Tasks

Name	Current State	Summary
15.9398	Resubmit	under the owner drop down data window/list - inconsistency

Complete Issue Information

Description

I noticed under the drop down data window for owner code (NBI), that some of the values contained the NBI value and description and others only contained a description. I would really think it would be best to have all of the items contain the value and description.

AND then sorted by the value. They're currently not sorted by the value.

FROM:jihnat DATE:12/29/1998 09:23:09

Owner information is maintained on the Configuration Browser (double-click on "Parameters", then select "Ownership" in the "Selection Criteria" dropdown list).

Todd Thompson 12-30-1998

yes the information is stored there, and can be edited there. But where does one change so that the sort order is more organized?

FROM:jduray DATE:02/15/1999 17:09:42

We are sorting on parmvalue. The data is from the Pontis paramtrs table.

FROM todd thompson 2/25/1999 Bete Build 3

Does appear to sort correctly now.

BUT how does one enter the parmvalue in the configuration module?

Or how does one copy the data from the pontis paramtrs table to the virtis database?

We need some mechanism so a state can enter their county names and values.

Right now we seem to be missing this.

FROM:hlee DATE:7/10/2006 8:37:47 AM

Changed Project to Support Center.

Tasks

Name	Current State	Summary
82.9334	Resolved	Bridge Workspace - need commands to expand and collapse all children

Description

This is the first ral opportunity to review the GUI for SI. There is no "Weight" in the SI system, only Mass and Force. So "Rail Weight" is named incorrectly. It is really "Rail Force" in N/m or "Rail Mass" in kg/m. Both are cumbersome. In place of "Rail Weight" our office would use "Rail Loading", works for both US & SI.

FROM:jduray DATE:01/12/1999 11:26:27
 Good suggestion!
 Krisha - please check where else this applies and let me know.

4/19/2016 3:12:37 PM

HRS AASHTO

4

Complete Issue Information

FROM:kkennelly DATE:01/15/1999 15:22:22

The parapet and median in the Library and at the Bridge level have "Unit Weight" and "Total Weight" on the screen regardless of the unit system selected.

Library and Bridge railing has "Railing Weight", Library and Bridge generic appurt. has "Barrier Weight".

Library Vehicle grid has "Axle Weight" and Library Shapes have "Nominal Weight".

Steel shape selection dialog grids say "Weight".

FROM:dteal DATE:Monday, January 27, 2003 9:37:38 AM

There is no such thing as "weight" in the SI system??? Loads, Forces & Mass is what's used in place of weight.

Description

1-11-1999 tst

Is there a way to open all branches in a tree or close all branches in a tree like in the old file manager?

4/19/2016 3:12:37 PM

HRS AASHTO

Complete Issue Information

After spending a day using the bridge explorer, it seems that one spends a lot of time opening and closing various parts of the tree.

FROM:jduray DATE:01/12/1999 10:25:40

We have the tree fixed so that we can control how it expands (Beta 1 has a bug that causes the tree to open differently each time depending on where the mouse pointer is when the view opens).

How would you like to be able to control the tree expansion/collapse? We currently have programed the tree to open completely.

We have another arrangement coded but disabled that opens the bridge, structure definitions and members. Perhaps we should activate this and add to the right mouse button menu the ability to open/close the current node and all its children.

1-12-1999 TST

I sure would like to see the right mouse menu ability to open/close the current node and all its children. While it is alright to have it act like it does now,

I think this added feature would add to the funtionality of the Bridge Explorer as sometimes one would like to open all the branches for a given alternative

without having to go to each little node. Like the old File Manager had the ability to open or close a given branch...

FROM:jihnmat DATE:12/22/2005 8:16:24 AM

Right-click Expand/Collapse Branch implemented for version 5.4.0 (Beta 4).

FROM:xli DATE:3/23/2006 1:30:14 PM

Tested with 5.4 Beta 7. Resolved.

Description

1-14-1999 TST

Currently there is no mechanism to import/export "VIRTIS" data. Is there a plan for the future to do this?

I can see many uses to have the ability to import/export VIRTIS data including user support when reporting problems. Also for any states that hire consultants to do inspections and/or analysis, there is no mechanism for the consultant to analyze the data using

4/19/2016 3:12:38 PM

HRS AASHTO

9

Complete Issue Information

VIRTIS and then submit the data to the state for inclusion in a master database. (I don't see many, if any, State IT/IS departments allowing consultants access to a client/server database).

Until we have the import/export capability, I don't see us being very successful at marketing to consultants.....

FROM:jduray DATE:01/14/1999 10:24:56
There has been some discussion about this but no plan yet.

FROM:jduray DATE:05/03/1999 10:39:37
We have added the ability to export the data to an ASCII file.

Task Force authorized this for version 2.1.
For version 2.1 we need to enhance this to export to a binary file and add the ability to import the file.
We also need to deal with the library items that are referenced.
120 hours est. (incl. testing)

FROM:rdquinn DATE:07/14/1999 14:26:18
Export added to BWS and Import added to BWS and Bridge Explorer.

FROM:jduray DATE:04/06/2000 16:30:44
Further enhanced for 3.0 Release.

Tasks

Name	Current State	Summary
186.9231	Discard	Schematic - Profile view - Show distance from first/last support to end of beam

Description

D Teal 1/15/99

When putting in P.O.I. locations for each span. Lets say you want a POI at the .5 span for each of 4 spans. Select span #1 - tab - .5 - APPLY
Then select span #2 - tab - .5 APPLY

The second one overrides the first. You have to select OK, which closes the window, then select POI to re-open again for the second, and so on.

FROM:jduray DATE:01/20/1999 09:13:56

It sounds like it is behaving the way it is supposed to, however, seems like we need a POI wizard to hel generate POI quickly.

FROM D Teal 2/25/99

It would save time to do POI for all spans on one screen instead of clicking OK and reopening the screen again and again. With an 8 span structure, this could get old in a hurry.

FROM:jduray DATE:02/25/1999 15:20:48

We need a wizard for this. We will be sure to get it in for P/S. Doubtful for steel. I'll see what we can do!

Name	Current State	Summary
247.9172	Assigned	No default value for Modulus of Elasticity of a new Reinforcing Steel library item

Description

FROM: todd thompson 1/25/1999
 Can we add to or replace the current controlling location?
 The current location only by distance from end isn't very clear for a quick summary report.
 I would like to see the Span Point either be added or replace the distance for this report.
 To me the Rating Results Summary should be a report to quickly tell the engineer the capacity, what controlled and where it controlled so that in a quick glance he/she knows what he has.

FROM Todd Thompson 4/14/1999
 This item was requested at the VIRTIS training.
 I believe Task Force member Barnhill requested this, so I'm asking that this be looked at again.

FROM:kkennelly DATE:6/29/01 3:27:53 PM
 This feature currently exists in Version 4.0, not sure when it was originally added. Rating Results Summary now includes span and percentage of span in addition to distance from end.

20

Complete Issue Information

From: J. Duray 3/8/99

Windows with tabs on them have this behavior and it is because of the way the window and tabs were implemented. It is not a bug. Perhaps it is a design flaw, however, we have commercial applications that we use that behave the same way (probably for the same reasons) and have assumed that is acceptable. We are investigating ways to improve the behavior.

We need to know if this is something that has to be changed before acceptance of the product. If not changed the user will have to use the mouse to navigate to certain parts of the windows.

FROM:jduray DATE:05/03/1999 11:11:56

Tasks

Name	Current State	Summary
288.9132	Discard	Viewing BWS report lacks navigation aids

Description

Dick Groff, 1/26/99

When viewing the BWS report for a Member or a Structure Definition, which can be lengthy, it would be useful to be able to search easily for a string (for example, for "warning"). The Edit/Find menu option brings up a Find dialog but a found string is not highlighted until the dialog is canceled. This makes repeated use of the "Find Next" button impossible. For a string that occurs often within the report, the user is forced into many extra steps, repeatedly re-invoking the menu option from scratch and canceling the dialog again and again in order to see the results of the search. At the very least, the user should be able to see highlighted search results without closing the dialog (or a "Not Found" message), as is done in Word. Further, it would be useful to be able to use the Ctrl-F key option in place of the 2-step Edit/Find on the menu.

FROM:jduray DATE:7/5/01 2:47:18 PM

This incident was originally entered during 3.0 development.

FROM:jduray DATE:7/5/01 2:48:22 PM

Consider adding the canned BWS report to the Report Tool as a canned report.

FROM:hlee DATE:4/30/2008 2:13:31 PM

299.9121	Discard	No logical order of units shown within tooltip

Description

Dick Groff, 1/26/99

When viewing the BWS report for a Member or a Structure Definition, which can be a lengthy document, it would be useful to have some expected navigation tools to move about, such as Ctrl-Home, Ctrl-PgUp, Ctrl-PgDn and Ctrl-End, as in Word. Also, when the Up and Down arrows reach the ends of the visible page, they do not cause scrolling of the page as expected.

Tasks

Name	Current State	Summary
325.9095	Closed - Inactive	Grid behavior not consistent when tabbing through cells

Description

Vinacs: Tool tips does not appear when I hover the mouse over the dimension texts. When I copied a section from Library, it appears within the GUI depending on the established unit. I needed to change the units to see the dimension. Tooltip would be the best choice to see the dimension to verify the correct dimensions. Therefore, I would like to have tool tips over dimension.

FROM:jduray DATE:01/29/1999 14:16:29
Tool tips don't appear for bridge parapets.

FROM:jihnmat DATE:01/29/1999 16:12:08
These fields do not have unit text associated with them. Instead, the view says "All units are in ...". These windows would have to be redone in order for them to have tooltips. When creating the tooltip text, the OCX reads its unit text for the unit conversion. So unitless OCXs cannot have tooltips. Library and Bridge Appurtenance windows are both this way. Also Library shapes.

27

Complete Issue Information

Pressing F2 will cause the current cell to go into Edit mode, with highlighted text and a blue background. This behavior is like Microsoft Excel.

Do you mind if I ask, where do you "Typically" see this behavior?

Vinacs: As you mentioned pressing F2 is causing the current cell and changes to blue background. However, When you tab to reach the next cell, it does not change the background to blue. Also note that I do not need to press F2 to change the values of the table. Also note that there are a lot GUIs in which the backcolor automatically change to blue (see connector, Median GUIs) within this Virtis program.. I have also noticed the back ground color does not change at allin some of the tables. In otherwords, we have inconsistently within the program. I have seen in several programs (In house SMART, Visual Analysis, Risa3-D, Microsoft Access) that when you tab to reach a cell, it highlights the whole text and ch

FROM:jduray DATE:03/05/1999 08:33:28
Joe - Vinacs indicates we are inconsistent. I think we need to fix all grids to be consistent (unless a particular grid needs special bahavior). My preference is have the cell become editable when entered (text selected). However, I think there is still a problem with the grid control isn't there and therefore we can't implement that feature at this time???

Description

S. Hida 1/29/99

It would be real nice to input stiffeners with respect to the cross-frames. I think designers/detailers usually locate the cross-frames first, and then subdivide the space between the crossframe with so-many stiffeners. Presently, there is no indication if you've placed a stiffener on top of, or too close to, a cross-frame.

565.8858	Suspended	Profile Schematic w/ overlapping stiffeners or diaphragms causes dimensioning to be upside down

Complete Issue Information

Description

Dick Groff, 2/19/99

From the Bridge Explorer, viewing the Bridge Rating Results window, when the user clicks on the "View Structure Rating Results" button, that window opens up in the same position with the same size, covering up the first window. Similarly, viewing the Structure Rating Results window, when the user clicks on the "View Member Rating Results" button, that window opens up in the same position with the same size, covering up the previous 2 windows. This is confusing to the user who doesn't realize that 3 different results windows have been opened (they look very similar). It would be better if each of these results windows were opened in "cascade" fashion (so each window title is visible), or tiled fashion, if there is enough room.

Dick Groff, 2/23/99

While I can understand many of your "suspends", I'm having a hard time accepting your dismissal of this one and #558. To leave these windows inoperative and stacked invisibly one behind the other is really strange windows behavior. It is misleading and frustrating to the user and leaves the impression that program development is not complete. Please reconsider.

FROM:jduray DATE:7/5/01 2:30:00 PM

Complete Issue Information

Tasks

Name	Current State	Summary
572.8851	Resolved	POI engine properties - default BRASS LFD to detailed output

Description

FROM:kkennelly DATE:02/23/1999 09:27:51

When I enter 2 ranges of transverse stiffeners that overlap each other or 2 ranges of diaphragms that overlap each other, I get an upside down dimension in the profile schematic.

Example:

Say my member is 150' long
Transverse stiffener ranges

Start Dist (ft)	Num Spaces	Spacing (in)
0	30	60
10	3	72

In the profile I get the # 140'-0" showing upside down under the stiffener spacing dimensions. Same thing happens for diaphragm spacings.

FROM: cclancy 2/24/99 The schematic for the profile was attempting to dimension the gap between adjacent ranges of stiffeners/diaphragms (for the case where the starting point for the range is not the same as the ending point for the last range). A check was added to ensure that this is only done for the cases where the starting point is greater than the end point for the previous range.

However, when the stiffener ranges overlap, the dimensions still may be confusing because they overlap also. I'm not sure why one would want to define overlapping stiffener ranges - should we allow it? It would be a good idea to check to see if BRASS interprets the overlapping stiffener and diaphragm ranges as expected.

FROM:kkennelly DATE:02/24/1999 10:14:16

Brian is making the changes in BRASS for overlapping stiffener and diaphragm ranges. The users want the ability to enter 1 range of stiffeners that are the connection plates for the diaphragms and then another range for other stiffeners between the cross frames.

FROM: cclancy 2/24/99 This should be ok for the schematic as long as the diaphragm/cross frame ranges don't overlap with themselves and the stiffener ranges don't overlap with themselves. They are drawn/dimensioned separately in the schematic so there shouldn't be any problem with overlapping dimensions. Will the Virtis GUI check to see that this doesn't happen (i.e. warn the user if they overlap)?

I'm assuming that BRASS will combine the ranges of cross-frame connection plates and stiffeners when it comes to determining stiffener spacing for shear analysis/design.

Let me know if I am missing anything in my assumptions.

Name	Current State	Summary
608.8815	Discard	Girder Profile Schematic - Additional Feature - Display support type

Description

From Gale 23 Feb - BETA 3

In order to compare Virtis & BARS rating results, I need the expanded BRASS output provided by the STEEL-1 command (the last parameter, Intermediate Output)

It would save time, if the POI engine properties for BRASS LFD were defaulted to provide the DETAILED OUTPUT REPORT.

FROM:kkennelly DATE:6/29/01 3:49:14 PM

This feature exists in 4.0, don't know when it was added.

FROM:hlee DATE:7/10/2006 8:44:45 AM

Tasks

Name	Current State	Summary
648.8776	Discard	Ability to set location of directory for BRASS files

Description

Vinacs:

1. When we place this program in a server, will the BRASS files written in the server location? Won't that be a problem for the server when we have approximately 20,000 bridges?
2. When I was working on a bridge, I created several structure definitions and reated those structures. Later, I erased them from Virtis database. However, when I looked at the disk, I noticed all of the previously erased strcutures are still stored in the disk. Whose will take the responsibility to erase all of the unnecessary BRASS files? This question needs to be addressed by the system manager, if we place the program in a server.

HRS AASHTO

45

Complete Issue Information

JDuray 2/24/99:

As it is right now the files go into a subdirectory under the virtis installation. I don't think we have any options on that because that's the way BRASS works. Perhaps we should cleanup the files when we are finished with an analysis?

Vinacs: we can definitely delete all the subfolders for the structural definitions that are not available within Virtis. we need to keep it other subfolders(for the existing structural definitions) because user need those files to view or print the BRASS files. Note that the user has no option to print out the BRASS input and output from Virtis.

I don't know the solution, but I know the disk storage will be a problem for administrators.

FROM:jduray DATE:5/21/02 9:11:25 AM

Part 1 has not been addressed yet. Incident 648 is the same.

Part 2 has been implemented.

Since part 1 is a duplicate of 648 and Part 2 is completed, I am closing this incident.

Tasks

Name	Current State	Summary
787.8638	Suspended	Behavior of Tree within BWS - Which folders are opened or closed not remembered

Description

Vinacs: When I tried to rate a girder, BRASS stated that the change point is withing 0.099' of tenth point. Export program supposed to catch this error and make adjustment to the BRASS input file. User has idea of the BRASS program when he creates the bridge geometry.

Complete Issue Information

FROM: bgoodrich DATE: 03/02/1999 17:30:00

The BRASS computational program generates the bridge model (nodes & elements), so it would be difficult for the export to detect when an element is too small. The BRASS user was required to adjust the cross section changes, etc. to correspond to the model. Virtis collects the description of the bridge which should not be modified to conform to an engine. In this case, the engine must conform to the Virtis data. The best place to address this issue is in the BRASS engine itself where the model is generated internally.

Vinacs: BRASS export program is specifically created to create an BRASS input file and therefore, I beleive this error could be handled by either inside the BRASS or in the BRASS export program. I don't agree with the point that BRASS export belongs to Virtis--it actually belongs to the third party developer-BRASS.

Typically, BRASS creates the nodes at every tenth points and section changing locations. If the export program can merge a section change location (if it too close to the tenth point) to a tenth point, this will solve this error. I think that it should be take care of now. Otherwise, at this point, we may have unhappy many campers.

Tasks

Name	Current State	Summary
830.8596	Discard	Framing Plan Schematic - Show transvere stiffeners

Description

Vinacs: I am not sure how to explain it because of lack of understanding of some technical terms. In the Bridge Tree, at a collapsed state one could see only the folder. (If I am wrong, please correct me. I will continue further with this assumption).

I was able to made to see all the branches in the tree. Later I wanted to collapse some of the folder to minimize the size of the tree. I can do that in the Virtis. However, I am not able to save that tree.

Whenever, I close the bridge and reopen the bridge, it shows the full tree. (CONFUSED. Sorry about this. IF you don't make sense, please give me a call.)

In a nutshell, What I would like to have here is that program opens up the bridge tree exactly similar to the one that the user left off at the end of the bridge entry.

FROM:jduray DATE:03/06/1999 11:33:36

We do not save the tree. The tree differs for each bridge and to save it to the registry (the usual approach) for each bridge would be unreasonable. Perhaps as an enhancement we could devise a way to save the tree for a bridge to a file and only save the most recent ones. If the tree opens and differs from the contents of the file the default would apply. There are a lot of complications to this and the likelihood of opening the tree the way the user last used it is low unless noone else worked on the bridge between sessions.

860.8566	Discard	Program Output: Rating Report Summary - Add additional information

Description

FROM: cclancy 3/18/99 - This is being taken under consideration. The dimensioning of the cover plates on the profile is difficult given the flexibility Virtis allows in adding multiple cover plates. There can be multiple stacked cover plates and gaps between sets of cover plate sets (i.e., different variations of cover plated and non cover plated ranges) and combinations of these configurations. Given this, a general dimensioning procedure would be rather complex.

883.8543	Discard	2.0 BETA 4 - Remove effective slab properties from non-composite section definitions during BARS import

Description

I entered 1/10 points from 0.0 to 1.0 and only got the 0.4 and 1.0 points in the Rating Report Summary.

Also, it would be nice if the program automatically showed the the critical point / lowest rating value when performing a rating.

FROM: bgoodrich DATE: 03/16/1999

A single vehicle defined in Virtis may be split into an "Axle" vehicle and a "Lane" vehicle for use by BRASS. The Rating Results Summary show the critical rating factor and location for each vehicle

4/19/2016 3:12:49 PM

HRS AASHTO

61

Complete Issue Information

(axle, lane, etc. separately). Are you wanting the critical rating factor for every vehicle or the critical rating factor for the axle/lane entries from a single Virtis vehicle? It seems like the 0.4 and 1.0 points were just the critical points for the specified vehicles. Please attach the BRASS data file and output file. Also, if you could attach some screen dumps of the Results Summary windows with some indication of what you think is incorrect, it would help.

FROM: bbeeran 3/17/99

Attached is Virtis02s.db, look in the "Beta Build 4.0" FILE at BRIDGE ID "Matrix No. 4 - 4". Then go to STRUCTURE DEFINITION

2 spans @ 75' - Cross Section Based
MEMBERS
G2
MEMBER ALTERNATIVES
Member Alternative 01

Also, attached is a screen shot of the results summary in file "Comment411"

The .4 and 1.0 are, as you said, the critical points. However, if a user doesn't specify (or doesn't know what point to specify) in the POINTS OF INTEREST he won't see what is controlling.

Suggestion(s):

In the Summary Table - MEMBER ALTERNATIVE highlighted: capacity, loads, and rating values for bending, shear, etc... of each vehicle specified at each 1/10 point (as well as any other specified point by the user) and the controlling 1/10 point value highlighted.

In the Summary Table - STRUCTURE DEFINITION highlighted: The controlling member in the Girder System with corresponding rating values.

For whatever reason, I can't attach the files. Let me try to e-mail them.

FROM: bgoodrich DATE: 03/17/1999

Jim - There is nothing wrong with the GUI or the export because the Rating Results Summary was designed to show the most critical inventory/operating rating factors and their corresponding locations. The data Ben would like to see is not available in the results object, so it is not shown in the GUI. The BRASS output could be opened to get some of this information. I think this issue would be an enhancement.

FROM:jduray DATE:7/5/01 1:38:07 PM
This incident was originally entered during 2.0 beta testing.

911.8515	Resolved	Steel-Girder Control Command - Issues related to composite/non-composite regions

Description

From Gale 16 March BETA 4

4/19/2016 3:12:49 PM

HRS AASHTO

63

Complete Issue Information

This came from Illinois today. They coded one section definition with composite properties. They coded the ranges as non-composite or composite and always used section one. Import creates two sections (one called non-c & the other comp) and correctly identifies the non-c/comp ranges, but includes the effective slab width & thickness on the COMPOSITE TAB of both sections. The export to BRASS includes the effective properties in all ranges and therefore creates a stiffer section in the non-composite ranges for Stage 2 & 3. Manually deleting the effective dimensions for the non-composite section gets the same RF as BARS. I know it's kind of late in the game, but can we have IMPORT omit the effective dimensions for the sections designated as non-composite ??

FROM:jduray DATE:03/17/1999 10:26:51

Can we do this within our time schedule (ie. by Monday) without impacting other code and opening a can of worms? We should not be adding new features at this time. Let's discuss this.

FROM:jduray DATE:7/5/01 1:39:50 PM

This incident was originally entered during 2.0 beta testing.

FROM:hlee DATE:4/30/2008 2:16:26 PM

Discarded by TAG 12/07.

Description

From: kfulton Date 3/17/99

On a structure that is composite only in the positive moment regions, the steel-girder-control command created by the program is placing a 5 in the last field for the non-composite areas.

FROM: bgoodrich DATE: 03/22/1999

Jim - The 5 Keith is referring to is the section type as entered on the STEEL-GIRDER-CONTROL schedule command. Currently, the export uses the contraflexure locations to determine regions of positive or negative moment. The export then determines if the member alt is composite or not, to determine the section type. The export generates the STEEL-GIRDER-CONTROL command using 1) the non-composite section type codes (2 or 3) if the BRASS sequence type is one-stage non-composite or 2) the composite section type codes (4 or 5) if the BRASS sequence type is multi-stage composite. The export does not mix the two based on the cross sections input or the schedule of shear connectors (composite regions). What would you like me to do? I am checking with Dan Glandt to see what effect a section type of 5 would have for a non-composite cross section analysis.

FROM: jduray DATE: 03/24/1999 08:53:32

Jeff - we need to discuss this with Jay ASAP.

FROM: jduray DATE: 03/30/1999 12:34:33

Discussed with Brian. Requires changes to BRASS LFD to override schedules with POI data. Section type 5 will work for this build.

From: kfulton Date 4/7/99

There is no way to change the 4 parameter of this card. This causes a problem for composite structures that qualify as compact. Currently the value is set to a 4 which will cause brass to only use the moment at first yield for the capacity instead of M_p .

From: Jay Puckett

Keith is correct and this was illustrated in the short course example problems.

If the section at the piers are compact then full M_p can be achieved in the M_+ region -- parameter 41. We have this flag in the GUI in the engine tab to indicate compactness for the pier region. Also, I think that it should be assumed that all simple-span structures can be "compact" at pier in order to achieve a M_p hinge. This would solve this issue with a lot of structure and could be address w/i the export.

FROM: bgoodrich DATE: 10/12/2000 4:29 PM

At some point, we modified the export to use a 41 code for simple spans. We have done nothing for continuous spans. Jay indicated that we have a flag in the GUI in the engine tab to indicate compactness for the pier region, but that is only for BRASS-LRFD. I think we need modify Abxbrass2 so the compactness indicator is available for BRASS-LFD also.

FROM: jduray DATE: 10/13/2000 9:11 AM

Do it!

FROM: bgoodrich DATE: 10/17/2000 3:27 PM

I modified Abobrass, Abxbrass2, and Abxbrass to address the compactness issue for BRASS-LFD. I have also modified the BRASS-LFD engine properties help file. Fixed for version 4.0.

920.8506	Closed	COPY from Library: Leave copied item selected in grid after pressing Apply button

Description

3/17/99 D Teal

I can view the girder on the screen just fine, used zoom & scroll bars. I tried a print preview. It will not advance to the next page. All I can ever print is starting at the left end of the girder to what ever fits on one sheet. I can do a fit view and get a tiny image.

FROM: cclancy 3/18/99 - This is a known problem with the schematic views. A couple of things you

4/19/2016 3:12:50 PM

HRS AASHTO

68

Complete Issue Information

can do to work around this problem until we can better address it are as follows:

* Try setting your page setup to landscape and reducing the margins prior to printing. This will give you more space for the girder profile.

* Copy the bitmap to the clipboard (using standard Windows copy keystrokes) or from the edit menu. This bitmap can be pasted into another application and printed from there. Note that the bitmap is copied at the resolution corresponding to the current zoom level. Therefore, if you want a more detailed bitmap, zoom in first and then copy it to the clipboard. The entire bitmap will be copied, including the portions outside the viewable area.

I know that neither of these solutions is ideal and we will try to remedy this problem as soon as possible.

FROM: dteal DATE: 9/1/1999 10:43 AM

I don't believe this work around was provided to users who received the release version 2.0?

FROM:jduray DATE:09/01/1999 16:57:14

We should make this description available on our web site.

FROM:jihnata DATE:1/23/2002 2:52:23 PM

Print/PrintPreview fixed for version 4.1.1 and 4.2.0

FROM:dteal DATE:Tuesday, April 02, 2002 3:23:49 PM

Incident #1411 seems to be relevant and part of this problem, was that fixed also?

FROM:jihnata DATE:4/3/2002 8:22:20 AM

This incident dealt specifically with schematic printing and print preview. I don't see the connection to 1411. Incident 1411 is the place to ask about incident 1411.

Description

3/18/99 D Teal

A very early on incident (build 1 or 2), I can't seem to locate the incident to read about it's resolution. When bracing ranges are entered, it seems very redundant to have to locate a stiffener in the same location. You have to connect a x-frame to a stiffener, therefore the stiffener should placed automatically at x-frame locations. Much time would be saved. Keep in mind that in doing a new design from scratch, which most designers do, you are not importing anything.

4/19/2016 3:12:51 PM

Tasks

Name	Current State	Summary
962.8464	Suspended	Database Disconnect - add reconnect feature and timed disconnect-reconnect

Description

3-22-99 D Teal

When selecting a Bridge, we have no Rt click to open it (which there should be). You have to rely on double clicking. More than half the time I try I get a small dithered box next to my mouse pointer. In order to open that bridge I will have to click off the requested bridge someplace to unhighlight it and go back and try double clicking again. I went to my control panel to check my double click rate. I tested my settings many many times and never once did I fail to click too fast or too slow. We don't need to frustrate new users any more than we have to.

FROM:jduray DATE:03/22/1999 10:45:22

I assume you are referring to the Bridge Explorer. There are three ways to open a BWS for a bridge: 1) double click (works best if you point to the center of a row so you don't get the copy cursor); 2) select a bridge and select File/Open; 3) select a bridge and click the toolbar Open button. You can also use the up and down keys to scroll the list of bridges and in the next build you can use the Tab key to navigate between the folders and the list and Enter will open (same as double-click) the BWS for the selected bridge.

3/23/99 D Teal

I pointed at the center of the row the best I can and still get the copy cursor 75% of the time. It's frustrating! And I am using a 19" monitor. Maybe the rows are too small. If we can't fix the double click then I propose we utilize the mouse right click function. This is where most users would look anyway. When I look for faster easier methods, I always check out the rt click.

FROM: dteal DATE: 3/17/2000 3:38 PM

Tasks

Name	Current State	Summary
------	---------------	---------

Description

FROM:jduray DATE:03/22/1999 12:03:49

The first release has a partial implementation of the database disconnect. However, beta testing uncovered a problem that we could not fix correctly prior to release and since only NY requested the feature we decided to disable the feature for that release. The following describes how it is currently implemented (but disabled) and what needs to be done to fix it.

The LRESULT CMainFrame::OnStartDbDisconnectTimer(WPARAM wParam, LPARAM lParam)

function is called when the mainframe opens. It creates a timer

The void CMainFrame::OnTimer(UINT nIDEvent) function gets the message when the timer expires and

calls CMainFrame::Disconnect() which calls CDbConnectionMgr::DisconnectPrimary().

CDbConnectionMgr::DisconnectPrimary() calls BOOL CDbConnectionMgr::Disconnect(short iKey)

which calls BOOL CDbConnection::Disconnect(). BOOL CDbConnection::Disconnect() calls BOOL

4/19/2016 3:12:51 PM

HRS AASHTO

75

Complete Issue Information

CDbDatabase::Disconnect() which checks that there are no pending transactions and no recordsets created. Recordsets are put into a list held by CDatabase. There are added to the list when created (not opened) and removed when closed.

The timer is restarted in void CUiDescDtopGridView::SetDbDisconnectTimer(). This needs to be done anywhere we access the database or perhaps it should be done in the OnIdle function. This may need to be more sophisticated to prevent disconnect during processing and will require significant testing.

To make this feature more robust and less dependent on the db we need to store more in memory. All access to the system tables and the library cause a reconnect.

The code is disabled with #if 0 and commented with // ##### Database disconnect.

Two functions were overridden (and then if-defed) in CDbDatabase because the CDatabase::Connect() function queries for the top level window. Dialogs using abocfg had a problem with this and assert. The OpenEx() function calls Connect and it too was overridden but not changed. We need to find why this problem exists and correct it. Maybe the override is the only way but we need to be certain of that since it will be a maintenance problem as new versions of MFC are delivered. I removed the reference to the window oin the overridden Connect function and it seemed to work. Didn't test it much though.

To make this work we need to do the following:

- 1) buffer more of the library in memory
- 2) buffer much of the system tables in memory
- 3) find a better way (OnIdle or something similar) to reactivate the timer after the database is reconnected
- 4) fix the problem with the dialogs that access abocfg objects ()and test that there are not other similar situations)
- 5) find a way to detect a lost connection and reconnect
- 6) provide a way to refresh the buffered data

FROM:jduray DATE:4/14/2005 3:34:31 PM

An alternative to this is to tickle the db by querying the db based on a timer event. Should add enable/disable and the time interval to the preferences.

The BWS command Save Results saves all result sets in memory. If someone made 20 design runs all of them would be saved. Is this ok? The help for the tool bar button does not indicate that all result sets are saved.

Complete Issue Information

Possible solution a dialog with tree control listing analysis events with bridge components analyzed should as child of each event.

FROM:jduray DATE:03/23/1999 07:50:37

I think we should improve this for the first maintenance release in July. I would like Mehrdad to write a description and mockup (basically a spec) for a dialog (Event Browser) that allows the user to save selective events and parts of events. I also would like for the user to be able to cancel the save after an individual event and member alt has been saved. This spec should also address events in general and provide for a better way for the user to understand what events are in memory and in the database. We also need to address maintenance of the events in the database and provide a way for the user and the administrator to remove events. We need to add to the results the option to save the BWS report as a text blob. I would like to be able to save part of the results instead of all or nothing.

Perhaps we need an Event Browser in Configuration too. We have other events that are being logged to the databae but have no way to view them.

I think for the current release we should warn the user that there are x events in memory and give him an opportunity to cancel. We should tell him (in the dialog) that he can open the Analysis Events dialog for each member alt and save the results individually.

FROM:mordoobadi DATE:03/23/1999 12:01:24

A dialog box is added to warn the user and to give him an opportunity to cancel when there are multiple unsaved results in memory.

I change the category of this incident to enhancement to work on it later (for July build).

FROM:mordoobadi DATE:03/23/1999 14:03:29

FROM:mordoobadi DATE:03/24/1999 13:28:23

FROM:mordoobadi DATE:03/26/1999 13:09:56

Fixed for Beta Build 5.

A specification document created for Event Browser (EventBrowser.doc in sourcesafe)

Description

FROM:kkennelly DATE:03/23/1999 15:18:13
When calculating simple beam df for interior beam, code does not check if adjacent wheel of truck is outside of the travelway.

example, * wheel can't be there cause it's other wheel is in parapet, outside of travelway. but my code doesn't currently check if other wheel of truck is outside travelway, it just checks if other wheel is within the girder bay and if it is, it is included in calculating the df. I'm afraid this will take more than a couple of lines to fix.

*

Tasks

Name	Current State	Summary
1147.10233	Closed	Check-in,check-out - Headings for grid tables don't update when display units changed

Description

FROM:jduray DATE:05/03/1999 08:18:43
From Dean Teal

When you select several things to be charted at one time, the legend falls off the bottom of the window. Resizing the window doesn't help, it still stays hidden behind the tabulated numbers window.

FROM:jduray DATE:11/24/1999 08:45:01
Joe - did you fix this when you were working on the chart?

FROM:jihnmat DATE:11/24/1999 11:56:21
No. (Same problem as 1030)

FROM: dteal DATE: 4/21/2000 2:52 PM
Something should really be done here to clean this up!

FROM: dteal DATE: 11/16/2000 9:27 AM
Same problem as #2667

4/19/2016 3:12:55 PM

HRS AASHTO

92

Complete Issue Information

FROM:jduray DATE:1/5/01 12:00:22 PM

The legend is automatically produced by the charting tool we are using (Objective Chart). We need to submit this to the developer.

Joe - please submit to StingRay or whoever they are.

FROM:jihnath DATE:1/5/01 1:09:30 PM

Here's what I wrote on 5/24/2000 in Incident 2667:

"This is not a Stingray problem. As originally written, the chart only gives a fixed percentage (15%) of the window for displaying the legend."

Someone's going to have to spend some time redesigning our chart implementation for this to get fixed.

The county numbering in the "as sent" data base in 2.1 Beta was -2,-1,01,02,03,.....
45,46,111,222,333,777.

I added 101,102 and 201.

They were put at the top of the list instead of being put in numerical order. Now the numbering is 101,
102, 201, -2,-1,01,02,03,.....45,46,111,222,333,777.

FROM:jduray DATE:08/09/1999 08:36:15

This is a list of strings and is sorted as such. This is coming from Pontis and I don't think there is anything we can do about this problem. If you want to use 3 digits the number 1 should be input as 001 and 10 should be 010, etc. This will allow for proper sorting.

FROM:mordoobadi DATE:08/09/1999 09:04:07

This is because the sorting is done by misvalflg (missing value flag) first and then the ID. The current records in the parameters table in the sample database have a non-null misvalflg. So when we sort, those original records are put at end of the list.

FROM: dteal DATE: 8/9/1999 8:33 AM

Keeping in mind that the numbering order shown above is found in the listing when you look at the "Parameters". The following is the ordering you find when you look in the BWS – Description (Cont'd) tab. 01, 02, 03, ...10, 101, 102, 11, 111, 12, ... 19, 20, 201, 202, 21, ... 33, 333, 34, etc. Shouldn't the numbering be the same between the Description tab and the parameters window?

I don't know anything about "non-null misvalflg", but I do know we all were taught how to count properly at an early age.

Being HELP does not address this, a user may input county numbering in logical order using 1 or 2 digits. Now, when the user finds out he has to use at least a 3 digits number to define there 105 counties, he will go back and find that you can NOT EDIT the ID numbers. You have to delete them and re-type all 105 counties over again! There is going to be some frustrated users.

FROM:jduray DATE:08/09/1999 10:45:28

Mehrdad - please check the Pontis help file and let me know how they describe the entry of parameters.

Also, these two windows should show the same order.

FROM:mordoobadi DATE:08/09/1999 11:45:17

The drop down lists in Bridge Description/Cont'd tab sort the data. We should disable sorting on those drop down lists.

FROM:jihnat DATE:08/09/1999 13:24:15

Sorting has been disabled.

FROM: dteal DATE: 8/9/1999 12:46 PM

What about being able to edit the ID name so the entire entry doesn't have to be re-entered?

FROM:mordoobadi DATE:08/09/1999 15:39:02

The IDs are not allowed to be changed for existing parameters because they might be used in other tables. Renaming the used IDs could cause problems in database integrity.

Description

FROM: dteal DATE: 5/14/1999 1:01 PM
Trying to edit/add KDOT's terminology.

Example 1: In the Owner/Maintainer Name fields I am trying to put Kansas Dept. of Transportation for ID #1. I can put in KDOT or Kansas Dept. of Transpor (if I put anything more after the "r" it will not save.

Complete Issue Information

Example 2: In Functional Class, I am trying to put in Other Freeways & Expressways, If I leave the word OTHER out it will save.

It appears to have a string length parameter. But if this length is exceeded, nothing will be saved (all work in that window will be lost and you'll need to start over). HELP does not mention a limit to the length. No warnings as to field length on the Parameters input screen.

FROM:jduray DATE:06/08/1999 09:54:33

Mehrdad - Please check into this. We may need to limit the number of characters permitted during input. Check with Joe regarding the grid.

FROM:mordoobadi DATE:06/16/1999 14:20:14

SetMaxLength() function is called to limit text length in Grid Cells.
Fixed for both versions 2.1 and 3.0.

FROM: dteal DATE: 8/6/1999 3:05 PM

Are we going to be limited to 24 characters??? I tried to put in "Kansas Dept. of Transportation", I ended up cutting off the last 4 characters.

FROM:jduray DATE:08/09/1999 08:32:42

The length is defined by Pontis and probably NBI. These fields are being stored in the Pontis bridge table and are shared with Pontis. We can not change them. We can check to make sure that we have used them properly within our code.

Mehrdad - please verify that our lengths are correct in the pontis_bridge table. Check with the most recent version of Pontis database that we have.

FROM:mordoobadi DATE:08/09/1999 11:54:50

short_desc attribute in paramtrs table in version 3.4 pontis database is a char(24).

FROM:mordoobadi DATE:08/09/1999 12:01:17

FROM:jduray DATE:11/24/1999 09:25:41

We should restrict the number of characters the user can input.

FROM:mordoobadi DATE:11/24/1999 09:53:03

The number of characters is already limited to 24 in the grid.

FROM:jihnmat DATE:12/27/1999 08:10:46

For Ken Hurst, Kansas State Bridge Engineer
Library, Steel Shapes
Shapes should be grouped by units with the USC and the SI counterpart right under it, or separate USC or SI.
ie: USC = HP10x42 SI = HP250x62

LRFD Distribution Factors
Shouldn't the slab thickness "ts" be structural thickness?

Stages
Is it possible to have multiple structural slab thickness by construction stage?
Stage 1 = 0", 7" DL Only
Stage 2 = 7" composite with 1.5" SFO
Stage 3 = 8" composite with 0.5" deduct, add FWS

Intermediate Stiffeners
Need a full depth option with clips, weld similar to connection stiffeners

Weight/Mass Output
Can you get approximate weight/mass in BRASS output? Can you get it by adding up the reactions for self weight? This is needed for optimizing economical designs.

HL-93 Includes?
How can you tell is the HL-93 includes the HS20 + Lane or Tandem + Lane or 90% (2 HS20's + Lane) or (2 Tandem's +Lane)?

Name	Current State	Summary
1235.10146	Suspended	Live Load Distribution – Deflection

Description

FROM: dteal DATE: 6/22/1999 7:40 AM

Windows should open up without having all the column's pushed to the left. At least expand them so the column headings can be read without manipulation.

FROM:jihnat DATE:07/08/1999 12:45:10

We generally do this. Do you know specifically which window(s) he is referring to?

FROM: dteal DATE: 7/21/1999 10:24 AM

For the most part all new windows require user manipulation. You have to grab each column seperatly and widen them to see the text. You can read the column headings, but text below the headings is usually partly hidden.

FROM: dteal DATE: 7/26/1999 12:55 AM

At the User Group meeting this past week I watched as each different window was opened. Jim went to the top of the column to widen something on every window he opened to see the text. This extra column width manipulation is what I'm referring to.

FROM:jduray DATE:08/12/1999 07:51:30

We will look into this, however, this is only necessary the first time a window is opened after Virtis is installed. When each window closes we save the info to the registry for future use. It may not be possible, or reasonable, to size the columns perfectly because the size of the text varies from row to row. Also, (i'm not sure about this one) the font may affect the size and to determine for each row may slow window updates.

1254.10128	Resolved	INPUT OF SLAB DATA

Description

FROM: TIM SCHWAGLER DATE: 7/1/1999 2:04 PM
THE TRANSVERSE STIFFENER OVERRIDE IN THE POINT OF INTREST WINDOW DOES NOT CHANGE THE BRASS INPUT FILE.

FROM: bgoodrich DATE: 8/2/1999 12:33 PM
Does this issue pertain to BRASS-LFD? If so, BRASS-LFD does not currently allow the user to override the schedule data. There should be a warning produced in the progress window.

4/19/2016 3:13:00 PM

HRS AASHTO

121

Complete Issue Information

FROM: tschwagler DATE: 9/23/1999 8:09 AM

This issue is from a Virtis run using BRASS-LFD. When running Virtis there is no mention of the Transverse Stiffener override not working. This seems to be a translation problem between Virtis and BRASS. If Virtis gives the option to do something and it cannot do the function I think the option should be removed from Virtis or the Engine should be modified to do the option.

FROM: bgoodrich DATE: 10/7/1999 11:17 AM

The warning that is issued by the export is:

"The POI control parameter on the ANALYSIS command indicates to generate points of interest from the schedule data. BRASS currently does not allow the generated data to be overridden with the data entered on the point-of-interest commands."

This warning pertains to all point of interest overrides - stiffeners (transverse, bearing, longitudinal), bracing, lateral support, etc.

Virtis/Opis is designed to capture the complete bridge description (geometry, loads, etc.). I doubt any computational engine utilizes every piece of Virtis/Opis data, but an engine should utilize a good majority of it. I think that users must understand the limitations of the engine being utilized. This incident only occurs in BRASS-LFD, so this is a limitation of one rating engine. Hopefully, others will implement additional engines.

FYI: Some items that BRASS does not address are concentrated moment loads and temperature gradients. BRASS is also limited to a fixed number of load cases, loads, cross sections, schedule ranges, etc. These are discussed in the BRASS help files installed with Virtis/Opis.

Description

FROM: TIM SCHWAGLER DATE: 7/1/1999 2:18 PM

WHEN MODELING A CONTINUOUS BEAM AND THE SLAB IS DEFINED AS BEING CONTINUOUS FROM ONE END OF THE BEAM TO THE OTHER AND REBAR INFORMATION IS INPUT AT THE PIER. BRASS USES THE SLAB DATA TO CALCULATE THE SECTION PROPERTIES AT THE PIER. THE REBAR IS NOT USED.

FROM: bgoodrich DATE: 11/29/1999 2:41 PM

I will examine this issue.

FROM: bgoodrich DATE: 11/29/1999 2:50 PM

BRASS-LRFD always uses the slab in the section properties for structural analysis if it was entered. BRASS-LFD uses the slab or rebar depending on which one is exported.

1273.10111	Duplicate	Standard parapet can not be modeled

Description

FROM: rmbest DATE: 7/9/1999 11:19 AM

For a specific bridge(, VIRTIS and OPIS are in conflict over the moment capacity. VIRTIS claims the composite ductility requirement fails for this section, thus making the section braced, non-compact and the capacity is moment at first yield. OPIS claims the composite ductility requirement is OK, thus making the section compact and the capacity is between the plastic capacity and the yield capacity. The fact that OPIS and VIRTIS follow different codes is irrelevant since the requirements are the same in this case. Data file available on request.

FROM: rmbest DATE: 7/9/1999 1:10 PM

Sorry - this is no longer valid. The problem was resolved in Beta 4. Please remove.

1321.10064	Information Needed	BRASS Import HINGE command

Description

FROM: rmbest DATE: 7/9/1999 11:31 AM

Section breaks too close (.099') to a tenth point are not permitted by BRASS. User will get an analysis error "Element too small". The user will have to change the location of section breaks that fall that close to a span tenth point. This means that the model in the database will not represent the plans perfectly. This is very undesirable.

1323.10062	Not Reproducible	BRASS export problem with stiffeners.

Description

FROM:jbosch DATE:07/26/1999 07:59:19

BRASS we use the HINGE command. We enter the point which we are interested into the 3rd and 4th parameters. However, VIRTIS codes ours hinge points into the 1st and 2nd parameters. This causes very low ratings. Since we are trying to import many BRASS files into VIRTIS which contain special analysis points this is a big problem. Is there another way to enter special analysis points in VIRTIS.

Ed - It seems like we are not handling this correctly. The way he describes their BRASS file Hinge command they are specifying an additional analysis point, not a hinge. Do interpret that to be a hinge?

FROM: emartin DATE: 8/2/1999 3:31 PM

Please provide an input file. The sample files I have do not add hinges from parameter 3 or 4 data of the HINGE command.

on the screen.

FROM: bgoodrich DATE: 8/18/1999 9:57 AM

I am unable to reproduce this incident. I need a specific example that causes this problem to effectively determine if there is indeed a problem. Note that the BRASS schedule commands use a stiffener spacing applied over a range, instead of the Virtis/Opis method of defining actual stiffener locations. If there are double-sided stiffeners at the cross frame locations with several single-sided stiffeners in between the cross frames, the double-sided stiffeners may just be merged into a range of single-sided stiffeners.

Description

FROM: dteal DATE: 7/26/1999 12:11 PM

Using defaults settings (as sent):

Under "Bridge Description", a design engineer has read, write, create and delete privileges. The design engineer should be able to alter the Bridge Description data as stated in the privileges window. So I opened up training bridge #1 and alter the location. I selected OK. I opened up the same window to verify that it was changed, OK. I then selected SAVE. I got a system error message window that simply stated "Unable to Save Bridge Data". This window should of at least stated why – that user is not authorized or something. According to the privileges listing I should have been able to save this. If I did not have privileges to save, then the data fields should have been grayed out and not let me change them?

Then when trying to exit the bridge I am again asked if I would like to save the changes, as if it where going to let me NOW save them.

Is this normal?

4/19/2016 3:13:04 PM

HRS AASHTO

138

Complete Issue Information

FROM:jduray DATE:07/30/1999 08:20:01

I believe this is normal...did you figure out why you couldn't save? If you don't have privilege to create or write the BWS opens in read-only mode and nothing can be changed. I suspect this problem is not related to privileges.

FROM: dteal DATE: 8/6/1999 11:07 AM

I had a misunderstanding of PRIVILEGES, disregard that part.
The system error message (Unable to Save Bridge Data) was no help – it should have stated something to the effect (User is not authorized to save changes – Unable to Save Bridge Data).

FROM:jduray DATE:11/24/1999 09:13:32

Need to improve the error message.

trailing to the maximum length for this field. If the ID was only "TEST", it would not be possible to highlight 9 characters worth of space. How did the ID appear in the BWS tree? As "TEST" or as "TEST "?

FROM: dteal DATE: 8/6/1999 11:06 AM

(First Sentence) – There where no spaces trailing TEST, it occupied 4 spaces. When I changed the ID name to TEST, I put the cursor in the ID field and pressed end, then I backspaced to the beginning of the field and entered TEST.

(Second Sentence) – If the 4 letter word TEST is in the Bridge ID field, you can highlight more than the 4 characters (press left mouse button and drag across the field). This is the only way I can enter more characters than were previously there.

(Third Sentence) – It appeared as “TEST “

FROM: dteal DATE: 8/9/1999 8:53 AM

FROM: jduray DATE: 11/24/1999 10:05:09

I can not reproduce this. I followed the steps described above and was able to type "NewBridge" plus more.

Description

FROM: dteal DATE: 7/27/1999 12:34 PM

Is there any combination of access privileges that would allow the User (designer or rater) to be able to copy bridge(s) to a folder without having delete privileges. Any way I have tried, delete & remove from folder are always (on or off) together.

I want the user to be able to create, copy and remove without being able to delete from the master list of bridges.

FROM: dteal DATE: 7/28/1999 12:59 PM

OK – I can separate the Delete & Remove from folder.

FROM: dteal DATE: 8/6/1999 11:11 AM

This incident should be listed as RESOLVED or CLOSED

2. Would like to allow designers/raters to remove bridges from there personal folders and not be able to delete any folders belonging to somebody else. Or be able to remove bridges from folders that belong to somebody else.

FROM:jduray DATE:07/30/1999 08:08:19

Please refer to the help on this topic...When you copy a bridge you must rename it because the names must be unique. If you are simply adding a bridge to a folder but not copying it, they cannot have different names because they are the same bridge. Remember, bridges copied to folders are just references or short-cuts to the original bridge. Use Copy if you want another copy of the bridge.

FOLDERS AND BRIDGES ARE NOT PERSONAL at this time!

FROM: dteal DATE: 8/6/1999 11:09 AM

The USER should have personal folders that only the User and the Administrator or Manager can manipulate (delete).

Description

FROM: dteal DATE: 7/29/1999 11:30 AM
Bear with me and follow the logic.

With Bridge Description Delete allowed – User can delete any bridge from the “All Bridges” to the Deleted Bridges folder. Where an administrator or manager can control there removal.

With Bridge Folders Delete allowed – User is allowed to remove any bridge from any folder (except All Bridges) plus remove any folder. User could remove an entire directory tree. Not a good idea!

With Bridge List Delete allowed – User is allowed to delete a bridge from “All Bridges” and not from any other folders. User is also allowed to empty or delete the contents of the Deleted Bridge Folder. Also not a good idea!

The big problem here is in the Bridge Folders Delete allowed. The user needs to maintain (clean up) his own folders. Included in that privilege is the ability to delete ANY or ALL folders. The user doesn't need global access to the folders. He should only be able to do maintenance on his own folders. Along with that should be a “delete” that is not global. Should only be able to delete something he created, not some existing bridge from the database.

FROM: gbarnhill DATE: 7/29/1999 1:26 PM

4/19/2016 3:13:06 PM

HRS AASHTO

151

Complete Issue Information

This somewhat goes along with the Nashville discussion of "Global folders" and "User folders". Perhaps we should think about being able to enable Checkin/Checkout at the folder level as well as per bridge.

FROM:jduray DATE:07/29/1999 15:03:20
The user doesn't own a folder. All folders are global.
We need to give ownership of folders to users.

FROM: dteal DATE: 8/5/1999 3:55 PM
Exactly, that's the problem. If you give a user access to folders (read/write/delete) so he can manage what's in his folder, than he can also do a delete on another users stuff. That's no good!!

FROM:jduray DATE:01/07/2000 16:56:05
Consider adding two columns to abw_group.
Add private_group_ind and person_id. Only use these if the group is a folder (of bridges). Folders could be private or public (using private_group_ind). If private then only the owner can see it and modify it. If public then all can see but only the owner can modify. Folders where both are NULL are public and cannot be modified (like All Bridges).

Description

FROM:jduray DATE:08/09/1999 07:54:40
The following was copied from an e-mail fro dvire:

As I was entering a bridge into VIRTIS, I came upon a small problem.

The bridge is a steel multibeam, skewed, simple span.

While entering the diaphragm spacing under "Structure Framing Plan Details", I am confronted by a message stating "End Distance is 62.5000 ft. Beam Length is 63.0000 ft. Do you want to change the spacing? Yes No."

If I choose "No", VIRTIS will not allow me to apply the diaphragm spacings as input. It once again displays the message stated above. If I choose "Yes", VIRTIS modifies the diaphragm spacing, which does not accurately model the structure.

4/19/2016 3:13:07 PM

HRS AASHTO

155

Complete Issue Information

Evidently the "No" option does not point to the appropriate line in the code to allow a bypass of this check.

FROM:kkennelly

I think it's working ok but it's just annoying.

If he hits Apply, Validate() will tell him the distance is 62.5' twice in a row. Once for the left girder and once for the right girder of the bay. If he answers No to these and then hits OK to close the window, Validate() tells him twice again, once for the left girder and once for the right girder. If he answers No to change the spacing these 2 times, the window will close and save the distance of 62.5' like it should.

I think I would have to save some kind of flag to not show the warning again after it is displayed on Apply and the user hits No.

Or I could add to the message which girder (left or right) the message applies to. That would make the appearance of two messages seem more warranted and not look like a code error.

FROM:jduray DATE:08/09/1999 08:16:23

FROM:jduray DATE:08/17/1999 10:42:28
I like option 2 above.

FROM:kkennelly DATE:08/18/1999 10:32:29
Fixed with Option 2, message now states to which girder the message applies.

Tasks

Name	Current State	Summary
1375.10010	Suspended	diaphragm wizard--possible to highlight entire bay and delete at once, rather than line-by-line?

Description

FROM: dteal DATE: 8/10/1999 1:21 PM

I have a question about Additional Self Wt % that is not spelled out in help. % of what? (Help states, percentage of the member) Is this percentage of the GIRDER alone or percentage of the GIRDER + CONCRETE?

FROM: rmbest DATE: 8/10/1999 2:34 PM

We always assumed that it was percentage of steel girder alone, and think that is what it should be. The percentage should be for additional steel weight, such as diaphragms, plates, etc. In incident # 1272, I noted that it does not appear the weight of additional steel, added in the form of a percent, is included in DL1. At least we weren't seeing an increase in the moments.

FROM: dteal DATE: 8/10/1999 3:01 PM

Right above that there is Additional wt in Force per unit length.
 ?Is this acting on one girder (effective width)?
 ?Is this acting on the total width fo the deck?
 I think Help should be a little clearer here.

FROM: jduray DATE: 08/11/1999 16:14:18

Brian - how did you implement this in the export. I can add to further explanation to the help.

FROM: bgoodrich DATE: 8/12/1999 8:27 AM

The Additional Self Wt % and force/length is intended to adjust the bare girder self-weight. Check the girder self-weight load case for the contribution to these increases, not dead load group 1. Note that this load is applied on the member alternative, which is a single girder, so the load adjustment should be entered for one girder only.

Deck Concrete – will Opis calculate the Modular Ratio, n for the user or do we have to calculate one and enter it?

Reinforcement – Will Opis calculate a stiffness for the deck using AASHTO min. requirements or do we have enter some re-steel.

If Opis does these for me, how would the user know? Is there some place to look to find out what items Opis calculates if left blank (or can be over ridden by the user)? If yes, where? Any new user would automatically assume that if the field is blank with out any other explanation that he would have to enter something. This defeats the purpose of many of the software's features.

FROM: jduray DATE: 08/11/1999 15:58:19

The ending export (the log file created during a Brass analysis) should tell you these things.

FROM: dteal DATE: 8/11/1999 3:40 PM

I think you missed the point. When a user is entering data, nothing has been run yet. Also, checking the log file can certainly be a problem for a user that is not up to speed with BRASS commands.

This may be a Windows 95 problem. When i try to view the girder profile or framing plan schematics, I can only get small length structure to view properly. So far, for any structures over three spans, I can only see the first span and part of the second. I can not get the third span to show up. The schematic I can see is not correct. If I try to change the magnification, all I get is a blank screen.

Name	Current State	Summary
1401.9984	Resolved	Long. stiffeners

Description

FROM: kfulton DATE: 8/12/1999 8:38 AM

When adding a large number of stiffeners, the cursor always goes back to the top stiffener when the newor duplicate button is pushed. So every time you have to grab the slide bar and take it to the bottm so you can add the next stiffener.

When I finished inputting a long list of transverse stiffeners, I got a message that the length I input does not match the length of the beam, which it should not for a transverse stiffener.

FROM:jihnmat DATE:10/04/1999 15:17:12

I'm unable to reproduce this. Are you still seeing this problem in Version 2.1? I'm assuming you mean the Stiffener Ranges window since you mentioned the New and Duplicate buttons. Is this correct?

Description

FROM: kfulton DATE: 8/12/1999 8:43 AM

When adding longitudinal stiffeners, the new and duplicate buttons will not take the end distance from the previous stiffener and use it for the new start distance.

FROM:kkennelly DATE:08/17/1999 10:07:35

This is the behavior that we want.

We only fill in the start distance for a new row for items that have to be continuous along the length of the member (things like flanges, webs, etc.). Long stiffeners do not have to be continuous along the length of the member so we don't fill in the next start distance for the user.

In the member window I have values for the End Bearing Locations as Lt = 350 mm & Rt = 200 mm. According to the help file, this X distance (girder overhang) is from the centerline of bearing to the end of the girder. My left span was 35 m centerline to centerline of bearing. The left span + girder overhang is then 35.350 m. The view shows the 2 pair of stiffeners correctly with there offsets, but the girder stops at the centerline of bearing and does not extend out the actual end of the girder. Should it show in the view this extension?

Tasks

Name	Current State	Summary
1416.9969	Closed	Results Graph - Design Ratio < 1 but spec checks pass

Description

FROM: kfulton DATE: 8/12/1999 1:16 PM

I created a bridge that had three structures. One structure was a simple span, one was a two span, and the third was a three span. I rated the bridge from the bridge explorer and found the following. See attached files.

1) The bridge rating results gave the single controlling factor for the entire bridge. It would be nice to see which structure and location were this occurred.

2)When I view the structure rating results, I get the same rating factor for all structures, which happens to be the controlling factor for the bridge. Also the ratings are repeated three times for each structure. This screen should show the controlling factor for each structure and the location.

3)When i view the member rating results for each structure i again get the same rating factor (the controlling factor for the bridge) for each member and each one is repeated three times. For s1 g1 the first three results are for the controlling vehicle (hs20 truck, lane values are not shown) and the last six are from s2 g2 and s3 g3. Also the results screen has three sets of inv and opg columns with nothing to distinguish then from each other.

4) An enhancement I would like to see is that the results show the length and tenth point that controls the rating.

FROM:jduray DATE:08/13/1999 07:46:39

1) You can drill down to structure and member.

2) We will investigate this. (Mehrdad)

3) Same a 2.

4) This is an enhancement.

FROM:mordoobadi DATE:08/13/1999 11:43:29

1425.9960	Q/A	Could LRFD dist. factors default to 1.0

Description

Could "design ratio" be defined somewhere? I looked in the "help" but couldn't find anything. Or is that a hover-thing you're doing later. In any event, that's terminology we're not used to using. (in tree for viewing analysis results)

FROM: shida DATE: 8/13/1999 11:45 AM

FROM:jduray DATE:08/16/1999 08:16:21

Brian - we need to define what this is supposed to represent. Can you give me the BRASS definition of this so I put it in the help somewhere?

FROM: bgoodrich DATE: 8/16/1999 9:48 AM

From the BRASS-GIRDER(LRFD) technical manual:

Design ratios are computed for stages in which live loads are not applied. A design ratio is computed using:

Design Ratio = A / B

where:

A = Total load resistance of the structure

B = Total load effect

The total load represents the combined factored action and the total load resistance represents a factored resistance.

FROM:kkennelly DATE:12/01/1999 09:43:27

1430.9955	Q/A	save analysis settings with each bridge?

Description

I ran BID #16, and the y-axis for moment was labeled without exponential notation i.e. 25000000000.00 rather than 2.5×10^{12} . Is this still in the works? Also, the graph was off of the top i.e. inappropriate scale was chosen.

FROM: shida DATE: 8/13/1999 1:36 PM

FROM:jduray DATE:08/17/1999 13:22:16

The values coming from BRASS appear to be incorrect. The output file prints *****.
Brian - please investigate this.

FROM:jduray DATE:08/17/1999 15:43:05

The problem seems to be a difference in the way the FORTRAN compiler optimizes the code for the release build vs the unoptimized debug build. The release build is generating erroneous results for this member.

FROM: bgoodrich DATE: 10/7/1999 11:42 AM

The GUI bug is due to incorrect results from the release build of BRASS. The debug version of BRASS will be distributed to address this issue in the short term. This issue will be investigated when BRASS funds are available and assigned to this task.

1435.9950	Q/A	Library – Standard/Agency - Add capability to rename items in the standard folders

Description

If I run a bridge, close it, go on to another, and come back to the first, I still have to reset "design" and vehicle selection.

Is there a way to set "design" (as opposed to rating) so that it doesn't have to be set each time I do a run?

Designers rarely rate, and raters rarely design.

Also, could the vehicle selection be saved so that each time I run a bridge, I don't have to reopen the analysis settings window?

Can any editing be done to the standard library? Like edit a name or description.

There may be several names used in the standard library that an agency would have the same description for. If they could just rename the Item, there would be no need to add an Agency item to the data base.

Also, an agency may only want users (in-house or consultants) to have access to only the materials used by this agency. If we cannot edit the standard library items, then can we restrict access to Agency only materials?

4/19/2016 3:13:14 PM

HRS AASHTO

186

Complete Issue Information

FROM:jduray DATE:08/17/1999 08:31:35

I don't think we can allow the names to be changed in the standard folders. That would allow a user to rename a HS20 to HS25 or Joe's coal truck and that would not be correct. YOU can restrict access to agency library but not specifically to materials.

FROM: dteal DATE: 10/11/1999 10:59 AM

The user would not have privileges to change the names. That is left at the administrator or manager level.

Being we can't currently change a name, then how do you restrict the user to just the agency library without access to the standard library?

Version 2.0

While experimenting with access privileges.

I had Bridge Description – Create – set to N in one group and to Y in another group.

Opened up TrainingBridge1 and selected Member Alternative, selected Rolled Beam and then selected Cancel. I got the following error message:

The attempt to delete this object has failed!

(Reasons Unknown)

Please shut down Virtis and contact Virtis Technical Support.

This error message is inappropriate. It doesn't tell the user he doesn't have the needed access privilege.

4/19/2016 3:13:14 PM

HRS AASHTO

190

Complete Issue Information

FROM: dteal DATE: 8/25/1999 11:55 AM

More exact information on this error message.

When Bridge Description – Delete is set to “N”

Double click on lets say Appurtenances – Generic, now don't enter any information, just click Cancel.

Being you don't have any permissions to Delete, then you get this error message, the coding thinks you are deleting, not just canceling out of a window you entered by mistake.

FROM:jduray DATE:08/26/1999 08:39:09

The domain should check for a negative object id (or similar check) and allow the delete if it is.

Check into possibly passing CDeObject (m_pData or m_pCurrentData) in the call to CDoCmdTarget::CanDelete. In the function we can check GetDataStatus to determine if it is new or newmodified.

FROM:jduray DATE:08/26/1999 08:58:41

FROM:jduray DATE:03/14/2000 10:23:27

Created a new CanDelete function that takes a short that should be the value returned from GetDataStatus(). Modified the following domain objects:

from abobrdg:

DoBridgeAlt.cpp
DoConcreteRailing.cpp
DoGirderLineStructDef.cpp
DoGirderSystemStructDef.cpp
DoLfdFactor.cpp
DoLfdLoadingSet.cpp
DoLrfdFactor.cpp
DoLrfdLimitStateSet.cpp
DoLrfdLoadFactorSet.cpp
DoLrfdLoadingSet.cpp
DoMatlConcrete.cpp
DoMatlPsStrand.cpp
DoMatlSteelReinforcement.cpp
DoMatlStructuralSteel.cpp
DoPsShapeStrandGrid.cpp
DoSteelRailing.cpp
DoSuperStruct.cpp
DoSuperStructAlt.cpp

and from abognrl:

DoCmdTarget.h
DoCmdTarget.cpp

The code has been changed so that a user without BRIDGE_DESC_PRIV delete privilege can delete items he created. However, at this time the GUI prohibits him from deleting them. The net result is that if he creates an new item and then cancels the new item is deleted.

FROM:jduray DATE:03/14/2000 16:29:52

Many more files had to be changed in abostld, abobrdg and abocncb.

Version 2.0

The following error message was received while trying to SAVE a Workspace when the access privilege for create was set to "N" in one group and to Y in another group.

Unable to save Bridge data!
Assignment of data to recordset variables failed.
Trying to set NAME to NULL in table ABW_SPNG_MBR_DEF, but the field is not allowed to be NULL.
Operation cannot be completed without WRITE access for Bridge Description privilege.

The last sentence states I have no WRITE privilege. My WRITE privilege was set to "Y" but the CREATE was set to "N" in one group and "Y" in another group. I think we are getting the wrong error message here.

FROM: dteal DATE: 8/24/1999 3:33 PM

FROM:jduray DATE:08/26/1999 08:37:32
If you can recreate this please save an export file prior to saving to the database. Send me the export file.

FROM: dteal DATE: 8/30/1999 3:15 PM
What is an export file?
I can't recreate it either.

FROM:jduray DATE:09/02/1999 10:16:50
File/Export from the BWS.

FROM: dteal DATE: 3/20/2000 11:14 AM
What info are you needing from me?

FROM:jduray DATE:03/23/2000 08:58:54
I think there are two problems here - The error message "Trying to set NAME to NULL in table ABW_SPNG_MBR_DEF, but the field is not allowed to be NULL." indicates that you have a member alt without a name. You can display the BWS Report and you should see a member alt without a name listed in the report. Validation may also tell you this.

The other error - "Operation cannot be completed without WRITE access for Bridge Description privilege."
" - needs investigation.

FROM:jduray DATE:03/27/2000 10:55:08
I was not able to reproduce this.

Description

FROM: bgoodrich DATE: 8/25/1999 3:33 PM

A new HL-93 loading was added to BRASS-GIRDER(LRFD) called the Tandem Train. A new type (TYP_VEHICLELD_VLD____) needs to be added to the domain and the associated results objects need to be updated with this new load. This load is located in the AASHTO LRFD Specification Commentary, and it IS important in generating the critical negative moment over interior piers. Should we always generate this new load when the HL-93 vehicle is specified, or will we need to add some way to indicate to generate it?

Jim instructed me to add this as an enhancement.

FROM:jduray DATE:10/11/1999 10:09:38

We should add an attribute to the Tandem tab for the vehicle or handle it on the Analysis Settings

4/19/2016 3:13:15 PM

window similar to the Fatigue vehicle.

FROM: bgoodrich DATE: 11/1/1999 12:13 PM

I think we should handle this issue on the Analysis Settings window. This way the user does not have to create a record in the vehicle library for each group.

FROM: jihnat DATE: 5/30/2003 11:32:50 AM

Mehrdad, please add the TYP_VEHICLELD_VLDTANDEMTRAIN, then assign this back to me.

FROM: jihnat DATE: 5/30/2003 4:23:50 PM

I've already changed SysTypeDefines.h

FROM: mordoobadi DATE: 6/6/2003 1:58:22 PM

Sybase Databases (5.0.1 and 5.1.0) updated . The migration scripts for Service Pack 1 updated.

FROM: jihnat DATE: 6/10/2003 4:14:32 PM

The Help needs to be updated.

FROM: kkennelly DATE: 6/11/2003 8:33:05 AM

Help updated.

The "tandem train" checkbox that was added to the Advanced Vehicle Properties window is only enabled for the HL-93 vehicle. It should be enabled for any vehicle that has tandem data. If PennDot were to ever use Opis, they use an agency PHL-93 vehicle that would require access to this checkbox.

FROM: jihnat DATE: 6/12/2003 3:21:20 PM

Done for 5.0 SP1

FROM: gbarnhill DATE: Thursday, June 19, 2003 5:23:15 PM

The HELP still reads like this:

This window allows you to specify whether a single lane is loaded and enter a scale factor and impact factor for each

It appears we have replaced the SINGLE LANE LOADED option with the new TANDEM TRAIN.

FROM: kkennelly DATE: 6/23/2003 9:28:24 AM

Help fixed.

FROM: gbarnhill DATE: Thursday, July 10, 2003 1:48:13 PM

OK in 5.0.1 Beta 7 July

Description

FROM: dteal DATE: 9/2/1999 2:16 PM
 When you first open the Stiffener Ranges Window there will already be stiffeners populated by the wizard (if you selected stiffened). Being I want them at diaphragms, I will have to delete all of them. Then I select Apply at Diaphragms. If you select OK here, you will get the error announcing 2 stiffeners at the same location. What I found is that you have to select Apply after you delete the existing, then you can use the wizard.
 Is this normal?

1515.9871	Resolved	Privileges/Bridge Description saving

Description

FROM: tthompson DATE: 9/22/1999 8:56 AM

In entering our "standard/agency" parapets, one of our designers noticed that the computed net centroid appears to be in error. This error appears to be fairly small but does put doubt in the designers mind if there are other errors not so noticeable.

The dimensions entered were from left to right across the top

7 in, 2 in, 7 in

and from top to bottom

0 in, 19 in, 10 in, 3 in

There was no additional load placed and the parapet unit weight used was .150 kcf. The computed properties from Virtis place the centroid at 5.456 inches and total weight at .339 kips/ft. I've computed (and our designers also) the centroid to be at 5.528 inches.

I'm not sure if this is really worth pursuing, but if a simple area/centroid can't be calculated accurately, the designers will doubt other calcs....

FROM:jduray DATE:09/27/1999 12:25:03

Let's fix this for 3.0.

FROM:mordoobadi DATE:09/27/1999 14:03:25

The problem was inside the function that computes centroid locations of a trapezoid in the domain object.

Fixed for 3.0.

FROM: tthompson DATE: 1/5/2000 1:01 PM

Checked with 3.0 Beta Build 2 and appears to have been correct.

It compute the centroid at 5.529 (vs. hand calcs of 5.528).

Description

FROM: dteal DATE: 9/30/1999 1:58 PM

Does the effective width field have to be filled in or is calculated internally? If it's calculated internally then where can I view the values it used?

FROM: bgoodrich DATE: 10/4/1999 9:46 AM

BRASS does not compute the effective width of the deck internally, so it is a required input (for BRASS). We have considered computing the effective width within BRASS, but there is one problem. BRASS also requires the user input the amount of rebar within the effective width. Do you feel the BRASS export from Virtis/Opis or the BRASS computational engine should be enhanced to perform this computation?

FROM: dteal DATE: 10/4/1999 3:29 PM

The Eff. Width is different from interior to exterior girders and from span to span. How sensitive is it? I don't think we need to add it, but we need to make the user aware that it's not calculated by the engine and we have to enter the data.

I gave an Opis demo at the K-State Bridge Workshop. This question was asked there. Why do you have to enter it when all the information you need has already been entered.

Every time I work with a new user the same questions pop up.

Description

FROM: dteal DATE: 10/4/1999 2:28 PM

When using the Wizard and selecting stiffened.

The wizard will create a Wizard Stiffener, one for each girder bay. If a 5 girder structure only has 2 different stiffeners, the other 3 that appear in the workspace are useless and should be deleted. But in order to delete them the user has to go to the Member Alt – Stiffener Ranges for Member 3, 4 and 5 and delete them there first.

It seems to me that we should have the wizard only create one wizard stiffener and populate all the stiffener ranges with it.

Description

FROM: dteal DATE: 10/4/1999 3:55 PM

When entering a parabolic haunched section where the web plate thickness changes someplace in the haunch. Does the second section geometry start with a line with a zero slope or does it continue it's slope from the first section??

FROM: jduray DATE: 10/06/1999 12:59:04

My understanding is that BRASS has been modified to handle the continuous slope.

FROM: jduray DATE: 10/06/1999 13:00:16

Brian - can you verify?

FROM: bgoodrich DATE: 10/7/1999 8:35 AM

Jim is correct. Also, the web depths at the end of the first range and start of the next range must be the same or the ranges will all start with a zero slope at one end. The depth is not always a nice round number, so enter at least four digits to the right of the decimal. BRASS uses a fine tolerance to detect the continuous slope.

FROM: dteal DATE: 10/20/1999 2:41 PM

I found that you have to be more accurate than 0.000002 mm or the web will be considered "not continuous". User ends up doing a bunch of decimal chasing.

FROM: jihnat DATE: 12/27/1999 07:50:50

4/19/2016 3:13:20 PM

220

Complete Issue Information

Resubmitted by dteal via email.

FROM: bgoodrich DATE: 12/27/1999 1:19 PM

BRASS uses an SI units tolerance of 0.1 mm for detecting discontinuous parabolic web profiles. I also increased the number of digits right of the decimal (from 1 to 3) when exporting all start distances and ranges from Opis. There should not be any round-off of error from these distances. The web depths are also exported with 3 digits past the decimal.

Dean - Please attach a BBD file that produces the problem, so I can check the latest export module.

FROM: dteal DATE: 1/3/2000 11:50 AM

I can't reproduce it!?!

FROM: dteal DATE: 1/3/2000 1:31 PM

I had attached the .bbd file to Incident #1581.

FROM: dteal DATE: 1/4/2000 8:37 AM

I was able to reproduce it today, as per my email to Brian G. Attached is the .bbd file and a below is copy of the error message. Input Errors (1103) - Cross-section area less than or equal to zero

----- End of Contents of BRASS Error File -----

The cross section area is zero for span 2 and span point 11. Check data file for possible error.

----- Contents of BRASS Error File -----

FROM: bgoodrich DATE: 1/4/2000 1:26 PM

Mehrdad is converting two BBD files that will be used to find any problems.

FROM: bgoodrich DATE: 1/18/2000 8:02 PM

A few of the web ranges were entered to 6 digits past the decimal, however, one of the start distances did not equal the end distance of the previous range by a small distance. After changing the length of a couple of the ranges, so the end distance equaled the start distance of the next range, the bridge could be analyzed.

The analysis was not completed due to a bug in the BRASS computational code. The problem only occurs for the 104 point. I have found the BRASS problem and the issue will be addressed for beta build 4.

FROM: bgoodrich DATE: Tuesday, April 09, 2002 4:55:41 PM

Track field marked with "A", so status set to Accepted.

FROM: bgoodrich DATE: Tuesday, April 09, 2002 5:11:36 PM

(3) have been populated and are carried to the Member Alt. Description Tab. Now if you use the wizard, the only Analysis Module field that is populated is the LRFD and LFD for the Default Rating Method. To do a rating the user will have to go to the Member Alt. Window and select BRASS LFD as the analysis module.

I think that all the analysis modules should have a default in them to start with, like when not using the wizard.

FROM:jduray DATE:10/14/1999 16:52:14

The original intent of the wizard was for design (LRFD - Opis) and that is why it behaves the way you describe. The other analysis modules should be straight forward to add.

Description

FROM: dteal DATE: 10/6/1999 3:21 PM

Both the Top & bottom flange tabs.

I entered one line of input with a material selected. I duplicated that line 6 times. I then finished modifying flange widths, thickness' and ranges, leaving the material alone (being a duplicated the first line I didn't have to change the material). I applied and went on to do the bottom flange. I OK'd the window and went on. When my model wouldn't run I discovered that the material in the flanges were only present for the first line. No material defined for the lines I duplicated. I then selected each material pulldown list and re-selected my material. I applied, OK'd and saved, (several times) and each time I go back and check to see if the material stayed I find the fields blank. I tried the same (duplicating) in the deck profile – reinforcing and it works just fine.

To fix it I tried to delete all rows in the top & bottom flange. I re-entered the data, and OK'd it.

Re-entered the top & bottom flange window and found the material fields to be blank. The only way I could make it work was to go to the Default Materials window and change the default material to the material the flanges were made of.

Description

FROM: tthompson DATE: 10/19/1999 10:49 AM

I'm not sure if this is a bug or if this should be an enhancement request. I've observed that when one deletes a structure from virtis/opis, that it doesn't delete the structure folder and subsequent folders and output files from that structure from the harddrive.

If it's a bug we should fix it.
If it's not a bug, please submit this as an enhancement request.
Thanks

FROM:jduray DATE:10/19/1999 17:04:21
This is not a bug. We think the directories are named such that Explorer can be used to clean up. This would be a good enhancement though.

FROM: tthompson DATE: 10/26/1999 11:39 AM

4/19/2016 3:13:22 PM

HRS AASHTO

229

Complete Issue Information

is true that Explorer can be used, but if the user isn't alerted to the fact that he must additionally delete these directories, there is no easy way to track which directories are valid or invalid. PLEASE add this as a needed enhancement. Hopefully it can be incorporated with the concrete release. The cleaner and better this can be, the better buy in we can have for its use.

FROM:hlee DATE:6/18/2001 3:20:39 PM

The revision includes deleting bridge, super structure def., member, and member alt. from Virtis/Opis.

FROM:bgoodrich DATE:10/15/2001 10:30:55

When deleting the files and folders associated with an item, the UI should warn the user if all the applicable directories could not be deleted. For example, if a user saves a file to a directory associated with the bridge, all the directories cannot be deleted.

FROM:jduray DATE:10/23/01 8:10:20 AM

FROM:hlee DATE:10/30/2001 2:44:36 PM

A warning message will be displayed with the location of the first folder that has problem.
Done.

Description

FROM: dteal DATE: 10/19/1999 3:47 PM

Scenario – 2 span (27.450 m & 27.060 m), used a girder system, schedule based. After running an analysis I looked Critical Moments, Strength I, Max (I found it happens to all). In the tabular information I found on the second line, Span 2, -24.71 for the location and 2.74 for the distance. The third line is Span 1, distance and location are 2.75. It is giving me the first 10th point in span 1, once from support 1 and once from support 2. I deleted all my Points of Interest and had requested output at 10th points. No change.

Now it has some funky things happening. I unchecked the requested max moment, when the screen refreshed, this -24.71 remained in the tabular output. When I recheck the one max moment it put another point for -24.71. Now the value for the first -24.71 is blank and the new one now has the value. And so on. They keep adding up until you leave the Analysis charts window and open it again.

FROM: dteal DATE: 10/21/1999 9:16 AM

Please also see Incident #1272

I received a phone call from Ill. DOT today. They where glad to see that somebody else had found the same problem.

FROM:mordoobadi DATE:10/22/1999 14:48:18

This is fixed in version 2.1 update (abgrslt to be downloaded from our web site)

Fixed in version 3.0 (the way values of y placed in the grid improved)

FROM: dteal DATE: 10/27/1999 8:42 AM

I down loaded TN0003, the documentation for the technical note states that it contains the file ABGSTL3.DLL and not the one you referenced (AGBRSLT.DLL).

FROM: dteal DATE: 10/27/1999 9:29 AM

I have found no change after down loading and executing TN0003 & TN0004. Is there some other patch you are refering to?

FROM:mordoobadi DATE:10/27/1999 10:38:14

Where did you see a reference to TN0003 for this problem? You should download TN0006.

FROM: dteal DATE: 10/27/1999 1:42 PM

Reference to TN0003 is available under the "Down Loads" tab.

I down loaded TN0006 and installed. It fixed some of the problems but not all. When I select Design Ratio, I get a point that doesn't belong. In the left hand column the span number is indicated. In the middle of the Span #1's there is a span #2 with a negative location and a positive distance. The distance into span #1 is correct but it is located to the left of the beginning of span #2.

FROM:mordoobadi DATE:03/13/2000 10:51:23

Please Test this in the new build and see if you can reproduce it.

FROM:dteal DATE:Tuesday, April 02, 2002 8:47:53 AM

No - I can't reproduce it anymore. Mark it closed.

1635.9753	Resolved	Make member inactive for analysis

Description

FROM: rmbest DATE: 10/26/1999 9:34 AM

There seems to something wrong in the rating computations for dead load in Girder System models .

1. When parapet is defined in Appurtenances and is specified as a Stage 2 load in the Structure Typical Section then the dead load force contribution from this parapet isn't included in the in the Dead Load Actions results in the tabular report (Stage 2, SDL).

2. If the parapet is toggled to Stage 1 load instead, then the results in the tabular report for Stage 1 Superimposed Uniform Dead Load actually decreases instead of becoming larger as expected. There is something wrong here. It appears that Superimposed Uniform Dead Load was created by the program and it would be helpful if this were better defined. (see incident 1505)

3. If I make parapet a separate load case and specify it as Stage 2 then I don't see the Parapet as a Dead Load Case in the tabular report.

4/19/2016 3:13:23 PM

HRS AASHTO

232

Complete Issue Information

FROM: bgoodrich DATE: 10/29/1999 12:07 PM

BRASS-LFD requires that the parapet loads be entered as a line load over all spans and assigned a stage. BRASS distributes the dead load to the girder of interest by moment distribution and then internally adds the contribution to the superimposed dead load case for the specified stage. Depending on the girder you are examining, the contribution of the parapet could be nearly zero or even sometimes be negative due to the moment distribution method. A warning message is printed during the BRASS export process. We are currently enhancing BRASS-LFD to perform the other distribution methods (tributary width, uniformly distributed, etc.), but this will not be available until Virtis 3.0 is release. If this discussion does not address your concerns, please attach your bridge export file (*.BBD).

FROM: rmbest DATE: 11/2/1999 11:26 AM

That explains the problem - Thanks

Email from Dennis Winkie

Hi, sorry to bother you again, I was wondering if you had a list somewhere or knew of an easy way to obtain a listing of all the orphaned tables in Virtis 2.1. I couldn't find anything on the CD that contained this information. The ERD has a few lines that go into tables but the table that the line originates

4/19/2016 3:13:24 PM

HRS AASHTO

239

Complete Issue Information

from is not shown, for example, in a few spaces the line starts in blank space and then goes two or three inches (on a print out that we made) into the table, so I don't know which tables are joined by that line. It's not a printing error as I was able to locate those lines in the .pdf file for the ERD.

Thanks,

Dennis Winkie

FROM:mordoobadi DATE:11/22/1999 13:50:42

Erwin diagrams sometimes don't show the relationship links correctly. I think that's the case here. For example the link between abw_bridge and abw_bridge_alt does not start from abw_bridge in the diagrams. If you try to move abw_bridge or abw_bridge_alt table or move the link, the link would appear.

FROM:kkennelly DATE:11/22/1999 16:00:15

I don't think we should have allowable slab compression on this window since the other items in this window correspond to the girder concrete material selected in this window. We could have a stress limit for an 8 ksi girder and a 4 ksi slab. Then say the user changes the deck concrete to a 3.5 ksi concrete in the deck profile or structure typical section window. The allowable slab compression in our stress limit no longer applies but we don't have any way to validate for that.

FROM:jduray DATE:11/22/1999 16:30:27

Good idea. Suggest where to put it.

FROM:kkennelly DATE:01/10/2000 14:48:38

I can't think of anywhere else to put this. Maybe the stress limit also has to have a deck slab material associated with it.

1760.9628	Suspended	Shrinkage/Time window - time for AASHTO equation - add engine coef. entered by user

Description

FROM: dteal DATE: 11/23/1999 2:32 PM

I am verifying HDR's LRFD Single Span Skewed Bridge. It is the same as your "Trainingbridge1" except I am using SI. I am using all dimensions from the example in the Design Handbook.

I got the following error:

** ERROR: The range is NOT located on Span No. 1. Review the input for the (# 8) STIF-TRAN-SCHEDULE command that was entered.

4/19/2016 3:13:24 PM

HRS AASHTO

242

Complete Issue Information

An error occurred while interpreting the schedule for Transverse Stiffeners . See the output file for detailed error message(s) that explain how to correct the problem.

I was getting an error that that said "An end distance (46229.30) of the Trans. Stiffeners for Span No.1 exceeded the start distance (46229.20) of the next range. Overlapping is not allowed."

The actual distances Opis refers to should be 46229.250. I think there is a rounding problem going on here.

FROM: dteal DATE: 11/23/1999 2:34 PM
I attached the BRASS input file

FROM: bgoodrich DATE: 12/14/1999 3:47 PM
This issue will have to be addressed in more places than just the transverse stiffener schedule. Other schedule commands will have to be modified, so two digits past the decimal are exported to the BRASS commands when SI units are specified. This is only a issue for BRASS-LRFD because BRASS-LFD does not export data in SI units.

Jim - Are two digits past the decimal sufficient or should we just go with three?

FROM: dteal DATE: 1/18/2000 2:05 PM
My boss just asked me for an update on the HDR Engineering examples. What is our status on this one? If I create this in Version 3 Beta Build X (Sybase), I will have to re-enter it when we get a 3.0 release version (Oracle).

FROM: dteal DATE: 3/7/2000 9:31 AM
Where do we sit on this one??

FROM:jduray DATE:03/09/2000 15:58:44
Yes you will have to re-enter it since we are only migrating from 2.1 to 3.0, not 3.0 beta to 3.0 release.

Brian - do the recent changes to the comparison functions fix this problem?

FROM: bgoodrich DATE: 3/10/2000 10:02 AM
This is a different issue, so the comparison function changes do not fix this problem. When these and other range commands are generated in SI units, three digits right of the decimal are now exported instead of one. This issue has been resolved in the export.

FROM: dteal DATE: 4/6/2000 8:25 AM
With Brians last comment - is this incident to be marked Resolved? If so, should it be verified with Release Version 3.0.0?

Tasks

Name	Current State	Summary
1762.9626	Closed	Deck Profile – Deck Concrete – Modular Ratio

Description

FROM:kkennelly DATE:11/24/1999 10:19:45

The time additional under beam and deck on the shrinkage tab is a value in AASHTO LRFD eq. 54.2.3.3-1 and 2 dependent on moist or steam cured. (35 if moist cured, 55 if steam cured). they should be removed from virtis since we know the type of curing.

FROM:kkennelly DATE:11/24/1999 10:29:25

Also, there is a checkbox to consider deck differential shrinkage loads on this tab. Should this be part of the analysis event?

Complete Issue Information

FROM:jduray DATE:12/17/1999 15:47:53

Default the time additional (if null) when the curing method is selected. Also, default to moist cured.

I think we should set these default values in the domain when the member alt is created. Krishna - do you agree?

I don't think it should be in the analysis event.

FROM:jduray DATE:12/22/1999 10:26:10

Let's move these two values to engine data.

Krishna - remove from window

Mehrdad - remove from db and domain

Brian - add to engine data and fix export

FROM:kkennelly DATE:01/06/2000 16:41:04

Additional time removed from window for Beta build 3.

FROM:mordoobadi DATE:01/12/2000 15:13:49

Remove deck_additional_time from abw_super_struct_spng_mbr_alt.

Remove additional_time from abw_ps_precast_beam_def.

ERwin model updated.

FROM:mordoobadi DATE:01/12/2000 16:21:28

Database updated.

FROM:mordoobadi DATE:01/12/2000 16:52:55

Data dictionary updated.

FROM:mordoobadi DATE:01/14/2000 14:54:10

Domain updated.

FROM: bgoodrich DATE: 1/18/2000 9:15 AM

BRASS allows overrides for the additional times plus a handfull of other factors, which are entered on the PSLOAD-SHRINK-STRAIN command. Either all or none of this command's parameters should be added to the engine properties.

I spoke with Jim on 1/17/2000 and he instructed me not to add the additional times to the engine properties. We may come back in a later release and add them.

The times have been removed from the export, so the BRASS defaults are now used based on the concrete curing method.

Name	Current State	Summary
1800.9589	Suspended	Just default stress limit range

Description

FROM: dteal DATE: 11/24/1999 11:37 AM

When you leave the Modular Ratio field blank, Virtis/Opis will calculate the ratio "n" using Es/Ec. When it does the math BRASS uses a number to 3 decimals (I was using "TrainingBridge1" in US units). AASHTO 5.7.1 states the in SI it should be rounded to the nearest tenth and US Customary it should be rounded to the nearest integer and in either case shall not be less than 6.

FROM: dteal DATE: 11/24/1999 11:38 AM

Version should have been listed as 2.1 with patches.

FROM: bgoodrich DATE: 12/2/1999 9:53 AM

I modified the export to compare the computed modular ratio to 6.0 and take the larger. The specification states the the rounding assumption "may" be used. From my understanding, the rounding is just to make hand computations easier, but since we have a more exact number, it should probably be used. Jim - do you agree?

Description

FROM: DTeal DATE: 12/1/1999 12:26 PM
Version 3.0 build 1

Only Steel and Prestressed Concrete are available. What about reinforced concrete slab? If you select lets say Prestressed I on a girder line, on the next window (Beam Data) we are to enter a Beam Shape. And you can't go past this window until a Beam Shape is selected. So you have to enter just anything to get past and finish. And then go to Member Alternative to define a reinforced concrete slab.

FROM: jduray DATE: 12/2/1999 9:01 AM
We did not plan to handle slab here. Should we?

FROM: dteal DATE: 12/20/1999 11:28 AM
And to make things worse, a Member Alt was created that is not applicable. You have to go back to the

Name	Current State	Summary
1851.9539	Discard	Live Load Distribution (LRFD) – Slab Bridge – Duplicate Input

Description

FROM: dteal DATE: 12/2/1999 8:03 AM

Calculations for the dist. Factors should be done by a calculate button. At this point we already know span lengths, number of lanes and section width. Needed input at this point would be the "physical edge to edge distance of the bridge" and skew angle.

In US units we always divide by "1 FOOT" for simplicity. But in SI this is not the case. If a user were to change a section width and not change the Dist. Factors errors in output would result.

FROM: dteal DATE: 12/2/1999 8:21 AM

Attached is a simple spread sheet I worked up last night for calculating Dist. Factors. It's basic, but it works.

FROM: dteal DATE: 1/20/2000 11:57 AM

Being RATING doesn't have LRFD code to follow yet, they are still using LFD Dist. Factors for Slab Structures. They don't know yet how important this "will be" to them.

Complete Issue Information

FROM: dteal DATE: 3/15/2000 2:00 PM

Description

FROM: dteal DATE: 12/2/1999 8:04 AM

V & M Dist. Factors are always equal. User is forced to duplicate his input, hopefully without errors. Depending on the outcome of Incident 1849, Deflection may be included in this.

FROM: jduray DATE: 12/2/1999 9:42 AM

I don't think they are always the same. If they are ALWAYS the same why do we have them seperate?

Jay - can you help?

FROM: kkennelly DATE: 02/11/2000 13:39:36

I think he means they are always the same just for a slab bridge. I think it would be more confusing to the user if he could only enter deflection and shear df and not the moment df for slab bridges. If you could see all of the df's at the same time like on the Std tab it would be clearer cause then you could

4/19/2016 3:13:29 PM

HRS AASHTO

266

Complete Issue Information

see the moment disabled and see it get populated with what you entered for shear. Just for slab bridges we could not let them pick from the Action type list box and just ask for the df and just store that as the df for all of the action types in the db(this would all be hidden from the user). But then the user could never change just one of the action types.

Jim, what do you want me to do with this?

Tasks

Name	Current State	Summary
1866.9526	Closed	Strand Layout – Harped

Description

FROM: dteal DATE: 12/2/1999 9:31 AM
 BRASS assumes Z = 170 kip/in (30 000 N/mm)
 Agencies will need a little over ride control here. Our agency uses Z = 130 in the Negative moment area and Z = 170 in the Positive moment area.
 This is from AASHTO 8.16.8.4 (LFD), I don't have a Spec. book here so I don't know if LRFD follows in this area.

FROM: dteal DATE: 12/3/1999 8:12 AM

Complete Issue Information

BRASS only assumes 170 kip/in only if Z is not set in the member window. But, it only allows for "one" Z value for both top and bottom. I guess this would have to be addressed on the same Member window.

FROM: dteal DATE: 1/24/2000 2:05 PM

I think we need some discussion here. Our Bureau uses the following for all slab designs. (RC, Steel Girder & PS Girder).

Z = 130 kip/in for areas of Neg. Moment Steel

Z = 170 kip/in for areas of Pos. Moment Steel

The Structure Typ. Section only allows for one choice to be used on both top and bottom.

FROM: dteal DATE: 2/3/2000 11:37 AM

See Attached sketch.

FROM: dteal DATE: 6/28/2000 7:40 AM

BRASS output itemizes 2 z values. One for top and one for bottom. It is Opis that is lacking an input field for each.

FROM: jduray DATE: 10/03/2000 09:04:25

Brian - please discuss with Jay and suggest solution.

FROM: bgoodrich DATE: 10/3/2000 1:00 PM

Please refer to Incident 1499 as it pertains to this discussion.

FROM: bgoodrich DATE: 10/25/2000 4:47 PM

Jim - I discussed this issue with and and we think the crack control parameter (Z) for the bottom of the girder should be added to the member alternative window. We should not put it on the same window as the deck Z (Structure Typical Section window for GS and Member window for GL) because at those levels the type of member alternative is not known. The Z for the bottom of a girder is only applicable to R/C and P/S structures. BRASS allows only one Z for the DECK when part of a steel or P/S structure. BRASS allows a top and bottom Z for concrete slabs. Please let me know what you decide.

FROM: jduray DATE: 10/26/2000 16:26:29

Yes - we should add z to the member alt for r/c and p/s member alts.

FROM: dteal DATE: 11/16/2000 12:51 PM

On 10/3/00 Brian referred to Incident # 1499. I can't find this incident???

FROM: jduray DATE: 11/27/2000 08:34:04

We need to add z for the bottom of a concrete member to the member alt window.

FROM: mordoobadi DATE: 11/29/2000 15:07:24

bot_crack_control_param_z attribute added to abw_conc_beam_def.

Db, Dm, De, and Domain updated,

Joe, Please use the new attribute in the member alternative window.

FROM: jihnat DATE: 12/01/2000 12:39:23

GUI updated for Beta Build 2.

Brian - I think Ed gets this after you, then Krisha needs to update the Help.

4/19/2016 3:13:30 PM

HRS AASHTO

269

Complete Issue Information

FROM: bgoodrich DATE: 12/5/2000 8:08 AM

The BRASS-GIRDER(LRFD) export has been modified to generate the CONC-MATERIALS command with the crack control parameter (Z) for the bottom of R/C and P/S beams.

Note that BRASS-GIRDER does not support input of any Z, so no BRASS-GIRDER import modifications are required.

Ed – When you are finished, assign to Krishna to update the Help.

FROM:kkennelly DATE:12/14/2000 16:09:30

I've added this to the VirtisOpis help for Version 4.0 Release.

FROM:dteal DATE:01/25/2001 16:22:43

Deck crack Control Parameter on the Member GUI screen doesn't state if it's for the top or bottom of the deck. The Help doesn't help either.

The Member Alternative Description has added the crack control parameter for the bottom of the slab , OK.

Both of these values should be on the same GUI screen!

FROM:jduray DATE:6/12/01 10:39:10 AM

I don't think they should be on the same window. The z on the member windows is for the deck. The member windows can't display for the bottom because it doesn't know what kind of member alt will be assigned. Only concrete member alts have z for the bottom. The member can have steel and concrete member alts assigned.

FROM:jduray DATE:8/2/01 11:44:51 AM

All but the BARS import was complete for version 4.0.

FROM:dteal DATE:Monday, April 01, 2002 3:07:17 PM

Jim – For RC bridge it is all deck, monolithic, there are no girders.

FROM:jduray DATE:5/21/02 10:37:20 AM

The z for the bottom of the rc member has been added to the member alt and was included in the 4.0 release. The BARS import has not been updated. Change the status to Suspended until the TF authorizes modifications to the BARS import.

FROM:dteal DATE:Tuesday, June 17, 2008 11:38:26 AM

Being I assume that we are not going to update BARS import - Accepted based on that assumption

Description

FROM: tschwagler DATE: 7/13/1999 1:46 PM

When modeling a continuous girder the deck profile can not be input as runnig from begin bridge to end bridge or brass will not use the rebar at the piers to calculate the section properties. When the deck profile length is changed the following start distances are changed. For example in the deck in span 1 runs form 0 to 80', the spans are 100', the deck in span 2 runs from 20' to 100'. If the length of deck in span 1 is changed to 75' the start distance in span 2 is changed to span 1 75'.

4/19/2016 3:13:30 PM

HRS AASHTO

272

Complete Issue Information

FROM:jduray DATE:07/20/1999 10:27:57

Krishna - please investigate and let me know if he is referring to a GUI problem or a BRASS export problem.

FROM:kkennelly DATE:08/04/1999 15:41:27

GUI issue. We calculate the next start distance for the user when they change the length of the previous row. I guess we shouldn't do that in this window since the user is more likely to have a discontinuous deck for continuous beams? (unlike a flange that has to be continuous across the length of the beam, the deck doesn't have to be.)

I seem to have found a bigger problem. In Concrete Deck Profile and Web Profile, say you have 2 rows of data saved in the db. When you change the length value in the first row, it changes the start distance of the following row. Hit Ok. When you reopen the window, the first row has the new length that you put in (that put an M in the Update column). But the second row doesn't have the new start distance that was displayed before, (modified flag didn't get set when the cell was updated).

FROM:jduray DATE:11/24/1999 09:14:20

We need to fix these two problems.

- 1) We should not compute the start distance (Joe - let's review this before we make changes).
- 2) Fix the modified flag problem.

FROM:jihnata DATE:12/03/1999 08:11:47

This was originally entered as Incident 1280.

- 1) For Deck Concrete, recalculation of start distances when an end distance is changed has been disabled.
- 2) All occurrences of the "modified flag" problem have been fixed. All changes have been made for Beta Build 2.

Description

FROM: dteal DATE: 12/3/1999 12:45 PM

With a short PS beam, several strands are harped at beam center point (1/2 span). Being the beam is short the 1/2 span harp point is used to keep hold down forces within allowable. Also, being the beam is short, several strands had to be debonded to lower the end block stresses.

How can a strand layout be entered that contain both harped and debonded?

FROM:jduray DATE:12/04/1999 11:48:02

We do not handle that at this time. We asked the User Group about this (during GUI design) and they indicated this is not done and should not be handled.

FROM:jduray DATE:6/29/01 4:39:26 PM

This incident was originally entered during 3.0 beta testing.

1927.9468	Resolved	PS Shapes - need templates to describe additional P/S shapes

Description

FROM: pjensen DATE: 12/6/1999 12:06 PM

I just loaded the beta 3.0.0 build 1 on to my system and installed the tables into a new user named "VIRTIS30". I went into the ABW_PERSON table and change the username "VIRTIS" to "VIRTIS30". The software says that "VIRTIS30" dose not have privilages to change data in the database. I looked at the configuration table and "VIRTIS30" belongs to the "ADMIN" group. I own the tables, and therefor have full access to all of the tables. Is there something else that I need to do?

Tasks

Name	Current State	Summary
1935.9460	Suspended	Rebar Sizes - add to library including square bars

Description

FROM: VVinayagamoorthy DATE: 12/8/1999 1:50 PM

Prestressing can be achieved using strands or bars. Although we are not planning to include ps bars in this version, we may, at a later date, include PS bars within the Library. Because of this, I prefer use the term "Prestressing Steels" instead of "Prestressing strands"

FROM:kkennelly DATE:12/14/1999 13:25:10

I think we may have to have a separate material for Prestressing Steel bars. Strands can be two types, low-relaxation and stress-relieved. Bars can be either plain or deformed. If you want to describe both strands and bars in the same window, we'll have to add another attribute specifying if it's a bar or strand cause they also different jacking stress ratios.

FROM:jduray DATE:01/04/2000 14:10:43

Can we proceed with Prestressing Strands and when we support bars add Prestressing Bars? Is the list of properties the same or would bars have more or fewer properties to describe?

FROM: VVinayagamoorthy DATE: 3/21/2000 6:12 AM

I guess that is OK!

FROM:jduray DATE:6/29/01 4:42:11 PM

This incident was originally entered during 3.0 beta testing.

1939.9456	Discard	Compute "Interior Diaphragm" - Diaphragm Weight

Description

FROM: VVinayagamoorthy DATE: 12/8/1999 1:58 PM

Don't we need to have a library that lists all the possible rebar sizes? In 1930s, they used "square bars" in RC bridges. Now, we have metric rebar sizes. Although we could convert these bars to "circular bars", having these bars in a library will help to improve the efficiency of the program.

It would be helpful if Virtis would calculate a default diaphragm weight using the diaphragm thickness, the area of void in the box beam, and 0.150 KCF concrete unit weight. The user would have to be able to override this Virtis-calculated weight. Also, if the length extends to 2 or more spans, we will have to be careful because the beams sizes might vary from span to span and therefore each span would have

4/19/2016 3:13:32 PM

Description

FROM: dteal DATE: 12/14/1999 9:25 AM

We need to have 4 more fields added to cover Final Allowable Tension & Compression for Rating. So, we need Stress Limits for DESIGN, OPERATING and INVENTORY for final compression and the same for tension. I know AASHTO hasn't released a LRFD Rating Manual but our bureau has 3 values for each in LFD also (1 for design and 2 for rating). We certainly can't expect the user to go back and change this value to switch between the design review and rating or visit this GUI twice to do a Rating (Inv. & Operating).

Description

FROM: ttiberio DATE: 12/22/1999 11:34 AM

I recently was working with a Clip Art Program that had a mega structure of tree branching and an explore type environment similar to VIRTIS BRIDGE WORKSPACE. The very nice feature of this program was that it remembered where you were in the tree and when you came back into the program, it would open up the tree and go to the the last point you were at. Although not in WINDOWS Explore, I think this is a feature that VIRTIS should seriously consider, especially since the tree branching structure can become a little taxing to remember and have to constantly re-open every time you come back into the program. I talked with Mary Rosick about the feasibility of this being done and she indicated that this is able to be programmed without too much trouble.

FROM:jduray DATE:12/22/1999 13:13:04

We have considered this and have done a little investigation into how we can do it in a multi-user environment where someone may have changed the data in the database since you last viewed the BWS. It is not so simple when the multi-user aspects are considered. We could probably implement

4/19/2016 3:13:33 PM

HRS AASHTO

283

Complete Issue Information

something is phases. For example:

Phase 1 - save the name of each BWS tree item and its expanded/collapsed tree status. Also save the name of the item that is at the top of the visible tree (probably would have to save several names because names may not be unique but its likely that a name sequence would be unique). The next time the user opens that particular BWS we could iterate the list of items and set the status as it was saved. If we encounter one that no longer exists in the current tree (because someone deleted or renamed it) we could skip that particular item and any of its siblings.

Phase 2 - also save a list of open windows and their size/position/z-order.

Name	Current State	Summary
2069.11288	Discard	Diaphragm wizard - Adjusting Spacing

Description

FROM: pjensen DATE: 12/23/1999 10:32 AM

I think that one of the constraint scripts is in correct. It is the relationship between PONTIS_BRIDGE and ABW_BRIDGE (R_1620) I think the script should have CASCADE ON DELETE added. The problem comes from when you delete a bridge from PONTIS_BRIDGE, the bridge needs to be removed from the complete tree (current tree implies PONTIS_BRIDGE -> ABW_BRIDGE). I change my copy of the script to reflect this change.

Is this assumption correct? Please let me know.

FROM: jduray DATE: 01/04/2000 17:28:48

No. the only way to delete a bridge is in the Bridge Explorer. There are several tables where relationships are such that the cascade doesn't work.

Tasks

Name	Current State	Summary
2073.11284	Discard	Diaphragm weight when we use Wizard

Description

FROM: VVinayagamoorthy DATE: 12/23/1999 10:06 AM

When I was entering diaphragms using wizard, I was using the 2nd type shown in the 2nd row. I entered the distance and number of equal spacing. Up to the point, everything went OK. However, when I click on the "APPLY" button, program in essence states that the end distance does not match the length of girder and whether I like to adjust the spacing. If I click "NO", everything went on OK. However, if I click "YES", it adjusts the spacing of the bay that is selected in the "Framing Plan Detail" GUI. It is expected because "APPLY" button is applicable for the bay that is selected in the GUI. However, since I use the wizard to create the diaphragms, I would like to see that diaphragm spacings in all of the bays be adjusted.

FROM:kkennelly DATE:01/10/2000 16:16:46

Jim, the message that he is getting about the end distance not matching the length of the girder is displayed thru the validate function in this window. Validate() is only checking what is visible in the window. I'd have to ask the user twice if they wanted to change the spacing, once for this bay displayed and once for all of the bays. (I'm not even sure that any other girder bays in the domain will have the same diaphragm end distance.) I don't think we should change something in the domain without the user seeing what the original values are on the screen.

FROM:jduray DATE:01/17/2000 14:41:49

I don't understand the problem. Is he working in the wizard or has he used the wizard to generate

4/19/2016 3:13:34 PM

HRS AASHTO

286

Complete Issue Information

diaphragms and is then changing them?

FROM:kkennelly DATE:01/17/2000 15:23:19

I think he used the wizard to generate the diaphragms and based on what he input he got a diaphragm at the end distance of say 99.9' and the girder length is 100'. When he hits Apply in the Framing Plan Details window, the window validation for the girder bay shown will tell him that the end distance is 99.9' and the girder length is 100'. Window validation will ask him if he wants to change the spacing so that the end distance matches the girder length. I think Vinacs wants the spacing in the other bays not displayed in the grid changed like he just changed the spacing for the girder bay currently displayed.

Description

FROM:VVinayagamoorthy DATE: 12/23/1999 12:21 PM

I noticed that the user has to enter diaphragm weights after the wizard generated all the diaphragms. I understand that the weight depends on the area and length of the diaphragms. Can we allow the diaphragm to obtain the weight per length from user and then estimate the weight?

4/19/2016 3:13:34 PM

HRS AASHTO

287

Complete Issue Information

FROM:jduray DATE:01/04/2000 15:49:18

This seems like a reasonable input for the wizard. We would not store the weight in the database. Just prompt for it and use it to generate the diaphragm weight.

FROM:kkennelly DATE:01/11/2000 08:00:37

Do you want the user to be able to input a different weight per length for the end diaphragm and an interior diaphragm?

I'll have to change the code to generate the diaphragm ranges a little bit because it currently works like this:

say I have a 100' span and I want 3 equal spaces of diaphragms. following ranges generated:

Start Dist	Spacing	Num Spaces	Length	End Dist
0	0'	1	0	0
33.33	0	1	0	33.33
33.33	33.33	2	66.67	100.00

the last end diaphragm is part of range that also includes an interior diaphragm.

FROM:jduray DATE:01/12/2000 11:40:49

No - we don't have time to do this now.

FROM:jduray DATE:6/29/01 5:06:02 PM

Use TrainingBridge3 to duplicate this incident. Also, see related Incident 2127.

The BRASS data is passed into the results object fine. I analyzed the bridge in debug mode and the data and null bitmask values were correct and passed using the AddRow function.

There seems to be a problem with how this report is displayed when using the GUI. It is still occurring with version 3.0 beta (build 3). Please call me if you wish to discuss this issue.

FROM:mordoobadi DATE:02/08/2000 14:42:57
There was a problem with the units.
Fixed.

Description

FROM: VVinayagamoorthy DATE: 1/5/2000 12:52 PM

When we 'right' click on members, it gives us several options, including 'review'. This option allows to check our input. I would like to have this option included to all GUIs that have multiple Tabs. This will allow a user to quickly check/verify his/her input without checking each Tabs (and sometimes within each Tab, user need to chage the load cases as well). ThOne could argue that user could go to member and get a review. This is OK, however, user need to scroll down to information corresponding to the particulr GUI. For example, if this option is available at member loads section, load case input only will be shown in the review. This will allow him to check his input as he enter the data.

FROM:jduray DATE:01/05/2000 17:23:36

This is a good suggestion.

	Incident 2240 slab compression.doc	

Tasks

Name	Current State	Summary
2240.11119	Suspended	Structure Definition – Prestressing Strand – Final Allow. Slab Compression

Description

FROM: ttiberio DATE: 1/18/2000 2:43 PM

First, I'm wondering why we list angles, tees, etc. under the designation "BEAM SHAPES". If this tab is a "catch all" tab, maybe you should just call it "SHAPES". Same remark concerning the tab "STEEL BEAM SHAPES." In fact, on the BWS report it just uses the term "STEEL SHAPES". Also if you are going to include single angles under this then why not double angles, tubes, pipes.

FROM: ttiberio DATE: 1/21/2000 11:41 AM

I realize now that we really are not reviewing STEEL since it has already been accepted by the client. Perhaps for the future development, however, you might want to input a comment that when we get to Trusses, etc. we may want to make this TAB more general and not limit it to the term "beam".

Description

FROM: dteal DATE: 1/24/2000 3:31 PM

May be related to Incident #1916

This should be populated with the AASHTO default. In order to do that, Deck Concrete material must have been selected prior. Deck concrete isn't defined until the next GUI in the wizard.

In the LRFD BRASS manual, pg 9-7.1, Item #7, it refers to AASHTO 5.9.4.2.1, I think it should be 5.9.4.1.1.

FROM: bgoodrich DATE: 1/24/2000 3:29 PM

Because the P/S losses are removed in the non-composite stage and the deck comes into play in the composite stage, I think the reference to AASHTO 5.9.4.2.1 (Stresses at Service Limit State AFTER Losses) is correct.

FROM: dteal DATE: 1/27/2000 3:04 PM

Your correct about the code reference in the BRASS manual.

4/19/2016 3:13:37 PM

HRS AASHTO

303

Complete Issue Information

Are we going to populate the Final Allow. Slab Compression field? If we are using AASHTO 5.9.4.2.1 table 5.9.4.2.1-1, the full calculation should be $0.60\phi w f' c$ (ksi) where ϕw is a reduction factor for boxes.

FROM:jduray DATE:01/31/2000 09:03:36
Krisha - please advise.

FROM:kkennelly DATE:01/31/2000 09:25:26
See incident 1748. The only thing I think we can do is put a deck concrete material on the stress limit window. Then we have to make sure the deck concrete used on the deck profile is the same as the deck concrete associated with the stress limit being used. Or maybe we should take the allow. slab compression off the Stress Limit window and put it on the deck profile window? But that's not such a good idea cause it would just be on ps member alts and it doesn't really match the other type of data we have on that window.

FROM: dteal DATE: 2/4/2000 9:04 AM
Incident #1748 is not available to me on the "All Incident List". Could you provide a copy for me?
Thanks

FROM:jduray DATE:02/07/2000 10:02:06
Dean - you should now have access to 1748.

FROM:jduray DATE:02/25/2000 13:16:01

FROM: dteal DATE: 3/6/2000 1:11 PM
Marked as "Information Needed". What's the question?

FROM: dteal DATE: 3/17/2000 10:48 AM
Be sure to look at # 1748 also.
I think we still need some attention here.
The wizard enters a value of zero if the user skips over it.
If the user enters a value here, and then on the Deck Profile window decides to use a different strength concrete, he will never remember to go back to the PS Stress limit window to change the value for the Final Allowable Slab compression.
A lot of the time this program is being looked at mostly from the Rating aspect where the concrete strength value doesn't change. But from the design side, we may change the concrete strength during the iterative design process.

FROM:jduray DATE:03/22/2000 17:20:31
Krisha - let's discuss this.

FROM: dteal DATE: 5/17/2000 9:05 AM
Have we made any progress here??

FROM:jduray DATE:3/2/01 11:53:11 AM
No progress.

FROM:kkennelly DATE:5/17/01 1:56:04 PM
Refer to attached document for possible resolution.

2276.11085	Discard	Improvement of Structure Wizard is proposed

Description

FROM: VVinayagamoorthy DATE: 2/7/2000 11:45 AM
I strongly recommend that we replace the COMPUTE button with a CHECK BOX. I am proposing this after having a lot of struggle in using template type of input. Instead of allowing user to press COMPUTE button, we allow the user place a check mark, if he wants the program to evaluate the some of the values. This change, in my opinion, will give much more flexibility to the program. We have COMPUTE buttons resides within Properties of PS I beam, Lane Position Tab of Structure

4/19/2016 3:13:37 PM

HRS AASHTO

305

Complete Issue Information

Typical Section, and Standard Tab of Live Load Distribution Factors. At this point, user has to enter all the required variables and then click COMPUTE button. This is OK if we are entering these values for the first time. Having a user enter all the data correctly during his first attempt is slim. A typical user enters the data and then corrects them as he rechecks these data. Errors typically crop up during the check and user changes whenever he finds them. If he change any of the variables, he has to click on COMPUTE button to change values that are dependent on the changed values. (Note when he enters for the first time, most of the related values are reported null and flags the user; as a result he will either enter a value or click the COMPUTE button). Since most of the cells are filled with numbers, user may overlook/forget to click on the COMPUTE button. This may result in error that may or may not be detectable depending on the overall effect of the changed variable.

We could argue that user should check his data thoroughly before completing his input. Again, we need to modify our program such that it is user friendly and produce less problems to the user in the long run. Consider a case we have CHECK BOX instead of COMPUTE button. During the first go around, user enters the variables and check the box appropriately. (If the user decides to let the program determines the values, he will check the box, and otherwise he will not NOT check the box). Later if we finds an error any of the variables, as he change the variable, program will automatically update the values that are dependent on the variable if the user had checked the box.

One example is here. Consider a bridge that was built in 1940s. They have used substandard rails those days. Assume that bridge was already in the Virtis Database. Now, in 2000, we updated the bridge rails and needs to rerate the bridge. When we update the bridge rail, that will effect the Lane Position of Structure. Present Virtis expects that the user will visit Lane Position Tab and click COMPUTE button to update the results. On the other hand, if implement the proposed change, user need NOT visit Lane Position Tab. Please note that this is very simple example.

FROM: VVinayagamorthy DATE: 2/8/2000 7:52 AM
version used is 3.3 Beta

FROM: jduray DATE: 02/08/2000 11:53:26

The Task Force has reviewed the Compute buttons on several occasions and seem to be in favor of them instead of the checkbox as you suggest. I will mark this as an enhancement and for discussion with the TF.

FROM: VVinayagamorthy DATE: 2/10/2000 7:57 AM

Having COMPUTE button has some advantages as well. User could easily determines the AASHTO based results and then he could modify the values as he wishes. COMPUTE check box provide some more flexibility to COPY an PASTE style data entry. Because of these two reasons, CAN we support both on the windows?

2277.11084	Discard	Improvement of Structure Wizard is proposed # 1

Description

FROM: VVinayagamoorthy DATE: 2/9/2000 8:51 AM

Structure Definition Wizard for Girder System

At present, this wizard has very limited use for a Girder System Option. Please note that Two important items—skew and Girder Spacing—need to be improved to give us a better wizard. We have cases where skew at supports varies. Furthermore, we have girder spacing are entered using two different options—perpendicular to girders or along the support. This wizard does not support these cases.

1. Please consider adding one more GUI for Girder system case, where user could enter different skew values at each support locations and allow the user to select girder spacing for each bay depending on the type of entry he chooses.

What I tried to do next was to see how easy for a user to use the wizard and create an rectangular pattern first and then modify the skew and spacing as shown in the plan. This lead to a frustrating

Complete Issue Information

experience. I will try to list all the problems that I came across during this process as separate incidences.

FROM:jduray DATE:02/09/2000 14:52:31

The wizard is intended to be quick and easy for standard brigdes. The capability you are asking for would complicate the wizard. You can use the wizard and then go the the framing plan details window and change the skew and spacing.

FROM: VVinayagamoorthy DATE: 2/9/2000 1:16 PM

That is what I thought at first. I tried your proposed method earlier and had so much trouble in adjusting the mismatched girder lengths and etc. As a result, I have reported 13 incidents. I could find many more problems if I check all possible options. That is why I proposed this enhancement.

FROM:jduray DATE:02/15/2000 16:03:55

We will have to investigate this as a future enhancement.

Description

FROM: VVinayagamoorthy DATE: 2/9/2000 8:58 AM

First I created a 2 span, 4 girder bridge (overhang is 3 feet in both side) with 60 and 90 feet long spans with skew of 0 degrees girder spacing of 8 feet perpendicular to girders.

1. When I created this, Even if I forget to select an appropriate Material, program let me to continue to next page. In my opinion, program should prompt an error and direct the user to select a material or warn him about his action and its consequences. User has to visit every GUI and select an appropriate material for that particular item. It is very time consuming and could lead to error

FROM:jduray DATE:02/09/2000 15:35:15

This seems reasonable. Let's discuss.

FROM:kkennelly DATE:03/30/2000 08:16:03

I think we decided back in the beginning that we would only warn the user if they left out things that were fundamental to the definition (like span numbers or lengths).

FROM:jduray DATE:7/3/01 3:34:13 PM

This incident was originally entered during 3.0 beta testing.

This seems appropriate within the wizard since so much is generated by the wizard.

4. Can we set the Wizard to fill the LFD related information when it creates all the GUIs? In order to do rating using LFD method, I need to visit almost all GUIs, since the wizard does not automatically fill the data that are specific to LFD method. For example, if the material property of girder is given, then program can, in my opinion, fill AASHTO based values for LFD method as well.

FROM:jduray DATE:02/09/2000 15:09:57
the wizard is for Opis and LRFD.

FROM:jduray DATE:7/3/01 3:58:58 PM

Complete Issue Information

FROM:jduray DATE:02/09/2000 15:09:03
Let's discuss this.

FROM:kkennelly DATE:02/10/2000 08:51:04
Wizard lets you pick PS strand material and then automatically assigns AASHTO loss method and sets the jacking stress ratio based on the strand type. If you're going to put all of the PS property input on the wizard screen, what's the point of using the wizard? Just visit the gui.
Design tool will generate shear reinforcement (at least a good enough starting point). Note, we didn't put any steel plate girder stiffener input on the wizard to limit the amount of data the user entered in the wizard.

9. When I changed my skew angels, the member lengths changed automatically. That is good. However, several GUIs within member alternatives had reported mismatch in length. Those GUIs are 1. Live Load Distribution (Deflection, Moment, and Shear) Tabs; 2. Stress Limit Range of Beam Details GUI; 3. Deck Concrete of Deck Profile; and Haunch Profile; Unless, I revisit the GUI and click on APPLY or OK button, user will not aware the problem. Reports or Comments during SAVE commands do not warn the user about the mismatch in the span length. WE need better ERROR checker. Or we need to have schematic diagram that shows the mismatch.

FROM:jduray DATE:02/15/2000 15:32:43

Validation does identify some of the data that need to be changed but it could do more. This is an enhancement that the TF will have to prioritize.

Description

FROM: VVinayagamoorthy DATE: 2/9/2000 9:29 AM

11. Is there way where we can let the program to name them using the structure name given by the user? At present, program names every thing starting with WIZARD. How about it start with the name given by the user. For example, user name the structure as APPROACH then program names the variables as APPROACH- Prestress Properties(WZ), APPROACH Prestress Limits(WZ), APPROACH -Member 1(WZ), APPROACH-Member 1 Alternative(WZ), and etc. (WZ) is to indicate that is created using Wizard.

FROM:jduray DATE:02/09/2000 15:04:34

Why? The items are created under the structure def so they cannot be confused with items from other structure defs.

FROM: VVinayagamoorthy DATE: 2/9/2000 1:09 PM

When you use the Wizard to create another structure (bridge can have several structures), wizard starts with the same "WIZARD". This could lead to some confusion. I can think of other possibilities as well.

FROM:kkennelly DATE:02/10/2000 08:39:21

We'll have to limit the size of the structure def name we let the user use. If the user names the struct def something long like "Approach Spans Eastbound" and then we tack on Prestress Properties(WZ) the names are going to get too long.

FROM: VVinayagamoorthy DATE: 2/10/2000 12:26 PM

4/19/2016 3:13:39 PM

HRS AASHTO

314

Complete Issue Information

You have a point. How about requesting the user to enter a 6 character long special ID within the Wizard panels and then add that instead of WIZARD? You are able create all names with 6 character long WIZARD and therefore it will fit the allotted space. Whenever user does not enter any ID, use WIZARD as default name.

FROM:jduray DATE:02/15/2000 16:01:33
We will have to investigate this as a future enhancement.

FROM:VVinayagamoorthy DATE: 2/15/2000 12:25 PM
At present, we are allowed to copy-paste and modify to enter new set of stress limits. A GOOD FEATURE. However, it needs a minor improvement.
Final Allowable slab compression is supposed to be entered by the user. When a user enters a stress

4/19/2016 3:13:39 PM

HRS AASHTO

315

Complete Issue Information

limit, allowable slab compression cell is blank and as a result, user will be forced to enter the correct value. However, when a user copy and paste an already entered stress limit, this may not happen. Please note that the final allowable slab compression cell is already filled when you copy and paste. This could lead to problem. Is there any thing that we can do to bring the user's attention to that cell? Please note that since the deck material for the whole bridge will be the same and therefore, there may be a remote possibility to have different allowable compression stress. Because of this reason, this can be considered as an enhancement for later release.

Now that the per/bridge checkout is working, can we gray out CHECKOUT in the BRIDGE menu if the user is not authorized to CHECKOUT the selected bridge ??

If a user selects a bridge that is checked out by another user and then clicks BRIDGE, CHECKIN is available. If clicked, an information message tells them who and when the bridge was checked out and then an error message that they can't check in the bridge. Can we gray out CHECKIN if another users checked out bridge is selected ??

FROM:jduray DATE:02/18/2000 16:49:17

I'll check on this. I think it is reasonable to do.

FROM:jduray DATE:04/05/2000 09:25:53

This would also have to be done in the BWS.

FROM:jduray DATE:04/05/2000 10:07:57

This is not a trivial task and has implications relative to the disconnect feature that NY has requested (but is not yet fully implemented).

For number 3 - should the vehicles be shown?

Maybe ask Brian for help on these.

FROM: bbeerman DATE: 2/24/2000 11:51 AM

FROM:mordoobadi DATE:02/29/2000 15:59:50

Brian would you please respond to this incident.

FROM: bgoodrich DATE: 3/1/2000 11:24 AM

Mehrdad - Please review my comments below. Then, set the status to "Information Needed" because we need more information for Items 1 and 3.

I ran PCI 9.9.6 and examined each item described above.

Item 1:

The "Prestress Loads" and "Initial Prestress Loads" actions are different. The only way they would be the same is if Lump Sum losses of zero were used. We need to import the BBD file from your bridge if you still get the same results for both.

Item 2:

The BRASS results shown in the "Live Load Actions" report contain both impact and live load distribution. I think a message to this effect could be added below the engine version. In the long-term, functions should be added to the DualInterface.f90 file, so the engine can set flags indicating if the live load actions include impact and LL distribution. Then, the results GUI could create a display string based on the flags.

Item 3:

I am not sure what "The vehicles loads are not shown in the tables for moment/shear/reac./def." means. Are you referring to one of the following?

A. The vehicle load types (i.e., axle, tandem, etc.) are not shown.

B. The "Moment Max Vehicle", "Moment Min Vehicle", etc. columns are not filled for some stages. Note that this occurs for dead load only stages, where there is no vehicle applied yet.

C. The factored live load actions corresponding with the critical action are not shown. Note that these are not available in BRASS, so they cannot be shown in the results GUI.

The BRASS "Min. Moment" results are passed to the results object correctly, so I think there may be a problem in the GUI.

The actions in the "LRFD Critical Loads" include dead load only for non-live load stages. For live load stages, the actions include both dead and live load.

FROM: bbeerman DATE: 3/27/2000 7:35 AM

Item 3: "C"

Resubmit - Item 2, did not see any changes made in the pre-release version

FROM: jduray DATE: 03/27/2000 13:56:10

Enhancement - add a function (maybe two functions) to the results object for the engine to call to indicate if live load actions include impact and LL distribution.

2453.10924	Resolved	Haunch thickness with BARS to VIRTIS conversion

Description

FROM:jmckool DATE:12/08/1999 11:35:25

This window under Stage 1 for SERVICE-I has a section where it lists the DL+P/S moments. The DL portion of the moment listed here only includes the beam selfweight, not the slab. This is misleading since the slab is also a Stage 1 DL. Also, there is an axial force listed which is due to the prestress, but it does not tell you what P/S force it is, either P/S with only initial losses or after all losses. By comparing to PCI Design Example 9.9.4, I have determined it is the P/S force after only the initial losses. Therefore, I think the intent is to calculate the beam stresses at prestress transfer, but this is not clear anywhere. Also, as I stated in Incident #1915, the stress calculated here is compared to Final allowable DL stress in one of those rating factor windows so I'm not positive of the intent but something appears to be wrong. Could more description be added to these spec checks?

FROM: bgoodrich DATE: 12/14/1999 8:14 AM

I can add some wording to indicate if this is an initial stress check or not, but it will not be ready for beta build 2. Again, the BRASS output was used to illustrate these comps and indicate that they were for the initial stress checks with a single heading above the spec checks. Should something be added to the results object to indicate that certain spec checks are for initial stresses? The initial stress checks are performed after the final stress checks, so I think a single function could be called when BRASS starts the initial stress checks. The function could then set a flag in the spec checks table.

Jim - How should we proceed?

FROM:jduray DATE:03/02/2000 08:12:45
Is this a duplicate?

Brian - Can you add a description to the memo field?

FROM: bgoodrich DATE: 3/2/2000 12:35 PM
The spec check detail is written from a general tool, which does not know if initial or final P/S forces are being applied. Therefore, I cannot add anything to the memo field, without passing more parameters into the tool. There are a few other spec check details that are so general that they may not make much sense when reviewed by themselves. We probably need to review several of the spec check details as shown by Opis and determine which ones need more information.

Description

FROM: snshah DATE: 6/30/1999 10:39 AM

The haunch thickness is not converted correctly when converting from BARS to VIRTIS.

FROM: emartin DATE: 12/13/1999 3:20 PM

Please provide a BARS input file that produces the incorrect haunch thickness.

FROM: emartin DATE: 2/29/2000 3:10 PM

Input data file provide by Kurt Brauner (LaDot).

FROM: emartin DATE: 2/29/2000 3:12 PM

The input file specifies a fillet thickness of 4.5 inches and an effective slab thickness of 7.5 inches. The given distance from the centroid of the effective slab to the top of the steel is 7.25 inches. BARS Import uses these two dimensions to compute the haunch thickness: $7.25 - (7.5 / 2) = 3.5$ inches
BARS Import uses the fillet dimensions to compute the Dead Load from the haunch.

2489.10888	Suspended	non numeric entries are allowed within Live Load Distribution factors

Description

FROM: VVinayagamoorthy DATE: 3/6/2000 8:27 AM

I was able to select ASD as default rating method for PS girders. Do we have a ASD rating method for PS girders?

Although I have selected ASD as my default rating method, BRASS rated this girder using LFD method. Please check this. If ASD rating method is available for PS girders, do not change the GUI. If the BRASS does not have the capability to handle ASD method for PS, then warn the user about his selection.

FROM: VVinayagamoorthy DATE: 3/6/2000 9:14 AM

As we know that Rating can be done at different levels. I tried to rate from the bridge explorer level. First I rated a PS girder using LFD method and then rated the girder using ASD method. Please note that Within the girder, I did not provide any ASD factors.

Question 1: How does the program assign ASD factors? I assume that it uses AASHTO standard specification, however, I want to confirm it.

Question 2: When I rated Member alterantives using LFD and ASD, program rated the girder using LFD method only. However when I rated at Bridge explorer level, program was able to rate using both methods. Is this a bug?

FROM: jduray DATE: 3/8/2000 11:20 AM

FROM: bgoodrich DATE: 3/10/2000 3:04 PM

Jim - Vinacs is correct that there is no ASD rating method for P/S girders. If the LFD rating method was selected, BRASS performed an ultimate strength analysis. If the ASD rating method was selected,

4/19/2016 3:13:44 PM

HRS AASHTO

337

Complete Issue Information

BRASS performed a service load analysis. Basically, BRASS requires two runs to perform the total analysis. I am not sure how we address this in the export.

FROM: bgoodrich DATE: 3/10/2000 3:04 PM

Regarding question 1: BRASS uses service load factors from the spec or rating manual.

Regarding question 2: I could not duplicate the bug. When I selected the ASD rating, BRASS performed a service load analysis and when I selected the LFD rating, BRASS performed an ultimate strength analysis.

Jim - Vinacs is correct that there is no ASD rating method for P/S girders. If the LFD rating method was selected, BRASS performed an ultimate strength analysis. If the ASD rating method was selected, BRASS performed a service load analysis. Basically, BRASS requires two runs to perform the total analysis. Maybe the BRASS analysis control should call the BRASS export function twice for prestress, however, I am unsure how this would affect the results. Only one set of results can be shown at a time. Could the two results be combined to show the critical inventory and operating ratings.

FROM: jduray DATE: 03/20/2000 16:08:05

I looked at the AASHTO Manual for Condition Evaluation of Bridges and it looks to me as though there is an ASD rating 6.6.2.5 and a LFD rating 6.6.3.3. It seems that ASD rating requires a check of the ultimate moment in addition to the in-service allowable stresses and LFD rating requires a check for serviceability in addition to strength requirements.

It seems to me that the engine should be able to provide this such that when the user requests ASD he gets what the spec requires. Similar to LFD.

FROM: bgoodrich DATE: 3/20/2000 3:58 PM

Jim - The 1994 AASHTO Manual for Condition Evaluation of Bridges states the information you listed above, however, the 1995 and 1996 Interims changed the two articles you listed. Now, Article 6.6.2.5 simply refers to Article 6.6.3.3. I guess this could be interpreted as both ASD and LFD rating exist.

The BRASS-LFD engine performs the strength analysis in one run and the service analysis in a separate run. If these analyses were run from Virtis, only the results from the later analysis would be available in Virtis. There is not currently an easy way within BRASS to combine the results from the two analyses. One possibility using Virtis would be to create a single data file containing two data sets (for a strength run and a service run). The data sets would be identical, except for the DESIGN, INVENTORY, and OPERATING commands. Then, BRASS could write two sets of rating factors to the results object. The results object would then have to choose the critical inventory or operating factor from the two sets of results. I think I could get this working in a few hours. I would have to make sure BRASS didn't write two sets of dead load, live load, and critical load actions. Then, I could put a loop around the code that creates the DESIGN, etc. commands and stack the data sets in one file.

FROM: jduray DATE: 03/23/2000 10:06:16

FROM: jduray DATE: 03/24/2000 08:31:07

Discussion with Jeff - It should be the engine's responsibility to do a rating in accordance with the spec. BRASS should be fixed to do a proper LFD rating which should include the proper serviceability checks.

FROM: jduray DATE: 7/5/01 9:26:05 AM

This is being addressed by BRASS for the next release (4.1).

2532.10845	Discard	BRASS and Virtis use different dll's

Description

FROM: VVinayagamoorthy DATE: 3/17/2000 10:24 AM

Program allows to drag and drop a folder. I use this option instead of using copy and paste option. It make the modeling easier. However, when I have a long bridge tree I am not able to use this option.

This is because that I am not able to see both copy and paste folders within displayed window. Futhermore, Virtis does not scroll down the tree automatically. (I noticed that Windows explorer does scroll down automatically)

Can we improve Virtis such that it scrolls down automatically? This needs not to be addressed in this release. (An enhancement request.)

Description

FROM:jduray DATE:03/22/2000 07:44:21

E-mail from Jay...

Jim: How can we link the Window/resource ID to an error message? My suggestion is that we (the engine folks) have an output window that lists possible errors. Here the user can double click on an error and bring up a Window that outlines possible error(s). The user selects an option and Virtis/Opis goes to the appropriate Window. If only one possibility exists then the double click places the user in the most likely place. Very similar to the compiler IDE. Seems like we need to a resource ID table in the Domain. The engine provides a one-to-many relationship. One engine error to several possible Virtis/Opis bridge definitions problems.

2579.10798	Closed	Girder Profile – Parabolic Haunch Input

Description

FROM: VVinayagamoorthy DATE: 3/22/2000 4:38 PM

I am requesting an enhancement to allow the users to delete analysis results that are stored in the database.

To allow a Permit vehicle to cross over several bridges, an agency may analyze those structures at Bridge Explorer level. As soon as the analysis is done, summary of the results will be shown within rating result table. In order to show the results, program stores the analysis results within database. Problems starts here.

Whenever we analyze structures for various permit trucks, Virtis will accumulate all the results and consume a lot of space. Because of this, agency may want to remove the results of permit trucks from database. Furthermore, Once the analysis is done and permit is issued/rejected, agencies may wish to delete the results pertains to the special permit truck.

4/19/2016 3:13:46 PM

HRS AASHTO

351

Complete Issue Information

At present, user has to open the member alternatives of each analyzed bridge and remove analysis events from the database. If we have two members for every bridges that is analyzed, there will be a lot of time necessary to delete them. Furthermore, analysis event does not show the vehicles that are used to analyze and therefore, user has to go by the exact date and time to locate the proper event to erase.

Because of this potential problems, I suggest that we improve the way to remove the analysis results that are stored in the data base. For example, program should be able to remove all the analysis pertains to a particular vehicle. Several other options could be considered.

Complete Issue Information

Input Errors (1103) - Cross-section area less than or equal to zero

----- End of Contents of BRASS Error File -----

The cross section area is zero for span 2 and span point 11. Check data file for possible error.

Location : Data File

Type : Input Error

Error No.: 1103

Data File: C:\Program Files\AASHTO BridgeWare\VirtisOpis21\105-292_WWCH_Sk00_Cur00
\Unit_#3_-_P#5_to_A#2\G2=Girder_K\Girder_K.dat Fatal Error
Encountered - Unexpected Termination

File: C:\Program Files\AASHTO BridgeWare\VirtisOpis21\105-292_WWCH_Sk00_Cur00\Unit_#
3_-_P#5_to_A#2\G2=Girder_K\Girder_K.ERR
----- Contents of BRASS Error File -----

Because of the problems I had getting it to validate, my guess would in rounding of significant digits.

FROM: dteal DATE: 10/20/1999 3:50 PM

I found that if I removed the change in plate thickness that fell within the parabolic haunch geometry, BRASS would run to completion.

When I looked at the schmatic drawing of the girder, it was represented correctly for both.

FROM: bgoodrich DATE: 10/26/1999 8:54 AM

Dean - Would you please attach the Virtis Export file (*.BBD) as well as the exported BRASS file (Girder_K.DAT). This way I can import the *.BBD file and I'll have your exact bridge to help me figure out how to best address this issue. I may just need to increase the number if digits past the decimal. Thanks.

FROM: dteal DATE: 10/27/1999 9:09 AM

Brian, there is no file *.BBD created. I attached the other file requested.

FROM: dteal DATE: 10/27/1999 3:09 PM

I think I exported correctly and created the *.bbd file.

FROM: bgoodrich DATE: 11/12/1999 4:42 PM

In the attached girder_K.dat file, I noticed some commands with duplicate ranges. The domain functions convert the schedule based girder profile to cross sections and the export just generates the BRASS cross sections and ranges. I am not sure where these extra ranges come from (see commands below).

```
SPAN-GENERAL-LENGTH 2, 70100.0
SPAN-GENERAL-SEGMENT 2, 3150.0, L, 617.53, 3150.0
SPAN-GENERAL-SEGMENT 2, 3150.0, P-, 16100.00, 2418.0
SPAN-GENERAL-SEGMENT 2, 2418.0, P-, 16100.00, 2418.0    <= extra range (equal web depths)
SPAN-GENERAL-SEGMENT 2, 2418.0, P-, 35050.00, 2100.0
SPAN-GENERAL-SEGMENT 2, 2100.0, P-, 56800.00, 2519.0
SPAN-GENERAL-SEGMENT 2, 2519.0, P-, 56800.00, 2519.0    <= extra range (equal web depths)
SPAN-GENERAL-SEGMENT 2, 2519.0, P-, 69482.47, 3150.0
SPAN-GENERAL-SEGMENT 2, 3150.0, L, 70100.00, 3150.0
```

4/19/2016 3:13:47 PM

HRS AASHTO

353

Complete Issue Information

My version 2.0 does not allow importing of BBD files and I did not see any patches to make it able to import. I could not get version 2.1 to import the attached BBD file, so I used the BRASS data file to determine the girder profile. I have tried to duplicate the problem with version 2.1 and 3.0 and have been unsuccessful. The BRASS error is given because it detected an element with a length of zero.

Krishna - Could you try to import the BBD file? If you can, please try exporting it to see if you get the same error as Dean.

FROM:kkennelly DATE:12/09/1999 08:47:19

I was able to import the bbd file and reproduce the problem. The input for the problem is as follows so you can reproduce it. The problem is with all of the digits after the decimal places.

Girder Profile - Web

Begin Depth	Vary	End Depth	Thick	Support #	Start Dist	Length
2100	none	2100	18	1	0	16.390
2100	parab	2348.47487	18	1	16.39	16.750
2348.47487	parab	3150	20	1	33.14	17.682474
3150	none	3150	20	1	50.822	1.235053

2418.03234	parab	2100	18	1	16.100001	18.95
2100	parab	2518.95885	20	2	35.050	21.75
2518.95885	parab	3150	20	2	56.800	12.682474
3150	none	3150	20	2	69.482	1.235053
3150	parab	2277.32327	20	3	0.618	20.282474
2277.32327	parab	2100	18	3	20.900	14.150
2100	none	2100	18	3	35.050	71.244998

Girder Profile Top Flange

Begin Width	End Width	Thick	Support	Start Dist	Length
380	380	25	1	0.000	33.140
450	450	38	1	33.140	34.400
380	380	25	2	16.100	40.700

4/19/2016 3:13:47 PM

HRS AASHTO

354

Complete Issue Information

450	450	38	2	56.800	34.200
380	380	25	3	20.900	14.150
450	450	38	2	35.050	30.250
380	380	25	4	11.950	40.995

The domain generates a cross section change pt at 67540 (from left end, 16100 in Span 2) for the top flange plate change. It then generates a cross section change pt at 67540.001 for the web plate change. The domain checks for duplicate change pts but we use a standard tolerance of 0.0000001 when comparing if 2 numbers are the same. 67540.0 is not the same as 67540.001 when using that std tolerance.

So the duplicate ranges you see aren't really duplicates

SPAN-GENERAL-SEGMENT 2, 3150.0, P-, 16100.00, 2418.0
SPAN-GENERAL-SEGMENT 2, 2418.0, P-, 16100.00, 2418.0 <= extra range (equal web depths)

is actually

SPAN-GENERAL-SEGMENT 2, 3150.0, P-, 16100.00, 2418.0323637283
SPAN-GENERAL-SEGMENT 2, 2418.0323637283, P-, 16100.001, 2418.0323301629

I can't tell why BRASS is giving the internal error about the cross section having zero area because as far as I can tell, the following cross sections are generated by the domain

Brass Cross Sect #

5	top flg 450x38	web 20x2418.0323637283	bot flg 450x38
6	380x25	web 20x2418.0323637283	bot flg 450x38
7	380x25	web 20x2418.0323301629	bot flg 450x38
8	380x25	web 18x2418.0323301629	bot flg 450x38

that matches the BRASS data file produced.

I'll check with Jim when he gets back about using a different tolerance when checking if the change pts are at the same location. Even though the points are really at the same location and the user shouldn't have to worry about the extra cross sections, I think all of the data has been defined for BRASS to run.

FROM: bgoodrich DATE: 12/15/1999 10:36 AM

Krishna - Was the 16100.001 mm distance physically entered? The 0.001 is an extremely small fraction of a millimeter, so was there an input problem. Also, did you talk to Jim about the tolerance?

FROM: kkennelly DATE: 02/07/2000 10:18:42

Talked it over with Jim. The 16100.001 was physically entered by the user. User entered top flange

Complete Issue Information

and web profiles that are 0.001 mm apart. The domain recognizes this and generates 2 sections as it should. Either the export or brass needs to handle this. BRASS needs to handle the precision that the user enters.

FROM: bgoodrich DATE: 2/8/2000 11:40 AM

I modified the export so it does not generate a web or cross section range that is within 1/32 inch of the previous one. Note that the export sorts the ranges in consecutive order. I tested this modification with the exact distances listed above and BRASS runs successfully.

FROM: dteal DATE: 3/23/2000 2:15 PM

Below is the BRASS error info I got when attempting to verify this problem. I attached the .bbd file and the wizard alternative.dat files. I only have info entered under member 2.

Section Analysis and Specification Check Errors (3225) - Depth of web in compression cannot be zero

----- Contents of BRASS Error File -----

File: C:\Program Files\AASHTO BridgeWare\VirtisOpis30
\Parabolic_Example\Parabolic_Haunch_Example\Member_2\Wizard_Alternative.ERR

Fatal Error Encountered - Unexpected Termination

Data File: C:\Program Files\AASHTO BridgeWare\VirtisOpis30
\Parabolic_Example\Parabolic_Haunch_Example\Member_2\Wizard_Alternative.dat

Error No.: 3225
Type : Section Analysis or Spec. Check Error
Location : NonCompactComprFlangeSlend

The depth of web in compression (Dc) cannot be zero. This causes a divide-by-zero error in a compression flange slenderness check.

----- End of Contents of BRASS Error File -----

FROM: dteal DATE: 3/23/2000 2:17 PM

FROM: bgoodrich DATE: 3/23/2000 5:04 PM

I ran the data file (Wizard_Alternative.dat) with BRASS and received no error. I also imported the bridge (Parabolic Example.bbd) with Opis and analyzed the Wizard Alternative member alt of Member 2, however, I did not receive an error here either. I do not think this is a debug/release version issue because I ran the data file just with BRASS and no problems occurred.

Jim - Could you please have someone try to duplicate this incident.

4/19/2016 3:13:47 PM

HRS AASHTO

356

Complete Issue Information

FROM:kkennelly DATE:03/27/2000 09:23:19

Stage 3 Pt 103 (15432 mm) BRASS calculates xbar as being in the bottom flange so the Depth of the web in compression is 0. BRASS quits because when it tries to check AASHTO 6.10.4.1.4 Noncompact Section Compression Flange Slenderness with $D_c = 0$ it will divide by zero.

FROM: bgoodrich DATE: 3/27/2000 5:23 PM

Krishna sent me the data file and some intermediate output files. I found that I could reproduce this incident from Virtis by specifying the US units HL-93 vehicle when analyzing the SI units member alternative. For this bridge at the 103 point, the superimposed stresses due to the minimum actions do cause the depth of web in compression to be zero. Furthermore, the elastic N.A. computed using the stresses and similar triangles falls in the bottom flange. Therefore, the outer fibers of the flange are in compression and inner fibers are in tension. BRASS checks the outer fiber to determine if a flange is in compression, which is why BRASS attempted the compression flange slenderness equation. I am currently working on correcting this issue in BRASS.

FROM: bgoodrich DATE: 4/3/2000 2:28 PM

I have addressed this issue and will be sending a new DLL soon.

FROM: dteal DATE: 4/13/2000 12:55 PM

FROM: dteal DATE: 4/18/2000 1:03 PM

I checked this with an interior girder and all was fine. When I check it with an exterior girder, G1, (from same structure) I get an "Unable to compute depth of web in compression" error. I get the error in "unit #3-P#5 to A#2, Member G1", Member G2 was OK. Attached is a copy of the error message and a copy the .bbd file.

FROM: bgoodrich DATE: 4/28/2000 10:37 AM

We will have to release a new BRASS-GIRDER(LRFD) DLL to address these issues. I will contact Jay and get the ball rolling.

FROM: bgoodrich DATE: 5/19/2000 9:13 AM

WYDOT or I will try to send a new DLL to Baker by the end of next week.

FROM: dteal DATE: 6/27/2000 11:34 AM

What release or patch will reflect the changes?

FROM:jduray DATE:12/18/2000 10:37:38

FROM: bgoodrich DATE: 12/18/2000 2:47 PM

Most issues in this incident (except the depth of web in compression bug) were corrected as indicated in the comment made above on 4/18/2000.

The depth of web in compression issue was addressed for the Version 1.03.01 release of BRASS-GIRDER(LRFD), which was released around the end of May with Service Pack 3 for Opis 3.0. This correction was documented in the BRASS-GIRDER(LRFD) Release Notes for Version 1.03.01 as well as the "Service Pack 3 Readme.pdf" file. The tolerance and zero length issues should have been corrected in this release as well.

Complete Issue Information

Submitted by James Pierce, MN

FROM:kkennelly DATE:03/29/2000 08:06:44
Internal brass lrfd error. I sent the .bbd and .dat files to Brian yesterday.

FROM: bgoodrich DATE: 3/30/2000 1:32 PM
I have located the problem and am working on a solution. The steel girders in this bridge are extremely deep and are entered in SI units. When the structural analysis is performed, the values from some intermediate computations are too large to store in a REAL*4 variable. These variables will have to be changed to REAL*8 to store these large intermediate values. I suspect this problem has not occurred because a bridge with this deep of girders has not been run. I will add this bridge to our test suite.

FROM: bgoodrich DATE: 5/19/2000 10:31 AM
The problem has been addressed in BRASS. I or WYDOT will try to send Baker a new BRASS DLL by the end of next week.

2592.10785	Resolved	Database Security - July 1999 User Group Mtg

Description

FROM:kkennelly DATE:03/31/2000 10:13:28

VIRTIS needs to allow the input of minimum and maximum impact factors. It should also allow, during permit vehicle analysis, the ability to generate rating factors based upon (A) unrestricted travel, (B) reduced impact travel and (C) reduced impact and centerline-of-roadway travel. This would allow quantification of needed restrictions, on a per bridge basis, for the permit request without requiring multiple runs of the bridge analysis program.

FROM:jduray DATE:7/5/01 9:37:22 AM

This incident was suggested at the 1999 User Group Meeting..

FROM:jduray DATE:7/31/2003 11:34:44 AM

This is the Permit Restrictions enhancement included in 5.0.1.

Description

FROM: gbarnhill DATE: 3/31/2000 1:20 PM

3.0.0 Release

This is a re-submittal of Incident 2338 which was marked duplicate to some other incidents (but I don't know which ones).

The STRAND LAYOUT graphic for any prestressed shape comes up partly off the screen to the top with no vertical scroll bar. If I reduce the window (not minimized) and then maximize it, the graphic

4/19/2016 3:13:49 PM

HRS AASHTO

367

Complete Issue Information

appears complete in the window.

This appears to be related to the width dimension. If I set any width dimension in the BEAM SHAPES dimensioning window greater than or equal to 76.4 inches, then the graphic shows up too high. If all width dimensions are 76.3 or less, then the graphic appears complete. A horizontal scroll bar comes up when the graphic opens for widths greater than 76.3.

A height dimension of greater than 57 produces a graphic off the top of the window, but also produces a vertical scroll bar.

FROM:jduray DATE:04/04/2000 09:15:01

Is it doing this for ps i and boxes? I'm not able to reproduce this.

FROM:jduray DATE:04/04/2000 09:22:48

For PS I I've tried the following:

80 inch top flange and 48 inch depth. I have varied the size of the window that opens to display the shape but it always opens correctly (with scroll bars if appropriate).

Trying boxes next.

FROM:jduray DATE:04/04/2000 09:27:13

Tried a width of 80 inch and depth of 42 in. Varied the window size and works fine.

FROM: gbarnhill DATE: 4/5/2000 1:16 PM

I've attached a bbd file for a Nebraska Twin Tee bridge. We model it as a single stem tee. Import puts it into the "I" shape category.

When I open the STRAND LAYOUT WINDOW, the shape is shifted off the top of the screen. If I reduce the schematic window and then maximize it, the shape is correctly placed (with a horizontal scroll bar).

I'm on a 17 inch monitor with 1024 x 768 resolution.

I can make it occur for box shapes also.

FROM:jduray DATE:04/17/2000 17:04:15

Gale is opening the window maximized.

FROM:jduray DATE:04/19/2000 16:06:37

If the shape is deeper than the window can display the vertical scroll bar should appear but it doesn't if the window is maximized.

FROM:jduray DATE:05/30/2000 10:22:25

Resolved for version 4.0.

FROM:gbarnhill DATE:02/12/2001 15:12:29

4.0.1 - I still get the original results with Virtis in "full window" mode. If Virtis is in "reduced window" mode, then the STRAND LAYOUT window opens with a vertical scroll bar.

I've attached a BARS data file. It's a tee that models as an "I" with an 84 inch top flange.

FROM:jduray DATE:4/12/2005 10:49:05 AM

Window should open fit to view.

2599.10778	Suspended	View Latest Analysis Output

Description

FROM: dteal DATE: 4/6/2000 11:53 AM

Our Oracle people haven't yet got us up and running so I installed the new version 3.0.0 to run locally on SYBASE. I loaded this on one other persons PC (266 mz) besides mine (550 mz). The other persons pc gets an error "Error Loading BRASS DLL" and states the Analysis Failed. I exported the file and ran it on mine, it sent the data file along to BRASS but stopped when BRASS encountered 3 input error. I reinstalled the software and still get the same error "Error Loading BRASS DLL". I tried to run one of the example problems, they get the same error on that pc also. Any ideas where I should look?

FROM: dteal DATE: 4/6/2000 2:12 PM

We solved it at this end. Being this machine only had 64 meg or ram the virtual memory was set too low. We increased it and it works fine now.

FROM: jduray DATE: 04/07/2000 08:43:32

Yes, that is what I was going to suggest you check.

Description

FROM:jduray DATE:04/07/2000 10:06:47
E-mail form MoDOT:

One thing that we have noticed when running Virtis is that it goes out and stores some data files on our hard drives. These files are data files that are used by the analysis engine for Virtis which is Brass. We were trying to figure out if there is a way to have these files stored somewhere besides our hard drives. The problem that we are going to have is that these files are large. They range in size from 250 Mbytes to 2.0 Mbytes. There will basically be a file stored for each bridge. (For example if you analyze A4974, then a directory for A4974 is created on your hard drive with various files in it.) Sooner or later, we will run out of space on our hard drives (this would especially be true if we wanted to analyze a large group of bridges). We want the program to be installed on our hard drives so that we are taking advantage of the speed of our machines when compared to having the program out on the network. What we would like to be able to try was to have these files written out on a network drive somewhere while keeping the actual executable files on our hard drives. Another option that we might have would be to have these files automatically deleted whenever Virtis is started. I was wondering if you could look into this matter and determine if there is some way that we can get around this. Me and Rich looked to see if there was an INI file somewhere which would allow you to redirect these files, but we could not find one.

My response back to them:

4/19/2016 3:13:52 PM

HRS AASHTO

377

Complete Issue Information

The issue of files created by the analysis engine, their size, location, etc. is on our list of enhancements that, with AASHTO approval, we will be addressing in the version 4 release in September. We may be able to do something sooner on a smaller scale.

At this time you have to maintain the files using Explorer. It sounds like you understand the directory structure so you know where to find the files and how to delete them. There is no provision for writing the files on a server and this may not be feasible given that multiple users can work on the same bridge at the same time. For example suppose person A checks a bridge out and is modifying the bridge description while person B is doing a permit analysis of that same bridge. Person A rates the bridge and the files are written to the server. Before person A opens the output file for review person B does a rating of a different vehicle and possibly with different structural properties. Person A then opens the output file (not knowing that person B has also done an analysis) and is now looking at the wrong analysis results. Furthermore, writing the large output files to a server may be slow (as you mention). I think it is best that we provide tools for managing the files we create but continue to write them to the local PC drive (although maybe we should send them to a user-defined location and add a userid to the directory structure). Perhaps an option to delete files when a bridge workspace is closed.

---end of my response

The following needs to be scoped to improve the way we manage output:

- 1) a utility for viewing and maintaining the analysis events stored in the database - at the Bridge Explorer level. (80) hours)
- 2) a utility for viewing and maintaining the engine output files on the disk - at the Bridge Explorer level. (80 hours)
- 3) add the option to not write batch rating results to the database but still review them the way we do now (from the Bridge Explorer). -----done for 4.1
- 4) provide 1-3 above but from the Bridge Workspace (160 hours)

Description

FROM: dteal DATE: 4/11/2000 2:03 PM

It was brought up and I thought solved some time ago.

My system default is SI units. When I make a new PC installation, the upper right corner of the bridge workspace reads US Customary. Shouldn't this be SI according to the defaults set???

FROM:mordoobadi DATE:06/05/2000 14:39:35

We display two system of units in Virtis. One for Bridge Workspace (when BWS is active) another for Bridge Desktop (when desktop is active).

1 - Default system of units for a new bridge is stored in the Virtis/Opis database and should be the same for everyone who uses the same database, and can be changed by going to 'Configuration Browser' / 'System Defaults' / 'Bridge Workspace' Tab.

2 - System of Units for Bridge Workspace is stored in the Windows registry database and can be different for different users. This can simply be changed by selecting a different system of units in

4/19/2016 3:13:53 PM

HRS AASHTO

385

Complete Issue Information

System of Units drop down list on the toolbar when Bridge Explorer window is active.

You can also specify the system of units that you'd like to view the information in at the following levels of bridge structure:

- Bridge
- Structure Definition
- Member Alternative

Conclusion:

If Bridge Explorer "System of Units" is SI on your PC. Others can have different System of Units displayed in Bridge Explorer and/or Bridge Workspace.

When you create a new bridge from your PC and some other PC that is connected to a common database, the system of units will be set to the system of units specified in the system defaults window (Config. Browser). So the toolbar's system of units for new bridges should be the same on the two PCs.

Please let me know if you are still having problems with the system of units.

Description

FROM: dteal DATE: 4/12/2000 2:16 PM

I am not able to delete structures that where created in version 2.1. At the Administrator level, I am able to delete structures from the deleted bridges folder only if they are created in version 3.0 or copies of structures that where created from version 2.1. I have one structure that was created in 2.1 that at the administrator level can not even be marked for delete. The administrator has all delete privileges checked. I have double checked that the bridge isn't checked out at the time.

FROM: jduray DATE: 04/17/2000 09:30:35

I migrated a 2.1 database and then deleted several bridges. The delete worked as it should (marked the bridge as deleted so it appeared in the Deleted Bridges folder, then I removed all deleted bridges). What error do you get when you do this?

FROM: dteal DATE: 4/18/2000 9:25 AM

Attached is a copy of the error messages I get. The file "delete error" was an error trying to mark a bridge for delete that was created in 2.1. The file "marked delete error" was an error trying to delete a

4/19/2016 3:13:54 PM

HRS AASHTO

389

Complete Issue Information

bridge from the deleted bridges folder that had been created in version 2.1

FROM: dteal DATE: 4/20/2000 7:51 AM

I just ran into a bridge just created in version 3.0 that I can mark for delete but I can't delete it from the deleted bridges folder.

FROM:jduray DATE:04/28/2000 08:03:23

FROM:jduray DATE:04/28/2000 08:06:58

Based on the error messages Oracle is not configured properly. Have your DBA increase the size of the rollback segments.

FROM:jduray DATE:04/28/2000 08:08:49

FROM: dteal DATE: 5/11/2000 8:24 AM

Jim - Did you find out what your Rollback segments are set to?

FROM:jduray DATE:05/11/2000 10:59:48

We have 7 rollback segments. Each with initial_extent=51200 bytes, next_extent=256000 bytes, min_extent=2, and max_extent=121. The number of rollback segments doesn't matter since a transaction only can use one segment. Within Virtis we do not in any way control rollback segments or assign transactions to particular segments. Your dba will have to increase the size of ALL rollback segments since Oracle manages the assignment of a transaction to a rollback segment.

FROM: dteal DATE: 5/16/2000 11:02 AM

Here is a summary of what our db folks have done. I am still not able to delete one of our bridges.

1. He suggested we increase the size of the rollback segments:

I have increased the size of the rollback segments on DT06FT01. They are set to Initial: 104k, Next: 256k, min_extent=3, and max_extent=121. The old value for next extent was 104k, so this is a significant increase in segment size. Hopefully, this will resolve the problem with the segment size. It should be available now for your use.

2. Open_cursors are set above 150:

>>> Carol Baldry 04/28/00 08:52AM >>>

I checked the Open_cursors and we are OK there. I remember we bumped that up last year and it is currently at 10,000.

3. Result:

You were able to delete one structure you could not delete before. The rollback used 22 meg of space, which was more than was available before I changed the rollback segment size, but now you have up to 40 meg of rollback segment available. You attempted to delete another structure, which failed. This second structure used no rollback segment at all, so the problem with this must lie in a different area. Since the error messages came from within Virtis, and not from the database, you should consult with Virtis concerning this. I have no way to interpret their error messages. If there are any special requirements for the system, Virtis should have a list.

what can we try next???

FROM:jduray DATE:05/30/2000 10:25:30

What error message do you get when you try to delete? It sounds like there is a different problem than

Description

FROM: dteal DATE: 4/12/2000 2:33 PM

I thought this was addressed along time ago??

When I look at the screen everything is OK. When I print it:

- 1) The line under "Dead Load Actions Report" has text printed over itself.
- 2) In the column headings, for Moment, the "t" at the end of moment is wrapped to the next line (it wasn't on the screen) which makes the units "kn" down one more line which is typing over the first line of values.

I attached a .bmp file so you can see the actual problem.

FROM: jduray DATE: 04/17/2000 12:06:15

#2 above is caused by not setting the column width wide enough to fit the heading.

Mehrdad - Fix #1 above.

FROM: dteal DATE: 4/18/2000 8:55 AM

#2 above had the column width wide enough for viewing on the screen!

FROM: mordoobadi DATE: 04/19/2000 10:37:31

There is nothing we can do about how tables are printed. Printing is done by Objective Grid functions.

FROM: mordoobadi DATE: 04/20/2000 10:02:50

We can use smaller fonts to resolve #1.

FROM: mordoobadi DATE: 04/20/2000 13:49:40

Text trimmed and ellipses put at the end.

FROM: dteal DATE: 11/15/2000 2:12 PM

2616.10761	Closed	Memory Problems?

Description

FROM: dteal DATE: 4/13/2000 9:47 AM

Found this problem with wide top flange US units only, NOT with narrow top flanges or in SI units.

1) When you check the Nominal Weight per foot, in the attached example, the compute button comes up with 798.024 lb/ft. Hand calc's $(767\text{in}^2 \times 150\text{#/ft}^3 \times 1/144 = 798.958\text{ 3/ft})$ This difference in value will not make a difference in the design, but it's not correct. The correct #/ft where calculated for narrow flange beams.

2) The volume to surface ratio is shown as 2.963 when it should be 3.01.

FROM:mordoobadi DATE:10/01/2001 11:29:21 AM

In the calculations concrete density is assumed to be 2400 kg/m³ which is slightly different from 150 lb/ft³.

Description

FROM: dteal DATE: 4/13/2000 11:43 AM

Something has got to be done about this before I jump out a window.

When you have lets say the Schematics: Profile View window open and you want to exit that window. So you click the "X" in the upper right. But you got the very top "X" by mistake and now you are exiting Virtis/Opis. Very frustrating. There should be a pop up window to ask if you really want to exit Virtis/Opis and close the program or cancel.

Now after analyzing a structure and mistakenly exiting, I have to go back and analyze it again before I can view the results. I bet I'm not the first one this has happened to.

FROM: dteal DATE: 4/13/2000 11:43 AM

We need to be able to define the haunch thickness from the top of the web and the width relative to the

Complete Issue Information

width of the flange. We currently do not offer that combination.

This was approved by the TF 4/13/00.

FROM:kkennelly DATE:04/18/2000 10:44:30

I noticed code in UiHaunchVw.cpp checks if we have an ext or int member by looking at the first and last mbrs in list. Shouldn't use list, should use FindGirderBay().

FROM:kkennelly DATE:04/20/2000 10:13:57

GUI ready but need 2 types defined.

Need 2 types added to SysTypeDefines for type category HaunchDim. We currently have 2 types: TYP_HAUNCHDIM_FLNG and TYP_HAUNCHDIM_WEB. Also need type for:

- 1. Haunch thickness from top of web and haunch width from edge of flange
- 2. Haunch thickness from top of flange and haunch width from cl of web

FROM:jduray DATE:04/20/2000 15:09:38

Krishna - please fix UiHaunchVw.cpp .

FROM:jduray DATE:05/01/2000 09:12:05

Release this with Version 4.0.

FROM:mordoobadi DATE:05/05/2000 09:17:14

Fixed.

FROM:kkennelly DATE:05/05/2000 15:37:08

GUI fixed for 4.0. Change only applies to steel mbr alts. (Haunch profile window only gui window change, struc def wizard not changed.)

Brian, Please see if any of the export code needs changed. Attached bitmaps show the 2 additional ways haunches can be dimensioned.

FROM:bgoodrich DATE: 7/18/2000 4:51 PM

I modified the export to address the new haunch dimension references. I also tested the export for each of the four haunch dimension variations and the commands are generated with the correct values. This includes the haunch depth on the cross section commands and the haunch dead load on the dead load commands. I will send the updated export code to Jim.

Krishna - Does anyone else need to work on this?

2624.10753	Closed	Saving Error
2625.10752	Resolved	Fatigue rating fails for certain tenth point POI'S

Description

FROM: dteal DATE: 4/19/2000 9:00 AM

I have a structure that has a problem saving. It was created in version 3.0. I can save all work except "Diaphragms". After I enter the data for the diaphragms (input attached) and try save, validation has no errors, I get the attached error message. I have went to other areas and entered data, saving went just fine. The only problem seems to be when saving the diaphragms. Could an input error be the problem??

FROM: dteal DATE: 4/19/2000 9:01 AM

Structure type is Steel welded plate

FROM:jduray DATE:04/19/2000 15:41:10

I imported the bbd file you provided.

FROM:jduray DATE:04/19/2000 16:00:49

I imported the attached bbd file and save it to the database. I then entered the diaphragm locations listed in the attached bitmap for girder bay 2. I saved to the database after each row in the table was entered so I would know which row is causing the problem. Guess what?...they all saved. I would like for you to do the same and let me know how it works. I looks to me as though something was wrong with your data that exporting to a bbd and importing cleans up.

FROM: dteal DATE: 4/20/2000 8:52 AM

Yes, that worked fine.

Please close this incident.

Description

FROM:kkennelly DATE:04/19/2000 13:06:51

Attached bbd is file from Aaron Stover for Baker Arizona DOT bridge rating project.

Release 2.1. Member G1. If Member Alt Engine tab has Generate POI's at tenth points, Point 207 will have a 0 rating for fatigue. BRASS LFD output file also attached. For some reason, Load Level 4 fatigue at this point is 0.00 but NA everywhere else. If you change the Member Alt Engine tab to Generate user defined POI's only, Point 207 will rate ok.

Migrated bridge to Release 3.0, kept Generate POI's at tenth point and rated ok.

FROM:jduray DATE:04/19/2000 14:44:33

Although this problem does not occur in 3.0 I am concerned that it is coincidence that it doesn't occur since it seems to be erratic in 2.1. Has code been changed in BRASS that may have fixed this problem?

FROM: bgoodrich DATE: 4/25/2000 8:44 AM

I have asked Dan Glandt to determine if this issue is truly resolved. I am awaiting his findings.

FROM: bgoodrich DATE: 5/1/2000 12:12 PM

Entered for Dan Glandt:

There was a change to subroutine St_LFD so that fatigue rating was done for both top and bottom of the section and stored accordingly. In areas of stress reversal, the older version could get a 0.0 rating. So has been fixed.

FROM:kkennelly DATE:05/02/2000 13:32:04

Attached is 01359_export.bbd which is another one of the Baker Arizona bridges that is having this problem in 3.0. Bridge entered and ran in 3.0. Member G6, analysis point 45 (410.00)

FROM:kkennelly DATE:05/02/2000 13:38:39

Tasks

Name	Current State	Summary
2628.10749	Closed	PS Stirrups

Description

FROM:kkennelly DATE:04/19/2000 13:57:45
Reported by Aaron Stover, Baker Arizona DOT bridge rating project. bbd file attached.

FROM:jduray DATE:04/19/2000 14:27:33
Aaron found that if the space between the last intermediate stiffener and an interior support (pier) is larger than the space before the last stiffener BRASS ignores the stiffener. Adjusting the location of the stiffener such that the space is smaller than the previous space enables BRASS to use the stiffener (however, it is in the wrong location).

Brian - please check on this and report to Wyoming if you confirm that it is BRASS and not the export (or Virtis) causing the error.

FROM:jduray DATE:04/20/2000 08:58:43

FROM:kkennelly DATE:04/20/2000 13:11:23
I reattached the version 3.0 bbd file for this incident and also sent it to Brian via e-mail.

FROM: bgoodrich DATE: 4/20/2000 4:35 PM
I tried several stiffener spacing variations around the interior piers and I cannot duplicate the stiffener problems using version 3.0. Both the exported file and the BRASS results look correct, so I believe this issue was corrected somewhere between 2.1 and 3.0. I could have fixed it in the export, but I don't recall anything specifically. Dan Glandt worked on some schedule based issues in BRASS for the 3.0 release, so it may have fixed then.

Jim - Can this user migrate to 3.0 to verify this?

FROM:jduray DATE:05/08/2000 12:32:40
We are still having the problem.

FROM: bgoodrich DATE: 8/29/2000 3:46 PM
I tried again to reproduce the problem. I cannot find anything wrong with the export or BRASS.

Jim - Could you get more information from Aaron Stover, i.e., the bad BRASS output where the stiffener is neglected?

FROM:bgoodrich DATE:09/04/2001 14:09:10
I have never received any more information on this incident.

Stirrup-Schedule 1,1,3,1147,30
Stirrup-Schedule 1,1,6,1177,6
Stirrup-Schedule 1,1,3,1183,3
Stirrup-Schedule 1,1,3,1186,3

FROM: bgoodrich DATE: 4/20/2000 9:26 AM

When stirrups are entered into Virtis/Opis, the ranges may start or end within the beam overhangs (in your case within the 8"), however for BRASS, the stirrup ranges may only be defined within the span length (in your case within 100'). Therefore, only the stirrups located within the 100' are exported. The BRASS export is working correctly.

Jim - Should we add something to the BRASSLFDENGINE.HLP and BRASSLRFDENGINE.HLP files? If so, please send me the latest documents, so I can modify them.

FROM: jduray DATE: 05/30/2000 10:29:54

2635.10742	Resolved	Sybase SQL Anywhere migration

Description

FROM: dteal DATE: 4/20/2000 1:27 PM

In BRASS, for a Reinforced concrete slab we would input the Wheel Fraction of 1/E (invert of E, not 1ft/E). Now in Opis the Standard Live Load Dist. Factor requested is not 1/E, is this correct. It is asking for "E" and calling this the Distribution Factor, correct?

FROM:kkennelly DATE:04/24/2000 08:40:16

BRASS LFD uses the Standard Live Load Dist. factor exactly as it is entered in Virtis. The export does not modify the df that the user enters in Virtis for the BRASS commands.

FROM: dteal DATE: 4/24/2000 8:57 AM

This may be misleading then. Opis is asking for "Wheel Distribution Factors" and assumes that the user will enter what BRASS is asking for which is "Wheel Fraction".

From AASHTO 3.24.3.2 we get distribution width "E" which we call the Distribution Factor.

From BRASS we want Wheel Fraction which is "1/E".

Do you see the confusion between DF and Wheel Fraction? Should it be mentioned in the help?

FROM:kkennelly DATE:04/25/2000 07:55:30

AASHTO 3.1 says E is the width of slab over which a wheel load is distributed. AASHTO 3.24.3.2 calls E the distribution width. When you say we call E the Distribution Factor do you mean your state calls it that or we are calling it that somewhere in Virtis? I think AASHTO is clear that E is the dist. width not the dist. factor.

A wheel line is distributed over slab width E. So the distribution factor for that wheel line is 1/E if you are designing a 1 ft width of the slab. If you entered a 2' wide section in the cross section window, you would want to enter 2(1/E) as the distribution factor.

Description

FROM: dteal DATE: 4/24/2000 8:42 AM

Our installation of Version 3.0.0 doesn't include the new training bridge examples that should go along with it. It only includes the first 16 bridges that were included with version 2.1. What did we do wrong during the installation? How do we correct it?

FROM: jduray DATE: 04/26/2000 15:32:56

WE do not add them to the Oracle installation because we don't have any way to know what BID to give them. The BID is system generated for each bridge you add. The best way to get them into your Oracle db is to export (bbd file) them from the database we delivered and import them into your Oracle db.

Description

FROM: dteal DATE: 5/3/2000 10:33 AM

For the Spec Checker I can suppress items such as N/A so it doesn't clutter up and confuse the output. But when you view the Results Graph there is no filter. So for example, the Spec Checker (with filtered items) has no failures on a particular design review but the Results Graph could be cluttered with RED failures and you don't know which ones apply.

I was mostly looking at a RC Haunched slab structure.

FROM: dteal DATE: 5/3/2000 10:40 AM

The biggest confusion is "Rating Factors" that don't apply and can't be filtered out.

FROM: dteal DATE: 5/4/2000 8:18 AM

I was looking at the wrong N/A. I confused the flexural sense N/A with "Not Applicable". Mark this item CLOSED.

Description

FROM: dteal DATE: 5/3/2000 11:01 AM

My options for Stages are:

Non-Composite Stage 1

Composite (long term) Stage 2

Composite (short term) Stage 3

What I see here is confusion. When entering data for a RC Haunched Slab structure, none of the above options for Stages apply. There are no composite regions in a slab bridge (no girders). There is no direction anywhere to go to the Member Alt Properties to select "All loads applied in Stage One". The help for the key word "Stages" doesn't address this at all.

When you select "All loads applied in Stage One" in the Member Alt Properties, does this over ride

4/19/2016 3:14:04 PM

HRS AASHTO

anything you may have selected in the Load Case Description window??

FROM: jduray DATE: 05/08/2000 10:29:24

Brian - please answer the question about the override and then assign to me.

FROM: bgoodrich DATE: 5/8/2000 10:54 AM

The short answer is YES. No matter what a user enters into the Load Case Description window, BRASS only allows one stage for R/C, so the export applies the loads accordingly. Maybe the stages in the Load Case Description window could be filtered based on the Member Alternative Types check boxes on the Structure Definition window.

Also, for an R/C member alternative, the ASD/LFD engine properties show two options (in a drop-down box) for the Load Sequence:

- => Computed based on loadings and composite regions
- => 1 stage - R/C bridge with one construction stage

However, the LRFD engine properties show the Load Sequence as a set of radio buttons that are the same for every type of girder, i.e., Computed, Stage 1, Stage 2, and Stage 3. We may need to hide the radio buttons that are not applicable to R/C to prevent any further confusion. Note that the Computed option is required because that is the default set in the default string of the member alt engine properties, which remains constant for all girder types. The 1 stage option was required for the import of BRASS data file.

The export does issue a warning if the users applies a load to a stage which does not exist in BRASS for the structure type. When this occurs, the load will be applied to the last allowable stage, which is stage 1 for R/C.

Description

FROM: dteal DATE: 5/3/2000 12:54 PM

My system default is SI, but whenever I go to view the Rating Results (Member Rating Results) they are in US and I have to go to the top and click the radio button for SI.

FROM:mordoobadi DATE:8/2/01 4:41:50 PM

Fixed in 4.1

FROM:dteal DATE:10/09/2001 17:25:04

I see no changes in operation.

Set my system default to SI. Opened the provided bridge, Matrixbridge12, set the Bridge Description window and the Matrix No. 8 structure definition to SI. I rated the Matrix No. 8 structure definition. Going to the view analysis results for Rating Results Summary – All Inventory and Operating locations are still in feet when all the defaults are set to SI.

FROM:mordoobadi DATE:10/10/2001 11:40:26 AM

Dean the Windows operate based on the selected system of units on the toolbar not the system of units in bridge description or structure definition.

FROM:dteal DATE:10/16/2001 15:31:58

I discovered a new problem with 4.1 beta 1 while trying to verify this incident. I reported it as #3443. I will revisit this incident for verification when #3443 is resolved.

FROM:dteal DATE:10/16/2001 16:32:54

FROM:mordoobadi DATE:10/17/2001 10:22:57 AM

440

Complete Issue Information

see #2810

FROM:mordoobadi DATE:11/9/2001 10:44:26 AM

This seems to be caused by BRASS supplying duplicate points (very close) to Virtis. The Tolerance that we are using right now is 0.0000001. I changed it to 0.001. This resolves the problem. In the meantime Brian is going to investigate why we get two different set of data for some points.

FROM:bgoodrich DATE:12/05/2001 11:06:29

I have corrected the BRASS engine to compute the distance to points in a consistent manner. Previously, one area used single precision and another used double precision, which caused slightly different distances to be passed to the results object. When multiple reports are superimposed, the blanks appear because a result value is not present for some of the points because the value was stored a nearly identical point. Fixed for version 4.1 acceptance build.

FROM:bgoodrich DATE:Wednesday, April 10, 2002 11:50:54 AM
Track field marked with "A", so status set to Accepted.

FROM:bgoodrich DATE:Wednesday, April 10, 2002 12:00:57 PM

2662.10715	Resolved	P/S strand layout - cannot save changes to debonding locations for box beams

Description

FROM: dteal DATE: 5/4/2000 10:42 AM

There are two fallacies in the BRASS procedure for calculating the Bearing Resistance for the bearing stiffeners.

1. The bottom flange width should be used, not the top flange width. The bottom flange is where the reaction is applied to the bearing stiffener.
2. The effective bearing length on the flange is calculated incorrectly. The clip dimension should be the sum of the inside and outside clips at the bottom of the stiffeners. The program used the larger of the top or bottom clips. Also, when performing the left hand portion of the equation for beff, the clip dimension should be the inside clip only.

Equation Used:

$$\text{beff} = \left(\left(\frac{\text{flange width} - \text{tw}}{2} \right) - \text{clip} \right) \leq \text{bt-clip}$$

Equation Should Be:

$$\text{beff} = \left(\left(\frac{\text{bottom flange width} - \text{tw}}{2} \right) - \text{inside clip} \right) \leq \text{bt-total clip}$$

Two methods are available to overcome this problem:

1. In the Opis input for "Stiffener Definitions", code the same clips for top and bottom even though they are different.
2. Override this information in the "Points of Interest" input.

FROM: jduray DATE: 05/08/2000 10:23:24

Brian - is this problem in BRASS or the export?

FROM: bgoodrich DATE: 5/9/2000 5:27 AM

I have requested permission from WYDOT to modify the bearing resistance code within BRASS to always use the bottom flange width and not the minimum of the top and bottom flange widths. This is a minor code modification.

The other issue regarding the clip dimensions will have to be addressed in the export. BRASS only

4/19/2016 3:14:06 PM

HRS AASHTO

443

Complete Issue Information

allows one clip to be entered, i.e., the bottom inside clip. However, Opis allows the user to enter inside and outside clip dimensions for both the top and bottom of the stiffener. The export sums the inside and outside clip dimensions at the top and then repeats this for the bottom. Then to be conservative, the maximum of the top and bottom clips are exported. This portion of the export will need to be changed so only the bottom clips are considered.

Jim - Please let me know if I can make this change in the export.

FROM:kkennelly DATE:05/15/2000 11:16:14

Similar question about clips. I've attached one of the Arizona bridges Baker is rating (00664.bbd). Member G4 analysis point 110. Bearing stiffener entered in Virtis as 5.5" wide, no clips entered. Top and bottom flange widths are 12", web 0.3125" wide. If I don't have the detailed output checked for POI 110 engine data, BRASS output file lists clip as 0.0. If the detailed output is checked on the poi engine data window, analysis point 110 detailed output for the spec check 10.48.7 lists the bearingstiffener clip (bcl) as 0.125". Rating factor calculated using 0.125" clip.

FROM:kkennelly DATE:05/15/2000 11:29:46

FROM:jduray DATE:05/26/2000 13:56:48

Discussed with Brian 5/25. He will calculate an effective clip based on the clips and the flange width.

FROM:jduray DATE:05/26/2000 13:58:35

Fix for patch 3.

FROM:bgoodrich DATE: 5/26/2000 2:52 PM

BRASS export fixed so effective clip is generated.

Krishna - I found that if a zero clip dimension is detected by BRASS-LFD only, the clip is set to 1/8" to account for a minimum weld size. This is done internally, so the LFD help should be updated to reflect this.

FROM:kkennelly DATE:07/27/2000 13:19:22

Help fixed for Version 4.0

FROM:dteal DATE: 11/15/2000 2:24 PM

FROM:kkennelly DATE:12/21/2000 09:16:05

Accepted based on A in track field.

2667.10710	Duplicate	Results Graph – Symbol Legend

Description

FROM: gbarnhill DATE: 5/9/2000 1:23 PM

I created new agency PS beam shapes in the library. To get the properties to check with our hand calculations for our shapes, I left the fillet dimensions as zero (both for a wide top flange type and a narrow top flange type).

When I select the agency shapes in the BEAM DETAILS window and then open the STRAND LAYOUT window, the shape does not appear in the schematic view.

If I put a dimension other than zero (0.0001) in for the fillet dimensions, then the schematic appears.

FROM: jduray DATE: Saturday, November 08, 2003 8:13:17 AM

I checked this in version 5.1 and it has been resolved (not sure when).

FROM: gbarnhill DATE: Monday, January 12, 2004 11:25:49 AM

OK in v5.1.1 and 5.1.0

2674.10703	Accepted	Int Transverse Stiffeners not showing up

Description

FROM:kkennelly DATE:05/15/2000 09:24:03

I've imported some bridges from Aaron that don't have the GUI member alt type set on the structure definition window . Aaron originally entered one bridge 2.1, migrated to 3.0 and then emailed to me. When I imported into 3.0, it didn't have gui member alt type set. He entered another bridge in 3.0, definitely set the member alt type in 3.0, emailed it to me. When I imported into 3.0, gui member alt type was not set.

FROM:jduray DATE:10/09/2000 09:26:36

I could not reproduce this in a version 4 alpha debug build. Test the release build.

FROM:jduray DATE:12/20/2000 11:16:08

Reproducible in release build.

Problem is in setting the value in the little bucket. The correct value is in the export file and is read in correctly by the archive class. CDmBridgeArchive::operator>>(IDeLongCom* pIDeLongCom) function calls setValue on the little bucket and the value does not get set.

SetValue was in an ASSERT instead of VERIFY.

Description

FROM: tthompson DATE: 5/15/2000 9:02 AM

I have a Comp Cont Steel Girder bridge that no matter what I do, I can't seem to get BRASS to recognize the Transverse Stiffeners.

My analysis is giving me 0.00 at Span Point 110 and the BRASS output states that there are no Transverse Stiffeners and makes the section unstiffened. Yet I have entered all the stiffeners for the girder. I also tried to override the stiffeners at this check point, but the BRASS output still says there are no stiffeners.

I'm not sure if I have a mistake or if there is a problem in the program.

I've attached an export of the bridge. The problem is with MEMBER G2. I was originally imported from BARS.

Complete Issue Information

FROM: tthompson DATE: 5/15/2000 9:06 AM

FROM: kkennelly DATE: 05/18/2000 08:55:36

The export is generating a stif-trans-schedule command with 0" spacing and 0' length at 120'. I'm not sure if this is the problem but I noticed that the data you have for the transverse stiffener ranges has a transverse stiffener located directly at each of the piers. (A transverse stiffener is not located at the start distance of a range but is located at the end distance of a range in Virtis) You also have bearing stiffeners at each of the piers. I'm not sure if the BARS model you imported from had a trans stiff at the pier and the import worked correctly based on the incorrect BARS model or the import placed the trans stiff at the piers incorrectly but I don't think you would have both a trans stiffener and bearing stiffener at the same location.

If you change the trans stiff range with start dist = 105.83', 34" spacing to have 4 spaces instead of 5, you will end up with an end distance of 117.17' and BRASS will run correctly for point 110 with a trans stiff spacing of 2.83'. I'm not sure if a trans stiff at the same loc as a brg stiffener is causing the problem with the export because you don't get this error at the other piers with both trans stiff and brg stiff. After you make the previous spacing change, pt 110 will run ok but point 510 will now have the same problem with shear.

As for not being able to override the stiffeners at that point, the export issues the following warning in the .log file:

WARNING (High):

The POI control parameter on the ANALYSIS command indicates to generate points of interest from the schedule data. BRASS currently does not allow the generated data to be overridden with the data entered on the point-of-interest commands.

If you want to override something for one of the points, you have to enter all of the override info for all of the points of interest and pick option 0 - "No point of interest data will be generated" on the Mbr Alt Engine tab for POI Control. BRASS currently doesn't let you mix overriding some points and using the generation option for the other poi's. Picking any other option for POI control will ignore any override data entered on the POI windows (other than the POI Engine tab). The Engine related help is being revised to explain this more clearly.

Brian, Can you look into why the export generates a stif-trans-schedule command with 0" spacing and 0' length at 120' and why point 510 thinks it is unstiffened? (maybe related to incident 2627.)

FROM: bgoodrich DATE: 5/19/2000 4:06 PM

BRASS is generating a small range at the ends of some of the spans because a stiffener is positioned near a support. For span 1, the schedule range at 105.833333' has an ending distance of 119.9999997' within Virtis ($105.833333' + 5*(34/12)' = 119.9999997'$). Therefore, the export thinks there is a space of 0.0000003' at the end of the span. Similarly, for span 5, $89.830000 + 2*(37/12) = 95.99666667'$, which is not exactly equal to the 96' span length. Because the range is sometimes extremely small, a zero range is exported due to the number of digits right of the decimal point that are written to the data file. I modified the stiffener ranges export code to ignore a stiffener if it located essentially at a support.

In general, transverse stiffener should not be placed at the supports. If you remove the transverse stiffeners at the supports, BRASS runs fine.

Krishna - If the BARS import generated the stiffener schedules, it needs to be modified. Please assign to Ed if this is the case.

Complete Issue Information

FROM:kkennelly DATE:05/22/2000 09:36:34

Todd,

Did the BARS import generate the transverse stiffeners at the piers based on the BARS data file having stiffeners there or did the import place trans. stiffeners at the piers when the BARS file did not contain trans. stiffeners at the piers?

FROM: tthompson DATE: 5/24/2000 10:11 AM

Sorry didn't get back right away, but have been out of the office.

The BARS import did not place the stiffeners at the Pier. I did that by accident. I didn't enter my stiffeners correctly. If I remove that last stiffener at the Pier, then it seems to work.

I added the BARS data set in case you want that.

FROM:kkennelly DATE:05/24/2000 12:33:00

BARS import seems to be ok as is. Brian has fixed export to ignore trans stiffeners at supports so this incident should be resolved. Waiting to get fix from Brian so we can test it, this fix will probably be in Patch 2.

FROM:jduray DATE:05/26/2000 13:50:17

FROM: tthompson DATE: 6/29/2000 11:04 AM

Appears to be ok in Service Pack 3

FROM:kkennelly DATE:07/11/2000 08:25:53

Accepted based on A in track field.

Description

FROM: tthompson DATE: 5/16/2000 9:35 AM

I keep getting this error message:

Input Errors (1103) - Cross-section area less than or equal to zero

09:28:10 AM - Line 2124 in source file E:\virtis\Dev\DOMAIN\aborst\DoMemberResults.cpp.

The structure has a lot of fractions and I'm guessing that there is a problem with rounding causing the problem. I've been trying to enter the fractions out to (ex. 101.864583). But can't seem to solve this. I am guessing that this may require an enhancement, unless I just have a bust in my data.

I've attached the bbd and the error message.

FROM: kkennelly DATE: 05/17/2000 13:59:47

I've reviewed the Virtis input and the BRASS input file generated by the export and I cannot determine what is causing this error. The BRASS input generated by the export looks ok to me. This is an internal BRASS error when BRASS is trying to compute the beam properties for the non-composite section (that's what appears in the BRASS window that opens in Virtis when analyzing with BRASS) so I'm assigning this to Brian and I'll notify him by email.

FROM: bgoodrich DATE: 5/19/2000 4:19 PM

There is problem in the export when generating commands containing distances. Some of the span and load commands have either 81.3437 or 81.3438 generated as ranges. The primary problem is the last range on the SPAN-D command for span 1 is not identical to the span length on the corresponding SPAN-A command. Therefore, there is a gap at the end of 0.0001 feet when BRASS interprets the commands. The actual span length and cross section ranges entered into Virtis are 81.34375 feet and only four digits right of the decimal point are exported. If I just changed the distance to 81.3438 in the data file, BRASS runs fine, so I know this is where the problem is located.

I re-entered the span length and cross section ranges into Virtis but still get the same export problem. The debugger even reports the span length and the cross section distance as the same, both 81.343750000000. If I subtract 81.3 from these values in the debugger watch window, the results are 0.043750000000003 and 0.043749999999989, respectively. This may be why the export is generating the commands incorrectly. However, if I subtract 81.34 from these values in the debugger watch window, the results are 0.003749999999966 and 0.003749999999824, respectively. I'm not sure why this span length value does not stay greater than 0.00375.

4/19/2016 3:14:09 PM

HRS AASHTO

461

Complete Issue Information

Just as a test, I retrieved the span length from the domain in inches and then in feet. The span length entered in the GUI is 81.34375 feet. The retrieval results seem odd and are shown below.

dSpanLengthInches/12-81.3 = 0.043749999999989

dSpanLengthFeet-81.3 = 0.043750000000003

The cross section change points are generated using inches because both the LFD and LRFD export use the same functions. However, the span length for LFD is retrieved in feet, which is causing the problem, I think. This issue is probably not isolated to just the cross section ranges. Any ranges used to generate BRASS commands (schedules, loads, etc.) would have to be checked as well. One possible way to correct this problem would be to increase the number of digits past the decimal that are exported (from 4 to 5). However, we increased them from 2 or 3 to 4 for the Version 3.0 release to address a similar issue.

Jim - Any suggestions?

FROM:jduray DATE:05/26/2000 13:45:26
Precision

FROM:jduray DATE:6/25/01 3:59:39 PM
Krisha - is this still a problem?

FROM:kkennelly DATE:7/16/01 11:51:39 AM
I migrated this bbd file to 4.0.4 and it ran without any problem. Tolerances seem to have fixed this problem.

2679.10698	Closed	Import of bbd from sample db to migrated db fails

Description

FROM: dteal DATE: 5/16/2000 2:07 PM

In "PCITrainingBridge4" the LRF Distribution Factor for deflection is given as 0.499 for single lane and 0.732 for Multi-Lane. Where did these numbers come from?? According to Article 2.5.2.6.2 (found in the last paragraph of the commentary) – Distribution Factors for Deflection are simply Number of (Lanes/Number of Girders) * Multiple Presence Factor.

So for this case:

Single Lane = 1/6 Girders * 1.20 Mult Presence Factor = 0.200

Multi-Lane = 4/6 Girders * 0.65 Mult Presence Factor = 0.433

I have found this error in several of the example problems that came with the installation.

We need to have these examples correct.

FROM:kkennelly DATE:05/16/2000 15:33:04

These examples came from the PCI Design Manual. The PCI Design Manual states that it is more conservative to use the moment distribution factor since it is larger than the deflection dist. factor. We tried to follow the data in the PCI examples so users could refer to the PCI Design Manual.

FROM: dteal DATE: 5/22/2000 8:36 AM

The PCI example fails to state that the Dist Factor for Deflection should have been multiplied by the multi presence factor of 1.20 for single lane and 0.65 for the 4 lanes. This would have closed the gap between the DF's for moment and deflection.

This PCI example is also in error in 9.4.15.2 where it states that L=121 feet to calculate the deflections. L = 120 feet would be correct!

I would propose an enhancement to be able to sort sub-folders under another folder. I currently created a folder called State Bridges. Under this folder, I am attempting to create a folder for each state highway. Currently, it appears that these individual folders are sorted only in the creation order. It would be of tremendous value to be able to sort these by folder name.

FROM: jduray DATE: 05/30/2000 09:22:29

I changed the folder update so it always sorts. If we need the option to sort then there is more work to be done. Mark as resolved.

Include in Version 3.0 Patch 2.

FROM: tthompson DATE: 6/9/2000 11:14 AM

It currently sorts in alphabetical order.

This is much better than in the order of creation.

I will accept these results but I anticipate that there may be additional needs/abilities in the future.

2687.10690	Accepted	3.0 Release - span lengths with .17 & .67 decimals will not analyze

Description

FROM: rmbest DATE: 5/17/2000 3:54 PM

The File/Print option from within the View BWS Report malfunctions. It prints countless blank sheets after the end of the normal report. The user can specify to print from page 1 to say page 20 to reduce the number of blank sheets but Print All needs to be fixed.

FROM:mordoobadi DATE:10/04/2000 10:20:47

I remember putting some comments in this incident. I haven't been able to reproduce this problem on our printer.

Description

FROM: gbarnhill DATE: 5/17/2000 4:50 PM

I imported a BARS bridge with spans of 49'-2" 65'-10" 49'-2". I added bracing data and lateral support data. When I tried to analyze, I get this error:

Unable to convert cross section based steel beam to BRASS cross sections!
Error generating BRASS cross section commands!
Unable to get cross section dimensions!

4/19/2016 3:14:12 PM

HRS AASHTO

474

Complete Issue Information

Unable to move to specified STEEL cross section range using MoveDistance!
Error getting cross section from STEEL cross section ranges!

I changed the span lengths to 49 65 49, added the bracing and lateral support data and was able to analyze.

I've attached the bbd file for the 2 & 10 inch spans.

FROM:kkennelly DATE:05/19/2000 13:45:35

I know this is a flaky work around but if you go to the Cross Section Ranges window, just click inside the last row's start distance, hit ok, BRASS will run.

Problem with precision. Span lengths are entered 49.166667/65.666667/49.166667 which add up to 164.000001'. When export tries to get cross section at end of beam, it does so at distance in inches = 164.000001*12in/ft = 1968.000012". Last cross section range ends at 1968.0". When we try to MoveDistance we use the new tolerance but it's still too tight (1968.000012" <= 1968.0 + 0.00001" returns false and can't get section at end of beam).

Clicking on the last row's start dist resets the length to 35.000001' which makes the last cross section end at 164.000001'

FROM:jduray DATE:05/26/2000 13:42:52

Fix for patch 4.

Krishna - please verify this is fixed.

FROM:kkennelly DATE:10/09/2000 11:30:31

Works as planned in Version 4.0. If user specifies a tolerance on inches 0.0001 or greater, domain thinks 1968.000012 = 1968 and BRASS will run. I also added the specific distance at which the domain can't get a cross section and the current tolerance to the error message to help user pin down error.

Fixed for 4.0. We said this would be in Version 4.0 not a patch as indicated on 5/26.

FROM: gbarnhill DATE: 12/19/2000 9:06 AM

OK in 4.0 Beta 2, see related comments in Incident 3006

FROM:kkennelly DATE:12/19/2000 10:39:53

Accepted based on A in track field.

Name	Current State	Summary
2689.10688	Closed	Viewing results after analysis of struc def with linked members

Description

FROM: tthompson DATE: 7/18/2000 3:52 PM

I logged on as user "toddt" and checked out a structure definition (not the entire bridge, just the structure definition).

I then logged on as user "virtis" and checked out the BRIDGE. The user virtis then had complete control over the bridge and all lower levels of structures and members.

I then logged on as user "toddt" and had NO control over the structure definition that I had previously checked out.

Is this intended to work this way? Shouldn't one be able to check out a structure definition and then if somebody else tries to either check out the structure (or bridge), that they would not be able to? Seems to be a bug in how it works now.

FROM: jduray DATE: 07/19/2000 13:44:05

You should be able to do what you describe. I will investigate. Did it work correctly prior to SP 3?

FROM: gbarnhill DATE: 7/19/2000 4:48 PM

I reloaded Virtis without any Service Packs and was able to duplicate what Todd did. I authorized two designers to check out a bridge. Logged in as designer1, opened the BWS, highlighted the bridge description name and checked it out. I was able to change something and save the BWS. I could not change any items above the bridge description.

I logged out and then logged in as designer2. I highlighted the bridge and checked it out. I opened the BWS. The tree indicated that I had the bridge and the description both checked out. I was able to change something in the description and save the BWS.

I logged out and logged in as designer1. The Explorer indicated the bridge was checked out to

4/19/2016 3:14:12 PM

HRS AASHTO

476

Complete Issue Information

designer2. I opened the BWS and could not change anything.

I agree with Todd that there should be a security check to see if a description is checked out before a second person can check out the entire bridge.

FROM: tthompson DATE: 7/20/2000 7:02 AM

Jim, I never checked this prior to SP 3. But based on Gales experience described, appears to be a problem/bug. Please also review Incident 2688, it also has a problem with User privileges. It's been listed as open since May.

FROM: jduray DATE: 10/03/2000 17:04:41

I believe this is fixed in Version 3.0 Patch 4 (3.0.4). I just checked version 4.0 and it is fixed.

Tasks

Name	Current State	Summary
2696.10681	Resolved	Structure Typical Section Schematic does not draw median correctly

Description

FROM: gbarnhill DATE: 5/19/2000 11:17 AM

In addition to Todd's comments about filtering bridges for overloads, we should be able to view the rating results for all bridges in a folder. We can analyze all the bridges in a folder by highlighting the folder in the tree. To view the rating results, we need to highlight all the bridges in the right-side table view. We should be able to view all the bridges by highlighting the folder name.

FROM: gbarnhill DATE: 5/19/2000 11:26 AM

I filed this & then noticed incident 2682. They may be related. I highlighted a folder name and clicked VIEW RATING RESULTS. If I had previously highlighted brides in the folder on the right-side table view, those bridge results showed up in the BRIDGE RATING RESULTS window. If I changed folders and then returned to the first folder and clicked VIEW RATING RESULTS, an empty BRIDGE RATING RESULTS window opens.

FROM:gbarnhill DATE:12/28/2000 12:31:51

The second comment in this incident appears to be corrected in 4.0 Release. With focus on a folder name, nothing happens when the RESULTS icon is clicked.

Complete Issue Information

This incident should be marked SUSPENDED until the first comment and Incident 2683 are addressed.

FROM:jduray DATE:5/22/02 11:45:28 AM

Tasks

Name	Current State	Summary
2706.10671	Closed	Steel Girder – Haunch DL

Description

FROM: tthompson DATE: 5/24/2000 10:34 AM

This is similiar but different than a previous enhancement request. I would like to use VIRTIS for doing overweight permits and I would like to be able to create a folder/list of all the structures that a permit vehicle may cross. Since 99% of all permits loads use more than 1 highway, I don't see a way to currently create a structure list based on multiple routes.

I would like to see a more robust way to create folders/lists so that one may use VIRTIS for overweight permitting. I would say that a dozen routes for a permit is not uncommon (at least in our state). An upper limit would probably 18 or 20 routes. Maybe there is already a way to do this but I don't see how yet.

FROM: jduray DATE: 05/24/2000 14:20:28

If a list folder is adequate you can do it by creating a filter folder for each route and then copying the bridges in each of the filter folders to the list folder. Then delete the filter folder. I suspect you really want a filter folder that has multiple route criteria. If that is what you want let me know and I will add it to the list of enhancements for the TF to review and schedule.

FROM: tthompson DATE: 5/24/2000 3:41 PM

I really think that we need a multiple route filter (along with highway direction(s), suffix, mile posts, etc (previous enhancement request)). I wanted some of these enhancements brought up prior to the User Group meeting so TF has time to review, estimate costs and times. This way users can make better decisions on where to make changes, enhancements etc.

2707.10670	Closed	bbd import - can't save file

Description

FROM: dteal DATE: 5/24/2000 2:43 PM

I know that the DL contribution of the haunch concrete is calculated for us when using a girder system. I also know that this DL is very insignificant. I was led to believe that this DL would be included in the slab DL. But when I calculate the concrete DL I found that the haunch concrete was not included. The gap for the haunch has been accounted for in the section moment of inertia (in the BRASS output). But I think the gap contains only air like it does in BRASS. The help item "Dead Loads" states that this DL is automatically computed by the BRASS Engine. I think we have a problem here?

FROM: bgoodrich DATE: 6/9/2000 5:00 PM

There is a problem here. I have corrected the export so the haunch loads are generated. If the haunch loads are generated, they will always show up in the uniform load commands of the load groups. For a girder line, they may be combined with the slab loads and possibly others that are described with COMMENT commands. For a girder system, the slab loads are computed by BRASS internally, so the haunch loads will not be included with the slab. I will send new export code, so a patch can be released as soon as possible.

490

Complete Issue Information

Integrity constraint violation: column 'dirsuffix' in table 'pontis_bridge' cannot be NULL

Both databases have been migrated from Version 2.1.

I believe that patch one was applied to BOTH databases.

I don't even see from the GUI, that there is a place to edit/manipulate the dirsuffix.

I have previously reported failure in importing bbd from a 3.0 sample db to a 3.0 (migrated from 2.1 db).
Not sure if this is related or not.

FROM: tthompson DATE: 5/25/2000 11:06 AM

I double checked and the patch1.sql was applied to BOTH the local database and the server database.

FROM: jduray DATE: 05/26/2000 13:32:11

Please attach the bbd file. Name it vi2707.bbd

Fix for 3.0 patch 3.

FROM: tthompson DATE: 5/30/2000 7:36 AM

Done as requested.

FROM: tthompson DATE: 9/14/2000 4:55 PM

Any update on this request. I still can't get this to work.

I get this error when I try to import a bbd from a copy of our database.

Unable to save Bridge data!

04:57:25 PM - Line 745 in source file D:\Virtis\GUI\ABGBRDG\UiBWSDoc.cpp.

Error updating database record set.

Description

FROM: tthompson DATE: 5/25/2000 1:36 PM

(1)

I would like to see the following reports have the following data printed with each report:

Bridge ID
Bridge Alt
Structure
Structure Alt
Structure Definition
Member
Member Alt

We are currently trying to import our structures from BARS into VIRTIS and at the completion of importing, we are analyzing and printing the results. Unfortunately, the following reports do not contain any information about which structure it deals with:

Rating Results Summary Report
Dead Load Actions Report
Live Load Actions Report
LFD Critical Loads Report (Probably is a LRFD report also)
Any of the graphs

Some of the other reports contain at least the structure number/bridge id in a BRASS comment card, so there is a little help as to which part of the structure and which structure the output is for. Currently, one frequently ends up with printouts that one is not sure for which structure or which member for a structure is which. One is pretty much forced to print one report, pick up that report, hand label it, and then repeat the process.

(2)

I would like to see a more detailed summary report for a BRIDGE.

We currently have a VERY detailed report from BRASS that is very complete.

We currently have a very BRIEF Rating Results Summary report for a given member alternative.

BUT we don't have a Rating Results Summary Report for the BRIDGE. I would like to propose a report

4/19/2016 3:14:15 PM

HRS AASHTO

495

Complete Issue Information

similar to the Rating Results Summary report for a member alternative, but expand it to include all Members that are Current and existing for the bridge. Currently, one has to look at each member alternative rating results and then manually select the ratings that control for a given structure. There may or may not be some additional items to include on this report when compared to the Rating Results Summary report.

(3)

I would like to propose to the Task Force that a Reports/Output TAG be formed to address the topics of on-screen reports, printed reports and the like. We can have the greatest GUI, greatest DB, greatest engine, but if a user can't easily extract out the necessary data - it's useless and not very productive. Also, the reports that one needs when doing a design is much different than the user rating/analyzing a bridge for NBI purposes or for load posting purposes and is much different than the user analyzing an overweight load over a stretch(es) of highways for one given load over many structures.

FROM: tthompson DATE: 5/25/2000 1:52 PM

FROM: jduray DATE: 05/26/2000 12:20:17

We are working on a reporting tool that should address these needs.

FROM: tthompson DATE: Tuesday, December 11, 2007 5:10:32 PM

Task Force needs to address Reports at the Strategic Level, including creation of a Reports TAG. Maybe use Crystal to take the xml data to create reports.....

2713.10664	Closed	Added a span to Example 7 and could not save

Description

FROM: tthompson DATE: 5/25/2000 2:34 PM

What impacts are there if one deletes a user? (If any)

Example: If he/she has a rating event (results) saved, can the user be deleted but the rating event results stays? I'm just not sure of the relationships of the abw_person table with the other tables.

FROM:jduray DATE:05/26/2000 09:02:57

Deleting a user causes all of the events for that user to lose the information about the user. All of the results remain in the database but they are no longer associated with a user.

More detail...

We delete the user from abw_person. That causes the entered_by column in abw_event to be set to NULL. Prior to the delete is contained the person_id. Because the person_id no longer exists in the abw_person table entered_by must be set to NULL.

Perhaps we should do this a little differently. We should add a column to abw_person to track active users (for security) and when a user is deleted change the flag to inactive if he/she has ownership of any objects (like events). He/she would be removed from abw_person if no ownership. We would have to add an indicator to the Configuration Browser and to the Person window so you can tell if the person is active, or inactive with ownership of objects.

An alternative approach is to add another table of active users. I like this better. The table would be as follows:

user_id short (PK)
person_id short (FK to abw_person::person_id)

With this approach the abw_person table remains a generic table of persons. The use of the persons is moved to the abw_active_users table.

Complete Issue Information

Description

FROM:jduray DATE:05/26/2000 13:05:55

This was from Manitoba from Travis Herntier (EDS Canada):

FROM:wsmyers DATE:05/26/2000 13:10:07

User:

Travis Herntier

EDS Canada

2200 One Lombard Place

Winnipeg, Manitoba R3B0X7

(204) 926-2615

Travis.Herntier@eds.com

Note: EDS Canada provides full time computer support for the Manitoba Department of Highways.

Problem:

Travis was installing Virtis 3.0 on a PC. When he tried to run Virtis, the Virtis Splash Screen displays and then he received an error message similar to: "Security Key Not Found".

Additional Information:

1. Installed Virtis 3.0, basic installation, no database, restarted the computer after installation.
2. PC is an IBM model 627559U 300 GL running NT 4.0 w/SP3 (Note: Virtis readme says SP4 is required). The LPT1 port is enabled in the BIOS as EPP (bi-directional communication). The PC has 64 MB of RAM and a 6 GB hard drive. The C: drive is a 2 GB NTFS partition that contains the operating system and Virtis. NT is configured to use a 164 MB swap file.
3. There is no other software installed on the PC. The PC was recently formatted and the NT image reinstalled.

Troubleshooting Steps:

1. Reviewed records which shows the Virtis hardware lock should not expire until 9/30/2000.
2. Interviewed the user to obtain detailed information about the type and configuration of the computer.
3. The event log was cleared, the PC was rebooted and there were no errors or warnings in the System or Application event logs.
4. The virus protections software was turned off.
5. Task Manager was used to determine the Physical Memory is 64 MB with only 22 MB in use. Also, Commit Change Limit is 222 MB with a peak of only 50 MB.
6. The NET USE command was executed at a command prompt which verified that none of the LPT ports were mapped to network printers.
7. Tried installing Virtis on another PC and got the same error message.
8. Tried connecting a ZIP drive to the LPT port and it worked.
9. Installed an older version of Virtis and also received the same error message.

4/19/2016 3:14:17 PM

HRS AASHTO

501

Complete Issue Information

- 10. Ran the HardwareKeyView.exe program from the Virtis installation directory and it displays UNKNOWN for all the license information, even after clicking on the Read button.
- 11. Looked in CONTROL PANEL / DEVICES and the device SENTINEL which is required to communicate with the hardware lock was started.
- 12. Mailed a new hardware lock and it worked.

Future Considerations:

Future versions of Virtis would benefit by including two utility programs on the CD.

- 1. The first program would be the HardwareKeyView.exe program for users to verify they can communicate with the hardware lock.
- 2. The second program would be a HardwareKeySet.exe program that would permit the user to program the hardware lock when the user payed for an additional year of support and the lock had expired. When this situation occurred the user would call for technical support, after checking the records, a fax would be sent with a long string of encoded characters on it and instructions for the user to run the HardwareKeySet.exe program and enter the encoded characters. The program would decode the characters and store the proper information into the lock. Then the user would run the first program to verify the lock was configured properly.
- 3. Future troubleshooting should include steps 1-6,11,10,8 in that order.

2721.10656	Resolved	BARS import error - RC equivalent I section

Description

FROM:jduray DATE:05/30/2000 13:32:04
David reported the following via e-mail:

A bridge user was having problems saving a bridge, and he tried exporting the bridge and importing it into one of our other databases. The error he received is in the note below this note.

I tried to import the file he sent me into two of our other Virtis 3.0 databases.

I could not get the bridge to be saved on either database.

I exported another bridge from the database to a .bbd file. I could not get this bridge to be saved either.

For both bridges, I received the same message, and it is different than the one the user received. Here is the error it gave me:

Unable to save Bridge data!

07:18:17 AM - Line 745 in source file D:\Virtis\GUI\ABGBRDG\UiBWSDoc.cpp.

Unable to generate database primary key.

07:18:17 AM - Line 491 in source file E:\virtis\Dev\data management\ABMSYS\DmEvent2.cpp.

SQLBindCol failed.

Unable to generate a new primary key ID.

07:18:17 AM - Line 811 in source file E:\virtis\Dev\data management\abmgnr\DmObject.cpp.

-----end of e-mail-----

He later reported the following via e-mail:

Jim, I tried importing and saving two structures again this morning and got an

Complete Issue Information

error again. The error message is shown below. This message is different than the one shown at the bottom of this note, so I thought that I would send you a copy of this message for your benefit in trying to debug this part of the program.

I have played around with these two import structures some more, and I have finally been able to get them to save. To get them to save, I changed both the bridge ID and the NBI structure ID. When you initially import a bridge, it comes in at the bridge description window. You can hit okay there and it will go to the bridge workspace. If you then try to save, you get the error shown below. I then went in and modified the NBI structure ID and tried to apply it and it prompted me that the Bridge ID was not unique. If I then changed the Bridge ID and hit okay, it would go to the bridge workspace. I could then save the file. The problem seems to be that the program will not check to make sure that the Bridge ID and the NBI structure ID are unique when you first import a bridge. If you don't change anything, you can just hit okay and go to the workspace. If you change one of the above mentioned ID's, then it forces you to make them unique. What probably needs to be done is make sure that this check is done when you initially import a bridge and have the system force you to change these two ID's before it will allow you to go to the bridge workspace. I hope this helps in debugging this problem.

As a side note, the two structures that I I have been getting errors on are the same two structures that I have been unable to delete from our production database. (See incident #2698) I updated incident #2698 this morning and attached the bbd file for both structures.

Unable to save Bridge data!
10:53:52 AM - Line 745 in source file D:\Virtis\GUI\ABGBRDG\UiBWSDoc.cpp.

Error updating database record set.
10:53:42 AM - Line 573 in source file E:\virtis\Dev\data management\abmbrdg\DmBridge.cpp.

2725.10652	Resolved	Adding new spans - deck panel length not reset

Description

FROM:kkennelly DATE:05/31/2000 13:37:54

I have a girder system struct def, add spans in struct def window. PS member alts - Assign beam to span in beam details window, open Strand Layout window and the strand configuration type is not set. All of the controls for both strand config types are displayed in the window on top of each other until you select a radio button for strand config type.

FROM:jduray DATE:05/31/2000 15:24:38

Joe - this may have already been fixed. Please check.

FROM:jihnat DATE:05/31/2000 16:07:35

Patch 2 doesn't fix this problem.

FROM:jduray DATE:10/03/2000 16:59:46

Is this a problem in the adding of spans?

FROM:mordoobadi DATE:10/05/2000 16:42:15

It is fixed in version 4.0. I'll investigate whether it works in 3.0 patch 4.

FROM:mordoobadi DATE:10/05/2000 17:12:02

This bug is fixed in patch 4.

When we create a new structure definition, the gui sets the length of the deckpanelrangeset equal to the length of the struc def ref line (only when we create a new struct def). If you add or delete a span, the deckpanelrangeset length does not get reset. Validate will tell you the deck panel ranges not over entire length or not on struc def but user has no way to change the deck panel range length.

FROM:mordoobadi DATE:10/09/2000 10:45:35

Fixed for 4.0 Alpha build 3.

FROM:mordoobadi DATE:10/09/2000 11:20:37

The status is Resolved. It has not been fixed for 3.0 yet.

Jim, do you want to include this in a patch for 3.0?

2727.10650	Duplicate	Validation gives warning/error message - but can't update/correct in GUI

Description

FROM: tthompson DATE: 6/1/2000 7:37 AM

I noticed that when I analyzed a structure (LFD) from the Bridge Explorer, that it gives results that I did not ask for.

I selected 1 structure from the Explorer and selected RATE. By default I have the following: LFD , Inventory - HS20 vehicle, Operating - HS20, SD Type 3, SD Type 3S2, SD Type 3-2. After the analysis completed, I selected View Rating Results. And for the following windows Bridge Rating Result, Structure Rating Result, and Member Rating Result it gave me the 5 results I was asking for PLUS it gave me the inventory rating results for the 3 SD Type trucks. This appears to be similar to Incident 103. There it was doing this when one analyzed a bridge from the bridge workspace. It turned out to be a problem where BRASS appears to analyze each vehicle for all load levels, regardless of which vehicles were chosen and whether it was inventory/operating levels. Can we make this fix also.

Side Note: Is this why the analysis seems slow? That BRASS is doing more work than is really necessary.

FROM: tthompson DATE: 6/1/2000 7:45 AM

FROM: jduray DATE: 06/01/2000 08:58:44

Brian - please investigate and let me know what can be done.

FROM: tthompson DATE: 6/1/2000 8:43 AM

Brian - I noticed that when I reviewed the analysis results from the Bridge Workspace, that for LFD Critical Loads, I am getting many trucks and their results showing up under Inventory Load level, even though those trucks were not selected for Inventory Level (same happens at Operating Level). We may want to review all the reports and/or graphs for this. If one asks for a given truck at only one level (inv or op) and one should not expect it to show up in other levels. I know about the limitations of BRASS, but VIRTIS should be reporting the results that were asked for.

FROM: bgoodrich DATE: 6/8/2000 1:10 PM

BRASS has no way to assign a particular truck to an inventory or operating rating. BRASS performs an analysis for each truck only once. It then combines the loads as necessary for both the inventory and operating ratings. Finally, BRASS passes both the inventory and operating results for each truck to the results object. It appears that when the bridge is rated from the Bridge Workspace, the GUI filters the rating results, however, when run from the Bridge Explorer, the GUI does not. I really don't know why there is any difference.

4/19/2016 3:14:18 PM

HRS AASHTO

511

Complete Issue Information

We need to correct this problem, so the user only sees the inventory rating results for the trucks assigned to inventory ratings and similar results for the operating rating. We could correct this problem in the GUI as was done for the Bridge Workspace. Alternatively, we could modify the dualinterface.f90 file with functions that determine if a truck is applied to a certain rating type (inventory, operating, both). This result could be utilized when writing data to the results object.

Note that the analysis may be slow due to the variable axle spacing of the HS20 truck.

FROM:jduray DATE:08/18/2000 15:07:19

We will investigate this a part of the management of analysis results enhancements.

FROM:jduray DATE:3/16/2005 11:27:30 AM

This is not a bug. Change to enhancement.

2729.10648	Suspended	Brass Question - RC Slabs with Tension and Compression reinforcement

Description

FROM: tthompson DATE: 6/1/2000 9:22 AM

I have a RC Slab bridge that was originally imported from BARS into VIRTIS.

It is a parabolic varying slab.

For Section G0101, the h = 16.12 inches, +As = 2.40 inches and is 14.23 inches from top of slab, -As = 2.68 inches and is 3.32 inches from top of slab.

For Section G0102, the h = 21.36 inches, the area of steel and location is the same as section G0101.

The cross section ranges are:

Section G0101 for a distance

Section G0101 varying parabolically to Section G0102

Section G0102 across the bent/pier

Then varying parabolically from G0102 to G0101 at midspan and the rest of the bridge is symmetrical.

I reviewed the analysis of this structure, and found at Span Point 2.50:

REINFORCED CONCRETE SECTION - STRENGTH DESIGN/RATING

ANALYSIS POINT 205.00

SECTION DIMENSIONS (in)

SECTION DEPTH : 16.12

WEB THICKNESS : 12.00

TOP FLANGE THICKNESS : 0.00 TOP FLANGE WIDTH : 0.00

BOTTOM FLANGE THICKNESS: 0.00 BOTTOM FLANGE WIDTH: 0.00

REINFORCING DETAILS

BOTTOM STEEL: AREA1 = 2.400 (in²) DIST FROM BOT. D1 = 7.130 (in)

AREA2 = 0.000 D2 = 0.000

AREA3 = 0.000 D3 = 0.000

TOP STEEL : AREA4 = 0.000 DIST FROM TOP D4 = 0.000

AREA5 = 2.680 D5 = 3.320

4/19/2016 3:14:19 PM

HRS AASHTO

514

Complete Issue Information

AREA STIRRUPS, A_v = 0.000 (in²)
STIRRUP SPACING = 0.000 (in)

MATERIAL STRENGTH

REINFORCEMENT YIELD, f_y : 40.00 (ksi)
CONCRETE, f_c (top) : 4.000 (ksi)
CONCRETE, f_c (bot) : 4.000 (ksi)
CONCRETE, f_c (shear) : 4.000 (ksi)

The value of D1 in the BRASS output states $d = 7.13$. The correct value should be 16.12 inches - 14.23 inches = 1.89 inches. This incorrect d is causing incorrect analysis results. I'll attach the 51065080.bbd and mbr_alt_1.out files. Maybe I'm just missing something in the VIRTIS input. I also even attempted revising the data for G0101 so that the bottom steel distance was referenced from the bottom of the slab, but I still got the $d = 7.13$ value and not the 1.89 inch value.

FROM: tthompson DATE: 6/1/2000 9:33 AM

FROM: tthompson DATE: 6/7/2000 4:19 PM

Brian, I've come across another structure with same/similar deal.

I attached another file: 21424228.bbd

At Span Point 2.5 the bottom steel was located 12.94 inches from the top with a total section depth of 14.75. So the distance from the bottom of the slab should have been 1.81 inches. BUT the brass output shows it being 7.06 inches from the bottom. Thus giving a very low rating. Must be some bug in the export routine into BRASS?

FROM: bgoodrich DATE: 6/8/2000 3:54 PM

For cross section G0102, there is an entry on the Reinforcement tab of 2.40 #9 bars at 14.23" from the top of slab. This places the rebar for this cross section at 7.13" measured from the bottom of slab. BRASS interpolates section dimensions if they vary along the length, however, rebar is not allowed to vary. BRASS uses the rebar information from the start of a cross section range, which is why the 7.13" is reported. Because the bottom of the section varies parabolically, the bottom rebar location should also vary parabolically. Therefore, I think the BARS data file or possibly the BARS import may be at fault. Please check.

FROM: tthompson DATE: 6/9/2000 7:38 AM

The rebar for structure 51065080 does not vary with the parabola. It is a constant 14.23 inches from the top of the slab.

Incidentally the second structure that I reported with this problem 21424228, does not vary parabolically. Both of these structures are our 'typical' reinforced concrete slab bridges. We have probably 600 +/- on our state highway system.

I'm not sure what to think, other than I've entered the data on the GUI (originally from BARS import) and the data described in the GUI is as the bridge actually is.

At section G0102, the rebar is referenced from the top of the slab as 14.23 inches from the top and even though the concrete section varies from G0102 to G0101, the rebar at G0101 is 14.23 inches from the top of the slab. SO I guess I don't understand how BRASS sees it as 7.13 inches from the top.

FROM: bgoodrich DATE: 6/9/2000 11:46 AM

There was a bug in the export when generating cross sections. Two cross sections may be defined identically except for the web depth. If the web depths are different and the top and bottom rebar locations are referenced from the top of the section, the sections are different. Because the export was comparing the section dimensions excluding web depth and the rebar area, distance, and distance reference (top or bottom), it thought some sections were the same even though they were not.

Therefore, I adjusted the rebar locations to reference the bottom of the section before comparing them

4/19/2016 3:14:19 PM

HRS AASHTO

515

Complete Issue Information

to ensure that the correct cross sections are exported. This fixes only the problem with the structure with horizontal cross section ranges.

There is still a problem with defining rebar in the bottom of the section that does not follow the linear or parabolic haunch. This is a limitation of BRASS and I see no way to address it with the export. BRASS uses the rebar area and distance from the cross section at the start of a cross section range. BRASS will need to be enhanced to address this issue. BridgeTech will discuss this issue with WYDOT and possibly get permission to correct the problem.

FROM: bgoodrich DATE: 6/9/2000 5:07 PM

E-mail from Todd:

The one structure does vary parabolically but the other one does not vary parabolically. The bottom resteel is horizontal with the top of the slab and does not vary with the bottom of the slab. This is the way it was input in BARS and this is how it appears in VIRTIS after being imported from BARS.

FROM: bgoodrich DATE: 6/9/2000 5:11 PM

Another e-mail from Todd:

I think I need to clarify/correct a statement I made earlier.

The Parabolic bridge was designed and built with the bottom mat of resteel that followed the bottom of the slab. Only for the BARS analysis was it input as being parallel with the top of the slab.

So, I think if I modify the location of the bottom mat and reference it from the bottom of the slab, that should fix my problems with about 200 parabolic changing bridges.

I did try that and it appears to work. I just have to go in and reference all the bottom steel from the bottom instead of the top for 200 +/- bridges. Too bad the BARS import didn't place them reference top for top mat and bottom for bottom mat. I might not have had this problem.

But I'm not sure how to handle the other structure(s), what we call the SQUARE HAUNCHED slab bridges. Those structures have a drop down (square) haunch at the Piers. The structure 21424228, that I attached previously to VI, is typical of our 400 +/- bridges that we have in the state system.

FROM: bgoodrich DATE: 6/9/2000 5:13 PM

The SQUARE HAUNCHED slab bridges should be able to be analyzed correctly after making the code correction described earlier today. The parabolically haunched girders should be analyzed correctly after Todd modifies the reinforcement distances to follow the bottom of the section. I will send the export source code modifications.

Jim - I think this issue is resolved as far as the export goes. However, should the BARS import be modified to reference the bottom rebar from the bottom of the section?

Description

FROM: tthompson DATE: 6/1/2000 2:51 PM

Is there a way to neglect the effect of Compression Reinforcement if it's been entered on the section - Reinforcement tab. We would like to have the ability to neglect the compression steel. We would like to have the option to use only AASHTO Section 8.16.3.2 and neglect the compression reinforcement. This would be especially true for our R/C slab bridges for the slab steel over the Piers. We typically only butt the positive (bottom) steel at the Piers.

During early Beta versions of 3.0, it only used tension steel, but later versions of Beta 3 started using AASHTO Section 8.16.3.4. I couldn't locate in any of the BRASS help any "switches" for using tension only or tension and compression.

Thanks

FROM: jduray DATE: 06/02/2000 10:14:01

Brian - is there any way to do what Todd is asking for in our current version?

4/19/2016 3:14:19 PM

HRS AASHTO

517

Complete Issue Information

FROM: bgoodrich DATE: 6/8/2000 3:56 PM

No. BRASS-LFD now uses the BRASS-LRFD flexural resistance functions. We would have to add an option to BRASS (and engine properties) to ignore the compression rebar. Let me know if I need to request this as a BRASS enhancement from WYDOT.

FROM: tthompson DATE: 6/9/2000 7:21 AM

If the compression steel does not have adequate lap length at these locations, one is not getting correct results as the program currently stands. Couldn't a check box be added that states "Ignore Compression Steel effect" and then have the BRASS export ignore the compression steel? This would be similiar to the check box that states to Ignore Shear. We're just not very happy with what we have. The BRASS version during the early BETA testing we were very happy with since it behaved as we designed our concrete slab bridges.

FROM: bgoodrich DATE: 8/18/2000 11:14 AM

Jim - Please review.

FROM: jduray DATE: 08/18/2000 15:04:32

This is about a 60 hour effort. Add parameter to the member alt (beam def for R/C), revise both BRASS programs to ignore comp. reinf.

Description

FROM:kkennelly DATE:06/06/2000 08:49:16

Reported by Aaron Stover for Arizona bridges. Attached bridge is a copy of a bridge. Aaron then changed the number of spans and tried to copy a member alt to different members and got the following error:

Invalid object id assigned.

08:51:05 AM - Line 476 in source file D:\Virtis\Dev\domain\abobrdg\DoMbrAltSupportDetailsSet.cpp.

I tried testing his bridge after I imported it and found the following: I can copy the member alt to another member immediately after I import the bridge. I changed the number of spans from 3 to 2 and then tried to save the bws. Virtis crashed. Reimported bridge, changed number of spans from 3 to 2 and tried to copy member alt to another member and got the same error message that Aaron got.

FROM:mordoobadi DATE:06/07/2000 13:04:56

I do not think this is related to the adding or removing of spans. Because after importing the bdb file, if I try to save the bridge virtis crashes.

I guess I need to investigate more.

FROM:kkennelly DATE:06/08/2000 13:32:13

Attached file 00426.bbd is the original bridge aaron started with. He copied 00426 to 00427. Changed the number of spans from 5 to 3 in 00427, deleted mbr alts from G2 and G3, made some changes to G1 mbr alt, tried to copy G1 mbr alt to G2 and G3 and got error message about invalid object id. attached file 00427.bbd is file he exported to me. 00427 has a mbr alt under G2 but none under G1.

FROM:kkennelly DATE:06/08/2000 13:36:06

FROM:kkennelly DATE:06/08/2000 13:54:36

FROM:mordoobadi DATE:06/09/2000 14:28:46

I think we have three problems here.

1 - Adding removing spans added member alt support details to steel member alts which caused some problems. Fixed.

2 - The BBD file contains some invalid ids for current and existing member alts. Which I do not know how it happened.

3 - Because of the corrupted data virtis crashes when BWS is saved. Fixed.

FROM:jduray DATE:08/03/2000 09:43:09

We need to trace down how the invalid ids got into the bbd file. this may be related to the problem with bbd files containing deleted objects.

FROM:mordoobadi DATE:09/11/2000 15:17:13

abobrdg.dll fixes 1 and 3.

FROM:mordoobadi DATE:10/04/2000 10:14:06

4/19/2016 3:14:19 PM

HRS AASHTO

519

Complete Issue Information

Jim, I do not know how to reproduce the corruption of the BBD file, or why it was corrupted. Please advise what you'd like me to do.

Please note that the crash and support details problem is fixed.

FROM:mordoobadi DATE:10/04/2000 10:44:14

I talked to Jim, he says if it is not reproducible, mark as resolved.

FROM:jduray DATE:10/09/2000 09:22:55

Item 2 is no longer reproducible.

Gale confirmed this is fixed for Version 3.0 SP4.

KDOT has a parapet that we use often. It can not be described using the standard GUI that is supplied. I have attached a sketch that explains our dilemma. How do we get a GUI added??

FROM: jduray DATE: 06/08/2000 10:37:02

Others have also requested different parapet configurations. This should be discussed with the TF and perhaps at the User Group meeting. I would like to add a parapet that is more generic. the most generic would be one that the user can define the number of sides or the number of vertices and then give the coordinates of the vertices relative to the lower left corner with a coordinate of (0,0). this would take a little more effort for users to define but would be able to accommodate any type of parapet.

If the above is too complex then we should poll the users to find out how many more dimensions are needed to cover most of the configurations. Maybe one with five points defining each side for a total of 10 points.

2734.10643	Resolved	Grid Control of Bridge Explorer - Check Out of Brridges

Description

FROM:kkennelly DATE:06/08/2000 13:57:43

Shear connector range not adjusted (like deck concrete profile or girder profile, etc.) when spans deleted.

FROM:mordoobadi DATE:10/09/2000 12:04:27

In the AdjustMbrAltAndBeamDef function we have a block of code that takes care of this, and it has been there for a long time.

I deleted a span and the shear connector ranges get removed properly. Can you tell me which bridge you tried?

FROM:kkennelly DATE:10/09/2000 13:47:22

Training Bridge 3 in the sample database. I changed from the 3 spans to 2 spans and it doesn't adjust the shear connector range.

FROM:mordoobadi DATE:10/12/2000 17:22:53

Resubmitted.

FROM:mordoobadi DATE:10/18/2000 11:50:09

I figured this happens when deck is composite (no shear connectors).

FROM:mordoobadi DATE:10/18/2000 15:04:54

Fixed.

Version 4 code fixed.

FROM:mordoobadi DATE:10/18/2000 15:27:26

I asked Jim, whether we need this in the next service pack for version 3, he said because the user can adjust the range in a GUI window, there is no need to include this in a version 3 service pack.

2735.10642	Resolved	Display of Live Load Distribution Factor - extra 9999999

Description

FROM: tthompson DATE: 6/8/2000 2:08 PM

More of a question.

If I use the CONTROL key and select a series of structures to check out, it does not allow one to check out bridges. One can use the SHIFT key and select a series of bridges and one is allowed to check out bridges.

The CONTROL key and selecting a series of bridges on the Bridge Explorer works to analyze structures, but it doesn't work to check out bridges. Just not sure if this is a bug or just a system shortcoming with the grid control.

If it is supposed to work, it would be great to get it fixed. Thanks.FROM: tthompson DATE: 6/8/2000 2:12 PM

FROM:jihnat DATE:11/18/2003 10:41:32 AM
Fixed (allows CONTROL key to be used) for 5.1.1

Complete Issue Information

back, it once again is displaying 1.6059999. This does not happen just to one structure either, but to most. Is this a problem with the GUI or what?

FROM:jihnat DATE:06/20/2000 14:05:33

Doesn't look like a GUI problem. The problem seems to be somewhere between the database and the little bucket. When 1.606 is entered, the window can be closed and reopened and the value remains 1.606. It's only after a Save is done that the value becomes 1.6059999. I stepped through some of the code and the GUI passes 1.606 to the Domain, but after the bridge is saved the Domain passes back 1.6059999. The value does appear as 1.606 in the database.

FROM:kkennelly DATE:10/09/2000 11:52:24

I can enter 1.606, Ok to close, Save bridge, reopen window and 1.606 appears. Only shows up as 1.6059999 when I save, close the BWS and reopen the BWS.

FROM:kkennelly DATE:10/09/2000 15:38:14

This grid doesn't have the restriction of typing in digits beyond the edit mask + 4. I can type in as many digits as I want in version 4.0.

FROM:kkennelly DATE:10/09/2000 16:02:17

Added SetGridColAttributes() to version 4.0 to fix number of digits beyond edit mask. Still have 1.6059999 problem.

FROM:kkennelly DATE:10/09/2000 16:07:01

Must be some problem with unitless data because I can reproduce this on the Member alt window, sustained modular ratio factor. Enter 1.606, close BWS and save, reopen Member Alt window, it's 1.605999

FROM:kkennelly DATE:10/10/2000 08:55:17

I've found the following pattern:

Following attributes are unitless and have a data type 10208 (real). Enter 1.606 for all and GetValue() returns 1.6059999 for all even though value in db is 1.606.

abw_super_struc_spng_mbr_alt: modular ratio, lfd dist factors, asd factors (except for timber which has data type 10203)

abw_girder_sys_struc_def: modular ratio

abw_ll_distfactor_range: dist factors

Following attributes are unitless and have a data type 10203 (double). Enter 1.606 and GetValue() returns 1.606.

abw_shear_reinf_def: vert_num_legs

abw_super_struc_spng_mbr_alt: asd factor for timber

FROM:kkennelly DATE:10/13/2000 16:19:16

I changed data type to double in Sybase Central and 1.606 gets passed back ok.

FROM:mordoobadi DATE:10/18/2000 16:39:09

There are 320 attributes in the Sybase database that have float datatypes.

The SQL command to change the datatype of a column for Sybase database is:

```
ALTER TABLE table_name MODIFY coumn_name new_data_type;
```

Jim, decided to do this change for Sybase database. for version 4.0.

----- End of Contents of BRASS Error File -----

FROM: bgoodrich DATE: 7/3/2000 12:00 AM

This is basically a problem with transferring data using ASCII files. We will try to do something on the BRASS side to correct this problem. We will probably add some checking to determine if the start distance of one range is within some tolerance of the end distance of the previous range.

FROM: jduray DATE: 08/03/2000 10:13:15

We are working on a fix for this and it will be in version 4.0.

We are adding a window where the user can enter the tolerance to be used for comparison for the different units of length. All comparisons will be made using the user defined tolerances. It will be the

4/19/2016 3:14:21 PM

HRS AASHTO

527

Complete Issue Information

users responsibility to input descriptions to consistent accuracy. For example: suppose three top flange plate lengths measuring (25-2 + 31-2 + 25-2) are entered by the user as 25.1667, 31.1667 and 25.1667 for a total of 81.5001 and the span length input by the user is 81.5. Essentially the same number. If the comparison tolerance is smaller than .0001 the two are considered to be different. If the user defines the tolerance for comparison of feet units to be greater than or equal to 0.0001 the two numbers will be considered to be the same. This new feature will resolve this problem by allowing the user to decide the tolerance for each length unit. It will be set in the database for all users. We will deliver the db with tolerances we feel are appropriate values.

It will be the responsibility of the export to resolve these differences appropriately for the analysis engine. One approach might be to always force the last length in a series of n ranges or lengths to be the distance the engine uses for comparison minus the sum of n-1 lengths. Using the above example, for a tolerance of .0001 or larger the two numbers are the same and the GUI would have accepted this input. The export must also recognize these as the same and for the length of the last plate pass $81.5 - 25.1667 - 31.1667 = 25.1666$ not 25.1667 as input by the user (unless the engine can be told what tolerance to use for comparison).

FROM: bgoodrich DATE: 10/16/2000 11:01 AM

I implemented the tolerance modifications in the BRASS export to address this issue. I imported the BBD file into version 3.0, migrated the DB to version 4.0 alpha 1, exported the bridge to a 4.0 alpha 1 BBD file, imported the BBD file into 4.0 alpha 2, and analyzed the bridge. I received no errors from BRASS this time. Now, the last cross section range exported to BRASS equals the span length. Fixed for Version 4.0.

2738.10639	Suspended	Find in the Spec Checker

Description

FROM: dteal DATE: 6/15/2000 3:22 PM

During the IBC a designer from New Jersey asked this question.

Does Opis use "AASHTO 3.6.1.3.2 Loading for Optional Live Load Deflection Evaluation" or not. If yes – how do you turn it on or off? New Jersey uses this option.

FROM: dteal DATE: 6/21/2000 12:09 PM

Kansas Also uses this option.

FROM: bgoodrich DATE: 6/22/2000 2:41 PM

BRASS does not currently perform this computation. BRASS provides the live load deflections (reported for each live load separately), so there is enough information to do this check by hand. If you feel BRASS needs to perform this computation, please make a request.

FROM: dteal DATE: 6/23/2000 10:22 AM

Kansas feels that this computation should be done. How do we make a request?

FROM:jduray DATE:11/08/2000 12:11:33

You just did...

Brian - please check with Jay about this and if necessary forward to Wyoming as an enhancement request.

FROM: bgoodrich DATE: 11/20/2000 7:06 AM

I have forwarded this issue to Jay.

FROM: bgoodrich DATE: 11/28/2000 6:30 AM

WYDOT has approved this enhancement. It is currently scheduled for the Spring release of BRASS.

FROM:bgoodrich DATE:07/10/2001 14:24:03

I have implemented live load deflection checks in BRASS-GIRDER(LRFD) for release with Version 4.1. Some export modifications are still required.

Jim - Have any methods been implemented/planned in Opis to control if this deflection check (or any limit state for that matter) is performed or not? Currently, concrete shear seems to be the only limit

4/19/2016 3:14:21 PM

HRS AASHTO

529

Complete Issue Information

state we can control from Opis. Incidents 2513 and 3162 request the ability to control bearing. There are bound to be others more engineers begin using Virtis/Opis.

FROM:jduray DATE:7/11/01 10:35:03 AM
No

FROM:bgoodrich DATE:08/01/2001 10:50:27
I modified the export (BrassLrfdLoadControl.cpp) to generate the new LOAD-LIVE-DEFLECTION commands when a design type truck is detected. The two combinations that are exported are the truck alone (1.0*Truck) and 25% of the truck plus the lane (0.25*Truck+1.0*Lane). The second combination is only exported if a corresponding lane exists. The results can be seen in the specification check window.

FROM:dteal DATE:Monday, March 04, 2002 8:55:20 AM
This is an optional control - how do we turn it on or off?
The way the code reads for 3.6.1.3.2 is "If the owner invokes the optional live load deflection criteria". I can't find a way to turn it off and on?

FROM:dteal DATE:Monday, March 04, 2002 9:02:17 AM
I think this is related to #3623

FROM:bgoodrich DATE:Friday, June 28, 2002 12:46:05 AM
The specification check filter could be set to ignore the specification check, however, the design ratio could still show up as a fail.

FROM:dteal DATE:Thursday, January 16, 2003 10:32:25 AM
As it stands right now, BRASS can handle this as OPTIONAL but the GUI can not. So we need to have the GUI give us this option.

FROM:dteal DATE:Wednesday, November 07, 2007 10:32:10 AM
This is incorrectly called a BRASS enhancement
Please see VI#7141 for clarification

FROM:dteal DATE:Wednesday, November 07, 2007 10:37:51 AM
7141, 5008, 4979 & 2737 are all related to LL Deflection problems

FROM: Herman Lee DATE: 7/12/2012 2:35:34 PM Eastern Daylight Time
Changed Category from Enhance BRASS to Enhancement.

FROM: dteal DATE: 6/15/2000 3:24 PM

While in the Analysis Results window, I would highlight some text to copy.

1. The "Copy" tool bar button never becomes active
2. In the edit pull down menu, copy is sometimes available and sometimes not. Very reproducible.

FROM: kkennelly DATE: 1/22/2002 3:41:49 PM

I tested this in version 4.1.0 and I can't really reproduce it. I think the grid is very touchy when you try to select a row or text to copy. If you select a row with the mouse hovering directly over a number in the grid, that cell becomes the active cell and then the copy button isn't available. But if you select a row with the mouse not directly over a number in the grid, the entire row is selected and copy is available and works. I think this is resolved.

Description

FROM: dteal DATE: 6/16/2000 11:15 AM

Attached structure – reference Exterior girder for Structure Definition “5 Spans 5-wwGC”
Opis doesn’t check to see which DF controls, single or multi lane, in an exterior girder. If the roadway width is adequate for multi lane, then it uses multilane. I know I can always override this – but shouldn’t this be an item Opis (BRASS) checks and applies properly. In the attached bridge – the DF used for the exterior girder was for multi lane. It should have been the single lane DF.

FROM:jduray DATE:06/23/2000 08:53:29

Krishna - please investigate.

FROM:kkennelly DATE:06/28/2000 10:19:08

This is a BRASS LRFD change request issue. When LRFD distribution factors are not entered into Virtis, they are calculated by BRASS LRFD. Since you haven't overridden the number of lanes loaded, the export tells BRASS to figure out single or multi based on structure definition. I think BRASS would need changed internally to use the controlling df instead of number of lanes. The export doesn't know the df's since they are calculated by BRASS so it can't be responsible to tell BRASS to use single instead of multi.

I did notice when I was testing that if the user inputs single and multi lane LRFD distribution factors, the export will check if the structure definition has single or multi lanes and then export only the single or only the multi as appropriate. So when you look at the LRFD output file, you will see the same value for single and multi lanes. That seems a bit confusing to the user.

FROM: dteal DATE: 6/29/2000 10:26 AM

See also #2754

FROM: bgoodrich DATE: 7/5/2000 1:25 PM

BRASS-GIRDER(LRFD) already contains a flag to indicate if the critical distribution factor is to be used for the live loads. However, Opis does not support it. The export gets the number of lanes loaded specified by the user (girder line) or computed based on the deck travelway widths (girder system). The export only outputs those distribution factors that correspond to the number of lanes loaded. At one point, I had the export generate both the single and multiple lane loaded distribution factors, but we changed it so the user did not have to input distribution factors that did not control. Also, distribution factors are optional for girder systems.

Here are my suggestions to address this issue:

1. The number of lanes loaded will no longer be used to determine which distribution factors are exported or used by BRASS. Would there ever be a case when you would not want to analyze for the critical distribution factors?
2. BRASS-GIRDER(ASD/LFD) does NOT support both single and multiple lanes loaded distribution factors, so the export must determine the critical.
3. BRASS-GIRDER(LRFD) does support both single and multiple lanes loaded distribution

4/19/2016 3:14:22 PM

HRS AASHTO

534

Complete Issue Information

factors, so BRASS can internally determine the critical. BRASS-GIRDER(LRFD) requires both because the Fatigue truck always uses the single lane loaded factors. This fatigue check is not being performed now, so this is a flaw in the 3.0 export. This change may affect existing structures that do not have both single and multiple lanes loaded distribution factors specified. However, this would eliminate the confusion that may occur when the export populates the single and multiple lane distribution factor parameters on the BRASS command with only the multiple lane loaded factors.

Jim - Let me know how to proceed.

FROM:jduray DATE:08/18/2000 14:47:12
Krisha - let's discuss this.

FROM:jduray DATE:5/17/01 11:13:50 AM
Brian - If I understand what you say above it seems like you need to change the export to have BRASS LRFD use the critical factor unless the user has specified distributions factor within Opis. If the user inputs df then the export should determine the critical and send to BRASS.

If we do this then how are the travelways used (or aren't they)?

FROM:bgoodrich DATE:05/17/2001 13:29:41
The travelways will still be needed if the lever rule distribution factors are necessary or if dead loads are to be distributed to the girders.

I can modify the export to generate the TRUCK-CODE command with the critical-lanes loaded option specified. For fatigue type vehicles and vehicles that are manually set to one-lane loaded in the Vehicle Properties, the one-lane loaded code can be exported. Currently (in version 4.0), if the bridge is only wide enough to support one lane, the one-lane loaded distribution factors will be exported and the multi-lane loaded DFs will be neglected.

FROM:bgoodrich DATE:05/18/2001 14:35:14
Per Jim's instructions, I modified the export to generate the TRUCK-CODE command with the critical-lanes loaded option specified for most vehicles. For fatigue type vehicles and vehicles that are manually set to one-lane loaded in the Vehicle Properties, the one-lane loaded code is exported for that vehicle. If the bridge is only wide enough to support one lane (as obtained from the domain), the export will continue to populate the one-lane and multi-lane loaded distribution factors parameters with the one-lane loaded DFs, i.e., the multi-lane loaded DFs will be neglected. If more than one lane can be supported, then one- and multi-lane loaded DFs will populate the command parameters (if specified by the user). The engine will continue to compute the appropriate DFs when they are not specified in Opis.

FROM:jduray DATE:6/4/01 8:59:04 AM
Dean accepted resolution of this incident.

Under the Structure Framing Plan Details; Diaphragms help section, after the first paragraph, the link for Engine Related Help gives an error message for our users.

FROM:kkennelly DATE:06/21/2000 08:55:30

Complete Issue Information

I'm not able to reproduce this. Do you get this message for the Engine Related Help link in every topic or just the Diaphragms help? If the engine help is not configured properly, you get a message about the enginehelp.hlp not being found for every Engine Related Help link. If that is the message you are getting, go to the Help menu, Engine Help Configuration and select either BRASS LFD or BRASS LRFD. This will set the help file to be opened when you select the Engine Related Help link. If this does not solve your problem, please list the exact error message you are getting.

FROM: tthompson DATE: 6/22/2000 9:36 AM
User had not selected which engine help.

Description

FROM: tthompson DATE: 6/19/2000 1:39 PM

I have a user creating a new LRFD structure. When he attempts to create a new load case description he keeps getting an error message.

Error message is Setting Load Case Name to None will cause the grid to be cleared. Proceed? Yes No (I attached word document with snap shot of error message).

I watched him create a load case description and he had all the columns filled in. He had to hit Yes numerous before it gave control back to the Load Case Description.

FROM:kkennelly DATE:06/21/2000 08:43:27

The window that you are seeing this message occur in is the Member Loads - Settlement tab. You do not create new load case descriptions in this window. You select a load case from the list of load cases previously entered in the Load Case Description window. The settlement values you enter in this grid are applied to the load case you select in this window. If you select None as the load case, that means you don't have any settlement values to apply so the values in the grid are wiped out. If you want to create a new load case, use the Load Case Description window. Then the new load case you created will appear in the list box on the Member Loads - Settlement tab. The help for this tab also explains this window.

FROM: tthompson DATE: 6/22/2000 9:22 AM

No, I watched him create (attempt to create) the load case in the Load Case Description window. He has never gone to the member loads - settlement tab. I'm not sure where you would have gotten that it comes from Settlement - I never mentioned it and the error message doesn't say it. He definitely gets this error message from the Load Description window. If this error message goes with another window, I'm not sure how he's getting that error message to be generated then.

FROM:kkennelly DATE:06/22/2000 14:34:50

I searched the entire gui for that error message and the only place it is used is in the Member Loads - Settlement tab so that is why I assumed you were in that window. I really don't have any idea how you could get that error message from another window. Do you get this message when you hit apply or ok in the Load Case Description window?

Are you able to reproduce this? If you can, can you tell me exactly how you produce it? And also let me know which service packs you have applied?

Description

FROM: tthompson DATE: 6/19/2000 1:58 PM

I'm not sure if this is the same or similiar to VI 2708 and 2709.

- 1) I selected various bridges on the Bridge Explorer to do an overweight analysis.
- 2) I selected the RATE button, opened a template, made necessary adjustments (ie. selected the overweight vehicle that I had defined) and selected OK.
- 3) The analysis was performed for the bridges selected
- 4) I went to view the rating results (window Bridge Rating Results)and everything is okay.
- 5) I never saved any of the results (nor is there an option to do so like there is when within a given bridge).
- 5b) I exited from virtis/opsis.
- 6) I had another overweight truck to analyze on a another group of bridges. (some of these bridges overlapped with the first batch of structures). I got back into virtisopsis.
- 7) I selected the necessary bridges
- 8) I selected the RATE button, opened a template, made necessary adjustments (ie. selected the overweight vehicle that I had defined) and selected OK.
- 9) The analysis was performed for the bridges selected
- 10) I went to view the rating results (window Bridge Rating Results) and all of the results from the first overweight analysis were still showing up along with the latest/current.

I didn't think analysis results were going to persist in the database, unless the user explicitly saved those results. Why do these results persist? It is very impractical and extremely time consuming to go to each and every bridge and delete these results.

I would propose that there be a mechanism to remove/unload these rating results from the database (or at least not save these results when rating a batch of structures).

I see that based on Incident 2708 that the solution proposed was to manually delete these results. I find this as a very poor solution. It's just too time consuming to 1) keep track of the structures that you need to go to 2) to open up each structure and delete the necessary analysis results

I see that based on Incident 2709 that the solution proposed was to create a report with the much needed and awaited report generator. While this is a reasonable solution, it want to see better control over the data/results stored in the database.

4/19/2016 3:14:23 PM

HRS AASHTO

542

Complete Issue Information

A given overweight analysis may cross only a few structures or it may cross hundreds of structures. We need a mechanism to be able to batch rate these structures and be able to get results. A program can produce the best and most correct results, but if the user can not easily get to these results and present them in a logical, clean, and user definable manner - the program is pretty much useless (or it's use will be minimal).

FROM: tthompson DATE: 6/19/2000 2:18 PM

A secondary problem is that until a user manually deletes these rating results, a user can not remove the rating vehicle from the library of trucks. We have historically average about 600 to 700 overweight analysis requests a year. Luckily we have low ADT and truck traffic. But we don't want hundreds of vehicals stored in the truck library. We will want to remove these at a fairly frequent basis (weekly), but it's going to take considerable effort to delete all these rating results to do so.

FROM: jduray DATE: 06/20/2000 15:46:40

This is very important as you are aware. I will present to the TF to approve of a solution to this.

Complete Issue Information

Description

FROM:jduray DATE:06/20/2000 15:36:02

CDmStlComponent (and perhaps all other top-level sub-type objects) do not properly initialize the sub-type objects in the ImportData function. There is a for loop that does not set pDeStlComponentImport to NULL before moving on to the next steel component. This causes an exception to be thrown when a different steel component sub-type is being imported. Also, pDeStlComponent should be set to NULL at the top of the function.

FROM:jduray DATE:06/20/2000 15:44:29

This should be fixed for version 4. After I know the extent of the changes required we should decide whether to apply to version 3.0.

FROM:jduray DATE:06/20/2000 16:44:14

CDmStructDefRefLine are also incorrect. A similar line must be added to the end of the loop. I looks to me at this point as though any time a bbd file contains deleted objects the import will fail. We need to review the ImportData function in all DM objects.

FROM:jduray DATE:06/21/2000 08:53:31

The above problems stem from the fact that there are five use cases for the import/export. Each should be handled a little differently within the code but aren't and so we end up with none of them being handled correctly. Number 1 is the primary goal and it is the closest to being handled properly.

- 1) bridge transfer between different instances of the same-version database.
- 2) auto-recovery if a BWS is lost due to unexpected termination of Virtis/Opis.
- 3) technical support - so we can investigate user problems using "exactly" their data (similar to #1 but slightly different).
- 4) saving a work-in-progress for later import if needed. (useful in a design iteration for different scenarios)
- 5) used to rollback the BWS if adding or deleting spans and/or members fails

FROM:jduray DATE:06/21/2000 09:11:06

Bridge Description Exchange (1 and 3 above)

Import/export for transfer of a bridge description from one database to another should reset the DataStatus flag to NewModified if the object is new and Modified if it can reuse a previous object. The import can be initiated from the BWS or the Bridge Explorer. The import marks all objects as deleted and then tries to reuse objects if the primary keys match objects in the bbd file.

Suggested changes for Import/Export for bridge exchange:

- 1) no changes to the export
- 2) change the import to not import Deleted objects (consider adding an option to the Import file selection dialog to allow the user to import deleted objects - for tech support primarily).
- 3) add a parameter to the ImportData function to indicate the type of import (data exchange or recovery) This flag indicates how to set the DataStatus flag and how to handle deleted objects.

Add RecoverData(LPCTSTR lpszFileName) function to CDoBridge. CDoBridge::RecoverData should call CDmBridgeCache::RecoverBridgeData and CDoBridge::ImportData should call

Complete Issue Information

CDmBridgeCache::ImportBridgeData.

I created two new functions in CDmBridgeCache named RecoverBridgeData and ReadBridgeDataFromFile. The code that was in ImportBridgeData is now in ReadBridgeDataFromFile. RecoverBridgeData and ImportBridgeData call ReadBridgeDataFromFile with a parameter indicating exchange or recovery.

Change
CBridgeWorkSpaceDoc::RevertData() and
CBridgeWorkSpaceDoc::RestoreData()
to call CDoBridge::RecoverData(LPCTSTR lpszFileName).

Bridge Description Recovery (2, 4 and 5 above)

Import/export for recovery of a bridge description should set the DataStatus flag to exactly what is in the bbd file since there could be objects marked for delete that exist in the db. Recovery files should not be used for exchange between databases. Since the export is always the same a bbd file from Export and a bak file for recovery can be interchanged.

Suggested changes for Import/Export for bridge recovery

- 1) no changes to the export
- 2) change the import to set the DataStatus flag according to the bbd file.

Tasks

Name	Current State	Summary
2756.10621	Closed	Importing Multiple Structures

Description

FROM: dteal DATE: 6/23/2000 9:29 AM

AASHTO 3.6.1.1.2 states that the Multiple Presence factors do not apply to the fatigue limit state for which one design truck is used, regardless of the number of design lanes. When calculating the live load distribution factor for one lane load, a multiple presence factor of 1.2 is used. To remove this multiple presence factor the live load scale factor should be coded as $1.0/1.2=0.8333$. This scale factor is editable in Opis under the advanced features button of the analysis settings window.

In the BRASS LRFD Technical Manual under moving loads, page 2-14, it states: "For a fatigue truck, several items must be adjusted. The % impact defaults to $15\%/33\%=45.45\%$ of the standard impact value, thereby making the fixed impact factor 0.15 (0.4545×0.33). The scale factor defaults to $1/1.2$ to remove the multiple presence factor from the distribution factors (see AASHTO 3.6.1.1.2). Finally, the number of lanes loaded defaults to one. The user may override any of these items."

BRASS seems to neglect this command and use one lane load.

It is asking a lot of the user to adjust the scale factor under the advanced settings button. The engineer (user) is going to miss this one 9 times out of ten.

FROM:kkennelly DATE:06/28/2000 08:32:28

I'm not sure of exactly what your request is. When you say "BRASS seems to neglect this command...", are you saying that the export is generating the wrong commands? I found the following when I tested this:

For the LRFD Fatigue truck with nothing set on the Advanced window, the export generates the following command:

Truck-Code 5, FAT_....., 45.455, 1.0, MULT

The 45.455 is the % impact. The export gets this from the Member Alt Impact window if nothing is entered for the impact on the Advanced window. The 1.0 scale factor is used since nothing is entered on the Advanced window and MULT is used since the Structure has more than one lane and this is not overridden on the Advanced window. If you override data on the Advanced window, the export uses that override data to generate the Truck-Code command. That all seems to work as expected. If you think the export or BRASS is using the wrong command, please let me know the details.

Are you requesting that we default the Truck-Code command for a fatigue vehicle to use 0.83 scale factor and Single instead of Multi? That does seem to make sense but that would be a change request and I'll have to talk to Jim about that. I'm not sure if we want to set the scale factor and # lanes to something other than what we get from the structure and have it hidden on the Advanced window.

4/19/2016 3:14:25 PM

HRS AASHTO

550

Complete Issue Information

FROM: dteal DATE: 6/28/2000 4:01 PM

Yes, that's exactly what I'm asking for. The user is very seldom going to catch this under the advanced window.

I don't feel this is a change request, I think it's an error. Opis isn't passing on the correct scale factor for a fatigue truck when one lane is used.

FROM:kkennelly DATE:07/11/2000 08:03:00

Opis correctly passes on what is entered on the Advanced tab for the vehicle. If you select one lane and enter a scale factor in the Advanced tab, Opis will pass that on correctly to the export.

Jim, do you want the gui to set the scale factor to 0.83 on the Advanced tab if the user selects the Single Lane Loaded? I'm not sure if this will satisfy Dean since the user still has to open the Advanced tab to set the Single Lane Loaded checkbox.

FROM:kkennelly DATE:07/11/2000 08:32:56

I think this incident is related to 2766.

FROM: dteal DATE: 11/16/2000 10:51 AM

I think you hit it just right when you restated the request.

Default the Truck-Code command for a fatigue vehicle to use 0.83 scale factor and Single instead of Multi. We wouldn't be hiding it on the Advanced tab. To my mind it is already hidden and it is our responsibility to see that it has the correct settings to start with.

FROM: dteal DATE: 6/23/2000 3:31 PM

We have around 225 structures in the state that are made up of multiple structures (jumpspans). In the past using BRASS we have labeled these structures like 021-42A and B a C, etc. When imported, they will create one file each, correct? There is no way to append a structure and add another one to it is there? If we want to create a bridge that is made up of several structures from our existing BRASS data we will have to import lets say 021-42A and then enter the data manually for B and C, correct?

FROM: dteal DATE: 6/23/2000 3:55 PM

The same questions apply to when importing 5 girder lines for the same structure. You can import the exterior girder, but I assume that you can not append the structure and import the interior girders also? All this BRASS data out there will be in girder lines.

FROM:jduray DATE:06/26/2000 10:13:55

Brian - can you answer these questions about the BRASS import?

FROM: bgoodrich DATE: 6/26/2000 9:02 AM

You are correct about the contents of one data file being assigned to one bridge (i.e., one file). There are two options to get the bridges into Virtis. Option 1 would be to import all the bridges as is, and then copy the all structure definitions for a particular bridge to a common bridge file. The materials, shapes, etc. should automatically be copied in this process. This would require quite a bit of work I think. Option 2 would be move all the structures that make up a bridge into one BRASS data file where each structure is separated by and END command. Then, each of these new data files could be imported and the Virtis bridge would contain all the structures. Then, if you needed to move things around or change any information, you only have to work with one file.

2764.10613	Not Reproducible	BRASS Import into a defined structure

Description

FROM: rmbest DATE: 6/28/2000 11:38 AM Version 3.0 - We are unable to import a bbd file into a database when that structure already exists in the database. The imported bridge comes over but when we go to save it we get an error message "Unable to save Bridge data, Error updating database record set. We foresee instances when it will be necessary to do this.

FROM: rmbest DATE: 6/28/2000 1:12 PM

FROM: rmbest DATE: 6/28/2000 1:13 PM

FROM: jduray DATE: 6/29/2000 10:15 PM

This is probably happening because you may not have duplicate bridge names, etc. Try importing and changing the names in the Bridge Description window.

FROM: rmbest DATE: 7/7/2000 8:23 AM

I tried as you suggested. Making the the name identical in both existing Bridge Description window and in the bbd file but the bbd will not save after importing.

FROM: jduray DATE: 10/09/2000 10:21:29

Richard - are you still having this problem? If not I would like to close this incident.

Tha above advice seems to be in error. You should get an error if the Bridge Id and NBI number are the same as one that is already in the db.

Description

FROM: dteal DATE: 6/28/2000 4:02 PM
In the attached structure in the output for G1 (exterior) the following command line is found:
Truck-Code 5, FAT_LRFDFA-6, 45.455, 1.00, MULT
For the fatigue truck, BRASS uses the one lane distribution factors even though MULT is shown.
BRASS seems to neglect this command and use one lane loaded.

FROM: jduray DATE: 6/29/2000 10:04 PM

FROM: bgoodrich DATE: 7/5/2000 1:32 PM
For BRASS to analyze a truck for the Fatigue limit state, the first three characters of the truck name must be "FAT". When a vehicle is placed in the Fatigue truck category in the Analysis Settings window, the export adds an "FAT" prefix to the truck name. When BRASS detects this prefix, it sets the number of lanes loaded for that truck to one lane loaded as outlined in the LRFD specification.

Complete Issue Information

Jim - Should I modify the export to set the lanes loaded indicator for a fatigue truck to one lane loaded and generate an informational message?

FROM:jduray DATE:08/18/2000 14:38:50
Sounds like a good idea since that is what BRASS is really doing.

FROM: bgoodrich DATE: 8/23/2000 3:28 PM
I modified the export to set the lanes loaded indicator for a fatigue truck to one lane loaded in the BRASS export.

2768.10609	Resolved	Possible bug in the Strand Layout window

Description

FROM: pjensen DATE: 6/29/2000 1:19 PM

I was trying to import a brass file into an existing bridge and I received an error message and the software termination. Attached is the error.

FROM: pjensen DATE: 6/29/2000 1:25 PM

FROM: bgoodrich DATE: 7/5/2000 1:36 PM

This error message is issued by the operating system and indicates there is a serious error in the import that is not detected and trapped. Please attach the data file you were trying to import, so I can duplicate the error.

FROM: bgoodrich DATE: 7/18/2000 11:07 AM

Jim - I am assigning this incident to you. We discussed this issue with Paul in Minneapolis and he said he would send you the BRASS data file. Paul also indicated that the problem might be with the Oracle database.

FROM: pjensen DATE: 7/20/2000 3:42 PM

I attached a zip file with the Oracle export (8.0.5) and the import files that will not import into that database.

FROM: mordoobadi DATE: 10/06/2000 09:48:38

Importing of the BRASS data file was successful in both Sybase and Oracle (not the Oracle database that Paul sent us) databases.

The included BBD file does not contain structure definition and below, so I think the abnormal program termination happened when Import was saving the bridge.

Paul, is this reproducible, or did it happen just once?

I'll import the Oracle dump file into my system and try to reproduce it.

FROM: mordoobadi DATE: 10/06/2000 11:48:01

Jim advised me not to import Oracle dump file at this time.

FROM: mordoobadi DATE: 2/21/2006 3:06:32 PM

Incident closed.

Name	Current State	Summary
2769.10608	Closed	Right Equation – Wrong Equation Number in BRASS

Description

FROM:mordoobadi DATE:06/30/2000 15:47:09

The user would get a few errors in the strand layout window if the rows in the strand grid window are not sorted based on the vertical distance of the row from the bottom of the beam.

We should not assume that the DoPsShapeStrandGrid->MoveFirst(), MoveNext() provides us with a sorted list. GetRowNumber() could be called to determine the row number for each strand row.

FROM:jduray DATE:Sunday, November 09, 2003 7:44:32 AM

I think the problem described above has been resolved. There is code to effectively sort the rows.

However, there MAY be another problem. I'm not sure if this is a problem. The strand layout (the actual locations of strands (abw_ps_precast_strand_layout), not the strand grid(abw_ps_shape_strand_grid))

Complete Issue Information

is stored by row_id (relative location rather than absolute location). That row_id is not a foreign key to abw_ps_shape_strand_grid. row_id is not stored in abw_ps_shape_strand_grid. So, if the user deletes a row from abw_ps_shape_strand_grid we do not modify abw_ps_precast_strand_layout until the strand layout window is opened. Then we try to match strands to locations based on a row number (row_id from abw_ps_precast_strand_layout). The row number in the grid is determined by querying a list of sorted row vertical distances.

Example 1: A beam has three rows (2, 4 and 6 inches from the bottom of the beam - b-o-b) of possible strand positions with equal number of positions in each row. In the strand layout window the user places strands in row 1 (2 inches from b-o-b). Then deletes row 1 from the grid. The strand layout window will show the strands in the row that previously was row 2 (4 inches from b-o-b). This behavior seems reasonable except the user is not aware this happened unless the strand layout window is opened.

Example 2: A beam has two rows (2 and 6 inches from the bottom of the beam - b-o-b) of possible strand positions with equal number of positions in each row. In the strand layout window the user places strands in both rows. Then adds a row at 4 inches from b-o-b. The strand layout window will show strands in the bottom two rows, 2 and 4 inches from b-o-b (effectively moving the strands that were 6 inches from b-o-b to 4 inches from b-o-b). This seems ok too if we warn the user.

FROM:jduray DATE:9/19/2005 8:50:35 AM
TF mtg Aug 31, 2005 - add a warning message.

The message should be generic and inform the user that adding or deleting rows may change strand locations and the strand layout should be reviewed for beams that use the current beam shape. Investigate the effort to determine if the shape is being used and report the name of the member and member alt that uses it.

FROM:jihnata DATE:9/21/2005 3:59:43 PM

Description

FROM: tthompson DATE: 7/5/2000 8:00 AM

I have a user trying to match a hand analysis vs. OPIS. He used the W 30 X 148 steel shape from the library. (It shows an AREA = 43.5 in² and I = 6680 in⁴)

But when he reviews the BRASS output, it shows an AREA = 43.1 in² and I = 6609 in⁴. We're not sure why BRASS is using different section properties than was selected with the member. Of course, both I and A impact the LRFD distribution factors.

Why are different section properties being used than from the library?

FROM: tthompson DATE: 7/5/2000 8:05 AM

I attached the bbd and BRASS out file.

FROM:kkennelly DATE:07/11/2000 08:34:26

The engine related help for BRASS LRFD explains that BRASS LRFD does not use the properties entered on the Properties tab but calculates the properties based on the dimensions entered on the Dimensions tab. (I don't know why it does that.)

Engine related help can be accessed by:

1. Selecting Help/Engine Help Configuration/BRASS LRFD from the menu
2. While on the Properties tab of the Steel I Shape window, select F1 to display the Virtis/Opis help.
3. Select Engine Related Help shown in red to display the BRASS LRFD engine help for this Virtis/Opis window.

Description

FROM: tthompson DATE: 7/5/2000 8:47 AM

I entered a structure with longitudinal stiffeners. I left the material blank (it is blue, so I thought it was optional) but when I attempted to analyze (LF) the structure, I kept getting error messages that material was missing for stiffener. I then added the Material for the stiffener and was able to get the analysis to work.

If material is needed, then the GUI needs to be fixed so that it doesn't show blue as being optional.

FROM: jduray DATE: 07/19/2000 13:21:18

Joe - please confirm with Brian that the material is required and then fix the window. Add it to the next patch.

FROM: jihnat DATE: 07/20/2000 13:02:33

Brian, this is reproducible. Can you confirm that the material is required (by BRASS)?

FROM: bgoodrich DATE: 7/21/2000 8:29 AM

In general, Virtis is supposed to collect complete information about a bridge. Allowing users to omit a component's material is not a wise thing to do just because an engine does not use the data. I think the longitudinal stiffener material label font should be changed from blue to black, so it is treated as a required input.

Regarding the export, the longitudinal stiffener material is not required for BRASS-LFD, however, it is required for BRASS-LRFD. Both exports use a common class to generate the longitudinal stiffener groups and schedules because the commands were identical except for the yield stress of the material. I missed checking for this condition. Should I change the export so an error is not generated if the longitudinal stiffener material is not specified for BRASS-LFD?

In the attached bridge, G1, Span 3. The rating factor computation never appears for the Bearing force for the truck train in the Spec. Checker. But the values do appear in the Steel Limit State Summary Report.

FROM: bgoodrich DATE: 7/19/2000 4:02 PM

In an effort to reduce the amount of intermediate output, I "think" BRASS internally shuts off some output when the same check has been performed and output for the first truck. I'll check into this further.

FROM: bgoodrich DATE: 8/23/2000 1:08 PM

I modified BRASS to output this additional information only when BRASS is called from Opis. This will be available in the 4.0 release of Opis.

Description

FROM: tthompson DATE: 7/18/2000 3:52 PM

I logged on as user "toddt" and checked out a structure definition (not the entire bridge, just the structure definition).

I then logged on as user "virtis" and checked out the BRIDGE. The user virtis then had complete control over the bridge and all lower levels of structures and members.

I then logged on as user "toddt" and had NO control over the structure definition that I had previously checked out.

Is this intended to work this way? Shouldn't one be able to check out a structure definition and then if somebody else tries to either check out the structure (or bridge), that they would not be able to? Seems to be a bug in how it works now.

FROM: jduray DATE: 07/19/2000 13:44:05

You should be able to do what you describe. I will investigate. Did it work correctly prior to SP 3?

FROM: gbarnhill DATE: 7/19/2000 4:48 PM

I reloaded Virtis without any Service Packs and was able to duplicate what Todd did. I authorized two designers to check out a bridge. Logged in as designer1, opened the BWS, highlighted the bridge description name and checked it out. I was able to change something and save the BWS. I could not change any items above the bridge description.

I logged out and the logged in as designer2. I highlighted the bridge and checked it out. I opened the BWS. The tree indicated that I had the bridge and the description both checked out. I was able to change something in the description and save the BWS.

I logged out and logged in as designer1. The Explorer indicated the bridge was checked out to designer2. I opened the BWS and could not change anything.

I agree with Todd that there should be a security check to see if a description is checked out before a second person can check out the entire bridge.

FROM: tthompson DATE: 7/20/2000 11:22 AM

I agree with Gale. I did not see this problem before SP 3, but then again, I did not check it either.

4/19/2016 3:14:29 PM

570

Complete Issue Information

FROM: gbarnhill DATE: 7/20/2000 1:15 PM

From the HELP for CHECKIN/CHECKOUT. Note the last sentence.

Security of bridge data in a multi-user environment is provided by a Checkin/Checkout feature that allows a user to "checkout" a bridge for modification. While a bridge is checked out, it can only be modified by the person that has checked it out. Other users may view the bridge but not modify it. This also applies for structure definitions. When a bridge is checked out, all of its structure definitions are also checked out. Individual structure definitions can be checked out. To modify objects that are owned by the bridge (such as materials, appurtenances, and factors), the bridge must be checked out. A bridge can not be checked out if other users have one or more structure definitions checked out.

FROM:jduray DATE:07/20/2000 16:12:16

In CDoBridge::GetStructDefCheckOutStatus when the bridge is checked out we need to check if the struct def is checked out to a different user than the bridge.

FROM:jduray DATE:07/20/2000 16:24:11

In CDoBridgeManager::CheckOutBridge we need to check if any struct defs are checked out to others and prohibit the bridge checkout if there are. Allow the checkout if struct defs are checked out to the user checking out the bridge.

FROM:jduray DATE:08/01/2000 13:44:43

Added code to prohibit a bridge from being checked out if struct defs are already checked out to another user.

New problem: When a bridge is checked in that contains a struct def that was previously checked out by the same user that is checking in the bridge the checkin of the bridge fails because StructDefCheckedOutDataArray does not contain any rows. Don't know why yet...

UpdateReadOnlyStatus is the where all De objects are set to read-only or read-write.

FROM:jduray DATE:08/09/2000 08:59:24

Fixed for version 4.0.

Issue in Version 3.0 Patch 4 if possible.

FROM:jduray DATE:08/29/2000 13:28:50

FROM:jduray DATE:10/09/2000 09:20:03

Gale confirmed this is fixed for Version 3.0 SP4.

FROM: tthompson DATE: 10/11/2000 11:43 AM

Yes, this all appears to be functioning. I marked A to accept the results.

2785.10593	Closed	3.0 SP3 - Bracing (and other) ranges difficult to set up

Description

FROM: bgoodrich DATE: 7/20/2000 12:35 PM

For R/C slabs, there is a bug in the Live Load Distribution window (Standard tab). For slabs, the multi-lane row is grayed so no values can be entered, and the values from the 1-lane row are supposed to be automatically copied to the multi-lane row. A problem occurs when the user enters a value on the 1-lane row and then selects the OK or Apply buttons. The 1-lane value is not copied to the multi-lane row. This problem occurred during the Minneapolis training. There is not a 3.0 Release version in VI, so I set the version to 4.0 Dev.

FROM: jihnat DATE: 07/26/2000 08:36:55

Fixed for Version 4.0.

FROM: bgoodrich DATE: 12/19/2000 11:19 AM

Tested with Version 4.0 beta 2. Accepted.

Description

FROM: gbarnhill DATE: 7/21/2000 2:45 PM
HELP !! I've fallen into my bracing ranges and can't get up.

In trying to understand how to correctly set up bracing ranges with spans of 49'2", 65'8", 49'2" (Incident 2687), I created a structure def with 40-60-40 spans and then tried different ways to model the bracing ranges. The BRASS BRACING-SCHEDULE command seems to be very sensitive. I've attached a bitmap showing 3 setups for the Virtis DIPHRAGM tab, 3 text files showing partial BRASS output for the analysis and the bbd file.

For BRACING 1, the Virtis ranges are set to exactly fill the span lengths. BRASS finds the correct

4/19/2016 3:14:30 PM

HRS AASHTO

573

Complete Issue Information

spacing left and right of each pier.

For BRACING 2, I indentionally shortchanged the ranges in each span. BRASS couldn't fine a brace 10' left of pier 1 or 12' left of pier 2.

For BRACING 3, I intentionally overran the ranges in span 1 & span 2. BRASS found a brace 8.5' left of pier 1 but put one at 12.5' rt instead of 2' right of pier 1. At pier 2, BRASS couldn't find a brace left of the pier and set one at 10' rt instead of 4.5' rt.

In the bbd file, the first struc def is the 49-2,65-8,49-2 bridge. The EVEN SPANS struc def is the 40-60-40 bridge.

FROM: bgoodrich DATE: 9/22/2000 2:46 PM
For the bracing tests 2 and 3 that you performed, there are some warnings in the export regarding diaphragms missing at the start and end of some of the spans, which will affect the BRASS analysis. The export does not assume that the supports are braced, which is why there are some gaps in the BRASS bracing schedules. BRASS assumes that bracing ranges will be specified to fill up the entire span, with no gaps.

Jim - I spoke with Dan Glandt and we cannot think of a case where the support would not be braced. Should we assume the supports are braced, so there are no bracing gaps generated by the export? If not, we may need to issue errors instead of warnings.

FROM:jduray DATE:09/22/2000 17:00:56
I don't think we should make any assumptions. The user should define the bridge.

FROM: bgoodrich DATE: 10/16/2000 11:07 AM
I spoke with Keith Fulton about a similar bracing issue where he has the ends of his girders embedded in the abutment and there are no diaphragms at those locations. The user would have to enter a bracing location at the abutments, but exclude entering any weight.

Basically, you must always enter a cross frame at each support even when there is no physical diaphragm. Any deviation will cause incorrect analysis results.

FROM: gbarnhill DATE: 12/19/2000 11:16 AM
OK as is V4.0 Beta 2. Based on clarification of input requirements for BRASS.

2788.10590	Resolved	Library factors spec. year

Description

FROM: bgoodrich DATE: 7/25/2000 5:46 PM

Jay noticed that the exterior girders in the girder system in TrainingBridge1 gave low ratings where shear controlled. It appears that the some transverse stiffeners are missing from the schedules in Virtis/Opis. This example was taken from the HDR examples handbook, but the example only provided stiffener information for the interior girder. The transverse stiffener schedules in Virtis/Opis need to be modified, so the ratings do not fail. Jay suggested contacting Mike Grubb to obtain the complete information.

FROM:kkennelly DATE:08/03/2000 16:10:25

I added some stiffeners to the exterior girders so the ratings don't fail. Note that shear at the beam ends of the interior girders does fail but that is because the HDR example handbook uses an eta factor (AASHTO Article 1.3.2.1) of 0.95. Our TrainingBridge1 uses the AASHTO default of 1.0 so our loads are slightly higher than the handbook's and the shear fails.

FROM:bgoodrich DATE:12/15/2001 13:22:03

Accepted.

2791.10587	Resolved	3.0 SP3 - Stiffener Duplicate probelm
------------	----------	---------------------------------------

Description

FROM: tthompson DATE: 8/1/2000 9:31 AM

I don't think the Duplicate feature is working correctly for Transverse Stiffener Ranges. It duplicates/copies everything but the spacing (in) . It leaves this blank.

The duplicate for Diaphragms under Bracing Ranges works correctly. It copies all the data correctly.

FROM:kkennelly DATE:08/04/2000 09:44:55

That is the intended behavior for this window based on incidents reported in early testing (#701, 716, 717, 735). We've tried to make some assumptions about why a user would want to use the duplicate button. For a transverse stiffener, duplicate will calculate the start distance as the previous row's end distance, copy the stiffener definition and leave the spacing blank. We figured the user would use the same stiffener definitions along the beam more than use the exact same spacing.

Tasks

Name	Current State	Summary
2795.10583	Closed	Checkin/out from BWS problem

Description

FROM: gbarnhill DATE: 8/2/2000 10:06 AM

In the window for input of vertical & horizontal shear reinforcement ranges for PS, for the interior spans of a multi span bridge, if zero is entered for the start distance of the first range in the span, a VALIDATE error indicates that shear reinforcement definitions are outside of the beam. The Bridge Workspace Report shows negative zero for the start distances for all spans after Span 1.

The work-around is to start at a distance greater than zero.

Since Virtis/Opis convention is to place an item at the end of a range and not the beginning, it seems reasonable that we should be able to start the range at zero to get the first stirrup placed at some distance from the left end of the beam.

The attached zip file is a bitmap showing the VERTICAL SHEAR REINFORCEMENT tab and the BWS for that data. The same situation occurs for HORIZONTAL REINFORCEMENT.

I've also attached a text file of part of the VALIDATE messages and the BBD file for this bridge.

FROM:kkennelly DATE:08/04/2000 13:14:14

Validation problem is due to tolerances and precision. Domain thinks actual beam in Span 2 starts at 21.1328 m. User entered 0 for reinf start distance in span 2, this got saved to the domain as 21.13279989m. Validation checks if 21.13279989 is less than start of beam in span 2 (21.1328 -

4/19/2016 3:14:32 PM

HRS AASHTO

580

Complete Issue Information

0.0000001 tolerance) which returns true so validation thinks it should check shear reinf like it is in Span 1 not Span 2 which returns an error cause it ends in Span 2 not Span 1. We're working on precision and tolerances now so hopefully that will get fixed.

(I checked the validation for a case where the continuous support distances were 12" not 10" and setting the first shear reinf to start at 0.0 in an interior span works ok. Think problem is trailing 3's in 10/12 = 0.83333333')

FROM:kkennelly DATE:08/04/2000 13:46:22

Getting -0 in BWS report because it reports start distance as Start Dist of shear reinf - Start Dist of precast beam = 69.33333 - 69.333333333333 = -0.000000333333 or -0.000 when it gets formatted. Don't see the -0.000 in the gui window because the gui checks if Shear Start Dist = Beam Start Distance within hardcoded tolerance of 0.000001 which is true and sets Start Dist to 0.000000

FROM:kkennelly DATE:08/04/2000 13:53:06

FROM:kkennelly DATE:08/31/2000 08:35:45

User tolerance has been added to Version 4.0 which should solve the problem in Validation. BWS report formatting fixed to show 0.00 instead of -0.0.

FROM: gbarnhill DATE: 11/15/2000 8:07 AM

Complete Issue Information

Name	Current State	Summary
------	---------------	---------

Description

FROM:jduray DATE:08/03/2000 09:30:14

This problem existed since 2.0. If a bridge is checked out from within the BWS and then checked in and the BWS closed and then reopened the database did not get read because the bridge still existed in memory.

This problem was occurring because the BWS document class stores the BridgeObjectId when the BWS is opened. Checking a bridge out causes the Domain to assign a new BridgeObjectId which never gets sent to the BWS document. When the BWS closes it calls CDoBridgeManager::RemoveBridge which is supposed to remove the bridge from its list of bridges. The BridgeObjectId that is passed is the original one and RemoveBridge doesn't find it in the list so it does nothing to remove the bridge from memory. The next time the BWS is opened (during the same session) for that same bridge the CDoBridgeManager::RetrieveBridge function first checks if the bridge is in memory. Because it finds it in memory it never reads the database.

Solution:

Modified BWS document to always query DoBridge for the BridgeObjectId instead of relying on the stored value in the document.

Fixed for Version 3.0 service pack 4 and version 4.0.

FROM:jduray DATE:08/03/2000 09:52:21

Complete Issue Information

I've observed the following problem with the rows initializing incorrectly:

- 1) Created a new row and left it as support one. This row is ok.
- 2) Created a new row and using the number pad, select support two. The row initially populates the same as support one. That is the left side is greyed out and not able to enter the data. If I use the mouse and the drop down window, the row is initialized correctly.
- 3) The same happens if I create another row, using the number pad and select support 3 (3 span bridge). The row is initialized like the previous row but it should be greyed out on the right side. Works okay if I select with the mouse and the drop down data window.

I'm not sure if this is a bug in VIRTIS/OPIS or a bug in the grid control product used to create this window.

FROM:jihnat DATE:08/09/2000 08:52:13

This looks alot like a known grid problem. See incident 77.

The same workaround works here also: Press the number key on the keypad twice.

Issue ID: 2799
Subject: Checkout of structure definitions

Tasks

Name	Current State	Summary
2801.10577	Resolved	Checking in a structure def while the bridge is checked out

Description

FROM:jduray DATE:08/08/2000 16:15:13

After enabling checkin/out I opened TrainingBridge 1 and copied the struct def twice (and saved to the db) so I then had three struct defs. I then checked out the first two. When I attempted to checkout the third one I got the following error message:

```
E:\Virtis\Dev\data management\abmbrdg\DmStructDefRefLine.cpp(986) : Unsaved data detected.  
03:50:43 PM - Line 986 in source file E:\Virtis\Dev\data  
management\abmbrdg\DmStructDefRefLine.cpp.
```

Doing an export to a txt file after checking each of the struct defs out revealed that after the second one is checked out there are eight new reference lines in the txt file marked as "NewModified" and 12 new reference lines marked as "NotModified".

FROM:jduray DATE:08/08/2000 17:08:06

This appears to be a problem in the bridge cache with the retrieve code. Probably exists since 2.0 - need to confirm.

FROM:jduray DATE:08/09/2000 15:09:30

Comparison of txt export files:

- A - after opening the BWS (tb1 no checkout.txt),
- B - after checking out one SD (tb1 1 checkout.txt),
- C - after checking out second SD (tb1 2 checkout.txt),

No differences between A and B.

The following differences between A and C:

- CDmStructDefRefLine - 20 extra rows (18 vs 38)
- CDmStlComponent - 48 extra rows (72 vs 120)
- CDmSuperLoadCase - 8 extra rows (12 vs 20)
- CDmSuperLoadScenario - 2 extra rows (3 vs 5)
- CDmSpngMbrDef - 8 extra rows (12 vs 20)
- CDmDeckPanel - 2 extra rows (3 vs 5)
- CDmSupportLine - 4 extra rows (6 vs 10)
- CDmSuperStructMbr - 8 extra rows (12 vs 20)
- CDmStlBeamAssembly - 40 extra rows (60 vs 100)
- CDmSuperStructSpngMbrAlt - 8 extra rows (12 vs 20)

and probably many more!

bbd files are attached.

FROM:jduray DATE:08/09/2000 15:39:37

Checking out the 1st SD makes no inappropriate changes to the domain but must cause the retrieve code to be incremented in the bridge cache thereby causing the above listed Dm objects to reread the db during the checkout of the second SD.

FROM:jduray DATE:08/14/2000 10:29:38

Open the BWS (without anything checked out). Set a break in CDmStructDefRefLine::Retrieve and monitor iRetrieveCode being passed in.

Checkout the first SD, iRetrieveCode = 3, m_iRetrieveCode = 2 executes else if (iRetrieveCode > m_iRetrieveCode) block

Checkout the second SD, iRetrieveCode = 4, m_iRetrieveCode = 3 executes else if (iRetrieveCode > m_iRetrieveCode) block

Checkout the third SD, CDmBridgeCache::SaveBridge fails, never gets to CDmStructDefRefLine::Retrieve.

Failure is due to the extra rows in the cache with an incorrect status.

FROM:jduray DATE:08/14/2000 10:36:10

The retrieve code is being incremented by CDoBridge::CheckOutStructDef(long IStructDefObjectId, LPCTSTR lpszComment) when it calls pDmBridgeCache->SetCheckOutStatus(IStructDefId, TRUE). It appears that this causes m_xDoDataControlCom.Retrieve(TRUE) that is a few lines later to retrieve all objects that are children of the structure def. The problem is that these objects were not purged prior to their retrieval and as a result we get extra copies in the cache. When checking out a bridge the cache creates a new cache and then retrieves into it.

FROM:jduray DATE:08/14/2000 13:55:51

4/19/2016 3:14:33 PM

HRS AASHTO

588

Complete Issue Information

Determine if we are trying to only retrieve the struct def being checked out?

FROM:jduray DATE:08/28/2000 15:21:55

FROM:jduray DATE:08/29/2000 10:12:15

The problem is in the Dm Retrieve function. The where clause generated to exclude structure definitions from the retrieve is incorrect when one or more SD's are checked out. The generated where clause is:

where bridge_id = 1 AND (struct_def_id <> 1 OR struct_def_id <> 2)

It should be:

bridge_id = 1 AND struct_def_id <> 1 AND struct_def_id <> 2

This needs to be changed in all of the above listed Dm's (by changing the template and regenerating the Dm's).

There is still a problem with CDmStructDefRefLine and 8 extra rows with a status flag set to NewModified. Check on whether this will be corrected when the other Dm's are fixed.

FROM:jduray DATE:08/29/2000 10:56:19

Fixing DmSuperStructMbr also fixed the 8 extra rows in CDmStructDefRefLine.

FROM:mordoobadi DATE:10/04/2000 10:25:02

The template changed, code regenerated for the structure definition level Dm objects.

2806.10573	Resolved	SP3 - Error messages with Shear Connectors on PS Girder bridge

Description

FROM:jduray DATE:08/17/2000 08:19:46

The following is from a e-mail from Carol Baldry at KsDOT on behalf of Dean:

Jim,

We are running Virtis/Opis version 3 with an Oracle database v. 7.3.3.4 on Windows NT.

Dean Teal is having problems deleting structures. He has been able to delete several structures, but sometimes the delete fails. Yesterday, he was able to delete one structure, but the second one failed. He received the following error messages:

Unable to delete bridge!

03:39:17 PM - Line 2715 in source file D:\Virtis\gui\abgdtop\UiDescDtopGridView.cpp.

Error deleting record from database record set.

03:39:17 PM - Line 1099 in source file E:\virtis\Dev\data management\abmbrdg\DmStructDefRefLine.cpp.

4/19/2016 3:14:34 PM

HRS AASHTO

591

Complete Issue Information

No rows were affected by the update or delete operation.

We talked with you about this same error in May. You gave us your settings for the rollback segments and Open cursors parameters. We did enlarge our rollback segments to :

Initial_Extent = 106496 bytes
Next_Extent = 262144 bytes
Min_extent = 3
Max_extent = 160
and open cursors = 10,000

These settings exceed your recommendations.

We have watched the rollback segments while Dean Teal executed a delete. The first delete used approximately 22 meg of space with approx 40 meg available, the second delete failed and did not use any of the rollback segment.

FROM:jduray DATE:08/17/2000 08:21:19

This could be related to MoDOT delete problems (VI 2698).

We should send Dean a 3.0 DmBridgeCache.dll with the code that posts an error message indicating the object where the delete failed. Send same dll to MoDOT.

FROM:jduray DATE:08/17/2000 08:23:58

FROM:jduray DATE:08/21/2000 12:23:09

It appears the problem is related to the data stored in the database table abw_struct_def_ref_line. The x and z coordinates for reference lines are computed within the domain for girder system struc defs. I have been able to reproduce the described behavior if I enter a value with more than 15 significant digits into the row. For example:

1. and 29 decimal digits e-15 -> can delete
1. and 30 decimal digits e-15 -> can not delete

123456789012345 -> can delete
1234567890123456 -> can not delete

I have tested both Oracle's and Microsoft's ODBC drivers.

Next - ask Dean to run the following:

```
select bridge_id, struct_def_id, struct_def_ref_line_id,  
       to_char(x),  
       to_char(y),  
       to_char(z),  
       to_char(direction_angle_x),  
       to_char(direction_angle_y),  
       to_char(direction_angle_z),  
       to_char(straight_line_length) from abw_struct_def_ref_line where bridge_id = 32
```

FROM:jduray DATE:08/23/2000 09:03:39

I imported Dean's bid 32 and compared the values in our Oracle db with the values Dean (carol)

4/19/2016 3:14:34 PM

HRS AASHTO

592

Complete Issue Information

reported to us. The values that differ are as follows:
reference line 7 (the one that fails to delete):

	Dean	Our Import
x	0.00000000000000590803911327231	
y	9.54468858735449000000000000000000E-30	

Reference line 10 has the same differences. The other lines are identical between Dean's data and the import from his bbd file.

I suspect that changing the values to 0.0 will correct the problem and allow the rows to be deleted.

update abw_struct_def_ref_line set x=0.0, y=0.0 where bridge_id=32 and struct_def_id=1 and (struct_def_ref_line_id=7 or struct_def_ref_line_id=10)

At this point this problem is only occurring in abw_struct-def_ref_line. We are going to modify CDoReferenceLine and CDoGirderSystemStructDef to set the coordinates of the reference line to zero if the computed values are less than the tolerance.

Incidents such as this one will be resolved as necessary by preparing a script to correct the data in the user's database. The script should set very small numbers (abs(1.0 e-14) and smaller) to zero.

For the long term we are going to investigate a change to CDeDouble and CDeFloat SetValue function to truncate the value to 14 and 6 significant digits respectively. We will write a test program to test the algorithm on thousands of generated numbers to make sure it works properly.

FROM:jduray DATE:08/23/2000 10:38:21

FROM:jduray DATE:08/23/2000 15:45:49
Dean (Carol) ran the script to change the values and Dean was then able to delete the bridge (BID 32).

FROM:jduray DATE:08/23/2000 16:17:39
Dean (Carol) ran the script to change the values and Dean was then able to delete the bridge (BID 58).

FROM:jduray DATE:08/23/2000 16:46:10
Procedure for resolving this problem:

- 1) Replace abmbche.dll with the version that shows us which cache object is causing the problem - should be CDmStructDefRefLine.
- 2) Replace abmbrdg.dll with the version that shows us which reference line is causing the problem - code is in CDmStructDefRefLine::ProcessDbDelete.
- 3) Have the user execute the select statement show above using the correct bridge_id.
- 4) Verify the problem is the same as the Kansas problem.

Complete Issue Information

- a) Load the bbd file for the bridge into Virtis (here in our db) and save.
- b) Compare the the user's data to what was imported into our db
- c) If the 15th significant digit differs between the user's db and the same bridge in our db and the value is nearly zero the problem can be fixed by this procedure.

5) Have the user execute the following script for each offending reference line (as determined in 2 above):

```
update abw_struct_def_ref_line set x=0.0, y=0.0 where bridge_id= xxx and struct_def_id= xxx and struct_def_ref_line_id = xxx
```

6) Delete the bridge.

7) Restore the original dll's.

FROM:kkennelly DATE:09/11/2000 14:16:00
Abobrdg.dll has reference line changes.

FROM:jduray DATE:10/09/2000 09:19:06
Gale confirmed this is fixed for Version 3.0 SP4.

FROM:jduray DATE:10/19/2000 08:16:21
The code revisions to reslove this had to be backed-out due to side affects. Continue investigating.

FROM:jduray DATE:10/19/2000 08:52:55
I have written a utility TestDigits.exe that allows me to add floating point values to the test_digits table in Oracle. The utility accepts floating point numbers and equations which it can parse and perform the required calculation including trig functions. The only way I can reproduce this problem is to use Oracle SQLWorksheet and input a number with more than 15 significant digits. The TestDigits utility never inserts more than 15 sign. digits into the database no matter what the calculation is or what the number(s) are. TestDigits can always delete what it inserts. It cannot delete a number containing more than 15 sign. digits input using SQLWorksheet.

I am using Oracle 8.00.05 ODBC driver. This may be an Oracle ODBC problem. Dean is using 7.3.3.4 of Oracle. I don't know what driver version.

FROM:jduray DATE:10/19/2000 12:53:49
Set x and y (in abw_struct_def_ref_line to 0 if the actual value is nearly 0. Do nothing with z.

FROM:kkennelly DATE:10/24/2000 08:36:10
In DoGirderSystemStructDef.cpp, x and y for the struct def ref line are set to 0 if actual value almost zero. In DoReferenceLine.cpp, x and z are still set to zero in the SetFiniteLine and SetInfiniteLine functions. It seems to be ok to keep setting z to zero, it's not having any affect on the order of the girders. Also if the direction angle is equal to $\text{Pi}/2$, its cos value is set to zero in the FindIntersection function so that we don't get values back that are very close to zero when they should be exactly zero. Fixes made for Version 3.0 Patch 5 and Version 4.0.

FROM: dteal DATE: 11/15/2000 2:37 PM

FROM:kkennelly DATE:12/14/2000 08:24:01
Investigation of incident 3015 led me to discover that the girders are still being added out of order when creating a new struc def system in Version 4.0 Beta 2. My previous statement from 10/24 about keep

FROM: tthompson DATE: 8/18/2000 11:20 AM

I have a PS girder bridge and I keep getting error messages that SHEAR CONNECTOR ranges overlap and SHEAR CONNECTOR ranges not on member alternative.

I have no shear reinforcement added.. PLUS there is no way to access SHEAR CONNECTORS in the GUI.

I have attached the bbd file. Bridge was originally imported from BARS.

FROM:kkennelly DATE:08/22/2000 08:24:58

There must have been a problem with the import from Bars because I imported your bridge into virtis and checked the database. This bridge has 4 shear connector ranges in the database. I'll check into the import from Bars.

FROM:kkennelly DATE:08/22/2000 10:22:42

4/19/2016 3:14:35 PM

HRS AASHTO

595

Complete Issue Information

Can you attach the bars file so I can check the import?

FROM: tthompson DATE: 8/28/2000 11:28 AM

I added the BARS data set.

When you run an analysis or do a validation, do you get the error messages I reported? I doesn't surprise me that there are 4 ranges in the database. that wasn't the problem.

FROM:kkennelly DATE:08/29/2000 08:21:13

I get the same error messages you got. I'm not sure why you say the 4 ranges of shear connectors doesn't surprise you and that that's not the problem. In our gui, you can't enter shear connectors for a ps bridge. I think it is a problem if you import a ps bridge and the import creates shear connectors that shouldn't be there or can never be accessed.

FROM: tthompson DATE: 8/31/2000 8:49 AM

Oops, never mind my comment on the shear connectors, I was thinking of shear reinforcement. Sorry for the confusion.

FROM:kkennelly DATE:08/31/2000 11:11:54

I also get shear connectors when I import 027100.dat. I think the problem is the import sees the "C" in column 27 of the card 14 line and sets the slab as composite (which is ok I think). Line 7155 in BarsImportDoc.cpp creates DoMbrAltShearConnectorRangeSet when the slab is composite. I think for a ps beam, maybe we should be creating DoBeamShearReinfLocationSet and adding a Horizontal range, setting it to composite instead of creating shear connectors.

FROM:kkennelly DATE:08/31/2000 16:26:14

I spoke to Brian about how export determines if PS is composite. It first looks if any Horizontal PS Shear Reinf ranges exist. If they do, then composite flag is set. (Engine related help not really clear on this, it says nothing on tab used. It really means doesn't use spacing, etc. but is used to determine compositeness). If Horiz PS Shear Reinf ranges don't exist, export then checks if Vert PS Shear Reinf extends into deck.

Fix for import: If slab is described in data file as composite, create a Horizontal PS Shear Reinf range over whole length of mbr that is default "Composite".

Will we need to write a script to remove shear connectors from ps beams previously entered?

FROM:jduray DATE:10/09/2000 10:07:16

Krishna - please prepare a workaround description for the web page.

Then assign to Ed to fix the import.

Then assign to Mehrdad to prepare the script.

Let's get this in Patch 5 ASAP.

FROM: emartin DATE: 10/9/2000 10:30 AM

FROM:kkennelly DATE:10/09/2000 14:20:55

Received code from Ed and checked in to Virtis version 4.0. Needs checked into 3.0Maintenance after Ed gets back to me about some other incidents.

FROM:kkennelly DATE:10/09/2000 15:18:14

FROM:kkennelly DATE:10/13/2000 10:04:06

Tested and repinned in 3.0Maintenance for Patch 5.

In the attached RC Slab structure all the rating factors are zero in the Results Graph (LRFD Design Review). Why?? In the Spec Checker the Rating Factors are Non-zero.

Complete Issue Information

FROM:mordoobadi DATE:10/09/2000 10:03:10

I imported the rating BBD file and did an LRFD Design Review analysis with HL-93 Design Review template I got non-zero results for moment rating factors.

I didn't get any values for SHEAR rating factors. I compared th e results with the tabular reports they seem to match.

Brian, I assign this to you to investigate why we are not getting shear rating factors from BRASS.

FROM:bgoodrich DATE:10/10/2000 11:38:00

Dean specified to ignore shear on the member alternative, which is why there are no shear rating factors. Also, I ran this bridge with the HL-93 Design Review template and got non-zero rating factors for moment, but only after turning on the R/C output options on the Output tab of the Analysis Settings window.

FROM:dteal DATE: 11/15/2000 2:38 PM

FROM:mordoobadi DATE:11/15/2000 16:15:22

Accepted by Dean.

In the attached RC Slab structure I found that for span 1, Location 13.50 m is listed twice. Should it be?

FROM: dteal DATE: 11/16/2000 11:48 AM

see #2658

FROM:mordoobadi DATE:11/9/2001 10:36:01 AM

This seems to be caused by BRASS supplying duplicate points (very close) to Virtis. The Tolerance that we are using right now is 0.0000001. I changed it to 0.001. This resolves the problem. In the meantime Brian is going to investigate why we get two different set of data for some points.

FROM:bgoodrich DATE:12/05/2001 11:14:54

This is a duplicate issue to 2658.

This incident organizes several other incidents for resolution for version 4 and 4.1.

E-mail from Brian:

I think we need a domain function for getting the export path and base file name without any extension. There is a function called GetInputOutputFilePath in UiAnalysisProgressDlg.cpp, BrassAnalysisCtl.cpp, and MaderoAnalysisCtl.cpp that all do the same thing, so there is a possibility for inconsistencies to occur.

The path should contain the following (the only new item is the engine string which can be retrieved using the domain):

4/19/2016 3:14:36 PM

HRS AASHTO

601

Complete Issue Information

Drive:\VirtisOpisPath\Bridge\StructureDef\Member\MemberAlt\Engine

The base file name should be derived from the member alternative name. Then for Madero, I can append the vehicle name as we discussed.

Also, occasionally, I cannot open the LOG file with the Virtis viewer even though it exists in Windows Explorer. I think the viewer may not use the same method for constructing the path for which to open the LOG file. Here is another case instance of where a domain function would be handy.

The following needs to be scoped to improve the way we manage output:

Bridge Explorer:

- 1) a utility for viewing and maintaining the analysis events stored in the database. (80)
- 2) a utility for viewing and maintaining the engine output files on the disk. (80)
- 3) add the option to not write batch rating results to the database but still review them the way we do now (from the Bridge Explorer). (80) -----done for 4.1

Bridge Workspace:

- 1) a utility for viewing and maintaining the analysis events stored in the database. (40)
- 2) a utility for viewing and maintaining the engine output files on the disk. -----done for 4.0

FROM:jduray DATE:12/04/2000 12:24:08

Need to add a user preference for the user to chose whether to delete analysis events from memory when a new analysis is performed. (24)

FROM:jduray DATE:5/21/02 9:08:31 AM

Some of this work was authorized by the Task Force and has been completed. The remaining work is not authorized, therefore, this incidnet is changed back to Suspended.

Description

FROM: dteal DATE: 8/23/2000 2:34 PM

I have attached a RC Slab structure. The member alternative named "Good One" works fine. The member alt. Named "Bad One" is the problem. Both of these member alt's have the same number of sections and ranges. The only difference is "Bad One" has one less section in span 1 and one more section in span 2 and "Good One" (hence, they both still have the same number of sections). I received the following message when Rating "Bad One".

Error generating BRASS span commands!

No. of ranges = 16 (Maximum = 15)

Maximum number of web profile ranges exceeded for BRASS!

Error generating BRASS span commands!

The error message says I have 16 ranges. I believe that I have 40 ranges total (20 per half). So what does this error message mean and what is wrong with the member alt "Bad One"?

FROM: bgoodrich DATE: 8/29/2000 3:49 PM

For BRASS-GIRDER(LFD), there are a maximum of 15 web profile ranges per span. For BRASS-GIRDER(LRFD), the limit is 20 ranges web profile per span.

Jim - Should this be treated just as a limitation of the engine?

4/19/2016 3:14:36 PM

HRS AASHTO

603

Complete Issue Information

FROM:jduray DATE:08/30/2000 10:04:44

Dean says he has 20 in each span. Why does the error message indicate 16? Why does he have so many ranges? How would he model this bridge using BRASS without Virtis/Opis? Does he have this many because we include the depth of section in the cross section?

FROM: bgoodrich DATE: 8/30/2000 8:39 AM

There are three spans not two in Dean's structure, with 12 ranges for spans 1 and 3 and 16 ranges for span 2. There are several parabolic segments at the right end of span 1, all of span 2, and the left end of span 3. I imagine that several of the parabolic web segments could be merged to create fewer segments in each span. However, this would require writing an algorithm in the export to do so. Months ago, we chose to add an algorithm to BRASS to merge the web segments, so it benefited both BRASS and Virtis/Opis user.

I think we are going to run into these engine limitations more often as more engineers start using Virtis/Opis and enter unusual and complex structures.

FROM: dteal DATE: 8/30/2000 11:02 AM

Jim asked why I had so many ranges. This is a KDOT standard Reinforced Concrete Haunched Slab bridge. Being steel can not be entered over a range it has to be entered in a cross section defined at each bar cut off point. With both top (3 bar pattern) and bottom (4 bar pattern) longitudinal steel, the number of bar cut off points add up. Cross section can not be combined and still model the slab correctly.

FROM:jduray DATE:08/30/2000 12:11:48

Being referred to Wyoming as a BRASS enhancement.

FROM: bgoodrich DATE: 8/30/2000 11:07 AM

For an R/C slab, the rebar is basically located in the web. BRASS cannot analyze this structure by only defining the web and rebar. The work-around in BRASS would be to define a portion of the web as the top and bottom flange, so rebar could be defined independently from the web profile. The number of cross section change points per span in BRASS-LFD is 18 or 19, so I think this structure could be analyzed with BRASS by defining cross sections as equivalent I-shapes where the flange widths equal the web thickness. The export simply generates commands as the structure is defined. The same problem could also occur in T-beams where there is no bottom flange.

Jim - Please consider this and let me know if I should still forward this issue to WYDOT.

FROM:jduray DATE:08/30/2000 13:26:20

Our goal in Virtis/Opis is to model the bridge without consideration of the engine to be used for analysis and its shortcomings. I don't think the user should model this slab bridge as an I-beam. The export could do this but then when the user reviews the BRASS output he/she may be confused by I-beam output instead of slab output. I think BRASS should be changed to accept more ranges and I think the total ranges within a beam should be equal to or greater than the max per span * number of spans.

FROM:jduray DATE:11/29/2000 14:40:54

Brian - did we ask WyDOT about increasing the number of ranges per span?

FROM:bgoodrich DATE:08/09/2001 13:20:32

The number of cross section and web ranges has each been increased to 40 per span in both BRASS-GIRDER and BRASS-GIRDER(LRFD). This is related to Incident 2938. Fixed for Version 4.1.

Description

FROM: dteal DATE: 8/25/2000 11:32 AM

Structure is a 3 span RC slab with an integral pier beam. The structure definition is the second one (15-20-15 MS22.5) I received the below error in Opis. Virtis runs to completion. The error message is too ambiguous (undefined terminology) for me as a non-BRASS user to find the input error. I'm sure other non-BRASS users would have the same problems. I know the error location is at the face of the pier beam. I have a POI defined there.

I don't know what to fix!

FROM: dteal DATE: 8/25/2000 12:53 PM

For this problem structure, I found an error in Cross Section 12, it's depth should be 740.724 mm. This didn't change the original error message.

The structure definition 15-20-15 MS18, Member MS18, 11 m Rdwy has had the structure defined in the same way, and that one works just fine. That's why I don't understand the error message meaning.

FROM: dteal DATE: 8/25/2000 2:34 PM

New Attachment

For the 15-20-15 MS18 structure definition, Member Alt. "Interior 1800 mm Strip", it works fine. Then I reordered the POI's – mind you, they are all the same, just a different order, Member Alt "Reordered POI's). Then I will get the same error I got with the 15-20-15 MS22.5 Structure Definition.

FROM:kkennelly DATE:08/30/2000 16:26:29

I think the problem is the point of interest at Span 1 14.5m. $14.5/15 = 0.9667$ which is similar to the error you get (109.667). BRASS is telling you that this point is not a node point as defined by BRASS (For BRASS, Analysis points must be at node point locations. Node point locations are 1/10 points, cross-section change points, hinge locations, special analysis point locations, and web depth change points.). You don't have a cross-section change point at 14.5m so BRASS won't run.

15-20-15 MS18, Member MS18, 11 m Rdwy works cause it does not have analysis point at Span 1 14.5m.

The error message you get about 109.667 is misleading but that is an internal message from BRASS. BRASS refers to Span 1 14.5m as 109.667 , the data file generated by the export uses the 109.667 connotation.

runs ok but "Reordered POI's" doesn't. They both have a poi at 14.5m but only Reordered POI's gives the error about 14.5m not being a node point.

FROM: bgoodrich DATE: 8/31/2000 2:45 PM

The problem stems from specifying too many non-tenth points of interest per span. The BRASS maximum was set to 5 and Dean had 12 for span 1. The work-around until version 4.0 is release is to reduce the number of non-tenth points of interest per span. I have corrected the problem in BRASS for the version 4.0 release.

FROM: dteal DATE: 9/1/2000 10:52 AM

Reducing the number of non-tenth point POI's is not an option. These POI's are the bar cut off points and are not adjustable on existing structures. I need another work around

Description

FROM: dteal DATE: 8/25/2000 11:33 AM

The following is an excerpt from the help screen related to the Longitudinal Stiffener Ranges tab. When you use % of Web option, the units at the top of the column are still in inches. So the user doesn't get confused, this column heading should reflect the "%" option being used.

Y

Enter the distance or percentage from the location selected in the "Measured From" column to the centroid of the longitudinal stiffener plate, as shown in the sketch.

Measured From

Select from the following:

% of Web – Bottom Flange – the Y distance is measured from the top of the bottom flange and is entered as a percentage of the web depth (with units of percent)

% of Web – Top Flange – the Y distance is measured from the bottom of the top flange and is entered as a percentage of the web depth (with units of percent)

FROM:kkennelly DATE:1/22/2002 3:56:03 PM

We can't change the title of the column since each row in the grid can be referenced in a different way (inches or percent).

FROM:jduray DATE:4/12/2005 10:59:15 AM

REmove the units from the header and put them in the Measured From text.

FROM:sboukamp DATE:5/16/2005 10:54:45 AM

Made the above described changes. Fixed in 5.3.0 Service Pack 1.

FROM:dteal DATE:Monday, June 27, 2005 3:36:53 PM

5.3.0 SP1 Beta 1

The "measured from" pulldown doesn't display the correct units. I was in a structure created in SI, I changed my unit of measure to US Customary. The units in the pulldown stayed in SI, everything else on the window displayed correctly for the units requested.

The steel suppliers in Canada supply metric bars. How can we select and use Metric Bars in our designs and ratings with the actual Metric bar properties not soft-metrification.

Complete Issue Information

FROM:jduray DATE:08/28/2000 12:42:36

Please investigate adding hard metric bars to the db. Does BRASS need to be revised for this?

FROM:kkennelly DATE:08/31/2000 08:27:28

I think all we have to do to the db is add rows for the metric bars. Based on the help for BRASS LFD, I think it only does US bars. The BRASS commands use the bar size and a number of bars so the export would have to manipulate the metric bars into an equivalent US bar or BRASS LFD would need revised. BRASS LRFD help says it uses US, Metric ("hard" sizes like 10, 15, 20) and soft metric (10, 13, 16) which BRASS LRFD calls hybrid.

2821.10558	Resolved	SP3 - Composite Steel and Concrete Structures - Composite/Non-composite problem

Description

FROM: dkoenig DATE: 8/29/2000 3:03 PM

There is a conceptual problem that occurs when a bridge is copied which contains data in the Member Loads-Uniform Load tab. The new copied bridge will take the uniform load and place it in the Distributed Load Tab. The load is technically still correct, just in the wrong place. This problem can create confusion for our users. This window is tedious enough when there are many load cases, and the user needs to check for loads contained in the Member Loads window.

I expect that this will also occur during importing and exporting. My assumption is, that this is a bug. Let me know if I am mistaken.

FROM: jduray DATE: 08/30/2000 09:40:15
This is the same as incident 2661.

We use the 0.0000001 tolerance defined in SysComparisonFunctions to compare the load at the start and end. If they are equal using 0.0000001 tolerance and the load spans over a complete span (using 0.0000001 as the tolerance on the length of the load) then we assume the load is uniform and display it on the Uniform tab. Else it is displayed on the distributed tab.

Version 4 will have an improved scheme for comparison of floating point numbers.

Description

FROM: tthompson DATE: 8/31/2000 1:20 PM

We have been trying to analyze a structure using Virtis and we want the entire structure to be composite. Even though we are able to create all the Cross Sections as composite, the analysis only considers the structure to be composite based on the dead load contraflexure locations described. It always leaves the regions over the piers, between the DL contraflexure locations as non-composite. In fact, even on structures that are composite in pos moment regions and non-composite in neg moment regions, if this location is different than the DL contraflexure locations, they are regions that are coded as composite based on cross section but the analysis forces them to be non-composite.

4/19/2016 3:14:38 PM

HRS AASHTO

612

Complete Issue Information

In visiting with Keith Fulton and Brian Goodrich, if we make the dead load contraflexure points at 0 and 100 % of the spans, we are then only able to make the structure composite the entire length.

Is this how this is supposed to work? Or why does the composite/non-composite regions get any influence from the dead load contraflexure locations? Just not sure if this is a bug, or just an undocumented thing that one must know and understand or ????

FROM: bgoodrich DATE: 8/31/2000 3:34 PM

Please attach your bridge BBD file. I want to see what the POI Control engine data field is set to. If POI are to be generated, the export uses the contraflexure locations to generate the STEEL-GIRDER-CONTROL commands, which set the BRASS section type to a 4 or 5 for composite structures. If no POI are generated, the BRASS uses data from the Virtis points of interest windows. If these are used, then you must manually set the BRASS Section Type on the Point of Interest engine properties window because it defaults to a non-composite code.

FROM: ttompson DATE: 9/1/2000 8:57 AM

Brian, I've attached the bbd for a given bridge with the problem(s) I've described. Look at Structure Definition TJO's Deck Replacement and Member S03(Int - 4 Span Cont). It appears that the POI control is 5 - Generate user defined POI only. We changed the contraflexure locations to 0 and 100 as you suggested to Keith Fulton. Appears it may be just a problem of not understanding what controls what. I just couldn't find anything on this in the BRASS or VIRTIS/OPIS help.

FROM: bgoodrich DATE: 10/13/2000 11:56 AM

The way you had originally defined the bridge, BRASS would have definitely considered the regions over the piers, between the DL contraflexure locations, as non-composite. However, if rebar would have been defined over the interior piers, the rebar areas would have been included in the BRASS cross sections, but the slab still would not have been considered. It appears that you would like to consider the slab for all positive bending calculations. However, when sections experience negative bending, the slab cannot be considered by BRASS in its section analysis. Note that BRASS performs the structural analysis using the positive bending properties of each section as entered on the BRASS cross section commands.

Would it help if I added the following note to the BRASS-GIRDER(LFD) Properties help file, i.e., the help file that is available from the window in which the contraflexure locations are specified? Under the Points of Contraflexure section (as the first note), I could add:

Entering points of contraflexure other than 0 and 100 will result in regions over the interior piers being considered as either:

1. Composite where dead load moment is negative. This will occur when a slab and/or rebar are present, but only the rebar will be considered in the analysis.
2. Non-composite. This will occur when no slab or rebar are present.

FROM: bgoodrich DATE: 10/16/2000 2:54 PM

Begin e-mail from Todd:

What you suggest is probably okay.

When we normally design a steel girder bridge, we do not consider the slab or resteel over the Piers (negative moment) as composite or contributing to the section properties. But on some rehab projects with deck replacements, in order to maintain a reasonable load rating, our designers must sometime consider composite throughout (with or without resteel contributing to section). This doesn't happen

4/19/2016 3:14:38 PM

HRS AASHTO

Complete Issue Information

often.

I think as long as the designer understands the limitaions of BRASS and it's analysis, that what you suggest is okay.
End e-mail from Todd

FROM: bgoodrich DATE: 10/17/2000 3:34 PM
I made the modification described above to the BRASS-GIRDER(LFD) Properties help file. Fixed for version 4.0.

Description

FROM: dteal DATE: 9/5/2000 9:44 AM
It has happened to us again. I have another bridge that I can not delete. Here is how it happened. A designer has had some problems with a bridge. Last week after entering some description stuff (diaphragms, etc.) he was unable to save it. Had to exit the bridge and lose his work. Was able to work on bridge after that and (I think) save his work. This morning now he tried to work on this bridge again, but could not save his work. So we made a copy of it and was able to continue on working and saving. I tried to delete the original bridge from the deleted bridges folder. I get the same old error messages I got before when it would not let me delete it.

4/19/2016 3:14:38 PM

HRS AASHTO

Complete Issue Information

Unable to delete bridge!
Delete process failed while deleting CDmStructDefRefLine (SaveOrder object 107).
Error deleting record from database record set.
No rows were affected by the update or delete operation.

FROM: dteal DATE: 9/5/2000 9:46 AM
I think the most important part would be how this file became corrupt to begin with. Why couldn't we save it??

FROM: jduray DATE: 09/06/2000 12:22:54
I will send you scripts to fix it. Patch 4 will fix the problem so it shouldn't happen anymore. Patch 4 will be available next week.

FROM: dteal DATE: 9/7/2000 8:01 AM
Are you talking about fixing the deleting after it has become corrupt or the reason it got corrupt in the first place????

FROM: jduray DATE: 11/08/2000 12:17:53
This is difficult to fix since we cannot reproduce it and don't know exactly why it happens.

However, we know what is happening and when it happens can provide a script to fix the bad rows in the database. Patch 4a includes code revisions that should prevent it from happening in the future, however, rows that are already "corrupt" can only be repaired by a script.

Here is what is happening...
What is happening is numbers with more than 15 significant digits are getting into the database in the abw_struct_def_ref_line table. The number is a result of geometry calculations for the coordinates of reference lines. On our systems at Baker Virtis never sends more than 15 significant digits to Oracle but your (and Missouri's) ODBC driver seems to be sending more. The numbers are always nearly zero (something like 1.2345398374628234628 E-30). When you delete Virtis reads the value and because a double precision number in memory is only significant to 15 digits the value in memory is different than the number in the db. During the delete operation the number in memory is compared to the value in the db and if they differ Virtis cannot complete the delete. The script sets this value to zero and then Virtis can delete the row.

It would be helpful to know what version of Oracle's ODBC driver you are using.

FROM: dteal DATE: 11/14/2000 10:40 AM
Oracle 7 32 bit ODBC Driver 2.0.3.1.1

FROM: dteal DATE: 02/15/2001 10:20:34
I still need the script so we can delete this rouge file and clean up our database.

FROM: dteal DATE: 09/21/2001 14:33:13
I am still in need of the script you referred to - we have since updated to Oracle 8.x

Description

FROM: tthompson DATE: 9/5/2000 4:18 PM

I have a 3 span cont comp steel girder bridge, that when I reviewed the log file created, has a

COMMENT The TRANSFER command specifies locations of non-10th pt POI.

TRANSFER 3, 41.9000

But since this is a Steel Girder bridge, I don't see any way to fix this. This bridge was imported from BARS.

I've attached the bbd and the log file.

FROM: tthompson DATE: 9/5/2000 4:27 PM

This is for member G02. And as a side note, I'm getting poor analysis results for this structure. I've typically gotten good results on the Steel Girder Bridges I've imported into Virtis from BARS. It might also be related to another incident I reported that had some PS girder problems but on a steel girder bridge.

FROM: tthompson DATE: 9/5/2000 4:30 PM

Actually incident 2806 was a problem with Steel Girder commands showing up on a PS girder bridge, so never mind.

FROM: kkennelly DATE: 09/07/2000 16:28:35

The Transfer command can be used for all material types (steel, ps concrete, rc concrete). It is used for steel and rc concrete girders to specify points of interest that are not at tenth points. For PS concrete girders it is used to specify poi at non-tenth points and transfer lengths for ps strand. The point of interest at Span 3 41.900001 is slightly different from the 0.6 point so the Transfer command is issued. I'm not sure why you're getting poor analysis results but the Transfer command is not the reason. If you move the point of interest slightly so it is at 41.9 exactly, the analysis runs without the Transfer command and you get the same rating results.

FROM: dteal DATE: 9/7/2000 1:50 PM

The following message is found in the Analysis Progress window when doing a rating.

WARNING (Low):

The POI Control engine property for the member alternative has been set to generate tenth points. Any user-defined points of interest will be ignored even if they are located at tenth points.

It is correct, I have POI's defined but have requested output at 10th points only. When I look at the Analysis Results tables (DL or Live Load), all points have been reported, user defined POI's along with 10th points. I don't think the user defined points should be there, they where not requested.

FROM: bgoodrich DATE: 9/8/2000 8:12 AM

Dead and live load actions are always produced at tenth points and sometimes at all "node" points if the appropriate output option is specified. The points of interest referred to in the message represent locations where detailed section analyses is performed and specification articles are checked.

Description

FROM:kkennelly DATE:09/08/2000 10:28:24
Submitted for Todd Thompson from his email on 9/7:
Using version 3.0, Service Pack 3, LF load rating

1)

I created a Steel Girder type Girder System for a new structure. I created an interior girder and an exterior girder. I linked G3 and G4 from G2. I linked G5 from G1. But I keep getting this error message:

Girder System (Girder System Structure Definition)

Warning: Member G5 linked to Member G1 but the girder spacings are not identical.

I've attached the binary file for the bridge.

I had first created G2. Then linked G3 and G4. I then copied G2 info to G1 and modified the deck dimensions to reflect the exterior girder dimensions.

2)

Also, in reviewing the output, I had entered a .035 k/ft uniform load (load case description misc attachments). In reviewing the output, it appears to be using .135 k/ft. Not sure if it combined some other load with mine to get it, or if it's a misprint in the output. The BWS report doesn't print applied loads.

4/19/2016 3:14:39 PM

HRS AASHTO

622

Complete Issue Information

3)

Also, in reviewing the output, I noticed that while I entered a deck of 8.25 inches, the output says the deck is 0.00 but the topping is 8.25 inches thick.

I'm not sure what is happening here. (happens for both G1 and G2)

DECK GEOMETRY AND LOAD SUMMARY REPORT

No. Girders: 5

Bay No. Girder Spacing, in

1 107.000

2 107.000

3 107.000

4 107.000

Cantilevers:

Left = 42.000 in

Right = 42.000 in

Deck Width = 512.002 in

Slab Thickness = 0.000 in

Topping Thickness = 8.250 in

FROM:kkennelly DATE:09/08/2000 14:50:17

1) The warning in validation that spacings are not equal is due to the tight tolerance (0.0000001) used in the comparison of the overhangs and the floating point numbers that result from the domain calculations when it calculates the overhangs. Domain (in metric) calculates left oh 1.0668 m and right oh 1.06673904 m. Difference between these 2 numbers is 0.000061 > 0.0000001 so it thinks they're not equal. Version 4.0 will let you enter your own tolerances that would think these numbers are equal.

FROM:kkennelly DATE:09/08/2000 15:19:05

Brian, can you answer 2 and 3? The input file generated by the export has the 0.035k/ft load in it so I don't know why the BRASS output says it's 0.135 k/ft.

FROM: bgoodrich DATE: 9/12/2000 11:11 AM

Regarding issue 3, the BRASS export populates the total deck thickness parameter with the value entered in Virtis, i.e., the 9 inches. There is also another BRASS parameter available for entering the structural thickness, which is used primarily for deck analysis and is not supported by Virtis/Opis. The difference between the total thickness and structural thickness is the topping thickness. The structural thickness is specified on a schedule basis, so the thickness could potentially vary, which is why nothing is entered for the structural thickness. I have forwarded this issue to Jim for his input.

FROM: bgoodrich DATE: 9/13/2000 8:34 AM

Regarding issue 2, the 0.135 klf is due to the two barriers being uniformly distributed to all of the girders in stage 2. The 0.035 klf is applied in stage 1. There are no computational problems with the program. Note that BRASS only performs the dead load distribution computations for deck loads (appurtenances, slab, wearing surface, etc.). Girder line loads such as girder selfweight and any member loads (i.e., the 0.035 klf load) are not included in the dead load distribution output.

FROM: tthompson DATE: 9/25/2000 12:17 PM

4/19/2016 3:14:39 PM

HRS AASHTO

623

Complete Issue Information

FROM: bgoodrich DATE: 10/31/2000 7:41 AM

I modified the BRASS export so the deck thickness is placed on another parameter (see the DECKC-DIM3 command). This will cause the topping to be zero and the deck thickness to be reported as entered in Virtis. I modified BrassStdDeck.cpp, which affects Abxbrass.ocx. Fixed for version 4.0.

----- End of Contents of BRASS Error File -----

02:30:20 PM - Line 908 in source file D:\Virtis\GUI\abxbrass\BrassAnalysisCtl.cpp.

I've attached the bbd file.

FROM: jduray DATE: 9/14/2000 11:12 AM

Brian - I can't tell from the messages if the problem is in the export, BRASS or the results object. Can you help?

FROM: bgoodrich DATE: 9/22/2000 12:05 PM

There was some kind of problem in the lateral bracing export. In the lateral bracing window of the BBD file, there is only one range that starts at zero and has a length of zero, which for some reason, causes the range exported to BRASS to be extremely large and exceed the 40 character parameter length maximum. The export now checks to make sure the length is non-zero, which prevents the problem from occurring. If the length is set correctly, the problem does not occur. Fixed for Version 4.0.

Description

FROM: rmbest DATE: 9/14/2000 8:27 AM I would like to see more timely updates to the Virtis/Opis Technical Support Homepage. For instance some news about the development of 4.0, FAQs, training examples in PDF format and a user discussion forum.

FROM: jduray DATE: 9/14/2000 10:29 AM
AASHTO is preparing the discussion forum. My understanding is that they have changed the appearance or format of their web pages a few times and have not completed the forum yet.

Joe - Add info to the News page regarding 4.0 in Alpha testing and scheduled for Beta testing in mid-Oct. We need to discuss adding another link to a new page for documentation and add the training manual, etc.

Assign to me. We then need to review incidents and common questions and prepare the FAQ file.

2847.10532	Suspended	Display warning messages issued within BRASS output

Description

FROM: tthompson DATE: 9/14/2000 4:43 PM

I imported a BARS structure into Virtis. Appeared to be successful - no error messages. From the Bridge Explorer, the Bridge ID and Bridge Name are displayed correctly. When I open up the structure, it doesn't display the bridge id and name. It also won't let me enter and save the correct bridge id from the bridge workspace (says it's not unique). It also won't let me edit any of my data and save, because it says that it needs valid entries for the bridge id/name. I got this the first time and thought there was just a bug in the import. So I deleted the structure and removed it from the deleted folder. I did let me import based on the correct unique bridge number, but it won't let me enter it. I'm sort of stuck with this structure.

I've attached the bbd file and the bars data file.

FROM: tthompson DATE: 9/15/2000 8:11 AM

FROM: jihnat DATE: 09/15/2000 13:37:14

I haven't been able to reproduce this.

Is your database Oracle or Sql Anywhere?

When you run the BarsImport for this dat file, do you accept the defaults for Bridge IDs and Name (i.e. "58101321" and "Imported Bridge") or do you enter new values?

FROM: tthompson DATE: 9/21/2000 10:04 AM

Sorry but couldn't respond until today because baker web site was down until today.

For Bridge ID, I leave it as 58101321

For NBI Bridge ID, I use it as 000000058101321

For Bridge Name, I use 58101321

Gale Barnhill from NE imported it into his database and didn't have a problem, so the BARS data appears to be okay. I wonder if there's a problem with having had deleted the structure and then import it in again.

We are using Sybase SQL Anywhere 5.5.03 Build #1666.

When I import a bridge from BARS I use

Bridge ID 58101321

NBI BRIDGE ID 000000058101321

Bridge name 58101321

I wonder if the problem deals with having deleted the structure and imported again. I know that Dean Teal from KS DOT has had problems with deleting structures. Gale Barnhill from NE imported the data ok. SO the BARS data appears to be okay. Appears the problem may be in the database.

2861.10518	Resolved	BARS import of RC beam that used "same as" command in Card 13

Description

FROM:kkennelly DATE:09/18/2000 12:47:24

DoGirderSystemStructDef->AddGirder() is called in UiStructDefDlg with a bay spacing of 0.000000001 when we add a girder. AddGirder() calculates the offset position of the new mbr ref line to be -0.000000001 and sets the new mbr ref line Z value to be right exterior girder Z + -0.000000001. When DoGirderSystemStructDef->SetGirderMbrSpacing() is called, it sorts the Z values of all girders before setting the bay spacing. This sort makes the right ext girder be before the first int girder. When Compute From Typical Section is called to calculate the distribution factors the wrong df are calculated for the first int girder on right and right ext girder. Becomes very obvious in 4.0 where we changed the code in the HaunchProfile to determine if we have an exterior girder based on FindGirderBay(). In 3.0 we check for rt ext girder based on last member in list so it looked ok.

FROM:jduray DATE:09/19/2000 09:21:34

## Complete Issue Information

for pontis.bridge dirsuffix = 0 when Not Applicable  
and  
= 1 for Northbound  
= 2 for Eastbound  
= 3 for Southbound  
= 4 for Westbound

This is the same as NBI Item #5E.

This is the one of the items we really need to display on the desktop and be able to do queries against in order to be able to do overload requests on batches of structures.

FROM: tthompson DATE: 10/11/2000 11:13 AM

Also note the original request was Incident 2707 and not 2778.

FROM: tthompson DATE: 10/11/2000 1:18 PM

After testing several other structures, it appears this problem occurs whenever the pontis\_bridge.dirsuffix contains values of 2, 3 or 4. It appears to function correctly when values of 0 and 1 occur. It leads me to believe that the virtisopis database does not match the pontis database for this field. (are there probably other fields that are also incorrect?).

Also, on another note: Pontis 2000 will contain the following database changes to the pontis.bridge table. This will impact the virtis pontis\_bridge table.

The following fields are being dropped from pontis.bridge:

nhs\_ind, funcclass, kind\_hwy, routenum, dirsuffix, and kmpost. There are some additional items being dropped that weren't being used anyway, other items being added and others having their datatype changed. The roadway info that was "duplicated" in the bridge table and is being dropped is information that virtis uses and is important. I haven't seen what the proposed changes are to the Virtis-Opis database to accomodate the Pontis changes.

FROM: jduray DATE: 10/11/2000 5:21 PM

I have a list (the new Pontis schema) of changes for Pontis 2000. Unfortunately we are not going to make any changes for version 4.0. WE just got the changes a few weeks ago and it's too late to implement them.

As far as dirsuffix goes, we set it to 0 intentionally since it is a required field in the pontis bridge table (that we are using). I will chack on why 2, 3, 4 make a difference. How do they get there?

FROM: tthompson DATE: 10/30/2000 7:09 AM

FROM:mordoobadi DATE:4/12/2005 9:01:00 AM

The dirsuffix is no longer included in the BBD file. Because it does not exist in the abw\_overflow table.

The problem no longer happens because the dirsuffix is not stored in the BBD file.

### Description

FROM: dkoenig DATE: 10/3/2000 12:22 PM

I have some questions regarding the use of POIs in Virtis, and how BRASS uses these data fields.

Question 1: From my understanding, BRASS does not support any of the parameters or overrides in the POIs. For now, the POIs can be used only for more detail in the BRASS output. Is this true? If it is, is BRASS planning on upgrading to these capabilities?

Question 2: This is related to item 2821. Assuming BRASS can handle the POIs, do these fields override the contraflexure points? The contraflexure points set up the boundaries for composite and

non-composite action for positive moment. I am not sure how these fields relate.

FROM: dkoenig DATE: 10/6/2000 10:49 AM

I have another question that I cannot remember seeing an answer for yet.

Question 3: For example, tie down location often has a Brass Analysis error involving the location being too close to an analysis point (10th points). Will this problem be handled by Virtis/Brass in the near future, or does the user need to adjust appropriately.

FROM: bgoodrich DATE: 12/5/2000 3:00 PM

Question 1: BRASS-LFD has been enhanced to allow POI overrides, but the export does not support this feature yet. This may be implemented in Version 4.1.

Question 2: The POI commands will override the information generated on the STEEL-GIRDER-CONTROL command which uses the contraflexure locations to set the BRASS section type.

Question 3: For now the user must adjust their bridge data if they want to use BRASS. The small element issue is being brought before the Task Force for consideration, which is basically the issue as described here.

### Description

FROM: tthompson DATE: 10/4/2000 8:58 AM

We need a more robust and user customizable desktop for the bridge explorer. Currently a user can only display, sort and manipulate a limited selection of data items.

I would request at a minimum the following additional fields be able to be displayed, sorted and queried:

pontis\_bridge.funcclass  
pontis\_bridge.kind\_hwy  
pontis\_bridge.level\_srvc  
pontis\_bridge.dirsuffix  
pontis\_bridge.yearbuilt  
pontis\_bridge.yearrecon  
pontis\_bridge.designload  
structure types

Yes, this is similar to request 2704, submitted on 5-24-2000. Hopefully in these 5 months, some progress has been made on this?

| 2882.10497 | Closed        | 3.0 with SP4 - beta check - need message when trying to delete a bridge with checked out str def |

## Description

FROM:jduray DATE:10/06/2000 14:24:05

When the user checks a bridge in using BWS he/she is not informed that the data is being saved. Add a dialog asking user if he/she wants to continue saving. He has the option to cancel the checkin. We should explain the he can close the BWS and check the bridge in from the Bridge Explorer.

The dialog can be added to BWS::OnCheckinBridge.

If the bridge is still checked in (which means the domain was saved to the db) we should clear the flag that indicates the data has been modified. During the checkin process the domain saves the data to the db, clears the checkout status and retrieves the bridge and the BWS rebuilds itself.

**Description**

FROM: gbarnhill DATE: 10/6/2000 1:55 PM

During verification of INCIDENT 2778, I came across the following. I tried to delete a bridge with a structure def checked out to someone else. I got the error message that I couldn't delete the bridge, but no other explanation as to why. Can we get the same message as when I try to check out a bridge that has parts checked out to another user ?? Maybe we need to add a new symbol to the CHECKED OUT column on EXPLORER to indicate a part of the bridge is checked out.

## Description

FROM:kkennelly DATE:10/09/2000 14:16:23

In the BWS report, if the Horizontal Shear Reinf Def is selected as the default "Composite", we should list that in the Shear Reinforcement column. Right now, it is blank like the user forgot to specify a reinforcement def for the range. When Validate is done for the Horizontal Shear Reinf Ranges, we shouldn't issue a warning if the spacing and number of spaces is undefined if they have selected the default "Composite" as the shear reinf def.

FROM:mordoobadi DATE:10/02/2001 3:01:22 PM  
Fixed.

### Description

FROM: dteal DATE: 10/11/2000 10:34 AM

We should add the Service Pack update number to the About Virtis/Opis in the help pulldown. This would be a great time saver to system administrators!

FROM: tthompson DATE: 10/11/2000 10:44 AM

Also in the Title Bar of the Connect Screen and the Splash Screen.

FROM: gbarnhill DATE: 10/11/2000 12:46 PM

Me, too, Me, too !!!!! How about a quick utility that reads the date stamps of the dll's, etc in the folder & checks against what everything should show according to which Service Pack is installed.

FROM: jduray DATE: 10/11/2000 5:13 PM

This feature is planned for version 4.

FROM: dteal DATE: 11/20/2000 10:38 AM

4/19/2016 3:14:46 PM

### Complete Issue Information

As far as I can tell - it's not included in the version 4 beta. This that correct?

FROM:jhnat DATE:11/20/2000 15:19:20

The Version 4 Betas and the Version 4 Release will all show version 4.0.0 (but the Betas show "Beta Build x" on the Splash Screen and About window). When the Service Packs for Version 4 are released, they will be version 4.0.1, 4.0.2, etc.

FROM:jduray DATE:1/16/01 11:42:47 AM

This feature is in the Service Pack 1 for version 4.0 being prepared today. All program files will be updated with the patch number. The Splash screen, About box and the Login dialog all display 4.0.1. Also, if you use Explorer to view the properties of the dll's it will show version 4.0.1 (Build 3002). The date of the dll is also changed.

### Description

FROM: tthompson DATE: 10/11/2000 1:59 PM

I came across a situation in which I have multiple databases, which may have the same structure on different databases. I had originally analyzed a structure on db A. I then made a change in the grade of structural steel and re-analyzed the structure. I came back to Virtis later and was using db B. I then went to View the Latest Analysis Results and View Analysis Log. Things didn't look right and after further investigation, the results I was seeing was from the db A results.

I think it's important that users realize this system shortcoming when we save data on a local hard drive that may or may not be current for the structure that they are looking at.

This is similar to Incident 1550 in having structures that are deleted have their results persist on the local harddrive. I have since learned to frequently clean out these files and subdirectories. I have found typically that each bridge consumes about 1.5 MB of hard drive space.

FROM: jduray DATE: 10/11/2000 5:06 PM

Please add to the bridge delete (from the bridge explorer) cleanup of the files on the hard drive.

FROM:jihnate DATE:2/27/2002 12:57:04 PM

Cleanup after bridge delete was added to incident 1550, which has been completed by Herman Lee.

### Description

FROM: dteal DATE: 10/11/2000 3:24 PM

In the Virtis/Opis Training Manual page RC2-17 we have an example of LRFD Moment and Shear distribution factor calculations. We don't have an example of calculating the Dist. Factors for single and multi lane deflection.

This calculation is # of lanes divided by # of girders. In the case of the equivalent width of longitudinal strips, the # of girders are equal to lane width divided by strip width.

FROM: jduray DATE: 10/11/2000 5:14 PM

Krisha - please add to manual.

FROM: kkennelly DATE: 10/26/2000 16:07:46

I've added the following to the Training Manual. Dean, let me know if it doesn't sound right.

The deflection distribution factor is calculated as the number of lanes divided by the number of girders. For a reinforced concrete slab bridge, the number of girders is taken as the lane width divided by the strip width. Our lane width is 12 feet and our strip width is 12" or 1 foot.

$$\text{Deflection DF} = \frac{1 \text{ lane} * 2 \text{ wheels/lane}}{(12' / 1')} = 0.1667 \text{ wheels/ft}$$

FROM: dteal DATE: 11/17/2000 8:42 AM

No – following is my interpretation of how Jay explained it to me.

$$\text{Deflection DF} = (\# \text{ Lanes} / \# \text{ of Girders}) * \text{Multi Presence Factor}$$

4/19/2016 3:14:46 PM

HRS AASHTO

660

**Complete Issue Information**

# of Girders = (Lane Width/Strip Width)  
 Therefore, Defl DF = (# lanes/(Lane Width/Strip Width))xMulti Presence Factor

For this example:  
 # Lanes = 1 or 2  
 Lane Width = 12 feet  
 Strip Width = 1 foot  
 Multi Presence factor = 1.20 for 1 lane and 1.00 for 2 lanes (Jay suggested using max number of lanes for multilane)

Single Lane DF = (1 Lane/(12' Lane/1' Strip)) x 1.20 = 0.100  
 Multi Lane DF = (2 Lane/(12' Lane x 2/1' Strip)) x 1.00 = 0.0833

FROM:kkennelly DATE:11/20/2000 08:13:35  
 The calculation that I put in above was for the LFD deflection df, I put that on page RC2-11. I've put the LRFD calculation in also on page RC2-17.  
 FROM: dteal DATE: 11/20/2000 10:34 AM  
 How do I get a copy of the most current training manual?  
 FROM: dteal DATE: 11/21/2000 11:42 AM  
 As of Nov 20th. the example manual is on the web. Thanks

| 2896.10483 | Resolved      | Incorrect Analysis Error Message |

### Description

FROM:kkennelly DATE:10/12/2000 12:58:43

I was trying to test some changes to the domain when I came across the following in the testcoverplates.bbd bridge.

Member G1 has a steel rolled beam cross section based alternate with 2 cross sections defined. Both cross sections have top and bottom cover plates defined. For the cross section ranges, I have 3 ranges. The middle range is over the pier. I defined section 2 at the left end of the range and section 1 at the right end of this range. When I try to run BRASS LFD, I get a zero web depth in this range. The sections.lby file has the correct shape dimensions in it so I'm not sure why BRASS is getting zero web depth.

FROM: bgoodrich DATE: 10/12/2000 3:52 PM

This bridge contains rolled beams with bottom cover plates that taper along the length of the girder. I don't think BRASS supports this type of definition. I think we ran into this issue before, but BRASS was not enhanced. I will forward this issue to WYDOT.

FROM:kkennelly DATE:10/13/2000 08:59:56

Maybe we should just have the export issue an error and stop.

FROM:jduray DATE:11/27/2000 14:40:23

I think the export should halt and inform the user that BRASS can't analyze this situation. It sounds to me like the error BRASS gives is not correct since it is referring to the web depth but the problem is tapering cover plates. Perhaps BRASS should be fixed too.

FROM:jduray DATE:11/28/2000 16:09:27

FROM: bgoodrich DATE: 11/29/2000 6:09 AM

I modified the export (BrassCrossSections.cpp) to detect this type of structure and halt execution. Fixed for Version 4.0 Beta Build 2.

Jim - Please change status of this incident to Resolved unless you think we should keep it around as a Suspended enhancement until we get approval from WYDOT to modify BRASS to address this structure type.

**Description**

FROM: dkoenig DATE: 10/12/2000 4:01 PM

When contraflexure points are located to close to tenth points, an error message will appear explaining that these two cannot coincide. Similarly, the same thing happens when a contraflexure point is located at a change point. However, the error message will refer to a change point being located at a tenth point. This is inaccurate. Here is an error message for a 114.8294 ft (35m) span. The 7th tenth point is located at 80.3806 ft., and the contra point is located at the field splice at 83.62 ft.

Error No.: 2103  
Type : Structural Analysis Error  
Location : Data File

\*\*\*\* ERROR \*\*\*\*  
THE CHANGE POINT LOCATED 83.62 FEET FROM THE LEFT END OF SPAN 1 IS WITHIN  
0.099 FEET  
OF THE 7TH TENTH POINT OF SPAN 1. NUMERICAL INSTABILITY WILL RESULT. ADJUST  
THE LOCATION  
OF THE CHANGE POINT SLIGHTLY AWAY FROM THE 7TH TENTH POINT. SEE PAGE 10.1 OF  
VOL 1

-----  
Error No.: 2103  
Type : Structural Analysis Error  
Location : Data File

One or more elements are too small. See detailed error messages above.

----- End of Contents of BRASS Error File -----

I assume the error message is needed, but is incorrect and misleading.

In addition to the above, I found that a contra point could be located exactly at a change point (High precision). Is this a problem? I think it would be, even though contra points are often located at 70, 30% (tenth points). Maybe a brief explanation would clear things up for me.

FROM: jduray DATE: 10/13/2000 9:22 AM

FROM: bgoodrich DATE: 10/13/2000 5:43 PM

I am not able to reproduce the problem based on the information you provided. Please attach your the BBD file for this bridge and I will investigate further.

FROM: dkoenig DATE: 10/16/2000 8:18 AM

I have attached a bbd file. G1 - Member Alternative's Engine is set with contra-points that will give the analysis error. The other girders, G2 - G5, have more precise contra-points defined. These girders do not give the error described above.

FROM: bgoodrich DATE: 10/23/2000 10:42 AM

I have forwarded the error message issue to Dan Glandt with some suggestions on wording. The issue regarding the precision to which contraflexure percents must be entered should be somewhat addressed by the new user-defined tolerance available in version 4.0. Currently, it is the users responsibility to enter contraflexure locations that do not create small elements, so some care must be taken when entering the contraflexure location percentages. This incident is related to the small element issue of Incident 2498.

FROM: bgoodrich DATE: 10/26/2000 9:43 AM

Dan Glandt corrected the error message in the BRASS-LFD engine. I will send the new BRASS DLL to

4/19/2016 3:14:47 PM

### Description

FROM: dkoenig DATE: 10/13/2000 7:57 AM

For bridges created after the release of patch 4, the distribution factors calculated from the "compute from typical section" are incorrect. I created 2 bridges from scratch, a 4 girder and a 5 girder. Exterior G1's factors are calculated like that of an interior girder for both bridges. The 4 girder bridge's G2 is given exterior distribution factors. G3 and G4 are OK. The 5 girder bridge's G3 has exterior factors while the rest of the girders are OK. It seems like certain girder's references are being switched. I assume this error occurred from the correction of Incident 2849.

The two bridges bbd files are attached to this document.

FROM: bgoodrich DATE: 10/13/2000 11:51 AM

I spoke with Jay about this issue. His suggestion is to modify the export to scale the number of bars in each row by the ratio of the yield stress of the that row to the yield stress of the first row. Say the first row contained 10-#8 bars (fy = 40 ksi) and the second row contained 12-#8 bars (fy = 60 ksi). The first row would be exported as is, but the second row would be exported as  $60/40 * 12 = 18$ -#8 bars (fy = 40 ksi). A warning message would definitely have to be issued for this case. I estimate I could make this modification in 4 hours. This affects steel structures as well as R/C and P/S. Please let me know what you decide.

Entered for Jim Duray:

Sounds good to me. Go for it!

FROM: bgoodrich DATE: 11/1/2000 9:35 AM

I modified the export (BrassCrossSections.cpp) to export the rebar as described in my comments from 10/13/2000. This affects Abxbrass.ocx. I tried testing this bridge using the latest BRASS-LFD engine (containing the omnibus steel changes) and I am getting a zero rating for several points. I am checking with Dan Glandt to determine if BRASS is truly correct.

FROM: bgoodrich DATE: 11/7/2000 3:52 PM

Dan Glandt corrected the rating factor problem. Fixed for Version 4.0. I sent the new BRASS DLL to Baker today.

FROM:kkennelly DATE:12/19/2000 10:51:38

Tested for Version 4.0 Release, export looks ok. BRASS LFD seemed to run ok.

**Description**

FROM: tthompson DATE: 10/13/2000 4:41 PM

We updated all our PC's in the office this week to SP4. IS there an easy way to get back to SP3? Or will a fix to SP4 be coming soon?

FROM: jduray DATE: 10/14/2000 11:10 PM

I hope to have a revised SP4 (SP4a) on Monday that replaces the faulty DLL and allows the other dll's that are part of SP4 to remain inplace.

If that isn't possible we will post the DLL's that were replaced by SP4 so you can easily remove SP4 (by going back to SP3).

Sorry for the inconvenience.

FROM: tthompson DATE: 10/18/2000 11:00 AM

Thanks for SP4A

**Description**

FROM: gbarnhill DATE: 10/18/2000 4:41 PM

I've created a girderline in metric that's a symmetrical 3 span steel composite. The critical rating comes out at POI 203 but the ratings at POI 207 do not agree. The difference seems to be in the calculation of  $\Phi * Mn$ . At 203 BRASS calculates +/- 3200 ftkip. At 207 the number is +/- 5100. The schematic appears to be symmetrical. If the number at 207 is correct, then the critical rating will be at 104 which gives a symmetrical result with 306.

I've attached the bbd file.

FROM: gbarnhill DATE: 10/19/2000 3:59 PM

update

I looked closer at the output. Virtis defaults the counterflexure change to 0.3 and 0.7 span. BRASS apparently always uses section properties at the left side of a change. The slab rebar stops at 2.274. 2.3 left is composite negative so no rebar or slab exist (the composite slab starts at 2.3 right). 2.7 left is composite positive and the composite slab exists. I changed the counterflexure location away from 2.3

4/19/2016 3:14:48 PM

HRS AASHTO

669

**Complete Issue Information**

and 2.7 and the results were then symmetrical (2.3 does not govern with composite positive sense). However, the capacities at 109 and 201 are approximately reversed from 301 and 209. The capacities at 110 and 200 are exactly reversed from 300 and 210.

FROM: jduray DATE: 10/19/2000 7:39 PM

FROM: bgoodrich DATE: 10/20/2000 10:49 AM

I imported this bridge with Version 3.0, analyzed it, and received unsymmetrical results just as Gale did. Then, I migrated by 3.0 database to 4.0 and analyzed it. This time the results were approximately symmetrical. The BRASS data files exported from both versions are nearly identical (comments differ slightly). It appears that the BRASS-LFD engine has been fixed between now and the last release. Fixed for version 4.0.

FROM: gbarnhill DATE: 11/15/2000 8:14 AM

OK in V4.0.0 Beta 1

### Description

FROM:jduray DATE:10/20/2000 08:54:25

To help with investigating the digits problem (VI 2802) I wrote an equation parser that can be used with edit controls. It is CParseEquation class in the TestDigits (CParseEquation) project in Source Safe. The following is a summary of what it does, how it works and what is needed to implement it within Virtis.

#### Summary of CParseEquation

-----

CParseEquation uses two stacks, one for numbers and the other for operators and functions. The advantage of this approach is it is easy to look at the next operator. This is necessary to determine how processing should proceed. A single stack could be used but a function would be required that can iterate the stack to look at the next function. I haven't found a situation with the two stacks where operations and values can get out of sync with each other, although that is a risk.

The equation is parsed and values are placed on the value stack and operators and functions are placed on the operator stack. Values are computed when ), \*, / or a function is the next operator ("compute" operators). The result of a calculation is pushed onto the value stack. As values and operators are used they are popped of their respective stack. As long as the next operator is a "compute" operator values continue to be computed. If the next operator is not a "compute" operator parsing of the equation continues.

Example of the two-stack approach:

=16\*cos(45+15)/4+(3+5)\*2

| Value Stack                                             | Operator Stack |
|---------------------------------------------------------|----------------|
| 16                                                      | *              |
|                                                         | cos            |
|                                                         | (              |
| 45                                                      | +              |
| 15                                                      | )              |
| -----compute because ) is next on the operator stack    |                |
| 16                                                      | *              |
|                                                         | cos            |
| 60                                                      |                |
| -----compute because function is next of operator stack |                |

## Complete Issue Information

```
16          *
.5
-----compute because * is next of operator stack
8          /
4
-----compute because / is next of operator stack
2          +
3          (
5          +
           )
-----compute because ) is next on the operator stack
2          +
8          *
2
-----compute because * is next of operator stack
2          +
16
-----compute because end of equation
18
```

Remaining to be completed:

- 1 - general cleanup of the code, can be more efficient and more testing
  - 2 - add more functions
- Suggestions:
- sqrt()
  - tan()
  - atan()
  - power 2^4
  - ToRadians()
  - ToDegrees()
  - PI
- 3 - add capability to convert feet inches and fraction to decimal feet  
(12 6 1/2 should convert to 12.5416667)
  - 4 - need to report why an equation cannot be evaluated (error reporting)
  - 5 - need to figure out how to implement in the GUI

Some issues are:

- do we store the equation for viewing after it is evaluated
  - need a wide edit control for entering/viewing the equation
- 6 - perhaps improve the equation scanner to identify syntax that may confuse the parser

It currently supports +, -, \*, /, cos, sin, acos, asin, ( & ) with nesting. The stacks are currently fix-dimensional arrays but could be changed to CArrays so they can grow as necessary. The values are stored in the CStack object and the operators are in COperatorStack object.

FROM: kfulton DATE: 10/20/2000 3:45 PM

I have several structures where there is not a diagram at the beginning of the span. When I try to run an analysis, I get the following error message:  
Input Errors (1878) - BRACING-SCHEDULE: The first range used for defining cross bracing for a span, must begin at 0.0 feet.

----- Contents of BRASS Error File -----

File: D:\VirtisOpis30\LDL\6\_Girder\_-\_W\_Beam\_-\_Simple\_Span\G3\interior\_-\_G3.ERR  
Fatal Error Encountered - Unexpected Termination  
Data File: r\_-\_W\_Beam\_-\_Simple\_Span\G3\interior\_-\_G3.dat

## Complete Issue Information

Error No.: 1878  
Type : Input Error  
Location : Input Data File

### \*\*ERROR\*\* BRACING-SCHEDULE

The first range used for defining cross bracing for a span, must begin at 0.0 feet.

----- End of Contents of BRASS Error File -----

This is a BRASS limitation, but it should not require the user to input bracing that does not actually exist. I feel that the export should take care this problem.

FROM: gbarnhill DATE: 10/25/2000 12:54 PM

Please be sure to check this out both in system and girderline. In Girderline in the BRACING RANGES window, you MUST put in a zero start distance and a zero space for Virtis to correctly export the first BRACING SCHEDULE command to BRASS.

FROM: bgoodrich DATE: 10/31/2000 7:46 AM

Keith - I spoke with Jim and he said you should enter a diaphragm at the support to indicate that the beam ends embedded in the abutments are brace. Virtis is not currently capturing diaphragm materials and geometry. He does not want the export to "assume" that the ends of the beam are braced.

### Description

FROM: dkoenig DATE: 10/24/2000 10:53 AM

A low rating (0.13) occurred on a 2 span continuous plate girder bridge. The tabular report shows that shear controls at the 200.00 point of the bridge (2nd support – Right side). Looking at the Brass data, the low rating occurs because Brass considers this point unstiffened when it should be considered stiffened. Looking at the Brass schedule commands, the STIF-TRAN-SCHEDULE commands for span 1 are OK, but the two stiffener spacings just to the right of support 2 are incorrect (Virtis is correct). This spacing would give this low rating. The tabular report supports this, but I can only analyze the low rating when a 110.00 POI is created not a 200.00 POI. It seems like there is some switching going on here between data.

The correct stiffener spacing near the support in mm is:

[ 3350 [ 1675 [ 1675 [ 3350 [

with the center being the bearing stiffener.

In addition to this, the following warning message was given at the 107.00 location.

\*\*\* WARNING \*\*\*

AT ANALYSIS POINT 107.00, THE WEB THICKNESS REQUIREMENT, AASHTO 10.48.5.1 EQ. (10-104) OR AASHTO 10.49.2 EQ. 10-120), HAS NOT BEEN SATISFIED. LONGITUDINAL STIFFENERS THEREFORE REQUIRED. NO LONGITUDINAL STIFFENERS WERE ENTERED

## Complete Issue Information

AT THIS LOCATION, ENGINEER SHOULD REVIEW

This plate girder is comprised of 50 grade steel and a 10 mm web throughout.

I have attached the bbd file for this bridge (A5783).

Any information leading to the cause of the low rating is appreciated.

FROM: bgoodrich DATE: 10/26/2000 9:48 AM

The low rating is caused due to round-off when the stiffener ranges are written to the BRASS data file. The span length is 111.5485564 ft which is written to the data file as 111.5486 ft. The start distance and range for the problem stiffener are 106.0531496 ft (106.0531 ft in data file) and 5.4954068 ft (5.4954 ft in data file), respectively. When the start distance and range in BRASS are added together, we get 111.5485 ft. Therefore, the small gap of 0.0001 ft within BRASS contains no information regarding stiffener spacing, so it is treated as unstiffened. Because the gap is adjacent to the 110.0 point, this is why the low rating occurs. I don't think there is any work-around that can be done because the problem stems from round-off problems. You might try defining the stiffeners in each span by referencing the start of the span, i.e., do not define ranges that cross supports. I am currently working on a correction to this problem.

FROM: dkoenig DATE: 10/27/2000 8:39 AM

I forgot to tell you that I corrected the Brass stiffener schedule (Visually it looked correct) data by entering the stiffeners near the support referenced from the support. This did not correct the rating.

FROM: bgoodrich DATE: 10/31/2000 7:52 AM

The problem with the stiffener ranges being switched for span 2 was due to an export error when interpreting the ranges that crossed interior supports. I corrected this problem so stiffener ranges are correctly generated and I tested several configurations to verify the modifications. I also addressed a similar problem with the generation of the BRASS stirrup and bracing schedules. This affected the following Abxbrass files:

- BrassStifTranScheduleGroupCmd.cpp
- BrassStirrupScheduleGroupCmd.cpp
- BrassBracingScheduleCmd.cpp

I corrected the round-off problem for the last range of a span by comparing the sum of the start distance and range that BRASS will use to the span length that BRASS will use. The export basically adjusts the BRASS range so when added to the BRASS start distance, it adds up to the BRASS span length. This affected the following Abxbrass files:

- BrassCmd.cpp
- BrassCmd.h
- BrassLrfdStifTranScheduleGroupCmd.cpp
- BrassLrfdStifLongScheduleGroupCmd.cpp
- BrassLrfdBracingScheduleCmd.cpp
- BrassLrfdLatSupportScheduleCmd.cpp
- BrassShearConnScheduleCmd.cpp
- BrassLrfdStirrupScheduleGroupCmd.cpp
- BrassConcStlimScheduleGroupCmd.cpp
- BrassStdStifTranScheduleGroupCmd.cpp
- BrassStdStifLongScheduleGroupCmd.cpp
- BrassStdBracingScheduleCmd.cpp
- BrassStdLatSupportScheduleCmd.cpp
- BrassSteelGirderControlCmd.cpp

**Description**

FROM: snshah DATE: 10/27/2000 12:52 PM

I am getting an error from VIRTIS while attempting to enter vertical stirrups in reinf. concrete T-girders. I am being told that the end distance is not equal to the beam length; however, this is NOT correct. The information that is entered does actually equal the beam length. It seems as though VIRTIS does not acknowledge the last stirrup line entered.

In the attached file, the problem can be found in girder G2.

FROM: kkennelly DATE: 11/03/2000 08:25:46

Validate checks if the end distance is within 1' of the end of the span and issues a message asking if you want to change the spacing so that the end distance = the end of the span. It doesn't consider which row of the grid the data is in because a user could enter data into the grid out of order (for example the first row in the grid could contain the data for the rightmost range of stirrups on the girder). If you say no to the warning message you can continue in Virtis without any errors.

FROM: kkennelly DATE: 12/19/2000 12:53:58

I'm marking this as duplicate of 3017. Another user reported same behavior in incident 3017. This functionality will be changed in Version 4.1 under incident 3017.

**Description**

FROM:kkennelly DATE:10/31/2000 10:16:42  
Submitted from email received on 10/10/00 from AIMS Group

Jim,

I've been having some problems in analyzing this steel bridge with VIRTIS 3.0. With this e-mail, I'm attaching its the .bbd file.

I have looked at both the BWS file and performed validation for the bridge but unable to fixed the errors. I hope you can give me some pointers on how to resolve the described problems. Below are brief descriptions of the bridge and its error messages from

VIRTIS.

File Name: 002562.BBD

Bridge Description:

It is a 5-spans continuous & 4-girders steel bridge with concrete deck. The exterior girders are continuous steel plate girders with various size of webs and flanges. The interior girders (stringers) are both standard steel rolled shapes (W21X68). The weight of both stringers and their loads are supported by floor beams (various sizes along the bridge). The floor beams then transferred the loads to both exterior steel plate girders (so both stringers sit on top of the floor beams). The top flanges of all the girders are embedded in the haunch.

Bridge Creation Method:

I used the girder system method and specified the floor beams as diaphragms. I created the exterior Steel Plate Girders and the interior standard rolled shape stringers using the schedule method. The contributing dead loads: girders' & floorbeams selfweight, concrete deck and two road barriers.

Live Load: Standard HS-20

Error during analyzing process:

 Max. number of cross-section ranges exceeded for BRASS  
 Error Generating BRASS span commands.

My email response 10/11/00:

Hi,

Jim Duray asked me to look into the problems you are having analyzing Bridge 002562. I've found the following:

- 1. Error Msg: Error Generating BRASS span commands.  
 No. of Ranges = 20 (max=18)  
 Max. number of cross-section ranges exceeded for BRASS  
 Error Generating BRASS span commands.

BRASS LFD has a limitation of a maximum of 20 cross section ranges in a span. A cross section range exists between points where the girder cross section (plate widths & thicknesses, deck thickness, etc.) changes properties. Span 3 of your bridge has 18 cross section ranges in BRASS due to the changes in the web and flange properties. BRASS LFD also internally creates a cross section change point at the points of contraflexure in the span. This adds another 2 ranges to Span 3 causing it to have 20 ranges which exceeds the BRASS maximum.

**Workaround:**

BRASS is placing the 2 points of contraflexure at 30% and 70% of the Span 3 length. This can be found on the STPLGR(outside) Member Alternative:

Engine tab. Select BRASS LFD as the engine, click the Properties button and a window will appear displaying a table of the points of contraflexure.

The default locations are 30% and 70%. This turns out to be 90' and 210' into Span 3. Based on the flange profiles that you have entered, this span has a flange change point at 96' and 204'. Change the locations of the points of contraflexure to 32% (96') and 68% (204') of Span 3. This reduces the number of cross section ranges in BRASS to 18 for Span 3 and this member will run (probably without a major effect on the analysis).

Another workaround is to slightly modify the top and bottom flange profiles so that they match the web profile to eliminate 2 small cross section ranges. The web profile in Span 3 has a change point at 47.5244' and 252.2574'. The top and bottom flanges have change points at 47' and 253'.

If you modify the top and bottom flange profiles to change at 47.5244' and 252.2574' as follows, this will reduce the number of cross section ranges

in this span and the member will run (again, probably without a major effect on the analysis)

Top and Bottom Flange Profile (I've only shown a portion of the grid)

| Support Number | Start Dist | Length  |
|----------------|------------|---------|
| 3              | 29.0000    | 18.5244 |
| 3              | 47.5244    | 48.4756 |
| 3              | 96.0000    | 21.0000 |
| etc. etc.      |            |         |
| 3              | 204.0000   | 48.2574 |
| 3              | 252.2574   | 18.7426 |
| 3              | 271.0000   | 58.0000 |

etc.

I will forward this incident to Bridgetech (the writers of BRASS) so that they can check into increasing

**Complete Issue Information**

the maximum number of cross section ranges in a span.

FROM: bgoodrich DATE: 11/1/2000 5:46 AM  
I forwarded this issue to WYDOT around a couple weeks ago, but a decision has not been reached.

FROM: bgoodrich DATE: 08/09/2001 13:18:32  
The number of cross section and web ranges has each been increased to 40 per span in both BRASS-GIRDER and BRASS-GIRDER(LRFD). This is related to Incident 2812. Fixed for Version 4.1.

FROM: kkennelly DATE: 10/31/2000 10:22:18  
Submitted from email received on 10/10/00 from AIMS Group

Jim,  
I've been having some problems in analyzing this steel bridge with VIRTIS 3.0. With this e-mail, I'm attaching its the .bbd file.

## Complete Issue Information

I have looked at both the BWS file and performed validation for the bridge but unable to fixed the errors. I hope you can give me some pointers on how to resolve the described problems. Below are brief descriptions of the bridge and its error messages from VIRTIS.

File Name: 002562.BBD

Bridge Description:

It is a 5-spans continuous & 4-girders steel bridge with concrete deck. The exterior girders are continuous steel plate girders with various size of webs and flanges. The interior girders (stringers) are both standard steel rolled shapes (W21X68). The weight of both stringers and their loads are supported by floor beams (various sizes along the bridge). The floor beams then transferred the loads to both exterior steel plate girders (so both stringers sit on top of the floor beams). The top flanges of all the girders are embedded in the haunch.

Bridge Creation Method:

I used the girder system method and specified the floor beams as diaphragms. I created the exterior Steel Plate Girders and the interior standard rolled shape stringers using the schedule method. The contributing dead loads: girders' & floorbeams selfweight, concrete deck and two road barriers.

Live Load: Standard HS-20

Error during analyzing process:

2. Error Msg: Error Generating ASF/LFD loads commands.
  - Error generating load group commands.
  - Load Case: Haunches & Diaphragms.
  - The number of concentrated loads exceeds the maximum allowed by BRASS.
  - No. of concentrated loads = 92 (Maximum = 70)

My email response 10/11/00:

Hi,

Jim Duray asked me to look into the problems you are having analyzing Bridge 002562. I've found the following:

2. Error Msg: Error Generating ASF/LFD loads commands.
  - Error generating load group commands.
  - Load Case: Haunches & Diaphragms.
  - The number of concentrated loads exceeds the maximum allowed by BRASS.
  - No. of concentrated loads = 92 (Maximum = 70)

This message is being produced when trying to analyze Member G2. This structure has a total of 46 diaphragms in each girder bay. When Member G2 is analyzed, the export applies the weight of each diaphragm as a concentrated load to the member in the BRASS LFD input file. Since this member is an interior member, it gets the load of the diaphragms from both bay 1 and bay 2 which results in a total of 92 point loads due to the diaphragms.

Workaround:

Eliminate the diaphragms in bay 2 and double the weight of the diaphragms in bay 1 to produce the

4/19/2016 3:14:50 PM

HRS AASHTO

684

**Complete Issue Information**

same loading effect on the member. This will cause only 46 point loads to be applied in BRASS LFD which is below the maximum of 70. I will forward this incident to Bridgetech (the writers of BRASS) so that they can check into either increasing the maximum number of point loads or combining diaphragm point loads that exist at the same location along the length of the member to reduce the number of loads.

As an aside, I don't think that your attempt to model the floorsystem of this bridge in Virtis is creating an accurate model. The 2 interior stringers that you have modeled are going to have span lengths of 150'/225'/300'/225'/150' not the true span lengths between the floorbeams. The diaphragms in Virtis do not provide any support below the members, just lateral support. Also, the diaphragms in Virtis are not transferring any live load to the exterior girders as floorbeams would.

FROM: bgoodrich DATE: 11/1/2000 5:48 AM  
I forwarded this issue to WYDOT around a couple weeks ago, but a decision has not been reached.

I did modify the export (LoadsUtility.cpp) to combine concentrated loads due to diaphragms when they are applied at the same location. This affects Abxbrass.ocx. Fixed for version 4.0.

Jim - Should we still be making the point load increase request to WYDOT? Is it necessary for us to update the engine help to indicate that the combining of diaphragms at the same location is done by the export?

FROM: jduray DATE: 11/28/2000 15:25:21  
I don't think we need to now. What the export is doing (with your recent change) is what an engineer would do. With this change Virtis should be able to analyze any diaphragm arrangement that BRASS can analyze.

**Description**

FROM: dteal DATE: 10/31/2000 11:03 AM  
Effective Width is named by 2 things in Virtis/Opis and a third in AASHTO.

In the "Structure Definition Wizard – Deck" it is called Effective Slab Width.  
In the "Deck Profile" window it is called Effective Width.  
And in AASHTO it is called Effective Flange Width.

We should be calling it the same as AASHTO does in the Spec book - Effective Flange Width.

FROM: jduray DATE: 11/07/2000 08:53:05  
Seems reasonable.

FROM: jihnat DATE: 11/28/2000 10:01:06

### Description

FROM: dkoenig DATE: 11/2/2000 1:13 PM

During the rating of a continuous non-composite WF bridge, a fatigue rating of zero occurred. The following information is what I know about the situation.

1. Rating control point is 207.00.
2. Contraflexure points were defaulted to 30, 70.
3. The error occurs when the contraflexure point is set as 70.  
70.0001 and 69.9999 does not give this rating or anything even similar (Serviceability controls).
4. Setting the contraflexure points to 20 and 80 does not cause a fatigue rating of zero.
5. The zero rating occurs because the Allowable Fatigue Stress is shown to be zero in Brass at this point.
6. This is the first time I have ever seen Brass give a value for the Allowable Fatigue Stress (usually gives \*\*\*\*\* for the value).
7. The 70 point is in between a diaphragm and a change in section, but so is the 80 point.

This fatigue rating is incorrect, and I do not believe it should have occurred. I am attaching the .bbd file for this bridge. The contraflexure points are only defaulted for G1 and G2, and only the second spans

## Complete Issue Information

of each. This may help with comparisons.

FROM: bgoodrich DATE: 11/20/2000 11:22 AM

There is a 0.0001 ft gap in the STEEL-GIRDER-CONTROL schedule commands, which is caused by rounding of floating point values when generating the BRASS commands. Basically, the start distance one command does not exactly equal the start distance plus the range of the previous one. The tolerance modifications do not address this problem because it is all in how the rounding is done. This gap problem can potentially occur in all BRASS schedules depending on the values input by the user. It would be straight-forward to modify BRASS to check the schedule ranges and adjust them slightly so there are no gaps. If this is not done, then the export will have to be modified to store all schedules as they would be output to BRASS, i.e., a Virtis value of 45.55555555 is basically 45.5556 to BRASS because of rounding. I think modifying the export would take much more time than modifying BRASS.

FROM: bgoodrich DATE: 12/1/2000 2:58 PM

I modified the following files to address the issue regarding the minor gap or overlap due to rounding. Because the schedules were generated from left to right in consecutive order, I stored the end distance of each range, so the next time a command was generated, the distance written to the previous BRASS command could be used to determine if the current start distance and length should be adjusted.

### Description

FROM: dteal DATE: 11/2/2000 1:17 PM

On a steel welded plate structure I have indicated that I wanted my POI to be on the "Right" side (Opis). In Stage 1 it reported correctly (right side) but for stage 3 it switched and reported shear values for the left side. I believe that this should be fixed.

FROM: bgoodrich DATE: 11/7/2000 3:43 PM

Note that BRASS computes actions at the element ends, but it reports them at nodes. BRASS should report the actions for the element with the smallest area and moment of inertia. Please attach the BBD file and indicate the POI for which you think an error exists. Also indicate the truck, limit state, and any other information that you think will help.

FROM: dteal DATE: 11/15/2000 9:27 AM

I have tried to duplicate the problem - could not reproduce it! I will go back and check it from time to time to see if it happens again.

FROM: bgoodrich DATE: 11/28/2000 6:34 AM

Marked as Not Reproducible.

**Description**

FROM: dkoenig DATE: 11/2/2000 3:05 PM

When a bridge is copied for ease in creation of another bridge, the materials cannot always be deleted. I have noticed this on the concrete materials, and assume it is the same for the rest. The materials that cannot be deleted are from the bridge originally created from scratch. If the materials were created at the beginning of the process of creating the bridge, these materials cannot be deleted for the copies of this bridge. These materials can be changed, but not deleted. If a material is added to a bridge after the bridge is created from scratch and then copied, the copy can delete this material. This leads me to believe that the materials are being referenced somewhere behind the scenes when a bridge is created.

Note: The materials that cannot be deleted have had all the references removed that are attainable by

**Complete Issue Information**

the user.

I have attached two bbd files. A6017 is the bridge created from scratch. A6018 is the copied bridge. Neither bridge uses the Class B1 concrete. This material cannot be deleted in the A6018 Bridge.

FROM:jduray DATE:11/07/2000 09:02:12

I was able to reproduce this by creating a new bridge, add a conc matl, add a gl struct def, add a member, add a slab member alt, add a cross section and assign the conc matl. Save the bridge, copy using the BE, open the copy and add a new conc matl. Change the conc matl for the cross section to the new matl and apply, then delete the original conc matl. The delete fails because it is assigned. After stepping through GetAssignmentStatus(CDeMatlConc\* pDeMatlConc,...) I found that the original conc matl is still assigned to the top flng. Changing the conc matl for the cross section changes m\_peiFkConclCom but not m\_peiFkTopFngConclCom.

FROM:jduray DATE:11/07/2000 09:59:38

I don't think this has anything to do with copied bridges.

When a new cross section is created CUIBWSTreeRcXSectionLabelItem::OnFileNew() calls DoRcXSectionPtr->SetConcreteld(IConcreteld) and DoRcXSectionPtr->SetTopFlangeConcreteld(IConcreteld) which set the top flange conc. id. For a slab xsect there is no way to ever change the top flg conc id so the one assigned to it can never be deleted. This value is probably not used anywhere. We either should not set the top flange conc id here or we should reset it when the conc id is changed.

FROM:jihnat DATE:11/10/2000 09:27:34

I made both changes. Not setting the ID when the slab xsec is created will fix the problem for new xsecs, and setting ID to zero in the slab xsec view will allow existing slab xsecs to function correctly, Fixed for Version 4.0 Beta Build 2.

\*\*\* Users should also be aware that a material cannot be deleted if it is a default material for a member alt. \*\*\*

**Description**

FROM: kfulton DATE: 11/13/2000 9:55 AM

Since Madero requires all of the LL distribution factors (both single and multiple lanes) and I can not import my existing brass files I will be entering (if i decide to enter the bridges) all of the timber structures as girder systems. Because of this, I will let madero calculate the LL distribution factors. When we have a structure with broken/split/repared stringer, we increase the wheel fraction to the adjacent stringers. I would like to have a field that allows for a percent increase/decrease to the wheel fraction and since I am asking for enhancements, I would also like to see a place to mark if the stringer is broken/split/cracked/repared/etc.

HRS AASHTO

693

**Complete Issue Information**

FROM:jduray DATE:12/04/2000 09:45:24

We do warn before the delete. What else do you suggest we do. We could add a Deleted Folders folder and security similar to what we do for the Delete Bridges folder.

When a folder is deleted we would move it to be a sub-folder of Deleted Folders. We would allow undelete if the parent folder is still present.

FROM:dteal DATE:Tuesday, February 26, 2002 3:46:48 PM

An option like that would be wonderful - when can we have it??

FROM:dteal DATE:Tuesday, June 17, 2008 11:35:50 AM

Exactly what was resolved?

Anything to test here?

## Complete Issue Information

FROM:jduray DATE:11/16/2000 10:06:08

Sounds like a good idea to me. I will check on how to code that.

FROM:jduray DATE:11/22/2000 15:56:40

Looks like we could allow a user to change the folder, however, we would have to iterate the tree to check the folders along the branch.

We do not allow private folders to have public children. To keep with this (I think this makes sense) we must do the following:

When changing a private to public:

Check that no folders up the tree are private (a public folder may not have a private ancestor).

When changing a public to private:

Check that no folders down the tree are public (a private folder may not have public children).

| 2972.10407 | Closed        | 4.0 beta 1 - SCALE FACTOR in Analysis Settings not used by BRASS |

### Description

FROM: snshah DATE: 11/15/2000 1:32 PM

When performing analyses for overweight permit vehicles, we are often required to recalculate distribution factors using methods besides the AASHTO standard equations, or reduce the impact factor. However, in VIRTIS, you must be able to check out a bridge in order to change the distribution or impact factors, which also allows you to alter the entire set of bridge data.

If possible, it would be quite useful if it were possible to manipulate impact and distribution factors without being able to change the structural data within the file. That way, a technician could manipulate these factors without worry that they could drastically alter the data file.

### Description

FROM: gbarnhill DATE: 11/15/2000 4:18 PM

I checked to see how the VEHICLE PROPERTIES (the ADVANCED button on ANALYSIS SETTINGS) could be used for Incident 2969.

Virtis Help says:

Scale Factor

For the displayed vehicle, enter a scale factor by which the live load is to be increased or decreased. For example, if the displayed vehicle is an HS20 vehicle, a scale factor of 1.25 can be entered to represent an HS25 vehicle.

Since the SINGLE LANE LOADED check on the properties is no good for Girder Line definitions, it would seem possible to generate a single lane distribution factor by entering 5.5/7.0 as the scale factor value.

HOWEVER, the export log says:

WARNING (High):

4/19/2016 3:14:53 PM

HRS AASHTO

697

## Complete Issue Information

The Vehicle Properties scale factor is not used by BRASS!

FROM: bgoodrich DATE: 11/28/2000 2:43 PM

The scale factor is not supported by BRASS-LFD as indicated by the warning message and the Vehicle Properties topic in the BRASS-LFD engine help.

The export could modify the axle weights based on the scale factor, but the BRASS output would not indicate that this was done. BRASS could be enhanced by adding this factor to a command and modifying the engine appropriately. Therefore, this issue will be considered an enhancement and suspended until approved by the Task Force.

FROM:bgoodrich DATE:06/08/2001 14:17:02

Incident 3154 is a duplicate of this incident. Incident 3154 contains instructions from Jim Duray to address the scale factor issue by adjusting the wheel fractions of the appropriate vehicle.

FROM:bgoodrich DATE:06/08/2001 15:28:13

I modified the export for versions 4.0 and 4.1 to include the scale factor in the wheel fraction passed on to BRASS. I also added an export warning message when a scale factor other than 1.0 is specified.

Krishna - Please update the BRASS LFD engine help. In the Vehicle Properties (BRASS LFD) topic, remove:

Scale Factor  
Not used by BRASS LFD.

and replace it with:

No exceptions to this window for BRASS LFD.

### Complete Issue Information

#2812 address's BRASS LFD's shortcomings in number of allowed sections. Going to schedule based input would greatly reduce the amount sections entered and the problems with finding economical designs.

Think of this design scenario to find the bar cut off point in the top steel near a pier beam. Every time you want to do a design review with a bar a foot shorter or a foot longer you have to: 1. Calculate a slab thickness of the haunch at the new section 2. Enter the new section (which will not be numerical order – it will be placed at the end of the listing) 3. Change all the range information from that point on. Sounds messy!

## Description

FROM: dteal DATE: 11/17/2000 2:31 PM

There is definitely a need for a way to re-order the cross section listing for a RC bridge. When cross sections are first entered they are in order from left to right. During the design process we find that re-steel needs to be either extended or shortened. So a new cross section may be added. This new cross section will be added to the end of the list. Once the final design is accepted the cross sections

**Complete Issue Information**

in the center of the beam, the program can not resolve the spacing and export it correctly to BRASS-LRFD (OPIS)

Attached is the export of the bridge and also the error message during the run. The distance for the 40 middle rows is 15.4 m not 15.399.

attached are some files that may help on the problem

Thanks

FROM: jduray DATE: 11/21/2000 9:01 AM

FROM:kkennelly DATE:11/30/2000 14:56:46

This problem is due to the fact that you have entered a shear connector range with a length = 0. If you delete the shear connector row with a start dist = 0 and length = 0, BRASS LRFD will run ok.

Brian, The export is generating an incorrect Shear-conn-schedule command for the shear connector row that has length=0. One of the variables in that command must not be initialized and a garbage number is passed to the BRASS input file. (Structure name: Single, Member 2)

FROM: bgoodrich DATE: 12/1/2000 2:55 PM

I corrected the export (BrassShearConnScheduleCmd.cpp) so it does not try to export a zero length for shear connectors. Fixed for Version 4.0 beta build 2.

| 3008.12340 | Resolved      | BRASS LFD Serviceability check at transfer pt vs. CL Brg |

**Description**

FROM:kkennelly DATE:11/21/2000 09:32:55

When viewing analysis results (especially LRFD critical loads) it would be nice to show moment, then shear, then axial across the grid. We currently show moment, axial, shear. Once you scroll over to see shear, the span and location are no longer visible in the grid. It would be even nicer to be able to turn off some columns in the grid.

FROM:jduray DATE:11/21/2000 14:56:39

Joe - please arrange the columns the way Krishna suggests.

FROM:jihnmat DATE:2/6/2003 3:06:21 PM

Done for version 5.0.0 beta build 4 (columns arranged Moment-Shear-Axial).

Incident now changed to Suspended/Enhancement for the second part of this request.

| 3012.12336 | Resolved      | Framing Plan Schematic - Timber Bridge |

### Description

FROM:kkennelly DATE:12/12/2000 10:04:45

Submitted based on phone call from Mike Perham, Bayside Engrs. 617-625-4696:

BRASS LFD box beam, serviceability (tension in top of beam) at 100 point is controlling. He is used to checking serviceability at transfer pt so little bit of DL there helps reduce the tension. His question is BRASS checking the serviceability at CL bearing or transfer point. I think he also wants to know how to check serviceability at transfer pt instead of cl brg.

I spoke to Brian this morning and he is going to return call to user.

FROM: bgoodrich DATE: 12/12/2000 9:54 AM

I called Mr. Perham and suggested that he add a point of interest at the transfer location and that he could change the POI generation option to only generate user-defined POI.

4/19/2016 3:14:55 PM

HRS AASHTO

707

### Complete Issue Information

He also inquired about where he could find the loss output. This output is available from BRASS-LFD, but it has not been implemented in the engine properties. I added this issue as Incident 3010.

FROM: kfulton DATE: 12/12/2000 1:31 PM

The framing plan schematic has some problems. In some bays, lines are shown which are not shown in others.

FROM: jduray DATE: 12/13/2000 08:16:24

Please provide a bbd file so I can reproduce. Are you running on NT or 2000?

FROM: kfulton DATE: 12/13/2000 9:09 AM

I am running NT. The bbd file will be in incident 3015.

4/19/2016 3:14:55 PM

HRS AASHTO

708

**Complete Issue Information**

FROM:jduray DATE:12/18/2000 10:56:00  
Does it still draw incorrectly since you got the abobrdg.dll?

FROM: kfulton DATE: 12/21/2000 11:02 AM  
The new dll helped, but the picture still has some problems when small girder spacings are entered. For most of our timber structures we have small spacings (<2ft). If you enter a girder system with variable spacing (all spacing less than 3 ft) the length of the diaphragm (red line) is not scaled correctly. For one. bay it is only a small dot and the next it is full length. See attached bbd file.

FROM:jduray DATE:12/21/2000 13:38:56  
Since I couldn't reproduce the problem and didn't hear from you I assumed this was resolved. We have already done the release build so this will have to be addressed in a future service pack or release.

FROM:jduray DATE:1/5/01 10:13:10 AM  
I am changing this to a release bug.

FROM:kkennelly DATE:1/23/2002 8:10:42 AM  
I can reproduce this in 4.1.0

FROM:jihnata DATE:7/19/2005 11:56:43 AM  
The space between the girder and the diaphragm is constant, not the length of the line representing the diaphragm.  
I tweaked the schematic to look a little better when small girder spacings are used.  
For future testing, a version 5.3.1 BBD file is attached.  
Fixed for 5.4.0

I modified the export to address the errors reported above. Now, only one should be reported indicating that splayed girders and/or tapered overhangs were detected. BRASS does not support a splayed girder system. This is mentioned in the engine-specific help topic named "Structure Framing Plan Details: Layout" for both BRASS programs. You must define this structure using girder line structure definitions if you wish to use BRASS. Fixed for Version 4.0.

Please see attached lrfdtest.bbd file (4.0 beta 2) - member 2. ( file 2286.bbd is the 3.0 version)

In the deck profile - shear connectors tab, I get a message when ever I hit the OK or Apply button that

## Complete Issue Information

states that the end distance is not the same as the beam length and if I want to change the length. If you look at the values, I have shear connectors defined for the full length. I would prefer not to have to hit the no button on the message popup everytime. In version 3.0, the an error occurs in the shear connect spacing export, but does work for 4.0beta2.

In 4.0beta2, I get an error about the diaphragm spacing needs to be greater than zero. The structure is a single span with one diaphragm in each bay.

Here is the error message I get:

Error generating LRFD schedule commands!

01:45:05 PM - Line 192 in source file D:\Virtis\GUI\abxbrass\BrassLrfdSchedules.cpp.

The number of diaphragm spaces must be greater than zero!

FROM:jduray DATE:12/14/2000 16:01:46

Krishna - please investigate the problem in the deck profile window then assign to Brian.

FROM:kkennelly DATE:12/14/2000 16:29:55

I am unable to import this bridge into 4.0. Please try to export this bridge again and attach a new bbd file while we try to figure out why the import doesn't work.

FROM: kfulton DATE: 12/14/2000 5:01 PM

Try lrfd-40-beta-2.bbd file

FROM:kkennelly DATE:12/15/2000 08:04:06

I was able to import lrfd-40-beta-2.

1. The message you are getting in the Shear Connector window is telling you that the end distance for the next to last row is 15.7m. In the grids in the gui, if the end distance for an item is within 1' or 300 mm of the end of the beam, we issue a message to ask the user if they want the gui to change the length or spacing for them so the end distance matches the end of the beam. We did that because users previously requested help entering data particularly for skewed members that might have slightly different beam lengths. Since items can be entered in the grid in inconsecutive order, we do this check on every row in the grid, not just the last row. I'll check with Jim if we should change the behavior of the gui. I'm hesitant to do that because we would have to do that to every grid in Virtis and I don't want to introduce any widespread problems right before release.

2. The error message that you are getting about the diaphragms is "The number of diaphragm spaces must be greater than zero" not the spacing must be greater than zero. You have incorrect data entered in the Framing Plan window. For example, Girder Bay 1 has the following data:

### Complete Issue Information

| Support | Start Dist Left | Start Dist Right | Spacing | # spaces |                     |
|---------|-----------------|------------------|---------|----------|---------------------|
| 1       | 0               | 0                | 0       | 1        |                     |
| 1       | 9.905           | 9.097            | 0       | 1        |                     |
| 1       | 9.905           | 9.097            | 0       | 0        | <----- invalid data |
| 1       | 16              | 16               | 0       | 1        |                     |

If you delete this row of data and the similar row in Girder Bay 2, Brass will run.

FROM:kkennelly DATE:12/15/2000 08:34:28

1. We are going to make this change for 4.1.

Programmer Resolution for 4.1: In the Validate functions for the grids in the gui in the if statement if the end distance is less than the end length of the beam within the max tolerance, call a function to scan every end distance in the grid and check if the current end distance is the largest of all the end distances. If it is the largest, issue the message to the user. If some other row contains the largest end distance, don't issue the message. (Note this scan function will have to add the span start distance to the end distance to get the true end distance from the left end of the beam for each row.)

Keith, I'm marking this incident as resolved until you read it and comment and then I will change its status to Assigned and Category to Enhancement to make sure it gets done for 4.1.

FROM: kfulton DATE: 12/15/2000 3:52 PM

The line you want me to remove from the diaphragm spacing is placed there by the diaphragm wizard.

FROM:jduray DATE:12/18/2000 10:28:35

FROM:kkennelly DATE:12/18/2000 13:29:40

Diaphragm wizard no longer creates a diaphragm range set with 0 number of spaces. Code fixed for Version 4.0 Release.

FROM:kkennelly DATE:5/17/01 2:01:19 PM

Estimate time for this enhancement:

24 hrs to make this change.

8 hrs to add and test function to UiMiniGrid to scan all rows for largest end distance.

Windows to visit to add this change:

**Description**

FROM: dteal DATE: 12/21/2000 3:23 PM

AASHTO LRFD BRIDGE DESIGN SPECIFICATIONS (2000 INTERIM):

S 6.10.4.3.1a General

For homogeneous sections, Rh shall be taken as 1.0.

In the design example, the only material specified for use as "Structural Steel" is the "Copy from Library" values for A709M Grade 345W steel. Using a girder system and creating the members using the software's wizard, each plate girder is schedule based and has the above material specified for each of the top, and bottom flanges and the web.

The analysis settings are set for a Design Review for an HL-93 Design truck (SI) and an HL-93 Fatigue truck (SI). The design method is set to LRFD. The output includes the Dead and Live Load action reports, LRFD critical load report, LRFD specification check, and the Steel Limit State Summary.

After the analysis is run, regardless of whether shear studs are specified or the bridge is simple defined as "Composite", the software calculates a hybrid girder factor, Rh, of 0.0 at location 100. The software also calculates a flange stress of 0.010 MPa at this location. The girder system has supports defined as roller, pin, roller. The software either does not calculate the same 0.010 MPa stress at the opposite abutment or it does not calculate a hybrid girder factor of 0.0. The location 200 does not show up in the specification check as having failed.

FROM: bgoodrich DATE: 01/04/2001 11:17:30

I was able to duplicate the hybrid factor issue with the version of BRASS released with Opis 3.0, but not with the version of BRASS released with Opis 4.0. Please verify that you do not get an Rh of 0.0 using Opis 4.0.

### Description

FROM:rmbest DATE:12/29/2000 10:22:27 VIRTIS/OPIS 4.0 - It seems that bbd files that were created in version 3.0 are incompatible with version 4.0. I had to first import the bbd files into a 3.0 database and then migrate that database to 4.0 and then re-export the bbd files. Is this the only way to do this? If this is true it means that all stand alone participants will have to be using the same version. It also means that it will be of no value to save bbd files for archival purposes or re-use later. It would be a welcomed enhancement if the import routine could be made downwardly compatible.

FROM:jduray DATE:01/01/2001 17:01:38

Correct. BBD files are not intended for archival purposes. That is a use case that perhaps we should consider. I will check the Help. We should describe the use cases that are supported by the BBD files.

### Description

FROM:rmbest DATE:12/29/2000 10:26:59 VIRTIS/OPIS 4.0 - The report tool produces a single window previewed in MS Internet Explorer. This is only a about a half a page worth of information for Overall Summary, however when I print this I get 3 pages of mostly white space. Can you adjust the XML so that this prints one page?

FROM:jihnat DATE:12/29/00 10:46:48 AM

Did you try unchecking the "Begin each topic on a new page when printed" checkbox (on the Report Tool window) before generating the report?

FROM:gbarnhill DATE:12/29/2000 12:26:02

Unchecking the "Begin each...." doesn't change the printout. There is a page break after the main header info and then a blank page is produced after the summary page. I've attached xml and xsl files from an LFD report.

FROM:jihnat DATE:1/12/01 12:35:50 PM

This problem exists in version 4.0.0 with two of the PS reports. Also, for all reports, an empty last page prints whether the checkbox is checked or not.

This is fixed in Service Pack 1.

| 3034.12314 | Resolved      | False error indicating tapered cover plates |

### Description

FROM:kkennelly DATE:1/2/01 10:00:48 AM

Submitted on behalf of Jason Mahoney, Bayside Engineers. Run BRASS ASD, open Analysis Output window, double click on name of a file, gets message about path not being specified, Notepad opens with an empty document. When he selects File/Save As in this empty Notepad document, the directory shows up as Virtis40 instead of a BRASS\_ASD directory. When he looks in Explorer, the tree was created correctly and the BRASS files exist in the BRASS\_ASD directory.

FROM:jihnmat DATE:1/12/01 1:18:03 PM

One of the names in this bridge (I think it was a struct def) had a comma in it, which was not being handled properly.

The workaround for Version 4.0.0 is to avoid using commas.

4/19/2016 3:14:58 PM

HRS AASHTO

722

**Complete Issue Information**

This is fixed (i.e. you can use commas) in Service Pack 1.

FROM:rmbest DATE:01/03/2001 10:52:26 Version 4.0 - We are getting a system error message that says that "A rolled beam with tapering cover plates was detected". However our model (4 span WF steel beam with cover plates at piers 2 and 3) does not have tapered plates and this same model did

4/19/2016 3:14:58 PM

HRS AASHTO

723

**Complete Issue Information**

run in Version 3.0. To illustrate the problem, our bbd file is attached. We finally got the analysis to work by eliminating breaks in the plates at the piers but we are not sure why it worked.

FROM:bgoodrich DATE:01/04/2001 11:21:43

I think there is a problem in the domain functions that generate cross sections and ranges from schedule input. The problem range is the first 2.0 meters of span 3. Using the domain cross sections and ranges, the export generates the SPAN-C command for span 3 as starting at the support with cross section 3 and ending with cross section 4 at 67.5853 ft (2.0 meters). I don't understand what is unique about this range that would cause this problem.

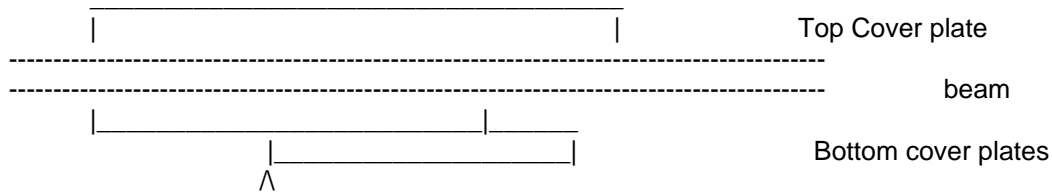

Krishna - Please check the domain functions that generate cross sections.

FROM:kkennelly DATE:1/5/01 9:29:12 AM

The domain is not processing all of the cover plates when it is generating the cross sections. Export shouldn't be getting a range starting at 0 in Span 3 and ending at 2 in Span 3 because the data is input with 2 section changes within that first 2 meters. Domain does generate the change point locations correctly, I'll fix the code to process all cover plates.

As an aside, are you sure the cover plates are entered correctly? The bottom cover plate at Pier 2 is entered as follows:

Top Cover plate starts in Span 2 at 19, 1.6 m long. Another top cover plate starts in Span 3 at 0, is 2 m long

Bottom cover plate starts in Span 2 at 19, is 2 m long so it goes into Span 3. Another bottom cover plate starts in Span 3 at 0, is 1.6 m long. There is an overlap in the bottom cover plates.

FROM:kkennelly DATE:1/8/01 3:36:59 PM

Programmer notes:

Deck Reinf and cover plates can be discontinuous along length of beam and also overlap.

abobrdg: code change in DoGirderMbrAlt->FillCrossSectionData() for deck reinf and cover plates to process all range sets.

MoveDistance failing on following situation for this bridge:

| Span 2: | Plate 1      | Plate 2      | Plate 3      | Plate 4      |
|---------|--------------|--------------|--------------|--------------|
| 19 m    | Cov PL Start | Cov PL Start |              |              |
| 20.6 m  |              | Cov PL End   | Cov PL Start | Cov PL Start |
| 0.4 m   | Cov PL End   |              |              |              |
| 1.6m    |              |              |              | Cov PL End   |
| 2m      |              |              | Cov PL End   |              |

Move Dist() tries to get range at 0.4m right, will return null after it cycles thru Plate 2 because it thinks there is a gap after Plate 2 when really there is an overlap. When section to left of 1.6 is filled in it has 2 cover plates so get section at left end of range with 0 cover plates, section at right end with 2 cover

**Complete Issue Information**

plates.

abognrl: DoRangeSetCmdTarget->MoveDistance() needs modified to keep cycling thru range sets instead of break at line 158 when it gets to gap in ranges. For Deck Reinf could overlap.

abostld: DoSteelAssemblyRangeSet->MoveDistance() line 330 change break to continue. For cover plates could overlap.

FROM:kkennelly DATE:1/9/01 11:58:39 AM

## Complete Issue Information

Received the following e-mail from Keith:

-----begin e-mail-----

I ran the script you sent me and it ran without errors. Now when ever I try to log into the Oracle DB I get the following message:

Unable to verify database schema!  
Please contact database administrator.

Any idea on why I am getting this? Any help would be appreciated.

-----end e-mail-----

FROM:jduray DATE:1/8/01 1:00:31 PM  
My e-mail back to Keith:

-----begin e-mail-----

Did you do any beta testing of version 4 on Oracle?

I think your DBA should run the attached script that creates public synonyms. Since Virtis (I assume virtis is the owner of the tables) can run I believe one or more public synonyms are missing. You will get an error for each synonym that already exists that the script tries to create. Ignore the errors.

-----end e-mail-----

I attached Publicsynonyms40.sql from the oracle directory. Before sending I changed the schema owner to Virtis.

FROM:jduray DATE:1/8/01 3:59:42 PM  
I was able to reproduce this problem even with the public synonyms created. Need to check the role.

FROM:jduray DATE:1/8/01 4:14:25 PM  
If the grant to the role for abw\_sys\_database is missing we get this error.

Unable to verify database schema!  
Please contact database administrator.

After granting select on the role to abw\_sys\_database I get the following:

"Error opening SysDataDictionary record set."

FROM:jduray DATE:1/8/01 4:37:08 PM  
I copied the CreateVirtisReadOnlyRole.sql and CreateVirtisReadWriteRole.sql to GrantVirtisReadOnlyRole.sql and GrantVirtisReadWriteRole.sql and removed the create role command , changed the schema owner to the proper owner (virtis40ac on our server) and ran the scripts. Success! Virtis ran as it should except the checkin/out was not enabled.

Changed the schema owner to Virtis and sent the modified scripts to Keith.

**Description**

FROM:jduray DATE:1/8/01 2:40:59 PM

Travix Fox with ABMD called with migration questions. while describing the process to him I realized our migration instructions omit a step. The instructions have the user copy the active db to the new installation directory and perform the migration. We do not tell the user to modify the ODBC connection info to point to the migrated db in the new directory.

I modified the instructions and sent them to Travis Fox at ABMD. The revised instructions are attached.

Version 3.0

I have entered a 3 span haunched slab. Cross sections represent the locations where the bars are

4/19/2016 3:15:00 PM

HRS AASHTO

733

## Complete Issue Information

terminated. POI's are set to these same points. Traffic in Both Directions has been selected. For the Design Review we have Design Loads = HL-93(SI), Permit Loads = None and Fatigue Loads = LRFD Fatigue Truck (SI). Select All was use to generate Output.

After the design review go to the Spec. Checker. Set your filter to only return the Failed items. Note that all is satisfied for Stage 1 Span 1 and Span 2 up to the center of the bridge. Past the center of the bridge I have found several locations that failed. For example, there should be no difference between Span 2 - 8260 mm and Span 2 - 11740 mm. One fails and one passes???

Being the user will only enter cross sections for half the bridge, should the results be the same on the symmetrical second half?

I came across this when I had only checked my POI's for the first half at user locations only. When I turned on the user locations and tenth-points, the tenth points are calculated for the entire structure, and I found these failures in the second half of span 2 and in span 3. I thought at first that I had my traffic going in one direction only, but that wasn't the case.

FROM:kkennelly DATE:1/26/01 3:17:48 PM

I imported the bbd file to Version 3.0, migrated to 4.0, applied patch for Version 4.0 Service Pack 1, exported, and attached new bbd file.

FROM:dteal DATE:01/31/2001 13:54:06

Here is another example:

I have entered x-sections for 1/2 of the reinforced concrete parabolic haunched slab bridge. This is a 3 span structure. Doing a design review I requested 2 POI's. One at the 4/10 point of span 1 and one at the 6/10 point of span 3. These two points should be identical.

I have attached the structure and also attached the output for Rating Factors at these two points. Being we are in the parabolic haunched area you should first look at the dead load. Notice that they are the same, therefore we are at the same spot in span 1 as we are in span 3. Notice that the resistance in span one is 20% greater than in span three. Also look at the Live load - they also are not the same, they should be. I have the trucks running in both directions which means that they should find the same maximum value. I tried running the trucks in one direction only, once up station and once down station. The live load values never changed, they should have.

FROM:bgoodrich DATE:02/23/2001 18:37:01

The structure is not defined symmetrically in Opis! The cross sections ranges must be defined so that the rebar does not change within a cross section range. See my comments in Incident 3121.

I am not sure what is going on with the live load symmetry. I am investigating this as part of Incident 3115.

Because these issues are described in other incidents, I am setting the status of this to duplicate.

| 3047.12301 | Resolved      | Low rating based on fatigue in deck slab ??? |

## Description

FROM:kkennelly DATE:1/12/01 10:50:35 AM

I was testing incident 3028 in Patch 1 and found the following situation:

Tried importing the 3 attached bridges without saving after importing (their BWS was left open and went to Bridge Explorer to import next bridge). After 3rd file imported, its Bridge window displayed but a lot of edit controls were missing from the display. OK didn't work on that window so used Cancel to close it. Tried to open its Struc Def window and Virtis crashed.

FROM:kkennelly DATE:1/12/01 11:12:16 AM

FROM:jduray DATE:01/14/2001 14:11:46

Please test this on version 3.0. I removed the changes I made for incident 3028 and the problem still occurs. I will continue to try to find where the error occurs but it will be helpful to know if it is new to version 4.0.

4/19/2016 3:15:00 PM

HRS AASHTO

735

**Complete Issue Information**

FROM:kkennelly DATE:1/15/01 8:33:36 AM

I tested Version 3.0 and found the following: I imported 4 bridges without saving them. The 4th bridge when imported didn't open the Bridge window after importing. Then when I tried to import bridge #5, nothing happened when I picked Import off the menu. Bridge wasn't imported and didn't crash. I tried this same procedure while I had Intercept open, and when I tried to import bridge #4 Virtis crashed. I am able to reproduce this.

FROM:jihnata DATE:1/15/01 2:20:00 PM

I've found that I can reproduce this same problem just by clicking "New Bridge" three times. It crashes Developer Studio on my PC, so I can't debug it after the fact. Rather, I'm trying to step through the code before it crashes. Also loaded Version 2.0 -- it does the same thing after about 5 "New Bridges".

FROM:jihnata DATE:1/15/01 2:51:19 PM

I'm also seeing a maximum of about three or four \*existing\* bridges that I can \*open\* before bad things happen.

FROM:jduray DATE:1/15/01 2:59:00 PM

It also does this when using Oracle and creating three new bridges.

FROM:jihnata DATE:2/1/01 9:01:19 AM

I was able to trace this to the "Desktop Application Heap" in Windows NT. This is a global heap that Windows uses to store objects (menus, pens, brushes, etc.) When our BWS is created, we create a CMultiDocTemplate for each of our child windows, and each child window was getting its own copy of the BWS menu and this was filling the desktop heap until no more windows could be created. For the fix, I implemented menu sharing, as described in Microsoft Knowledge Base article Q118435. Now, more BWSs can be opened (I stopped at twenty).

Fixed for Version 4.1

### Description

FROM:rmbest DATE:01/12/2001 15:45:55

VIRTIS 4.0 - We have discovered what appears to be a bug. Every once and awhile we are getting a false Inventory Rating Factor of 0.00 based on fatigue, where fatigue should not be an issue. This usually means that something is out of whack with our placement of the deck reinforcement. Is BRASS actually checking fatigue in the deck or is the misplacement of the bars forcing it to happen? I have attached an example illustrating the problem. I hope that it is not actually intended that the ratings be based on fatigue in the deck slab. If so, there should be an option to disable it.

FROM:jduray DATE:1/16/01 9:01:22 AM

FROM:bgoodrich DATE:01/17/2001 08:30:40

I am unable to reproduce the zero rating. I believe there may have been a small gap in the schedule of STEEL-GIRDER-CONTROL commands, which caused this problem. The allowable fatigue stress for this gap was never set to a large number ( $1 \times 10^{10}$ ), so it was controlling the rating. I recently corrected a problem in how the BRASS schedules were generated, which I believe has addressed this issue. This should be available in Patch 1.

### Description

FROM:bgoodrich DATE:01/17/2001 08:40:20

The Existing and Current checkboxes continue to cause confusion during the training sessions. The "Current" text is misleading because the meanings of existing and current are similar. Suggestions include changing "Current" to "Current Display", "Current Schematic Display", or something to better indicate the true intension of this field.

### Description

FROM:bgoodrich DATE:01/17/2001 08:43:05

Two users (at the Boston training) exported a BBD file from Version 4.0 and then tried to import the BBD file. They received a message box indicating that the security key was removed or not available and were subsequently unable to import the BBD file. The import works fine on a computer without a security key.

FROM:jihnata DATE:6/19/2001 12:45:25 PM

Reported again 6/14/01 by Brian Boucher (Bayside - 617-625-4696). He was having this problem on Windows Me and Windows 98.

I was able to reproduce this on Windows 98, but not on Windows NT or Windows 2000.

FROM:jduray DATE:6/25/01 3:13:25 PM

We have tried again but are not able to reproduce this on NT or 2000. This seems to be a problem with the security key dll's on 98. Since for version 4.1 we are implementing different security mark as Closed - Inactive.

**Description**

FROM:jduray DATE:1/23/01 5:22:43 PM  
 I received the following e-mail from Bill Simons at Ks DOT:

-----begin e-mail -----

Jim,  
 We're having trouble with the Parameter views that are used in the V/O Configuration Browser. Six views apparently were not create/replaced when the migration script ran. I've taken care of three of these: County, District and NHS; although these views exist and data can be viewed in SQL, the V/O form still does not populate. With the other three views: Administrative, Functional Class and Owner-Maintain; I'm not sure what tables these are built from.

I'd appreciate any assistance you may be able to provide.  
 Thanks again,  
 Bill

Bill Simons

 simons@ksdot.org

-----end e-mail -----

**Complete Issue Information**

I am able to reproduce this behavior using version 4.01 schema owned by Bridgewater in our instance of Oracle. It doesn't appear to me as though we use the views he describes. The CDmParamtrsList class uses pontis\_paramtrs not the views. I searched the creation and migration scripts and could not find any views that uses these views. However, there is not data returned to the Dm from the Db even though there are rows in the db table.

FROM:jduray DATE:1/23/01 6:34:27 PM

The problem is due to the change in column data type from char to varchar2. The data has trailing spaces and our where clause does not so the query of the pontis\_paramtrs table with a typical where clause such as where table\_name='bridge' and field\_name='district' does not return any rows. I wrote script g:\...\v40 sp2 oracle test.sql thatl corrects the problem, however, there are several other tables where we made the same datatype change that we need to check.

FROM:mordoobadi DATE:2/1/01 8:47:27 AM

We made changes in column data types from char to varchar2 only in the following tables:  
pontis\_bridge - many attributes (we do not use most of these attributes in Virtis/Opis.  
pontis\_paramtrs - couple of attributes.  
abw\_bridge - brkey (FK from pontis\_bridge table).

a SQL script is created to trim the trailing spaces of the varchar2 attributes in these tables. (File G:\...\v40 sp2 oracle.SQL)

FROM:mordoobadi DATE:2/1/01 3:40:34 PM

This patch SQL script was tested on a database that was originally a version 3.o database and was migrated to version 4.0.

Before applying the patch I tried the parameters window. I didn't see anything listed in that window. Then I applied the patch and everything seems to be working OK.

I sent the patch to Bill but he indicated that he is still having problem updating old records in the parameters table (which I cannot reproduce).

I asked Bill to send me the contents of his pontis\_paramtrs table to investigate more.

FROM:mordoobadi DATE:2/6/01 1:27:44 PM

Accepted by Dean Teal.

| 3063.12285 | Not Reproducible | BARS import for RC misses tributary width |

**Description**

FROM:jduray DATE:2/9/01 10:23:40 AM  
Let's release this patch. It is important for the database.

FROM:jduray DATE:2/9/01 10:29:33 AM  
Mehrddad - prepare the script and readme instructions for the database that includes updating the version (4.0.2) and the build number (3003).  
Do any of the other changes from char to varchar2 cause problems? Did you investigate this?

FROM:mordoobadi DATE:2/12/01 9:09:33 AM  
A SQL script named v40 sp2 - Oracle.sql is created on G:\PROJ\VIRTIS\LONGTERM\VirtisOpis Builds\Version 4.0\Release\VirtisOpis Version 4.0.0\Service Packs\Service Pack 2\ which takes care of trimming trailing blanks for old CHAR attributes in pontis\_paramtrs, pontis\_bridge, and abw\_bridge. Also Folder Properties(Find Bridge) code is changed to deal with the trailing blanks, so that if the user had an old SQL based folder, he'll be able to recover the folder by opening folder properties window and saving it.

FROM:jduray DATE:2/14/01 11:03:46 AM  
We also need a script to sybase, etc. to update the patch and build numbers.

FROM:mordoobadi DATE:2/16/01 1:30:09 PM  
Database related incidents (3060, 3108, 3110) verified for an oracle database which was migrated from version 3.0 to 4.0.0. Working fine.

### Description

FROM:dteal DATE:01/25/2001 14:27:51

We have over 5 thousand slab bridges similar to the one I have attached. The cross-sections have been cut at the bar termination points (less a development length). Cross sections are need at these points to perform the design analysis (to be sure the bars a long enough). Being these slabs have a variable haunch depth, simply moving x-sections around is very cumbersome and time consuming. Can you provide a reasonable workaround until this issue has been addressed? Please, also see August Incident #2812.

FROM:dteal DATE:01/26/2001 08:25:57

The only work around we have come up with is:

Using one set of x-sections and ranges to define the bar terminations for design. And another set to check critical sections for rating.

**Description**

FROM:dteal DATE:01/25/2001 14:30:18  
It was noticed right away. Version 4.0 database refresh rate in the Explorer window has really slowed down. I called our Oracle DBA, I am the only one hitting on it right now. I checked with our Network administrator, he found no processes using up resources. Any suggestions?

FROM:dteal DATE:01/25/2001 15:51:52  
Never mind! We rebooted our server and things straightened right out.

| 3071.12277 | Resolved      | Strand layout window doesn't open if strand grid is not defined |

**Description**

FROM:jduray DATE:01/25/2001 16:03:46

Copied a stiffener and the validation dialog opened and the stiffener was not copied. It occurs on the second copied. The first one was copied using drag n drop, the second one using the right mouse click menu.

FROM:jihnat DATE:1/29/01 8:01:48 AM

I'm not able to reproduce this. Can you provide some additional information? Was it a Plate or Angle Stiffener? Were you copying to the same Struct Def or a different Struct Def? Same or different BWS? Are you saying that the validation dialog opened as a result of the copy?

### Description

FROM:dteal DATE:01/26/2001 11:26:31

Now that we have consultants on board we have the need to share agency library data. We need to give them access to our approved list of materials and appurtenances. How do we share this with them? If not electronically then how as a last resort how would we print out the text to a file?

FROM:dteal DATE:03/09/2001 10:45:01

Several consultants have asked for help in this area. It sure would be nice to have a way to export our agency libraries (all – including vehicles) to a .bbd file that we could make available to any consultant that is doing work for us.

It would also be nice if the consultants could have more than one agency library. For example – Consultant XYZ has headquarters in Kansas City. They do work for KS, MO, NE, IA, OK, etc. They need to name agency libraries for each state they do business with. As you know, no two states do anything the same!

### Description

FROM:dteal DATE:01/26/2001 14:41:07

Why are the values for Pitch and Input for shear studs stated (\*\*\*\*\* out in the spec checker? See attached .bmp file

FROM:bgoodrich DATE:02/19/2001 10:12:36

The pitch appears to be larger than that allowed by the format statement. I modified the format statement to allow larger numbers.

FROM:dteal DATE:02/26/2001 11:52:24

I will need to know which version or patch to verify this for acceptance.

FROM:jduray DATE:3/2/01 11:29:43 AM

We need to send the patch to Dean for testing prior to release. This requires a new BRASS dll from Wyoming.

**Description**

FROM:astover DATE:01/27/2001 12:36:22

I was trying to type a long description into the description window and was cut off after about 5 lines of entry into the window. This seems like a rather small limit for a window that fills 3/4 of the screen.

the following is the truncated description...

"Bridge is slightly curved, but is entered as straight in Virtis.

**Assumptions**

Approximate member loads are applied to Fascia Girders to approximate Curvature.

Travel Way has been adjusted to utilize maximum and minimum overhangs. Effective De"

Did he hit the db limit or is there some other problem? Db limit is 255.

This looks like the db limitation.

I'm changing this to an enhancement request to increase the field size or add comments capability.

**Description**

FROM:kkennelly DATE:1/30/01 9:03:54 AM

Version 4.0.1 BWS Report only contains data for first 2 girders in a 4 girder system. Can reproduce in TrainingBridge1 in sample database.

FROM:kkennelly DATE:2/6/01 9:09:23 AM

Problem exists for schedule based steel girders. When writing the haunch profile for steel girders, IsMemberAltExteriorGirder() is called. This iterates through GirderMbrList. The members are written in a while loop iterating through the member list, it is in that while loop that IsMemberAltExteriorGirder() eventually gets called which advances the place in the GirderMbrList so not all members are written.

FROM:kkennelly DATE:2/6/01 9:40:00 AM

Not a problem for ps cause BWS report is printing out all of the ext girder haunch data for ps so it doesn't check for ExteriorGirder.

FROM:kkennelly DATE:2/6/01 11:16:11 AM

GirderMbrList reset to member which is being reported on after find out if mbr is exterior girder. Added code to print out PS haunch additional dimensions.

FROM:gbarnhill DATE:05/31/2001 12:26:46

OK in Service Pack 3 for version 4

## Description

FROM:kkennelly DATE:1/30/01 9:17:36 AM

The attached bbd file is a modified version of the PCI Training Bridge 1 delivered with the db. A composite concrete deck has been added. (exported from Version 4.0.1). When try to run BRASS LFD, export gives error that there are too many load cases, try to merge some manually. If I take out the weight of the interior diaphragms BRASS runs. This member has following dead loads: Stage 1 (non-composite): beam selfweight, int diaphragms, slab. Stage 2 (composite): Member loads added for FWS and parapets. BRASS LFD limitations help says limit of 4 dead load groups with number 4 reserved for prestress. I think that this bridge only has 2 dead load groups plus the 1 for prestress = 3. Can the interior diaphragms be incorporated into the beam dead load group somehow? This member doesn't seem to have an excess number of loads.

**Complete Issue Information**

Krishna - When running P/S box beams with BRASS-LFD, BRASS load groups 1 and 4 are reserved for interior diaphragms and prestress loads, respectively. It looks like we need to document this in the engine help. Note that BRASS-LRFD allows the interior diaphragms to be applied to the internal BRASS beam selfweight load case. BRASS users are able to get around this because there is an additional dead load case that we did not implement in the export. This dead load case is a uniform dead load on all spans. We did not implement this load case because of the general way that the user entered loads with Virtis/Opis. Basically, we did not want to lose the Virtis/Opis load cases.

FROM:bgoodrich DATE:02/26/2001 13:52:55

I corrected a bug in the export (BrassStdLoadControl.cpp) with determining the number of available load cases. Krishna - I sent you the file to add to SourceSafe.

FROM:kkennelly DATE:1/30/01 10:08:08 AM

Attached bridge is exported from Version 4.0.1. Struc Typ Section schematic shows incorrect haunch for Member G1. Haunch entry for Member G1 has data 13.875 for Z3. For the left exterior girder, Z3 should be measured on overhang side of deck. Changing the value of Z3 for this member makes the schematic change to the right of member G1.

| 3087.12261 | Closed        | AASHTO Specification Check - 6.10.7.4 Shear Connectors (STUDS) |

### Description

FROM:kkennelly DATE:1/30/01 1:57:05 PM

The Deck Concrete (Deck Profile) output in the BWS report should be reformatted and each row in database printed over a couple of rows in the BWS report. Right now each row in db is a row in BWS report but 8 1/2" wide paper too narrow for 1 for of Deck Concrete and text wraps/is abbreviated and hard to read.

FROM:kkennelly DATE:1/30/01 2:10:12 PM

Shear Reinforcement ranges spread over 2 lines and hard to read. It should fit on 1 line.

FROM:kkennelly DATE:1/31/01 11:26:02 AM

Sometimes the Bearing Stiffener Locations output is not in order from Support 1 to Support n. For example, I have a 3 span bridge and in the BWS report I get the following order of output: Support 4, Support 2, Support 3, Support 1.

FROM:kkennelly DATE:2/6/01 3:11:15 PM

Deck concrete - think it has to stay the way it is. User can copy BWS to Word and change margins, font size, etc.

Shear reinf ranges resolved.

Brg stiffener locations: I remember a conversation with Rick about the list of brg stiff groups not being in order in the domain. Now using GetItem() for BWS report. Resolved.

**Description**

FROM:dteal DATE:01/30/2001 15:41:44

This question relates to the AASHTO Specification Check - 6.10.7.4 Shear Connectors (STUDS). My point of interest is 202.00 at Construction Stage 3. For the calculation of the pitch (Shear Fatigue Resistance) (AASHTO 6.10.7.4.1b) lists under other the "I" and "Q" used in the equations. At this particular point it is using the "I" and "Q" determined in the Positive Sense. My question is what is Brass checking to determine whether the point is in the positive sense or negative sense?

FROM:bgoodrich DATE:02/23/2001 18:52:50

If the value of the maximum factored live load moment is greater than or equal to the minimum factored live load moment, the section properties for positive flexure are used.

I can't find in the Help where we describe how to add new user groups.

FROM:kkennelly DATE:2/2/01 9:20:07 AM

I don't think we do. I tried to do this so I could update the help but I'm not sure this is working right in 4.0.1. I can add a new user group by sitting on Users in the Config Browser tree by selecting the New button on the toolbar. That creates a folder called New Item. I can rename this folder to whatever I

4/19/2016 3:15:09 PM

776

### Complete Issue Information

want. If I sit on this new folder in the tree and select New I get the User window. I enter a new user, hit the Groups button and see that it says this user is a member of the new folder. Save and this user appears in the All Users folder but not the new folder I just created. I am able to add a new user to groups delivered with Virtis.

FROM:gbarnhill DATE:02/06/2001 09:40:05

Here's my two cents worth on this one.

I followed Krisha's path & get the same result. New Group folder is visible, but a new or existing user does not show up under the folder UNTIL I close the Config Browser and reopen it. After that, any new or existing user added to the folder shows up immediately.

FROM:mordoobadi DATE:12/11/2002 2:43:16 PM

Fixed For 5.0 Alpha 5.

### Description

FROM:dcrovo DATE:02/02/2001 12:06:52

In general, there are 4 types of timber bridges: (Referring to 'Timber Bridges' - U.S. Agriculture Department - 1992)

1. Glulam system: Deck: Glulam - Beam: Glulam
2. Sawn lumber system:
  - \* Deck: Nail-laminated deck or Plank deck
  - \* Beam: Sawn lumber
3. Longitudinal Deck Superstructures
4. Longitudinal Stress-laminated Deck Superstructures

Right now Virtis Version 4.0 just provides for rating of 'Sawn lumber system'. We have some timber bridges belonging to other types. Please add 3 more types on the nearest release

FROM:jduray DATE:02/07/2001 22:57:49

How many of each of these types do you have?

FROM:dcrovo DATE:02/08/2001 09:52:37

There are a total of roughly 170 timber superstructures in our inventory. There is no breakdown for these structures other than they are defined as timber stringers. Besides, we have one longitudinal glulam bridge constructed in 1999, one glulam bridge (glulam system) constructed in 2000.

**Description**

FROM:jihnat DATE:2/5/01 11:19:22 AM

The Report tool does LFD and LRFD but not ASD.

This incident was originally # 3092, but it had to be deleted then re-added due to database corruption.

### Description

FROM:dteal DATE:02/05/2001 12:48:39

Version 4.0.1 did not remember column width settings from the last time the structure was viewed in version 3.0 SP4a.

When I open a structure that I haven't touched since version 3.0 I find that many of the column widths have been decreased. I have to touch each one of the columns that have been shrunk so I can view the contents.

I found the same problems with the libraries.

FROM:jduray DATE:02/05/2001 17:33:24

Correct. You uninstalled version 3.0. That deleted the window size/position/column size info stored in the registry. We do not preserve from one version to the next because the column widths are based on position within the grid. During Beta testing of 2.0 we found that sometimes new column would not

appear because there was no column size for them but there was for the columns that existed in the previous version. To pass this info on to the next version is an enhancement.

Perhaps we could dump the registry to a ini type file in the installation directory or perhaps the windows temp directory. After install we could search for it and import and adjust as necessary.

FROM:dteal DATE:02/06/2001 08:27:40

It is one of those annoying things that should get fixed – sometime.

In the Structure Framing Plan Details – Layout Tab – Girder Spacing Orientation

There is a whole lot of excess real estate on this page. But when you view the Girder Spacing Orientation you have to use the up/down and right/left scroll bars to view the data. Can't we make the window bigger?

FROM:jduray DATE:04/06/2001 14:27:15

You should resize the columns (horiz) so you won't have to scroll right/left.

We can modify the window to resize the grids vertically.

## Description

FROM:dcrovo DATE:02/06/2001 12:19:59

A report from Binh Ha, MassHighway

The same as incident 2632 for version 2.1 but with different aspects.

In the negative moment region for the rolled beam: If we input top cover plate, bottom cover plate and slab reinforcement:

- \* Version 3.0 ignores top cover plate
- \* Version 4.0 has been improved but the mistakes still exist

From Virtis version 4.0 output:

- \* Pages 5 and 6 (Construction stage 1 - Non-composite)

FROM:kkennelly DATE:2/7/01 9:17:58 AM

I think the export that takes the data from Virtis and puts it into the BRASS input file is working as intended. The log file that is created when you run BRASS from within Virtis contains the following warning message:

WARNING (Medium):

BRASS does not support a slab and a top cover plate in the same cross section. Therefore, the top cover plate was combined with the top flange to create a flange with an equivalent area and moment of inertia.

The top cover pl was combined with the top flange, that is why you do not see the 1.26" thick and 12.11" wide flange in the BRASS output. The values for the area and I of the section are only off by 0.6% between the modified section the export created and the actual section. I'll assign this to the person responsible for the export but I think that's probably as close as the export can get it. If that's not adequate for your needs, you'll have to request a change to the BRASS program through this incident.

FROM:bgoodrich DATE:02/19/2001 11:28:57

The previous comments made by kkennelly are correct. The top flange and top cover plate are combined when a slab/rebar are present. This is a work-around performed by the export to conform to the BRASS input requirements. BRASS does not know that the export has adjusted the top flange dimensions, so no message is printed from BRASS.

**Description**

FROM:gbarnhill DATE:02/07/2001 09:57:06

For schedule based input, I can't find a place to put in the "n" value for a composite steel & concrete member alt. According to HELP for the DECK CONCRETE tab on the DECK PROFILE window, it should be the last column, after EFFECTIVE FLANGE WIDTH (LRFD). There is no column there.

FROM:jihnath DATE:2/7/01 10:01:44 AM

Had you uninstalled Version 3 before installing Version 4? Otherwise the window reads the old column widths and "n" had zero column width in Version 3.

FROM:jihnath DATE:2/7/01 10:19:55 AM

My mistake. The column for "n" was not just added with Version 4. However, somehow a width of zero seems to have been stored in the Registry for this column.

**Complete Issue Information**

FROM:gbarnhill DATE:02/07/2001 10:39:21  
The column shows up in 4.0.0. It was evidently "zeroed" out in SP1.

I CHECKED THE LAPTOP WITH 4.0.0 RUNNING. I HAVE UNINSTALLED ALL PREVIOUS VERSIONS FROM IT. IT ONLY HAS 4.0.0 ON IT.

FROM:gbarnhill DATE:02/07/2001 10:41:02  
I just checked a machine that did not have a previous version of VirtisOpis installed. I installed 4.0.0 and then SP1. The "n" column is visible.  
The machine where the column is missing has had all previous versions and beta's installed. I've been using REGISTER.BAT to switch between versions.

FROM:jihnate DATE:2/7/01 11:03:51 AM  
It looks like a column was added after Version 2.1 (a second Eff. Flange Width). So this problem will surface if version 3 or 4 is run without uninstalling version 2.1. This is a known limitation and it's why we always ask users to uninstall the previous version before installing the latest version.  
The only other workaround would be for you to manually edit your Registry.

FROM:gbarnhill DATE:02/07/2001 12:08:44  
I agree that this is a self-inflicted problem caused by not doing what the install instructions require. It shouldn't be a problem for most "production" users. We "BETA" types tend to do things a little out of the mainstream.  
This may be something that could be included as a caution note in the FREQUENTLY ASKED QUESTIONS section.

### Description

FROM:dteal DATE:02/08/2001 08:43:13

What Access Privilege allows the user to Create and Save a Template and to Delete a Template in the Analysis Settings?

FROM:jduray DATE:2/9/01 11:12:21 AM

There is no security on the templates.

FROM:dteal DATE:02/12/2001 08:27:53

Don't you think we should have some control over who deletes them?

FROM:jduray DATE:2/12/01 10:05:52 AM

It sounds like you think we do. If it can be controlled by an existing privilege we can just do it. If it requires a new privilege we will have to handle it as an enhancement.

Perhaps it should be included in Design and Rating events. You must have Create privilege for Design or Rating events.

FROM:gbarnhill DATE:02/12/2001 14:07:34

My turn !!!

Is there a way to treat templates like PUBLIC and PRIVATE folders ???

There could be PUBLIC TEMPLATES that are available to everyone with restricted create/delete privileges, but each user could create PRIVATE TEMPLATES that they could change/delete as they want. The users would only see the PUBLIC templates and their own PRIVATE ones.

FROM:dteal DATE:02/13/2001 12:50:02

I like Gales Idea!

FROM:jduray DATE:2/14/01 10:18:34 AM

Sound like a good idea. It requires some investigation to estimate the cost. I suspect it is a fair amount of work and will require TF approval and scheduling. I'm changing the status and category to Suspended/Enhancement.

## Complete Issue Information

FROM:dteal DATE:08/31/2001 09:55:34

Can we revisit this one? I consider this a very large security issue! This is more of a bug than an enhancement.

Our agency has already ran into problems with this issue. A designer created a new template which included 2 special permit trucks. These trucks where to be single lane loaded for both with zero impact on one and 50% of AASHTO on the other. This designer then reused this template that he had created some time later using these rating results in a report that got sent to upper management. Later on we found out that his rating result where wrong. At some point, some other designer (with run analysis privileges) had went in and changed (deselected) the single lane loading box and resaved the template. We need to ensure that this sort of thing doesn't happen again. When a template is saved by somebody, it should not be changeable by somebody other than the person that created it and the system administrator.

Agencies need to be sure this sort of thing doesn't happen again!

FROM:dteal DATE:09/21/2001 10:55:13

The analysis settings template has again come back to haunt us. One of our designers (with run analysis privileges) has deleted most of the templates that had been previously saved. He didn't know he was deleting templates from the entire system. These templates had been set up by our agency for specific purposes. Now they are lost and will have to be recreated with all the advanced settings they originally contained.

Back on 2/12/01 you stated that an access privilege could be set if it could be controlled by an existing privilege. Could this be controlled by the "Libraries" Access Privilege? From my point of view, this would satisfy our immediate problem.

FROM:jduray DATE:9/21/01 2:22:43 PM

FROM:dteal DATE:10/16/2001 15:00:45

FROM:dteal DATE:Friday, October 18, 2002 11:45:16 AM

And it has happened again - Our Kansas rating trucks got deleted by a designer by mistake. He recreated them when he discovered what he had done. This was great, except he missed some important settings for our permit vehicles and the problem wasn't discovered until sometime latter. Houston, we have a problem!

FROM:dteal DATE:Thursday, January 22, 2004 3:51:48 PM

And it has happened again - Our Kansas rating trucks got deleted by a designer by mistake. This is a persistant problem that needs to be addressed!

FROM:dteal DATE:Friday, August 26, 2005 12:06:25 PM

"AND IT HAPPENED AGAIN" <= Notice, capital letters in quotes

This time, a user selected the advanced tab, selected Single Lane Loaded for both the HL-93 vehicle and the Fatigue Truck. Then they saved the change to the template. Now every person that may have used this template (which is our default template for Opis in USC units) got a single lane loaded design review.

4/19/2016 3:15:12 PM

HRS AASHTO

793

## Complete Issue Information

What use are templates if you can't depend on using them, if you can't depend on them having the correct information. They are there to speed up the process – not slow us down.

Now I have to contact all our designers to red flag any designs that my have run the Opis USC design review. Being there is no date stamp on the change – they need to investigate all there USC designs.

**Description**

FROM:dteal DATE:02/08/2001 14:07:54

I had saved a new template in the Analysis Settings. The first time I used it I got a error message that stated "Parameter 4 on Truck-Code must be greater than zero".

I spent quit some time trying to figure out how to correct this. Parameter 4 in Truck-Code is a BRASS message. Doesn't mean much to an Opis user. I finally found the source of the problem. Using the Advanced Button I needed to enter a value other than default of zero for the scale factor.

We can correct this confusion in one of two ways. 1) Default the scale factor to 1 instead of zero when creating a new template or 2) Supply a better, non-cripted error message that an Opis user would understand.

FROM:jduray DATE:2/9/01 10:17:08 AM

How did you create a new template? When I do this the scale factor does default to 1

FROM:dteal DATE:02/12/2001 10:05:56

Sporadically Reproducible – My first attempt resulted in a default scale factor of 1. Further digging resulted in a scale factor of zero. I had to add- delete templates. I was able to reproduce it 3 times out of about 20 tries. I also found another sporadic problem in the templates that I will report in another incident.

FROM:kkennelly DATE:2/9/01 11:07:00 AM

Version 4.0.1. Enter a new bridge. Create a new Bridge Alternative, say ok to close bridge alt window. Name of bridge alt shows up in tree with (E)(C). Reopen Bridge Alt window, change name, click OK. New name in tree but (E)(C) not in tree name. Open Bridge window and the new bridge alt name shows up in alternatives tab with E,C checked.

**Description**

FROM:mordoobadi DATE:2/9/01 6:47:59 PM

If you change properties of a bridge folder and save it you will get an error, which is caused by trying to set owner\_id to zero (not NULL).

The code in question is in the function:

BOOL CDmBridgeGroup::ModifyGroupProperties(long IGroupId, LPCTSTR IpszName, LPCTSTR IpszDescription, LPCTSTR IpszSQLText,

IParentGroupId, BOOL bUseSQLInd, long

BOOL bPrivate, long IOwnerId)

we might have similar cases in other parts of the code.

FROM:dteal DATE:02/12/2001 10:07:26

I have been switching back and forth between saved templates. In one, the Engine (LRFD) Properties are set to "do not print stage 2 & 3 output". On another they are set to print. When switching back and forth, clearing, opening, switching between Vehicles and Engine tab, etc. Sometimes, (sporadic) the template that should "print stage 2 & 3 output" is listed as "Do Not Print". The Output Tab, as far as I can tell has always been correct for the template being checked.

## Description

FROM:dteal DATE:02/13/2001 12:45:22

I have a design review of a slab bridge using an HL93 Truck. In the Report Tool for LRFD Analysis Output, Moment Summary for Live Load, Span 1, Location 0.00 (at abutment #1), Maximum Negative Moment Controlling Live Load I find that the "Truck Train" is listed as controlling. I don't think a Truck Train is to be used anywhere but to find Max Neg Moment over a pier?

FROM:kkennelly DATE:2/13/01 3:01:34 PM

4/19/2016 3:15:14 PM

HRS AASHTO

806

**Complete Issue Information**

Report Tool in Virtis is just displaying what's in the BRASS LRFD output.

FROM:bgoodrich DATE:02/19/2001 10:42:57

The negative moment over interior supports and reaction at interior supports are computed by BRASS from the truck train loading. All other actions are initialized to zero. BRASS runs through all computations for each truck individually, so there are several places where a zero moment or shear exist but will not control. The end moments are non-zero, so I will have to investigate this further.

FROM:bgoodrich DATE:02/23/2001 19:02:27

Because you have restrained the ends of the spans that are located at the abutments, there is some negative moment at these locations. The truck train is used for negative moments between points of contraflexure, so for each end-span you have two contraflexure locations instead of one. I spoke with Jay Puckett and he agreed that with considering ALL negative moments between points of contraflexure and not just those over an interior pier. I am aware of there not being a corresponding negative moment for the truck train at the right end of the bridge. I have corrected that problem in BRASS-GIRDER(LRFD) Version 1.4.0.1. I am investigating the lack of symmetry in the live load actions as part of another incident.

## Complete Issue Information

| Name | Current State | Summary |
|------|---------------|---------|
|------|---------------|---------|

### Description

FROM:dteal DATE:02/13/2001 14:10:59

This is a different issue than Incident # 3045 which deals with cross-section symmetry.

Trucks are traveling in both directions on a RC 3 span structure.

When I check the controlling Max Neg and Max Pos Moments for this 3 span structure I find that they are not equal from Span 1 to Span 3 or the Span 2 halves are different. Being the trucks travel in both directions, the max LL Moments should be symmetrical. I found that as much as a 53.6% difference between the Max Neg Moment at the 1/10 pt of span 1 compared to the 9/10 pt of span 3. These two points should be considered identical. I have attached the design file (.bbd) and an excel spread sheet highlighting the comparisons in red.

FROM:bgoodrich DATE:02/23/2001 19:12:33

For a symmetrical structure loaded symmetrically, the actions should be symmetrical. I simplified your 3-span R/C structure to just have one cross section. Then, I changed the supports to pin, roller, roller, pin and analyzed it with BRASS. The dead and live load actions are symmetrical. Next, I changed the supports to fixed, roller, roller, fixed and analyzed it with BRASS. The dead and live load actions are symmetrical. Then, I added rotational springs to the first and last supports and analyzed it with BRASS. The dead load actions are symmetrical, however, the live load actions are not. I even tried adjusting the wheel advancement parameter in the member alternative engine properties. I will have to investigate this issue further.

FROM:bgoodrich DATE:04/27/2001 17:24:21

BRASS-GIRDER(LRFD) Version 1.4.1 was modified to correct the live load symmetry issue. Note that BRASS produces slightly different results at interior supports for the HL-93 Design Truck Train.

FROM:jduray DATE:6/4/01 8:59:22 AM

Dean accepted resolution of this incident.

FROM:bgoodrich DATE:06/13/2001 07:54:39

### Description

FROM:dteal DATE:02/13/2001 14:14:33

I saved the attached .XML file from the report writer. How the heck do I view it?? I used the "Save As" command the excepted the default name that was supplied, (LRFDRreport.XML) When I double click it I get the following message:

The XML page cannot be displayed Cannot view XML input using XSL style sheet. Please correct the error and then click the Refresh button, or try again later.

The system cannot locate the object specified. Error processing resource 'file://C:\Download\LRFDRreport.xml'.

FROM:kkennelly DATE:2/13/01 2:57:23 PM

When you used the Save As command to save the .xml file, did you save it to a directory different from the one in which it was originally created? The Virtis help for the Report Tool window explains that an .xsl file is required for Internet Explorer to know how to display the report and that file must also be copied to the directory where you saved the xml file.

FROM:dteal DATE:02/13/2001 15:40:24

FROM:kkennelly DATE:2/14/01 8:05:00 AM

I've added this item to a list for the Frequently Asked Questions help.

### Description

FROM:dteal DATE:02/15/2001 10:16:25

I have a 3 span RC structure. I have entered all X-Sections for each of the three spans to avoid the problems of the x-section symmetry (Incident #3045). When I check the Pos and Neg moments in the Live Load Actions Report at the pier 1 find that the last point in span 1 is different than the first point in span 2. These are the same points. They differ for Axle, Tandem Lane and Fatigue but are correct for the Truck-Train.

I have attached the bbd file and the .XML Report which shows the same thing at pier locations.

FROM:dteal DATE:02/15/2001 10:23:37

The thing at Pier #2.

FROM:bgoodrich DATE:02/23/2001 18:45:24

The live load actions include the distribution factors. Spans 1 and 2 have different distribution factors for moment, which I believe is the source of the difference. I am looking at overall live load symmetry in another incident.

Also, the last cross section (4.000 CL Brg Abut #2) has width of 18000 mm instead of 1800.

FROM:dteal DATE:02/26/2001 10:02:51

I caught the section width input error just after I sent it in. It made no changes for this particular problem.

| 3123.12226 | Assigned      | Determining Reinforcement Input for P/S Bridge |

### Description

FROM:dteal DATE:02/15/2001 15:16:12

In the attached structure, why are the Section Moduli and Stress' different at the end of span 1 and beginning of span 2? Aren't these considered the same point, over the pier?

FROM:bgoodrich DATE:02/23/2001 18:41:38

The sections appear identical (rolled beam, slab, rebar, haunch, etc.) so the section moduli and stresses should be the same. I ran this problem with BRASS-GIRDER(LRFD) Version 1.4.0.1, and I am unable to duplicate the results. The section moduli and stresses are the same between the 110 and 200 POI. The new version may be available in the next service pack.

FROM:dteal DATE:02/26/2001 11:53:25

I will need to know which version or patch to verify this for acceptance.

FROM:jduray DATE:3/2/01 11:27:26 AM

We need to send the patch to Dean for testing prior to release. This requires a new BRASS dll from Wyoming.

FROM:jduray DATE:6/4/01 8:58:17 AM

Dean accepted resolution of this incident.

### Description

FROM: dkoenig DATE: 02/16/2001 09:23:16

When entering the # of bars in the Reinforcement tab of the Deck Profile for a P/S Girder, which effective flange width should we use (LFD or LRFD)? Is the user expected to change this parameter depending on which analysis is used?

What happens if the LRFD effective flange width changes along the length of the bridge? Currently the AASHTO LRFD manual uses the points of contraflexure to determine the span length to be used in

4/19/2016 3:15:16 PM

HRS AASHTO

815

**Complete Issue Information**

calculating the effective flange width. With shorter spans this value can dramatically decrease the effective flange width in the positive and negative moment regions for shorter span continuous bridges. Maybe AASHTO made a mistake. If they did not, this can make the reinforcement input tedious. Maybe the reinforcement should only be input over the negative moment region to simplify this process since that is the only reinforcement exported by the current LFD Engine.

Are there any future plans that would incorporate laying out the longitudinal reinforcement in 3-D? Maybe this would be located in the Structure Typical Section or as a separate folder for Girder Systems. Then the effective flange width could be calculated or manually entered, and the reinforcement needed for each composite section could be automatically determined. Currently, any changes to the effective flange width calculations will result in manual recount of bars.

Any help or thoughts on these issues are appreciated.

FROM:kkennelly DATE:2/16/01 2:34:33 PM

Use the effective flange width for the type of analysis(LFD/LRFD) you are currently running when inputting the deck rebar. As Virtis/Opis is currently set up, you have to change the deck rebar you input if the effective flange width differs between LFD and LRFD and you are switching from LFD to LRFD.

The LRFD effective flange width can vary due to the pos/neg moment span lengths and also any changes in top flange plate width (steel beams). I would suggest only inputting the rebar in the negative moment region since that is all that is used now. Hopefully, we'll be able to enhance Virtis to let the user enter the rebar without regard to the type of analysis being used (LFD/LRFD).

### Description

FROM:dteal DATE:02/16/2001 10:23:44

With an existing bridge in our database, created in version 2.xx 1994 LRFD was the specification available. Now with version 4 we have upgraded to the 1998 LRFD Specification. So I want to do a design review using the new Spec. I added the 1998 Spec. to my "Factors". (So now I have two Spec's listed under LRFD Factors) How or where do I select which Spec is used? How do I know which spec is being used?

FROM:jduray DATE:2/16/01 2:51:07 PM

FROM:jduray DATE:2/19/01 3:54:48 PM

You select the spec in the member alt window. You can set the default spec in the config browser.

FROM:dteal DATE:02/20/2001 11:35:37

You said I could select the spec in the member alt window. – No I can't! There is no mention of spec in this window. I have a structure, created in Version 3.0 and in the Factors GUI, LRFD 1994 was copied from the library. Now after updating to Version 4.0 I have copied the 1998 LRFD spec to the Factors GUI.

How do I know which one is being used?  
Can I switch between them?

The default spec is set in the config browser – I don't have any selections, just 1998. Should I have selections?

When populating the Factors GUI using Copy from Library, I only have one selection there also, the 1998 Spec. Should 1994 Spec also be present?

FROM:jduray DATE:3/2/01 11:05:41 AM

>>>>>>> Important change ----> Apparently the config browser does not allow agency-defined factors to be the default. I think this should be changed .

4/19/2016 3:15:16 PM

HRS AASHTO

817

**Complete Issue Information**

The engine will use the factors that are specified in the config browser unless you override this in the Analysis tab of the Structure Def window or the Factors tab of the Member Alt window.

FROM:jihnath DATE:3/2/01 2:47:51 PM

Jim - The GUI change to allow this is simple enough, but there's code in CDmLibDefault::Save() that specifically prohibits agency factors from being used as system defaults.

FROM:jduray DATE:3/13/01 4:28:48 PM

Mehrdad - please change CDmLibDefault::Save() to allow this particular agency item to be saved.

FROM:mordoobadi DATE:3/20/01 1:57:04 PM

Save function fixed. Fixed for 4.1.0.

FROM:jihnath DATE:6/6/2001 3:28:12 PM

GUI updated for version 4.1

Rating results for a RC slab structure are wrong due to the wrong area of steel being used in some x-sections. (.bbd attached)

I have a RC slab structure. For simplicity I will only discuss the top steel (3 bar pattern).

Input is as follows (see excel spreadsheet for bar pattern sketch)

X-Section 1.070 has 4 #36 bars, they extend from Section 1.070 to Section 1.110.

At Section 1.110 we change to 8 bars, they extend from Section 1.110 to Section 1.120.

At Section 1.120 we change to 12 bars, they extend from Section 1.120 to Section 1.130

Now looking at the BRASS output from a Rating run.

X-Section 1.070 has 4 #36 bars, they extend from Section 1.070 to Section 1.110. OK

From section 1.110 to 1.120 we should have 8 bars present but BRASS only uses 4 bars.

From section 1.120 to 1.130 we should have 12 bars present but BRASS only uses 8 bars.

FROM:jduray DATE:2/27/01 9:45:36 AM

Brian - please investigate. Sounds like the problem could be in the domain, export or brass.

### Complete Issue Information

FROM:bgoodrich DATE:02/28/2001 19:00:11

The structure is not defined symmetrically in Virtis! The cross sections ranges must be defined so that the rebar does not change within a cross section range. See my comments in Incident 3121. This is a duplicate of 3045 and 3121.

FROM:dteal DATE:Monday, February 26, 2007 12:21:38 PM

Schedule based input made this a mute point - Accepted

### Description

FROM:dteal DATE:02/22/2001 12:31:10

I got the following error (too many RC X-Sections)

Error generating BRASS span commands!

No. of ranges = 16 (Maximum = 15)

Maximum number of web profile ranges (per span) exceeded for BRASS!

The below text is from the On-Line Help within VirtisOpis for BRASS LFD. It states that I can have up to 100 sections???

Enter the number for the unique cross section to be described by the library Standard Designator entered in the next command parameter. Up to 100 unique cross section numbers are allowed.

This Error is for BRASS LFD. BRASS LRFD will handle this amount of sections

FROM:bgoodrich DATE:02/26/2001 13:58:47

Both BRASS programs support 100 unique cross sections. The issue with this particular error message is the number of cross section RANGES. This incident is basically a duplicate of Incident 2938.

### Description

FROM:dteal DATE:02/22/2001 13:33:58

For a RC Haunched Slab, all top steel must be dimensioned for the top of the slab and bottom steel from the bottom. In order to get the structural "d" correct, the sacrificial wear must be deducted from the slab thickness used in the Cross Sections and then account for it's weight in the Member Alt Description window under Additional Self Weight. We discussed this in incident #1857 (12/2/99). This above method works fine for Opis (design). But when considering Virtis (rating), in Kansas, and I'm sure there are other states, consider the entire slab thickness when calculating capacity for Rating. So a new problem arose. Structures (RC Slabs) that have been entered in Opis will present the wrong structural thickness in Virtis and result in a lower rating.

FROM:kkennelly DATE:3/8/01 2:53:07 PM

I think we need 2 slab thickness inputs on the rc slab beam xsection window: one actual thickness, one effective thickness.

I searched through the incidents and found the following incidents regarding rc slab beams and their rebar: 1414,1491,1857,1970. I think Rick wanted to use the height attribute we have in the xsection for the actual thickness of the slab (as per incident 1414). Incident 1857 says to use the total deck thickness and eff deck thickness to account for sacrificial wearing surface but that doesn't work for a rc slab beam since it is girderline and there is no other window in which to enter the total deck thickness. The Michigan rating job is also using the total deck thickness (less any loss based on actual inspection reports) in their ratings not the deck thickness they use in new design.

FROM:kkennelly DATE:9/13/2004 8:35:41 AM

Checkboxes for user to indicate if they want eff slab thickness used for rating and design are added to Version 5.2.0.

**Description**

FROM:dteal DATE:02/22/2001 14:02:42

I have a structure that is totally SI. But when I Rate the structure and view the Analysis Output (BRASS), it is all in USC. This makes reading output very awkward and paves the way for mistakes.

FROM:bgoodrich DATE:02/28/2001 16:24:30

This issue is not a bug but rather a request for an enhancement, hence, I changed the category. There are no plans that I am aware of to make any units conversions from US Customary to Metric in the output for BRASS-GIRDER(ASD/LFD). Virtis allows you to view results (dead load actions, live load

4/19/2016 3:15:18 PM

HRS AASHTO

825

**Complete Issue Information**

actions, etc.) in either system.

FROM:bgoodrich DATE:03/01/2001 14:49:15

Jay Puckett agrees with my comments above. Note that LRFR (the rating spec) will be implemented in BRASS-GIRDER(LRFD) soon. Jay also indicated that you could run BRASS-GIRDER(LRFD) with the rating option, however, this must be done outside of Virtis.

FROM:dteal DATE:03/01/2001 17:03:09

FROM:dteal DATE:08/28/2001 09:27:50

After checking with our Ratings Group - enhancment monies could be better spent, therefore I think we should close this issue.

FROM:bgoodrich DATE:02/28/2001 19:01:39

I have performed a preliminary investigation and have forwarded the BRASS data file to Dan Glandt for a detailed review.

FROM:dglandt DATE:03/01/2001 18:00:53

I looked at this data set. The problem is this:

I am only looking at the 104. I imagine the other points that kicked out are the same.

There is a web depth change at 19.6358 feet. The 4/10 point is at  $.4 \times 49.213' = 19.6852'$ . He used the transfer command to put a node point at 19.6358 feet on span 1.

As these points are so close together, the program only generates a node at the 104.00. You can take out the TRANSFER commands without changing the results.

The difference between 19.6358 feet and 19.6852 is .0494 feet. He then asks for a poi at the 103.99. This is 19.63599 feet on span 1.  $19.6852 - 19.63599$  is 0.04921 feet which is exactly .001 times the span length.

The purpose of the error message is to try and get the user to take a realistic look at his data set. We explain this on page 10.1, the ninth paragraph, but it probably doesn't get read. The error message though also explains that nodes are put at 1/10 points. If you change the poi command to ask for the 104, the program runs ok. Or if you ask for a poi at the 103.9, the error won't occur. If you ask for a poi at the 103.99000264, it will run without an error because it meets the criteria.

So I wonder does the user really need to have poi's .59 inches apart.

If this type of data set generation is going to be a problem, maybe we need to look at how we merge nodes that are close together. In this case, maybe we should lose the 104 and get the 103.99 as it is at a change in cross section. Our idea has been that the user would read the error message and change his web range distance to match the 4/10 point. In this case, that would be a little over 1/2" and I can't believe it would affect the results significantly. Either way, the user needs to have some knowledge of the node generation system.

4/19/2016 3:15:19 PM

HRS AASHTO

829

## Complete Issue Information

On the next point, there is a cross section range change at 29.4455 feet into span 1. He asks for a poi at the 105.983. This is 29.4441379 feet into the span. The difference is  $29.4455 - 29.441379 = .004121$  feet which is ok except the 105.983 was merged with the 106.0 which is 29.5278 feet into the span, which is 0.0836621 feet from the requested poi and out of range of the check.

I don't know why OPIS would work unless some of the numbers are very slightly different.

I see that there are some errors in the error message that I need to fix for the next release. I will also work on adding some wording to the message about merging points.

FROM:bgoodrich DATE:03/01/2001 18:01:38

I modified the Virtis/Opis POIs as follows:

- > Removed 5.985 m (Span 1) because it was too close to 4/10 point and 6.000 m already entered.
- > Changed 8.975 m (Span 1) to 9.000 m because it was too close to 6/10 point.
- > Changed 41.025 m (Span 3) to 41.000 m because it was too close to 6/10 point.
- > Removed 44.015 m (Span 3) because it was too close to 6/10 point and 44.000 m already entered.

After making these changes to the POI, I was able to run an analysis with BRASS-LFD. Having to change or remove data is not desirable at all.

Jim - Is there any action we should take in Virtis/Opis or the BRASS engine data, so a point of interest can essentially be ignored by a particular engine, but still exist in Virtis/Opis?

Note that there are already some incidents requesting enhancements to BRASS to address the short element and node point merging issues.

FROM:bgoodrich DATE:08/13/2001 10:23:44

Thomas Carr (SWEC) reported a similar problem. His BBD file (M210221UD.bbd) is attached.

FROM:bgoodrich DATE:09/04/2001 12:20:22

Dan Glandt corrected the BRASS-GIRDER engine (Version 5.8.4 - August 31, 2001 build) to address this issue. Fixed for Version 4.1.

### Description

FROM:dkoenig DATE:02/27/2001 12:24:15

A 3-span P/S girder was entered and analyzed in Virtis 3.0. Three potential problems arose from taking a look at the Brass output.

1. I am not sure that the Strand Layout is creating perfectly symmetric girders. A lump sum loss was entered, and the Vertical shear force,  $V_p$ , was compared at sections along the first girder. In regions where the strands are draped and fully developed, different  $V_p$  values are found on each side of the girder (Longitudinally). Since a Lump Sum was used, the stresses should be the same in the strands. I believe the strands are at different angles in Brass. I agree with the left part of the span, but cannot figure out what is going on in the right part.

Look at POIs @ 4' and 45.5833' for G2 in bbd file.

2. While looking at the above, I found some strange stresses occurring near the continuous support for Span 1. The fpe stress should be fully developed a transfer length away from the support, and constant throughout the rest of the draped length. I found that at the transfer length, the stress in the P/S strand is larger than the constant fpe value found in the rest of the strand (I used  $V_p$  again as a

4/19/2016 3:15:19 PM

HRS AASHTO

831

**Complete Issue Information**

comparison). POIs @ 45.5833' and 47.5' can be analyzed to see this apparent localized increase in stress. This is not found for the left part of the beam (POIs @ 2.0833' and 4').

Again, this does not affect the ratings much, but seems to be unusual. Maybe I do not understand some stress affects that are occurring near the interior supports.

3. The shear capacity found at 39.67' along the span is incorrect. When negative moment is analyzed to determine the shear capacity, many of the values are calculated wrong. Yt is based on positive moment. The fpc and fpe values are completely wrong. The fd and Mmax values are also based on positive moment. When the AASHTO losses are used, this incorrect capacity ends up controlling. I think the program is getting confused.

I also wonder if the program is correlating negative shear with negative moment and positive shear with positive moment. These should be independent.

I have attached the bbd file. The POIs have been created for G2 only. Any comments on these issues are greatly appreciated.

You could run this in 4.0 for comparison purposes.

FROM:kkennelly DATE:3/5/01 2:34:12 PM

1. Export is not creating a symmetrical layout for the strands. This is related to the BRASS LFD Engine PS modeling method selected on the Engine tab for the member alt. BRASS can't use a different span length for the simple span beam and the span length for the beams made continuous. This bridge has Center of simple span bearing picked for the modeling method in the Member Alt Engine tab window. If centerline of final supports is picked instead, the strand layout becomes more symmetrical. Maybe the export should create a symmetrical strand layout even if the user has picked "center of simple span bearing".

FROM:bgoodrich DATE:04/18/2001 17:22:12

Entered for Dan Glandt:

We are working on getting a solution from PCI. I believe they are going to publish a list of questions in the PCI Journal about how to handle shear near supports. Jay and I have decided to wait until we hear something definite from this before we change the program.

FROM:bgoodrich DATE:08/09/2001 13:11:52

Dan Glandt modified BRASS and added new shear options to address this incident. Fixed for version 4.1.

### Description

FROM:gbarnhill DATE:02/28/2001 11:19:44

4.0.2 - The attached bbd is a haunched 3-span continuous slab modeled as a one-foot strip. It has slightly odd span lengths. The section ranges are modeled to match bar cut-offs so there are some very short ranges.

The dead load moments at pier one are different on the left side verses the right side of the support. The live load moments have a strange jump at pier one.

I changed the model to even span lengths and only a few section ranges. The moments come out symmetrical.

I suppose it has something to do with section changes, but there are no warnings or error messages in the export or analysis.

FROM:bgoodrich DATE:03/02/2001 18:41:55

Gale – I think your support constraints are the problem. Support 2 is FIXED for the member “one foot strip (English)”.

FROM:gbarnhill DATE:03/05/2001 09:47:56

Thanks Brian. I didn't check that. Looks OK now.

AASHTO LOSS COMPUTATIONS as calculated by BRASS-GRIDER(LRFD)

BRASS-GIRDER(LRFD) uses an iterative procedure to compute the relaxation loss at transfer. I believe that this is incorrect. The relaxation loss at transfer is depended on the time of transfer and the jacking stress only. BRASS-GIRDER(LRFD) computes fpj as the following:

$$fpj = (P/S \text{ ratio} \times fpu) - (\text{Elastic Shortening} + \text{Relaxation at Transfer})$$

fpj should be the jacking stress.

PERFORMING AASHTO LOSS COMPUTATIONS - AASHTO 5.9.5 Loss of Prestress

Analysis Point : 205.00

## Complete Issue Information

Construction Stage: 1

AASHTO REFERENCE: 5.9.5.2.3a Elastic Shortening (Pretensioned Members)  
EQUATION NO. : (5.9.5.2.3a-1)

Input Parameters:

$f_{cgp} = 15.854 \text{ MPa}$     $E_p = 197000.000 \text{ MPa}$     $E_{ci} = 26321.373 \text{ MPa}$

Summary:

$ES = (E_p / E_{ci}) f_{cgp} = 118.655 \text{ MPa}$

AASHTO REFERENCE: 5.9.5.4.4b Relaxation (At Transfer)  
EQUATION NO. : (5.9.5.4.4b-2)

Input Parameters:

$t = 0.750 \text{ days}$     $f_{pj} = 1177.672 \text{ MPa}$     $f_{py} = 1674.000 \text{ MPa}$

Summary:

$R1 = \log(24 t) / 40.0 * (f_{pj}/f_{py} - 0.55) f_{pj} = 5.673 \text{ MPa}$

AASHTO REFERENCE: 5.9.5.4.2 Shrinkage  
EQUATION NO. : (5.9.5.4.2-1)

Input Parameters:

$RH = 65.00\%$

Summary:

$SR = 117.0 - 1.030 RH = 50.050 \text{ MPa}$

AASHTO REFERENCE: 5.9.5.4.3 Creep  
EQUATION NO. : (5.9.5.4.3-1)

Input Parameters:

$f_{cgp} = 15.854 \text{ MPa}$     $f_{cdp} = -4.700 \text{ MPa}$

Summary:

$CR = 12.0 f_{cgp} + 7.0 f_{cdp} = 157.343 \text{ MPa}$

AASHTO REFERENCE: 5.9.5.4.4c Relaxation (After Transfer)  
EQUATION NO. : (5.9.5.4.4c-1)

Summary:

$R2 = 138.0 - 0.4 ES - 0.2 (SR + CR)$   
 $= 49.059 \text{ MPa}$

$R2 = 0.3 R2 = 14.718 \text{ MPa}$  (low-relaxation strand)

Notes:

=> Any losses computed as negative were set to zero.

=> The creep loss equation (AASHTO 5.9.5.4.3-1) contains a + sign because  $f_{cdp}$  carries sign.

**Complete Issue Information**

FROM:bgoodrich DATE:03/01/2001 18:13:09  
BRASS-GIRDER(LRFD) follows the procedure outlined in chapter 7, section 7.10.4, pages 623-626 of Design of Highway Bridges by Barker and Puckett.

Dean - Please attach a spreadsheet or hand computations that illustrate your results and how BRASS may be incorrect.

FROM:dteal DATE:03/05/2001 10:59:27  
AASHTO RELAXATION LOSS AT TRANSFER COMPUTATIONS as calculated by BRASS-GIRDER (LRFD)

AASHTO LRFD ARTICLE 5.9.5.4.4b Equation (5.9.5.4.4b-2) includes a term fpj. In the listing of the Notations on page 5-6 fpj is defined as the stress in the prestressing steel at jacking, in other words, jacking stress.

However, BRASS-GIRDER(LRFD) considers fpj to be the stress in the prestressing steel after transfer of the force to the concrete beam. I believe that is incorrect.

Therefore, the relaxation loss at transfer is found directly and does not require an iterative procedure.

FROM:bgoodrich DATE:03/05/2001 12:17:31  
BRASS interprets the fpj variable in AASHTO LRFD 5.9.5.4.4b as defined in that particular article, i.e., the initial stress in the tendon at the end of stressing. Jay's book discusses relaxation losses in Chapter 7, section 7.7.6 (page 465) and makes a point to denote this variable as fpi (initial stress). The specification may need to be revised to clarify this stress.

FROM:bgoodrich DATE:04/16/2001 10:09:47  
We have requested that AASHTO clarify this issue, but have received no response yet.

FROM:bgoodrich DATE:08/29/2001 16:22:58

FROM:bgoodrich DATE:Wednesday, May 28, 2003 9:47:39 AM  
Khalid Obeidat (MN DOT) has similar concerns that need to be addressed.

### Description

FROM:dkoenig DATE:03/01/2001 14:37:18

A created another 3-Span Continuous P/S bridge in Virtis 3.0. I reproduced the shear computation error on incident 3136. This error can be seen in the detailed output of the POI set at 79.9583' for G2.

Another error was found for POI set at 39.05'. It can be seen in the positive shear calculations. Here the factored shear force is found to be about 6 kips when it should be well over a 100 kips. This would increase the shear capacity of the concrete greatly. Also, I noticed that the Mcr value calculated was incorrect. I came up with 505 kips using the values Brass gave. Brass calculated 447 kips.

Let me know if this has already been corrected for 4.0.

The Brass bbd file has been attached.

FROM:kkennelly DATE:3/2/01 8:57:19 AM

Brian, I migrated this bbd file to version 4.0.1 and attached it to this incident.

FROM:bgoodrich DATE:03/02/2001 13:36:54

I forwarded this issue to Dan Glandt.

FROM:bgoodrich DATE:04/18/2001 17:21:01

Entered for Dan Glandt:

We are working on getting a solution from PCI. I believe they are going to publish a list of questions in the PCI Journal about how to handle shear near supports. Jay and I have decided to wait until we hear

**Description**

FROM:dkoenig DATE:03/01/2001 14:45:35

I can create a girder system bridge (I have only checked P/S) that has an exterior member alternative copied to an interior member. When the haunch height Y1 is changed to 1.0 in the interior girder say from Y1 = 1.5, Y2 = 1.5 for the exterior girder, the Y2 old value is being kept. The Brass output will show the haunch as 1.25 (Average of 1.0 and 1.5), instead of 1.0. If the haunch line is deleted and 1.0 is entered, the correct value is displayed in Brass.

Again, this is for Virtis 3.0.

FROM:bgoodrich DATE:03/02/2001 15:32:08

Jim - I created an exterior member alt with a haunch profile where Y1 and Y2 were both 1.5 inches and

4/19/2016 3:15:20 PM

HRS AASHTO

839

**Complete Issue Information**

Y3 is 0.0 inches. I copied this exterior member alt to an interior member and then opened the PS Haunch Profile window for the new interior member alternative. In this window, only Y1 and Y3 are available for modification, so the Y2 value remains as 1.5 inches. The BRASS export does one of the following with Y1 and Y2:

- If Y1 and Y2 are both entered, the average is used for the haunch depth.
- If Y1 is entered but Y2 is not (i.e., null), then Y1 is used for the haunch depth.

The export does not check for interior or exterior girders. I think the Virtis/Opis copy feature should set Y2 to null when copying an exterior member alternative to an interior member alternative. Otherwise, Virtis/Opis may be inadvertently placing invalid data into the database.

FROM:kkennelly DATE:11/16/2001 2:08:15 PM

Steel member alts have the same issue when copied from exterior mbrs to interior mbrs. Exterior mbrs have a Y2 dimension, but interior mbrs do not.

FROM:kkennelly DATE:12/4/2001 10:44:27 AM

Domain has been changed so that when an exterior mbr alt is copied to an interior mbr alt, the Z3, Z4 and Y2 haunch values are set to null since the gui prohibits their entry. Change made for Version 4.1 but was made after Beta 3 build so still needs tested.

### Description

FROM:dkoenig DATE:03/01/2001 14:50:47

Example: 44.25' – 45' – 44.25' span lengths entered in structure definition.

Simple Span lengths = 43.5417 – 43.5833 – 43.5417

Two 5 in. overhangs, and 7 in. gap between ends of girders.

Total gap between centerline of bearings = 1.417'

POI entered is @ 88' from first support.

Results: POI – located at  $(88-44.25)/45 = 97.22\%$  of Span 2                      OK

Brass – located at  $(88 - 44.25 - 1.417/2) = 43.042'$  of span 2

Brass% =  $43.042/43.5833 = 98.76\%$  of span 2                      OK

Rating Results Summary:

Location =  $(88 - 1.417) = 86.58'$  Incorrect

$(86.58 - 44.25)/45 = 94.07\%$                       Incorrect

Brass bases the percentage on the location between centerline of bearings. The Rating Results Summary calculates a length ignoring the gap between bearings, and then compares this to the full model that includes the gaps. This is inconsistent and incorrect.

Again, I am using Virtis 3.0. Maybe this has been fixed for 4.0.

Incident 3139 has a bbd file where this can be seen readily (G2).

FROM:bgoodrich DATE:03/02/2001 15:36:25

BRASS returns results for the span lengths that were passed to it. BRASS makes no adjustments to the distances for results returned to Virtis. David is correct that the results viewer does not correctly position the BRASS distances on the full model. It appears that the BRASS results are positioned on each span, such that the start of the BRASS span matches the start of the Virtis/Opis span. The bearing offsets should be accounted for when the BRASS P/S modeling method is specified as "Centerline of simple-span bearing."

FROM:jduray DATE:2/4/02 4:36:43 PM

We need to determine if BRASS needs to make the adjustment or Virtis. I don't think the viewer can know anything about a modeling method described in engine data.

**Complete Issue Information**

FROM:bgoodrich DATE:02/06/2002 18:58:02

The BRASS engine cannot make any adjustments because it only knows the length of the spans passed to it via the data file. Virtis is simply displaying results from any engine, so I don't think it should make any adjustments. Maybe the export should access the results and make any necessary modifications.

FROM:jduray DATE:2/14/02 9:12:14 AM

I think the export should add a correction to the poi locations to account for the distance between CL of support. This will make the distances and percentages appear correct in most of the Virtis UI. However, the distances and percentages in the spec check results and the BRASS output will still differ from what the user expects based on the Virtis UI.

The best way to fix this problem is to change BRASS so it is aware of the distance between CL of support and uses it in the output. BRASS would benefit from this change.

We need to discuss this with Jay and perhaps Wyoming.

FROM:jduray DATE:2/25/02 9:01:49 AM

FROM:bgoodrich DATE:Friday, March 29, 2002 10:55:41 AM

I forwarded this issue to Jay Puckett and WYDOT on 2/26/02. I have not yet received a response.

FROM:bgoodrich DATE:Wednesday, June 22, 2005 10:14:59 AM

Ken Teng (RQAW) reported this exact issue.

Jim - Could we add a function to the export process that adjusts the distances associated with results passed to Virtis/Opis in the results object? It would only need to be called for P/S members. The export has access to the offset geometry and the P/S modeling method. I think this would take less time and less chance of breaking something than trying to make any changes to BRASS.

FROM:bgoodrich DATE:Friday, November 11, 2005 1:49:15 PM

Incident 6715 is a duplicate of this issue.

| 3143.12206 | Resolved      | Shear at Supports |

### Description

FROM:dkoenig DATE:03/01/2001 14:54:50

I noticed something peculiar about the P/S Loads graph. The negative P/S load is off-centered, compared to the simple span dead loads. These graphs should essentially mirror each other. The P/S load goes to zero at the left support, but reaches zero before the right support. Am I correct in my assumption? Has this been fixed for 4.0 (We currently are trying to get the databases updated for 4.0)?

Incident 3139 has a bbd file that will show you what I am talking about.

FROM:bgoodrich DATE:03/02/2001 15:30:46

David - You are correct that the P/S Loads graph shows a moment of zero at a few points near each of the supports. These locations are within the transfer length of the strand. For this example, there should be a negative moment at the points located at 1.62 ft, 41.46 ft, 41.88 ft, and 43.39 ft because the strands at these locations are stressed to something between zero and full stress. I will forward this issue to Dan Glandt for further investigation.

FROM:bgoodrich DATE:04/10/2001 08:30:32

Dan Glandt corrected a problem in BRASS to correctly handle the overhang when there is no debonding. This correction will be available when BRASS-GIRDER version 5.8.3 is released with a Virtis/Opis Service Pack.

## Description

FROM:dkoenig DATE:03/01/2001 14:58:07

Again, I am using 3.0. I noticed that the loads at the bearings are the loads being used at these points instead of using a distance  $h/2$  away from the face of the support (AASHTO 9.20.1.4). Is 4.0 taking this into account, or are there any plans to use this reduction in loads as an option in the future?

FROM:bgoodrich DATE:04/17/2001 15:50:17

The loads directly at the bearings are being used. There are presently no plans to make any modifications to the BRASS engine.

HRS AASHTO

845

**Complete Issue Information**

get the below error. I checked to be sure that my POI and x-section are at the same point, Virtis thinks so, Opis disagrees. This may be the same problem that I reported in Incident #3135. (.bbd attached)

Error No.: 2300  
Type : Structural Analysis Error  
Location : Data File

\*\* ERROR: Analysis points must be at node point locations. Node point locations are 1/10 points, cross-section change points, hinge locations, special analysis point locations, and web depth change points.  
101.550 is not at a node point. Adjust its position so that it is.

FROM:bgoodrich DATE:03/02/2001 18:32:00  
When BRASS-GIRDER(LRFD) generates its model (nodes and elements), it tries to create a node point for each POI specified. However, if a POI was within the BRASS tolerance (2 inches) from an existing node, BRASS would not add a node point to the model for that POI. BRASS now finds the node point that is closest to the POI and uses the actions, etc. for performing section analysis and specification checks. This feature will be available in the next BRASS-GIRDER(LRFD) release.

FROM:jduray DATE:6/4/01 8:59:37 AM  
Dean accepted resolution of this incident.

### Description

FROM:dteal DATE:03/02/2001 07:47:18

Under the Advanced Button of the Analysis Settings Window I am looking at Impact. The help tells me that to assign an impact factor that is ½ of the impact indicated on the Structure Definition Impact/Dynamic Load Allowance GUI that I would enter 1.50. I assume that if I wanted 0 (zero) percent impact that I would enter zero in the field for the particular truck???

Our permit vehicles are like this. T130 uses 50% and the T170 uses 0%Impact.

Because zero is a common value to be entered here – maybe the help should give us two examples (50% and 0%) so other users don't have the same confusion.

FROM:jduray DATE:3/2/01 10:58:12 AM

FROM:kkennelly DATE:3/2/01 2:11:09 PM

Example for 0% added to help.

Brian, for an HS20 vehicle I entered 0 for the impact on the Vehicle Properties window. The export generated the following command:

TRUCK-IMP -100.00, -100.00

The BRASS LFD output for the truck showed 0 for the reaction impact but for the lane the output showed -17.48% for the reaction impact. The reactions shown for the lane used an impact of (1-.1748) =0.825. (I ran Training Bridge 1). If nothing is entered for the impact on the Vehicle Properties window, the reaction impact is listed as 17.48% for both truck and lane for Training Bridge 1.

FROM:bgoodrich DATE:03/02/2001 16:03:27

The following is a list of how the user should enter values for impact in the Vehicle Properties window:

. Zero impact, enter 1.0

4/19/2016 3:15:21 PM

HRS AASHTO

847

### Complete Issue Information

- 50% impact, enter 1.5
- 100% impact, enter 2.0

The export takes the value entered here and subtracts 1.0. The result is then multiplied by 100 because BRASS requires a percent. In your example, you entered 0.0. Therefore,  $(0.0 - 1.0) * 100 = -100.0$ .

Jim, Gale Barnhill, and I discussed this issue, but I'm not sure for what incident, so there may be more information on why the input is required in this manner.

FROM:dteal DATE:03/05/2001 10:57:26

The values Brian stated the user must enter is making VirtisOpis input very Engine Specific. The user doesn't need to know that BRASS subtracts 1.0 from the entered value, this math should be taken care of in the export. The user should enter impact modifiers with common sense in mind. The Impact Factor is set in the Structure Definition Impact/Dynamic Load Allowance GUI as "Standard AASHTO Impact". Now in the Analysis Settings – Advanced Button we need to modify the impact factor on lets say two of the vehicles in the vehicle summary list. Common thinking would result in the following input:

Zero impact, enter 0

- 1/2 the amount of declared impact, enter 0.5
- All the impact declared, enter 1.0 (or leave blank)
- Double the amount of impact declared, enter 2.0

So for the T130, which wants 50% of the impact we would enter 0.5 and for the T170 we want zero impact and would enter zero. This makes sense to the users.

FROM:kkennelly DATE:3/6/01 2:05:51 PM

Incident 2971 is the incident submitted by Gale. I agree with Dean and Gale that the user should enter 0.5 to reduce the impact by 50%.

Brian, Has this enhancement request been sent to WYDOT and what was their response?

FROM:bgoodrich DATE:03/07/2001 19:41:20

My comments on 03/02/2001 were only to explain what the export is doing. Here's some history: The Vehicle Properties help topic for the versions previous to version 4.0 indicated to enter a value of say 1.3 when the impact was 30%, however, I think the intent of this field in these early versions was an impact factor and not an adjustment to the standard impact. When I first coded the export, I misinterpreted the intent and used the value as a percent adjustment. In Incident 2971, Gale Barnhill pointed out that the export was not using the value as a factor as indicated in the help. This value was always entered as a number greater than 1.0, so this is why BRASS had to remove 1.0 from it. Note that Jim Duray decided to leave the export as-is and change the help.

I too agree that it make sense to enter 1.0 for full impact and 0.0 for no impact. Also, in Incident 2971, Gale makes a good point that this impact override is not stored in the database, so we don't have to worry about existing data. I am in favor of changing the help, so values are input as Dean and Gale request. I can easily change the export to correspond to the new format.

Also, I have submitted the issue to WYDOT where there is no way in BRASS to override the final impact factor for a specific truck. BRASS only allows a percent adjustment on the standard impact.

FROM:kkennelly DATE:3/8/01 1:57:20 PM

4/19/2016 3:15:21 PM

HRS AASHTO

848

**Complete Issue Information**

Jim, should we change the export and the help so that the user can enter 0.5 to reduce the standard impact by 50%? It doesn't look like it's hard for us to change but will it confuse users already used to entering it the old way?

FROM:bgoodrich DATE:Wednesday, September 29, 2004 2:57:32 PM

This issue needs to be addressed as it relates to Incident 5368. We should revise the export and help as Krisha described on 3/8/01. Is there a way to check the Analysis Settings templates that users may have saved, which contain the Advanced (scale factor and impact) settings?

FROM:jduray DATE:9/30/2004 3:00:40 PM

Based on discussion with Dean, Brian Goodrich and Krisha:

Change the export to use the value entered as a multiplier on the impact. For 40% of the user specified impact enter 0.4. The export will multiply the impact by 0.4 and pass to BRASS. Enter 0 for 0 impact (0 \* impact). Leave blank or enter 1.0 for impact as specified in the UI.

Change the Help.

Write a script to convert the values in the db. Need to subtract 1.0 from the non-zero values in the db.

FROM:kkennelly DATE:10/6/2004 1:26:43 PM

Help updated for 5.2 and 6.0.

FROM:bgoodrich DATE:Thursday, October 07, 2004 12:41:55 PM

| 3147.12202 | Resolved      | BWS Report doesn't print out Measure To for Sidewalks and Railings |

### Description

FROM:dteal DATE:03/02/2001 12:06:43

The below Rating Factor Computation lists a Rating factor of 1.00. The Spec Checker lists it as a "Fail". As we can see from the applied load and available resistance that the rating factor was really 0.998 and not 1.00. Being the reported Rating Factor is a rounded value, shouldn't we also take it to 3 decimals. That way the Pass/Fail in the spec checker will always correspond to the numeric rating factor value.

#### PERFORMING RATING FACTOR COMPUTATIONS: Moment

Analysis Point : 101.57  
Construction Stage: 1      Resistance =      745.428  
Live Load No. : 1      Dead Load =      229.601  
Limit State : STRENGTH I Live Load =      517.107  
Units : m-kN      Rating Factor = 1.00

FROM:bgoodrich DATE:03/02/2001 14:14:19

I modified BRASS to out the rating factor to 3 decimal places. However, we could still have a case where the actual rating factor is say 0.99998 and the value reported would be 1.000. Nothing more can really be done about the rounding.

FROM:dteal DATE:03/05/2001 07:35:00

I will need to know which version or patch to verify this for acceptance.

FROM:bgoodrich DATE:04/10/2001 08:42:51

This correction will be available when BRASS-GIRDER(LRFD) version 1.4.1 is released with a Virtis/Opis Service Pack.

FROM:jduray DATE:6/4/01 8:57:34 AM

Dean accepted resolution of this incident.

FROM:bgoodrich DATE:06/13/2001 07:57:19

Closed.

| 3151.12198 | Suspended     | Printer Setup – Landscape |

### Description

FROM:dteal DATE:03/06/2001 12:23:22

When you want to print Analysis Results – Print Preview is the most common action you would take first. There is no button for Printer Setup on this window. So to rotate to landscape you have to exit the print preview and select printer setup. Then exit that window and select print. Printer Setup should be a button on the print preview window.

FROM:jduray DATE:3/8/01 8:30:27 AM

Joe - please chcek into what we have to do to provide this capability.

FROM:jihnat DATE:3/9/01 10:38:28 AM

The print preview toolbar is owned by the undocumented MFC class CPreviewView. Implementing this change would involve overriding that class, creating our own toolbar resource, and handling the toolbar message(s). We would also need to override the OnFilePrintPreview function in order to tell MFC to use our new CPreviewView class.

FROM:jduray DATE:04/06/2001 14:20:51

FROM:dteal DATE:09/21/2001 14:16:42

Seems to me what I am asking for here is functionality like a normal windows GUI. With a windows compatible program I would expect a print preview option for any window I would like to print.

FROM:jihnat DATE:9/21/2001 2:43:15 PM

I quickly checked three Microsoft programs: Excel has a Page Setup button on the Print Preview window, Word and WordPad do not.

FROM:dteal DATE:Friday, September 05, 2003 11:52:44 AM

Word has a "Print Preview" selection.

**Complete Issue Information**

FROM:dteal DATE:03/09/2001 10:21:09

I don't want to globally change the printer settings. I only want to change them in VirtisOpis. Is this what your asking?

FROM:jihnata DATE:3/9/01 10:31:56 AM

That was what I was asking. My thought was that a single flag (portrait or landscape) within VirtisOpis might make sense for a user like yourself who prints mainly in landscape. But for a user who prints about equally in both portrait and landscape, a single flag doesn't really help them at all. A more comprehensive change would be to store and use the last orientation for each type of document (Analysis Results, BWS Report, etc.) within VirtisOpis.

FROM:jihnata DATE:3/9/01 4:01:05 PM

MFC has no ready mechanism for doing this.

**Complete Issue Information**

On a permit vehicle which is included in rating vehicle summary list – how would one tell Virtis not to allow fatigue to control the rating. I would assume that in the advanced button for the vehicle properties would have been the place to set this. We already have Single Lane Loaded, Scale Factor and Impact modifiers in this window.

Is there some way to accomplish not letting fatigue control the rating?

FROM:bgoodrich DATE:03/08/2001 15:18:21

Virtis does not provide a field for controlling if fatigue should be considered in the controlling rating. BRASS currently defaults the allowable fatigue stress for every POI to a large number, so it will not control the rating for any truck. If you wish to change a value for a particular POI, you have to fill out the Fatigue tab for the POI. Even if Virtis had this field, BRASS would not be able to control fatigue on a per-truck basis.

Jim - I would think this would be a Virtis issue because it deals with rating in general, i.e., a user wants to ignore the fatigue rating for every engine. Comments?

FROM:jduray DATE:3/12/01 1:22:41 PM

Perhaps we need a checklist of what limit states to rate for?

FROM:bgoodrich DATE:04/09/2001 18:27:57

I agree. Depending on the level of detail, we might need to organize a different checklists for LFD and LRFD (when adopted). For steel, there are fatigue checks for shear connectors, rebar, web shear fatigue, flexural fatigue in flanges, etc. For strength: flexure, shear, bearing, and flexure-shear interaction. For service: flange stresses and crack control.

Jim - I am assigning this issue to you because changes will have to be made to Virtis first.

FROM:dteal DATE:Monday, January 27, 2003 9:23:31 AM

Are you requesting for any information from me??

FROM:jduray DATE:9/5/2003 12:03:30 PM

It looks to me as though we have the info we need for now. We need to prepare a list of possible limit states for rating and estimate the cost for implementing.

FROM:hlee DATE:6/4/2004 3:24:33 PM

### Description

FROM:dteal DATE:03/07/2001 10:45:47

Rating Permit Vehicles in Kansas (T130 & T170) require slab bridges to increase the Distribution of loads by 15%. Am I correct in thinking I can accomplish this by entering a scale factor of 0.85 for these two vehicles?

When we rate these two permit vehicles on girder bridges we limit the Dist. to Single Lane Loaded. This is handled just fine.

FROM:jduray DATE:3/8/01 8:23:11 AM

Brian - can you verify Dean's solution to his first question.

FROM:bgoodrich DATE:03/08/2001 15:00:17

The scale factor is not currently used by BRASS-LFD as indicated in the help. The export generates the TRUCK-WFR command, which contains the LFD distribution factors. We could multiply these DFs by the appropriate scale factor before writing the command. As Jim and I have discussed in the past, the BRASS output will only show the modified distribution factors, which may confuse the user.

FROM:jduray DATE:3/12/01 1:20:45 PM

I think we should modify the export to include the scale factor and note it in the export comments.

**Description**

FROM:dteal DATE:03/08/2001 08:22:44  
I have 17 BID numbers between 1 and 93 that are not being used. One of these numbers are on hold in the deleted bridges folder. The other 16 are currently not in use. When I create a new structure or make a copy, the BID number that is issued should be one of the numbers between 1 and 93 that is not in use but instead it adds the number to the end of the list, like 94.

**Complete Issue Information**

FROM:jduray DATE:3/8/01 8:21:35 AM

This is not reasonable to do or necessary. Why do want to reuse BID numbers.

FROM:dteal DATE:03/08/2001 10:38:09

Bridges that have been deleted - no longer in the database - the BID # (the first column in the Bridge Workspace)

Are you saying that when a bridge has been deleted - the BID # in the Bridge Workspace will never be used again???

FROM:jduray DATE:3/9/01 9:47:25 AM

Yes, the BID is generated by adding incrementing a counter. The next BID is always one greater than the last. The limit is 2,147,483,648.

FROM:jduray DATE:3/9/01 9:52:11 AM

E-mail from Steve Mample.

---begin e-mail-----

Hello,

My original concern was with the Load Factor shear analysis of reinforced concrete tee beam and composite reinforced concrete tee beam girders. The BRASS Load Factor shear analysis can result in a shear capacity anywhere from 5 to 10 tons lower compared to the BARS Load Factor shear analysis. I believe this could also occur with a few composite prestressed concrete girders and reinforced concrete box beams.

Idaho's consultant engineer, Mary Walker, has studied this difference between the BRASS and Bars shear analysis results. The apparent reason for the difference is that BRASS uses a more conservative application of the AASHTO standards. BRASS shear uses the AASHTO equation 8-49 to calculate Vc, rather than AASHTO equation 8-48 used by BARS. Also, BRASS uses phi = 0.85, while BARS uses phi = 0.90 in the AASHTO equations 8-46 and 8-47.

Of the 26 States that I sent E-Mail questionnaires to, I received 8 responses by E-mail. Four States did not receive my E-mail questionnaire due to the contact person having quit that Stat's employment. I called and

## Complete Issue Information

talked to a bridge section representative for those four States. Rather than try to summarize the responses, I will just list the responses below. I would like to thank those who sent a reply and who I talked to by phone for their information. This appears to be something we may want to talk about at the meeting in New Mexico. See you there, Steve.

We use both moment and shear to rate all of our steel structures; however, we ignore shear effects for many of our concrete structures such as reinforced concrete slab span bridges. Other bridges, such as those with prestressed concrete girders, are also often rated only considering moment. This is due to BRASS's inability to properly analyze shear in prestress girders. We have not addressed any policy changes concerning this issue.

So far we have not seen shear to be a big problem in our VIRTIS ratings. However, we are just getting starting in populating our database with girder system models and the bridges that we have loaded are not giving us a good picture of the shear issue. We are leaving the check LFD for shear option enabled. When we do encounter a rating where shear controls we will be looking closely at each bridge individually.

We are just getting our server set up to do virtis and have not yet converted over yet. One suggestion though, if you are having trouble under load factor methods, you may want to try ASD methods; at least for reinforced concrete.

We haven't started using VIRTIS in a production mode of load ratings yet. We have load rated probably 2/3 of our structures with VIRTIS though. And I have noticed that there are a few structures that were designed accordingly for shear (for that years AASHTO spec), but the current AASHTO spec causes some poor Shear Ratings on structures. (If I remember off the top of my head, it's typically on Hybrid Steel Girder bridges that were originally designed in the 1970's?). Another thought or question I've had is whether we rate our bridges for Moment Only, Moment and Shear, Moment and Serviceability, or Moment, Shear and Serviceability. Previously we used whatever BARS gave us.

We currently are using BARS and we only use a shear analysis on steel girder bridges. With the move to Virtis, we are planning on adding a shear analysis for prestressed girder bridges and for concrete girder bridges. At this point, we don't really have a problem with shear controlling the rating for bridges. We find that this already happens on some of the older plate girder structures. We anticipate that it will happen on a large portion of our concrete girder bridges. The concrete girder bridges are typically 50 to 75 years old and do not have very much shear reinforcement in them when compared to today's standards. On prestressed structures, we don't anticipate many problems with shear controlling because our design criteria for shear reinforcement in prestressed girders is very conservative.

(Our State) is not actively using VIRTIS as yet and thus we have not addressed your questions.

## Complete Issue Information

Our experience with Virtis is somewhat limited at this point. We have found that for some prestressed girder bridges the rating will drop substantially when shear is considered. We have not identified any particular reason why this occurs. At this point we are planning to use the ratings as given by Virtis/BRASS with shear included. The ramifications or problems for us because of this are uncertain at this time.

We do not load rate reinforced concrete haunch slab and T-beams for shear rating, however sometime we do load rate T-Beams for shear rating due to occurrence of the cracks. We do load rate prestressed Beams And Structural steel for combination of shear and moments. We are planning to load rate all our T-Beams for shear rating and use the lowest value. I would greatly appreciate if you inform me of the result of your survey.

---end of e-mail-----

FROM:bgoodrich DATE:02/04/2002 17:36:26

Dan Glandt has implemented Equation 8-48 in BRASS-GIRDER 5.8.5, which is scheduled for release with Virtis 4.1 Service Pack 1. The phi factor issue must be addressed within Virtis or the BARS import. AASHTO Specification article 8.16.1.2 indicates to use 0.85 for shear, which is the Virtis and BRASS default.

FROM:jduray DATE:2/5/02 9:38:24 AM

Call me to discuss this.

FROM:bgoodrich DATE:02/06/2002 10:40:15

The issue regarding Equation 8-48 is addressed in Incident 2807.

I spoke with Jim Duray and Gale Barnhill yesterday regarding the phi factor issue. Gale agreed to investigate whether or not BARS utilized a phi factor for shear of 0.9. Gale found that BARS uses 0.85 as outlined in the specification. Some documentation supporting Gale's findings must be added to this incident. Overall, there is not a problem with the import, export, or the engines.

FROM:bgoodrich DATE:02/07/2002 11:45:35

I attached BARS documentation from Gale (Bars Shear.pdf).

FROM:jduray DATE:2/25/02 8:58:18 AM

Please add to help.

FROM:kkennelly DATE:2/26/2002 8:15:43 AM

Upon further review, it was decided nothing needed added to the help. Brian, can you mark this as resolved if you think everything has been addressed?

FROM:bgoodrich DATE:Tuesday, February 26, 2002 2:41:18 PM

Resolved.

FROM:gbarnhill DATE:Monday, April 08, 2002 12:33:02 PM

Based on the above documentation, I assume this is resolved. Probably needs to be discussed at the User Group Meeting.

### Description

FROM:rmbest DATE:03/14/2001 12:45:35

We are finding that the rating on some of our existing inventory bridges are being controlled by the bearing stiffeners. This will be of interest to designers on new bridges but our raters certainly don't want it. Is there a way to exempt stiffeners from the rating? We have been inputting our bridges from scratch as girder system and I hate to start polluting the models by artificially beefing up members. There needs to be a switch to do this. I tried to set the Shear and Live Load End Shear distribution factors to

4/19/2016 3:15:25 PM

HRS AASHTO

868

**Complete Issue Information**

zero but for some reason my rating didn't change.

FROM:jduray DATE:3/22/01 8:33:19 AM

Brian - is there anything we can do to cause BRASS not to rate based on bearing stiffeners?

FROM:bgoodrich DATE:03/27/2001 19:27:23

There is no flag in BRASS-GIRDER to ignore rating the bearing stiffeners. For ASD, you could set the ASD factor for bearing to a high value (see the appropriate tab of the member alternative window). For LFD, you could set the resistance (phi) factor for bearing to a high value in the LFD factors window.

Richard - We will re-open this incident if my comments from above do not satisfy your request.

FROM:rmbest DATE:03/28/2001 15:58:50 - Changing the factors only seems to effect the end bearing (abut). What about bearings at the pier? We would like reopen this incident.

FROM:bgoodrich DATE:03/28/2001 17:15:57

Note that BRASS only supports one distribution factor and it is used for all actions (moment, shear, etc.). The Virtis distribution factor for moment is the one passed on to BRASS, which is why changing the others did not affect your rating.

FROM:bgoodrich DATE:03/28/2001 17:28:36

This is a duplicate of Incident 2513.

I suggest enhancing Virtis to include some check boxes for controlling what limit states are considered in the rating (flexure, shear, bearing, etc.). We are working this type of functionality into BRASS-GIRDER(LRFD) while we are implementing draft LRFR spec. I think every engine would benefit from having these flags, so I do not support adding these items to the engine data.

### Description

FROM:rmbest DATE:03/22/2001 17:58:58

For some reason Virtis is defaulting the wrong rating ASD factors for reinforcement. Our RC slab rating are coming up too low until we manually enter 0.55 and 0.75 the ASD Factors for the rebars. (0.55 and 0.75). Attached is a example.

FROM:jduray DATE:3/27/01 9:37:26 AM

FROM:bgoodrich DATE:04/09/2001 18:44:18

The BRASS defaults are different from what you specified above. The BRASS defaults for rebar are 0.4 (inventory) and 0.6 (operating). These have been the BRASS defaults for years. The only way to get exactly what you want is to manually specify the ASD values. Note that the BRASS defaults for Structural Steel are 0.55 and 0.75, respectively.

FROM:rmbest DATE:04/12/2001 09:44:53 Those defaults for rebars don't agree with the values in the Manual for Condition Evaluation of Bridges except for grade 60 steel. Where can I find a listing of all the default values used in BRASS?

### Description

FROM:kkennelly DATE:3/23/01 10:31:25 AM

Attached bridge, member G2 ran for HS20 rating. Shear controls rating at point 107.998. In the Load level 1, truck #2 (lane) calculations for shear capacity for dead plus neg live load shear = -69.5 kips, the cracking moment calculated as -862.93 kft. Mmax was calculated as 453.69 kft. Equation for Vci using Mcr and Mmax with different signs gives Vci = -99.1 kips so Vci min = 42.6 kips used as Vci. I'm not sure if the values for Mcr and Mmax are correct but I think they should have the same sign in the equation for Vci.

### Complete Issue Information

We are working on getting a solution from PCI. I believe they are going to publish a list of questions in the PCI Journal about how to handle shear near supports. Jay and I have decided to wait until we hear something definite from this before we change the program.

FROM: bgoodrich DATE: 08/09/2001 13:11:52

Dan Glandt modified BRASS and added new shear options to address this incident. Fixed for version 4.1.

### Description

FROM:bgoodrich DATE:03/23/2001 13:06:52

Review the parapet definition "OK Parapet" in the attached bridge. I am able to enter negative dimensions to achieve the desired shape. Then I use the Compute button to determine the travelway (see the Structure Typical Section schematic). It appears that Virtis/Opis assumes the bottom of the parapet is the widest dimension, however, in this case the widest dimension is at the top. We either need to check for the widest overall dimension or a request was made to add a new parapet shape to the library.

FROM:bgoodrich DATE:03/26/2001 08:38:35

Additionally, the wearing surface drawn assumes the bottom of the parapet is the widest dimension.

FROM:kkennelly DATE:5/7/01 11:15:55 AM

The wearing surface on the attached bridge appears to be drawn correctly to me.

The Compute button determines the width of the concrete parapet by adding up all of the horizontal dimensions that the user can enter on the appurtenances window. The user can enter any combination of + and - dimensions to model anything they want. I don't think it's worth modifying the Compute button to be really smart about the appurtenance geometry. The user can always override the computed lane positions if they're not correct. The generic appurtenance is the shape the user should use for this parapet. I'm not sure if enough requests have been made to add a user defined coordinate based appurtenance to warrant that as an enhancement.

### Description

FROM:rmbest DATE:03/28/2001 13:07:18

The route number in the Bridge Description window is limited to only 5 characters. This is not enough. The input box is sized for a much larger entry.

**Complete Issue Information**

FROM:jduray DATE:3/29/01 8:52:13 AM  
Mehrdad - please check on why it is limited. I think this is a Pontis field limitation.

FROM:mordoobadi DATE:3/30/01 4:34:56 PM  
Yes, It is Pontis' limitation.

FROM:tthompson DATE:04/06/2001 11:26:43  
More of a limitation on what M Baker chose to use from Pontis. They choose routenum, which is NBI Field 5D and that is only a 5 digit field. Facility carried is more along the line of what Richard is probably hoping for.

FROM:mordoobadi DATE:4/13/01 9:35:23 AM  
Jim, please advise.

FROM:jduray DATE:6/25/01 4:51:09 PM  
We can't change the size of the field we are using since it is dictated to us by Pontis. I am changing this to an enhancement to add Facility Carried.

### Description

FROM:dteal DATE:03/29/2001 10:35:27

When I perform a save operation on a couple of my files it takes 85 seconds or more. On the rest of my files it takes about 15 seconds.

The files in question, at one time had many Member and Member Alternatives defined. When I realized how slow the saving operation got I deleted most of them and created separate bridge files. When I deleted a bunch of the Member and Member Alt's it didn't make any difference in the save time, still 85 + seconds.

I have attached one of files that are giving me a problem.

FROM:jduray DATE:04/04/2001 15:06:29

FROM:mordoobadi DATE:6/18/01 10:27:22 AM

There was a bug in the save operation which caused full table scans to find the next primary key id. It is fixed and save should complete much faster.

This is in virtis/opis 4.0.3

FROM:dteal DATE:08/28/2001 14:29:21

I am currently using version 4.0.4. This is the same file I referenced on back in March of 2001. The save operation takes 65 seconds now instead of 85 seconds. Other like files still only take about 15 seconds. I don't think the fix for version 4.0.3 has made much difference. (.bbd file is attached)

FROM:mordoobadi DATE:9/17/01 11:29:42 AM

Dean resubmitted the incident.

I imported the BBD file save took 15 seconds.

Then I changed one of the cross sections and saved this took 65 seconds.

Then I changed the name of the bridge and saved. It took 51 seconds.

I believe this is because of the bridge being big (comparatively). In big bridges plenty of time is spent in processing GetModificationStatus(...) functions.

We might need to revise GetModificationStatus(...) code to improve save operation.

Status is changed to Assigned.

Jim, please advise, if you want me to investigate more.

FROM:dteal DATE:10/16/2001 14:42:28

Just to clarify something - this bridge is no bigger at 65 sec. save operation than the bridge at 15 second save operation. Re-read the original problem:

### Complete Issue Information

"The files in question, at one time had many Member and Member Alternatives defined. When I realized how slow the saving operation got I deleted most of them and created separate bridge files. When I deleted a bunch of the Member and Member Alt's it didn't make any difference in the save time, still 85 + seconds."

It would appear that something did not get deleted when I tried to downsize the one bridge ID into several bridges.

FROM:dteal DATE:10/16/2001 14:58:41

FROM:jduray DATE:1/29/02 1:44:49 PM  
Yes, investigate more.

FROM:mordoobadi DATE:7/26/2002 9:19:40 AM  
Code changed (All De classes) to mark a big bucket modified as soon as a little bucket is changed. By doing this there is no need to go through all of the little buckets to find out the modification status of a big bucket. By implementing this for a sample test case the speed of save operation improved six times. (i.e. 90 seconds --> 15 seconds).

Fixed in Version 5.0.

FROM:mordoobadi DATE:7/26/2002 9:26:03 AM  
Note that this would also improve the speed of Save operation of analysis results.

FROM:dteal DATE:Friday, September 05, 2003 10:51:36 AM

| 3181.12168 | Resolved      | Export doesn't give warning about modifying # rebar for different yield strengths |

### Description

FROM:jduray DATE:3/29/01 10:23:11 AM

Anousone Arounpradith (Missouri DOT) has requested that Virtis/Opis be enhanced to allow users to define P/S strand that extends into the diaphragm region over interior piers to take any positive moment. Currently, Virtis/Opis allows the user to define rebar in the diaphragm region. The engineers at the Oklahoma City training also commented on the lack of this feature. The work-around is to convert the P/S strand to an equivalent area of mild steel and then input it on the existing window.

| 3182.12167 | Not Reproducible | P/S Beam Details - assigned ps properties are sometimes lost |

### Description

FROM:kkennelly DATE:4/4/01 11:22:34 AM

Submitted for Connie Porter, (225) 927-9321, Forte & Tablada.

When user has 2 yield strengths for rebar in deck, export does not give warning that it modified the number of rebar in deck input by user to an equivalent number so all rebar has same Fy in BRASS. Member G02 in attached bridge. Refer to incident 2899.

FROM:bgoodrich DATE:04/10/2001 10:01:31

I modified the export (BrassCrossSections.cpp) to issue a warning regarding modifying the number of bars based on the ratio of the different yield strengths. This correction should be available in the next 4.0 Service Pack.

| 3184.12165 | Resolved      | Distribution of loads for Deck Girders/T-Beams |

### Description

FROM:bgoodrich DATE:04/05/2001 13:58:31

The BARS import needs to be enhanced to populate ALL possible analysis modules (engines) on the member alternative window regardless of the type of analysis coded in the BARS data file. For prestress beams, this is extremely important because you have to run both LFD and ASD analysis to get the ultimate strength ratings and the serviceability ratings. Users should not have to visit each member alternative to specify these engines. This would also prepare them for LRFR when it is adopted.

| 3185.12164 | Closed        | Wrong Column Datatype assigned in Oracle Migration scripts 2.1 to 3.0 |

## Description

FROM:dkoenig DATE:04/05/2001 14:34:41

When we rate Deck Girders (cast slab and girder together – T-Beam), we distribute the slab load continuously across the girders, and the barriers and wearing surface evenly across the girders. Virtis/Brass will not allow the barriers/wearing surface to be distributed evenly. Brass allows only stage 1 loads for T-Beams. This means that these loads will be distributed according to the stage 1 DL Distribution defined in Virtis. There is no option for evenly distributing stage 1 loads. What would be the correct way to handle this in Virtis (Girderline)? What are your thoughts on distributing loads for T-Beams?

I have attached the .bbd file.

FROM:bgoodrich DATE:04/09/2001 19:10:02

Virtis/Opis and BRASS do not currently allow specifying different distribution methods for each load case assigned to a particular stage. The only work-around would be to model the structure as a girderline and perform the DL distribution manually.

FROM:jduray DATE:4/11/01 1:37:45 PM

I suggest you try the following workaround:

Use Girder System structure def. Assign a concrete weight of 0 to the parapets so the parapets will not contribute to the DL but will be used to define the travel way in computing the LL distribution factors.

4/19/2016 3:15:30 PM

HRS AASHTO

## Description

FROM:mordoobadi DATE:4/13/01 9:40:56 AM

The migration scripts for migrating from version 2.1 to 3.0 assigned datatype FLOAT instead of INTEGER

to the attributes called GUI\_MBR\_TYPE\_BITMASK in tables ABW\_GIRDER\_SYS\_STRUCT\_DEF and ABW\_GLINE\_STRUCT\_DEF.

We should create a SQL script patch to fix this problem.

The patch should query Oracle data dictionary to see if the datatype is really FLOAT, and if it is FLOAT change the datatype from FLOAT to INTEGER.

Here are the scripts needed to re-create the PKs and FKs for these tables.

```
CREATE UNIQUE INDEX XPKabw_girder_sys_struct_def ON abw_girder_sys_struct_def  
(
```

**Description**

FROM:kkennelly DATE:4/16/01 3:20:29 PM

Attached bridge submitted on behalf of Travis Fox, ABMB. Somehow his db has some rows in abw\_conc\_railing\_loc that have null for the railing id in "sd for 175 span" and "sd for 75'span". Don't know how those rows got in db, can't reproduce. This causes the BWS report to crash when it tries to print the railing data since GetItem(0) returns a null pointer. Also can't run BRASS cause export tries to get railing with id = 0. I think the Structure Typ Section tabs might need revisited cause they fill up their railing lists with a railing name but an id=0.

### Description

FROM:dteal DATE:04/17/2001 09:57:29

Is an inverted PS Tee beam supported? If yes – do you use the narrow or wide top flange PS Shape and simply use the stem width in place of the top flange? According to our rating section, BRASS handles this (I am taking there word for it).

FROM:jduray DATE:4/23/01 2:29:10 PM

I don't know if this will work. I suspect the Strand Layout and Typical Section Schematic windows will have trouble drawing the shape. If that is the only difficulty we can correct it and away you go.

FROM:dteal DATE:Monday, March 28, 2005 8:21:48 AM

Works as long as you give it a small top flange the same width as the stem.

### Description

FROM:dteal DATE:04/17/2001 09:58:59

Comparing Tabulated results in the "Analysis Results Window" to the results from the report writer. With the attached .bbd file – do a LRFD design review in Opis and compare the reactions and moments.

LL Fatigue Truck (SI) compares OK

LL HL-93 (SI) No reactions or moment values are the same when comparing Analysis Results with the Report Tool (LRFD Output, Reactions & Moment Summaries)

Where did the values for the Report Tool come from? which is correct – Report Tool or Analysis Results Table?

**Description**

FROM:kkennelly DATE:4/18/01 9:18:24 AM

Submitted on behalf of Travis Fox, ABMB. Attached bridge, Member G12. (Bridge imported from BARS.) Girderline span length entered as 30.40625'. 1 cross section over a range of 30.40625'.

4/19/2016 3:15:32 PM

HRS AASHTO

896

### Complete Issue Information

Export generates the Span A command with span length formatted to 30.4063'. Span C command generated with length = 30.4062'. BRASS won't run, says cross section area = 0 at span 1 point 20.

FROM:bgoodrich DATE:04/18/2001 17:45:23

The range distances are converted to inches or mm and stored by the export for later use. This may have contributed to the rounding problem. I modified the export (BrassStdSpans.cpp, BrassStdSpans.h, and BrassLrfdSpans.cpp), so the distances exported to BRASS span commands are adjusted to get rid of any rounding problems. This logic is similar to that for adjusting distances for BRASS schedule commands. The next service pack should address this issue.

Krishna - I sent the export files to Joe.

### Description

FROM:kfulton DATE:04/18/2001 16:37:26

I created a girder line analysis for a prestressed girder. I then created a girder system with five girders. I copied the member alternative from the girder line to each girder in the girder system. When I run an analysis on the girder system, all girders will rate except the center girder (Girder #3) which gives the following error message:

Error filling general change point array!

02:39:42 PM - Line 2698 in source file D:\Virtis\GUI\abxbrass\BrassCmd.cpp.

Unable to determine the number of points of interest.

02:39:42 PM - Line 780 in source file D:\Virtis\GUI\abxbrass\BrassStdEngineData.cpp.

Unable to compute span length!

02:39:42 PM - Line 289 in source file D:\Virtis\GUI\abxbrass\EngineExport.cpp.

Error getting bearing distances in CEngineExport!

02:39:42 PM - Line 5540 in source file D:\Virtis\GUI\abxbrass\EngineExport.cpp.

I have also attached the bbd file for the bridge.

FROM:kkennelly DATE:4/19/01 11:33:27 AM

Do you remember what steps you took to create the girder system structure definition? Did anything unusual occur when you entered the skews or girder spacing? The domain doesn't think Mbr 3 is long enough to intersect the support line 2 so you are getting the error about computing the span length.

4/19/2016 3:15:32 PM

HRS AASHTO

898

### Complete Issue Information

The values in the db for the locations of the girders at the first support line do not appear to have the girders starting in a straight line along the first support line.

As a workaround, I went to the Structure Def window, reentered the span length as 21.04, hit OK. Then went to the framing plan window, reentered the skews and girder spacings, hit OK, saved the bridge. Mbr 3 then ran ok. The values in the db then had the correct locations for the girders in a straight line along support 1.

Note to programmer: struc def ref lines for girders do not appear to be in a straight line at support 1. X and Z values for girder ref lines are not identical with opp signs like they should be. FindSpanByDistance() fails when it calls DoReferenceLine:FindIntersection() line 729. t <= DLength1 fails. I don't think it's a tolerance problem in the domain, domain code should stay as is but maybe we need to figure out how the non-symmetrical girders got into the database.

FROM:kfulton DATE:05/02/2001 16:37:36

We did not use the wizard to create the girder system. We did use the diaphragm wizard several times to get the correct layout. The work around fixed the problem.

FROM:kkennelly DATE:5/11/01 2:29:08 PM

I don't think there's anything else we can do with this incident until we are able to reproduce the steps that led to the mbrs not starting in a straight line along the first support line.

### Description

FROM:jduray DATE:4/23/01 9:47:40 AM

-----The following is from an e-mail from Chad Edward Grinsteiner:-----

When printing an entire bridge workspace or structure definition review report, the print status dialog box shows numerous pages being printed. Indeed, after the report is finished, Opis is printing out blank sheets. Opis seems to be caught in an infinite loop and won't stop until the user presses cancel and turns off the printer. It seems to work correctly if the user specifies the range of sheets to be printed.

----- end of e-mail -----

I verified this behavior on 4.0.2.

FROM:jihnate DATE:9/17/2001 3:00:01 PM

This is primarily a Windows 2000 problem: Windows NT uses Rich Edit 1.0 (riched32.dll), while Windows 2000 uses Rich Edit 2.0 (riched20.dll).

Microsoft's own Rich Edit sample program (reitp) exhibits the same behavior.

I added code in the BWS report that checks if we're running on Windows 2000, and if so a new GetTextLength is used.

A (known) side effect of this is that an extra blank page is printed at the end of the BWS report.

I also added Print Preview to the BWS report while I was making this fix (requested in incident 167).

## Description

FROM:dteal DATE:04/24/2001 14:03:04

Does not remove the Shortcut Icon from the workspace.

I had renamed the shortcut – so I would not confuse it with my “None Academic Release”. Did this hinder the removal of the shortcut icon?

FROM:jihnate DATE:4/25/01 7:58:39 AM

You are correct. The icon could not be removed by the uninstall because it was modified outside of

**Complete Issue Information**

Needs a progress gas gauge so you know it is still running. (it takes a while and there is no screen activity)

FROM:jihnmat DATE:4/25/01 8:02:48 AM

The installation of MSDE gives no feedback to the installation program for there to be a gas gauge.

FROM:jduray DATE:4/25/01 11:34:26 AM

Joe - is this possible or reasonable to do?

FROM:jihnmat DATE:4/25/01 12:26:40 PM

The installation starts the MSDE installation program and then waits for it to finish. There is no way to know how far along the MSDE installation program is progressing.

What we do now is to display a message while the MSDE installation is running: "Installing MSDE now, please wait...". But this does run for a few minutes.

FROM:dteal DATE:04/26/2001 07:45:45

Food for thought - I thought it was locked up and was thinking about ctrl-alt-del and start over. Something - is needed to let the user know it's working.

FROM:jihnmat DATE:4/26/01 8:15:19 AM

I think the best we can do is to warn the user beforehand that the installation of MSDE will take several minutes.

FROM:jihnmat DATE:3/11/2003 8:49:57 AM

Added "This may take a few minutes..." to the message being displayed while MSDE is being displayed.

Done for version 5.0.0 Beta Build 6.

| 3203.12146 | Closed        | Questions re: BRASS LRFD stress calculations |

### Description

FROM:bgoodrich DATE:04/25/2001 13:32:42

Opis is giving some error messages when trying to export diaphragm locations to BRASS. James tried re-entering the data but is still getting the same errors. See the attached BBD file (JamesThomas940.bbd).

FROM:bgoodrich DATE:04/25/2001 13:40:29

I was able to duplicate your problem. I am not exactly sure why you were getting the problem. I believe the diaphragm data was the source of the problem. I copied your structure definition "Steel Plate Girder" and then began making modifications. I changed the units to SI/Metric in the Structure Definition window and re-entered the span lengths. Then, I deleted all the diaphragms in every bay on the Diaphragms tab of the Structure Framing Plan Details window. Next, I entered the diaphragm locations manually for the first bay and clicked the Apply button. Then, I used the "Copy Bay To..." to

4/19/2016 3:15:34 PM

HRS AASHTO

910

### Complete Issue Information

copy the diaphragms from Bay 1 to the other bays. Finally, I launched an analysis and did not receive the bracing error. I suggest that you repeat the process I described above just to make sure I didn't miss something. Please let me know if this does not address the problem.

I have attached a BBD file (JamesThomas.bbd) containing my version of your structure definition (see "Steel Plate Girder (Brian Goodrich)". Reverse the export process by using the File>Import menu item and select my BBD file. When the bridge is imported, it is not saved to the database until you manually save it. Be careful not overwrite your existing bridge with this BBD file.

### Description

FROM:kkennelly DATE:4/26/01 9:44:05 AM  
Submitted on behalf of Mike Hurd, Wallace Engineering:

I have a question concerning the Opis/Virtis software. I am designing a 3 span, composite steel girder bridge in LRFD. The bridge file is attached per our phone conversation today. My question is in regard to the Steel

4/19/2016 3:15:34 PM

HRS AASHTO

911

## Complete Issue Information

Limit State Summary Report.

-How are the actual stresses derived? I tried matching the dead and live load stresses for Strength I and have gotten lower stresses.

For example, for Stage 3, short term composite, Strength I, member 2 stresses at interest point 2-

1) I took the unfactored dead moments and controlling live load moment from the Actions Reports and divided by the steel flange section modulus (composite elastic properties in output file) to get unfactored stresses. The live load moments in the reports are noted as including the distribution factors and impact factor.

2) The appropriate load factors were applied to the stresses (Stage 1 dead loads x 1.25, barrier load x 1.25, wearing surface x 1.5 and live load x 1.75 per Factors - LRFD input) and the stresses summed.

3) The Strength I load modifier (found in the Factors -LRFD input section) was then applied to determine the dead and live load factored stresses. Note: I changed the modifier values on another model run and the stresses did not change. Is the modifier used in determining the actual stresses?

The stresses I calculated were lower than the actual stresses listed in the summary. If you can be of assistance in explaining the how the stresses are determined, it would be appreciated. Let me know if you need any additional information.

FROM:kkennelly DATE:4/26/01 9:49:54 AM

Item 3: In Opis you have to specify that you want to override the default system LRFD factors. This is done on the Structure Definition: Analysis tab. Check the Factor Override LRFD box on that tab and then select the factors that you want used in the LRFD factors list box. When BRASS is run in Opis, a log file containing the BRASS input commands and comments about assumptions is produced. If you do not override the factors on the Structure Definition: Analysis tab, you will see a comment in this log file before the FACTORS-LOAD commands that says "COMMENT Using system default LRFD load factors." If you do override the factors this comment will say something like structure def override factors used.

Serv2\_wallacebridge.bbd file attached is for Version 4 Service Pack 2.

FROM:bgoodrich DATE:04/26/2001 14:31:29

BRASS sums the DC, DW, and LL moments in each stage and factors them accordingly. BRASS considers both maximum and minimum dead load factors and finds the critical maximum and minimum moment at each point. BRASS looks at the sign of the moment to determine which section properties to use (positive or negative). To compute stresses, BRASS divides the moment for each stage by the appropriate section modulus. Finally, BRASS sums the stresses for use in design ratio or rating factor computations.

If you still question the results produced by BRASS, please send me your hand or spreadsheet computations. Also, include the span and point and the vehicle (HL-93 Axle+Lane, HL-93

4/19/2016 3:15:35 PM

HRS AASHTO

912

**Complete Issue Information**

Tandem+Lane, HL-93 Train+Lane).

FROM:bgoodrich DATE:04/27/2001 10:40:06

Michael sent me the attached fax (Incident3203 17080001.zip). BRASS is reporting only the critical flange, in this case the bottom (compression) flange for the 200.0 POI. Mike comps were for the top (tension) flange. Also, Mike's hand comps did not factor the truck train plus lane load by 90%.

FROM:bgoodrich DATE:04/27/2001 10:41:29

Submitted on behalf of Mike Hurd, Wallace Engineering:

I have found the controlling strength 1 stresses to be for the compression flange and not the tension flange as originally assumed. The stresses I calculated match the file output. Thank you for your prompt response to my inquiry.

## Description

FROM:jduray DATE:5/1/01 8:50:14 AM

I received the following e-mail from Chad Grinsteiner of White Engineering Assoc.

-----begin e-mail -----

Jim, Brian & Jay:

Thank you for your attention into our concerns about reports within Opis. We understand Oklahoma DOT is very interested in using Opis/Virtis as a long term design/rating solution, so we hope our feedback helps you to meet ODOT's needs as well as our own.

In its simplest form, what we would like to see is a SINGLE report to provide documentation, or "snapshot", of the input and results. This would provide the designer a means to communicate with a checker, reviewer, detailer and/or client the information available to and used by the designer. This documentation would be referenced to and relied upon during the design phase much like a contractor uses a signed and sealed set of plans during the construction phase.

This report documentation would contain: information to verify correct input, some basic analysis results (to aid in the design of substructure elements, to help derive independent checks of the engine, to perform checks not done by the engine, and to aid in detailing), and concise design results to indicate the design meets the specifications. This allows the design checker/reviewer to be reassured that the input being checked matches the output, and the detailer to be certain that what is being drawn matches what is intended by the designer.

Ideally, this would all be contained in as minimal of output as possible. This aids in reviewing the design and prevents "information overload" while wading through a sea of numbers for something simple.

Jay, you brought up a good point about how report inconsistency isn't much different in other software, and I largely agree with you. However, most of the programs have somewhat simple reporting features (even when compared to Opis in its current state) where the input is echoed in a simple ASCII output file which is generated every time the program is run. This simplistic model does have a level of unintended "security" in that the input echoed in the output report is "locked" with the results. If someone were to change the input, the new results would not be available until the program is run again. The new output would then also contain an echo of the new input. The new input is always available to compare to a previous

4/19/2016 3:15:35 PM

HRS AASHTO

914

## Complete Issue Information

analysis report's input for changes. Furthermore, having such documentation would be beneficial in verifying input has not been altered when output "suddenly" appears different, such as when an analysis engine has been updated.

As a side note, Integrated Engineering Software's Visual Analysis has a nice feature where the program warns the user whenever an change in input will affect the results. If the user continues with the change, the program purposely "loses" the previous analysis results that were affected. The user is then forced to re-run the analysis and a version number of the analysis is updated and stored along with the date and time when the analysis was performed. It is the responsibility of the user, however, to produce reports which contain both the input and results. Currently, Opis provides no indication that the current bridge workspace matches the current analysis information, inviting human errors related to: "I swore I re-analyzed after I changed that."

Also, I believe Opis/Virtis was developed with the "paperless" office in mind where designers would share the database information, and not reams of paper. I sympathize with that goal and I am not trying to dilute that goal. However, there should be a simple, concise, yet thorough, "master design document" which is easily transferable, either by hardcopy or electronic means. The \*.xml reports currently generated seem to support both mediums. Perhaps enabling the database to store such (smaller) files would be beneficial since storing results to the database is inefficient at this point.

As for the detailed content of this so-called "master design document", what we would like to see probably is not satisfactory for others, which puts software writers like yourself in an undesirable position. Opis has some customizable output levels in the analysis reports, and this philosophy could be extended to an all-inclusive report, which you probably have already decided upon. The end user is then at least partially responsible for the size of the final report (depending upon how much scalability is provided by the software). While this may be asking much at this point, such a function is in line with many of advanced features available in a piece of software like Opis/Virtis.

A listing to help you understand what we look for during typical designs follows. An "R"(equired) indicates we need this info for every design, while an "O"(ptional) shows we occasionally need this info.

Steel Girders:

1. Echo of input (include analysis version, date, time and engine version)(R)
2. Calculated section properties (non-composite, short-term composite, long-term composite)(O)
3. Calculated distribution factors (moment, shear, fatigue, deflection)(O)
4. Calculated loads not input (slab, FWS, railings)(O)
5. Total unfactored DC analysis results at span points (moment, shear,

4/19/2016 3:15:35 PM

HRS AASHTO

915

## Complete Issue Information

deflection)(O)

6. Total unfactored DW analysis results at supports (reaction, rotation)(R)

7. Total unfactored DC analysis results at span points (moment, shear, deflection)(O)

8. Total unfactored DW analysis results at supports (reaction, rotation)(R)

9. Total unfactored HL-93 analysis results at span points (moment, shear, deflection for axle, lane, impact)(R)

10. Total unfactored HL-93 analysis results at supports (reaction, rotation for axle, lane, impact)(R)

Note: Indication of controlling axle effect for HL-93 (i.e. tandem or design truck) is helpful.

11. Total unfactored P(ermit) V(ehicle) analysis results at span points (moment, shear, deflection for axle, lane, impact)(R)

12. Total unfactored PV analysis results at supports (reaction, rotation for axle, lane, impact)(R)

13. Total factored limit state results at section points (O)

14. Constructibility/slenderness status at span points (R)

15. Composite and non-composite flexural capacities at span points (R)

Note: Calculation of % utilization is helpful (i.e. max. factored effect/capacity)

16. Service II limit state status at span points (R)

17. Fatigue limit state status/categorization at span points (R)

18. Maximum web stiffener spacing (or shear capacities) at span points (R)

19. Maximum shear connector spacing (based on strength and fatigue) at span points (R)

Merlin-DASH is a decent example for a design report. DASH has only two levels of output (minimal or detailed), and we find the minimal report meets most of our needs. I've attached an example of the minimal report for your use (std100e.res in ASCII format). Some comments for the minimal report can be listed as follows:

1. Page breaks waste space.
2. Echo of card-based type input is rather dated for today's technology and isn't well-suited for checking. Less passive format is easier to interpret.
3. Explanation of input parameters (necessary for card based input) is helpful, but consumes valuable output space.
4. No section properties available.
5. No reaction output without impact (needed for elastomeric bearing design).
6. Stress output at limit states (other than Service II) is not needed.

Prestressed Concrete Girders:

1. Echo of input (include analysis version, date, time and engine version)(R)
2. Calculated section properties (non-composite, short-term composite, long-term composite) (O)
3. Calculated distribution factors (moment, shear, fatigue, deflection)(O)
4. Calculated loads not input (slab, FWS, railings)(O)

## Complete Issue Information

5. Total unfactored DC analysis results at span points (moment, shear, deflection)(O)
  6. Total unfactored DW analysis results at supports (reaction, rotation)(R)
  7. Total unfactored DC analysis results at span points (moment, shear, deflection)(O)
  8. Total unfactored DW analysis results at supports (reaction, rotation)(R)
  9. Total unfactored HL-93 analysis results at span points (moment, shear, deflection for axle, lane, impact)(R)
  10. Total unfactored HL-93 analysis results at supports (reaction, rotation for axle, lane, impact)(R)
- Note: Indication of controlling axle effect for HL-93 (i.e. tandem or design truck) is helpful.
11. Total unfactored P(ermit) V(ehicle) analysis results at span points (moment, shear, deflection for axle, lane, impact)(R)
  12. Total unfactored PV analysis results at supports (reaction, rotation for axle, lane, impact)(R)
  13. Total factored limit state results at section points (O)
  14. Initial concrete stresses at transfer (R)
  15. Anchorage zone stirrup checks (R)
  16. Debonded strand detailing checks (R)
  17. Final concrete stresses under dead and prestress loads only at span points (R)
  18. Final concrete stresses under 1/2 DL & PS plus live load at span points (R)
  19. Final concrete stresses under dead and live load at Service III limit state at span points (R)
  20. Composite and non-composite flexural at span points (R)
- Note: Calculation of % utilization is helpful (i.e. max. factored effect/capacity)
21. Minimum and maximum reinforcing limits at span points (R)
  22. Cracking moment computations at span points (especially debonded zones) (R)
  23. Maximum beam stirrup spacing (or shear capacities) at span points (R)
  24. Maximum interface stirrup spacing at span points (R)
  25. Summary of prestress losses (R)

PennDOT PSLRFD has a good example for a design report. PSLRFD has scalable levels of output. I've attached an example of a typical report for your use (std4-95i.out in ASCII format). Overall, the PSLRFD output has sufficient information in an easy to find format. The only complaints we have are that the page breaks waste space and some arrangement of output does not make efficient use of the sheet (necessitating more sheets).

Jim, I understand from our phone conversation that Opis/Virtis will begin to have better report capabilities starting with the November 2001 release for input and the 2002 release for analysis and design results. I hope this information will help you. If you should have any questions about these issues or would like some additional feedback for reports, please feel free to write back or call at 405-528-4074.

Thank you for listening,

Why does the Wizard allow me to enter 50 girders when BRASS can not handle it?

The number of transverse girders exceeds the maximum allowed by BRASS!

No. of Girders = 50 (Maximum = 30)

**Complete Issue Information**

I entered 50 girders in a 2 span rolled beam structure using the Wizard. This is the max number of girders allowed in the pick list. V/O displays the structure properly – but you will not be able to run an analysis, see above message from V/O.

Should the user be allowed to enter more girder lines than the engine can handle?

FROM:dteal DATE:05/01/2001 15:12:19  
Is it stated anywhere what is the max number of girderlines?

FROM:dteal DATE:05/01/2001 15:19:53  
I found the same thing is true about number of spans.

No. of spans = 50 (Maximum = 13)  
The number of spans exceeds the maximum allowed by BRASS!

I put in 50 spans from the pick list, but the max allowed is 13.

It seems to me that the user could waste time entering data that the program will not handle. User should at least be warned if not stopped during the data entry process.

FROM:jduray DATE:5/1/01 4:31:22 PM  
Remember - Virtis/Opis is written such that other engines can be used. Therefore, we cannot restrict Virtis/Opis to what BRASS can do. Most of the BRASS limitations are listed in the BRASS help files.

**Description**

FROM:dteal DATE:05/01/2001 12:49:04

Can not use the "Print Selection" option in the Analysis Progress Window. I highlighted the text I wanted and then hit the Print Button. Print Selection was not available.

FROM:mordoobadi DATE:5/1/01 5:04:28 PM

What do you mean by Print Selection?  
There is no Print Selection button on the window.

FROM:dteal DATE:05/02/2001 08:37:03

After you run an Analysis – There is PRINT button at the lower right corner of the Analysis Progress Window.

If you:

1. First highlight some of the text from this window you would like to print
2. Click on the Print button (lower Left)
3. Microsoft Windows will bring up a Print window. In the middle left area there will be 4 radio buttons (Print All, Current Page, Selection and Page #'s)
4. Of these 4 selections, only "Print All" is available. I would like to print only the highlighted (selected) text.

FROM:mordoobadi DATE:8/8/01 1:31:29 PM

Jim, please advise. Please set the priority for this incident.

FROM:jduray DATE:4/12/2005 11:48:38 AM

We should open the Print Dialog to allow the user to select what (All or Selection) and where it should be printed.

### Description

FROM:mordoojadi DATE:5/1/01 4:44:11 PM

Gale Barnhill reported a problem that rises when he added list folders containing bridges with big bridge\_id values (e.g. 31000000).

Symptoms:

- \* After creating the folder Configuration Browser will not open.
- \* If Virtis is shut-down and restarted a message will show-up saying "Access might be limited..."

The problem is because of smallint datatype for person\_id in abw\_person.

We get the error because in the where clause of the view abw\_v\_users\_group we have

```
abw_group_item.item_id=abw_person.person_id
```

which compares an integer with a smallint.

For now the View could be changed as follows as a work-around (in Sybase):

```
abw_group_item.item_id=convert(integer,abw_person.person_id)
```

We need to change the datatype for person\_id from smallint to integer.

### Description

FROM:dkoenig DATE:05/03/2001 16:26:18

Recently I have looked into the meaning of checking an alternative existing or current. This is what I have come up with.

Bridge Alternative and Structure Alternative levels

Existing – if checked, this alternative will be rated during an analysis whether the analysis is done inside the Workspace or outside in the Explorer.

Current – Has no purpose at this point?

Member Alternative

Inside the Workspace: The current member is rated (i.e. an Analysis Event will be stored). If the current member is not checked as existing; Tabular Results cannot be viewed for that member, the Charts option is disabled, and the Bridge Output will not overwrite the last accurate rating.

The current member will be displayed in the Structure Typical Section schematic.

Outside the Workspace: The existing member is rated (i.e. an Analysis Event is stored). If the existing member is not checked as the current member, the member will not be listed in the Ratings Results.

Is this how these labels were intended to be used? It would make sense that the current member should be the new member, structure, or bridge that is currently being worked on. These new alternatives should not affect the ratings occurring outside the workspace. Also, it would make sense that the current member should have all the analysis functionality available to it inside the workspace. I expect that the intended use of the current label is not to just view schematics.

I would appreciate any comments you have about this issue. Maybe I am missing something in the big

4/19/2016 3:15:36 PM

HRS AASHTO

924

**Complete Issue Information**

picture.

FROM:jduray DATE:5/4/01 8:23:34 AM

If what you say about the functionality associated with current is true then it has not been coded properly. Current is supposed to be just for schematics. A future feature will be to select which to use for analysis when inside the BWS. For now though, only the schematics should be using Current.

Joe - please check this. Also check that the Help properly defines the use of Existing and Current.

FROM:mordoobadi DATE:10/19/2001 1:31:07 PM

There was a problem in the rating. If there was a member with two different member alternatives one set as existing and the other is set as current, when we analyzed the member the existing member alternative was analyzed, but the rating results object was set inside the current member alternative tree item not the existing. It is now fixed.

FROM:mordoobadi DATE:10/31/2001 3:13:20 PM

Fixed.

**Description**

FROM:jduray DATE:5/11/01 10:09:43 AM

Alabama could not view the list of timber materials in the library.

While I was visiting AL DOT for a Virtis workshop I checked their Oracle installation. The message they were getting indicated that the table or view used by DmVLibMatITimberSawnList did not exist. I found that the abw\_v\_lib\_matl\_timber\_sawn public synonym was missing. I created it and that fixed the problem. I checked for other missing synonyms for views and found that public synonym for abw\_v\_lib\_timber\_rect\_beam\_shape was also missing.

If they continue to have similar problems we should have them run the sql script that creates public synonyms.

Mehrdad - please review our scripts and instructions to determine why these two synonyms were missing.

FROM:mordoobadi DATE:5/14/01 9:51:39 AM

The instructions in the readme.txt file tells them to create public synonyms.

The migration scripts [MigrateOracle401.SQL] that we provided for patch 4.0.1 has scripts to create some new public synonyms but it does not have all of them.

I think that they might have used that script.

## Description

FROM:bgoodrich DATE:05/17/2001 12:53:16

Consider the following enhancements for the structure definition wizard:

1. When a symmetrical structure is defined, member alternatives should only be created for the left exterior and first interior members. The others should be "linked". Then, if the girders are slightly different, the user only needs break the link and copy a member alt to the new member.

2. Set all analysis modules, not just LRFD. Users that design with LRFD still have to rate the structure with LFD. The user should not have to manually set these for each member alternative window in every structure definition in every bridge in which this was not done.

| 3218.12131 | Duplicate     | Filter rating factors displayed in Virtis to actions users want to rate for |

### Description

FROM:bgoodrich DATE:05/17/2001 13:04:11

An engineer at a short course for Vermont Agency of Transportation discovered the following problem. Here are the steps I took to duplicate it. I analyzed a composite steel girder system with 70 ksi steel with Opis. In the Results Graph window, I checked the Moment -> Rating Factor -> "Min. Envelope" checkbox to view the critical rating factors, however, nothing appears in graph. When the >50 ksi steel is used (for a composite girder), the flexural resistance is specified in terms of stress (not moment) as outlined in the LRFD spec. BRASS appears to be writing to the results object correctly, i.e., the appropriate null bitmasks are being used when flexural stresses are reported. I think rating factors computed from flexural stresses should be reported in addition to any rating factors from flexural moments. Also, within the same bridge, a flexural stress resistance may be applicable at one point while a flexural moment resistance is applicable at another.

FROM:gbarnhill DATE:11/02/2001 11:29:18

Will this be resolved for V410 Beta 3 ????

FROM:mordoobadi DATE:11/6/2001 2:57:22 PM

I discussed with Brian on how we want to show the results in the Tree and Graph. We decided that tree should stay as is and results for both Flexural Moment and Flexural Stress Rating Factors be displayed under Moment Rating Factors.

Fixed.

FROM:gbarnhill DATE:12/14/2001 15:12:38

V410 Rel Candidate 1 - Here's a V410 bbd. Opis Spec Check is not finding the most critical RATING FACTORS.

I'm seeing a failing RF at the support, but it's not the most critical. This structure is an unfinished design, so lots of things fail. The graph doesn't pick up all the checks to find the most critical. There are failing RF at other 10th points that don't show up.

FROM:bgoodrich DATE:12/15/2001 15:02:34

I have verified that the flexural stress rating factors are now shown in 4.1 RC1. This incident has been addressed.

4/19/2016 3:15:38 PM

HRS AASHTO

### Complete Issue Information

I think Gale's comments are important and should be entered as a new incident. The graph seems to be limited to showing only flexure and shear rating factors (and these are only for the strength limit states). Each rating factors is written to the spec check object, which show up as a fail when less than zero. The graph should be modified, so the rating factors are not tied to an action (moment, shear, etc.). There should be new tree items specifically for Design Ratios and Rating Factors, with the appropriate sub-tree items.

FROM:gbarnhill DATE:12/17/2001 14:10:47

V410 Rel Candidate 1 - I agree with Brian's comments. The original problem is corrected as stated since the graph picks up the moment rating factors. I'll put in a new incident for the modification to pick up all catagories of rating factors.

FROM:mordoobadi DATE:12/17/2001 3:46:27 PM

Accepted by Gale.

## Complete Issue Information

### Description

FROM:kkennelly DATE:5/17/01 2:51:16 PM

Request from Sylvester Yongho of Stone & Webster to not let serviceability control the rating of a bridge. Several other users have made similar requests to not let the bearing stiffeners control the rating either (they are attached to this incident).

Solution to this would be to let the user filter the Rating Results Summary for the actions that they want to see. For example, they could pick flexure and shear but not choose to see serviceability or bearing stiffeners.

Add a type to the rating results summary table to indicate what action controls. Types would be flexure, shear, serviceability, etc. Types would be added for results currently in database, they would be minimum BRASS shear, minimum BRASS flexure, etc. These types would have to be extracted from the string currently stored that lists the controlling action. We would also need a table to store all of these types.

The rating results summary table now only stores the minimum rating factor. We would need to store the minimum based on each action type.

GUI has to be modified so user can filter on displayed actions. Domain would actually do the filtering of the list.

| 3227.12122 | Resolved      | Switch STRUCTDEFS and BRIDGEALTS on BWS tree |

**Description**

FROM:dteal DATE:05/18/2001 11:47:17

In attempting to do a Inverted Prestressed T beam (18 beams) I get the following error message:

Error generating LFD/ASD deck commands!  
.bbd attached

FROM:dteal DATE:05/18/2001 11:50:34

What is the message referring to?

FROM:bgoodrich DATE:05/18/2001 15:41:40

The additional error messages were written to a GENERAL message object instead of an ERROR message object. I corrected the export (BrassStdDeck.cpp and BrassLrfdDeck.cpp) accordingly. This should be available in Service Pack 3.

The structure attached to this incident contains 18 members, however, BRASS-GIRDER only supports 13. Therefore, a girder system structure definition cannot be used for this structure. Note that a request to increase the number of transverse members has already been logged on Incident 2586.

Also, I tried to run this bridge with BRASS LRFD and received an engine-generated error. The cross section command assumes an I shape for a P/S I beam and requires dimensions accordingly. Virtis/Opis nor BRASS LRFD directly support an inverted T, so users may have to move a portion of the web to the top flange dimensions when the shape is defined. BRASS may not analyze shapes that do not conform to those directly supported by Virtis/Opis.

FROM:jduray DATE:5/21/01 12:46:01 PM

I'm marking this as resolved since the "bug" part is fixed for 4.0.3. The rest is informational.

### Description

FROM:kkennelly DATE:6/7/01 10:35:57 AM  
Submitted on behalf of Richard Best, Illinois DOT:

I loaded Service Release 3 on our test machine. The load went fine, however I noticed that some of our bridges that previously ran under 4.0.2 will no longer run under 4.0.3. Attached is an example. It will run under 4.0.2 and not under 4.0.3. Also attached is the error message. Please let me know what you find.

**Description**

FROM:dteal DATE:06/07/2001 15:34:05

In the Standard 1998 LRFD Library of Factors provided when installed I think we have a error. On the Fatigue-I line we have gamma = zero entered for all the columns that are not vehicular. AASHTO table 3.4.1-1 in the spec book has a dash (-) in the columns, not zeros. When it comes to calculating the fatigue stress range, according to 5.5.3.2 the f(min) should include DL. Looking at BRASS Maximum and Minimum Moment output for load 5 – Fatigue in Critical Moments and Concurrent Actions, being the gamma is zero, the Dead Load Action is then zero.

The gamma of 0.75 is being used for the Live Load correctly. But I believe it should be combined with the Dead Load moment.

FROM:dteal DATE:06/07/2001 17:06:51

## Complete Issue Information

After further investigation, we have found that if we edit the table and enter a value of 1 for the DC & DW (both Min and Max), ran the analysis, and found that BRASS still uses zero and not the 1 that was just entered.

FROM:bgoodrich DATE:06/13/2001 08:12:04

Please attach the BBD file with the DC & DW load factors set to 1.0. I suspect the LRFD factors are not being applied to the structure definition or the member alternative.

FROM:dteal DATE:08/29/2001 12:03:30

.bbd file attached

FROM:bgoodrich DATE:09/04/2001 15:25:34

I imported the slab file you attached. You have defined the LRFD factors for the bridge, but they have not been assigned to the structure definition or the member alternative. This is the reason you were always getting zeros for the dead load factors in earlier versions. Now, the export ignores the dead load factors specified for the dead loads (DC and DW) for the Fatigue limit state and exports 1.0 for these factors. I am running Version 4.0 with Service Pack 4, and the dead loads (factored by 1.0) are included in the fatigue computations. Note that the Critical Moments and Concurrent Actions report in BRASS only factors the live load actions by 0.75 (or whatever LL factor you enter). BRASS later multiplies the resulting factored live load action by 2.0 to address the various fatigue-related articles in the spec.

FROM:dteal DATE:09/06/2001 08:30:22

Now I can see that BRASS and Opis both have a problem here. It starts with the interpretation of AASHTO Table 3.4.1-1. Opis interprets the dash (-) for DW and DC fatigue-I as Zero. This is not a correct interpretation. The dash (-) in AASHTO's table is saying the value for this factor varies. Zero may be correct for steel structures. But in RC the value has to be calculated and the factor must be 1.00. If a factor of zero is used for RC you will get zero dead load actions for fatigue.

I created a copy of the standard LRFD factor table in the agency library and set the DC and DW factors (gamma) to 1.000 in this copy. I used the newly created factor table (copy from library) and analyzed my RC structure. BRASS still used gamma = zero for DC & DW unless you check the Factor Override. I shouldn't have to select factor override when I'm using the only table entered under the Factors in the workspace. This is an easy one to miss!

An obvious assumption the user will make here is: The Agency will create an Agency Factor table for the designers to use for RC. In the background, while being exported, the gamma factor of 1.00 for DW & DC will get changed to zero. The user is going to miss this one! The user is only going to look at the factor override if doing something special that required tweaking of the table for a special design, not for a RC plain design.

FROM:dteal DATE:09/06/2001 13:13:25

I also believe that the usage of gamma=zero for the Shrinkage and Creep is also wrong. They also need a value of 1.00 for RC.

Please read 5.5.3.2 for the description of  $\gamma_{min}$ . This states that you must combine the dead load. BRASS is reporting zero here due to  $\gamma = 0$

## Complete Issue Information

FROM:dteal DATE:10/16/2001 14:57:55

FROM:bgoodrich DATE:Friday, April 05, 2002 12:02:35 PM

Jim - I think the export should be modified to set the TU, SE, and PS load factors to 1.0 for the Fatigue limit state only. This is consistent with Incident 3224, where the DC and DW load factors were set to 1.0 for the Fatigue limit state.

The other issue pertains to having to set the LRFD factors override. Note that the default LRFD factors set in the Configuration Browser can be from the Agency folder. Other than that, I don't have any suggestions here.

FROM:bgoodrich DATE:Friday, November 01, 2002 10:37:44 AM

I modified the export to set the TU, SE, and PS load factors to 1.0 for the Fatigue limit state only. Fixed for Version 5.0.

FROM:bgoodrich DATE:Friday, November 01, 2002 10:43:38 AM

Jim - Do you see anything else that needs addressed here?

FROM:dteal DATE:Friday, September 05, 2003 2:24:52 PM

I checked this in version 5.1 and it's OK

FROM:dteal DATE:Friday, September 05, 2003 3:50:24 PM

Ignor what I said above - it's still broke. Works for steel - does not work for RC.

FROM:dteal DATE:Tuesday, September 09, 2003 12:22:51 PM

So if TU, SE and PS load factors are modified in the export, how is the user going to know this? Here is an example of how that will be a problem.

The user sees that Fatigue DC and DW are zero in the provided standard factors. So he changes them to 1.0 and selects the factor over ride in the member alt or structure definition window. Now TU and SE got changed back to zero. Is that correct or does BRASS over ride the over ride?

FROM:kkennelly DATE:4/11/2005 3:11:00 PM

1. Dean's 9/6/2001 comments: Since a bridge can contain many superstructure definitions we don't want to assume the user wants to use the Bridge LRFD factors for all superstructure definitions. The Bridge LRFD factors are intended to be a special set of factors, like you want to use different factors for a main span but the approach spans can use the standard agency factors. We should maintain having the user override the LRFD factors on the superstruct def and member alt windows.

2. Since the DC,etc. factors are not equal to zero only for some certain spec articles, we should still provide the default factors as zero in Opis. I think its up to each engine to decide what factor to use when examining different articles.

3. We need to determine if BRASS LRFD is using the shrinkage and creep factors of 1.0 for r/c. Dean said on 9/5/2003 it does not.

4. Not sure I understand Dean's comments on 9/9/2003. The engine related help tells user about this and the log file created by the analysis also contains warning messages that the factors were set to 1

4/19/2016 3:15:40 PM

943

**Complete Issue Information**

for the fatigue limit state.

FROM:kkennelly DATE:4/11/2005 3:28:21 PM

FROM:bgoodrich DATE:Monday, March 06, 2006 12:22:29 PM  
BRASS LRFD does not perform a shrinkage or creep analysis for an R/C analysis, so the corresponding load factors are not used.

FROM:kkennelly DATE:11/21/2006 10:55:11 AM  
I don't think there is anything else to do for this incident. It all boils down to some of the AASHTO load factors depend on the spec article that is being evaluated. It is not practical to specify these load factors in Opis for the limit state, spec article and material type (rc or steel, etc.). If the load factor varies based on the spec article, each engine just has to report the load factor they are using and warn the user if it varies from what they have specified in the Opis load factor table. I think that is currently occurring for BRASS.

Email from Brian Goodrich, 11/21/06:  
I agree with Krisha's comments. Will you add these comments to the incident and mark it as resolved?

### Description

FROM:dteal DATE:06/07/2001 15:35:09

This may be related to Incident #2754, or it may be something new that popped up after or during some work on #2754.

First Case:

Analysis Settings, Advanced Button

I changed the Fatigue Truck to 1 lane with a scale factor code of 0.833. I think everything works ok here for the Distribution Factors if the engineer knows he needs to use the advanced settings window.

Second Case:

Leave the Advanced settings window unchanged, with a scale factor or 1. At the bottom of the BRASS output page for Max Actions and Displacements for Live Load No. 5 (Fatigue). BRASS has printed a message stating that the value for the Distribution Factor will default to 0.833 for the Scale Factor on the TRUCK-CODE command. When I check the BRASS input file I find the scale factor is still 1 and did not default to 0.833.

Is Opis over riding BRASS here and changing it's intention to default the scale factor to 0.833?

FROM:bgoodrich DATE:06/08/2001 12:34:44

The BRASS default of 0.833 is only used if the Scale Factor parameter on the TRUCK-CODE command is left blank. This parameter is never left blank when the command is generated by the export.

In Service Pack 3, the scale factor exported to BRASS will be the product of the the scale factor you specify using the Analysis Settings, Advanced Button and 0.833.

FROM:dteal DATE:06/11/2001 09:53:32

We are using Service Pack 3

FROM:dteal DATE:06/11/2001 09:54:53

After further investigation I believe that BRASS is not performing the proper check for Fatigue. AASHTO 5.5.3.1 paragraph 5 states that we need to make a check using an unfactored load. Being BRASS has been defaulting this factor with a zero instead of a factor of one – it leads me to think that this check is not being performed correctly.

FROM:bgoodrich DATE:06/13/2001 08:15:14

Please indicate if the scale factor issue has been resolved. I believe your comments on the 6/11/2001 pertain to a different issue than was originally initiated by this incident. The fatigue dead load factors issue seems to be the same as Incident 3232.

FROM:dteal DATE:09/06/2001 08:39:00

You are correct, this issue has been resolved. Leaving Incident 3232 needing attention.

FROM:kkennelly DATE:6/7/01 3:43:07 PM  
If you open the Cross Section window for a steel rolled beam, enter a cover plate, OK to close window, reopen window and delete the width or thickness, OK to close window, reopen window the previous numbers will still be in the grid with no warning to the user. Other windows don't operate like this. We should either change the data dictionary so these values can be null or issue warning to user in this

**Complete Issue Information**

window that they have to enter a value.

In abw\_stl\_xsection\_cover\_plate, the width and thickness are not allowed to be null in the data dictionary. All other dimensions for steel beams, such as cross section flange width, thickness,etc. and schedule dimensions are allowed to be null.

FROM:jduray DATE:8/30/01 9:33:56 AM  
I think we should change the data dictionary.

FROM:kkennelly DATE:9/26/01 8:54:36 AM  
In Version 4.0.4, the xsection cover plates were not allowed to have null width or thickness. So the FillCrossSectionData() code in DoGirderMbrAlt has code in it to prevent generating a cross section cover plate if the user input schedule based data has a null width or thickness. In anticipation of the data dictionary being changed to allow nulls for Version 4.1, that code is not in the domain for 4.1. If the data dictionary is not changed for version 4.1, we'll have to add that code to DoGirderMbrAlt for 4.1.

FROM:mordoobadi DATE:10/02/2001 12:13:30  
ERwin model, database and data dictionary updated.

FROM:jduray DATE:10/03/01 3:33:29 PM

FROM:bgoodrich DATE:10/18/2001 11:03:17  
The cover plate grids in the steel cross section window now allow dimensions to be null. I entered values in the window, closed the window, reopened it, deleted one of the dimensions, and closed the window again. Then, I opened the window again and the dimensions remained null.

### Description

FROM:dteal DATE:06/07/2001 16:53:30

The Help for PS, Deck Profile, Deck Concrete Tab lists definitions for both Structural Thickness and Total Thickness. The Deck Concrete Tab only provides an input area for Structural Thickness. Should Total Thickness be one of the definitions here?

The user may get confused here, are we looking for section properties here or slab dead load?

FROM:kkennelly DATE:6/8/01 9:03:30 AM

I'm guessing your structure is girder system since the Total Thickness column is not available on the Deck Concrete tab. The help for Total Thickness says that field is available only for girder line.

FROM:kkennelly DATE:6/8/01 1:10:27 PM

Accepted based on A in track field and closed.

## Description

FROM:rmbest DATE:06/08/2001 09:37:17 For RC Slabs, fractional numbers of reinforcement bars are permitted in the input. This is converted into the correct area of steel for BRASS. However, the Member Section Schematic incorrectly shows only the integer number of bars.

FROM:jihnate DATE:6/19/2001 1:23:06 PM

The schematic rounds the number of bars to the nearest integer (except when the number of bars is between 0 and 0.5, then it rounds up to 1). This is working as designed; fractional bars cannot be represented in the schematic.

For the attached .bbd file, please highlight the Wizard Alternative for Member 1. Then select View Schematic from the tool bar. (I used SI if it makes any difference?)

Look at the Text for Dimensioning the Vert. Shear Reinf. Spacing. The text writes over itself making it unreadable. We know that when stirrups are being entered they will most likely be entered with some variable spacing. You need to come up with a way for the designer to see the ranges (text) they entered.

Cross section based with cover plates currently not storing relative positions correctly if user deletes and adds cover plate rows to grids. As discussed with Jim on 6/8, make following changes for Service Pack 4:

Cross Section window Cover Plate tabs:

Change col heading from "Plate" to "Relative Position".

Make relative position editable by user instead of current row heading.

Validation to check for cover plates with same relative position numbers.

Change help.

Profile Cover Plate tabs:

Change col heading from "Plate Number" to "Relative Position".

Validation to check if cover plates with same relative position are over the same range.

Change help.

FROM:kkennelly DATE:6/11/01 1:00:58 PM

Fixed for Version 4.0.4 and 4.1. Also changed heading font for col headings we originally said were optional. Weld headings were italic blue, now standard black.

FROM:jduray DATE:7/5/01 10:10:58 AM

Need to change Help - Deterioration Profile: Top or Bottom Cover Plate topic. Cover Plate text should say cover plate relative position instead of cover plate number.

FROM:gbarnhill DATE:07/06/2001 12:20:35

4.0.4 - OK with July 5 dll's.

Grid works in cross section input.

Column heading "Relative Position" for cross section deterioration.

Leave colum heading "Cover Plate" for schedule-rolled beam deterioration.

NEED TO FIX HELP SCREENS IN LATER RELEASE.

OK in Service Pack 4 for version 4

## Description

FROM:dteal DATE:06/11/2001 09:55:54

Using attached file, Strand Location.bbd and attached jpeg picture.

In the strand layout for Girder 1, at mid span I have three rows of strands (row 1, row 2 & row 3 starting at the bottom). I want to harp these strands to the following locations. Row 3 to Row 7, Row 2 to Row 5 and then Row 1 to Row 3. I get am prevented form doing the Row 1 to Row 3. The error message generated by Opis "Strands below the selected strand are harped. Removing the harp would result in crossed strands which is not permitted!". This is not a crossed strand, it would be considered a proper harping location, see attached jpeg.

FROM:jduray DATE:6/12/01 10:11:31 AM

The window assumes that when the user clicks on the strand in row 3 (to be harped from row 1) that he/she wants to remove the harping on that strand (it is harped from 3 to 7) and since row 2 is harped to row 5 the window determines that the strands must cross. We need to ask the user if he/she wants to harp to that location (to row 3 from row 1) and indicate that he/she cannot remove the harp without first removing the harp of the strands above that row.

FROM:jduray DATE:8/23/02 9:50:28 AM

When the grey strand in row three is clicked (after rows 3 and 2 have been harped to rows 7 and 5 respectively) we need to know if the user is incorrectly trying to unharp that strand or trying to harp the strand in row 1 to that row.

4/19/2016 3:15:42 PM

HRS AASHTO

955

**Complete Issue Information**

I discussed with Dean and his feeling is that strands should only be unharped by clicking the red strand (indicating the harped-to position). Modify to work as Dean suggests. Then, when the user clicks the row 3 position we will harp row to that position.

May have been the result of working on Incident #1858

The n value for the top is being rounded and n value for the bottom is actual. Shouldn't they be the same?

FROM:jduray DATE:6/12/01 10:38:32 AM  
He must be referring to the export.

4/19/2016 3:15:42 PM

HRS AASHTO

956

**Complete Issue Information**

FROM:bgoodrich DATE:06/13/2001 09:28:23

Incident 1858 pertains to R/C, so I assume this one does too. I opened RCTrainingBridge1 with Opis and set the modular ratios of the T-beam to blanks. Then, I exported the bridge and the BRASS commands were:

CONC-MATERIALS 0.150, 4.000, 60.00, 60.00,&  
7.958, 3644.149, 0.480, , , , 0.000600  
CONC-MATERIAL-FLANGE 4.000, 8.000, 3644.149, 0.480, 130.00

The modular ratio is 8.000 for the TOP FLANGE and 7.958 for the OTHER PARTS. For this example, there is only rebar in the bottom of the beam, so a corresponding modular ratio was computed by the export. For the top flange, there is no rebar, so a modular ratio cannot be computed. Therefore, the BRASS default of 8.0 is exported, which may appear at first glance to be 7.958 rounded up, however, it is NOT. If at all possible, the export computes the modular ratio. If you have not defined the modulus of elasticity for the concrete or rebar materials, the export will instruct you to specify the data completely.

If this does not address your concern, you will need to attach a BBD file and resubmit this incident.

### Description

FROM:dkoenig DATE:06/14/2001 09:01:36

I do not understand if this is an error or not. Please explain the following.

For concrete slab bridges without steel shear reinforcement (I did not check slabs with steel shear reinforcement),  $V_c$  is calculated. This value is then divided by 2, and multiplied by 0.85 (phi factor) to get the ultimate shear capacity.

Why is this value divided by 2. Is this an error. The following is pasted from a typical slab bridge output.

```
{..PERFORMING AASHTO SPECIFICATION CHECKS - 8.16.6 Concrete Shear  
CONSTRUCTION STAGE: 1  
ANALYSIS POINT : 300.00
```

Input Parameters:

4/19/2016 3:15:43 PM

HRS AASHTO

### Complete Issue Information

bw = 320.000 (in)      d = 13.837 (in)  
Av = 0.000 (in^2)      s = 0.000 (in)  
f'c = 4000. (psi)      fy = 40000. (psi)

Stirrup Angle = 0.00 (rad)  
% of Concrete to be used in Vertical Shear = 100.00 (%)  
Lightweight Concrete Factor = 1.00  
Phi(shear) = 0.85

#### Calculated Values:

Vc = 560.09 (kips)      [AASHTO (8-49)]  
Vs = 0.00 (kips)      [AASHTO (8-53)]

#### Ultimate Shear Capacity :

Phi \* Vn = 238.04 (kips)      [AASHTO (8-46)]....

I use the entire width of the bridge for the section. This gives the large Vc value. A smaller width would result in the same type of calculation explained above.

I attached a .bbd file in case you would like to look at the Brass output.

FROM:bgoodrich DATE:07/07/2001 13:35:50

Dan Glandt will be addressing this issue. As a work-around, you might try doubling the phi factor or the %Concrete for shear value.

From Dan Glandt:

I think the shear capacity is divided by 2 because of 8.19.1 which says that shear reinforcement must be provided when the factored shear force exceeds one half the shear strength provided by the concrete. It appears that we used to print an error or warning message that stirrups are required, and then that was changed to allow the program to go ahead and do a rating based on 1/2 the phiVc value.

There may be some question about whether or not this should apply to slab bridges. It says in all flexural members, except slabs and footings.

From Jay Puckett:

For a slab, one does not need to consider shear in the rating. If it is considered, I do not think that the additional factor of two is justified. Regarding girders, the additional FS of 2, this usually addresses where the stirrups are curtailed in the middle (low shear) area of the beam (design). Regarding how this should be used in rating, I think that it is open for beams and could be interpreted either way. I do not think that LRFR has the factor two.

FROM:bgoodrich DATE:08/01/2001 11:02:12

Dan Glandt added a new option to the analysis sequence parameter on the ANALYSIS command. A "21" indicates an R/C slab. Note that a "2" still indicates R/C in general. When the 21 code is detected, BRASS will not divide the shear capacity by 2.0. I modified the export (BrassStdAnalysisCmd.cpp) to generate the analysis sequence parameter as 21 for R/C SLAB member alternatives. If the user wishes to adjust the shear capacity further, they can always specify the "% Shear" field on the point of interest.

I did not modify the analysis sequence options in the engine properties at this time. Should we modify the engine properties to allow the 21 code? This would require changes to AboBrass and AbxBrass2

4/19/2016 3:15:43 PM

HRS AASHTO

960

### Complete Issue Information

and additional changes to AbxBrass. This seems unnecessary because Virtis knows if the girder is a slab. Additionally, the 21 code is only used to set a flag within BRASS so it knows whether or not to divide the shear capacity by 2.0. Everything else is the same.

### Description

FROM:dteal DATE:06/18/2001 14:14:05

In running a design review of member 2 I get a very reproducible run-time error followed by a Dr Watson for VirtisOpis. Attached is the error message and the .bbd file. I did not get any indication as to what the problem is??

FROM:jihnat DATE:6/19/2001 7:32:58 AM

Version 4.0.2 works OK but 4.0.3 crashes.

FROM:bgoodrich DATE:06/21/2001 16:22:05

I have corrected the problem which is causing the crash. The source code I modified has not changed since December 2000, so the problem has existed for a while. In previous versions, the fillet/taper command was not exported, which may be why this problem never showed up in any Opis testing.

### Complete Issue Information

I ran the BRASS data file from Version 4.0.3 with previous versions of BRASS-GIRDER(LRFD) and received the same run-time error.

For the "Double Tee" P/S I-beam shape entered for this bridge, there is a bottom fillet/taper with a 1" height, however, the bottom flange has the same width as the web thickness. This is most likely an input error. A shape like this has never been tested, which is why this run-time error has never been reported. I think we should address this issue for the next major release.

Jim - I do think that the P/S beam shape window should catch this invalid shape error, i.e., do not allow a particular fillet/taper if the corresponding flange width is less than or equal to the web thickness.

FROM:jduray DATE:6/25/01 2:58:55 PM

Mark for Patch Test and add a new incident for the validation within the shape windows. [new incident is 3274]

FROM:dteal DATE:06/27/2001 12:16:31

This was not an input error. I am entering a double tee beam. The bottom flange width will be equal to the stem width. Being I wanted to avoid "zeros" in my input I entered 1 mm bottom flange thickness. I needed to do this to get the GUI of the beam shape to work.

FROM:bgoodrich DATE:06/28/2001 14:56:08

The bottom flange thickness was entered as 50 mm, which is fine. The fillet/taper dimension was entered as 1 mm, which cannot be when the bottom flange and web are the same width. If this value is set to zero, BRASS runs successfully.

FROM:jduray DATE:6/29/01 9:53:48 AM

FROM:dteal DATE:07/13/2001 12:02:01

I left the fillet/taper value at 1 mm and it still ran successfully

### Description

FROM:hlee DATE:6/18/2001 4:21:04 PM

Bridge Explorer doesn't refresh after Bridge ID in BWS is changed and clicked OK and saved.

FROM:jduray DATE:6/19/01 10:45:56 AM

I think this is acceptable behavior. Refreshing the Bridge Explorer can be time consuming if the info is retrieved from the database (as it should be). The BE could contain a list of thousands of bridges and the user probably would not want to wait for them to be re-queried every time a bridge is saved.

We could update the BE without retrieving from the db but that would require messages to update BE from the BWS.

### Description

FROM:bgoodrich DATE:06/29/2001 13:51:00

Entered for Keith Fulton:

When parameter 2 on the SPAN-B command is left blank and there are no other parameters, the BRASS import gives an error message. It is acceptable for parameter 2 to be left blank if it is equal to the span length.

FROM:bgoodrich DATE:07/07/2001 12:23:32

I modified the export (BrassImportData.cpp) to allow parameters 2, 4, and 6 to be blank.

FROM:kkennelly DATE:10/18/2001 1:09:22 PM

Tested ok in Beta 1.

## Description

FROM:dkoenig DATE:06/29/2001 16:24:38

While checking for the correct way to input non-composite steel bridges, I ran into some problems. I cannot say I understand it all, but what I found is detailed below.

Non-Composite bridges should not contain a deck profile. Entering a deck profile will create composite action in the regions of positive flexure.

Steel Simple Span Bridge:

For a simple span bridge, no load is being added by the haunch profile. This is true whether a deck profile exists or not. Otherwise, the loadings seem to be correct.

Example of a Steel Continuous Span Bridge:

I analyzed a two span bridge at the 1.4 location. A deck profile with 0 section values (thickness and width), and a haunch profile with 0 mm thickness (above the flange) is entered for G2. I analyze the bridge. The following dead loads are created.

|            |         |         |        |
|------------|---------|---------|--------|
| Girder Wt. | SDL s-1 | SDL s-2 |        |
| 275.1      | 1050.5  | 467.1   | k. ft. |

Now I add haunch thickness of 1000 mm.

|            |         |         |        |
|------------|---------|---------|--------|
| Girder Wt. | SDL s-1 | SDL s-2 |        |
| 275.1      | 1050.5  | 467.1   | k. ft. |

Now I add the deck profile (220 mm thickness and 2580 mm width)

|            |         |         |        |
|------------|---------|---------|--------|
| Girder Wt. | SDL s-1 | SDL s-2 |        |
| 275.1      | 1050.5  | 647.2   | k. ft. |

Now I change the haunch thickness to 0 mm.

|            |         |         |        |
|------------|---------|---------|--------|
| Girder Wt. | SDL s-1 | SDL s-2 |        |
| 275.1      | 1050.5  | 564.9   | k. ft. |

The SDL s-2 load that should be comprised of the barrier and wearing surface load only, is being increased when a deck profile is added. It is also, being increased additionally if the haunch is increased when there is a deck profile defined.

Now if I were to increment the thickness (say from 220 to 0) the extra load added to the SDL s-2 will change (seemingly parabolic) from 647.2 or 564.9 to 467.1 depending on which haunch is used. This

HRS AASHTO

971

## Complete Issue Information

initial value, 647.2 – 564.9, is dependant on the size of the haunch.

Another twist to this is that the increase in load is a percentage increase. In other words, given a haunch value and a thickness value, the total SDL s-2 load will be increased by a certain percentage. The larger the thickness or haunch the larger the increase. I can reduce either the WS or the barrier load and the percentage increase will be the same.

### Problems:

Correct me if I am wrong, but no extra load should be added because a deck profile is created. In addition, any haunch load added should be added to the stage 1 load.

For girder system bridges, the haunch profile should automatically calculate the load and add it to the stage 1 load. This is not being done correctly for simple or continuous spans in somewhat completely different ways.

In summary, I think these two windows and the loads they produce should be reviewed. I think there may be more problems than what I have mentioned above. I noticed differences between going in and changing the parameters for the girder and copying the girder and changing the parameters. In the above example, I constantly changed the girder that already had been created.

I am attaching the bridge I worked on in its original form. I suggest changing the properties for G2 similar to what I mentioned above. I want to make sure that this is a Virtis Export issue and not a problem with our database set up.

FROM:dkoenig DATE:06/29/2001 16:28:09

FROM:bgoodrich DATE:07/06/2001 16:17:10

For schedule-based input for steel, the load due to the haunch profile is NOT being computed. Therefore, none of the moments reported in the initial description of this problem contain a contribution from the haunch. The continuous span example is most likely due to different section properties being used for Stage 2 which draw moment to them. You would not see these differences in a simple span.

The following discussion references the four sets of moments above.

1. No deck and no haunch
2. No deck and 1000mm haunch
3. 220mmx2580mm deck and 1000mm haunch
4. 220mmx2580mm deck and no haunch

For sets 1 and 2, the structure is completely non-composite. However, for sets 3 and 4, the structure is composite everywhere except over the interior support. Therefore, the composite system will use a larger area and moment of inertia in the structural analysis. There is also a difference between set 3 and 4 because set 3 has a large slab offset from the girder because of the 1000mm haunch depth.

I did notice some problems with your haunch data. For some of the interior girders, there are some hidden haunch dimensions (Y2) that contains values. This generally occurred in previous version when you copy a member alternative from an exterior member to an interior member. To remove this dimension, copy your member alternative back to an exterior member, open the haunch window, and delete the dimensions from the Y2 column. Then, copy the member alternative back to the appropriate interior member and delete the original and the exterior copy. You may have to adjust the Existing/Current checkboxes on the member window to delete the member alternatives.

4/19/2016 3:15:46 PM

HRS AASHTO

972

**Complete Issue Information**

I modified the export (BrassCrossSections.cpp) to compute the haunch load for schedule-based steel member alternatives.

FROM:dkoenig DATE:07/09/2001 08:58:50

Thanks for the input. I forgot about the haunch data issue that I originally reported. Also, I was originally under the impression that the deck profile would only add composite properties if the composite regions were specifically designated in the shear connectors tab. I see now that Brass is not using this data.

FROM:dkoenig DATE:07/09/2001 09:40:43

I have a question. Will it be possible to input the haunch data for non-composite bridges. It would make sense if this load was computed automatically. The dead load tables (manually or automatically calculated) would make the user believe that the haunch load is always calculated automatically.

FROM:dteal DATE:Tuesday, April 08, 2003 3:46:22 PM  
The Member Alt Items, it would be nice to copy the Row and Column data without having to copy the entire Member Alt. Such as the LRFD LL Dist Factors for Cross Section Based, Splice and Hinge Locations, Girder and Deck Profile and Stiffener Ranges.

FROM:gbarnhill DATE:Thursday, June 19, 2003 5:45:55 PM  
I don't understand what was added to 5.0.1 for this.  
I can right click on STIFFENER RANGES and I get a COPY option, but i don't get an option to PASTE anywhere.

FROM:jihnat DATE:6/20/2003 7:56:41 AM  
Looks like a bug in the Copy/Paste. Try dragging to another Stiffener Ranges then dropping.

FROM:jihnat DATE:6/20/2003 8:53:01 AM  
Fixed.

FROM:gbarnhill DATE:Friday, June 20, 2003 3:21:47 PM  
I can get the COPY/PASTE to function for:  
Steel - HINGE LOC, SPLICE LOC, DECK PROFILE, STIFFENER RANGES

In PS Conc - DECK PROFILE -- I get a copy function, but no paste.

In both steel & conc - LIVE LOAD DIST -- I get a paste function, but nothing happens.

I get no COPY/PASTE function for Steel - GIRDER PROF, HAUNCH PROF, LAT SUPPORT, DETERIORATION PROF

### Description

FROM:bgoodrich DATE:07/06/2001 16:32:01

This issue was discovered as part of Incident 3246. A user tried entering a "Double Tee" P/S I-beam shape by using the lower part of the web as bottom flange. Therefore, the web and "bottom flange" have the same width. Additionally, the user specified a fillet/taper height of 1mm, which cannot exist because the fillet/taper will have no width. Some validation should be performed in the P/S Beam Shapes windows when the user enters invalid dimensions.

## Description

FROM:dteal DATE:07/13/2001 14:22:14

In the Library – Steel Shapes – Angle for example 3x3x0.3125 the k value is blank. The AISC table has a provided value. Why doesn't our library provide a value for k. The user has to go find a AISC book and look it up.

FROM:jduray DATE:7/16/01 9:08:27 AM

We will check on this but I think the electronic form that we got from AISC does not include this value.

FROM:kkennelly DATE:7/16/01 12:57:46 PM

The electronic file that we got from AISC does not include the k value.

FROM:dteal DATE:07/16/2001 16:34:19

So - does that mean we are not going to provide it? The user will have to look up the steel section in the AISC manual anyway?

FROM:kkennelly DATE:7/25/01 2:25:15 PM

I'm sure we do not currently have any budget for someone to data entry all of the k values for the rolled shapes and then someone else to check all of this hand input. Do you want us to add this incident to our enhancement list for the Task Force to approve? (Do you use this k value for anything?)

FROM:dteal DATE:08/28/2001 13:35:27

The only place I know the k value is used is in splice plate design. It's a geometry thing to be sure the bolt holes and splice plate have adequate clearance.

An example of where it is displayed in the standard shapes library: HP 8x36 displays a vertical k value but the k1 value is blank. L 102x76x15.9 leaves the k value field blank.

Some have it some don't, do we need it? Not unless we are going to use it for splice plate design. I am not asking for this to be added to a future enhancement list unless we are going to be adding a splice plate design module that considers clearances. One consideration is – the user, when copying from the library expects all the data fields to already be populated.

I think the bigger issue here is the Standard Library security. If the software administrator had the ability to edit the "Standard Library" then this would not be an issue at all. This would solve several problems (inconveniences) that we as an agency have run into with standard library content.

4/19/2016 3:15:50 PM

HRS AASHTO

990

**Complete Issue Information**

FROM:dteal DATE:08/28/2001 14:04:34

Just so I don't run out of possible scenarios, the k value isn't being used for any structural calculations by BRASS but if another engine is to be used - would that engine require the missing value?

FROM:jduray DATE:10/30/01 9:23:25 AM

I am changing this to an enhancement request. The request is to allow an administrator to modify standard library items. There are some options here such as adding another "super library administrator" for each library category.

### Description

FROM:dkoenig DATE:07/20/2001 08:58:41

I have a question. Will it be possible to describe the haunch in the haunch profile for non-composite bridges. I am not sure if this window is meant for composite action only or both composite and non-composite. It would make sense if this load was computed automatically. The dead load tables in the Help menus would make the user believe that the haunch load is always calculated automatically for girder system - schedule based input.

This question is asked in incident 3258, but I know this incident has already been marked as "resolved".

FROM:dkoenig DATE:07/20/2001 09:07:07

By the way, the combo box used to sort the incidents is scrunched. I am not able to sort the incidents. I did not know if you people were aware of this or not.

FROM:dkoenig DATE:07/20/2001 15:28:58

It looks like the pull down menu is back to normal.

FROM:bgoodrich DATE:08/03/2001 11:52:37

If a bridge contains a haunch, it should be entered into Virtis/Opis regardless of if the bridge is composite or not. Note that there must also be a deck defined above the haunch because the unit weight of the deck is used to compute the load due to the haunch. For non-composite bridges, no shear connectors or composite regions would be specified. In the end, you get the dead loads, but no composite action. The deck and haunch loads are automatically computed for a schedule-based girder line or girder system.

FROM:dkoenig DATE:08/06/2001 09:02:36

So do you recommend for non-composite steel bridges, to enter the slab for the entire length of the bridge with no structural thickness or effective flange width. I just want to make sure that Virtis does

**Description**

FROM:dkoenig DATE:07/24/2001 12:07:26

I am trying to determine the correct method for entering the deck concrete tab of the deck profile window and the contraflexure percentages for steel bridges.

Recently, I became aware that the shear connectors tab is not being used by Brass. I now have questions about the intended use of these windows and there importance to Brass.

4/19/2016 3:15:51 PM

HRS AASHTO

994

## Complete Issue Information

Question 1: Is it the intention that the deck concrete be defined for the entire length for steel structures. In other words, should we instead only define the deck concrete in the areas where shear connectors allow composite action?

Question 2: Are the contraflexure points entered to create the regions of positive and negative moment analysis using the deck concrete tab to ensure composite or non-composite action, or to set up the regions of composite and non-composite section analysis using a deck concrete defined for the entire length of the structure? I am not considering the rebar in negative moment regions.

I guess what I need to know is how to correctly input a continuous steel bridge where the shear connectors do not exactly match the contraflexure points. I was originally under the illusion that a user defines the deck concrete for the entire length of the bridge, enters composite regions where there are sufficient shear connectors in the shear connectors tab, and enters the contraflexure points at the actual contraflexure points of the bridge (not at the intended regions of composite and non-composite action).

I know this has been discussed before, but I would like to be clear on the intended use of these fields and how Brass will actually use them.

FROM:bgoodrich DATE:08/03/2001 11:54:45

For any steel structure, you should enter complete information for the slab, reinforcement, and shear connectors (or composite regions). The ultimate goal of Virtis/Opis is to store the true description of a bridge rather than the engineering model. As you point out, the help does indicate that the Shear Connectors tab is not used for BRASS LFD. However, the export process does use this information to determine how to generate the appropriate BRASS commands. Additionally, the dead load contraflexure percents are used to help determine how to generate the appropriate cross sections. This is necessary because BRASS only supports a composite slab OR rebar within the same cross section but not both.

Here a brief description of how the cross sections are generated from the export. Change points are determined from cross section changes, composite region changes, contraflexure points, etc. Then, the process determines if each range (between sets of change points) is 1) in a positive or negative bending region based on the dead load contraflexure locations and 2) in a composite region based on the shear connector (composite) ranges. If the range is composite and in positive bending, the BRASS cross section will consist of the steel beam and the slab. If the range is composite and in negative bending, the BRASS cross section will consist of the steel beam and the rebar (if entered). If the range is in a non-composite region, the BRASS cross section will consist of only the steel beam.

A direct response to your questions follows:

Question 1: Deck concrete should be defined everywhere. Then, you get your dead loads automatically for schedule-based input and the export will handle the abstraction to the engineering model.

Question 2: The contraflexure points are used to establish regions of positive and negative bending. They are NOT used to establish composite action. Currently, the export will add the rebar to the cross sections in composite negative bending regions. There is not an option to indicate if the user wants to consider the rebar in this region. If this is important, then request an enhancement.

Krishna - I suggest we modify the following help topics in the BRASSLFDENGINE.HLP file to help clarify

## Complete Issue Information

what the BRASS export is doing.

---

### Deck Profile: Deck Concrete (BRASS LFD)

BRASS LFD does not allow the use of a concrete deck slab and deck reinforcement at the same location along the length of the girder. The slab will be exported when this region is within or overlaps a composite positive bending region defined by the engine property contraflexure locations. The deck reinforcement will be exported when this region is within or overlaps a composite negative bending region.

(Keep "Effective Width (LRFD)" and "n" sections the same.)

---

### Deck Profile: Reinforcement (BRASS LFD)

BRASS LFD does not allow the use of deck reinforcement and a concrete deck slab at the same location along the length of the girder. The deck reinforcement will be exported when this region is within or overlaps a composite negative bending region defined by the engine property contraflexure locations. The slab will be exported when this region is within or overlaps a composite positive bending region.

---

### Deck Profile: Shear Connectors (BRASS LFD)

BRASS LFD does not directly use any of the data entered on this tab. However, the export uses this data to generate the BRASS cross sections as described on the Reinforcement (BRASS LFD) topic.

---

### Cross Sections: Slab (BRASS LFD)

BRASS LFD does not allow the use of a concrete deck slab and deck reinforcement at the same location along the length of the girder. The slab will be exported when this region is within or overlaps a composite positive bending region defined by the engine property contraflexure locations. The deck reinforcement will be exported when this region is within or overlaps a composite negative bending region.

(Keep "Effective slab width (LRFD)" and "Materials" sections the same.)

---

### Cross Section Ranges: Shear Connectors (BRASS LFD)

BRASS LFD does not directly use any of the data entered on this tab. However, the export uses this data to generate the BRASS cross sections as described on the Cross Sections: Slab (BRASS LFD) topic.

FROM:dkoenig DATE:08/06/2001 10:08:46

What has been explained above is what I first assumed about the program, but can someone explain this. I get composite action for a bridge when nothing is entered on the shear connectors tab.

FROM:kkennelly DATE:8/6/01 2:13:41 PM

Brian, can you answer his question and assign back to me for the help?

**Complete Issue Information**

There was a bug in the export that always output the deck if it was entered, i.e., there was no way to control if the structure was non-composite or composite. The work-around is to remove the deck, haunch, rebar, and shear connectors where you want the structure to be non-composite. You may need to add in the deck/haunch dead load as a member load depending on the structure definition. I have modified the export for version 4.0 and 4.1 to address the composite issue.

FROM:kkennelly DATE:9/14/01 7:59:50 AM  
Engine help files emailed to Brian on 9/13 for above revisions.

FROM:bgoodrich DATE:09/17/2001 16:41:36  
I updated the engine help files per this incident and e-mailed them back to Krishna. The help will only be updated for version 4.1.

### Description

FROM:jduray DATE:9/5/01 11:35:18 AM

The purpose of the enhancement is to provide the capability to Virtis to analyze and load rate bridges based on permit vehicles with vehicle axle spacing greater than the standard design and rating vehicles. This requires modifications to BRASS the Virtis GUI. The effects of skew is not included.

Several approaches were discussed with the TF and the following is the one being considered by the TF for version 4.2.

Add a window for describing distribution factors for different gages for each member alt. When the analysis is performed the engine should use the df corresponding to the vehicle gage. Computing these df is the responsibility of the user.

This item was in the top five as voted on by the User Group at the July 2000 meeting.

FROM:kkennelly DATE:6/19/2006 9:41:55 AM

Will be in Version 5.5

| 3283.12067 | Accepted      | Need to handle timber decks on steel beams and concrete decks on timber beams |

**Description**

FROM:jduray DATE:7/31/01 1:32:26 PM

This was requested by Paul Jensen. The event table can grow in size without restriction. Paul would like to see a configuration setting that controls the number of modification events preserved in the table. The other events are controlled by the user (rating and analysis events). The modification events are chained (recursive). We need a dialog that allows the user (administrator) to specify how long or how many (or both) modification events to keep in the chain for an item.

We also need a purge process to purge modification events older than some date and/or keep only the most recent n events.

FROM:bha DATE:08/02/2001 13:21:51

When we use the ASD rating method to analyze and then changing to the LFD rating method for analyzing. The problem is the engine does not get the defined distribution factors for Live Load.

But when we get out the Virtis program and reopen, then use the LFD rating method first and analyzing, the problem disappears. After that if we want to change to the ASD rating method, things go smoothly.

Please fix that problem in the next Service Pack.

## Complete Issue Information

FROM:kkennelly DATE:8/6/01 8:23:25 AM

I am unable to reproduce this incident. Please export the bridge that is having this problem to a \*.bbd file and attach that bbd file to this incident. You can export a bridge by opening the BWS for that bridge and selecting File/Import from the command menu.

FROM:bha DATE:08/07/2001 11:34:35

Enclosed is my file (you can use whichever file, they will produce the same problem). Once again, I would like to modify the problem more specific:

\* First, we open an existing file (or create a new file) and use either LFD or ASD methods for analysis, then we change to other method (LFD or ASD)and remove the vehicles and add other vehicles (If we change to other method and keep the same vehicles, we have no problem). After that we analyze, the engine will not get the live load distribution factor.

FROM:kkennelly DATE:4/29/2002 11:46:22 AM

I tried this bridge again in 4.0.4 and am not able to reproduce this problem. I also tried it in 4.1.1 and cannot reproduce the problem.

**Complete Issue Information**

**Description**

FROM:mordoobadi DATE:8/8/01 1:05:52 PM

Right now there are no restrictions on deleting a user.  
I think deleting a user should be limited by the following rules.

- 1 - A user should not be allowed to delete him/herself.
- 2 - Do not allow deletion of a user if he/she has a bridge checked-out, or owns a private bridge group.
- 3 - I'm not sure if we should restrict the deletion of a user if he/she has any events.

We wouldn't know who made a change if we set the entered\_by field in the abw\_event table to NULL.

FROM:jduray DATE:8/10/01 8:25:24 AM

I think we should add these restrictions and perhaps there are others. However, right now the only way to disallow a user from using the system is to delete him/her. I think we need to add an attribute to the person table to indicate active and inactive persons.

FROM:jduray DATE:2/4/03 12:21:14 PM

Mehrdad - has this been done?

FROM:mordoobadi DATE:2/4/2003 3:22:29 PM

Active Indicator is added in version 5.0.  
But we still need to enforce the rules listed above.

FROM:mordoobadi DATE:2/19/2003 4:10:27 PM

The following is implemented:

Rules for deleting users:

- (1) A user cannot be deleted if he/she has events.
- (2) If a user owns private folders, those folders should be deleted before attempting to delete the user.
- (3) If a user has authorizations to check-out bridges, those authorizations should be revoked before attempting to delete the user.
- (4) A user is not allowed to delete himself/herself.
- (5) User Deletion Process
  - 5-a) Is user trying to delete himself/herself? If YES: Issue Error.
  - 5-b) Does user have any corresponding events? If YES: Issue Error. Recommend deactivating the user.
  - 5-c) Does user own private folders? If YES: Delete the folders.
  - 5-d) Is User authorized to check-out any bridges? If YES: Revoke authorizations
  - 5-e) Delete the user.

### Description

FROM:dkoenig DATE:08/15/2001 12:13:36

When opening the BWS Report for any of the deck girders (T-beams), Virtis crashes. I had the same problem for a continuous RC Slab bridge. All of the simple span RC slab bridges worked fine. The Application error is shown below.

{The instruction at "0x6a9b7c1a" referenced memory at "0x033b4000". The memory could not be "read".}

Click "OK". Next message says;

{The instruction at "0x5f4012a1" referenced memory at "0x00000004". The memory could not be "read".}

What is the problem? A couple of .bbd files are attached below.

FROM:kkennelly DATE:8/28/01 11:35:10 AM  
Unable to reproduce. Email sent to David 8/28/01 asking for more info.

## Complete Issue Information

For P366 - Implemented the BWS Report in the following ways to get the error. Highlight Bridge Name, Structure Definition #2, Member Alternative for G2 and G3 under Str. Def. #2. Most of these were done after analyzing the entire bridge (I do not think that matters, though). I am using 4.0 with patch 4. I have ran the other patches in order. No errors are found when validating.

FROM:kkennelly DATE:8/30/01 10:26:32 AM

I am still unable to reproduce this. Are you able to reproduce it now? If so, are you using a Sybase db? If you are, can you send us a copy of the db? I'm thinking maybe your db is missing some data that is somehow being set by either the export or import function. That may be why I can't reproduce it with the file you exported. You can transfer the copy of your db to our ftp server by doing the following:

From Internet Explorer, enter the following in the Address bar: <ftp://hrsdept:jetta@ftp.mbakercorp.com>  
You will then see 2 folders. Double click the Incoming folder, then double click the Virtis folder. You can then use the Copy or Drag function to copy the db from a Windows Explorer window to the FTP folder window.

Call if you have any problems copying the db (412)269-7914.

FROM:dkoenig DATE:08/30/2001 12:39:58

Our databases our setup using Oracle. If you need to run some queries or something on our database, please let me know and I will find out who you need to contact to have a query run.

FROM:kkennelly DATE:8/30/01 2:39:40 PM

There isn't too much we can do with the Oracle db. Can you try to export one of these bridges again and then reimport that bridge back into the Bridge Explorer and save it with a new name. Then try to create the BWS report on the new bridge and see if it still crashes.

FROM:dkoenig DATE:08/31/2001 10:51:59

I exported and imported this bridge (p0366) for all of our databases and I was still finding this problem. I looked in to the problem a little further and found that the error is somewhat random. If I select a structure definition, for example, I will not always get the error. The members act in the same way. I always get the error at the top level, probably because it has to go through all the data.

I am a little confused as to what you mean when you say "There isn't too much we can do with the Oracle db". Are you saying writing a script will not help for an error that seems this random.

FROM:jduray DATE:9/10/01 11:50:10 AM

What Krisha means is that if this were occurring in Sybase we would ask you to send us the Sybase db file. We can't do that with Oracle.

Just so I understand what you did...you exported a bridge and imported it back into the same (Oracle) database. Both the imported bridge and the original crash Virtis during creation of a BWS report. Is this correct?

Krisha - if this is correct then we should import his bbd file into our Oracle database and should see the same behavior.

FROM:dkoenig DATE:09/11/2001 08:59:04

That is correct. In addition to importing this bridge back into the same database, I imported it into a

Subject: Re: Problems with Virtis app

Dennis,

I got the dump file off of our FTP server and imported it into our database in VIRTISADM schema.

I noticed you are still using VIRTIS\_USER\_READ\_ONLY\_ROLE, VIRTIS\_USER\_READ\_WRITE\_ROLE. I don't think you should have those roles on your database. So please drop those roles because you have another set of roles with different names [VIRTIS\_SELECT and VIRTIS\_UPDATE].

Then make sure that Virtis/Opis users are granted the following roles:

|               |                                                     |
|---------------|-----------------------------------------------------|
| CONNECT       | DEFAULT                                             |
| VIRTIS_SELECT | DEFAULT with ADMIN option                           |
| VIRTIS_UPDATE | Should not be DEFAULT, should not have ADMIN option |

In order to do this for the user VIRTIS you can run the following scripts:

```
REVOKE "VIRTIS_SELECT" FROM "VIRTIS";
REVOKE "VIRTIS_UPDATE" FROM "VIRTIS";
ALTER USER "VIRTIS" DEFAULT ROLE NONE;
GRANT "VIRTIS_SELECT" TO "VIRTIS";
GRANT "VIRTIS_UPDATE" TO "VIRTIS";
ALTER USER "VIRTIS" DEFAULT ROLE CONNECT, VIRTIS_SELECT;
```

I got your database working on our system. I did not create the VIRTIS\_USER\_READ\_ONLY\_ROLE and VIRTIS\_USER\_READ\_WRITE\_ROLE roles.

## Complete Issue Information

I did not get any errors or crashes when creating the BWS report for bridge "P-366" or any other bridge with BID > 30.

Please let me know how it goes.  
Thanks,  
Mehrdad

>>> <winkid1@mail.modot.state.mo.us> 10/16/01 03:01PM >>>

Mehrdad,

I have finished ftp'ing the export file as specified. Let me know if you need anymore help from us. The table owner we use is VIRTISADM. I am attaching some DDL that may help you in your task. I changed the passwords on the users and the role to be easier.

The users also have two sets of roles, the ones we have set up (VIRTIS\_SELECT and VIRTIS\_UPDATE) and we just slapped on the ones that we used for testing that are provided by the DDL that comes with VIRTIS. We do not have any grants in the export file to those roles (READ\_ONLY, and READ\_WRITE) since we created them only for the purpose of them showing up attached to the users (for this export...we had dropped virtis\_select and virtis\_update and only had the roles provided when we did our testing as specified below). You have the scripts for the grants to these roles if you need them.

(See attached file: virt\_tablespace.ddl)(See attached file: virt\_users.ddl)(See attached file: virtis\_select.ddl)(See attached file: virtis\_update.ddl)

If you see something I missed or need anything else, let me know.

Have fun!  
Dennis

Subject: Re: Problems with Virtis app

Dennis,

I updated the corresponding incident (#3322) with a summary of the e-mails I sent and received about this problem.

I think the only way we might be able to reproduce your problem is to have an exact copy of your Oracle database.

So I suggest that you export your database schema to a dump file and put the dump file on our FTP server.

Please send me an e-mail when You are finished.

Here is the FTP address:

ftp://hrsdept:jetta@ftp.mbakercorp.com

Please put the dump file in the folder Incoming/MODOT.

Thanks.

Mehrdad

>>> <winkid1@mail.modot.state.mo.us> 10/16/01 11:45AM >>>

Mehrdad,

We have finished our testing following the steps below. We still received the same error. I believe at this point all signs point to an application error, and not a database error. Let me know if you need anything further from us.

Thanks (and good luck).

Dennis

Subject: Re: Problems with Virtis app

Dennis,

I suggest you to do the following.

- (1) start SQL plus and set-up the spool file.  
spool C:\VirtisSpoolFile.LST;  
set echo on;  
set define off;  
prompt off;
- (2) drop all public synonyms. Use DropPublicSynonyms40.SQL SQL script file.
- (3) drop the roles.
- (4) create public synonyms. Use PublicSynonym40.SQL SQL script file.
- (5) create the roles. Use CreateVirtisReadOnlyRole40.SQL and CreateVirtisReadWriteRole40.SQL files.
- (6) grant roles to users  
GRANT "VIRTIS\_USER\_READ\_ONLY\_ROLE" TO "VIRTISUSER" WITH ADMIN OPTION;  
GRANT "VIRTIS\_USER\_READ\_WRITE\_ROLE" TO "VIRTISUSER";  
ALTER USER "VIRTISUSER" DEFAULT ROLE CONNECT, VIRTIS\_USER\_READ\_ONLY\_ROLE;
- (7) stop the spooling.  
spool off;

4/19/2016 3:15:57 PM

HRS AASHTO

1028

## Complete Issue Information

(8) make sure you did not get any errors by looking at the spool file.  
(9) run the BridgeWareAdmin Utility to set the role names and read/write role password.

The SQL script files mentioned here can be found on your Virtis/Opis 4.0 Installation CD.

The roles should be granted to all users including the owner of Virtis/Opis schema owner. Because Virtis/Opis Application will not work if a user is not granted the read-write role.

If doing this does not fix the problem I might need to ask you to send me a dump file (EXPORT) for your Virtis/Opis database schema.

Regards,  
Mehrddad

>>> <winkid1@mail.modot.state.mo.us> 10/11/01 10:53AM >>>

Mehrddad,

Aaron and I logged on as the owner of the Virtis tables, and we encountered the same error.

At this point I'm thinking the problem is within the application. I think there is still a small chance the problem could exist on the database, which is why I'm giving you configuration information.

We are running Oracle 8.1.6.3 on AIX version 4.3.3. Other than issues with the database version, the only potential area I see that could still be a problem is within the roles (as in which are default and which have admin option). Can you tell me if I'm correct here? Virtis (which logs on to the app as administrator) needs both the read and write role as default with admin option. The owner of the tables also has both of these roles with admin option, but not as default roles. The typical user should have the read role as default (no admin) and the write role as non-default (no admin).

Is that correct? Theoretically the owner of the tables doesn't need the roles to access the tables since they are his tables, but maybe the application is looking for something and not finding it. There could be another avenue of error that I think is a highly unlikely one, but sometimes you never know where the hardcoded values might lay. We are using the names VIRTIS\_SELECT for the read only role, and VIRTIS\_UPDATE for the read\_write role. Again, I fail to see how that would matter since the application should not care what the roles are called, just as long as the user has access to the table.

Let me know if there's anything else that I can do on the database side, or if you also feel that it is an application issue at this point.

Subject: Re: Problems with Virtis app

Dennis and Aaron,

Here is the information about the abw\_lib\_rebar table.

VIRTIS\_USER\_READ\_ONLY\_ROLE role should have select privilege on abw\_lib\_rebar table.

VIRTIS\_USER\_READ\_WRITE\_ROLE role should have select, update, insert, delete privileges on abw\_lib\_rebar.

You should have a public synonym for abw\_lib\_rebar.

It might be helpfull if you login to SQL plus as a user other than the owner of database tables, and execute the following SQL script:

```
select * from abw_lib_rebar;
```

4/19/2016 3:15:57 PM

HRS AASHTO

1030

## Complete Issue Information

to see if you can access the table.

One more thing to check is to log-in to Virtis/Opis as the owner of Virtis/Opis database tables and do the test. If Virtis does not crash it means that there is something wrong in the user set-up (roles or synonyms). Please let me know if it makes any difference.

Regards,  
Mehrdad

>>> <winkid1@mail.modot.state.mo.us> 10/10/01 09:49AM >>>

Mehrdad,

I don't know how much Bobie and Aaron/David have filled you in on, but there is a problem with the Virtis application in which going to a certain type of bridge causes an error. I asked Aaron Kemna to log on and replicate the error. While he was doing this, I was capturing explain plans. This seems to be the last cursor he has open before he gets kicked out of the application:

```
SELECT
rebar_id,name,descr,library_type,si_or_us_type,weight_per_length,nominal_diameter,xsection_area,
perimeter,checksum FROM abw_lib_rebar WHERE library_type = 22901 OR
library_type = 22902 ORDER BY name
```

I am guessing the error either happens when the data from this table is trying to be interpreted or in the transition to this point. If you could maybe find out how you have abw\_lib\_rebar set up as far as constraints and grants go, then I'll compare that to what we have and see if ours is correct.

In case you need to see 'a trail' so maybe you guys can replicate the error, the following cursors are what I captured before the error struck (in order).

```
SELECT
table_name,attribute_name,attribute_type,data_type,null_allowed_ind,valid_ind_chars,
string_length,stored_unit_id,si_unit_id,us_unit_id,min_real_value,min_int_value,max_real_value,
max_int_value,default_si_value,default_us_value,default_int_value,default_type,type_category_id,
si_mask,us_mask,numeric_precision,numeric_scale,internal_use_1,internal_use_2,descr,
attribute_domain_name FROM abw_sys_data_dictionary
```

```
SELECT
bridge_id,brkey,group_id,group_item_id,event_id,item_id,district,county,facility,location,agency_code,
bridge_name,featint,routenum,nhs_ind,virtis_ind,opis_ind,kmpost,owner,custodian,adminarea,length,
yearbuilt,
deleted_ind FROM abw_v_sql_bridge_group WHERE (deleted_ind<>'T' or deleted_ind
```

## Description

FROM:bgoodrich DATE:08/30/2001 18:27:06  
Entered for Seung Yeol Lee (Arizona Department of Transportation):  
See RebarDepthInterpolation.doc.

FROM:bgoodrich DATE:08/30/2001 18:31:59

Seung Yeol has defined the structure correctly as far as I am concerned. The interpolation problem resides with the BRASS engines. Dan Glandt informed me that BRASS has never interpolated the rebar distance. BRASS is taking the rebar in the cross section at the left of the range and using for all points within the range except for the right end of the range, which has the correct rebar distances. The BRASS output shows that the bottom steel is 2" from the bottom of the section at the 1.8 and 1.9 points but 6" at the 2.0. Additionally, the bottom steel is 6" from the bottom of the section at the 3.1 and 3.2 points but 2" at the 3.0. As a work-around, Dan suggested creating cross sections and ranges that coincide with the POI that are failing. This will force BRASS to use the desired rebar distance.

FROM:bgoodrich DATE:09/04/2001 15:28:35

Dean Teal (KDOT) experienced this same problem with slab structures and came up with the same work-around on his own. I will request that the BRASS engines be modified to interpolate the rebar distances.

**Description**

FROM:dteal DATE:09/05/2001 10:39:22  
In the Prestressed Concrete under the second sub-bullet of the second bullet for Composite it states:  
“In the first stage, the structure is modeled as simple span non-composite so BRASS places a hinge at each support and stage one loads such as girder and diaphragm weight are applied.”  
I believe that it should also include the wet slab weight in stage 1 in this help message. BRASS includes this weight, it's the Help that doesn't.

**Complete Issue Information**

FROM:bgoodrich DATE:09/17/2001 16:47:28

I added the term deck weight to the help to be consistent with other bullets in the BRASS help. Fixed for version 4.1.

**Description**

FROM:kkennelly DATE:9/5/01 2:58:54 PM  
Submitted for Ming Teng, RQAW via email:

Dear Ms. Kennelly,

I got a question for the girder line question. Do I need to input reinforcement at the negative moment areas fro the girder line. If so, I suppose that the rating will be up. However, it is down a lot (from 1.3 down to 0.7). I check and check this whole morning but still cannot figure out why? Do I miss something?

Attached is the file that contained two issues, one is w/o reinforcement and another one is w/ reinforcement.

Thanks in advance! Have a nice day!

Sincerely,

Ming (Ken) Teng

ORA-04031: unable to allocate 2192 bytes of shared memory ("shared pool","ABW\_RATING\_RESULTS\_SUMMARY","KQLS heap","KQLS MEM BLOCK")

FROM:bha DATE:09/06/2001 15:22:18

FROM:mordoobadi DATE:9/17/01 10:20:34 AM  
This is an Oracle Error. It happens because your Oracle shared pool is too small.

One work-around could be to delete all of the rating results for the bridge before deleting the bridge.

If this didn't work you should ask your database administrator to increase the size of Oracle shared pool.

Here is what I found in Oracle Help:

ORA-04031 unable to allocate string bytes of shared memory ("string","string","string","string")

Cause: More shared memory is needed than was allocated in the shared pool.

Action: If the shared pool is out of memory, either use the DBMS\_SHARED\_POOL package to pin large packages, reduce your use of shared memory, or increase the amount of available shared memory by increasing the value of the initialization parameters SHARED\_POOL\_RESERVED\_SIZE and SHARED\_POOL\_SIZE. If the large pool is out of memory, increase the initialization parameter LARGE\_POOL\_SIZE.

FROM:mordoobadi DATE:10/15/2001 11:09:15 AM  
Shared pool size changed from 15 MB to 30 MB. Still unable to empty Deleted Bridges Folder.  
Suggested to delete rating results before deleting the bridge.

FROM:mordoobadi DATE:10/15/2001 11:13:44 AM  
Additional Information: OPEN\_CURSORS = 200

FROM:mordoobadi DATE:11/5/2001 2:20:19 PM  
I asked them to make the shared pool larger (64 MB), I did not hear from them since then.

**Description**

FROM:dteal DATE:09/06/2001 13:10:49

I came across a problem in the Parameters in the Config. Browser. It showed up in the

4/19/2016 3:16:00 PM

HRS AASHTO

1044

**Complete Issue Information**

Owner/Maintainer pulldown. If an ID begins with a zero, it can not be saved in the Bridge Description window under the "Description (cont'd)" tab for either the Owner or the Maintainer. I had used the following ID's

-2, -1, 00, 01, 02, 03, ... 09, 10, 11, etc.

the -2, -1, 10, 11, etc are savable, the 00, 01, 02, etc is not savable due to the zero at the beginning, I think.

I selected a Owner and a Maintainer from the customized pulldown list. I hit OK, and immediately reopened the window. The two fields are now blank. I can not find a way to save any data to thee two fields when the ID begins with a zero.

Now to make matters worse – either it has been this way from the get-go or during one of the version upgrades or service pack upgrades this problem has removed all data from these two fields in the existing bridges in our database (if the ID began with a zero).

I have other Parameters with ID beginning with zeros and they work fine.

FROM:mordoobadi DATE:9/17/01 10:51:06 AM

This is because of type mismatch in pontis tables: paramtrs and bridge for the fields owner and custodian.

owner and custodian fields have NUMERIC(2) in bridge but VARCHAR(8) datatype in paramtrs table.

I verified that the structure of Pontis 3.1 database tables bridge and paramtrs match the structure of Virtis/Opis 4.0 database tables pontis\_bridge and pontis\_paramtrs.

In Pontis 4.0 this problem is partially addressed.

Partially because now we have VARCHAR(2) in bridge and VARCHAR(8) in paramtrs table.

Jim, please advise.

FROM:dteal DATE:02/15/2002 12:25:40

In version 4.1 it appears to work correctly.

## Description

FROM:dteal DATE:09/10/2001 12:25:03

Working on RC structure

5.7.3.4 Control of Cracking by Dist. of Reinforcement

See attached jpeg file – the equation suggests using “ds”, this is incorrect, it should be “dc”. In this case the ds and dc values are the same so we get the correct result by default.

FROM:bgoodrich DATE:09/19/2001 13:13:49

BRASS computes the area (A) value using:

$$A = 2 * ds * b / \text{No. Bars}$$

The area is to have the same centroid as the rebar group. Because the ds term is the distance from the extreme tension fiber to the centroid of the group, then twice ds represents the height of the concrete area. The dc term cannot be used because it is the distance from the extreme tension fiber to the centroid of the most tensile row.

FROM:dteal DATE:09/20/2001 14:07:50

In the following excerpt from BRASS, how can the ds term be greater than 50 mm + ½ bar diameter? I think AASHTO recommends this limit.

PERFORMING AASHTO SPECIFICATION CHECKS - 5.7.3.4 Control of Cracking by Distribution of Reinforcement

Point of Interest : 200.00

## Complete Issue Information

### Input Parameters:

ds = 100.000 mm      No. Bars = 12.000  
b = 1800.000 mm      Z (top) = 23000.000 N/mm  
dc = 67.900 mm      fy = 420.000 MPa

### Calculated Values:

A = 2 \* ds \* b / No. Bars = 30000.000 mm<sup>2</sup>  
Limit = 0.6fy = 252.000 MPa  
f<sub>sa</sub> = Z / (dc \* A)<sup>(1/3)</sup> = 181.439 MPa [AASHTO (5.7.3.4-1)]

### Limiting Tensile Stress:

f<sub>sa</sub> = MIN(f<sub>sa</sub>, Limit) = 181.439 MPa

FROM:dteal DATE:10/16/2001 14:59:39

FROM:bgoodrich DATE:10/22/2001 11:37:08

There is an example in Design of Highway Bridges (Jay's book) that illustrates the crack control comp of 5.7.3.4-1. See Example 7.10.3, Section I.5 on pages 580-581. Note the y<sub>s</sub> term in Figure E7.3-16 is what BRASS denotes as ds (the distance to the centroid of all rows of rebar). BRASS does limit the cover to a maximum of 2" (50mm) when applicable. It appears from the output that there are multiple rows of reinforcement in the top of the slab/beam. If not, I will need your bridge to investigate further.

FROM:dteal DATE:11/02/2001 14:49:50

Resubmit – The example you referenced is a tee-beam with multiple layers of rebar in the stem. The y<sub>s</sub> term referred to is to the centroid of these multiple layers.

We are referring to a single layer (row) of rebar. (Jays book pg 552 - #2).

AASHTO is very clear here – 5.7.3.4

dc – depth of concrete measured from extreme tension fiber to center of bar closest thereto; for calculation purposes, the thickness of clear cover used to compute dc shall not be taken to be greater than 2.0 in.

From the commentary – Equation 1, the actual clear cover should be used where the clear cover is 2.0 in or less. Where the clear cover exceeds 2.0 in, a value of 2.0 in should be used for calculation purposes related to equation 1. Additional cover may be regarded as added protection.

FROM:dteal DATE:Friday, March 29, 2002 8:31:00 AM

FROM:bgoodrich DATE:Thursday, April 04, 2002 1:44:44 PM

After reviewing the source code, I have found that BRASS uses the ds directly and does not adjust it when the cover exceeds 2". I will get this fixed as soon as possible.

FROM:bgoodrich DATE:Thursday, May 23, 2002 10:47:54 AM

BRASS-GIRDER(LRFD) 1.5.2 contains the correction to the "ds" term where the cover no longer

4/19/2016 3:16:01 PM

HRS AASHTO

1047

## Complete Issue Information

The sustained modular ratio factor,  $m$ , is used for permanent loads. For Service I the live load moment is the largest portion of the total moment. It would be more accurate to have Section Properties for Dead Load using  $m$  and another for Live Load not using  $m$ .

FROM: bgoodrich DATE: 09/20/2001 17:24:19

If the dead load moments are small relative to the live load moments, try using a sustained modular ratio factor of 1.0 instead of 2.0, which removes the creep effect from the section properties. I analyzed an R/C bridge each way ( $m=1$  and  $m=2$ ) and found that the cracked moment of inertia increases by less than 2%. This increase only slightly affected the tensile rebar stress (by  $< 1\%$ ), which is what must be checked according to the spec. The compressive rebar stress was nearly cut in half; however, compression stress is not applicable.

FROM: jduray DATE: 9/24/01 8:30:25 AM

Please review this incident.

FROM: kkennelly DATE: 9/27/01 3:26:49 PM

In reviewing this incident I noticed that the export is not using the sustained modular ratio factor that the user can enter on the Structure Typical Section: Deck Cont'd tab. So BRASS LRFD always uses the default of 2. The BRASS LRFD engine help indicates this value is used.

I guess Dean is technically correct about using the different section properties for dead load and live load. I don't know if other software does that or to what extent it has on the stress computations.

FROM: bgoodrich DATE: 09/27/2001 16:07:32

For R/C, the deck is part of the top flange, so I guess the value entered on the Structure Typical Section: Deck Cont'd tab could be used for the entire beam.

I requested that the  $m$  value be moved to the member alternative level because the member alternatives could be steel or concrete, which get a different value (3.0 for steel and 2.0 for concrete). This implementation is already done for a girder line in the GUI.

FROM: bgoodrich DATE: 02/06/2002 18:40:27

I have modified the export to generate the concrete materials command with the appropriate sustained modular ratio factor ( $m$ ). Then, users can set the  $m$  factor to any value ( $m=1.0$  should address Dean's concerns). This correction is ready for Version 4.1 Service Pack 1. This issue is more of an export issue than anything. BRASS simply analyzes R/C structures in one stage, which is why different cracked moments of inertia for dead and live loads are not computed.

I still think the  $m$  value should be moved from the girder system structure definition to the member alternative because the value may be different between steel and concrete structures.

Jim - Please set the status to Patch Test if the location of the factor will be addressed in another incident.

FROM: jduray DATE: 2/25/02 8:51:53 AM

Krishna - please review and let me know if we should move the value to the member alt. If we should we should open another incident as an enhancement and change the status on this one to Patch Test.

FROM: kkennelly DATE: 2/26/2002 9:40:27 AM

I agree we should move the  $m$  value to the mbr alt level (even though I hate to make such a change!). Added as incident 3621.

RC Structure

This is wrong. The section modulus is calculated for a cracked cross section. For positive moment the concrete fibers in the bottom of the slab are in the tension zone. The concrete in the tension zone of a cracked cross section is neglected. Therefore this section modulus is NOT valid.

FROM:bgoodrich DATE:09/19/2001 13:11:02

I removed the section modulus for the concrete in tension for a cracked cross section. I also modified BRASS to use the gross section properties when determining the tensile stress in the concrete in the crack control checks. Fixed for version 4.1.

RC Structure

How is the stress in R5 computed?

BRASS has a value that is less than that calculated for strain compatibility. This difference is approx. 6%. I have spot checked a few other POI's and the BRASS value is consistently ~6% less than my hand calculations. I believe that BRASS is reducing the stress in the compression reinforcing steel in an attempt to account for the fact the area of the concrete compression block has not been reduced by the area of the compression reinforcing. Therefore a portion of the force in the compression reinforcing has been removed as it is included in the concrete force. After making some additional runs using different values of  $f'c$  I have determined that the % reduction is equal to the following;

$$\% \text{ Reduction} = (0.85 * f'c) / f_y = (0.85 * 30 \text{ Mpa}) / 420 \text{ Mpa} = 6.071\%$$

I believe the BRASS procedure is wrong. I would do the following;

$$\text{Reduction} = 0.85 * f'c = 0.85 * 30 \text{ Mpa} = 25.500 \text{ Mpa}$$

This value is a unit value not a %.

FROM:bgoodrich DATE:09/19/2001 13:07:07

BRASS calculates a fraction that is applied to  $0.85 f'c$  for the displaced concrete area when the steel is in compression. Traditionally the entire amount is used; however, the BRASS method avoids a discontinuity. The ratio is 1.0 when the steel and has yielded and is proportioned to 0.0 when the steel has no strain. This relationship is not codified in the specification and is performed on the basis of judgement.

**Description**

FROM:dteal DATE:09/26/2001 11:29:32

In the Bridge Description Tab, the Name: field will only allow 24 characters but the field appears to be much wider. Is this correct?

FROM:jihnna DATE:10/3/2001 1:20:35 PM

This is correct in version 4.0. But in Version 4.1, the name field is increased to 50 characters (for Pontis integration).

## Description

FROM:dteal DATE:09/28/2001 12:03:08

When a structure that has an abutment with one skew and a pier with a different skew angle (girder system). How can the span length be entered to model the bridge correctly? Each girder line will have a different length. We only enter the span length once, in the Girder system structure definition window. When you get to the Girder Profile window, Opus will give an error (span length and girder length will not match).

With this problem existing, why are we able to enter differing skew angles?

The On-Line Help for VirtisOpus doesn't give the user a heads up on differing skew angles. The engine help only makes reference to splayed girders.

FROM:kkennelly DATE:10/1/01 8:59:35 AM

The structure definition window has the following title above the span length table: Enter span lengths along the reference line. The help for this window describes how the member lengths are adjusted as needed when skew angles are entered. The span length you enter in the structure definition window is the span length of the structure definition reference line. If the structure definition reference line is moved around in the Structure Typical Section window and you have differing skews or splayed girders, the member lengths are adjusted accordingly. If you open the Member window, you can see

### Description

FROM:tthompson DATE:10/01/2001 14:38:18

Appears that one of the BRASS output moment/shear summary tables is incorrect.

The Total Unfactored DL and LL actions summary table appears to neglect all the Stage 1 and 2 DL actions

Span Point 4.059 (Moments) as reported in BRASS-LFD

4/19/2016 3:16:04 PM

HRS AASHTO

1062

**Complete Issue Information**

Sum of Stage 1 -7548.0  
Sum of Stage 2 -3279.9  
Stage 3 LL (Truck 2 = HS 20 Lane) -6043.3

Total Unfactored Moment for DL and LL actions = -6043.3

The total factored moments is correct.

I'll attach the BRASS output generated using Virtis 4.0.4 with LF Analysis.

FROM:ttompson DATE:10/01/2001 14:49:04  
I checked using BRASS ASD and this summary is correct. I have been unable to attach the output file. Keeps timing out. But will keep trying.

FROM:bgoodrich DATE:10/02/2001 15:12:08  
I forwarded this issue to Dan Glandt for investigation.

FROM:bgoodrich DATE:10/05/2001 14:39:52  
WYDOT assigned this issue to Problem Log #308.

FROM:bgoodrich DATE:10/22/2001 13:02:01  
This issue will not be addressed for Virtis 4.1. Dan Glandt should have this addressed for Virtis 4.2. On hold until then.

FROM:bgoodrich DATE:Wednesday, March 06, 2002 4:21:31 PM  
Dan Glandt corrected the output report in question. Fixed in BRASS-GIRDER 5.8.5, which should be released with Virtis 4.1 Service Pack 1.

### Description

FROM:dteal DATE:10/03/2001 08:40:07

After updating my SQL Anywhere from version 5.0 to SQL Anywhere Studio 7.0.3 I found that the instructions provided (Sybase ReadMe.txt) to update the database does not apply to the newer SQL release. The instructions follow the old version only, referring to what you see on the screen and what input the user needs to apply.

Future updates requiring database scripts to be run will have to be addressed.

### Description

FROM:dteal DATE:10/03/2001 08:40:51

I installed SQL Anywhere Studio 7.0.3 on 2 pc's. the NT installation went fine. On Windows 2000 I get an error message at boot up, but it seems to run fine, except you always get the error message – therefore something is amiss. This is the message: "SQL Server Installation is either corrupt or has been tampered with (unknown package id). Please rerun Setup." I reran setup, I reinstalled and again reran setup, but to no avail. I had our IT people look it over, no help. This is a standalone pc I use for testing only.

FROM:jduray DATE:10/5/01 9:50:27 AM

Mehrdad - Do we have 7.0.3? If we do please install on our Windows 2000 test PC and let Dean know if it works ok.

FROM:tthompson DATE:10/10/2001 14:44:20

I running Win 2000 on my laptop. I've installed ASA 7 and upgraded to 7.0.3 Build 2046. I'm running

4/19/2016 3:16:04 PM

HRS AASHTO

1065

**Complete Issue Information**

Pontis 4.0 and VirtisOpis 4.0.4. I've suffered no problems or weird error messages. (I believe it was the 7.0.x maintenance upgrade to 7.0.3 upgrade that I installed)

FROM:dteal DATE:10/19/2001 09:57:45

I didn't perform an upgrade, I deleted (removed) version 5.5 and installed a fresh version.

FROM:mordoobadi DATE:10/19/2001 10:56:14 AM

Dean, we do not have an 7.0.3 installation CD to try it on a windows 2000 machine. But I just noticed something in this incident. It seems like the error message is not related to SQL Anywhere Studio, the message refers to "SQL Server". Did you install SQL Server or MSDE? (MSDE comes with Virtis/Opis if you choose to install it)

FROM:dteal DATE:10/22/2001 08:54:11

The installation was applied on my Win200 pc and my NT 4.0 pc. I have no problems with the NT installation. As far as I know I selected all the same installation options. The installation cd doesn't ask anything about "server" it only states "SQL Anywhere Studio 7 will be installed", when installing 7.0.3 (not upgrading).

FROM:mordoobadi DATE:10/23/2001 11:14:23 AM

The error is not related to Sybase SQL Anywhere it is for another product called MSDE or (Microsoft SQL Server).

FROM:dteal DATE:10/25/2001 15:04:58

Now that I know to look for MS SQL:

Solution – It appears that the Win2000 pc I use for testing was upgraded from a NT 4.0. Somewhere along the line Microsoft installed MS SQL 7. I was on the pc but not being used. When I installed Sybase SQL 7.03, Bill Gates in his infinite wisdom thought we should be automatically using his software so MS SQL got in the way so we wouldn't forget about him. Anyway, we changed MS SQL in the services from automatic to manual and removed it from the startup. I no longer have any problems. Keep in mind, this only happened on my win2000 pc and not my NT pc.

### Description

FROM:dteal DATE:10/10/2001 08:32:26

It has become apparent that we need more options in the GUI to define the pedestrian rail correctly. The concrete base is the problem. We can define it's width but not it's height. The load can be handled just fine under "Railing Load". What the users are asking for is to get the GUI to represent the correct image for the rail base height.

**Description**

FROM:bgoodrich DATE:10/15/2001 10:18:44

Make the number of digits past decimal the same in the Flexure Analysis Summary and Shear Analysis Summary reports. The Resistance and LL columns have 3 while DL column has 2. I didn't see any problems with the other reports.

FROM:kkennelly DATE:10/16/01 1:16:25 PM

The report tool uses the edit mask stored in the data dictionary to display these values. I'm hesitant to change the edit mask in the data dictionary cause there may be other places in the results where we need more digits displayed.

FROM:kkennelly DATE:10/22/2001 1:45:35 PM

Suspended since the report has appeared this way since 4.0 and no one else has requested a change.

### Description

FROM:dteal DATE:10/16/2001 16:27:48  
Release 4.0.4

Entering data for a steel structure in the Wizard. In the second GUI we are required to declare whether the structure is Composite Throughout or Partial Composite in the positive moment regions. How do you enter "Non-Composite" throughout. It is my understanding that BRASS will never analyze a non-composite structure because the required card will never get changed from a 4 (composite) to a 3 (non-composite). Here in Kansas, all our steel structures built prior to 1980 are non-composite. Is the Partial Composite option assuming that we have flange embedment over the piers? Kansas does not/has not ever done that.

FROM:kkennelly DATE:10/19/2001 8:28:09 AM

We didn't put a non-composite option in the Wizard since the Wizard was originally intended for new LRFD design and a decision was made that new designs are typically not non-composite. The partial composite assumes that shear connectors and an effective deck flange width > 0" are only present in the positive moment regions, it does not make any assumptions regarding the flange embedment. About your BRASS question, are talking about LFD or LRFD? In BRASS LFD you can run a non-composite structure by not including an XSECT-C command to describe the structural deck for the cross sections. I'm not sure about the the 4 and 3 on the Steel-Girder-Control card. In BRASS LRFD

4/19/2016 3:16:06 PM

HRS AASHTO

1072

**Complete Issue Information**

you can run a non-composite section by not including a Composite-Slab command. You can achieve both of these in Virtis/Opis by not entering data for the structural slab thickness or effective flange width for the slab.

**Description**

FROM:dkoenig DATE:10/17/2001 11:25:21

I would like to know if incident 3211 has been looked into. This refers to the use of the "existing and current" check boxes. There are problems that exist as explained in incident 3211.

In addition, I was wondering about the intent of the current check box. The help explains that the current alternative will be chosen for non-batch analysis situations. I am wondering how this relates to say the bridge alternative. If a bridge is selected at the the bridge level and analyzed, what should occur if one bridge alternative is selected as existing and one is selcted as current. Should the current be selected since only one bridge alternative will be ran, or will the existing be ran since multiple members exist on the structure. I

4/19/2016 3:16:06 PM

### Description

FROM:tthompson DATE:10/18/2001 15:09:24

When I rate a bridge (or group of bridges) on the desktop and then view the bridge rating results, the window Bridge Rating Results is empty. It doesn't list the structure or anything but the headings. The rating results are stored in the database, and can be viewed if you open up the structure, but you can't see the bridge rating results from the desktop.

This is only happening on my new laptop machine. The database is a copy from our server and all the settings are the same as near as I can tell. LF analysis was the option taken.

Pentium III, 1.x MHZ 256 MB Ram, Windows 2000 Professional, Sysbase SQL Anywhere 7.0.3.2046  
I also have Pontis 4.0 installed on this laptop.

I've noticed no other "oddities" to date. Not sure if this is a Win2000 problem or a Sybase 7.x problem or ?????

FROM:mordoobadi DATE:11/2/2001 10:04:12 AM  
Todd, please verify that it works OK in the latest beta release.

FROM:mordoobadi DATE:2/21/2006 3:05:12 PM  
I haven't heard from Todd regarding this incident for 4.5 years. I close this incident.

## Description

FROM:gcolgrove DATE:10/19/2001 09:06:15

I cannot gain access to the check In/Out feature of V/O. We would like to assign projects to squads, but I cannot gain access to any dialog that will allow for that. All Check In/Out menu commands are greyed out. I have all rights assigned to the Admin. user for check IN/OUT capabilities. I have checked in as the admin roll. Am I missing something?

Using V/O 4.04, and Oracle 8.0.5, ODBC Driver 3.0, ODBC 3.51  
Database version 4.0.2.3003

FROM:mordoobadi DATE:10/19/2001 2:18:53 PM

You need to run the BridgeWareAdmin.exe utility program to enable check-in/out. You can find a copy of BridgeWareAdmin.exe file on your Virtis/Opis Installation CD. It is located in "BRIDGEWare Database" folder. With Virtis/Opis Service pack 3 we provided an update for the utility program. In order to get the latest version of the utility program. download service pack 3. Then extract the contents of the downloaded file to a temporary folder. Find a file named BridgeWareAdmin.exe. Copy the file into your Virtis/Opis installation folder.

Run the BridgeWareAdmin.exe program by double-clicking on it in the windows explorer. Login as the owner of database tables. Check the checkbox "Enable check-in/check-out". Hit OK.

### Description

FROM:dkoenig DATE:10/26/2001 14:24:04

Incident 2943 covers the issue of deleting extra materials from bridges. For bridges made after 4.0 was released and installed, the issue is resolved. For bridges created prior to this, the extra materials can still not be deleted. I wrote this incident to inform people in case this was not understood. As far as we (MoDOT) are concerned. All of these bridges will be deleted and re-entered at a later date. I was wanting to give people a heads up in case this would affect their situations. I do not know what priority this would take to resolve this issue, or if it can be resolved.

I attached a bbd file of an older bridge that has an extra concrete material defined, but no references are made to the B1 material.

FROM:jduray DATE:10/30/01 11:17:52 AM

You should open each of the slab cross section windows and click ok. Then save the bws. This should clear the problem. If you have a lot of these we could probably write a script of a little program to correct this.

Let me know.

FROM:dkoenig DATE:10/31/2001 09:11:16

I applied the appropriate material windows (Structure Typical Section, Default Materials, and Deck Profile) and saved the bridge. The deleting problem still occurred. These older bridges are all steel bridges.

FROM:jihnat DATE:11/6/2001 1:51:24 PM

This problem has been traced to setting all Default Materials when a new Member Alternative is created. And because any specific type of Member Alternative does not show all of the Default Materials, this problem is not fixable through the GUI.

I've changed the code (in Version 4.1 Beta Build 3) to only set the appropriate Default Materials for each type of Member Alternative. This will prevent the problem when new Member Alternatives are created.

Mehrdad is going to fix the problem for existing bridges in the migration scripts.

FROM:mordoobadi DATE:11/6/2001 3:03:17 PM

Migration Scripts need to be updated with the SQL scripts I have already created for this purpose. (FixDefaultMaterials.SQL in source safe)

problem. Could you help me out? What really stinks is that it's the end of the day and he can't save his bridge and has to log off losing his afternoons work.

We are able to analyze each member without any errors – but unable to save.

File attached.

### Error Message:

Unable to save Bridge data!  
Line 768 in source file  
D:\virtis\gui\abgbrdg\uibwsdoc.cpp

Saving New and Modified objects failed while processing  
Cdmstructdefrefline (saveorder object 96)  
Line 355 in source file d:\virtis\datamanagement\abmbche\dmbridgecache.cpp

Unable to edit and update recordset  
Line 848 in source file

No rows were affected by the update or delete operation

I exported the file, and tried to import it – got the following error message.

The last object successfully processed was cdmwelddef  
23 of 80 objects successfully processed before the error  
Unknown exception occurred while importing data!

One very important lesson here – An error message should be encrypted – the user should be able to read it and get some direction from it as to what's wrong.

FROM:mordoobadi DATE:11/1/2001 10:50:44 AM  
Unable to save bridge, not the results.

FROM:mordoobadi DATE:11/1/2001 2:23:21 PM  
Import problem:  
The problem is in the ImportData() function of CDmStIComponent object.  
De objects are imported from the BBD file one by one. In case we have a deleted object, when we start processing the next object, we reuse the old De object (that we created for the deleted object) without checking to see if subtypes match. This causes an Exception.

Fixed the CDmStIComponent object. Code Generation Template needs to be fixed. Also all top level sub-type Dm objects need to be regenerated.

After I fixed the Dm I was able to import and save the bridge.

It's impossible to figure out what went wrong when you were trying to save, giving the fact that the bbd file saves OK. (after the fix)

Here is the list of things to do:

4/19/2016 3:16:07 PM

## Description

FROM:dteal DATE:11/01/2001 10:37:59

This goes back to earlier versions also.

I am installing 4.1 beta 2. I used the control panel remove program option. Then went to the program files directory and removed any directories related to virtis. Then I ran a program called "Regclean" and then restarted my pc. At this time all things related to virtis should be gone. When I run the beta 2 install I get a message stating that I have an earlier version of virtis on this pc and I should remove it first.

FROM:dteal DATE:Monday, February 26, 2007 11:51:25 AM

Still getting this message - grrrrrrrr

FROM:jihnat DATE:5/24/2007 7:38:35 AM

This is addressed in 5.6.0 release.

FROM:xli DATE:6/15/2007 9:01:35 AM

Tested resolved with 5.6 Beta3.

FROM:dteal DATE:Wednesday, June 20, 2007 9:38:55 AM

Still returns the message that it shouldn't:

I uninstalled

Virtis Opus 5.6 beta 2

Virtis Opus 5.5 production release version

Ran a Regscrubber to clean up the registry

Ran Disk Keeper to defrag my local drive

Then I ran the exe to install 5.6 Beta 3

I still get the message about previous versions of this software has been detected --- ect.

I do have a version of Opus Sub installed , would that make a difference, I wouldn't think so??

FROM:jihnat DATE:6/20/2007 9:55:45 AM

Yes, having OpusSub installed will trigger this message.

Virtis, Opus and Opus Sub use many of the same DLLs, which is one of the reasons this message was originally implemented.

## Complete Issue Information

We need a process to import a .bbd file that was created by a non-agency entity (consultant) that is using an older version of VirtisOpis than the we (State) are using. As things are now we both have to be using the same version, I think?

Is there a migration script to update a .bbd file?

For beta testing purposes, I would like to import several bridges that I have in our oracle production database and run them against the current beta version to validate results. Is there any way I can do this?

FROM:jduray DATE:11/7/01 9:19:07 AM

The import/export is not designed or intended to work between versions and it is not reasonable to modify it to do so. If this is a requirement then it will have to be done differently. We implemented it during the initial development for a very specific purpose and then adapted it for import/export.

You must migrate the db to the proper version and then use the import/export.

FROM:dteal DATE:11/07/2001 11:53:22

When receiving a bbd file from a consultant - we have no control over his version, I don't think? We also don't have his database, all we will get is the file for us to import. Without the database to migrate - are you saying that we are hosed?

FROM:jduray DATE:4/1/02 1:47:09 PM

We have as an enhancement for release next winter (Feb 2003) a task to improve the export/import so we can handle different versions.

A reasonable workaround until then is to coordinate databases.

I think you should tell the consultant what version you want from them and let them do the conversion. It's not a big deal to do once you know how and are setup to do it.

For example:

You tell the consultant you want version 4.1.1 and consultant has been working on 4.0.4...

The consultant applies the migration scripts to their db to migrate to 4.1.0 and then to 4.1.1 (including running the utilities that come with 4.1.1).

The consultant exports the bridges and sends them to you.

You import them as you normally would.

NY DOT tells their consultants which version to use. I think MA and LA are too.

FROM:dteal DATE:Monday, February 26, 2007 11:49:58 AM

### Description

FROM:gchristian DATE:11/7/01 8:41:10 AM

I ran a steel girder bridge the analysis results do not include the weight of the concrete deck haunch. The graphic schematic shows the haunch as correctly input. Brian McCaffrey thinks that this was reported by someone previously but could not readily find it on the incident report log. The haunch in my example was input with the GUI as imbedded flange, exterior girder, haunch measured top of web and c.l. of girder.

FROM:kkennelly DATE:11/7/2001 9:03:10 AM

Can you attach the bbd file for the bridge with this problem to this incident? I will try to reproduce the

4/19/2016 3:16:08 PM

| 3522.11828 | Resolved      | P/S beam material in 4.04 |

### Description

FROM:bgoodrich DATE:11/12/2001 12:29:11

The more I use the BWS Report Tool window, the more I think it should be restructured like a Windows Explorer, i.e., a folder tree on the left and the list of attributes on the right. I find it cumbersome to scroll up or down through several attribute names just to get to another folder. If the user turns on attributes within a folder, the folder could be yellow. If none have been turned on, the folder could be red.

FROM:jduray DATE:11/21/2001 08:13:24

This sounds like a major change. Since it doesn't involve the report definition we can address in a future release if necessary. I suspect the users will have other suggestions for improving the tool. We should wait for the users to use the tool and submit comments.

**Description**

FROM:bmccaffrey DATE:11/19/2001 09:08:39

See attached .bbd file: If not attached I'll send it to Jim Duray.

When a concrete material is assigned and selected in the 'beam details' window it is not saved. Check beam # 7 and try to enter PS 45 MPA as the concrete material.

FROM:kkennelly DATE:11/19/2001 1:54:42 PM

The following workaround will fix your problem. Open the Concrete material window for your "PS 45 MPA" concrete. The name "PS 45 MPA" that shows up in this window has a blank space at the end of the name "PS 45 MPA ". Backspace to remove the extra space at the end of the name, click OK to save. Now when you go to the Beam Details you will be able to save the PS 45 MPA as the girder material. I'm marking this as resolved to let you know the workaround is available and you can keep working. Then I'll reopen this incident to figure out if we can find a better resolution.

## Description

FROM:tthompson DATE:11/20/2001 15:21:35

VirtisOpis 4.0.4

For all users except Administrators and Managers, the Find Feature opens up but all is greyed out. This wasn't the case before, but once we went to 4.0.4 this phenomena started. Is there a privilege or something that I can't find that needs revising or is this a bug?

To the best of my memory, I have left all the priviliges set as originally sent out. I have only added users to the different groups.

FROM:jduray DATE:11/21/2001 08:08:12

FROM:mordoobadi DATE:12/3/2001 9:12:07 AM  
It seems like it happens only when the folder is a private folder.

FROM:mordoobadi DATE:12/3/2001 10:20:37 AM  
Fixed.

**Description**

FROM:kkennelly DATE:12/3/2001 10:58:16 AM  
Entered on behalf of Stephen Punkay via email:

Jim,

I'm sorry to be forwarding my questions directly to you; however, I have been kicked out of the Visual Intercept website when reporting incidences the past three or four times.

I have attached a \*.bbd file containing a prestressed girder system modeled in metric. The first (21 m) span is a Type III girder. Its inventory rating is 1.539, and its (phi)\*(Mn) is believable at 3954 ft-kips. The second and third spans are Type IV girders. Their inventory ratings were reported as 110.000 and 0.000, in the analysis results window and Brass output, respectively. The Brass output reports the (phi)\*(Mn) for the third

1094

## Complete Issue Information

span as 0.197349 E+10. This value seems quite high.

What baffles me is that the first span appears to run fine, but the second and third blow up. I copied the first and modified the copy to create the second and third. I even tried changing the girder to a Type III thinking that the problem was the Type IV girder modeled.

Jim, have you encountered or heard of any similar problems modeling a Type IV girder in metric? Or any problems in general with the conversion from metric to english?

Please have someone review and run the attached \*.bbd file to see if there is a glaring error that I haven't observed.

Thank you for your help!  
Stephen Punkay

FROM:kkennelly DATE:12/3/2001 11:10:54 AM  
Stephen,

I looked at structure definition "26.25 m Type IV" member G2. The Deck Concrete window has a Standard Effective Flange Width of 2 mm. If you make that a larger width, BRASS will give you more reasonable results. Structure Definition 31.5 m Type IV also has the same issue. Did you intend to enter 2 mm as the width or is that an input error?

Brian,  
Running the attached structure definition "26.25 m Type IV" member G2 with a Std Eff Flange Width of 2 mm gives some funny output in the BRASS LFD file. The controlling limit state is listed as "PRESTRESS GIRDER( AMR2 ! )" in the output file. In the Virtis Analysis Results window, the controlling limit state shows up as "".

FROM:kkennelly DATE:12/5/2001 11:50:04 AM  
Email received from user 12/3/01 4:51pm:

Krishna,

Thank you for pointing out the obvious! I had intended to enter a Standard Effective Flange Width of 2.0 m, not 2.0 mm. Adjusting the Standard Effective Flange Width to 2000.0 mm, resulted in a believable rating. The issue has been resolved.

Thanks again for your prompt assistance.  
Stephen

**Description**

FROM:jihnmat DATE:12/6/2001 8:21:44 AM

Received from Brian:

On the Bottom Cover Plate tab of the Deterioration Profile window, the Cross Section column allows the selection of all cross sections instead of only those utilized in the Cross Section Ranges window. The user should not be able to specify deterioration for a section that does not exist along the span. Additionally, the list of cross sections should exclude any cross sections that do not contain the applicable cover plate. The behavior of the Top Cover Plate tab is the same.

FROM:jduray DATE:4/12/2005 1:24:22 PM

fixed based on testing with superstructure tag. Apply button calls validation that prevents you from applying deterioration to cover plate over range where cover plate doesn't exist.

### Description

FROM:kkennelly DATE:12/18/2001 11:27:54 AM

Changes should be made so the following will work:

Do a routing, save vehicles and results. Open Virtis later, do a routing with the same vehicles. The vehicles are already saved to the library so when the Analysis Event for the routing checks if the routing vehicles are new vehicles before saving the routing results, the library should be searched looking for the vehicle. (the search should occur when the user wants to save results, not when the routing is opened.)

If a vehicle with the same name is already in the library, a check should be made if the library vehicle has the same axles, lane, etc. loading as the routing vehicle. If an exact match is found, then the library vehicle id should be used when the routing results are saved.

If the names match but the axles, etc. don't, the name of the routing vehicle should be changed by adding some suffix to it and then the vehicle with the new name is saved and so are the results. Gui should query the domain to tell the user that the vehicle name was changed when the results were saved to the db.

FROM:jduray DATE:1/4/02 1:10:41 PM

Charge to MnDOT task.

FROM:kkennelly DATE:1/7/2002 9:52:28 AM

I don't think I'm the person to change this code, I don't understand what DoAnalysisEvent is doing when it checks to see if any current results are from a new vehicle. I think maybe Mehrdad should change this code.

FROM:jduray DATE:1/29/02 12:55:13 PM

FROM:mordoobadi DATE:2/4/2002 3:05:32 PM

Krishna, I added a function to the IDoAnalysisEvent. The function is called FindSimilarVehicle. The function returns an LPDISPATCH of a vehicle and it takes an LPDISPATCH of a vehicle as argument.

The function finds a vehicle that exists in memory (it could be a new or an existing vehicle) and has the same properties as the vehicle passed as argument.

Here is how you can use it in the routing interface.

- (1) Create the new vehicle using CreateInstance, Do NOT use IDoAnalysisEventPtr::CreateNewVehicle.
- (2) Call FindSimilarVehicle and Pass an LPDISPATCH of the Vehicle you created in previous step.
- (3) If FindSimilarVehicle returns a vehicle (NOT NULL) use that vehicle.
- (4) If FindSimilarVehicle returns NULL, Call IDoAnalysisEventPtr::CreateNewVehicle and then the IDoLibVehiclePtr::Copy to copy vehicle properties and use that new vehicle.

When you name the vehicle you have to make sure that the name is not already in use.

### Description

FROM:gbarnhill DATE:12/20/2001 14:03:23

I created a composite steel structure by setting a COMPOSITE range in the deck profile SHEAR CONNECTOR tab. When the structure is exported to BRASS and analyzed LFD the unbraced length of the top flange at various points is defined by the cross frame location data. I would like BRASS-GIRDER to consider the top flange laterally supported (i.e., Lb=0) over those regions we specified as composite.

I've attached a bbd from V410 Rel Candidate 1.

DISCUSSION PROVIDED BY BRIAN AND DAN GLANDT:

BRASS-GIRDER does not automatically consider the top flange laterally supported when the structure is composite. Therefore, the export must be modified to generate the necessary commands to make this happen. I would need to superimpose the shear connector and lateral support schedules and generate the LAT-SUPPORT-SCHEDULE commands. Dan said that once he added these commands, the unbraced lengths were correct.

FROM:gbarnhill DATE:12/20/2001 14:30:35

ADDITIONAL INFO - Since I exported the file, I went back and added a range of LATERAL SUPPORT. The results are now what I expect for an LFD rating.

The HELP for the SHEAR CONNECTOR tab indicates that composite action can be defined by the COMPOSITE connector ID. My assumption is therefore that I have defined lateral support. If that's what we intend, then the export needs to check that data to create the LATERAL SUPPORT command for BRASS.

If we intend to use the LATERAL SUPPORT dialog to be the only place to define that data, then the HELP needs to be modified and the BARS import process will need to be adjusted.

FROM:jduray DATE:1/4/02 1:09:08 PM

Krishna - please investigate.

FROM:kkennelly DATE:1/4/2002 1:49:40 PM

I don't think we should change the export to consider the top flange laterally supported when the user enters a composite range in Virtis. Some users may not want shear connectors and composite regions to dictate lateral support conditions. (I think we would have heard other comments by now if users wanted this.)

The Help for Virtis does not imply that entering Shear Connectors and composite regions has any affect on what regions are laterally supported. I can add a sentence that explicitly says composite regions do NOT indicate laterally support regions if you want.

The BARS import is currently creating the laterally supported regions from the data on Card16 which is the Lateral Support card for BARS so I don't think the import needs adjusted. Gale, do you have lateral support ranges created by the BARS import for a bridge where Card16 does not say the top flange is laterally supported?

**Complete Issue Information**

FROM:gbarnhill DATE:01/04/2002 17:53:19  
BARS data which is only ASD coded relies on CT14 for composite action definition. CT16 does define LFD support ranges.  
I think it would help make it clear that for an input bridge, lateral support is not defined by composite ranges and that the lateral support ranges must be used for that definition.  
Is it true then that the composite definition for the slab is only to define where composite section properties are to be used ???

FROM:kkennelly DATE:1/7/2002 8:10:57 AM  
Yes, defining composite regions of the slab only defines where composite section properties are to be used. (BRASS LFD also uses the Points of Contraflexure in conjunction with the shear connectors tab to determine if composite section properties should be used.) I added the following to the Help to clarify composite regions on the Shear Connector tab do not imply the regions are also laterally supported:

The shear connector data entered on this tab does not imply that the top flange is laterally supported. For a girder system, the Lateral Support window must be used to define regions where the top flange is laterally supported. For a girder line, the Bracing Ranges: Lateral Support tab must be used to define regions where the top flange is laterally supported.

FROM:gbarnhill DATE:01/07/2002 12:59:04  
OK with HELP additions.

FROM:gbarnhill DATE:Friday, March 29, 2002 12:38:43 PM

Help for DECK PROFILE:SHEAR CONNECTORS is OK.

Don't we need the same statement in CROSS SECTION RANGES:SHEAR CONNECTORS ???

FROM:kkennelly DATE:4/1/2002 9:56:08 AM  
Statement added to Cross Section Ranges: Shear Connectors help.

FROM:jduray DATE:4/4/02 2:49:24 PM  
Accepted by Gale (informed via email).

| 3551.11799 | Accepted      | Framing Plan Schematic error |

**Description**

FROM:kkennelly DATE:12/26/2001 10:05:28 AM

Request for PS Design Tool to use lever rule and actual  $Kg/12Lts^3$  value when computing LRFD distribution factors for user. Second part of email entered as separate incident.

Submitted on behalf of Jeff Smith via email 12/19/01:

Jim,

I haven't had much time to work with the latest beta version, Release Candidate 1, but I did have a chance to look at Incident 3329. This is an incident I had sent in to Krisha. It appears that this particular incident can be considered as accepted. However, I have some concerns about the prestress design tool underestimating the number of strands, particularly when either the lever rule or rigid body give a significantly higher distributiou factor compared to the formulas and using a value of 1 for  $Kg/12Lts^3$ .

&lt;&lt;Incident 3551&gt;&gt;

I also encountered an interesting schematic while entering a 120 ft simple span with 4 Type VI girders at 9.5 ft spacing with a 4.75 ft overhang. Attached is a screen shot of the resulting framing plan. This

Since 4.1 is ready for release this fix will be in the first service pack for 4.1.

Notes for programmer:  
I am able to reproduce this. Seems to happen when ever span length ranges from 120' to 124'. In SchematicFrmPlnView.cpp, InitSupportLines() calls CSchematicGeometry::Distance() to get the end offset of the last support line. Distance() subtracts pt2.x - pt1.x which is 120-120 and should be = 0 but the result contains some garbage values way out at the end so it is 1.4e-14. PositionPhysicalObjects() then checks dpt2a.y < dpt2b.y which gives a true since dpt2b.y contains 1.4e-14 instead of zero. This forces the y value of the end of girder to be positive instead of the negative it should be. Code changed to use SysComparisonFunctions::IsLessThan() which uses some tolerances so 1.4e-14 set to zero, schematic drawn ok.  
Code needs checked into SourceSafe.

FROM:kkennelly DATE:1/4/2002 1:29:07 PM  
Code has been checked into SourceSafe for Version 4.2 and Version 4.1 Service Pack 1.

## Complete Issue Information

Fixed.

FROM:mordoobadi DATE:12/11/2002 9:30:56 AM

Krisha, could you update the help for this.

The following has changed.

In configuration browser, User window, a check-box is added that indicates whether the user is active or not.

If a user is marked inactive the tree shows the user icon as greyed out.

If a user is marked inactive he/she would not be able to login.

**Description**

FROM:jduray DATE:3/26/02 11:52:18 AM

Joe - Add a warning to the beginning of the installation to inform the user that database scripts are required and give them the option to abort before installing anything.

Are we going to use the html version of the readme.

Several incidents in the readme need a brief description.

The readme should refer the user to the brass release notes.

The instructions for the utilities should be pdf instead of doc.

The utilities display the TM trademark symbol. They should not display this symbol since they are not trademarked.

When the utility is finished the Start button should be disabled.

The AddShearConnRanges utility shows the edit control without explanation of what it is for. I think we should remove it from the release build or provide a command line parameter to enable it so we can use it during testing.

### Description

FROM:gfrantz DATE:01/07/2002 13:20:59

This is probably not an "incident" or problem with the program, but just some questions about the program.

1. We have the academic version of Opis and Virtis.  
The Program Limitations say the academic version is limited to  
-maximum number of spans = 3  
-maximum number of girders per structure = 10.

A bridge has 2 spans, and the superstructure consists of 6 girders in each span. What is the number of girders for this structure? Is it 6 or 12? Will the academic version handle this bridge?

2. A suggestion: It might be helpful if the Tutorials had a Date listed with each Tutorial so it is easier for

4/19/2016 3:16:14 PM

HRS AASHTO

1116

**Complete Issue Information**

the User to see if the "new" or "updated" tutorial is a more recent update that what he may already have downloaded.

FROM:jduray DATE:1/8/02 9:11:40 AM

Your example has 6 girders and the academic version should handle it.

Note to the developer:

Joe - Do the second suggestion on our web page.

FROM:jihnna DATE:3/13/2002 1:19:53 PM

Web page has been updated and the updated tutorials are available.

### Description

FROM:jduray DATE:1/8/02 9:22:57 AM

Submitted for Gale Barnhill

Performing a rating from the Bridge Explorer in a migrated db (from 4.0) produces rating results that are very slow to update even though the results are only in memory. Doing the same rating using a 4.1.0 db updates results instantly. Gale used the 3rd PS example. He has given us his migrated db.

FROM:mordoobadi DATE:1/9/2002 9:32:02 AM

Gale's database contains 1666 bridges.

I tried bridge with (bridge\_id = 1721). It took 30 seconds after bridge explorer rating for the "Bridge Rating Results" to show up.

I imported the same bridge into another database that contains a significantly smaller number of bridges (12). The "Bridge Rating Results" window appeared instantly.

FROM:mordoobadi DATE:1/9/2002 2:21:07 PM

Resolved.

FROM:mordoobadi DATE:1/9/2002 2:25:36 PM

Affected DLL abgdtop.

FROM:gbarnhill DATE:Friday, March 29, 2002 1:37:28 PM

OK in 4.1.1 patch

## Description

FROM:dteal DATE:01/09/2002 15:00:10

I am entering a new bridge. (same for an existing) In the Bridge Description I want to enter text with a space between the words. Whenever I press the space bar it forces the cursor to the left and deletes like a backspace key. This is true for all fields (BridgeID, NBI, Name, Description, etc.)

My test pc is running release version 4.1.0 under Windows 2000. I had our IT people look to see if somebody had changed my key mapping – they reported no problems with the pc.

FROM:dteal DATE:01/09/2002 16:18:02

Hold the phone - I just discovered that MSWord does the same thing. I sure hope somebody isn't playing a joke! I'll get back to you.

| 3565.11785 | Closed        | Problem generating cross sections for parabolic varying webs |

**Description**

FROM:kkennelly DATE:1/10/2002 1:13:51 PM  
Submitted on behalf of Ken Teng, RQAW via email 1/10/02:

Attached bridge, member B3. Last diaphragm shows up on framing plan but not member alt profile schematic.

Appears to be a tolerance issue. The web shape has an end distance = 2027.999976 in the schematic (matches what user entered in the Girder Profile window). Schematic tries to put a cross frame at 2028 but it thinks the web ends at 2027.999976 so cross frame not drawn.

Maybe we should use the user entered tolerances in the schematic when it tries to figure out if object is on or off the beam.

FROM:jihnata DATE:7/12/2005 3:30:00 PM  
For future testing, I've attached a 5.3.1 version of the BBD file.  
Fixed for version 5.4.0 (added user entered tolerances)

FROM:jihnata DATE:7/13/2005 7:31:22 AM  
P.S.: In addition to the code change, I had to change the System Default inch tolerance from 0.00001 to 0.0001

**Complete Issue Information**

That code has been fixed in version 4.2 and 4.1 service pack 1.

But there is still a problem in the export. There is a girder flange change at 94.4167' in span 2 and a poc at 94.4467 in span 2. When the Span-Web-General command is created, it sees these two points are within a tolerance and skips over 94.4167'. But then the web depths of adjacent ranges aren't equal.

# 465 SPAN-WEB-GENERAL 2, 69.9891, 3, 94.4167, 73.4391  
# 465 SPAN-WEB-GENERAL 2, 73.4516, 3, 106.2500, 80.4174

FROM:bgoodrich DATE:01/16/2002 11:11:41

I modified the contraflexure percentage to 75.533333, so it coincides with a change point. Then, BRASS ran up to a point. The web depths for all spans appear to be incorrect. Spans 2 and 3 list negative values, which are not correct. Next, span 1 lists positive values, but I'm not sure they are correct because the web depth does not always increase from the left to the right. The web depth increases for a while, then decreases at a change point, and starts increasing again. This occurs at several change points, which almost looks like BRASS is generating a bunch of parabolas next to each other instead of one parabola that extends over several change points. I compared the span commands from the BRASS-GIRDER and BRASS-GIRDER(LRFD) data files and only see one difference. The BRASS export from Virtis adds a change point for the contraflexure locations, which are at:

Span 1: 78.000000%  
Span 2: 24.466667% and 75.533333%  
Span 3: 22.000000%

I have forwarded the web depth issue to Dan Glandt for further investigation.

FROM:bgoodrich DATE:02/01/2002 15:11:15

Dan Glandt has addressed this issue in BRASS-GIRDER 5.8.5, which should be available with the first patch for Virtis 4.1.

FROM:kkennelly DATE:4/8/2002 11:47:17 AM

Tested under SP1 and works ok.

<<

Run an ASD rating of a prestressed concrete bridge. Open View Analysis Results window in Virtis. Design method type shown is "LFD" instead of ASD.

>>

FROM:kkennelly DATE:1/14/2002 9:48:37 AM

I ran a steel mbr alt by ASD and the Results window shows ASD. I also ran this in 4.0.4 for a ps concrete beam and it used to say ASD in version 4.0.4. I looked at the DoMemberRatingSummaryPtr in UiMemberResultsReportVw::BuildRatingResultsSummaryGrid() and it is returning LFD as the design method type.

FROM:mordoobadi DATE:1/15/2002 8:50:08 AM

Brian, I think BRASS sets the design method type in the rating results summary object. Could you please take a look.

FROM:bgoodrich DATE:01/15/2002 12:36:17

There is no longer an ASD rating for prestress structures in the Manual for Condition Evaluation of Bridges. Note Section 6.6.2.5, which indicates to use Section 6.6.3. If the ASD rating method is specified in Virtis, the export will generate the BRASS data file with settings for performing an LFD rating. Additionally, BRASS was modified to perform LFD ratings only for prestress. I added a warning message to the export to indicate what the export has done.

### Description

FROM:mordoobadi DATE:1/17/2002 3:55:16 PM

If a bridge with a name longer than 24 characters is selected in the bridge explorer and then "Analysis Events Summary" window is opened

Symptoms: No results are reported in the window. "Unable to open recordset" along with "Data truncated" error when a bridge is opened later on.

Cause: The length specified for the "name" attribute in function CDbAbwVBridgeAnalysisEventsSet::DoFieldExchange(CFieldExchange\* pFX) is not correct (24).

Solution: It should be changed to 50 (see below). Also update the corresponding data dictionary item.  
RFX\_Text(pFX, \_T("name"), m\_sName, 50 );

FROM:mordoobadi DATE:1/17/2002 4:20:44 PM  
Code checked in 4.2 version.

Jim please let me know if you want this fixed in a 4.1 Service Pack. Note that this needs a database patch.

FROM:jduray DATE:1/22/02 1:49:03 PM

Yes, I think this needs to be fixed unless it has always been this way and no one has complained. If it has been this way then let's fix it for 4.2 or the next service pack that requires a db change.

### Description

FROM:kkennelly DATE:1/21/2002 3:17:51 PM  
Submitted on behalf of Richard Best, via email:

Hello Jim,  
I have been re-rating in Virtis 4.1 bridges of various types and comparing with the results we have recorded for version 4.0.4. As I already mentioned, we have a big problem with our composite steel models but I also discovered that every rating I tried on prestressed I-beams came up with numbers that were off by enough to warrant that they too be reconsidered. In looking through the New Features document I don't see any fixes mentioned that would account for our Prestress results changing. Also, I am now seeing a limit state for "Concrete Tension" on some of the prestressed results that used to be governed by "Ultimate Moment Capacity". Can you identify the changes in the program that might account for our number changing.

Richard M. Best, PE  
Computer Design Group Engineer

Illinois Department of Transportation

Springfield, Illinois 62764  
Phone:(217) 785-2922

FROM:kkennelly DATE:1/21/2002 3:19:51 PM  
Email sent back to Richard:  
Hi Richard,

Jim asked me to look into the problems you are having with your prestressed bridges. There were some significant changes made to the BRASS LFD program such as the allowable stress serviceability checks are now made for an LFD rating as per Section 6.6.3.3 of AASHTO Manual for Condition Evaluation of Bridges. Another change in BRASS LFD was how the shear capacity is computed near an interior support for simple span I beams made continuous for live load. Either of these changes may be affecting the results you are getting.

Can you export a couple of the bridges that are experiencing different rating factors and email their \*.bbd files to me so we can determine if the changes made to BRASS are causing your problem or if

4/19/2016 3:16:17 PM

HRS AASHTO

1132

**Complete Issue Information**

there is a problem in Virtis?

You can export a bridge by opening the Bridge Workspace in Virtis for that bridge and then selecting "File/Export" from the command menu. A dialog will open asking for a name for the file to be saved. You can then attach the \*.bbd file to an email to me.

Regards,  
Krisha Kennelly, PE  
Michael Baker Jr., Inc.  
Coraopolis, PA 15108

FROM:kkennelly DATE:1/21/2002 3:22:08 PM

I think the change from "Ultimate Moment Capacity" to "Concrete Tension" is based on BRASS LFD now doing the serviceability checks.

This incident is for the difference in PS Shear Capacity calcs in BRASS from Virtis version 4.0.4 and version 4.1.

In Virtis Version 4.0.4, BRASS LFD computed the shear capacity of PS beams near interior supports using the current AASHTO spec.

In Virtis Version 4.1, BRASS LFD computes the shear capacity of PS beams near interior supports using the 1979 or RC specs since the export generates a command to use the BRASS default.

Jim wants the export to set the PS Beam Shear command to use what was in previous versions of BRASS in Service Pack 1 for Version 4.1.

An enhancement will be added to let the user select what calculation option they want on the Engine tab.

FROM:bgoodrich DATE:02/01/2002 15:29:57

I updated the export to generate the PS-BEAM-SHEAR command with the Vci,Vcw method specified. Fixed for Service Pack 1 for Version 4.1. The engine properties will require an update for Version 4.2.

FROM:dteal DATE:Monday, April 08, 2002 9:56:19 AM

I can not find the Calculation option on the Engine Tab for LFD that this referred to.

FROM:jduray DATE:4/8/02 10:59:59 AM

Providing the use an option for selecting the method is an enhancement for a future release.

### Description

FROM:mordoobadi DATE:1/24/2002 8:42:04 AM

Paul Jenson reported a problem with the BridgeWareAdmin program. The program issues a warning that reads:

You are not owner of Virtis/Opis tables.  
You are not allowed to make any changes.

The latest Oracle ODBC driver that comes with Oracle9i and is also available for download on Oracle web site has caused this problem.

There is a piece of code that verifies that the user is the owner of Virtis/Opis database tables. It does not work (with the new ODBC driver) the way it used to work.

Paul uses Oracle 8.1.7 and he downloaded the latest ODBC driver from Oracle web-site.

One work-around is to use Microsoft ODBC driver for Oracle.

Is there something we need to change in the utility?

FROM:mordoobadi DATE:2/1/2002 10:09:48 AM  
I need to investigate this. Probably we need to use Oracle data dictionary tables rather than using the ODBC function SQLTables().

FROM:mordoobadi DATE:6/19/2002 5:02:25 PM  
With the latest versions of Oracle ODBC driver the SQLTables functions expects upper-case table name (ABW\_SYS\_DATABASE) and username.  
Fixed for 4.2 Acceptance Build.

FROM:kkennelly DATE:1/25/2002 11:37:42 AM  
This incident is closely related to 3574. That incident deals mostly with the new PS Beam Shear command in BRASS LFD. This incident is for structures whose PS shear ratings changed between Virtis versions but does not appear related to the PS BEAM SHEAR command. For these bridges, it looks like BRASS is using the same equations as 4.0.4 did but the results of those equations are different between 4.0.4 and 4.1. This incident is to verify that something internal was changed in

FROM:bgoodrich DATE:02/01/2002 15:15:08  
Dan Glandt found an error in BRASS-GIRDER 5.8.4. Dan corrected the problem in BRASS-GIRDER 5.8.5, which now agrees with 5.8.3 for the shear he is referencing. BRASS-GIRDER 5.8.5 should be available in the first patch for Virtis 4.1.

| 3580.11770 | Accepted      | LL Distribution Factor calcs for PS Adj box beams needs updated for AASHTO 1999 interim |

### Description

FROM:kkennelly DATE:2/4/2002 9:51:19 AM

The attached bbd file is for Virtis 4.1. This bridge is the RC4 Training Example for Virtis. 2 span rc slab parabollically haunched, BRASS gives error about cross section area = 0 in Span 2, Point 4.

FROM:bgoodrich DATE:02/04/2002 12:13:42

Dan Glandt and I already corrected this bug in the BRASS-GIRDER Version 5.8.5 engine, which should go out with Service Pack 1 for Virtis 4.1. I imported the BBD file and BRASS successfully analyzed the bridge. However, the critical rating factors were 99.0. Once I checked the option to ignore LFD shear on the member alternative window, the critical rating factors were determined as expected.

FROM:bgoodrich DATE:02/04/2002 12:24:50

I have submitted the rating factor issue as Incident 3581.

### Description

FROM:kkennelly DATE:2/6/2002 10:37:16 AM

Submitted on behalf of Robert Fulton via email and phone call:

Attached BBD file ran ok in 4.0.4 but Version 4.1.0 is giving zero ratings for shear calcs.

For member G2, I added a point of interest at Span 1 58', right since that is where the controlling rating of zero given. Examination of BRASS output at that point shows following for shear rating factor calculations:

$d = -129.952$  inches (This value certainly shouldn't be zero, and max depth of the t beam is 73.4375")

$V_u = -379.41$  kips

$V_{DL} = 38.28$  kips

$V_{LL} = 52.88$  kips

Difference in signs for  $V_u$  and actual  $V$  forces causes a negative rating factor so rating factor reported as zero.

The BRASS section properties printed at the beginning of the BRASS output show web depth jumping to negative values in Span 2 and Span 3 but the web depth reported for the support is shown as 67.19" so I don't know where the calculations are getting -129.952".

This may be related to incident 3579 but in that incident BRASS wouldn't even run so I'm not sure if the fix for that fixes this problem.

Also, Robert says when "Ignore LFD shear" is picked, the resulting moment rating factors given in Version 4.1.0 are less than those given by 4.0.4. Were there any changes made in BRASS that would cause different moment ratings between 4.1.0 and 4.0.4?

4/19/2016 3:16:19 PM

HRS AASHTO

1143

**Complete Issue Information**

FROM:bgoodrich DATE:02/11/2002 10:44:05

The issue with the incorrect web depths has already been addressed. The shear results appear to be addressed by this correction. I have forwarded this incident to Dan Glandt for further investigation and verification.

FROM:bgoodrich DATE:Wednesday, February 20, 2002 2:10:47 PM

There were no changes between 4.0.4 and 4.1.0 that would cause different moment ratings. Based on my tests with previous versions of BRASS, this issue appears to have been caused by the incorrect web depths computed by BRASS. Fixed in BRASS-GIRDER 5.8.5, which should be released with Virtis 4.1 Service Pack 1.

**Description**

FROM:dteal DATE:02/06/2002 11:17:50

On the attached .bbd file there is a PS span structure. Strand layout on the member alternative for any of the 3 spans in girder line 1 or 2 there is a problem. When I try to open the window for Span 1, the window border flashes on the screen and then disappears. I am unable to bring up a Strand Layout Window.

I exported this to a bbd and imported it hoping that the process would clean it up, no help. I copied the structure definition to a new bridge, no change. No error messages given – can you take a look at it.

Still running version 4.0.4 on Oracle.

FROM:bgoodrich DATE:02/06/2002 11:44:21

Dean - The beam shape you have assigned to your spans is missing its strand grid. Add the strand grid tab of the prestress shape. This has happened to me before. I checked version 4.1 also and there is still no warning to the user.

FROM:dteal DATE:02/06/2002 12:06:53

Yes - that was the problem, Thanks

This incident should then address the need for an error message when the strand grid has been left blank.

### Description

FROM:bgoodrich DATE:02/06/2002 12:58:43  
E-mail from Ed Lutgen (Asst. Rating Engineer, 651-747-2124):

Anyways I have a few questions regarding Virtis you might be able to answer. On a continuous steel bridge that was designed as a compact section what is the correct way of inputting that into Virtis? When we run it, Brass calculates a plastic moment capacity but says the user overrides that and uses the elastic properties. When we check the box that says it is compact at the piers under the engine properties, then brass correctly calculates the moment capacity using Mp. My question is if you check the box will it always use Mp even if the compact checks fail? If it doesn't then the box is counterintuitive. I would think you would always want to use Mp if you could. I think the standard configuration should always be to use Mp if allowed by code and have a box to check to allow only elastic properties. Another comment with the with this box is that it says compact at pier. Well my critical point was at the +M location and it appears that I need to check this.

Brian then replied with:

The compactness and moment capacity is a confusing issue with the BRASS-GIRDER engine. In earlier versions, the capacity was limited to the yield moment. AASHTO equations 10-129b and 10-129c were implemented only a few years ago. The "pier compactness" options were added so the user could specify if these equations were to be used for COMPOSITE sections. The BRASS engine requires the user to specify this information, i.e., there are no defaults. Within Virtis, we have attempted set defaults in a conservative manner, which is why the "pier compactness" options are NOT checked. When these boxes are checked, BRASS will use AASHTO equations 10-129b and 10-129c as appropriate for composite sections. From my initial testing, it appears that these equations will be used

**Complete Issue Information**

even when the section is non-compact. The programmer assigned to this BRASS engine is on vacation, so I will follow up with him when he gets back. The specification indicates that equations 10-129b and 10-129c are only applicable for "compact composite sections ... with compact noncomposite or composite negative-moment pier sections." These boxes should be used to indicate pier compactness only.

FROM:bgoodrich DATE:Thursday, March 07, 2002 11:06:32 AM  
E-mail from Dan Glandt (3/7/02):

We found an error in the logic that did allow the plastic moment capacity to be used even if the section did not meet the criteria for compactness. This has been corrected and will be in the next release.

The default can not be changed without significant modification to the program which has not been felt warranted. The main problem is that the compactness checks over the piers would have to be done first for the critical loading conditions in the positive moment region. The option the way it is at this time does allow the user to take advantage of the plastic moment capacity.

FROM:bgoodrich DATE:Thursday, March 07, 2002 11:07:16 AM  
Fixed in BRASS-GIRDER 5.8.5, which should be released with Virtis 4.1 Service Pack 1.

We want to enter our bridge Project Management System data directly into the Oracle database. We can save a lot of time entering this data in by hand. This information essentially populates the Bridge information found in the two initial screens of V-O. The fields are listed as follows. I think it is self explanatory, but if you need more info, please let me know. What I need to do is to get the fields I should attach these to in the Oracle database.

**Description**

FROM:dteal DATE:02/08/2002 11:28:19

When installing patches 1 – 4 for Version 4.0, the existing icon doesn't get overwritten. By the time I'm done installing 4.0, 4.0.1, 4.0.2, 4.0.3 and 4.0.4 I will have 4 icons on the desktop. This occurs when installing on Windows 2000. I have not checked it on NT.

FROM:jduray DATE:2/12/02 8:57:07 AM

I have notices the same behavior. Can we do anything about this? Can the upgrade remove the previous icons?

FROM:jihnata DATE:2/12/2002 9:17:37 AM

I've never seen this behavior. We're already doing a "Replace" of the desktop icons. I don't know what would cause this unless the previous icon had been manually altered.

HRS AASHTO

1149

## Complete Issue Information

I'll reexamine this when the next service pack is created.

FROM:jihnata DATE:3/11/2002 10:10:46 AM

Beginning with version 4.1.0, we're only showing "4.1" on the desktop icon (i.e. we don't write the patch level). So this won't be an issue with future service packs.

FROM:dteal DATE:Monday, April 01, 2002 8:25:39 AM

Bad Idea – How does one tell what version is on the PC????? The desktop now only displays 4.1, the properties only states 4.1, nothing in the directory gives me the true version, an relying on the date is not a good idea. We fixed the icon problem – what at what expense. Now the administrator will have to launch the program and do a “help – about” to find the version. I haven't checked to see if that works?

FROM:jihnata DATE:4/1/2002 9:22:28 AM

You don't even need to login; you only have to launch the app and look at the splash screen. (Help/About will work also, though.) How often does a user absolutely need this information anyway? Of the 28 icons currently on my desktop, only one (Adobe Acrobat) displays any version info at all, let alone the patch level.

FROM:dteal DATE:Wednesday, April 03, 2002 10:19:01 AM

From an administrator standpoint, when I have go trouble shoot at a user desk. The first thing I would look for is, are you use the current version? One glance at the icon would tell me. Now I will have to launch the program and wait for the splash screen. We just took one step backwards.

FROM:jduray DATE:4/9/02 10:36:19 AM

I suggest you just look at the file properties for the virtis.exe using Windows Explorer.

FROM:dteal DATE:Tuesday, April 09, 2002 12:30:05 PM

So now we have to open the explorer, properties and version tab. Now we have many steps to find out the same thing that used to be right on the desk top. I realize that not all icons display the version number, but not all programs are updating version with service packs 4 times a year.

## Description

FROM:dteal DATE:02/08/2002 12:54:06

An error is created and the Report Tool will not generate a report, only a crypted error message when the "&" sign is used in the Structure Definition name.

Example:

US-36 over Big Blue River & UPRR

This will generate the following error:

The XML page cannot be displayed Cannot view XML input using XSL style sheet. Please correct the error and then click the Refresh button, or try again later.

Whitespace is not allowed at this location. Error processing resource 'file:///C:/Program Files/AASHTO BridgeWare/VirtisOpis40/Reports/LRFDRpt.XML'. Line 18, Position 36

```
<STRUC_DEF_NAME>US-36 over River & Railroad</STRUC_DEF_NAME>  
-----^
```

If I remove the "&" sign the report will be generated and display like below:

Structure Definition Name: US-36 over River and Railroad

The HELP file doesn't reference any special characters we can not use. It should. So the help for Structure Definition Name should state that "No ampersand's are allowed.

FROM:jduray DATE:4/12/2005 1:39:13 PM

Krisha,

I have another question regarding the 3 span, prestressed concrete bridge

4/19/2016 3:16:20 PM

HRS AASHTO

1152

## Complete Issue Information

A user has sent me the attached bridge and is questioning the differences in the initial stresses at transfer between the Prestress Design Tool and the BRASS LRFD output. These stresses should be very similar since initial stresses at transfer are due to the simple span beam which is the same in the Design Tool and BRASS.

User is looking at Girder G1. (I had to delete his haunch for some reason to get BRASS to run). When I run BRASS LRFD for G1 and look at the axial forces in the beam due to the initial prestress loads, the pattern of loads looks unusual. The axial force is positive at the beam end and not a very large negative value in between the beam ends. I think this axial force is behind the difference in the stresses.

I used the prestress design tool in Opis and looked at the Transfer Point in Span 1, 8.4 m which corresponds to poi 104.0 in BRASS output.

At this point, at release the Design Tool has a stress at the top of beam = 0.942 MPa. The corresponding stress output by BRASS is 7.63 MPa.

I compared the initial losses computed by the Design Tool with the initial losses presented by BRASS and they match very closely. Design Tool  $F_{pes} = 98.7$  MPa and  $F_{pr1} = 12.4$  for a total initial loss of 111.1 MPa = 7.97%. The BRASS output has  $F_{pes} = 99.89$  MPa and 8.82 MPa for a total initial loss of 108.7 MPa so I think they agree.

I attached the BRASS output at point 104 for the initial stress calcs. The numbers agree with the Design Tool except for the axial force in the beam. The jacking force is 2790 kN in both Design Tool and BRASS. The axial force the Design Tool uses in the calc for the stress is -2567.6 kN (=  $2790(100-7.97)/100$ ). BRASS uses -109.17 kN for the axial force in the calc and that causes the difference in the stresses.

Design Tool stress =  $-2567.6\text{kN}/0.3668\text{ m}^2 - ((-2567.6\text{kN})(0.487\text{m}) + 443.3\text{ kNm})/0.1017\text{ m}^3$ .

BRASS stress =  $-109.17\text{kN}/0.3668\text{ m}^2 - (-806.49\text{kNm})/(-0.1017\text{ m}^3)$

Can you please take a look at this bridge and let me know how the -109.71 kN is computed by BRASS?

Thanks,  
Krisha

FROM: bgoodrich DATE: 02/11/2002 10:31:17

I have successfully duplicated the issue and am working on a solution. This issue was addressed and tested at one time for the 1.5.0 release as is documented in the associated release notes. However, subsequent code modifications must have affected the results.

FROM: bgoodrich DATE: Thursday, February 28, 2002 1:41:49 PM

I have corrected this issue in the BRASS-GIRDER(LRFD) 1.5.1 engine, which will be released with Opis 4.1 Service Pack 1.

### Description

FROM:dteal DATE:02/11/2002 14:33:30

Submitted for Mike Ingalls:

In the attached bbd file we have a PS bridge. At POI 206.00 BRASS computed a negative number for the stress in the strand. Therefore BRASS set the strand stress to zero. I believe the strand stress should be a large positive number (due to jacking minus losses) summed with a small negative number (due to the negative flexure), netting a large positive number and not a negative number that results in zero.

FROM:bgoodrich DATE:02/13/2002 13:33:02

I tested the BRASS file with BRASS-GIRDER(LRFD) 1.5.0, which was released with Opis 4.1. The BRASS concrete flexural resistance tool is unable to determine the correct neutral axis, which yields incorrect values for fps, Mr, etc. The neutral axis cannot be found for negative flexure due to the configuration of the prestress and the amount of rebar located in the slab. BRASS considers all rows

4/19/2016 3:16:21 PM

HRS AASHTO

1155

**Complete Issue Information**

of rebar and prestress in determining the flexural resistance. In the new version of BRASS, I have added warnings and made sure the flexural resistance is set to zero when the neutral axis cannot be found.

Dean and Mike: Are you able to determine a flexural resistance for negative flexure at the 206 point? What procedures, assumptions, etc. did you make if performing this computation by hand?

FROM:bgoodrich DATE:Friday, February 22, 2002 5:56:46 PM  
Incident 3615 pertains to this same issue and was marked as a duplicate.

FROM:dteal DATE:Tuesday, February 26, 2002 8:23:40 AM  
See attached hand calcs. These calcs are simplified. Only one row of deck steel, etc...

Also...for the beta 1 factor...since these calcs are for an odd shaped compression flange, I found the \*area\* of concrete needed to satisfy equilibrium. The beta 1 factor applies more to a rectangular beam...i.e

$$c*(beta1) = a$$

However, since I used an \*area\* required of the concrete to find the N.A. location, I do not think the (beta1) factor applies directly. I essentially found the "a", but dividing "a" by (beta1) would extend the elastic N.A. too far up the web...so I left it alone. This is something the program designers may need to look at, or essentially an individual could...similar to the calcs I used...just include the (beta1) factor in the equation to find the area of concrete required to satisfy equilibrium...then the problem would be what to multiply by to find Whitney's stress block...either way...the program designers can certainly work this out.

FROM:bgoodrich DATE:Thursday, February 28, 2002 1:43:49 PM  
I have corrected the flexural resistance computation to utilize a strain method outlined in Collins and Mitchell (1991) but only when the strands are within the compression zone. This method is similar to the KDOT hand comps except a shaping function is applied in determining fps. When the strands are in the tension zone, the AASHTO LRFD equations are utilized. This issue is addressed in the BRASS-GIRDER(LRFD) 1.5.1 engine, which will be released with Opis 4.1 Service Pack 1.

## Description

FROM:mordoobadi DATE:2/15/2002 2:45:37 PM

Due to conflict of table names between VIRTIS/OPIS and PONTIS when using an Oracle database that contains both VIRTIS/OPIS and PONTIS databases on a single instance the following tables need to be renamed.

```
bridge TO pontis_bridge
paramtrs TO pontis_paramtrs
roadway TO pontis_roadway
```

This will be included in 4.1 Service Pack 1.  
Create scripts. (for sybase, oracle, MSDE)  
Fix code.

FROM:mordoobadi DATE:2/15/2002 3:13:27 PM

Note: Project ABIGNRL is changed. BARS and BRASS import projects need to be rebuilt.

**Description**

FROM:dteal DATE:Wednesday, February 20, 2002 10:02:15 AM  
As our bridge database grows it is evident that we need more ways to search and group our structures. When initially entering a bridge into the database, if the user doesn't add a code of some sort to the "Bridge Name" it is tough to locate bridges of certain types.

In the Superstructure Definition GUI we already have Member Alt. Types (Steel, P/S, R/C, Timber) selected. We need to sort/filter using them.

FROM:dteal DATE:Wednesday, February 20, 2002 10:10:15 AM  
This was not 4.1 Beta - it is Release 4.1

**Complete Issue Information**

FROM:jduray DATE:2/20/02 1:39:55 PM

Do you have any thoughts on how we should accomplish this? How would you like to handle bridges consisting of multiple structures of differing member alt types? Categorizing bridges based on the types of member alternatives is rather complicated (but possible). We would have to look at the bridge alts marked as "Existing", the structure alts marked as "Existing", the structure def assigned to the structure alt and the member alts marked as "Existing".

FROM:smample DATE:Wednesday, February 20, 2002 1:51:42 PM

It would also be helpful to include the "Bridge Completely Defined" information in the Bridge Explorer window.

FROM:dteal DATE:Tuesday, February 26, 2002 12:09:48 PM

I thought the Report Tool may lend itself to helping out here but I think expanding the file properties filtering is a better answer.

I can see the complications coming from differing member alternatives. Here is an example of why expanding the filtering/searching capabilities is needed. I need to find a bridge from a 5,000 bridge database that I could use as a template for starting a 3 span welded plate girder of current design practices (built in the last 5 years). A bridge just like the one I need to design may already be in the database, I just need a tool to find it.

You wanted thoughts on how to accomplish this – Does it matter if this 3 span welded plate structure is one of the member alternatives. No – we should be able to find all instances no matter where they live.

### Description

FROM:dteal DATE:Wednesday, February 20, 2002 12:02:26 PM

See the attached .bbd

I ran this P/S structure using 4.0.4 (Structure Definition – 5 Girders at 2.50m, Member 2) and it passed all checks in the Spec. checker. Now when I ran the same girder in version 4.1 it has numerous Fails in the Spec. Checker.

Why?

FROM:bgoodrich DATE:Wednesday, February 20, 2002 6:55:24 PM

This issue may be the same as Incident 3600.

FROM:dteal DATE:Wednesday, February 27, 2002 9:35:27 AM

The error that I can identify is associated with 5.7.3.3.1 Max. Reinforcement. My girder is about 1140 mm tall (with out the slab) and "c" (distance for the extreme compression fiber to the neutral axis)is

4/19/2016 3:16:22 PM

HRS AASHTO

1161

## Complete Issue Information

2713 mm.

FROM:bgoodrich DATE:Thursday, February 28, 2002 2:00:45 PM

Because BRASS could not compute the correct flexural resistance, the neutral axis was basically invalid, which threw off the maximum reinforcement check and maybe others. By addressing Incident 3600, this issue was corrected. I tested the bridge with BRASS-GIRDER(LRFD) 1.5.1 and did not receive and failed spec checks.

Fixed in BRASS-GIRDER(LRFD) 1.5.1, which will be released with Opis 4.1 Service Pack 1.

FROM:dteal DATE:Monday, April 01, 2002 11:26:09 AM

I ran this bridge in 4.1.1 and received Failed spec Checks. I did not have any "fails" when running 4.0.4. I see no change.

FROM:dteal DATE:Monday, April 01, 2002 12:13:22 PM

4.1.0 had 6 fails for 5.7.3.3.1 and 4 fails for 5.8.3.5  
4.1.1 had 4 fails for 5.7.3.3.1 and 0 fails for 5.8.3.5

FROM:dteal DATE:Wednesday, April 03, 2002 9:22:54 AM

Note: Version 4.0.4 had no fails.

FROM:bgoodrich DATE:Tuesday, April 09, 2002 11:27:30 AM

The failed spec checks of AASHTO 5.7.3.3.1 occur in the non-composite. This check is more appropriately checked in the composite stage. Therefore, in a future release, this check will be set to "Not Satisfied" instead of "Fail" for the non-composite stage of a multi-stage structure. Users may choose to ignore these checks until the change is made.

FROM:dteal DATE:Tuesday, April 09, 2002 12:27:46 PM

After investigating both stage 1 and stage 3, I found the following differences between 4.1.0 and 4.1.1 beta,

Stage 1: 4.1.0 had 8 fails and 4.1.1 beta had 4 fails  
Stage 3: 4.1.0 had 40 fails and 4.1.1 beta had 72 fails (a bunch more)

I don't think that 4.0.4 had any fails in either stage 1 or stage 3. If you want me to verify this I can, I would have to reload 4.0 with all 4 service packs and then re-enter the bridge from scratch.

FROM:bgoodrich DATE:Thursday, April 11, 2002 11:07:43 AM

I have investigated the differences in failed spec checks among the versions and found the following.

Number of Fails (vehicles included HL-93 and fatigue)

Stage 1

4.0.4 0  
4.1.0 20 (4 are max rebar, 16 are longitudinal rebar)  
4.1.1 4 (4 are max rebar)

Stage 2

4.0.4 32 (all are RF)

4/19/2016 3:16:22 PM

HRS AASHTO

1162

**Complete Issue Information**

4.1.0 80 (8 are max rebar, 72 are DR&RF)

4.1.1 72 (72 are DR&RF)

The maximum reinforcement checks are showing up now because strands in the compression zone are handled differently. The resulting fps and dp values cause this difference. In 4.1.0, the iterative algorithm for the flexural resistance did not converge for this structure, so the flexural resistance, fps, and dp are simply wrong. See this comp in the intermediate output for the 201 POI. Additionally, the terms used to check the longitudinal rebar in 4.1.0 were not correct due to the iteration problem above, which is why these checks went away in 4.1.1.

Because this structure is not available in a 4.0.4 BBD file, I used the development environment to get some results using the 4.1.1 GUI and the BRASS engine for 4.0.4. I received 32 fails pertaining to rating factor computations. The 4.1.0 and 4.1.1 results give fails for both design ratio and rating factor computations. The design ratio results were not produced in 4.0.4, which is why the number doubled for 4.1.0 and 4.1.1.

It appears that the 4.1.1 version is producing the best results.

### Description

FROM:dteal DATE:Wednesday, February 20, 2002 1:03:38 PM

I just came across another PS structure that was designed in an earlier version. It now fails. See attached LaRoche.bbd

FROM:bgoodrich DATE:Wednesday, February 20, 2002 6:56:27 PM

This issue may be the same as Incident 3600.

FROM:dteal DATE:Wednesday, February 27, 2002 9:38:53 AM

The error that I can identify is associated with 5.7.3.3.1 Max. Reinforcement. My girder is about 1140 mm tall (with out the slab) and "c" (distance for the extreme compression fiber to the neutral axis)is 2713 mm.

FROM:bgoodrich DATE:Thursday, February 28, 2002 2:02:47 PM

This is a duplicate of Incident 3612. I tested the bridge with BRASS-GIRDER(LRFD) 1.5.1 and did not receive and fails.

FROM:dteal DATE:Monday, April 29, 2002 12:24:35 PM

This bridge is still getting errors. There where no errors in 4.0. Can you provide some reasoning why my stage 3 now has errors??

FROM:dteal DATE:Friday, September 05, 2003 2:09:10 PM

FROM:dteal DATE:Friday, September 05, 2003 2:09:10 PM

FROM:dteal DATE:Friday, September 05, 2003 2:09:10 PM

We designed this bridge using version 4.0, no errors or design ratio's failures where reported. Now in version 5.0.1 we get 3 Design Ratio Comps that are less than 1. All three are at the 210 pt. One is crack control and the other 2 are flexure.

Why at the 210 pt only and not the 210 and the 290 point?

Why when we have designed and checked a structure using one version and now with a newer version we get failures – what changed?

See attached bbd.

FROM:dteal DATE:Friday, September 05, 2003 2:40:57 PM

Never mind - works fine - close this incident

## Description

FROM:kkennelly DATE:2/20/2002 2:10:55 PM

Attached bridge is from version 4.1, member "test member", member alt "steel plate". Run BRASS

4/19/2016 3:16:22 PM

HRS AASHTO

1165

**Complete Issue Information**

LFD using load sequence on mbr alt engine tab "1 stage - noncomposite steel bridge". Based on the load sequence, the analysis should be for a non-composite steel girder. But the export generates an Xsect-C command containing the slab dimensions for the positive moment region and then BRASS uses these slab dimensions as if they are a very large steel cover plate. The export should not create the XsectC command using slab dimensions if the user picked load sequence as non-composite. Also, a warning is given in the BRASS output that there may be a problem but no warning is given in the export log file.

FROM: bgoodrich DATE: Friday, February 22, 2002 3:36:25 PM

I modified the export so the load sequence engine property takes precedence over composite ranges. These modifications were in the source code I submitted on 2/21/02.

### Description

FROM:dteal DATE:Friday, February 22, 2002 8:30:12 AM

What is the future? We have consultants buying new PC's and of course everything nowadays is pre-loaded with Windows XP. I checked with our IT folks, KDOT is looking into the migration in's and out's right now. State of Kansas is talking about starting test sites as early as the fall of 2002.

FROM:jduray DATE:2/25/02 8:23:10 AM

XP will eventually be supported, however, the Task Force did not put a high priority on it because the DOT's will probably be slow to move to it. We know Virtis/Opis runs on XP based on a limited amount of testing we have done (we did our standard build testing and found no problems). Until the TF says to support it and we have done more formal testing it will remain unsupported.

|------------|---------------|---------------------------------------------------------------------------------------|
| 3621.11730 | Suspended     | Move sustained modular ratio factor to Mbr Alt level for Girder System Structure Defs |

### Description

FROM:dteal DATE:Monday, February 25, 2002 9:53:48 AM

The n(conc) I have highlighted on the attached document is wrong. On the Deck profile GUI I had entered n=7.70 for the deck concrete. BRASS uses the default of n=8 (instead of the using the ratios of the "e's" given in the materials).

BRASS then used the equation of:  $n(\text{conc}) = 8.0/7.7 = 1.039$  (slab)

Should have been:  $n(\text{conc}) = 7.70/8.0 = 0.9625$  (slab)

Being the slab concrete is weaker than the beam concrete "n" can never be greater than one in this case.

FROM:bgoodrich DATE:Monday, February 25, 2002 6:30:01 PM

Based on the way the modular ratios are specified in the data file, the slab is actually considered

4/19/2016 3:16:23 PM

HRS AASHTO

1169

## Complete Issue Information

stronger than the beam concrete. The default of  $n=8.0$  was used for the beam, which is larger than the  $n=7.7$  computed for the slab. If the beam is stronger, its modular ratio should be less than that of the slab. Therefore, the BRASS engine is functioning correctly. It would be more correct to use the modulus of elasticity of the concretes to compute this value, however, the engine does not support or compute the modulus of elasticity for the deck in general because it doesn't know the unit weight.

The basic problem stems from not being able to specify any mild rebar in the prestress beam. If we could do that, the correct modular ratio could be exported for the beam instead of using the default of 8.0.

Jim - The bottom line is users are getting incorrect results and there is nothing they can do about it in Opis. The export could be modified to compute a modular ratio instead of relying on the fixed BRASS default. The export could utilize the slab rebar material to compute the beam's modular ratio. Another option would be for the export to assume a mild steel material with a modulus of elasticity of 29000 ksi.

FROM:bgoodrich DATE:Tuesday, January 28, 2003 2:58:02 PM

I modified the export to obtain the rebar material from the member alternative default for the beam rebar. Then, the modular ratio for the beam rebar to beam concrete can be obtained and exported to BRASS instead of the default of 8.0. Fixed for Version 5.0 Beta 4.

FROM:dteal DATE:Wednesday, November 12, 2003 10:41:20 AM

What I see in Version 5.1.0 is BRASS is still using the default of 8.0

FROM:bgoodrich DATE:Monday, January 19, 2004 2:15:28 PM

Dean is correct about the problem still existing. This issue was only partially addressed in Jan. 2003. I found another function that should have been revised. Therefore, I have revised both functions to obtain the rebar material from the member alternative default for the beam rebar. To address existing structures in which no default mild rebar material is specified, the modulus of elasticity of the rebar is assumed to be 29000.0 ksi. Then, the modular ratio for the beam rebar to beam concrete can be obtained and exported to BRASS instead of the default of 8.0. Fixed for Version 5.1.1.

FROM:dteal DATE:Tuesday, November 09, 2004 8:10:25 AM

I have a RC Haunched Slab bridge designed with an earlier version of Opis, most likely 4.0.1. I had no

4/19/2016 3:16:24 PM

HRS AASHTO

1173

## Complete Issue Information

failures – now in version 4.1.0 I get Rating Factor Failures for Live Load Deflection??? Horse sense tells me that LL Deflection will NEVER control a bridge of this type. I can't figure out what this is based on?? Where do find the controlling spec? I found no reference to a change on the Version 4.1 – New Features that would effect this?

See attached .bbd, I checked it with Superstructure 15-20-15 HL-93 (LRFD) and Member HL-93, 11m Rdwy,65 mm Clear.

FROM:bgoodrich DATE:Thursday, February 28, 2002 5:31:23 PM  
Versions of BRASS-GIRDER(LRFD) prior to 1.5.0 (Opis 4.1) did not perform live load deflection checks, which is why you didn't see this check before. The BRASS release notes reflected this new feature.

Note that BRASS uses an allowable deflection of (span length / 800), which yields 25mm for span 2 in the attached bridge. The live load deflection for the design truck alone is 32.95mm. Therefore, the live load deflection does fail based on the input sent to BRASS. Are your deflection distribution factors correct? Also, what allowable live load deflection would you use for this structure?

FROM:dteal DATE:Friday, March 01, 2002 3:28:21 PM  
Kansas doesn't checked Live Load deflections on a reinforced concrete haunched slab structure. This bridge doesn't even know that a truck is on it. How do I turn the LL deflection check off?

FROM:dteal DATE:Saturday, March 02, 2002 4:17:47 PM  
Was this to satisfy the LRFD Specification for Optional Live Load Deflection controls? If so, where do I toggle this on/off?

FROM:dteal DATE:Monday, March 04, 2002 9:00:23 AM  
I think this is related to Incident # 2737

FROM:dteal DATE:Friday, March 08, 2002 7:45:30 AM  
On your Feb 28th comment you said that the BRASS release notes reflected this new feature – Virtis and Opis uses do not read BRASS release notes. If it's not in the VirtisOpis New Features Readme file then where would a VirtisOpis user look?

FROM:jduray DATE:4/1/02 2:58:41 PM  
Apparently we missed including the BRASS release notes with the 4.1 release. They will be with service pack 1.

Joe - see if we have the release notes that should have been included with 4.1 and include them with 4.1.1.

FROM:dteal DATE:Tuesday, April 02, 2002 8:01:23 AM  
Are we really going to require the user to read BRASS release notes to find out how to use Opis? Being the code calls this Optional Live Load Deflection, shouldn't the user be able to turn the option on/off within Opis? Not all agencies are going to implement this option and let live load deflections control.

4/19/2016 3:16:24 PM

HRS AASHTO

1174

**Complete Issue Information**

FROM:jduray DATE:4/9/02 8:53:32 AM

The engine for Opis at this time is BRASS. I think it is reasonable to expect the users to read whatever they have to read in order to understand the engine. You have to realize that AASHTO has little impact on BRASS and what it does. BRASS was developed by and is maintained by Wyoming. Although they have a very good relationship, it would be difficult for us to repeat within Opis a description of all that goes on within BRASS. The BRASS developers (BridgeTech) have done a good job of describing the engine, providing release notes and other documentation. Perhaps someday AASHTO will have it's own LRFD analysis engine and then it is reasonable for AASHTO to provide what you are asking for. I don't think it matters if the title on what they are reading is AASHTO LRFD Analysis Engine or BRASS LRFD.

FROM:dteal DATE:Tuesday, April 09, 2002 1:52:24 PM

I think we are getting away from the issue here, and that was OPTIONAL LL Deflection Control. Is it going to be optional or is this something we will have to work around when the owner does not want to invoke the optional live load criteria as read in AASHTO 3.6.1.3.2? Isn't this something the GUI should be telling the engine we are going to use or not going to use. The engine shouldn't be tell the GUI that this is the way it is so work around it.

FROM:dteal DATE:Tuesday, March 28, 2006 10:54:46 AM

In a 5.4 beta 7 I ran a common 3 span KS slab. I used the POI wizard to find my POI's for Opis. The spec check returned 79 failures of either Rating Factors or Design Ratio's. There isn't enough information in the general GUI of returned spec checks to know what they are for - you have to open each and every on of the 79 pop up windows to verify that the failure was for LL Deflection. There is no way to filter it out that I know of.

### Description

FROM:dteal DATE:Wednesday, February 27, 2002 12:02:46 PM  
Need a way, or is there a way to set the default drive and directory when exporting a .bbd file. The user should not have to select the drive/directory each and every time – need a user defined default.

4/19/2016 3:16:25 PM

1177

**Complete Issue Information**

FROM:jduray DATE:3/1/02 3:11:29 PM

I assume you want the file stored somewhere other than the Virtis/Opis directory (which should be the default).

FROM:dteal DATE:Friday, March 01, 2002 3:34:32 PM

Yes - I would like to store it in another directory

FROM:dteal DATE:Tuesday, October 26, 2004 10:03:24 AM

Well it must have gotten fixed by accident. When I report a bbd now it goes to the directory that I last used (by default). We should close this incident.

**Description**

FROM:dteal DATE:Wednesday, February 27, 2002 3:36:25 PM

For the attached bridge we have a sidewalk on the right side. The sidewalk has the same 180 mm thickness as the deck without an overlay. The deck gets a 40 mm overlay so it's now 220 mm thick.

4/19/2016 3:16:25 PM

HRS AASHTO

1178

## Complete Issue Information

The sidewalk is still 180 mm thick. The View Schematic incorrectly shows the overlay covering the sidewalk. Does this also mean the overlay load is applied to the sidewalk too?

FROM:kkennelly DATE:3/6/2002 8:39:59 AM

The overlay load is only applied over the width of the travelway for both BRASS LRFD and BRASS LFD so the analysis is ok. The schematic should be changed to show the overlay over the travelway width only (I think that should always make sense) and the Help for the Wearing Surface tab should be revised to indicate the wearing surface is over the travelway width.

Dean, As an aside, I noticed on your bridge that you have assigned the wearing surface to load case DC2. But the log file for the BRASS LRFD run states that the wearing surface load is always applied to DW in BRASS. You might want to verify that the analysis is using the correct load factors for your wearing surface.

FROM:kkennelly DATE:3/6/2002 3:19:02 PM

Schematic and help updated for Version 4.2 and 4.1 Service Pack 1.

FROM:dteal DATE:Monday, April 01, 2002 10:16:19 AM

The schematic of the Typical Cross section still shows the sidewalk as thick as the deck with the overlay. I don't see any changes, corrections or improvements to the schematic.

FROM:kkennelly DATE:4/1/2002 1:12:01 PM

When I look at the attached bridge in version 4.1.1, the deck overlay is only shown over the travelway width as it should be. Do you see the overlay as a darker gray color over the travelway width? Do you see the darker overlay cover over the sidewalk? (I don't see that.) The sidewalk should be the same thickness as the deck (with no overlay) since this bridge has 0 width and 0 thickness entered for the sidewalk.

FROM:dteal DATE:Monday, April 01, 2002 2:53:24 PM

When I look at the schematic I see the darker color for the overlay on the deck and over on the sidewalk I see sidewalk thickness equal to the deck thickness, but then I also see a line above the sidewalk at the same level as the overlay, but between this line and the sidewalk it is not shaded in like the overlay is. But the line is definitely there.

FROM:kkennelly DATE:4/2/2002 9:04:26 AM

I can't reproduce the line you are seeing. We tried looking at the attached version 4.1.1 file "ver411\_sidewalk.bbd" on 2 pc's and it looks ok. Can you import that file and see how it looks? If it looks ok, please export the bridge you are looking at in 4.1.1 that shows the line and attach it to this incident.

FROM:dteal DATE:Wednesday, April 03, 2002 8:09:27 AM

I don't know if this is a dumb question or not but - how do I import a file (download an attachment) from Visual Intercept. As far as I know I can only attach files to send to you.

FROM:dteal DATE:Wednesday, April 03, 2002 8:26:10 AM

I am attaching 2 files. One is the bbd in 4.1.1 beta that I can create the anomaly with, Sidewalk Shot.bbd . The second file I am sending is Sidewalk Shot.bmp. This clearly shows in the sidewalk area,

4/19/2016 3:16:25 PM

HRS AASHTO

1179

### Complete Issue Information

the deck, a space and a line above the deck. The rail sits on top of this line and not on the sidewalk surface.

FROM:kkennelly DATE:4/3/2002 9:32:57 AM

I imported your bridge Sidewalk Shot.bbd and I see the line you are referring to. That line is showing the sidewalk thickness. This bridge has the sidewalk entered as 3050 wide x 40 thickness. You can see this line move by varying the sidewalk thickness on the Sidewalk tab. (The first file attached to this incident did not have a sidewalk width and thickness entered, they were left blank. That's why we couldn't see the line you are referring to.)

FROM:kkennelly DATE:4/3/2002 9:42:40 AM

I don't think there is any way for you to import a file from Visual Intercept but I don't think you have to import that file now anyway.

FROM:dteal DATE:Wednesday, April 03, 2002 10:16:19 AM

I checked with the designer on this structure. He changed the sidewalk thickness between the time I originally entered the incident to now when I'm trying to check it out. He had added the 40 mm. If I take the extra 40 mm off the graphic is displayed correctly. It appears that we can close this incident.

### Description

FROM:dteal DATE:Wednesday, February 27, 2002 3:37:55 PM

When the administrator goes to the "Deleted Bridges" folder for some clean-up. Select a bridge to delete, I get the check box to delete the files also. Should this be appearing here?

FROM:jduray DATE:3/1/02 3:09:34 PM

I think so. Why do you think it should not? we want to delete analysis files for the bridge being deleted.

FROM:dteal DATE:Friday, March 01, 2002 3:45:12 PM

These files that are deleted were created on the local PC when the analysis was done. Is that correct?

The administrator is the only one in our case that has permission to delete bridges from the deleted bridges folder. Why ask if he would like to delete files that aren't there?

FROM:jduray DATE:3/26/03 12:06:26 PM

He should not check the box if he doesn't want to delete the files. Others may implement Virtis differently and allow any user to delete bridges.

Perhaps the checkbox should also be on the dialog for deleting the bridge.

FROM:dteal DATE:Friday, September 05, 2003 10:38:02 AM

It's not a matter of checking the box or not - the administrator is being asked to delete or not delete files that live on somebody else's local PC that the administrator couldn't delete even if he wanted to.

FROM:dteal DATE:Wednesday, October 15, 2003 3:03:35 PM

If the administrator checks this box, he will get an error message!

FROM:dteal DATE:Tuesday, October 26, 2004 10:10:47 AM

Since the last time I looked at this - the administrator no longer gets an error message (5.1.1) - But the administrator still shouldn't get this message.

### Description

FROM:dteal DATE:Wednesday, February 27, 2002 3:38:59 PM

I recently was evaluating shear studs, and discovered a "FAIL" in one of the yellow-icon general calculations, specifically "LRFD 6.10.7.4.4 Shear Connectors: Strength Limit State". In my mind, any "failure" should be brought to the attention of the designer through a red "X" icon, rather than be buried in all the calculations. After discovering this failure in a general calculation, it made me wonder how many other "general calc's" had "failures" in them!

### Description

FROM:dteal DATE:Wednesday, February 27, 2002 3:41:42 PM  
Concerning the presentation of the LRFD Critical Loads FATIGUE-I moments and shears, both in the output tables and charts. If both HL-93 (SI) Truck and Fatigue Truck (SI) are included in the analysis run, the fatigue results are mis-represented. If the HL-93 truck is removed from the analysis setup and the bridge run with only the fatigue truck, the charts and tables look correct. In any case, the individual unfactored shear and moments look good as well as the spec checks concerning fatigue; it's only the LRFD Critical Loads that seem to have a problem working. I tried turning off all Limit States but fatigue,

4/19/2016 3:16:26 PM

HRS AASHTO

1183

**Complete Issue Information**

but still included the HL-93 truck in the run, and the fatigue results still looked wrong.

FROM:bgoodrich DATE:Monday, March 04, 2002 3:28:22 PM  
I corrected the problem with fatigue limit state results. The truck number for fatigue was being stored instead of the combination number. Fixed in BRASS-GIRDER(LRFD) 1.5.1, which should be released with Opis 4.1 Service Pack 1.

**Description**

FROM:dteal DATE:Thursday, February 28, 2002 10:12:54 AM

This is an excerpt from the BRASS output file from a Virtis Rating Run. What I am looking for is the allowable fatigue stresses. I want to know which windows I can check and what value the program is using. From this excerpt, the Allowable Fatigue Stress is \*\*\*\*? What does that mean? .bbd file is attached

Fatigue Rating Factor - Steel (Positive Action) - BOTTOM OF SECTION

Section Modulus = 1429.42 (in^3)  
 Live Load Moment (max) = 670.60 (ft-kips)  
 Live Load Moment (min) = -130.51 (ft-kips)  
 Moment Range (max - min) = 801.10 (ft-kips)  
 Stress Range (mom. range/sect. mod.) = 6.73 (ksi)  
 Allowable Fatigue Stress = \*\*\*\*\* (ksi)

Note: See parameter 9 of the STEEL-4 command, Fatigue rating will not govern and will print as asterisks

R.F. = Allowable Fatigue Stress

-----  
 Stress Range

R.F. = \*\*\*\*\*

FROM:dteal DATE:Thursday, February 28, 2002 12:51:48 PM

BRASS uses an Allowable Fatigue Stress Default = 1x10^10 KSI. We change this in BRASS to 21 ksi. How do I control this in Virtis?

FROM:bgoodrich DATE:Thursday, February 28, 2002 5:05:15 PM

To get the allowable fatigue stress into Virtis, add a row to the fatigue grid on the Fatigue tab in the

**Complete Issue Information**

Point of Interest window. The only value BRASS LFD uses is the allowable fatigue stress. Additionally, BRASS does not allow input of a vertical distance. Note that the export does not currently generate POI commands to override the schedules, although the engine supports this now. This issue was already submitted as incident 3062.

Now, to get the fatigue data exported to the data file, you will have to make an adjustment to the engine properties on the member alternative window. You will have to select POI Control option 0. Then, you will have to add stiffeners, bracing, etc. data to each of your POIs because the schedules cannot be used for this case. This is only a work-around until Incident 3062 gets addressed.

FROM:dteal DATE:Monday, March 04, 2002 9:24:38 AM

Above you stated - "The only value BRASS LFD uses is the allowable fatigue stress". In the BRASS output, the Allowable Fatigue Stress is listed as \*\*\*\*\*, what does "\*\*\*\*\*" mean? According to Ahmad, our ratings guy, if we use the BRASS default of  $1 \times 10^{10}$  ksi it will never control. That is why he enters 21 ksi in BRASS Girder LFD.

FROM:dteal DATE:Friday, March 01, 2002 8:29:16 AM  
See the attached Word document and .bbd file

FROM:bgoodrich DATE:Monday, March 04, 2002 4:47:01 PM  
I corrected the intermediate output to show the loss reports for all spans instead of just span 1.

FROM:bgoodrich DATE:Wednesday, March 13, 2002 8:56:10 AM  
E-mail from Jay Puckett:  
Per 5.9.5.1 the total loss is computed "relative to the stress immediately before release". So does the stress at release contain the R1 loss? See 5.9.5.4.4.b for an estimate of loss prior to transfer. If the fabricator stresses to include the R1 loss, hence the stress immediately before release is the fpj specified then I would say not to include it. But if the fabricator stresses to fpj and does not account for the R1 loss in the stressing process, then I would say it should be include in the computation. See commentary, "initial relaxation loss is determined by the fabricator". I assume (perhaps incorrectly) that the fabricator will over stress so that the net immediately before release is the fpj value (and PCI likely makes this assumption as well) You might wish to ask Dean about this practice.

FROM:bgoodrich DATE:Wednesday, March 13, 2002 9:09:01 AM  
Dean - Please review Jay's comments above and indicate what KDOTs practice is.

FROM:dteal DATE:Thursday, March 21, 2002 3:43:52 PM  
The value on Plans is  $fpu * 0.75 * Aps = 139.5 \text{ kN}$ . The value 138 kN come about converting this calc from english to metric.

To answer Jay's question, our prestress fabricators tension up to the value found on the plans, No additional to account for ES or Relax.

Jay's response did not answer my question on why R1 (relaxation of prestress at transfer) is included in the total loss calculation. The value R2 (total relaxation of prestress) includes the value of R1 and should not be added in again.

## Complete Issue Information

FROM:bgoodrich DATE:Monday, November 04, 2002 12:27:26 PM

LRFD 5.9.5.4a indicates that the total relaxation loss after transfer is the sum of the R1 and R2 losses. And the LRFD specification seems to assume (based on the commentary) that the R1 loss will be accounted for in the fabrication process. Based on the discussion in Section 7.7.6 (and Example 7.10.4) of the Design of Highway Bridges textbook, it follows that both the R1 and R2 losses should be included in the total prestress loss equation (5.9.5.1-1). I did not find any discussion in the specification or elsewhere that indicates that the R2 loss includes the R1 loss.

To eliminate the R1 loss from consideration, set the transfer time to 1/24 days (1 hour). This causes the R1 loss to be computed as zero.

FROM:bgoodrich DATE:Wednesday, May 28, 2003 9:44:33 AM  
Khalid Obeidat (MN DOT) has similar concerns that need to be addressed.

E-mail from Khalid Obeidat:

As we discussed in our phone conversation last week I'm sending you my findings about my review of prestress losses in OPIS/VIRTIS version 5. Version 5 loss calculations are a step on the right direction. There are still two issues (bugs) on version 5 (these are not new bugs and they are carried from previous versions of OPIS/VIRTIS). These bugs are: 1. OPIS/VIRTIS include R1 (Initial relaxation Losses) in total losses at final. As you can see in equations 5.9.5.1-1 and 2 in section 5.9.5.1 of AASHTO LRFD Bridge Design Manual the initial relaxation losses R1 is explicitly excluded from the total losses. The bug in OPIS/VIRTIS tends to increase total prestress losses. 2. When calculating initial relaxation losses R1, the initial stress in tendon fpj is calculated incorrectly (initial stress in tendons minus elastic shortening). The elastic shortening should not have been subtracted from the initial tendon stresses because initial relaxation happens before elastic shortening (Elastic shortening start immediately after prestressing while elastic shortening happens after cutting the strands). It is a good idea to list initial relaxation losses before the elastic shortening losses in the computations. The bug of subtracting elastic shortening losses from fpj tends to affect R1 and CR losses. I'm attaching a copy of OPIS file for MN/DOT LRFD design example in addition to the computation of our design example. Please let me know if you have any questions about this or if I could be of any help to you. Thanks

FROM:bgoodrich DATE:Wednesday, October 15, 2003 1:52:22 PM  
WYDOT has assigned this issue to BRASS Problem Log 458.

FROM:bgoodrich DATE:Sunday, December 28, 2003 12:24:44 PM  
Modifications have been made to the total loss calculation when AASHTO losses are specified. The relaxation loss at transfer (R1) is no longer included in the total loss calculation as specified in AASHTO LRFD 5.9.5.1. Fixed for BRASS-GIRDER(LRFD) 1.5.4. Fixed for Opis Version 5.2.

**Description**

FROM:jduray DATE:3/1/02 2:58:44 PM

Submitted on behalf of Brian McCaffrey from an email:

Would it be beneficial to add the ratings in tons in addition to the rating factor at the bridge and structure results level - when viewing from the bridge explorer???

We're trying to get a summary of everything we ran from 2001 for our Federal tape and they require the ratings in tons (this also applies to all the other states). I've been trying to manipulate the results in Access but only the BID (not the Bridge Id) is in the results table. Has anyone else done anything similar to this yet???

Bottom line, we're trying to generate the attached file for every bridge we've ran thru Virtis.

-----end of email -----

I think we can add the tons to the structure and bridge views. If it is simple to do I will try to get it in the service pack we are working on. Otherwise it will have to wait for a later release (possibly June).

If writing SQL to generate the report you will have to make sure you only report on "Existing" stuff (Bridge Alternative, the proper Structure Definition, and Member Alternative). This is not trivial when writing SQL to do the reporting. There is a view in the database (version 4.1) that returns the member alts for "existing" bridge alts, etc.. the name of the view is abw\_v\_cur\_mbr\_alt\_hierarchy.

FROM:mordoobadi DATE:8/14/2003 3:14:29 PM  
Inventory and Operating Capacity columns were added to Bridge and Structure Rating Results windows in version 5.0.1

I change the status of this incident from Suspended to Resolved.

## Description

FROM:dteal DATE:Wednesday, March 06, 2002 9:43:50 AM

See the attached .bbd file. Kansas extends strands to make the beams continuous over the pier. One method we tried was to increase the Yield Strength (fy) in the continuity bars over the pier to approximate the actual prestressed strands instead of rebar. So the instead of using fy=420 MPa, fy was increased to 1674 MPa. A new material was created for it and used in the beam details, continuity diaphragm tab. Beam #1 was set up this way. The beam was analyzed. In the output results (attached word doc) BRASS is not using the new material with fy=1674 MPa, it is still using fy=420 MPa.

FROM:bgoodrich DATE:Friday, April 05, 2002 6:06:44 PM

BRASS only supports one rebar yield stress for the entire structure. Therefore, increasing the yield stress for the continuity steel will not work right now. It may be possible to modify BRASS to allow different yield stresses for the girder and slab rebar. Internally, BRASS would only use one of the yield stresses in the computations, but the rebar areas could be adjusted to compensate. This issue really pertains to Virtis/Opis users only because BRASS users could modify their data file directly and adjust the mild steel areas accordingly.

Subject: VI 3633

Brian-

The prestressed continuity steel issues will be in 5.1 – we will need to get WyDOT permission for this. VI 3633.

Brian-can you develop the request for Ken Hurst to WyDOT; this should follow the standard process and be billed to AASHTO T&M. Ken Hurst will send us information about the development length for the continuity strands; we should consider both strands in the top and bottom of the girder. I see two scenarios:

1. Assume continuity strands are fully developed – simpler.
2. Use Ken's approach regarding a lesser stress for development length. We can discuss in more detail later.

No reply necessary today.

Jay

During the Alabama user group meeting (Aug 2003) Jay asked me how KS wanted to handle the strand extension issue for continuity. I discussed our options with Ken Hurst and this is what we would like to

4/19/2016 3:16:27 PM

HRS AASHTO

1192

**Complete Issue Information**

see to handle strand extensions and continuity steel.

Option 1: In the beam details GUI window we could provide a wizard that calculates the number of strands you need to extend. Knowing that number the user could select which strands to extend in the GUI.

Option 2: In the beam details GUI window we should have the ability to select which strands to extend, consider them developed, supply some sort of output (in spec checker) that checked these strands to be sure they haven't been overstressed.

FROM:bgoodrich DATE:Friday, February 27, 2004 11:15:16 AM

A formal request was made to WYDOT requesting modifications to BRASS, which is documented in Incident 4683. The status of this incident will be set to Duplicate and all future work will be documented in Incident 4683.

### Description

FROM:dteal DATE:Wednesday, March 06, 2002 10:10:43 AM

Am I correct here – I have a built up steel beam which uses angles for the top flange. I can model them as cross section based ok but I can not use the wizard to create the structure definition for a built up section. Is this intended, the wizard does not handle built up steel sections?

FROM:dteal DATE:Wednesday, March 06, 2002 10:47:21 AM

More on Built Up sections – Built Up sections can not be entered using schedule based either – is this correct? I am trying to enter a parabolic built up section. We have many pre 1960 bridges of this type.

FROM:jduray DATE:3/6/02 2:55:52 PM

Both observations are correct...the wizard does not handle built-up sections and built-up sections can only be described using cross-section based.

When creating a new folder or editing a folder I have ownership to – In the “Description“ field – I am not able to use the enter key or arrow keys to create a second line of text. I seem to be limited to the first line only?

FROM: jihnat DATE: 3/7/2002 1:13:42 PM  
We can change this for the next service pack to be consistent with other dialogs.  
In the meantime, you can start another line with <CTRL><ENTER>.

### Description

FROM:dteal DATE:Friday, March 08, 2002 12:23:33 PM  
For Jeff Ruby

BRASS LRFD is having a hard time calculating the haunches correctly. The attached graphic shows my situation.

BRASS Calculates...(From output)

COMMENT This load case is derived from data provided.  
LOAD-DEAD-DESCR 1, DC, 1, Haunches  
—>LOAD-DEAD-UNIFORM 1, 1, 0.000, 0.009434, 1456.693, 0.009434  
LOAD-DEAD-UNIFORM 1, 1, 1456.693, 0.010241, 1830.709, 0.010241  
LOAD-DEAD-UNIFORM 1, 1, 1830.709, 0.002560, 2086.614, 0.002560  
LOAD-DEAD-UNIFORM 1, 2, 0.000, 0.002560, 275.591, 0.002560  
LOAD-DEAD-UNIFORM 1, 2, 275.591, 0.010241, 629.921, 0.010241  
LOAD-DEAD-UNIFORM 1, 2, 629.921, 0.009434, 1968.504, 0.009434  
LOAD-DEAD-UNIFORM 1, 2, 1968.504, 0.010241, 2322.835, 0.010241  
LOAD-DEAD-UNIFORM 1, 2, 2322.835, 0.002560, 2598.425, 0.002560  
LOAD-DEAD-UNIFORM 1, 3, 0.000, 0.002560, 255.906, 0.002560  
LOAD-DEAD-UNIFORM 1, 3, 255.906, 0.010241, 629.921, 0.010241  
LOAD-DEAD-UNIFORM 1, 3, 629.921, 0.009434, 2086.614, 0.009434  
LOAD-DEAD-DESCR 2, DC, 2, Rail

I get: (400x25mm top flange for highlighted line above)

$400 * (85 - 25) / 25.4 / 25.4 / 12 / 12 * (0.15 \text{ kip/ft}^3) / 12 = 0.003229 \text{ kip/in}$  NOT 0.009434 kip/in

Or you could use Unit wt = 438.2 lb/ft<sup>3</sup> to get your answer. (That's almost the density of Steel.)

FROM:kkennelly DATE:3/11/2002 2:08:53 PM  
Member G2, member alt G2-4 exhibits this behavior. I had to change the system of units to US on the member alt window and then run BRASS LRFD to get the results that the user got. Dead load value

4/19/2016 3:16:28 PM

HRS AASHTO

1198

**Complete Issue Information**

for first haunch range should be 0.00323 kip/in.

FROM:kkennelly DATE:3/12/2002 10:38:30 AM

When I run this bridge under the current Virtis 4.1 Service Pack 1 I get the correct haunch load of 0.00323.

Looks like user must have copied the exterior mbr alt to the interior mbr alt prior to Version 4.1. Version 4.1 should have set the Z3 and Z4 values for the haunch range set to null when the ext mbr alt was copied to the int mbr alt. Can the user verify if Member G2, member alt G2-4 was copied from the exterior mbr alt prior to Version 4.1? Otherwise we have to figure out how the Z3 and Z4 values got in the database.

Brian, can you verify your Service Pack 1 code in sourcesafe fixes this problem? Thanks.

FROM:kkennelly DATE:3/12/2002 11:23:28 AM

FROM:bgoodrich DATE:Wednesday, March 13, 2002 8:35:39 AM

Copying the bridge from an exterior to interior girder works fine in version 4.1, so I suspect this bridge had to be entered prior to version 4.1. I just modified the export to ignore the Z3 and Z4 dimensions for an interior girder. I sent this code to Joe Ihnat on 3/11/02. Fixed for Virtis/Opis 4.1 Service Pack 1.

**Description**

FROM:mhurd DATE:Monday, March 11, 2002 12:13:34 PM

My question is in regard to dead load designations for a 3-span, prestressed concrete bridge. In the Load Case Description, I have listed the barrier and future wearing surface as being composite, long term. These loads will be placed after the deck is composite with the girders. During analysis, a warning states, "Brass does not support a composite (long term) stage. The results from loads are applied to this stage will appear under the composite short term stage".

Due to the possible long term effects such as creep, I would think that the barrier and FWS should be analyzed as long term. Is there a way to input these loads so Brass looks at them as being composite, long term?

FROM:bgoodrich DATE:Wednesday, March 13, 2002 12:59:37 PM

BRASS-GIRDER and BRASS-GIRDER(LRFD) analyze composite prestressed concrete structures in two stages. The first is non-composite and the second is composite. BRASS-GIRDER(LRFD) calculates transformed section properties utilizing the sustained modular ratio,  $m \cdot n$ , where  $m$  is the sustained factor input in Virtis/Opis. There is no BRASS-GIRDER command that provides input for the sustained modular ratio or the associated factor. With Opis, the  $(m)$  factor can be set to 1 and all loads to the composite structure will be considered as short-term. Or, the  $(m)$  factor can be set to 2 and all loads to the composite structure will be considered as long term.

### Description

FROM:kkennelly DATE:3/12/2002 1:35:50 PM

Request based on question received via email from Ken Teng, RQAW: Does BRASS uses the tire contact width on the library window?

We don't currently have any engine related help in the Library windows. I think that's ok for the items that get copied to the bridge, but we should add engine related help for the library vehicle since we use the library vehicle in the analysis.

FROM:jduray DATE:3/13/02 9:44:19 AM  
I agree.

### Description

FROM:dteal DATE:Wednesday, March 13, 2002 9:16:27 AM

In the design of a four span prestress I found what I think is an error in the specification check of AASHTO LRFD Specification 5.7.3.3.2. This specification was violated in the negative flexure sense at the mid-span of span #2. At this location the minimum factor moment, Mu, is 1499.43 (kNm). Since this is a positive moment, should Mr minimum be set to zero?

Why is the critical factored moment for all live loads used as Mu in the negative flexure sense and not just the loads applied in construction stage 2 (fws, rail, and live loads)? The construction stage 2 moments are 199.376 (kNm) for the total DL and - 467.791 (kNm) for LL. Adding these up gives - 268.415 (kNm).

I have attached Virtus/Opis input/output.

FROM:bgoodrich DATE:Thursday, March 21, 2002 2:16:47 PM

I have modified BRASS to take Mu as zero when the original Mu has a sign opposite the flexure sense. This causes the Mr minimum to be zero. Because we are using the flexural resistance for the strength limit state, it follows that the dead load from all stages be combined with the live load to obtain the Mu value. BRASS only computes the minimum reinforcement check one time for each point, so the Mu value shown in this check is the critical factored moment based on ALL dead and live load combinations for the Strength limit states. Fixed for Opis 4.1 Service Pack 1.

### Description

FROM:dteal DATE:Wednesday, March 13, 2002 2:46:28 PM

In Opis, the help screen brought up by F1 for "Structural Typical Section: Deck (Cont'd) refers to "Sustained Modular Ratio Factor, n" With the LRFD BRASS Engine Help it is called "Creep Factor, m". They should refer to and use the same terminology.

Is the GUI correct in calling it a Sustained Modular Ratio Factor for Opis?? It would be correct for Virtis, not sure about Opis?

FROM:kkennelly DATE:3/13/2002 3:41:49 PM

The Opis Help and BRASS LRFD engine related help for this window both use the same terminology

4/19/2016 3:16:30 PM

HRS AASHTO

1205

**Complete Issue Information**

so I think the Opis help system is ok. The LRFD BRASS Engine Help was written for BRASS being used stand alone and they can use any terminology they feel is appropriate. Opis will not be changed to match any analysis engines.(maybe another engine calls it "a"). I checked the AASHTO LRFD Specs 6.10.3.1.1b and AASHTO does not give this factor a name. They do however use the "modular ratio" term when referring to n and 3n. AASHTO 5.7.1 refers to "...an effective modular ratio of 2n...". So I think it is ok to use the terminology "Sustained Modular Ratio Factor" in both Virtis and Opis.

FROM:dteal DATE:Thursday, March 14, 2002 12:05:59 PM

The problem arises when in OPIS, I use the Help. Then I ask for engine help, being BRASS LRFD. BRASS states that input is optional and if left blank it will use BRASS defaults. That's all good and fine – so now search in BRASS to find out what the defaults are. You can not find "Sustained Modular Ratio" but if you really dig you will find the defaults under "Creep Factor".

Unless you know this – how would a user find out what the defaults are???

FROM:kkennelly DATE:3/14/2002 2:07:46 PM

You're right on that point. I guess the Engine related help should provide a link to the BRASS help topic showing the default. (I don't think they want the defaults listed in both the BRASS help and the Engine related help for Opis cause then they have to maintain their help in two places.) I'll change this incident to an enhancement for engine help to provide a link to their help file for defaults.

**Description**

FROM:dteal DATE:Wednesday, March 13, 2002 2:47:33 PM

For a multi span steel structure. In trying to resolve and utilize LRFD 6.10.3.4 and C6.10.3.4 in our agency, is it somehow possible to assign 3n over the pier and 1n elsewhere?

FROM:kkennelly DATE:3/13/2002 4:12:13 PM

I believe 6.10.3.4 is referring to the stiffness or moment of inertia to use when determining the stage 1, stage 2 and stage 3 moments and shears along the beam. I don't think Opis has any way for the user to enter what stiffness they want to use when the engine computes the stage 1 and stage 2 dead loads and the stage 3 live load. Brian, does BRASS LRFD have a way for the user to specify what stiffness to use when it computes the stage 1, stage 2 and stage 3 loads?

FROM:kkennelly DATE:3/14/2002 7:58:44 AM

And I guess Dean wants the ability to vary the stiffness along the length of beam for each stage.

FROM:bgoodrich DATE:Thursday, March 14, 2002 10:55:59 AM

For the purposes of structural analysis, BRASS considers the bare steel section for the non-composite stage. For the long-term composite stage, BRASS uses 3n anywhere a slab is defined. For the short-term composite stage, BRASS uses 1n anywhere a slab is defined. There is currently no mechanism to control this process. Note that once the moments and shears have been established, BRASS utilizes section properties based on the sign of the moment to compute stresses.

### Description

FROM:dteal DATE:Wednesday, March 13, 2002 2:49:55 PM

I am experimenting with one of the provided example bridges, MatrixBridge07. In the Deck Profile – Deck Concrete I enter a different n's for span 1 and span 2. After running a design review and looking at the BRASS input DAT file I find that the only n that got used was for span 1. Only one COMPOSITE-MATERIALS command line was generated.

If I leave span 1 blank and let BRASS use it's default and enter a value for span 2, span 2 gets ignored. The DAT file uses the first one it comes to and ignores the second.

FROM:bgoodrich DATE:Thursday, March 14, 2002 10:45:36 AM

BRASS only supports one concrete deck material for the entire bridge, i.e., one COMPOSITE-MATERIALS command. Therefore, the export fills the appropriate parameters at the first opportunity, which is for the first span. Warning messages are then issued when those materials differ from those in other cross sections or spans.

## Description

FROM:dteal DATE:Wednesday, March 13, 2002 2:51:15 PM

Structural Typical Section: Deck (Cont'd) - Sustained Modular Ratio Factor – Default.

If I leave this blank, for an Opis LRFD run, The BRASS DAT file never fills in what default it uses. If I where to leave the n blank in the Deck Profile-Deck Concrete BRASS enters a calculated value. Why are the default values for the Sustained Modular Ratio not printed in the BRASS DAT file?

FROM:bgoodrich DATE:Thursday, March 14, 2002 10:34:11 AM

The BRASS commands have several fixed defaults that may or may not be calculated. It makes sense to calculate a modular ratio because BRASS would use a default of 8.0. The sustained modular ratio factors are either 2.0 for concrete and 3.0 for steel and require no calculation. Rather than code the BRASS default in both the export and the engine, we have chosen to accept the engine default by leaving the appropriate command parameters blank. The value that BRASS uses for these types of parameters can be found somewhere in the main and intermediate output files.

### Description

FROM:kkennelly DATE:3/14/2002 9:08:20 AM

Can we make the New Mbr Alternative dialog easier to use by either:

1. Replace the drop down list for type with bitmaps of the beam shapes.
2. Make the drop down lists wider so users can easily distinguish between beam types (users in training have a lot of problems with rc i beams and t beams)

FROM:jduray DATE:3/20/02 7:49:03 AM

Sounds good to me...sketch up some ideas and give me an estimate of the time to do the bitmap

### Description

FROM:kkennelly DATE:3/20/2002 2:32:52 PM  
Submitted on behalf of Eric Evenson, URS via email:  
>>> <Eric\_Evenson@URSCorp.com> 03/20/02 11:53AM >>>

I entered in a 5 beam system with 3-span continuous W24x84's and cover plates at the pier. I entered and ran G2 first and got incredibly low ratings. I looked through all of my entered data to make sure I didn't misplace a decimal on the loads, but I couldn't see anything out of place. Out of curiosity I copied the member alternative up to G1 and re-computed the LL distribution and EFW. When I ran G1 the ratings were closer to what I was expecting to see. Can you think of any reason why G2 would be running so low and G1 be running so well with almost the exact same input?

Thanks,

### Description

FROM:dteal DATE:Friday, March 22, 2002 7:54:59 AM

For Ahmad B.

May not be calculating the depth of the beam properly using the haunches web depth. The attachment shows the web depths are negative in some locations.

My calculations indicate the depth @ first 10th point should be 48.40988 inches and for the second tenth point 43.06679 inches instead of -353.84 and -21.91 inches respectively.

The depth of the web will never be negative values.

FROM:kkennelly DATE:3/22/2002 10:12:00 AM

I think this has already been fixed in BRASS but we don't have the new BRASS executables so I can't test it. Brian, can you test this and verify the new BRASS dll for Service Pack 1 fixes this?

FROM: dteal DATE: Friday, March 22, 2002 7:57:20 AM  
For Ahmad B.

The schematic does not show the diaphragm at abutment # 1; but it shows the diaphragm at abutment # 2 and also in the framing plan schematics. See attached bbd file.

FROM: kkennelly DATE: 3/22/2002 10:41:37 AM

Can you tell me what Mbr Alt you're having a problem with? I'm not able to reproduce this. I looked at the mbr alt schematics for all of the mbr alts in structure 018(010)Br. over Timber Creek Sch. Base and I see crossframe at the beginning of the member. Also, what tolerances do you have set in the System Defaults window for feet and inches? I'm not sure if that's the problem but it might be.

FROM: dteal DATE: Tuesday, March 26, 2002 11:32:37 AM

4/19/2016 3:16:33 PM

**Complete Issue Information**

Tolerances at set in SI, m=0.001 & mm=0.1 giving us ft=0.003281 & in=0.003937.

Ahmads response to which mbr alt:

The member I am working on is member Alt for interior girder cross section base (G2) and also I get the same result for member alt sch. base for the same member.

FROM:kkennelly DATE:3/26/2002 3:55:29 PM

There is a piece of text that I think may be overlapping the 'x' depicting the cross frame in the mbr alt schematic. I can see part of the 'x' but not the total 'x' because some text saying "PL 5/8"x14"x" seems out of place. Do you see that text?

When I open the Girder Profile window for member 2, I see the first range for the top flange has a 0" width by 0" thick. Putting dimensions in for the width and thickness does not solve the schematic problem.

It would be useful to display a progress bar on the window so the user has some idea of how many more bridges are remaining to be rated when rating groups of bridges from the Bridge explorer.

Also, change the Cancel button to force the rating to abort instead of aborting just the current bridge. In the future we should add a dialog box to give the user the option to abort the entire group of bridge

FROM:bgoodrich DATE:Friday, April 05, 2002 11:30:25 AM

Richard,

I would carefully check the intermediate output for these type of structures. This will be the only place where you can see the unbraced length values. Points of interest at or near the interior supports may list incorrect unbraced lengths due to the missing ranges at the beginning of some spans. Also, Virtis/Opis handles the input of these structure just fine. The issue that needs addressed is with the BRASS export and/or possibly the BRASS engines.

Please send the framing plan to me or attach it to the incident. That way anyone on the development team involved with this incident can review it. I'll keep you informed as we address this incident.

FROM:bgoodrich DATE:Friday, April 05, 2002 12:26:50 PM

Attached framing plan schematic from Richard.

FROM:jduray DATE:4/23/02 8:28:56 AM

I think this is a BRASS (and perhaps the export) enhancement, not a bug in either the export or BRASS.

FROM:bgoodrich DATE:Friday, January 31, 2003 12:57:37 PM

Gale Barnhill reported a problem in Incident 4306 regarding bracing that does not coincide with a support.

FROM:hlee DATE:4/30/2008 2:28:26 PM

Discarded by TAG 12/07.

**Description**

FROM:dteal DATE:Wednesday, April 10, 2002 3:08:18 PM

I have a problem with this one bridge only in Version 4.1.0 using Win NT 4.0. I attached the structure. Used the Wizard Structure, Member 2, Modified Wizard. I did a HL-93 design review.

When I selected the View Analysis Charts, it was so slow to come in I had to pop up a print screen utility program and take a screen shot of the empty window (very slow screen.jpg). When I exited the Charts window, again it was slow enough to get a screen shot utility up and save it to a file (slow screen.jpg).

We rebooted out Oracle server, no change – I tried another 4 span bridge and the charts window acted properly. It is only this bridge that is giving me trouble. Is there any reason for this one bridge to slow down the charts window so drastically?

FROM:mordoobadi DATE:7/26/2002 9:35:29 AM

I tested this on my machine. I noticed the same behavior as Dean reported.

FROM:mordoobadi DATE:7/26/2002 1:53:40 PM

Code updated so that the screen gets updated while processing. The user can resize or move the window while processing.

Also added capability to stop drawing the graph when the user hits the X button.

Fixed in version 5.0.

FROM:mordoobadi DATE:8/22/2003 1:32:53 PM

Accepted by Dean Teal on 1/27/2003.

## Complete Issue Information

Thank you very much.

Ken

FROM:bgoodrich DATE:Friday, April 12, 2002 10:43:22 AM

I am unclear as to why you cannot assign the barrier and curb loads to the non-composite stage (Stage 1). Is it because you want those loads to be distributed differently from the self-weight of the slab? BRASS was designed to analyze non-composite structures in ONE stage, and the output was developed accordingly. It appears that analyzing the structure in more than one stage produces different results than if it is analyzed in one. Dan is checking into this in more detail.

We need more information before we investigate the negative moment issue you discussed. We need a list of the axle weights and spacings for the Toll Road Truck and a schematic if possible.

FROM:bgoodrich DATE:Friday, April 12, 2002 12:42:40 PM

E-mail from Ken Teng (4/12/02):

The concrete barrier and curb are placed in the field after the slab is poured. They (barrier & curb) are supported by the composite bridge (because the deck is set).

Also from the VIRTIS help, Stages 1, it says, "Non-composite (Stage 1) represents a non-composite structure. Loads applied to this stage are resisted by the non-composite girder". Since the slab is set up, I guess that the bridge is acting as composite bridge.

So for my case 1, non-composite, I use Stage 1, and for my case 2, composite, I use Stage 2. Now, Brass shows the compact check for any loading. I think you are right. (I attach a new bbd file)

For Toll Road Loading 90K, the non-composite section (case 1) shows both of the positive & negative moment check. But, for H20 or HS20, it only checks positive moment.

For the composite section (case 2), it only checks the positive moment for any loading (H20, HS20, Toll Road). Wired, isn't it?

FROM:bgoodrich DATE:Friday, April 12, 2002 1:37:09 PM

The new BBD file you sent has a new structure definition, which is composite this time because you added composite regions using the Shear Connectors window. Because your previous structure was non-composite for all stages, BRASS did not generate output for certain checks. Now that you defined your structure as composite, it appears you are getting the necessary compactness output. Therefore, I believe this output issue is resolved.

Dan does not think there is anything wrong with the algorithm that checks positive and/or negative moment. The weight and configuration of your truck may cause the moments to be such that positive and negative moment are checked. When the dead loads and live loads (H20, HS20, and toll truck) are factored and combined for the composite structure, the resulting moments are positive. However, for the non-composite structure, the live load moments are different. In general, BRASS only computes a positive moment capacity when positive moment is detected and then likewise for negative. Please review the live load moment reports for the non-composite and composite structures in Virtis or BRASS. I believe this BRASS issue is resolved as well.

FROM:kkennelly DATE:4/12/2002 10:49:16 AM

This was originally found in alpha testing for version 4.1 Service Pack 1. Couldn't save results for one of the sample PS training bridges. Mehrdad found that PS results had duplicate keys. Brian was made aware of this sometime in March. This incident to ensure that problem was fixed and we have the correct dll's.

FROM:hlee DATE:4/12/2002 11:51:38 AM

Tested OK on PCITrainingBridge2, 4, and 6 for the 3/31/02 Girder(LRFD).dll.

FROM:bgoodrich DATE:Friday, April 12, 2002 12:37:36 PM

I successfully analyzed and saved the same bridges. Closed.

FROM:bgoodrich DATE:Thursday, April 18, 2002 11:40:19 AM

When I modified BRASS to not generate duplicate results, I inadvertently caused the initial stresses to not be written to the results object. I have corrected the BRASS DLL.

FROM:jduray DATE:4/22/02 10:36:10 AM

Vi 3700 was created to track this latest problem.

### Description

FROM:dteal DATE:Friday, April 12, 2002 3:27:28 PM

A warning or error message is need to alert the user not to use program defined POI's at 10th points for reinforced concrete structures when taking advantage of symmetry and only defining ½ the X-Sections.

See attached bbd.

2 ratings where run. The first had the POI control under the Member Alt Description, Engine Tab set to 5- generate at user defined POI's only. The second run had the POI control set to 3- generate POI's at all 10th points and user defined points.

I ran an HS20 standard truck. When set to user defined POI's only the Axle Inventory Rating was 35.8 Ton @ 16.9% of Span 1. When the 10th points plus user defined points was used the inventory rating is 15.3 Ton @ 90% of Span 2.

Here is what has happened. X-Sections have been defined for ½ the bridge. These X-Sections are used in the Ranges to define the bridge from one end to the other. The X-Section depth is correct in the symmetrical half but the reinforcing in the section range will change (start and end will be reversed). This explains the wild differences the rating results.

There is no work around if you use program defined 10th points (POI Control #3) being BRASS will automatically adds the symmetrical X-Sections. Keep in mind that I am working on a minimum of 3 span parabolically haunched reinforced concrete structures with 3 bar reinforcing patterns in the top and 4 bar patterns in the bottom.

### Complete Issue Information

3131, 3121, 3045, 2008 are all incidents that are related to this problem. This is not a duplicate. It is requesting that the user be restricted from using POI control #3.

FROM:jduray DATE:4/22/02 4:42:14 PM  
How can Virtis/Opis know that you only defined half the structure?

FROM:dteal DATE:Monday, April 29, 2002 8:51:22 AM  
To answer the above question - for a three span bridge, the x-sections are cut at exactly the same place on each half of the bridge. It is how the ranges are handled. Igf x-sections are to be entered for both halves of the bridge we will be talking about 50 to 60 x-sections!

Please, try to do a LRFD design for this type structure. 3 span, parabolic haunch, 3 bar top pattern and 4 bar bottom pattern. Try to find NOT just an exceptable design but an economical design. You will need to find the most economical place to terminate your bars. To do this you will have to move x-sections around in the parabolic region. Until you have actually tried to do this type of design you will not know what the problems are.

FROM:jduray DATE:4/29/02 10:32:34 AM  
I don't think this is a bug. I changed the incident to and enhancement. I think we need to find a way to improve the cross-section description. Perhaps we should consider an interim solution to get us by until schedule-based R/C is implemented. I think we could do something like the following for less than \$10k:

- 1) Add a check-box to the cross-section for indicating the cross-section is to be used within a depth variation range.
- 2) The user would then define at parabolic range (or linear variation) bounded by cross-sections with the depth specified.
- 3) Within the parabolic range the user could specify other ranges that use cross-sections with the check-box checked. The depth of those cross-sections would be computed by the software.

There are some details to work out with this approach but I think we can come up with something that reduces the effort required to describe cross-sections based variations relatively inexpensively.

**Description**

FROM:dteal DATE:Tuesday, April 16, 2002 2:03:34 PM

I installed the service patch on my windows 2000 pc OK. I get the folowing error message when I try installing it on my NT pc.

Error:

RegDBGetitem failed!

Error Code: -2147024894

Message test: The system cannot find the file specified.

FROM:jihnate DATE:4/16/2002 2:39:29 PM

You'll need to reinstall version 4.1.0. Uninstalling is not required, just reinstall it over top of itself into the same directory to reset the Registry entry.

Be sure to select "Don't configure an ODBC Data Source".

Then install SP1.

FROM:dteal DATE:Tuesday, April 16, 2002 2:37:57 PM

We have 32 installations of the software - will this have to be done for all!!!!!!!!!!!!!!

## Complete Issue Information

FROM:jihnat DATE:4/16/2002 2:56:00 PM

I don't know the history of this particular PC, but it sounds like another instance of VirtisOpis was uninstalled after this instance was installed. This wiped out the required Registry entry. The easiest way to restore it is to reinstall. Or you could perhaps manually edit the Registry (although I haven't tried this).

FROM:dteal DATE:Tuesday, April 16, 2002 2:57:54 PM

I don't think that was the case. I ran register.bat and it didn't fix the problem. I had to do what you said and reinstall 4.1.0 first. I have checked 2 other installations (before I send this out to the all) and they worked OK.

In BRASS you can select an environment variable to define an editor for viewing/printing. If you do nothing it will use notepad. Notepad has no control for printing selections, it only prints all.

In Virtis, when you view an output file it defaults to notepad. We fooled Windows by:

4/19/2016 3:16:36 PM

HRS AASHTO

1240

**Complete Issue Information**

- 1) Finding and renaming Windows copies of notepad.exe to notepadorg.exe
- 2) Putting a copy of our editor of choice where the original copies of notepad.exe were.
- 3) Renaming the relocated copies of our editor of choice to notepad.exe.

But this has to be done with each PC.

It would be nice to have an option to select what editor you use in VIRTIS/OPIS.

FROM:jihnat DATE:4/19/2002 7:56:26 AM

Look at View/Preferences. On the Analysis tab you can enter your own Analysis output viewer.

**Description**

FROM:dteal DATE:Friday, April 19, 2002 8:05:06 AM

When doing our database migration from 4.1.0 to 4.1.1 on oracle we got 7 error messages. Our Computer Services guy asked me if they mean anything. I looked at the error messages with a blank stare and thought I would pass them off to you guys to see if they mean anything. See attached, Thanks

FROM:mordoobadi DATE:4/30/2002 9:13:17 AM

There was a problem in the order in which some views were created. The service pack should be updated with the revised migration script. Also for the people who have already done the migration and gotten the erros they should just recreate the views with errors. I created a script file for them to run to complete their migration. These people would have problem with bridge explorer viewing of results.

FROM:mordoobadi DATE:4/30/2002 1:07:17 PM

Revised Migration SQL script and also the SQL script to fix the problem reported in this incident are put on the web site.

### Description

FROM:dteal DATE:Monday, April 22, 2002 12:45:00 PM

For the attached bridge. Analyze member alt. For member 2. Go to the report tool and set report type to LRFD Analysis Output, and select one of the lower 5 items like say "Final Stresses at Transfer of Prestress". The report will be empty. The only reports it will generate are from the top 5 items.

Am I missing something here?

FROM:jduray DATE:4/22/02 3:38:52 PM  
Is this related to the missing Initial Stresses?

FROM:bgoodrich DATE:Tuesday, January 28, 2003 10:24:40 AM  
I was able to generate the report using 4.1.1. I tried a similar bridge with version 5.0.0 and the report was generated.

FROM:bgoodrich DATE:Tuesday, January 28, 2003 1:45:02 PM  
Dean - Please check if you are able to view all the reports in Version 5.0. Note that some of these reports will show nothing if there are no points of interest specified or generated. Could this have been the case?

Also, I noted a problem where the units for some reports are not listed and entered this as Incident 4300.

FROM:dteal DATE:Tuesday, January 28, 2003 3:40:43 PM  
I can't reproduce the problem??

FROM:bgoodrich DATE:Tuesday, January 28, 2003 3:57:06 PM  
Track field marked as "Accepted" on 1/28/03. Incident closed.

### Description

FROM:dteal DATE:Tuesday, April 23, 2002 2:25:06 PM  
I didn't notice this until upgrading to 4.1.1

First I brought up the NT Task Manager to monitor performance (Mem usage). Memory usage increases after each analysis. Each time I ran an analysis the memory usage figure keeps getting larger. I checked this because my analysis runs kept getting slower and slower with each run. I would have to reboot to speed things up again.

The second problem was exiting Opis. After things slowed down so I would have to reboot and I would hit exit, the hard drive gets very active and nothing seems to be happening. The task manager says that Virtis is not responding. But if you wait (several minutes) Virtis will finally close. If I exit Virtis after only one analysis run it will close right away. But after 4 or 5 runs it becomes very slow.

I am using NT 4.0 SP 6 on a 550 P2 with 128 Mb. I had our IT people take a look at my PC for any other problems. They could not find anything wrong with the PC.

FROM:dteal DATE:Tuesday, April 23, 2002 4:35:15 PM  
It took 80 seconds to close a bridge after it had been saved to the database. I saved it first, I waited until all hard drive activity stopped, then I exited the bridge (not virtis just the bridge). This exit took 80 seconds.

**Complete Issue Information**

FROM:jduray DATE:4/23/02 4:39:26 PM  
Dean - Were you doing a LFD or LRFD analysis?

The memory usage did not increase when I ran the 200+ validation LFD bridges. Perhaps this is a problem in the LRFD only.

FROM:dteal DATE:Wednesday, April 24, 2002 8:06:48 AM  
Attached the bbd  
Working on the Superstructure Def for 5 girders at 2.50, Wizard Alt for Member #2. I was doing a design review with HL-93 Design load and LRFD Fatigue Truck, both (SI).

FROM:dteal DATE:Wednesday, April 24, 2002 10:10:43 AM  
I found this behavior in both steel and prestressed. It only happens if the POI control for LRFD is set to tenth points. The more points that are defined the more memory it will not free back up. I have been using 3 span bridges with POI set to tenth points.

FROM:dkemna DATE:Wednesday, April 24, 2002 12:25:46 PM  
I have also found this to be true. I have been getting familiar with OPIS over the past few weeks. A couple of weeks ago I was analyzing numerous runs and found that the time to analyze was getting slower each time. I was analyzing a three span P/S\_I member alternative in LRFD (Not a complete definition) with POI's at tenth points. I also experienced a long wait when attempting to exit OPIS at the end of the day/s. I have been using OPIS 4.0.4 as we have not updated to OPIS 4.1 yet.

I am not sure whether this is related but after not rebooting my computer for about a week and a half while performing these numerous runs the Report Tool did not output any data. Rather, all the headings were output along with what appeared to be an infinitesimally small row of data (possibly). The spec checks were being printed jumbled and bolded and the validate and BWS reports were completely blank. These bugs were apparently fixed after rebooting my computer. I have not attempted to perform the numerous runs without rebooting my computer since.

I hope this information is helpful.

FROM:jduray DATE:4/26/02 9:35:41 AM  
There seems to be a memory leak in the LRFD analysis. Either in the results or BRASS. I used the NT performance monitor to track memory (process private and virtual bytes). LFD did not leak.

FROM:jduray DATE:4/26/02 9:51:10 AM  
Mehrdad is checking for leaks in the results objects.

FROM:mordoobadi DATE:5/2/2002 1:31:59 PM  
Here is what I experienced in versions 4.1.0 and 4.1.1

I analyzed TrainingBridge1 using LH-93 Template and monitored the memory using the task manager

| Stage    | Memory Level<br>4.1.0 | Memory Level<br>4.1.1 | Memory Level<br>5.0.0 (Debug) |
|----------|-----------------------|-----------------------|-------------------------------|
| -----    |                       |                       |                               |
| --       |                       |                       |                               |
| Open BWS | 525072                | 525940                | 569304                        |

4/19/2016 3:16:37 PM

**HRS AASHTO**

1247

**Complete Issue Information**

|              |        |        |        |
|--------------|--------|--------|--------|
| 1st analysis | 554376 | 554908 | 605932 |
| 2nd analysis | 582552 | 583412 | 639480 |
| 3rd analysis | 610608 | 611736 | 672392 |
| 4th analysis | 639104 | 640116 | 705612 |
| BWS closed   | 566504 | 566308 | 571152 |

The above results are for total memory usage of all of the processes which can be inaccurate.

FROM:jduray DATE:5/16/02 3:52:55 PM

I'm not sure this is meaningful. It does indicate that memory is being used and not released but since we don't know what the other processes are doing we can't say for sure (based on this) that Virtis is leaking memory. A couple things would be worth investigating:

Do debug builds of 4.1.0 and 4.1.1 show the same growth in memory usage?  
Does a release build of 5.0 show a growth in memory usage?

We need to monitor the memory used by the Virtis/Opis process, not total for all processes.

### Description

FROM:dteal DATE:Wednesday, April 24, 2002 9:35:56 AM

Wizard Alt. For Member 2.

Member Alt Description, Engine Tab, POI control set to tenth points only.

I get an HS20-44 Inventory Rating Location at 138.5 ft. This is not a tenth point? Why do I get a rating result that is not at a tenth point when I don't have any User POI's and told Virtis to do tenth points only?
