39 PM  
Submitted on behalf of Steven Maberry, NM DOT via bridgeware e-mail:

Bridgeware,

Attached find an xml file for a bridge. Using Version 5.4.0, Virtis Opis returns the following error message when one tries to rate the beams on Span Five:

-----  
-----

Error generating LFD/ASD load commands!  
Error generating concentrated load commands!  
Review input for items included in Load Case: Diaphragms  
Unable to get adjusted distance of load (P/S beams)!  
Error preparing concentrated load for BRASS commands!  
Unable to compute span where load is applied!

There is no "Diaphragms" Load Case, and I cannot tell what differences there might be between Span Five and the other FOUR Span Structures.

WHAT is causing this error? How should I fix it?

Steven Maberry

FROM:hlee DATE:12/15/2006 1:49:52 PM  
Response e-mail to Steven Maberry:

Steve,

## Complete Issue Information

I've entered your question into the Support Center (<http://aashto.bakerprojects.com/>) as Incident 7728.

We are looking for the cause of the problem. A work around for now is to change the diaphragm spacing from 13.916667 to 13.916666 ft.

Herman Lee

FROM:kkennelly DATE:1/15/2007 1:30:29 PM

This problem is related to the values entered for the diaphragm spacing on the Framing Plan Details window and the tolerances set on the System Defaults: Tolerance tab.

The diaphragm spacing is entered on the Framing Plan Details window as 13.916667' for 3 spaces resulting in the last diaphragm being located at 41.750001'. The export to the BRASS LFD program internally uses these distances in "inches" even though you entered them as feet in Virtis. When trying to create the "Point-DL" command, the BRASS export tries to determine what span the diaphragm load is on. When trying to determine what span the diaphragm is located on, the export uses the Tolerance for inches that is entered on the System Defaults: Tolerance tab. The Tolerance for inches on your pc must be set at a value like 0.00001 or smaller.

The export tries to find what span the last diaphragm is on by checking if  $41.750001 * 12 \text{ in/ft} = 501.000012$  is on the span length of  $41.75 * 12 \text{ in/ft} = 501.000000$ ". Using a tolerance of 0.00001, the system sees that  $501.000012 > 501.00001$  and the export thinks that the last diaphragm is not on the span. (If your tolerance for inches was 0.001 the export would see that  $501.000012 < 501.0001$  and think that the last diaphragm was on the span.)

The best solution is to enter your diaphragm locations as 13.916666'. This will ensure that the last diaphragm is on the span regardless of the Tolerances set on your pc. We do not encourage users to change the Tolerances because these Tolerances affect all of your bridges not just the bridge that is having this problem.

Virtis terminated when I tried to open the girder profile schematic.

Reply e-mail to Steve:

=====  
Steve,

BRASS doesn't conform to AASHTO 9.20.1.4 regarding the shear consideration at prestress beam end regions (at distance h/2 from face of support). There's not enough shear strength at the start and end of the girders. Also, please check the haunch profiles for the exterior girders.

Hope this helps!  
- Herman Lee

### Description

FROM:pjensen DATE:Tuesday, December 19, 2006 4:22:54 PM

some of my designers are having issues finding shear and moments at poi using lrfd. the hard output from the brass run is there, but in the graphs and the tables, there is no values.

I do not think this is normal. (lrfd the table are being populated with values for poi's).....

FROM:jduray DATE:12/20/2006 9:00:51 AM

Brian - Paul is right. Using TrainingBridge1 I added a POI at 75'. It appears in the BRASS output but not in the results object for reporting on the tabular reports and graph windows.

FROM:bgoodrich DATE:Wednesday, December 27, 2006 10:50:16 AM

The presence of the point of interest location in the actions output is controlled by the "Action Output Level" in the engine properties of the Analysis Settings window. "Print actions at all node points" should be selected to get the POI to show up in the BRASS output as well as the tabular and graphical results. BRASS-GIRDER behaves a bit differently than BRASS-GIRDER(LRFD), i.e., BRASS-GIRDER includes the points of interest in the action reports when the "Print actions at 1/10 points" option is selected.

I will forward a request to WYDOT for modifying the "Print actions at 1/10 points" option to include points of interest as well.

FROM:bgoodrich DATE:Monday, January 29, 2007 4:50:55 PM

WYDOT indicated this functionality would be added to the merged engine, but it is not yet authorized.

FROM:bgoodrich DATE:Tuesday, February 27, 2007 12:52:11 PM

WYDOT assigned this issue to BRASS Problem Log 737 and authorized the work.

FROM:bgoodrich DATE:Wednesday, July 25, 2007 12:21:12 PM

This issue has been addressed in BRASS-GIRDER(LRFD) 2.0.0. Fixed for version 5.6.

### Description

FROM:pjensen DATE:Tuesday, December 19, 2006 4:26:42 PM  
I think this is a problem that we had before with NSG. my designer and i was working on his workstation and had a number of lrfd runs completed (he indicated that he ran 10 or 12). When we

4/19/2016 3:19:50 PM

HRS AASHTO

2220

## Complete Issue Information

switched from design to rating, and tried to run brass lfd, we got the "brass dll can not be loaded" error.

FROM:jduray DATE:12/20/2006 9:10:43 AM

I tried to reproduce this twice. The first time with the Preferences set to "Remove previous analysis results before beginning a new analysis". As you know we added this setting to resolve the problem with NSG (because with each analysis (standard or NSG) the analysis events were retained in memory so they could be reviewed any time as long as the BWS remained open). For NSG this slowly depleted the available memory and eventually there wasn't enough to load the 400 mb BRASS dll.

The second was with the setting disabled so events were accumulated. The BRASS successfully loaded and executed each time. I also opened more BWS and performed ratings. I then ran several NSG analyses (still with Preferences set to accumulate events).

Can you reproduce this problem and if so please attach the error message to this incident?

If the Preferences are not set to unload events it is possible to eventually accumulate enough events to exceed virtual memory even with standard analysis and the analysis engine will not load. See the attached Word file containing a comparison of the effects of the preferences setting.

FROM:jduray DATE:12/20/2006 11:01:31 AM

FROM:pjensen DATE:Friday, December 22, 2006 11:16:29 AM

The user has not been able to reproduce this in the past day and a half. The only other applications that he has had open during the running of V/O is Microsoft Excel and Outlook 2003 sp 2. The remaining service patches of NT I do not know. The user is connect to Oracle 9.2.0.7

FROM:pjensen DATE:Friday, December 22, 2006 11:21:44 AM

one more thing-

the database is a repository and have check in/out. the user only checked out the structure alt.

FROM:jduray DATE:6/11/2008 11:49:52 AM

is this still an issue?

FROM:pjensen DATE:Wednesday, June 11, 2008 1:01:26 PM

today it has not happened. It comes and goes. Soon as I close this issue, it happens... I think it is an issue with the combination of programs and memory release with the WOW and the 16bit programs (ie BRASS). Is the standard engine 16bit or 32?

FROM: Jim Duray DATE: 10/6/2009 1:21:52 PM Eastern Daylight Time

It is 32 bit, all of Virtis/Opis is 32 bit.

FROM: Herman Lee DATE: 10/30/2009 2:48:48 PM Eastern Daylight Time

Changed Status to Not Reproducible until more information is available.

### Description

FROM:tarmbrecht DATE:Friday, December 22, 2006 10:49:28 AM

RE: PSDBAnalysisErrors(0162087).xml

In the attached file, the results for Superstructure Definition "West Span PSD (DPN)" appear to be erroneous. For example, for Member "1st N Int-x", the controlling inventory/operating rating factors are 0.139 (Concrete Tension) / 1.747 (Ultimate Strength Shear). The corresponding member in the other superstructure Definition, "West Span PSD (TES)", which appears to have virtually the same properties, returns inventory/operating rating factors of 1.178 / 1.968 (both are from Ultimate Strength Flexure). The results for the second are consistent with our design charts. Perhaps some kind of hidden corruption in the first? Please review and advise. Thanks, Tim

FROM:bgoodrich DATE:Monday, January 29, 2007 12:44:37 PM

I reviewed the two members and found one significant difference. Member "1st N Int-x" has completely fixed supports while Member "2 - 1st N Int" has a pin and a roller, thereby causing the moments to be completely different between the two. Could this be the source of the difference?

## Complete Issue Information

### Description

FROM:dteal DATE:Friday, December 22, 2006 12:35:17 PM

I ran a PS structure in Virtis 5.5.0

I then ran data set that Virtis created in BRASS Girder 5.9.4

In Virtis I used Structure Def. "As Rated" with Member #2

The rating factor for an HS20 Truck in Virtis is 1.008 and in BRASS Girder it's 1.230.

Which one is incorrect?

FROM:jduray DATE:12/22/2006 4:02:58 PM

Please complete the form on our web site so we can more efficiently review the difference. We need for you to compare the section properties, actions for DL, and LL, etc. (as we discussed during our TAG meetings). Once we know where the two programs depart we can investigate.

FROM:dteal DATE:Tuesday, December 26, 2006 8:42:17 AM

I'm drawing a blank here -

What form on what website?

FROM:jihnat DATE:12/26/2006 9:25:58 AM

Virtis Technical Support website, <http://aashto.bakerprojects.com/virtis/>

Technical Notes,

LFD Rating Analysis Results Comparison Template.

There's also a flowchart to assist you.

FROM:dteal DATE:Tuesday, December 26, 2006 10:00:24 AM

These are for comparing the Virtis Std Engine to BRASS

I am comparing the released stand alone version of BRASS 5.9.4 to the BRASS engine in 5.5

Do you still want to use this spreadsheet even if it doesn't have an area for BRASS stand alone?

FROM:dteal DATE:Wednesday, December 27, 2006 7:48:38 AM

This is a BRASS issue, 5.9.3 vs 5.9.4

FROM:dteal DATE:Wednesday, January 03, 2007 8:32:18 AM

FROM:dteal DATE:Thursday, January 04, 2007 8:10:09 AM

It appears that the version of BRASS (5.9.3) that is included in Virtis 5.5 has some errors in the PS.

When will be getting a patch that includes the corrections to BRASS 5.9.4?

FROM:dteal DATE:Wednesday, February 21, 2007 7:45:16 AM

I see in 5.6 beta that BRASS has been updated to 5.9.4

With that - I can close this incident

FROM:hlee DATE:2/22/2007 2:12:27 PM

Status changed to Close.

**Complete Issue Information**

I have looked for something that might be "page 10.1 of Vol 1," but I have been unsuccessful. I suspect that the error message wants me to move something in the SCHEDULE BASED description of the RC Beam.

FROM:bgoodrich DATE:Wednesday, December 27, 2006 11:26:21 AM  
I tried running this bridge with version 5.5 and received an error about the rebar being outside the beam (this may be new). I think the depth entered on the Web tab of the Girder Profile window should be the total depth of the beam, not just the web portion. Although there is no sketch on this for the schedule-based input, I checked the cross section based input window and the sketch shows the dimension as I described above.

FROM:bgoodrich DATE:Wednesday, December 27, 2006 12:27:16 PM  
I believe the node point issue is the same as 7643, which has already been assigned a BRASS problem log.

## Description

FROM:tarmbrecht DATE:Tuesday, January 09, 2007 5:12:17 PM

In the attached file, w/prestressed I-beams, when attempting to compute the Wheel Distribution Factor the following error is produced unless the adjacent Member Alternative(s) has(have) both "Existing" and "Current" checked (under the Member definition). This did not occur in v. 5.4.0 and we are not aware of the problem existing in the v. 5.5.0 Beta builds. Also, it does not occur with steel beam member alternatives.

"Beam shapes are not assigned to adjacent member alternatives! Virtis cannot determine if spread or adjacent beams exist and cannot compute the live load distribution factors!"

FROM:jduray DATE:Wednesday, January 10, 2007 9:54:59 AM

4/19/2016 3:19:52 PM

HRS AASHTO

2233

## Complete Issue Information

FROM:kkennelly DATE:1/10/2007 2:22:32 PM

The warning message is new to version 5.5 but it was present in all of the 5.5 beta builds. This warning was added in response to incident 7219. As per that incident Virtis was previously computing the DF for a ps beam by always using the Spread Box equations when the adjacent mbr alts didn't have beam shapes assigned to them. (Incident 7258 is the same as 7219 and was submitted by a user)

This message is only issued for prestressed concrete beams. We issue it for all types of PS beams, not just boxes, so we can determine if Article 3.23.4 should be used since Virtis allows PS I's and Tees to be adjacent deck beams.

FROM:kkennelly DATE:1/10/2007 2:46:52 PM

FROM:tarmbrecht DATE:Friday, January 12, 2007 11:42:30 AM

But why do both Existing and Current boxes need to be checked? It seems like this warning should only be produced when the Current box is not checked. It is my understanding that when the Existing box is not checked (and Current is checked), it indicates that a beam shape is assigned but that it is not to be analyzed.

FROM:hlee DATE:1/16/2007 3:23:36 PM

The warning message will only be produced when the Existing box is not checked in adjacent beam(s). The distribution factor computation is looking for existing adjacent member(s). The Current box represents the current alternative being modified or reviewed by user. The Current box is used for drawing the schematics.

FROM:kkennelly DATE:1/17/2007 3:25:05 PM

Need to discuss with Jim before we implement any changes. 2 possible solutions:

1. Workaround for user is to mark all of the beams as existing, use the Compute button to compute DF's and then uncheck the beams he doesn't want analyzed in a batch analysis before the bridge is saved. (User must be doing this unchecking of mbr alts anyway because the first mbr alt is always set to Existing when it is created.)
2. Or we can change the code to first check if the adjacent mbr alts are marked as Existing. If it is, use the Existing mbr alt for the DF calcs. If it is not then check if the adjacent mbr alt is marked as Current. If it is, use the Current alt for DF calcs. If it is not, then issue message that we can't compute DF's. Note that we'll have to make the same change on the Deck Profile: Compute Eff Flange Width button.

FROM:tarmbrecht DATE:Wednesday, January 17, 2007 3:47:30 PM

Krishna,

My consultant had originally reported this to me and prepared a response to Herman's 1/16 response and before your 1/17 reponse. It is as follows:

First, the incidents (7219 & 7258) that led to this are both with regard to box beams and the problem with determining whether they are "side-by-side" or "spread". Although kkennelly stated in the 1/10/07 response, "Virtis allows PS I's and Tee's to be adjacent deck beams, according to AASHTO (3.23.4) the kinds of beams that this might apply to are: channel beams, single-/multi-stemmed tee beams and box

4/19/2016 3:19:52 PM

HRS AASHTO

2234

**Complete Issue Information**

beams. I-beams are not indicated and could not practically compose an adjacent deck-beam type structure. Therefore, the computation of the wheel distribution factor ("DF" hereafter) for prestressed concrete I-beams should not be affected by the fix. The DF for PS I-beams is clearly stated under AASHTO Std. Specs. Table 3.23.1 and is unaffected by the nature of the flanking beam(s).

Second, the nature of the flanking/adjacent beam(s) should be based on which Member Alternative has the Current box checked, not the Existing box. This would be consistent with whether the computation for Deck Profile is allowed. In that case it is the converse of how the DF computation is done. In practice, these two boxes work thus:

- Existing selected/Current selected => member is present in the model and is to be included in batch analyses
- Existing not selected/Current selected => member is present in the model and is not to be included in batch analyses
- Existing selected/Current not selected => ??
- Neither Existing or Current selected => a member alternative that is desired to be saved but does not actually exist. (It should be stated that, in practice, the instance of multiple Member Alternatives under a Member permanently is extremely rare, probably fewer than 5 of the 2600 bridges entered by IL DOT.)

In the 1/16/07 response hlee stated that the problem only happens "when the Existing box is not checked". That creates a major problem! In by far the majority of cases, the outside beam and other beams that do not control the rating of the Superstructure Definition are to be left out of batch analysis ("Existing" box not checked). Therefore, the user is now forced to check the box, then go to the next member and set it up, running the DF computation, then go back and uncheck it. The same procedure must be performed for all the other members in the Superstructure Definition that will, by inspection, not control the rating. This has potential to significantly increase the time required to set up a bridge model for prestressed members. The wheel DF computation should be like the Deck Profile computation, which is based on the members that show in the schematic view (Current box selected).

(Tim A.) When I showed him the two possible solutions that you had proposed in your 1/17 response, he felt that the first option wouldn't work for the reason stated above. He agreed with the second option, but noted that none of this should apply to I beams for the reasons stated above.

FROM:tarmbrecht DATE:Wednesday, September 12, 2007 2:43:17 PM

Has there been any movement on this issue? Thanks.

## Description

FROM:jihnata DATE:1/12/2007 7:11:01 AM  
Received via email from Steven Maberry, NMDOT:

I am rating older bridges, and we have several bridges that were constructed from pre-cast RC U-shaped beams placed upside down. This "bottom" of the U-beam then formed the deck, with the lips hanging downward. See Sketch attached.

I find no similar beam configuration available in Virtis-Opis. Is the best way to handle these beams to treat them as T-Beams, with each "U" contributing half of the beam to the virtual T-Beam?

FROM:kkennelly DATE:1/15/2007 12:50:54 PM

The model you have described, (treat the beams as T-Beams with the 2 adjacent U legs forming the web of the T-Beam), is probably the best way to model the interior beams. However, the exterior leg of the exterior beams will not be accurately modeled in Virtis. Virtis assumes that the tributary width and

4/19/2016 3:19:53 PM

HRS AASHTO

2237

### Complete Issue Information

effective flange width entered in Virtis is equally split between the left and right sides of the web. (ie, if you enter 42" as the effective flange width Virtis assumes 21" exists to the left of the web CL and 21" exists to the right of the web CL.) I do not see any way to model the exterior beams in Virtis.

**Description**

FROM:jihnat DATE:1/12/2007 11:23:17 AM  
Reported by Michelle Jose, DMJM Harris (Boston)  
Import the attached bridge, change Span Details and Stress Limit Ranges, try to save, Virtis crashes.

There are two concrete materials with the same name.  
The workaround is to delete one of them then reenter the Beam Details info.

We should investigate the crash and prevent it if possible.

FROM:jihnat DATE:1/16/2007 1:32:42 PM  
Crash was duplicate of 7727.

| 7786.15549 | Resolved      | Support line skew in flared girder system. |

### Description

FROM:rcurtis DATE:Wednesday, January 17, 2007 1:02:35 PM

In a pin and hanger structure, one beam is used for span 1 and the cantilever portion of span 2, and a larger beam is used for the suspended portion of span 2. The results show the section properties at midspan of span 2 reverting to that of the smaller beam in span 1 with the Virtis LFD engine. The Brass LFD engine does not appear to do this.

FROM:hlee DATE:1/17/2007 3:55:28 PM

Please export the bridge as a Bridgeware XML data file and attach to this incident for us to investigate.

FROM:rcurtis DATE:Thursday, January 18, 2007 9:59:51 AM

See Span 1-2. It doesn't appear to be a problem in span 3-4.

FROM:hlee DATE:1/18/2007 2:59:42 PM

I'm not able to reproduce the problem. The results of both Virtis LFD and BRASS LFD engines show changes in section properties at 7.50 ft in Span 2 for "Spans 1-2" and 68.40 ft in Span 1 for "Spans 3-4".

## Complete Issue Information

Please provide more information about the problem. Direct us to a specific page on the output file or a specific window that shows the problem will be helpful.

FROM:rcurtis DATE:Friday, January 19, 2007 10:05:28 AM

The section properties at the locations you mentioned are supposed to change, as I stated a larger beam is used for those spans. The problem I mentioned is, as stated above, "The results show the section properties at midspan of span 2 reverting to that of the smaller beam in span 1" I am attaching a screen shot of the results output. I highlighted the portion of concern. This screenshot is from the report tool.

FROM:hlee DATE:1/22/2007 7:37:30 AM

There was a bug in the engine when populating Virtis results in 5.5. This bug had been fixed during the Virtis Std Engine enhancements for 5.6.  
Resolved for the 5.6 Release.

FROM:rcurtis DATE:Wednesday, January 24, 2007 3:42:29 PM

Will this bug affect my results?

FROM:hlee DATE:1/25/2007 10:09:52 AM

No, your rating results are not affected by this bug. The cross section properties in the Virtis Std Engine output text file (Bridge menu | Output) are not affected also. That's why I couldn't locate the problem the first time. This bug will affect the tabular reports (Bridge menu | Tabular Report) and the report generated by the Report Tool (Bridge menu | Report Tool).

FROM:xli DATE:2/2/2007 3:50:45 PM

Tabular report and report tool generated report are both checked fine in VirtisOpis 5.6 Beta build 1.

Phone: 617-973-7588. Fax: 617-973-7575  
Hanh.nguyen@mhd.state.ma.us

FROM:bgoodrich DATE:Tuesday, February 27, 2007 9:34:42 PM  
The intermediate output for Service II and Fatigue contains the following statement:  
"Beam stresses will be determined using only positive bending section properties per AASHTO LRFD 6.6.1.2.1 ."

Please forward the output/calculations illustrating how the effective slab is not considered. Also include which point of interest you are investigating.

FROM:bgoodrich DATE:Wednesday, February 28, 2007 11:24:15 AM  
E-mail from Hanh:

Thank you for responded to my email. As I stated below AASHTO LRFD Interim 2005 Articles 6.6.1.2.1 contains the following statement:

For flexural members with shear connectors provided throughout their entire length, and with concrete deck reinforcement satisfying the provisions of Article 6.10.1.7, live load stresses and stress ranges for fatigue design may be computed using the short-term composite section assuming the concrete deck to be effective for both positive and negative flexure.

Attached is output from Opis and Opis files. For the Fatigue check of cover plate (Beam #7 under safety curb) point of interest (108.63). The Composite Section in Negative Flexure didn't shown the effected of concrete deck.

thanks,

Hanh

FROM:bgoodrich DATE:Wednesday, February 28, 2007 11:26:36 AM  
Thanks for the additional information. I now see there is a problem in the BRASS engine with determining when only positive properties should be used for fatigue. I will forward this issue to WYDOT for assignment to a BRASS problem log.

**Description**

FROM:jihnat DATE:1/22/2007 8:32:13 AM  
Could it be that the parser is not in synch with the properties string in the db?  
Incident 6652 sounds similar, supposedly fixed (by me) in 5.5.

To reproduce in 5.5,  
define vehicles manually (i.e. don't use template) and there's no LL results.  
Workaround is to open engine properties, select everything for output, then get LL results.

FROM:jihnat DATE:1/22/2007 9:17:50 AM  
Stepping through the parser code, it's returning the correct value to AbxBrass.

4/19/2016 3:19:54 PM

HRS AASHTO

2245

## Complete Issue Information

FROM:jihnat DATE:1/22/2007 10:18:28 AM

The LL results aren't produced unless the Output for Stage 3 is turned on (even if the LL reports are turned on).

The BRASS input files are otherwise identical.

I don't know if that is the intended behavior.

FROM:bgoodrich DATE:Tuesday, January 23, 2007 12:18:56 PM

I ran TrainingBridge1 with version 5.5 and a truck set manually (no template). The live load actions were available in the tabular reports. Is the user running a database with an old db properties string?

FROM:mordoobadi DATE:1/24/2007 9:20:40 AM

This does not seem to be related to database migration.

The defaults for outputting stages 1, 2, 3 are TRUE, TRUE, and FALSE in AboBRASS and in the database. (TRUE, TRUE, TRUE in AbxBrass2).

While trying to debug the code I noticed that we have the parser code in two places AboBRASS and AbxBrass2. I am not familiar with the code but I think we should do all the parsing in AboBrass not in AbxBrass2. The two versions of parsing code in the two projects are slightly different.

Conclusion: the live load results are turned off because of the LRFD Event Engine Properties in the database.

Observation: If the user has a default analysis event template then the live load results will be reported even if the default template is a rating template.

FROM:bgoodrich DATE:Monday, January 29, 2007 11:49:47 AM

The stage 3 output flag has NOT always been FALSE. It was TRUE in earlier versions (at least in the defaults). The current CDoBrassLRFDAAnalEvtParser class in AboBrass is setting the default for stage 3 to FALSE. Was the stage 3 default changed to match the property string, when really the property string should have been changed to match the default?

Also, for some reason, the defaults (between 3.0 and 5.3) for several output flags were changed from FALSE to TRUE, when they should not have been. The output flags are supposed to be the same as the BRASS engine defaults. I'm not sure why this got changed but it appears to be discussed in Incident 6693, which may be the source of the problems. When "sboukamp" added camber, it was inserted in the parser. However, it appears that, the CDoBrassLRFDAAnalEvtParser::MakePropertyString function is not including camber in the string.

I suggest we revise CDoBrassLRFDAAnalEvtParser to use the defaults from the 3.00.01.01 properties string and correct the MakePropertyString function, which appears to be correct in AbxBrass2. Next, we update AbxBrass2 to use AboBrass to do the parsing so it is one place (as Mehrdad suggests in the incident discussion). Finally, we correct the properties string in the database.

FROM:kkennelly DATE:6/8/2007 3:38:37 PM

Problem also noted by Illinois DOT:

Email: Tim.Armbrrecht@illinois.gov

FROM:jduray DATE:8/7/2007 10:53:26 AM  
The parsing classes were added sometime after the code was written in abxbrass. That is why it is in two places. All new work after the parsing classes were created should use the parsing classes only. We did not go back to change abxbrass to use the parsing classes since what was being used had already been tested and released. If we are making changes to the engine data we probably should abandon the parsing code in the export and use the parsing classes.

FROM:hlee DATE:10/3/2007 9:50:29 AM  
The problem, resolution and test cases are in the attached file.  
Resolved for 5.6 Release.

FROM:bgoodrich DATE:Wednesday, October 03, 2007 11:11:32 AM  
I reviewed your file and added a column with the BRASS defaults (see attached file). I think your idea will work to get this release out. However, I think we need to rework Abxbrass2 to use Abobrass instead of having its own default setting and parsing functions. We don't want to keep maintaining the same code in two projects.

### Description

FROM:elutgen DATE:Wednesday, January 24, 2007 9:30:25 AM

I am attempting to rate a the floor system of a through truss. The total span length is roughly 50' with floorbeams spaced at about 5' throughout the span. The stringers run on top of the floorbeams and are continuous from one end of the bridge to the other.

When I attempt to run the stinger analysis, I get the following message:

```
-----  
Error No.: 1301  
Type   : Input Error  
Location : zero.for  
**** ERROR ****  
Increment of load movement across span is still too small. Decrease  
wheel advancement denominator below 50.0 See LIVE-LOAD command  
4th parameter. Program terminated  
-----
```

**Complete Issue Information**

I am at a loss as to how to deal with this problem. I have located what I believe to be the input data file for this analysis and have decreased the wheel advancement denominator well below 50.0, but continue to get the same results.

Please review and advise.

FROM:elutgen DATE:Wednesday, January 24, 2007 9:46:41 AM

FROM:jihnat DATE:1/25/2007 11:20:43 AM

Open your floorbeam definition window.

On the Engine tab, select BRASS LFD.

Click the Properties button. This is where you'll find the wheel advancement denominator.

(Repeat for the stringer member definition)

FROM:bgoodrich DATE:Monday, January 29, 2007 12:25:54 PM

This error pertains to the stringers, so the wheel advancement denominator should be adjusted on the stringer definition (named Pseudo stringer). Open the Stringer Definition window and follow the instructions from the previous post for getting to the engine properties. Because the stringers spans are so short (around 5'), a wheel advancement denominator of 50 results in the truck stepping across the structure in about 0.01' increments, which is smaller than the allowable element length for the structural analysis. I changed the wheel advancement denominator to 10 and it successfully ran.

FROM:bgoodrich DATE:Monday, January 29, 2007 1:12:39 PM

I contacted Ed Lutgen to discuss the wheel advancement denominator. His engineer made the change and no longer received the error.

## Description

FROM:dteal DATE:Thursday, January 25, 2007 10:13:29 AM

I have gotten this same error earlier with version 5.5. This is the second time in as many weeks. I really don't expect you to duplicate it, I just wanted to report it in case there is a pattern here.

System Error when saving data, structure attached

Unable to save Bridge data!

09:09:25 AM - Line 884 in source file .\UiBWSDoc.cpp.

Saving New and Modified objects failed while processing CDmSuperLoadCase (SaveOrder object 132).

09:09:18 AM - Line 446 in source file .\DmBridgeCache.cpp.

Assignment of data to recordset variables failed.

09:09:18 AM - Line 936 in source file .\DmSuperLoadCase.cpp.

Trying to set NAME to NULL in table ABW\_SUPER\_LOAD\_CASE, but the field is not allowed to be NULL.

09:09:18 AM - Line 1009 in source file .\DmObject.cpp.

FROM:dteal DATE:Thursday, January 25, 2007 10:29:41 AM

One thing I noticed that was weird –

Under the Girder Member Loads, there was one blank load case name (the first one).

FROM:mordoobadi DATE:2/7/2007 9:22:42 AM

The error indicates that a superstructure load case name is NULL (blank) this is the reason that it is failing.

I think we should check for blank names in the Load Case Description window validation if we are not doing it already.

Joe, could you please add validation of load cases to the window.

FROM:jihnat DATE:2/22/2007 10:45:58 AM

Validation added.

we are getting the following error when adding shapes to the timber shape lib. I just started happening

4/19/2016 3:19:57 PM

HRS AASHTO

2256

## Complete Issue Information

in 5.5..

save operation failed: Library Timber Rect Shape  
04:14:36 PM - Line 333 in source file .\UiLibShapeTimberRectVw.cpp.

Error updating database record set.  
04:14:36 PM - Line 356 in source file .\DmLibTimberRectBeamShape.cpp.  
State:23000,Native:1,Origin:[Oracle][ODBC][Ora]  
ORA-00001: unique constraint (PONTIS40.XPKABW\_LIB\_TIMBER\_RECT\_BEAM\_SH) violated

I tuned on the constraint and add a shape. The Database had 3 records and three records in the gui. The delete of the shape remove the record from the gui but not from the shape properites table. I removed by hand from the database and enabled the constraint. The same problem. Attached are screen shots.

FROM:mordoobadi DATE:2/7/2007 8:50:53 AM  
The data for a Timber shape is stored in two tables abw\_lib\_timber\_beam\_shape AND abw\_lib\_timber\_rect\_beam\_shape. Table abw\_lib\_timber\_beam\_shape is the sub-type parent of table abw\_lib\_timber\_rect\_beam\_shape.

Please make sure that a Foreign Key between the two tables exists and is enabled. The foreign key constraint will have a generated name (e.g. SYS\_C00123..). Also make sure that all the constraints for the two tables exist and are enabled.

Somebody may have removed or disabled the constraints on the tables.

As an example if the FK between the tables is disabled or dropped and then you remove the timber shape that was created last from library, the record in the abw\_lib\_timber\_beam\_shape will be removed but the record in the abw\_lib\_timber\_rect\_beam\_shape table may stay in the database. Then if you create a new rectangular timber shape, it creates a row in the parent table with the ID of the deleted shape and attempts to insert a record in the child table but a record exists with the same ID, so it fails.

So, you need to clean-up the records in the child table abw\_lib\_timber\_rect\_beam\_shape such that there is no records in it that does not have corresponding record in the abw\_lib\_timber\_beam\_shape table. (basically you are removing orphaned records). Then you need to enable the constraints that were disabled or dropped.

FROM:pjensen DATE:Wednesday, February 07, 2007 12:46:50 PM  
base on the information above- I have added the constraint to the database. I could not find the constraint in the update scripts (this database has been upgraded since version 2.0)...  
--For now please close--

## Complete Issue Information

FROM:jihnat DATE:1/30/2007 7:12:44 AM  
Received via email:

I am trying to verify the Load rating Factors that Virtis has spit out in the rating summary. In that summary I can find dead loads and live loads. In the Output data I can find the capacity for each girder. According to the AASHTO Manual for Condition Evaluation of Bridges Section 6.5.1, I can calculate the Rating Factor with the variables. But my calculations don't match the RFs from Virtis. I was wondering if the dead load and live load factors are different from what I entered.

Could you call me to discuss? Thanks.

Steve Howard

FROM:jihnat DATE:2/8/2007 10:37:04 AM  
Received from Steve via email:

What's the status on the VIRTIS Rating Factors? I still cannot reproduce the rating factors (by hand) that are produced by Virtis. Could someone tell me where I can find the correct Dead load and live load moment, impact factor, and capacity? Perhaps it isn't that simple.

FROM:bgoodrich DATE:Tuesday, February 27, 2007 7:15:30 PM  
I have been assigned to investigate your Virtis issue regarding rating factors. It would be helpful if you would send me your Virtis bridge in the form of a BBD or XML. If you haven't exported a bridge to a file before, open your bridge workspace, select the File>Export menu item, choose a filename, and click the Save button. It will help if I have the bridge in front of me for any discussions. If you have any of your rating calculations in electronic form, please send them as well. I also need to know what location you are investigating and what limit state is controlling (flexure, shear, etc.).

FROM:bgoodrich DATE:Wednesday, February 28, 2007 10:24:48 AM  
E-mail from Steve:

Thanks for taking my call. I have attached the bbd file and a pdf of my hand calculations. I am trying to verify the Virtis Ratings by hand and cannot reproduce the Rating Factors. In the back of my calcs is a spreadsheet that uses the RF equation (6-1a) from AASHTO's Manual for Condition Evaluation of Bridges. My hand ratings are a little lower than what Virtis shows and I just want to be sure that I am doing it correctly.

The ratings are for each girder line, each span. I even checked the Lane Load but the truck load controls.

Let me know if you need more info, or what you find out.

Steve Howard  
Bridge Engineer

FROM: bgoodrich DATE: Thursday, March 08, 2007 11:47:54 AM  
I believe I found source of the difference in the rating factors. The live load actions reported in Virtis/BRASS include impact. Then, your hand calculations are including impact again in the denominator of the rating equation. Please let me know if this addresses your concern.

## Description

FROM: elutgen DATE: Tuesday, January 30, 2007 1:57:37 PM  
I have a question regarding the calculation of member compressive capacity for a truss.

For my problem, the truss geometry necessitates an intermediate node at the mid-panel point along the top chord between the bracing points to correctly create the truss geometry. By default, Virtis uses the member length as the unbraced length for the compression capacity calculation. However, the actual

4/19/2016 3:19:57 PM

HRS AASHTO

2260

## Complete Issue Information

unbraced length I would like to use is double the default value. Stated another way, the unbraced length of the top chord members between bracing points should be 12.5'; however, given the nodal layout required to create the truss geometry, the default top chord member length (and therefore unbraced length) is 6.25'.

I have attached the input file truss1.bbd, which has only the default settings (top chord unbraced length = member length = 6.25'). When I run the file with the default settings, the Rating Results Report indicates an axial capacity of 267.89 kips for the upper chord members, and the Member Section Property Report indicates a member length and unbraced length of 6.25'. The reports indicate these values regardless of live load vehicle type considered. To verify the axial capacity, I have independently calculated the member capacity as 267.53 kips.

The problem to which I need resolution occurs when I use the MemberOfInterest command to change the unbraced length of the top chord members from 6.25' to 12.5'. The input file truss2.bbd contains the additional commands to change the unbraced length. When I run this file, the Rating Results Report indicates an axial capacity of 291.69 kips for the upper chord members for an HS 20-44 Design truck loading, and an axial capacity of 266.48 kips for an HS 20-44 Design lane loading. The Member Section Property Report indicates a member length of 6.25' and the unbraced length of 12.5' which is what I input. To verify the axial capacity, I have independently calculated the member capacity as 254.63 kips.

My questions are:

1. From the truss2.bbd output, how is it possible to have a different capacity for a top chord member for different types of live load?
2. From the truss2.bbd output, how can the axial capacity of a compression member increase from 267.53 kips to 291.69 kips when the unbraced length is increased from 6.25' to 12.5'?

Thanks for your attention to this problem.

FROM:gbhanushali DATE:3/19/2007 3:55:33 PM

291.69 kips was a reporting error.

Also, unbraced length was being ignored if it was greater than actual member length.

Both the issues are fixed for next release.

Note:

If you only want to specify the unbraced lengths on member to member basis than you don't need to enter Member of Interest. Please refer to Member command in user's guide. Also look at remark section 3 for how/when to enter #

You can input member command as below,

```
Member
// Upper chord
U0U1 U0 U1 Truss_Member_D # # 12.5 12.5
U1U2 U1 U2 Truss_Member_D # # 12.5 12.5
...
```

### Complete Issue Information

FROM:xli DATE:3/20/2007 2:35:27 PM

Tested: Truss1 and Truss 2

1. Truss2: Upper chord members compressive capacity is 256.02 kips for both HS 20-44 Design truck loading and HS 20-44 Design lane loading. (independently calculated by ELutgen 254.63 kips)

2. Truss1 vs. Truss2: Truss1, Upper chord members compressive capacity is 267.89 kips (independently calculated by ELutgen 267.23 kips)

Both problems reported by user were tested resolved.

**Complete Issue Information**

**Description**

FROM:dteal DATE:Tuesday, January 30, 2007 4:54:35 PM  
AASHTO 6.10.1.7 states that we should take 1% of the "total cross-sectional area" of the deck. (not structural thickness)  
Opis is using 1% of the "structural thickness"  
Jay Puckett new text book follows Opis (1% of the structural thickness)

Is Opis wrong or did AASHTO error in writing the spec?

FROM:bgoodrich DATE:Tuesday, February 27, 2007 8:23:03 PM  
I forwarded this issue to Jay.

FROM:bgoodrich DATE:Wednesday, June 06, 2007 8:32:55 AM  
BRASS only has the structural slab thickness available. If the deck geometry is input, we could get the actual slab thickness; however, it wouldn't vary by cross section.

FROM:bgoodrich DATE:Wednesday, June 06, 2007 6:38:56 PM  
E-mail from Jay Puckett:

1% is a nominal requirement. The interpretation is judgment. It would be conservative to use the larger area.  
Jay

FROM:bgoodrich DATE:Wednesday, June 06, 2007 6:46:25 PM  
I forwarded this issue to WYDOT.

FROM: Brian Goodrich DATE: 3/10/2009 12:28:37 PM Mountain Daylight Time  
This issue is to be addressed as part of BRASS Problem Log 764.

FROM: Brian Goodrich DATE: 1/26/2010 11:01:40 AM Mountain Standard Time  
BRASS has been modified to allow input of the actual slab thickness as part of the cross section. Furthermore, control options have been added to allow the user to choose if the actual or structural thickness is used in the Minimum Negative Flexure Concrete Deck Reinf. calculation. These changes must now be implemented in the export and engine properties.

### Description

FROM:tarmbrecht DATE:Tuesday, January 30, 2007 4:58:58 PM

Please see attached for the error message we're getting.

FROM:jduray DATE:Thursday, February 01, 2007 1:50:33 PM

Is there another vehicle in your library named "Test".

FROM:tarmbrecht DATE:Tuesday, February 06, 2007 5:20:52 PM

No there isn't. Curiously though, we were just able to save the truck now. After restarting the program it works? Not sure if we'll be able to duplicate the problem.

FROM:kkennelly DATE:2/7/2007 8:31:18 AM

This sounds just like 7784

FROM:mordoobadi DATE:2/7/2007 8:42:13 AM

The error indicates that a vehicle with the same ID exists in the database.

4/19/2016 3:19:58 PM

HRS AASHTO

2264

**Complete Issue Information**

Is the database a shared database that other people who use Virtis/Opis connect to? If yes, then if two people save a vehicle at almost the same time then this problem may happen.

FROM:tarmbrecht DATE:Thursday, February 08, 2007 1:38:51 PM

It is a shared database, but it is unlikely that two people were logged in at the same time, let alone saved a vehicle near the same time. Most people here just run our standard library of vehicles. Not too many new ones to save (only when we get a permit request), and we only have one person who handles permits in Virtis right now.

FROM:mordoobadi DATE:2/9/2007 4:37:40 PM

Are you able to reproduce this problem?

FROM:tarmbrecht DATE:Wednesday, February 14, 2007 12:11:23 PM

No, we are not able to reproduce the problem. Incident is closed as far as I'm concerned.

FROM:dteal DATE:Friday, February 16, 2007 8:08:47 AM

In the attached single span RC slab structure I get the error you see below while running attempting a rating. This POI command should have been taken care of in the export. I know how to correct it in BRASS, but I don't know how to work around this Virtis and the export?

Error No.: 1875

Type : Input Error

Location : Input Data File

4/19/2016 3:19:59 PM

**Complete Issue Information**

**\*\*ERROR\*\*** A POINT-OF\_INTEREST command is required when.  
parameter 6 of the ANALYSIS command is 3, 4, or 5.

FROM:kkennelly DATE:2/16/2007 12:53:27 PM

Seems like all of the generated POI's are being ignored when it comes to writing the POINT-OF-INTEREST command when only the POI's generated for LRFD dev lengths should be ignored. (You have 2 poi's that were generated as locations of interest. I think the Export should be creating POINT-OF-INTEREST commands for those 2. But even if you didn't have any poi's that should be considered I think the export should change the parameter 6 of the ANALYSIS command to a 1 instead of 3. At least that's how it works for a steel mbr alt when you specify 3 as the POI option on the Mbr Alt engine tab and you don't have any poi's created. The export changes the POI option to 1 in that case.)

The only workaround I see is to create a dummy POI so you have at least 1 POI that is user-defined and it will be considered. Or you can change the POI Control setting on the Mbr Alt engine from 3 to 1. But then you will have to change the POI Control setting back to 3 when you do a design review in Opis.

FROM:bgoodrich DATE:Tuesday, March 13, 2007 6:52:43 PM

The export attempted to adjust the POI control; however, it included the LRFD development length POI when making this determination. I revised the export to only consider R/C POI that are specific to the analysis method, which includes user-defined points. Fixed for version 5.6.

FROM:dteal DATE:Wednesday, June 20, 2007 9:49:18 AM

Accepted in 5.6 Beta 3

**Description**

FROM:rcurtis DATE:Friday, February 16, 2007 8:48:47 AM

In the attached bridge, when I try to solve I am getting an error that my floor beams have a cross section of zero. I have tried to adjust all of the lengths, to no avail.

Any troubleshooting steps to use in the future would be greatly appreciated.

FROM:kkennelly DATE:2/16/2007 12:36:08 PM

I think this is the same problem as incident 7639 and is due to the cantilever spans only being 0.5' long. BRASS tries to put nodes at tenth pts in the span which would be 0.05' = 0.6" which is probably too small of an element length for BRASS.

I've assigned this to Brian for him to confirm. Based on incident 7639 I don't think there is a workaround but maybe Brian can confirm that.

FROM:rcurtis DATE:Friday, February 16, 2007 12:56:22 PM

I modified the model to omit the cantilevers. Thanks for the help.

FROM:bgoodrich DATE:Tuesday, February 27, 2007 5:59:05 PM

This is a duplicate of Incident 7639. At this time there is no workaround.

### Description

FROM:mordoobadi DATE:2/16/2007 1:51:07 PM

Reported by Paul Jensen. [2/8/2007 2:56 PM]

>>> "Jensen, Paul" <pjensen@mt.gov> 2/8/2007 2:56 PM >>>

Attached are error messages that we have received with 5.5 when updating the Pontis ratings. We have done everything with the database. I have checked that the role is allowing write to the database and the bridge table and column. From sqlplus there are no issues.

I have been working on this problem for a week! I have no solution to the problem.

Paul

## Complete Issue Information

Paul send this error description to us:

-----  
Error updating database record set.  
08:53:48 AM - Line 314 in source file .\DmVPontisBridgeRating.cpp.

No rows were affected by the update or delete operation.  
-----

FROM:mordoobadi DATE:2/16/2007 1:56:12 PM

>>> Mehrdad Ordoobadi 2/15/2007 4:35 PM >>>

Paul,

After much investigation I have found the source of the problem. Here is what's happening:

When Virtis/Opis updates PONTIS ratings it uses Microsoft MFC database library and CRecordSet class. When an update command is issued through CRecordSet, it creates a command like this to the database. (See the SQL tab of the Session corresponding to VirtisOpis run in Oracle Enterprise Manager.):

```
UPDATE bridge
  SET truck1or = :v001,
      truck2or = :v002,
      truck3or = :v003,
      truck1ir = :v004,
      truck2ir = :v005,
      truck3ir = :v006,
      orload = :v007,
      irload = :v008,
      altorload = :v009,
      altirload = :v010,
      ratingdate = :v011
 WHERE truck1or = :v012
 AND truck2or = :v013
 AND truck3or = :v014
 AND truck1ir = :v015
 AND truck2ir = :v016
 AND truck3ir = :v017
 AND orload = :v018
 AND irload = :v019
 AND altorload = :v020
 AND altirload = :v021
 AND rater_ini IS NULL
 AND irtype = :v022
 AND altormeth = :v023
 AND ortype = :v024
 AND ratingdate = :v025
 AND altirmeth = :v026
 AND brkey = :v027
```

4/19/2016 3:20:00 PM

HRS AASHTO

2274

## Complete Issue Information

```
AND srstatus = :v028;
```

You can see from the WHERE clause that every column value in the abw\_v\_pontis\_bridge\_rating is checked against original values.

When MFC reads a double precision value from the database it puts it in a C++ variable with data type double which is accurate up-to the 14th or 15 digit. When you update or delete a row from a table through MFC's CRecordSet it builds a where clause (just like the one shown above) for the row to make sure that it is processing the same row. If any of the double precision values stored in that row of data have more accuracy than 14 or 15 digits, the WHERE clause that MFC's CRecordSet builds will not find the corresponding record. That is the reason you get the error message "No rows were affected by the update or delete operation." Because it is not finding the row that is trying to update.

I noticed that I can reproduce the problem that you reported with BID = 230. In order to fix this issue I rounded the rating values in the bridge table to 10 decimal places for BID = 230, BRKEY = 'I00015357+00752'. I ran the following commands to round the values.

```
UPDATE abw_v_pontis_bridge_rating SET truck1or = ROUND(truck1or, 10) WHERE truck1or IS NOT NULL AND brkey = 'I00015357+00752';
UPDATE abw_v_pontis_bridge_rating SET truck2or = ROUND(truck2or, 10) WHERE truck2or IS NOT NULL AND brkey = 'I00015357+00752';
UPDATE abw_v_pontis_bridge_rating SET truck3or = ROUND(truck3or, 10) WHERE truck3or IS NOT NULL AND brkey = 'I00015357+00752';
UPDATE abw_v_pontis_bridge_rating SET truck1ir = ROUND(truck1ir, 10) WHERE truck1ir IS NOT NULL AND brkey = 'I00015357+00752';
UPDATE abw_v_pontis_bridge_rating SET truck2ir = ROUND(truck2ir, 10) WHERE truck2ir IS NOT NULL AND brkey = 'I00015357+00752';
UPDATE abw_v_pontis_bridge_rating SET truck3ir = ROUND(truck3ir, 10) WHERE truck3ir IS NOT NULL AND brkey = 'I00015357+00752';
UPDATE abw_v_pontis_bridge_rating SET orload = ROUND(orload, 10) WHERE orload IS NOT NULL AND brkey = 'I00015357+00752';
UPDATE abw_v_pontis_bridge_rating SET altorload = ROUND(altorload, 10) WHERE altorload IS NOT NULL AND brkey = 'I00015357+00752';
UPDATE abw_v_pontis_bridge_rating SET altirload = ROUND(altirload, 10) WHERE altirload IS NOT NULL AND brkey = 'I00015357+00752';
COMMIT;
```

After doing this I attempted to update Pontis Rating Results again, it did not fail this time.

I suggest that you try updating Pontis rating results for bridge BID = 230, brkey = 'I00015357+00752'. It should fail with "No rows were affected by the update or delete operation." error.

Then run the above UPDATE statements to round the values.

Then update Pontis rating results again and confirm that it completes without any errors.

I am not sure how those numbers with too many decimal places have gotten into your database. Do you know?

Please let us know what you find out.

Regards,  
Mehrddad Ordoobadi

Here is Paul's response:

>>> "Jensen, Paul" <pjensen@mt.gov> 2/16/2007 10:39 AM >>>

Yes- they are coming from a computation update that was need to facilitate metric/English. This was done to facilitate errors that were from the users confusion on the columns are metric or English when using the Pontis website. The program will compute double precision ensure the elements will return the value that the user is inputting from the website (it is inputting English). I think this should accommodate doubles..

Thanks

Paul

FROM:mordoobadi DATE:2/16/2007 1:58:05 PM  
Paul is going to correct the program that has populated the double precision values with too many decimal places.  
In 5.6 we should change the Save operation in the corresponding DM class to run a SQL command (with a where clause like WHERE BRKEY = 'XXXXXXXXXX') and bypass CRecordSet to update the Pontis bridge records.

FROM:mordoobadi DATE:2/21/2007 4:03:18 PM  
Fixed for 5.6.0 Beta 2.  
Save function updated so that it doesn't use the corresponding CRecordset class.

**Description**

FROM:dteal DATE:Monday, February 19, 2007 12:43:37 PM  
View/Compute Column Stiffness in the help (RC Frame)  
Depth at top and Depth at bottom  
Both refer to the "column depth" at top or bottom of column  
This is confusing wording  
Width or thickness may be more appropriate.

FROM:kkennelly DATE:2/26/2007 1:01:12 PM  
The help has the description "The depth is measured parallel to the superstructure definition reference line." Does that make the intent clearer?

FROM:dteal DATE:Monday, February 26, 2007 3:16:02 PM  
I understand the intent. I can get the correct dimension.  
It just doesn't ring true with me to use "depth" to measure in this direction.  
But I can live with it :)

**Description**

FROM:dteal DATE:Monday, February 19, 2007 4:21:25 PM

I was entering a RC Frame very similar to the geometry in the attached PDF. The only difference is that the RC Frame Legs are longer.

Entering this as schedule based – have I entered the girder profile correctly?

FROM:kkennelly DATE:2/26/2007 12:45:34 PM

I think the girder profile and reinforcement profile look ok. I don't know what the plans look like for the rebar but I think entering the bars as you have is ok. The analysis is considering the first 1' of the span as a beam when it really isn't a beam but that should be ok because there is no moment there. The shear analysis should be ok since you've defined some rebar in that first 1' of the span so that the effective depth can be computed.

Do you have any specific questions about this bridge?

FROM:dteal DATE:Monday, February 26, 2007 3:23:04 PM

Just wanted somebody to verify that my model was entered correctly and that I don't make some bone head mistake. My main concern was the fillets at each end.

Thanks

### Description

FROM:dteal DATE:Tuesday, February 20, 2007 3:36:03 PM

In the Member Alt Description, Engine Tab

For LRFD and LFD we can select our POI controls.

We can select User-defined by itself or in combination with 10th points.

There is no mention of Wizard Generated Points (Gen )

I assume they are considered as User Defined??

Maybe we should state that

FROM:kkennelly DATE:2/26/2007 12:59:04 PM

We can included that in the help.

**Description**

FROM:dteal DATE:Tuesday, February 20, 2007 4:29:09 PM  
I have schedule based input for a 3 span RC structure.  
Be sure to look at the second structure definition (schedule based)  
When I run Opis I get the following error:

Error No.: 1707  
Type : Input Error  
Location : Data File

4/19/2016 3:20:02 PM

HRS AASHTO

2283

**Complete Issue Information**

\*\* ERROR: Parameter 3 on the CONC-REBAR command must be greater than zero.

From the .out file I have printed the error below:

8-2.8 CONC-REBAR 20, 1, 0.000, 9, 1.6250

\*\* ERROR: Parameter 3 on the CONC-REBAR command must be greater than zero.

- 1. Cross Section Number : 20
- 2. Row Number : 1
- 3. Number of Reinforcing Bars : 0.000
- 4. Bar Size : 9
- 5. Distance to Bar Center : 1.625

For some reason that I can't find, the export is generating a cross section #20 with no rebar present. I have checked and rechecked and I don't think this is correct.

FROM:dteal DATE:Friday, February 23, 2007 7:10:28 AM

I didn't mention earlier but it runs to completion in Virtis using the BRASS engine.

FROM:bgoodrich DATE:Tuesday, February 27, 2007 8:55:06 PM

It appears that cross sections generated by Opis include one with a very small area of rebar. When this small area is exported using 3 digits right of the decimal, it becomes zero to BRASS. I plan on modifying the export to detect the small area and then not generate a CONC-REBAR command.

FROM:dteal DATE:Wednesday, February 28, 2007 7:43:34 AM

Is there a work around in the mean time?

This happens on one of our slab standards we use in production, one of the more popular sizes.

FROM:bgoodrich DATE:Tuesday, March 13, 2007 6:56:46 PM

I couldn't find any work around.

I revised the export to detect when a small number of bars was input and then not generate that particular command. I did this for the CONC-REBAR and COMPOSITE-REBAR commands for LRFD and the XSECT-G command for ASD/LFD. Fixed for version 5.6.

### Description

FROM:rcurtis DATE:Wednesday, February 21, 2007 2:04:13 PM

I have a side-by-side box beam with two rectangular voids. I see an option for multiple circular voids. Is there a way to input multiple rectangular voids or an efficient work-around?

FROM:kkennelly DATE:2/26/2007 2:25:33 PM

You cannot enter a box beam with multiple rectangular voids in Virtis. As a workaround, you can try entering the wall thickness of the box beam in Virtis as 1/2 the sum of all wall thicknesses in your section. The BRASS program models the box as an I section anyway so this workaround may give you the same section properties as your multiple voided shape.

Refer to the BRASS help file for the BRASS "XSECT-B" command for more information.

FROM:rcurtis DATE:Tuesday, February 27, 2007 1:49:39 PM

Thanks for the help. I will try this.

### Description

FROM:jihnat DATE:2/22/2007 11:01:20 AM  
Received via email from Steven M, NMDOT:

Find attached a bridge model file for a bridge that is both skewed and has splayed beams. When the beam spacing are described "Along Support," and the deck is subsequently described in the STRUCTURE TYPICAL SECTION, the schematic places the beams under the deck as spaced equal to the spacing along the skewed support line rather than perpendicular to beams.

The result is a beam structure shown underneath the bridge deck that extends beyond the deck. Of course, this is highly confusing and terribly inaccurate (beams are actually spaced closer to 10-feet rather

## Description

FROM:jihnat DATE:2/22/2007 11:11:29 AM  
Received via email from Steven M, NMDOT:

Find attached a Virtis Opis bridge model for a schedule-based slab bridge.

The project is to replace an existing slab bridge that contains Grade 40 Reinforcement with a new slab bridge. To increase capacity, the plan was to use Grade 60 in place of the old Grade 40.

If you run this bridge with Grade 60 Epoxy-Coated, it has an inventory rating factor of 0.529.

If you LOWER the reinforcement strength (by merely changing the SPECIFIED YIELD STRENGTH in the MATERIALS ... REINFORCING STEEL), the bridge miraculously experiences an increase of the inventory rating factor to 1.094.
