Submitted on behalf of Mike Pichura, Michael Baker Jr., Inc.

To reproduce the problem:

1. Use Floorbeam0 in the attached bridge.
2. Analyze FB0. Completed OK.
3. Open the FB0 floorbeam member alternative.
4. Change the definition from FB2 to FB.
5. Analyze FB0. Completed OK.
6. Change the definition back to FB2.
7. Analyze FB0. Cannot be completed.

Workaround is to save the bridge and reopen the Bridge Workspace.

FROM: Herman Lee DATE: 4/5/2013 9:55:12 PM Eastern Daylight Time  
Fixed a problem in switching beam def type.

Resolved for 6.5 release.

**Description**

FROM: Dean Teal DATE: 12/19/2012 7:54:21 AM Eastern Standard Time  
I have a brass file that was imported into 6.4  
(For my info BID 7191)

In the control options I set LFD to Generate at user defined points only  
See first superstructure definition  
Will get zero rating factors

In the second superstructure definition I don't have any POI boxes checked in the control options  
I will get rating factors based on 10th points

I think this has something to do with imported file has an override schedule checked. In this case it is for Transverse Stiffeners.

## Complete Issue Information

I have the same issues in RC

In the control options I set LFD to Generate at user defined points only  
See third superstructure definition  
Will get zero rating factors

In the fourth superstructure definition I don't have any POI boxes checked in the control options  
I will get rating factors based on 10th points

I think this has something to do with imported file has an override schedule checked. In this case it is for Vertical Shear Reinforcement.

FROM: Krisha Kennelly DATE: 12/19/2012 9:25:37 AM Eastern Standard Time  
After you import, are you testing the BRASS LFD engine or the AASHTO LFD engine?

FROM: Dean Teal DATE: 12/19/2012 11:09:13 AM Eastern Standard Time  
After I import I am testing with the BRASS LFD engine.

FYI - if you try the AASHTO LFD engine it will simply fail to run (analysis failed)

FROM: Krisha Kennelly DATE: 12/19/2012 1:46:23 PM Eastern Standard Time  
I'm splitting this into 2 issues. New Issue 12114 is for AASHTO LFD engine not running.

This issue remains for what Dean originally entered for the BRASS LFD engine.

### Description

FROM: Krisha Kennelly DATE: 12/19/2012 2:20:57 PM Eastern Standard Time  
Split out from issue 12110. See that issue for the bridge.

FYI - if you try the AASHTO LFD engine it will simply fail to run (analysis failed)

FROM: Krisha Kennelly DATE: 12/19/2012 2:21:43 PM Eastern Standard Time  
First member alt in the bridge attached to 12110.

User does not have any concrete slab data defined. Export complains because the concrete material is not defined. But it doesn't have to be defined since no thickness or width is entered.

FROM: Herman Lee DATE: 7/19/2013 2:01:29 PM Eastern Daylight Time  
Modified the data checking to allow the analysis to continue for steel girder with no cross section based slab data. Fixed for 6.5.1 release.

Developer Note:  
With the fix, the analysis continue until CSCSuperSteelGirderElement::SetBraceMoments.

FROM: Krisha Kennelly DATE: 4/3/2014 2:07:38 PM Eastern Daylight Time  
Fixed for version 6.6 alpha 4+.

The problem is many of the POI's in the member alt have the checkbox checked to override the

4/19/2016 3:24:41 PM

3380

**Complete Issue Information**

diaphragm data but have entered zero as the distances to the adjacent diaphragms. Zero is not a valid entry. Even if the point is at a diaphragm itself, the distances to the adjacent diaphragms have to be entered since the section capacity is dependent on the brace pt moments (Cb values, etc.).

Changed code to issue a warning the Analysis Progress dialog for points of interest that have blank or zero distance to diaphragms when the override diaphragm box is checked. The override diaphragm data will not be used in the spec check if the distances are zero or blank. Also added code to the validation to warn user when this condition exists.

FROM: Hanjin Hu DATE: 4/18/2014 8:57:01 AM Eastern Daylight Time  
Backchecked for V6.6.0 Beta Build 1.

verified with TrainingBridge1 or TrainingBridge2. This is a release bug.

FROM: Herman Lee DATE: 12/20/2012 10:04:36 AM Eastern Standard Time  
Please fix this issue in 6.5. Thanks.

FROM: Wayne Skow DATE: 1/10/2013 11:02:21 AM Eastern Standard Time  
Fixed a bug in SCSuperSteelGirderElement::HasShearConnectorsOverEntireLength() where it would return true at times when it should have been false.

Test this by applying shear connectors over an entire span, then over a partial span and check article 6.6.1.2.2. (LRFD or LRFR).

FROM: Subhadeep Ghosh DATE: 4/24/2013 6:43:42 PM Eastern Daylight Time  
Checking in 6.5 Beta 1  
Tested this with TrainingBridge1 and TrainingBridge2. For TrainingBridge1, the shear connector range was reduced to 75' from 161' but the message appeared in the article 6.6.1.2.2.  
For TrainingBridge2, the message appeared at a location in span 1 when the shear connectors were removed from some the location in span 2.  
Hence resubmitting.

FROM: Wayne Skow DATE: 4/30/2013 10:20:53 AM Eastern Daylight Time  
The original fix got overwritten somehow. Fix has been reapplied.

FROM: Subhadeep Ghosh DATE: 5/10/2013 2:31:03 PM Eastern Daylight Time  
Verified for 6.5 Beta 1.

## Description

FROM: Dean Teal DATE: 1/2/2013 10:13:51 AM Eastern Standard Time

Using the provided culvert example

Using the provided LRFR Legal Load Rating analysis setting template.

In the standalone database it will analyze

In our oracle database it will crash (I had exported and imported into our oracle production database)

- Unable to perform analysis
- Analysis Failed

Screen shot attached

FROM: Dean Teal DATE: 1/14/2013 11:46:24 AM Eastern Standard Time

Any culverts I create cannot be load rated LRFR in Oracle

To get a LRFR analysis I have to export and then import into the stand alone SQL database.

We need a work around here soon!!

FROM: Amanda Jackson DATE: 1/15/2013 6:07:09 PM Eastern Standard Time

I seem to be having the same problem with our Oracle database. I don't have a standalone to try it on.

FROM: Herman Lee DATE: 1/17/2013 9:49:10 AM Eastern Standard Time

This is a duplicate of Incident 12032. This issue has been fixed. After verifying the fix, we will provide an updated 6.4.1 DLL for fixing this issue.

**Description**

FROM: Krisha Kennelly DATE: 1/7/2013 1:09:35 PM Eastern Standard Time  
In the Steel Plate Girder Profile window, a weld definition can be assigned. But if you decide you want to remove the assignment of that weld definition you can't. You can't "un select" it in the window and you can't delete the weld def because it is being used somewhere.

This will likely become a problem for users once Issue 10691 is added to version 6.5.

- Windows:
- Plate girder Girder Profile, all tabs.
  - Rolled beam Girder Profile, Cover Plate tabs.
  - Plate Girder Cross Section Dimensions, Cover Plate tabs.
  - Rolled beam and Builtup Steel Cross Sections Cover Plate tabs
  - Transverse and Bearing Stiffener Definitions

**Description**

FROM: Herman Lee DATE: 1/10/2013 9:56:49 AM Eastern Standard Time  
 Submitted on behalf of John Gregory, Colorado DOT.

Part of the Bridgeware e-mail received on 1/3/2013:

=====  
 Second, can a routine be added such that the flexural steel in a parabolic concrete tee girder could be defined/analyzed either as a distance from the top or the bottom? We can go in a change them manually but Brass could do either definition so we have numerous parabolic tee girder bridges defined

4/19/2016 3:24:43 PM

HRS AASHTO

3392

**Complete Issue Information**

this way. To change them will take a great deal of time which we don't have and we need these ASAP for permit route processing.

=====

The help for VirtisOpis states that bars referenced from the top of the beam are considered parallel to the top of the beam and bars referenced from the bottom of the beam are considered parallel to the bottom of the beam. The export to the AASHTO engines follows this definition.

For cross-section based beams, the BRASS export assumes that bars that are physically within the bottom half of the beam are considered parallel to the bottom of the beam.

Revising the export to the AASHTO engines to follow the BRASS export method is considered an enhancement.

FROM: Herman Lee DATE: 7/7/2013 1:04:56 PM Eastern Daylight Time  
A standalone utility will be provided to Colorado DOT to correct this problem in their database.

**Complete Issue Information**

Help has been updated with the following statement.

"Left and right under location is referring to the direction of the horizontal portion of the bar. Placement of the bar at left or right corner of a wall can be adjusted using wall clear cover".

Fixed for 6.5 release. For internal testing fixed for 6.5.1 alpha build 1.

FROM: Subhadeep Ghosh DATE: 4/25/2013 4:31:45 PM Eastern Daylight Time  
Verified for 6.5 Beta 1.

## Complete Issue Information

Resubmit

Checked in Beta 2 for 6.5.0 on 5/31/2013

Still some issues on some culverts

Will attach a couple more screenshots and culvert XML's for your testing use.

FROM: Todd Thompson DATE: 5/31/2013 9:00:49 AM Eastern Daylight Time

To follow up - I believe I used 100% in all the views and when I print the schematic (for the bridge record) - the printed version is similar to the screen view.

One can zoom out to like 400% and the schematic issue goes away, normally but would require dozens of pieces of paper to print and tape together.

Hopefully we can get this to work at 100% which works well for both viewing and printing.

FROM: Joseph Ihnat DATE: 6/3/2013 7:32:21 AM Eastern Daylight Time

Fixed for version 6.5.0 (Beta 3).

FROM: Todd Thompson DATE: 6/20/2013 8:19:54 AM Eastern Daylight Time

Tested in Beta 3 these three same box culverts. Looks good.

**Description**

FROM: Bryan Silvis DATE: 1/16/2013 2:10:38 PM Eastern Standard Time  
I looked this over with Bruce and believe this is a bug. I attached his attachments in the Documents tab.

Bryan

---

From: Shepard, Bruce (VDOT)  
Sent: Wednesday, January 16, 2013 12:29 PM  
To: Silvis, Bryan J., P.E. (VDOT)  
Subject: Virtis Section Properties

The section properties computed on the Beam Shapes tab are shown in the 1st screen shot. The section properties computed during the analysis are pasted below the screen shot.

Since Virtis is computing these, why don't they match? (area, moment of inertia, section modulus, Vol/Surface ratio)

The xml file is for a beam with a composite concrete deck, however the section properties I'm asking about are the beam-only only properties (note that the pasted info is for the Basic PS Beam)

<< File: 28809a.xml >> << File: screen\_shots.docx >>

Bruce Shepard, PE  
Structural Engineer Section Manager

bruce.shepard@vdot.virginia.gov

FROM: Herman Lee DATE: 1/16/2013 3:51:43 PM Eastern Standard Time  
As specified in the PS Box Beam window's Properties tab, "Note: Analysis engine computes section properties based on the dimensions given in the 'Dimensions' tab."

The section properties computation routine (coordinate based) used by the AASHTO Engine is internal in the engine. The routine used by the Compute button in the PS Box Beam window's Properties tab resides in the user interface. That's why the properties don't match.

Ben, please confirm the Volume/Surface ratio reported in both places. The following assumption copied from the Help is used in the Compute button.

=====  
Compute button

Computes the beam shape section properties based on the information provided on the Dimensions tab. For beam shapes containing internal voids, this button will compute the Volume/Surface ratio

4/19/2016 3:24:45 PM

**HRS AASHTO**

3401

**Complete Issue Information**

based on using 50% of the interior perimeter of the void to calculate the surface area as per the AASHTO LRFD specifications. Enter your own value for the Volume/Surface ratio if you do not wish to use 50% of the interior perimeter to calculate the surface area.

=====

FROM: Bryan Silvis DATE: 7/30/2013 8:03:46 AM Eastern Daylight Time  
I am assuming that getting the section properties computation used by the AASHTO Engine to match those calculations residing in the User interface would be an "enhancement." I am also assuming that having the AASHTO Engine use entered values from the User interface would also be an enhancement.

Please confirm/mark this incident accordingly so I know whether changes are being made or I need to push as an enhancement.

Thanks - Bryan

FROM: Herman Lee DATE: 8/2/2013 11:39:05 AM Eastern Daylight Time  
Getting the section properties computation used by the AASHTO Engine to match those calculations residing in the user interface is an enhancement already planned for the 6.5.1 release.

Having the AASHTO Engine use entered values from the user interface would be an enhancement request.

FROM: Bin Zhang DATE: 8/8/2013 10:35:10 AM Eastern Daylight Time  
The Volume/Surface ratio computed on the Beam Shapes tab is correct, it matches my hand calculation. My hand calculation was listed below.

\*\*\*\*\*  
\*\*\*\*\*

| Gross Area | Void Area1       | Void Area2  | IndentArea1 | IndentArea2 | Net Area |
|------------|------------------|-------------|-------------|-------------|----------|
|            | NetVolume (in^3) |             |             |             |          |
| 1008       | 113.0973336      | 78.539815   |             | 3           | 1.125    |
|            | 695.0155178      | 8340.186214 |             |             |          |

| OuterPerimeter Surface (in^2) | L_Void1    | L_Void2   | Total Exposed |
|-------------------------------|------------|-----------|---------------|
| 139.75                        | 37.6991112 | 31.415926 | 2317.88489    |

Volume/Surface ratio = 8340.186214 / 2317.88489 = 3.6

\*\*\*\*\*  
\*\*\*\*\*

Function "public virtual bool ComputePerimeter(ref double dPerim)" in the AbanGeometry could not

**Complete Issue Information**

FROM: Herman Lee DATE: 8/12/2013 9:19:10 AM Eastern Daylight Time  
Ben, is the UI Volume/Surface ratio computed based on the assumption listed in the Help? Please also confirm the Volume/Surface ratio reported in the spec check.

Bryan, we will mark this incident accordingly after we have confirmed the reported Volume/Surface ratio.

FROM: Bin Zhang DATE: 8/13/2013 5:32:11 PM Eastern Daylight Time  
Herman, the UI Volume/Surface ratio is computed based on the assumption listed in the Help. The Volume/Surface ratio reported in the spec check does not match my hand calculation. I looked into the spec check. Function "public virtual bool ComputePerimeter(ref double dPerim)" in the AbanGeometry could not handle the polygon with internal voids. We need an enhancement to calculate the perimeter of a polygon with interior voids.

FROM: Herman Lee DATE: 8/21/2013 9:37:03 AM Eastern Daylight Time  
Subhadeep, please fix the ComputePerimeter function in AbanGeometry.

FROM: Subhadeep Ghosh DATE: 9/3/2013 2:48:12 PM Eastern Daylight Time  
Fixed for 6.5.1.

FROM: Subhadeep Ghosh DATE: 9/6/2013 10:03:06 AM Eastern Daylight Time  
Please note that the section property computations are handled by a single set of functions, common to both the AASHTO engine and the GUI. This has been fxd for 6.5.1.

FROM: Subhadeep Ghosh DATE: 12/5/2013 3:15:55 PM Eastern Standard Time  
dll updated for 6.5.1 beta 1.

FROM: Kane Gyovai DATE: 12/5/2013 3:20:32 PM Eastern Standard Time  
Verified for 6.5.1 beta 1.

Herman

For some reason, we could not analyze the Girder 9 (G9).

Did we accidently enter something and data got corrupted?

Could you please look into this?

FROM: Bin Zhang DATE: 1/18/2013 10:44:54 AM Eastern Standard Time  
 Please use AASHTO LFR, Mem Alt of G9 to reproduce this issue.I attached the bridge model, the system error message and the assert info for debug in the documents.  
 I am able to run G9 successfully if I remove the skew which is 1.5 degrees.

FROM: Herman Lee DATE: 7/16/2013 12:07:55 PM Eastern Daylight Time  
 For G9, the member length stored internally in the bridge file is less accurate than expected. I'm not able to locate the cause of this problem.

The workaround for this problem is to set both support skews to 0. Hit Apply or OK. And set them back to 1.5 Degrees. This will reset the internal member length.

### Description

FROM: Todd Thompson DATE: 1/18/2013 11:50:55 AM Eastern Standard Time

I noticed for this 10 steel girder bridge - at the completion of what appears to be a successful LF rating - we get this error message.

ror getting flange plate from steel flange plate ranges to left of 100.43844093 m!

Current tolerance for m is 0.00030480.

09:12:27 AM - Line 946 in source file DoSteelAssemblyRangeSet.cpp.

The error message appears to be Metric. yet everything about this bridge looks like it was defined with english units. I looked at each Load Rating report log and there is no error messages in any of the 10 girders but this error message pops up at the very end.

Not sure what is triggering this error message. I noticed this happens in 6.4.1 (SQL Server) and I went back to 6.3.1 (Sybase). So it's been around for awhile. I don't remember which version we coded this up in, but we didn't get the error message during the initial load rating.

I'll attach the bridge xml from 6.4.1

FROM: Bin Zhang DATE: 7/22/2013 9:43:53 AM Eastern Daylight Time

I am able to reproduce this error message for version 6.4.1.

The length of the girder G7 is 329.49493 feet (58.87637 + 105.819868 + 105.8618 + 58.93686 = 329.49493), while the user input length is 329.522444 feet. This is the reason for the error message.

I revised the length for the "Girder Profile", "Deck Profile", "Haunch Profile" and the "Lateral Support" to be 329.49493 feet. Then this error message is gone.

## Description

FROM: Todd Thompson DATE: 1/18/2013 12:22:05 PM Eastern Standard Time  
Would like to get the new culvert, drilled shaft and any other new tutorials from version 6.4/6.4.1 published to the download section of support center.  
Thanks,

FROM: Herman Lee DATE: 1/18/2013 12:31:02 PM Eastern Standard Time  
The only tutorials we have for the 6.4 new features are those used in the User Group meeting. Those training materials are available in the download section.

VIRTIS/OPIS User Group 2012  
Training Materials (self-extracting exe file, 9.7 MB)

FROM: Todd Thompson DATE: 1/18/2013 1:11:49 PM Eastern Standard Time  
Ok - I was requesting they get added to the tutorial section so we have everything together in one place for the examples and tutorials. Thanks

FROM: Herman Lee DATE: 1/20/2013 12:10:08 PM Eastern Standard Time  
We have to first update those user group training materials to use the release version of 6.4.

**Description**

FROM: Bin Zhang DATE: 1/22/2013 9:46:53 AM Eastern Standard Time  
 I submitted this incident on behalf of George Huang from CalTran.  
 There is an inappropriate description regarding the 3D concrete girder model in the "AASHTO LRFD Superstructure Method Of Solution Manual". The comments / questions from CalTran was listed below:  
 \*\*\*\*\*  
 \*\*\*\*\*  
 3) For reinforced cross sections, the cross-section is modeled as a beam element using the web and the tributary area of the flanges to represent the girders. Shell elements are used to represent the deck (beam flanges), and rigid links to connect the beam elements to the deck elements (see Figure 7).  
 It seems the stiffness of deck area (tributary area) has been double counted, once in the beam element and once in the shell element.  
 How does Virtis calculate the live load demand, M and V? Since the force from girder (beam element)

4/19/2016 3:24:47 PM

HRS AASHTO

3412

**Complete Issue Information**

and deck (shell element) need to be combined.

\*\*\*\*\*  
\*\*\*\*\*

FROM: Bin Zhang DATE: 1/22/2013 9:52:09 AM Eastern Standard Time

I modified the description regarding the 3D concrete girder. The revised description was listed below :  
For reinforced concrete cross sections, the cross-section is modeled as a beam element to represent the girder. Shell elements are used to represent the deck, and rigid links are applied to connect the beam elements to the deck elements (see Figure 7).

This fix will be available for AASHTOWare Br version 6.5.

FROM: George Huang DATE: 1/30/2013 5:08:31 PM Eastern Standard Time

There may still be some problem in the modeling even with the modified description. There are shear forces between the web and deck. Using the rigid link with very small moment inertia (I), the shear force may not be transferred.

FROM: George Huang DATE: 5/6/2013 1:48:57 PM Eastern Daylight Time

For the modified description, will it be more clear to use "girder stem or girder web" instead of "girder" only, since girder includes both the stem (web) section and (effective) deck section? So the sentence will be "For reinforced concrete cross sections, the cross-section is modeled as a beam element to represent the girder stem (or girder web), ..."

FROM: Bin Zhang DATE: 6/20/2013 9:42:21 AM Eastern Daylight Time

I revised the "AASHTO LRFD LRFR Superstructure Method Of Solution Manual" per George's advice on 5/6/2013.  
We will update the description regarding the rigid link later.

FROM: Bin Zhang DATE: 4/10/2014 1:04:26 PM Eastern Daylight Time

I updated the LRFD solution manual about the connections between the top flange and the concrete deck.

For the straight girder 3D FEM analysis in version 6.6.0, we are still using vertically rigid link;  
For the curved girder 3D FEM analysis in version 6.6.0, we are using the master-slave constrain. For non-composite cross section, the vertical constrain will be applied; for composite cross section, the full constrain will be applied. Please read the attached figure for the Master / Slave Specification.  
We will use master-slave constrain for both straight girders and curved girders in version 6.7.0.

FROM: Hanjin Hu DATE: 4/18/2014 8:57:42 AM Eastern Daylight Time

Backchecked for V6.6.0 Beta Build 1.

FROM: George Huang DATE: 4/25/2014 5:21:26 PM Eastern Daylight Time

Thanks for the updating.

FROM: Krisha Kennelly DATE: 1/22/2013 10:31:04 AM Eastern Standard Time  
 see mbr alt in attached file. Run HL93 Design Review. At 54' in span 2, poi overrides diaphragm location with diaphragm at 52' and at 54'. Mid point of unbraced length is 53'. this is also the point where the LL moment is max so BrD thinks the the 53' point should just be considered for the shear connector articles. The stress article is not considered there and in 6.10.8.2.3 Cb at 54' the mid stress is incorrectly listed as zero.

(beam flanges), and rigid links to connect the beam elements to the deck elements (see Figure 7) ("AASHTO LRFD/FRFR Superstructure Method of Solution Manual", Page 21 of 48).

It seems the stiffness of deck area (tributary area) has been double counted, once in the beam element and once in the shell element.

How does Virtis calculate the live load demand, M and V? Since the force from girder (beam element) and deck (shell element) need to be combined.

\*\*\*\*\*  
\*\*\*\*\*

FROM: Bin Zhang DATE: 1/22/2013 3:35:27 PM Eastern Standard Time

I am able to confirm this incident using the BID11 bridge. Both Line Girder and 3D FEM analysis calculated the same beam cross section properties, such as area and MOI. The beam cross section property should not consider the contribution of the tributary area in the 3D FEM analysis.

FROM: Herman Lee DATE: 3/27/2013 2:17:23 PM Eastern Daylight Time

Fixed 3D FEM and Distribution Factor - Line Gider analyses not to include top flange in 3D model beam element properties for RC Tee and I beams. The top flange is included as shell elements.

Resolved for 6.5 release.

FROM: Bin Zhang DATE: 4/25/2013 5:03:20 PM Eastern Daylight Time

Verified for version 6.5 beta 1 using the BID11 bridge.

FROM: George Huang DATE: 5/6/2013 1:51:40 PM Eastern Daylight Time

Please let me know if anything I need to do for this VI. Thanks.

FROM: Phil Litchfield DATE: 1/24/2013 12:26:05 PM Eastern Standard Time

If the slab exposure factor is left blank in the culvert alternative description window, a factor of 1.00 is used. But when you specify a different factor, 1.00 will still be used in the spec check.

FROM: Herman Lee DATE: 2/25/2013 9:56:31 AM Eastern Standard Time

The entered slab exposure factor will only be applied to the top slab when there is no fill.

Having the wall exposure factor and perhaps also the interior surface exposure factor available for user input would be a good enhancement.

### Description

FROM: Dean Teal DATE: 1/30/2013 9:39:18 AM Eastern Standard Time

When using the rebar wizard for culverts with fillets (fixed corners)

When you enter the anything for the corner bar in the lower part of the screen, when you move to the next field the data you entered in this corner bar stuff disappears.

I can not enter corner bar data in the wizard, have to go back up and enter the bar name and go into the rebar tab and locate the bars.

FROM: Srujana Thogaru DATE: 2/4/2013 10:13:13 AM Eastern Standard Time

Can you please attach the bridge xml file causing the above issue.

FROM: Dean Teal DATE: 2/4/2013 1:33:00 PM Eastern Standard Time

I attached the bridge - I don't know what good that will do, I have already added the corner bars by adding the bars in the bar mark definitions window.

I was using the wizard when this happened - on every one I did that had corner bars.

FROM: Dean Teal DATE: 2/4/2013 2:05:17 PM Eastern Standard Time

It appears to be related to whether or not Moment Released at top and bottom of walls selection.

If these boxes are checked (pinned box) then you can put the corner bar in - but you don't need it then.

If these boxes are left blank (fixed box) then you can't enter the corner bar in the wizard - this is when you need it.

FROM: Srujana Thogaru DATE: 6/4/2013 9:02:53 AM Eastern Daylight Time

I am unable to reproduce the problem using the culvert sample bridge in the DB(entering new bar data for corner bar and c bar and saving for reinforcement wizard) .

I have tried all the options checking and unchecking the options in end conditions window.

I have asked for you sample bridge because if it is any different I can reproduce the problem and find the cause. Can you please attach your xml file which is cause the problem.

FROM: Dean Teal DATE: 6/7/2013 1:31:51 PM Eastern Daylight Time

Using my second structure of the attached culvert model

Go directly to culvert reinforcement and select the wizard

### Complete Issue Information

Enter all the data in wizard as I have shown in the screen shot  
( you can try to skip entering the data and just go the corner bar data entry)  
Then as a last item try to enter you corner bars as

1. S2 bar mark

As soon as you click on the bar size, your bar mark field is blanked out

FROM: Dean Teal DATE: 6/26/2013 10:13:19 AM Eastern Daylight Time

As a bug, I would have thought it would have been fixed in 6.5.0

When will this be addressed?

FROM: Srujana Thogaru DATE: 6/27/2013 1:01:43 PM Eastern Daylight Time

Able to reproduce the problem in 6.4.1 build unable to reproduce in 6.5. Some other fix might have  
have fixed this problem. Fixed in 6.5 Beta 3.

FROM: Dean Teal DATE: 7/23/2013 11:43:58 AM Eastern Daylight Time

Accepted in 6.5 beta 4

### Description

FROM: Dean Teal DATE: 1/30/2013 1:47:25 PM Eastern Standard Time

I entered this pinned box just like I have done all the others I entered.

When I attempt to load rate (LFD HS20 truck) the Analysis Progress window stops just after "Getting Component Results" and gives the error "All reactions are Zero" and analysis fails.

I can't see anything I have done different (I use a template to create culverts)

Can you find why this will not run?

I would understand zero capacity, but it simply will not run.

Culvert attached

FROM: Dean Teal DATE: 1/30/2013 4:41:35 PM Eastern Standard Time

I attached another very similar culvert created from the same template with the same end conditions and spring releases. This culvert runs just fine.

4/19/2016 3:24:50 PM

HRS AASHTO

**Complete Issue Information**

FROM: Dean Teal DATE: 2/4/2013 1:26:53 PM Eastern Standard Time  
The second culvert I attached was 076-045  
Work just fine on my laptop (windows 7 64 bit)  
When I run it on omy desktop, XP, it fails with the erros I reported

FROM: Dean Teal DATE: 2/4/2013 1:44:51 PM Eastern Standard Time  
More testing on 076-045  
Did NOT run on XP using Oracle  
Did run using Windows 7 64 bit on SQL database (laptop)  
Did NOT run using Windows 7 64 bit on Oracle

FROM: Dean Teal DATE: 2/4/2013 2:47:06 PM Eastern Standard Time  
More testing ont he First structure I attached (076-046)  
Did NOT run on Windows 7 64 bit on SQL database (laptop)  
Did run on Windows 7 64 bit on Oracle  
Did run on XP using Oracle

FROM: Dean Teal DATE: 3/1/2013 7:37:20 AM Eastern Standard Time  
Any work arounds so I can move forward with getting my culverts into BrDR?

FROM: Wayne Skow DATE: 3/4/2013 2:40:17 PM Eastern Standard Time  
The problem is with the moment releases on the "End Conditions" dialog. Whenever you release both moments, the structure is unstable due to side sway. To prevent instability, select "Provide side sway support" whenever both moments are released.

When sideway instability is present, it's hit-and-miss whether the analysis errors off or not. It depends on the values in the stiffness matrix. That's why the one model runs but the other doesn't even though both have side sway instability.

FROM: Herman Lee DATE: 3/27/2013 11:29:59 AM Eastern Daylight Time  
Email from Wayne:

=====  
No change required to box culvert. Although, we should think about a warning message when the user releases both moments but does not select the side sway support checkbox  
=====

I added a warning check during the analysis when both moments are released but the side sway support is not selected.  
Resolved for 6.5 release.

FROM: Bin Zhang DATE: 4/25/2013 5:59:28 PM Eastern Daylight Time  
Verified for version 6.5 beta 1.

|------|---------------|---------|

### Description

FROM: Phil Litchfield DATE: 1/30/2013 5:23:48 PM Eastern Standard Time  
From Consultant (Souther):

In the subject model, a 2-span PS Bulb tee, Virtis is not using the reinforcement in the deck or the effective slab width in the spec check calculations near the end of the beam (Span 1 - 118.67). We don't remember this being a problem in 6.3.1.

FROM: Krisha Kennelly DATE: 5/2/2013 8:53:23 AM Eastern Daylight Time  
This issue is related to 11878.

6.4.0 and previous versions were always exporting the slab rebar but only exporting the slab if the section was composite as marked by the user on the Shear Reinforcement Ranges window by tne of the following 3 ways:

- a. Vertical bars extending into deck.

4/19/2016 3:24:50 PM

HRS AASHTO

3427

**Complete Issue Information**

- b. Horizontal shear bars entered.
- c. A composite horizontal region entered.

The location of the rebar was incorrect if the slab was not also exported.

6.4.1 was revised to only export the rebar if the section was marked as composite by one of the 3 preceding methods.

As part of 11878, for regions between the simple span bearings near the pier, if the section within 1' of the simple span bearing is composite, then the point in question is composite.

118.67' is not marked as being composite by one the 3 methods above so the slab and rebar is not exported.

Fix has been implemented for 6.5.0 to also consider any points within 1' of the simple beam bearing when checking if the beam is composite within 1' of the simple bearing.

Workaround – On the Shear Reinforcement Ranges: Horizontal tab, enter a range over the entire length of the precast beam and say it is Composite.

**Complete Issue Information**

example). Upon reviewing the dead load actions due to the haunch load for Beam J (Spans 3 & 4) in the attached file, it is apparent that the program is incorrectly calculating the force effects due to this additional weight.

FROM: Herman Lee DATE: 4/9/2014 3:04:13 PM Eastern Daylight Time  
For Beam J (Spans 3 & 4) haunch profile:

Z1 and Z2 = 3.0", the haunch is extended 3" from the edge of the top flange (interior side) with Y1 = 1.0". The Typical Section View for this side is correct.

Z3 and Z4 = 0.0", the haunch is flushed with the edge of the top flange (exterior side) with Y2 = -2.25". I think the Typical Section View for this side is incorrect.

For embedded flange, the haunch load is calculated based on the following dimensions:

- 1. Thickness = Average of Y1 and Y2 + Flange thickness
- 2. Width = Average of Z1 and Z2 + Average of Z3 and Z4 + Flange width

How should the negative Y2 dimension be considered? Seems to me that the negative Y2 should be measured downward from the top of the flange since positive Y2 is measured upward from the top of the flange.

Creightyn, how many bridges in your inventory are coded with negative haunch dimensions?

### Description

FROM: Phil Litchfield DATE: 2/1/2013 3:27:38 PM Eastern Standard Time  
From Beisner:

There is no option to put a hook at the end of a bent bar in a culvert. But you do have the option in a slab. Can this be added to the bar definitions for culverts? Also, can a field be added to the bent bar definition to allow for multiple series of bends? Attached is the bar detail we were trying to model in a culvert.

## Description

FROM: Jeff Ruby DATE: 2/5/2013 2:59:47 PM Eastern Standard Time  
I was parusing the database with the attached sql script on the MSSQL version of the database and found what I think is a discrepancy in the dbo.abw\_sys\_data\_dictionary.

I think that the "us\_unit\_id" column for the "MAX\_OVR\_WEIGHTED\_IMP\_FACTOR" in table "ABW\_SUPER\_LL\_DIST\_SUB\_WDLA" should be "492" not "491".

Which means, the database is storing "percents", but the default us\_unit is "number"

Probably doesn't break much. But, might want to make sure.

FROM: Mehrdad Ordoobadi DATE: 4/26/2013 3:21:31 PM Eastern Daylight Time  
Geoff, could you look at the fields that Jeff has pointed out and correct them if necessary in Version 6.5.

FROM: Geoffrey Trees DATE: 4/29/2013 4:57:54 PM Eastern Daylight Time  
Jeff was right that it was the wrong number. Must have been like that for a long time but I corrected it in the database and updated the create, integrate and migrate scripts.  
Resolved...

FROM: Jeff Ruby DATE: 5/7/2013 12:05:51 PM Eastern Daylight Time  
I saved some numbers in a bridge in 6.4.1, exported it, then imported it in 6.5.0. The values appeared to be the same. See images.

### Description

FROM: Bryan Silvis DATE: 2/14/2013 11:39:34 AM Eastern Standard Time

I looked over Bruce's issue and it looks like it mixes and matches which is not correct. The xml for the file is attached in the Documents tab. The following is the write-up he submitted:

Prestressed voided slabs, bridge is type g from AASHTO Table 4.6.2.2.2d-1

3' wide exterior beams

4' wide interior beams

Virtis incorrectly calculates the exterior beam LL DF for moment

According to AASHTO Table 4.6.2.2.2d-1, the exterior beam DF (g) is based on the interior beam DF

4/19/2016 3:24:53 PM

HRS AASHTO

**Complete Issue Information**

(g-int).

Several variables are needed to calculate g-int. I, J and b are all used. In this calculation, Virtis uses I and J of the interior beam (that's correct), but it uses b of the exterior beam (that's not correct).

The result is that Virtis will use an un-conservative value.

This error only shows up when the bridge has different beam types.

Note: This is a different error than the one I've previously reported concerning the interior beam LL DF for moment. Because g-ext is directly related to g-int, that error also affects g-ext.

| Name | Current State | Summary |
|------|---------------|---------|
|------|---------------|---------|

### Description

FROM: Phil Litchfield DATE: 2/14/2013 2:30:20 PM Eastern Standard Time  
From consultant(Chamberlain):

We have a culvert where the walls are thicker than the top slab. And we are getting an error, "All reactions are zero." But if we reduce the wall thickness to be less than the thickness of the top slab, it runs without an error. Attached is a screenshot of the error and the model.

FROM: Wayne Skow DATE: 3/14/2013 1:24:24 PM Eastern Daylight Time  
I traced the problem to the FeModel analysis. After analysis, the displacements and forces are coming out of the FeResults objects with NaN's. All the data going in, however, seems reasonable. I generated the .xml and .std files (attached) for the model. I tried a few variations of wall thickness. When the wall thickness is set to 9.5, the analysis works. When set to 12", the analysis works. So a wall thickness greater than the top slab does not always cause a problem. In this model, the top slab is 9.5" and the bottom is 10.5". A wall thickness of 10" (and values around 10) cause NaN's to be produced.

Hopefully, the problem can be reproduced via the .xml file in a solution environment that allows us to debug FeModel.

FROM: Bin Zhang DATE: 7/19/2013 10:51:26 AM Eastern Daylight Time  
In the End Conditions window, both the "Moment release at top of walls" and "Moment release at bottom of walls" have been checked. These 2 releases caused a stability issue for the culvert analysis. I will add a warning message when the user picks these 2 checkboxes together.

Phil, I have a workaround for you. Please check the "Provide side sway support" checkbox in the End Conditions window. This provides a roller at the upper left corner of the left most culvert cell to restrain side displacement. It will make the model statically stable.

FROM: Bin Zhang DATE: 8/16/2013 3:48:05 PM Eastern Daylight Time  
An error message was added saying "Release moment at both top and bottom of walls may cause a stability issue!" when the user checked both the top and bottom walls moment release and meanwhile uncheck side sway support.  
Fixed for version 6.5.1.

### Description

FROM: Phil Litchfield DATE: 2/15/2013 3:13:58 PM Eastern Standard Time

You can enter a slab exposure factor for culverts. Is this factor also applied to the walls of the culvert?

FROM: Herman Lee DATE: 2/22/2013 10:15:37 AM Eastern Standard Time

No, the entered slab exposure factor will only be applied to the top slab when there is no fill.

While looking into how the slab exposure factor is used, fixed a bug in checking for whether a component is a top slab.

Resolved for 6.5 release.

FROM: Phil Litchfield DATE: 2/22/2013 6:39:10 PM Eastern Standard Time

Why is the slab exposure factor only applied when there is no fill? Also, why is there not an input for the exposure factor applied to the walls?

FROM: Herman Lee DATE: 2/22/2013 6:45:45 PM Eastern Standard Time

The AASHTO Culvert Engine is based on the WisDOT Box Culvert program. I found the following WisDOT policy regarding culvert exposure factor.

WisDOT Policy Item:

A class 1 exposure factor,  $e = 1.0$ , shall be used for all cases for cast-in-place box culverts except for the top steel in the top slab of a box culvert with zero fill, where a class 2 exposure factor,  $e = 0.75$ , shall be used.

**Complete Issue Information**

FROM: Herman Lee DATE: 2/25/2013 8:00:23 AM Eastern Standard Time  
Having the wall exposure factor and perhaps also the interior surface exposure factor available for user input would be a good enhancement.

FROM: Phil Litchfield DATE: 2/26/2013 6:24:49 PM Eastern Standard Time  
Herman,

Can you change this to an enhancement, to add a user input for the exposure factor for the walls. Also, to allow the slab exposure factor to be applied to culverts with fill.

Thanks,

Phil

FROM: Herman Lee DATE: 2/27/2013 7:39:04 AM Eastern Standard Time  
This incident will show up in the 6.5 Release Notes since there is a bug fix in this incident. To avoid confusion, I have submitted an enhancement request Incident 12213 (Culvert - Exposure Factor enhancement) on your behalf.

**Description**

FROM: Herman Lee DATE: 2/19/2013 3:21:53 PM Eastern Standard Time  
Submitted on behalf of Jacob Reneson (Jacob.Reneson@jacobs.com), Jacobs Engineering.

Part of the received Bridgeware email:

=====  
2) I do not agree with how the negative moment capacity is being calculated away from the pier when you get into the beam (i.e., critical rating of 0.832 for strength 1 flexure at 0.974\*span1 for member g1). As you get into the beam, the prestress force transfers into the beam and becomes significant. Thus, depending on the location of the center of gravity of strands towards the end of beam, you could have a significant prestress force towards the bottom of beam that would reduce the negative moment capacity. It would be analogous to putting prestress strands in the top of beam at midspan and the positive moment capacity being reduced if mild steel were in the bottom.

 Subject: RE: AASHTOWare Virtis\_Software Question

Good morning Ben,

Sorry for the late reply. I got few things needed to get them done yesterday. Still, right now I am not able to run the 6.3 database in Virtis 6.4 because of the backup copy of the database.

This morning I just uploaded the 6.3 database file and the log file via your ftp site. When you have a chance, please take a look and direct me what to do next.

Thank you

Hao-Chen

Subject: RE: AASHTOWare Virtis\_Software Question

Hao-Chen,

Could you please send your database file and log file to us via our ftp: <http://eftp.mbakercorp.com>? I will need that to reproduce your problem.

BTW, are you able to run the migrated 6.3 database in Virtis6.4 now?

Ben

### Complete Issue Information

1. Attach the old database to SQL server. Please skip this step if the old database is already in the SQL server.
2. Create the system DSN in ODBC. After this step, the 6.3 database will appear in the ODBC Date Source.
3. Migrate the old DB with migration tool.

Please "Run as administrator" when you run the migration tool. Please feel free to let me know if you still have question about this.

Please use the Virtis63 database to reproduce this issue.  
The workaround is that manually backup the database and then do the database migration using the migration tool. This workaround was send to the user on 2/22/2013.

FROM: Geoffrey Trees DATE: 2/27/2013 10:14:10 AM Eastern Standard Time  
I investigated this issue and I have not found anything wrong. I was able to migrate the database, as recieved, without any issue. I was also able to have the Migration Wizard make a backup of the database successfully. Since I am not able to reproduce the problem, I believe the issue is in permissions on the user machine and not an issue with the Wizard itself. One additional note is that when I inspected the database provided by the user, I noticed the connection GUID was NULL. This tells me that this database was never connected to by Virtis. Since the user informed us that there were needed bridges in this database, I am assuming we were sent the wrong database. All the bridges in this database were sample bridges.

FROM: Bin Zhang DATE: 2/27/2013 10:43:11 AM Eastern Standard Time  
I think it's a windows security issue. The user may not have the full permission to write on the hard drive or the folder where the database was backup.  
Please read the BackupErrorMessage and the PermissionForUsers in the document for details. Please ask the digital service department of your company to help you add the "write" permission for your user account.

-- 6.10.1.1.1b and concrete stresses.

Good observation. This is a little difficult to understand. But the use of stage 3 section modulus for concrete stresses in stage 2 is on purpose. The rationale for it is found in the commentary for article 6.10.1.1.1d. There is a note in the spec check output for article 6.10.1.1.1b that alerts the user:

Note:

\*As per Article 6.10.1.1.1d, slab stress due to all permanent and transient loads is computed using the short term modular ratio, n

-- 6.10.11.1.3

Note that Vn in 6.10.11.1.3 is not the Vn at that POI, but the Vn from adjacent panels.

(1) Does Virtis Opis support Windows Authentication for logging into the DB

(2) If not, are there any plans to pursue this?

As we migrate from Sybase to SQL Server - our DBA's are very reluctant to take the ancient practice of user id - password like what appears in Virtis Opis and really prefer Windows Authentication. The approach of user id and passwords is extremely rare for our SLQ Server DBA's.

FROM: Herman Lee DATE: 2/27/2013 2:46:57 PM Eastern Standard Time

Virtis/Opis does not support Windows Authentication for logging into the DB. Currently there is no plan to support Windows Authentication.

Please let us know if you would like to change this incident into an enhancement request. Thanks.

FROM: Todd Thompson DATE: 2/27/2013 3:05:28 PM Eastern Standard Time

Please make this an enhancement.

**Description**

FROM: Bryan Silvis DATE: 2/27/2013 2:27:51 PM Eastern Standard Time

The I beam section input will not accomodate VDOT bulb-T shapes (i.e. we have an additional flare in the bottom flange similar to the one you can input in the top flange currently). As a result, we have dimensions entered in the available fields that are close to, but do not match our actual shape. The values for the actual bulb-T properties are entered in the Properties tab including Area and Moment of Inertia.

However, this entered Area is not used in the dead load calculation for the beam (the self-load calculation is always based on the dimensions entered). If I was using the Compute button in the Properties tab, I would expect it to calculate the properties based on the dimensions entered. However, entered properties should be used by default for all calculations.

This is similar to Issue 12140 VDOT entered for voided slab sections. However, the properties entered there will not be used subsequently even when the self-compute button was used originally to compute the properties based on the dimensions entered.

Submitted on behalf of Richard Withers:

From: Withers, Richard [mailto:RWithers@mdot.ms.gov]  
Sent: Tuesday, February 26, 2013 4:28 PM  
To: Lee, Herman  
Subject: RE: Incident 12207: Duplicate of incidents 12032 and 12123 in Virtis 6.4.1

Herman,

I have attached a document detailing three errors we are getting with Virtis in the production system database that we don't get with the stand alone database. It should be noted that we were getting these errors with version 6.2 also. We skipped version 6.3 and upgraded directly to 6.4.1.

To give you a little background, Mississippi's database started out as a Pontis Sybase database. I believe Virtis was integrated with the Pontis database while it was still in Sybase. The database was then migrated from Sybase to Oracle by our IT people. It was suggested by someone at Baker (Mehrhad Ordoobadi I think) that we ship the Sybase database to you and let Baker migrate it to Oracle, but our people said they could handle it. I don't know if the migration from Sybase to Oracle has anything to do with our problems, but I thought it would be good information for you to have.

Thanks again for all of your help,

Richard

**Complete Issue Information**

ADDITIONAL SELF LOAD input to allow assigning a load case, so that you could add an ADDITIONAL SELF LOAD for each load type, if desired.

Thanks  
Scott

From: Scott Cavanaugh  
Sent: Thursday, March 07, 2013 10:45 AM  
To: 'Bridgeware,'  
Cc: Ekin Senturk  
Subject: Wearing surface consideration/improvement in virtis

Herman / Ben,  
Many state DOTs and Authorities are currently using Virtis for LRFR. In many of their load rating manuals and policies, they note that any future or additional wearing surface shall not be applied to the As-Built case. This makes sense.

Also, in these models, agencies like to maintain BOTH the As-built model and the As-Inspected model (typically might consider section loss). For section loss, this is typically addressed by adding a separate MEMBER ALTERNATIVE under the same MEMBER, and assigning a name with "As-I" appended. Then, this As-I MEMBER ALTERNATIVE is set to (E)(C) so that virtis sees this member as the EXISTING and CURRENT member. Often times As-B = As-I, but in the event of additional wearing surface, these will not be the same due to increased dead load.

In Virtis, the way the member loads and wearing surface input are treated, there seems to be no good way to consider As-I additional wearing surface in a model. At the SUPERSTRUCTURE level, if the As-I wearing surface thickness is input under WEARING SURFACE, and the SUPERSTRUCTURE LOADS / DL DISTRIBUTION is set to either UNIFORMLY TO ALL GIRDERS or BY TRIBUTARY AREA Virtis will automatically distribute this wearing surface dead load (DW) to all members within one superstructure. Thus if wearing surface is changed at this location, a separate SUPERSTRUCTURE would need to be created and named with "...As-I". This could lead to larger than necessary virtis file sizes and seems to be the only way to address As-I wearing surface changes in a model while still maintaining both the As-B and As-I cases.

The option to modify the wearing surface by adding an additional MEMBER LOAD is also not viable since this input would apply to ALL MEMBER ALTERNATIVES within one MEMBER. Again, the only option is to create a second SUPERSTRUCTURE definition as mentioned above.

What would be useful is if Virtis could improve its ability to handle this case, which is not uncommon, by incorporating a wearing surface thickness input at the MEMBER ALTERNATIVE level. Would this be easy to do, and do you think it might be beneficial? Has this issue been raised before?

Thanks

## Description

FROM: Load Rater Shanon Murgoitio DATE: 3/8/2013 4:24:35 PM Eastern Standard Time  
This error is for v6.4.1, but the version name and build pull down menu only gives me beta choices. When running bridges with the AASHTO LRFR engine v6.4.1, a system error occurs. It appears everything is running fine by looking in the analysis progress window while the analysis is being done. As soon as it finishes the analysis, a system error appears which states, "GetIDsOfNames returned an error while searching for CheckMessageLoop (DISP\_E\_UNKNOWNNAME). 02:00:35 PM - Line 244 in source file FeedbackByDispatchItem.cpp." Then the results appear. Attached is a screen print of the error and the results displayed in addition to the xml file. This is happening on all our bridges run with the AASHTO LRFR engine (AASHTO LFR does not produce an error). It is not specific to one structure type and occurs on the sample database that loads with Virtis as well as on our production database that is on an SQL server. It is happening to all ITD users, but the error is not occurring for our consultants. The error was not occurring when we did our testing for 6.4.1beta2. This is likely only a problem for ITD, but I could use some help in figuring out where to start trouble shooting.

### Description

FROM: Amanda Jackson DATE: 3/12/2013 11:53:20 AM Eastern Daylight Time

Whenever I do an analysis that uses the AASHTO engine (bridge rating analysis, calculate LRFD distribution factors), I get an error message at the end of the analysis. The analysis seems to run fine, and the rating completes, I just get the error box whenever I do an analysis. Once I click "OK" on the error message, it goes away and the rating is complete. I thought maybe it had something to do with our installation of 6.4.1, but our IT people here have been unable to track down what is causing the error, especially since they can't see the AASHTOWARE code. I've attached a pdf file of the debug error. Let me know if you need more information.

FROM: Joseph Ihnat DATE: 3/12/2013 12:17:09 PM Eastern Daylight Time

Two DLLs may have failed to reregister after the SP1 install (AbaFeModel and AbaFeResults). This is usually due to a permissions issue. Please try registering the DLLs, then try an analysis again.

On Windows 7, you have to open an elevated Command Prompt window (Start, Programs, Accessories, right-click "Command Prompt", select "Run as administrator"). Then change directory to the folder where Virtis is installed and type "register.bat" at the command prompt.

On Windows XP you can usually just double-click the register.bat file from Windows Explorer.

Make sure all DLLs register with result "succeeded".

### Description

FROM: Geoffrey Trees DATE: 3/12/2013 1:35:06 PM Eastern Daylight Time

On behalf of Richard Withers:

If you copy a bridge, then associate the copied bridge with its Pontis data and then try to edit any of the superstructure definition info, you get this error (image attached).

I don't recall having this issue before, but it could have been there since our normal procedure was to associate the Pontis data then immediately close the bridge and then reopen.

FROM: Geoffrey Trees DATE: 4/30/2013 2:57:24 PM Eastern Daylight Time

So far I have not been able to reproduce this issue. I will leave it open for now.

FROM: Srujana Thogaru DATE: 3/13/2013 9:41:13 AM Eastern Daylight Time  
Hello,

I'm rating a box culvert and using a #6 c shape spaced at 12 inches. It looks to me through the spec check that at the top of the wall virtis is cutting my reinforcement down to 0.28 in^2 per foot while at the bottom I have the regular amount of 0.44 in^2. I looked through the issues and didn't see this specifically. Is there a way around this? Should I just use straight bars and fix them at the ends?

Thanks,

Cody Parker, PE  
Bridge Engineer

HNTB Corporation  
257 East 200 South, Suite 1000  
Salt Lake City, Utah 84111

FROM: Srujana Thogaru DATE: 3/13/2013 9:44:11 AM Eastern Daylight Time  
I have tested the attached bridge with 6.5 development and 6.4.1 release and found that reinforcement for C- Bar at the start of wall (0.0ft) was cut down but at the end of beam (6.0 ft.) was Correct. I have also tested it using a straight bar. Both start and end of the beam reinforcement was cut down. There is no work around for this problem.

FROM: Srujana Thogaru DATE: 6/3/2013 9:37:03 AM Eastern Daylight Time

FROM: Wayne Skow DATE: 1/20/2014 1:44:35 PM Eastern Standard Time

The C-Bars were being processed as L corner bars resulting in wrong development length values at the start end. The wall cross section location at 0.0 was within the standard development length causing a reduction in effective area.

Fixed in v660.

Tester - run LFR and check Ext Wall 2 @ 0.0, article APPG.6.1. The area of rebar reported should be .22 and .22. (previously it was .14 and .14).

## Description

FROM: Dean Teal DATE: 3/13/2013 11:53:46 AM Eastern Daylight Time

I have a template file set up for fixed culverts (Culvert Template attached)

This file contains a material for Soil called Soil Properties

When I create a new culvert I will copy the template culvert definition to my new culvert

It drops the Soil Property and I have to manually enter the (copy from library) every time

FROM: Geoffrey Trees DATE: 3/27/2013 4:44:11 PM Eastern Daylight Time

Dean, I think we have two cases here.

- 1) When you copy your template, the soil material: Soil Property is missing.
- 2) When you have your template open and a new bridge open, when you try to copy (by drag and drop or copy and paste) a culvert definition from one to another, you get a crash.

For case 1 above, I am not able to reproduce the issue. When I copy your template, in the bridge explorer, the Soil Property soil is identical to the original copy.

For case 2 above, I am able to reproduce this issue, however, we don't support copying all the dependencies for a definitions from bridge to bridge. All of the materials, shapes, etc., must exist in the bridge you are copying into. This doesn't only apply to Culvert but you can see this with steel, prestress, rc, timber as well. For example, if you create a new bridge and attempt to copy the superstructure definition from training bridge 1 into the new empty bridge, it will have a similar error message. If you like, we can put this in an enhancement request to add this capability.

FROM: Geoffrey Trees DATE: 3/28/2013 10:35:58 AM Eastern Daylight Time  
Dean, I am going to look into this further. We tested it on a release version and it works for TB1 like you said to Jim. However it doesn't work for TB1 in our development version. We are going to investigate this more.

FROM: Dean Teal DATE: 3/28/2013 10:54:59 AM Eastern Daylight Time  
See my attached word doc for screen shots

**Case #1**

I am not using the bridge explorer  
I am copying from the Bridge Workspace "Culvert RCB Template" to the Bridge Workspace "New Culvert"

**Case #2**

I have NEVER gotten a crash doing this (drag and drop)

You are wrong that all materials, shapes etc. must exist in the bridge you are copying too. This is something we did in version 1.0. The materials will be copied over regardless!!

I just did this to TrainingBridge1 (drag the Superstructure Def to a new "blank" bridge) and all the materials got copied over.

FROM: Geoffrey Trees DATE: 3/28/2013 1:04:21 PM Eastern Daylight Time  
Dean, you are right that the materials should be copied over. What we experienced on our development environment is being investigated. I have assigned this to Joe to look into further. Sorry about the mixup.

**Description**

FROM: Srujana Thogaru DATE: 3/14/2013 4:31:14 PM Eastern Daylight Time

This issue is created based on the email sent by Kauzlarich, Joseph M (Joseph.Kauzlarich@mbakercorp.com) from Chicago, IL

=====  
Problem is caused due to Girder Spacing attributes under Girder System-structure Framing Plan Details. Work around is to delete girder space, save and then generate report.

Sample bridge causing the problem is attached with the incident.

FROM: Srujana Thogaru DATE: 6/26/2013 9:52:29 AM Eastern Daylight Time

Actual cause of the problem is that under super structure Span-18, in framing planning details window girder spacing orientation is entered in correctly. A warning issued when you open the window. If that error is corrected report tool works good. This is not a bug.

 Subject: Re: modeling moment transfer for slab

Thanks for the reply. So, even though I didn't have "Frame Structure Simplified Definition" checked, it somehow had them checked but caused it to crash because the actual selection of a "Frame Structure Simplified Definition" wasn't checked?  
 On Tue, Mar 19, 2013 at 8:36 AM, Bridgeware, <Bridgeware@mbakercorp.com> wrote:  
 Jessica,

To fix the error, open the Superstructure Definition window, click on the "Frame Structure Simplified Definition" checkbox and uncheck "Frame Connection" for all three supports in the Frame Connections grid.

Herman,

I've run a structure in Virtis 6.2 successfully, but I get the attached error when I import it to 6.3 to run. Do you have any suggestions?

Thanks,  
Jessica

3479

**Complete Issue Information**

brass file and the sections library

2. Using an old XP computer, the same .dat file is used, this time it imports but will not save.

So, windows 7 and XP are getting different failures

I imported a RC structure with windows 7, imported and saved just fine.

See attached files for screen shots

FROM: Herman Lee DATE: 3/19/2013 3:08:37 PM Eastern Daylight Time

The location of the BRASS section library file is defined in the BRASS Import Preferences dialog (see attached png file, select File| Preferences to open this dialog).

Are both Windows 7 and XP referencing the same location for the BRASS section library file?

FROM: Dean Teal DATE: 3/19/2013 3:35:52 PM Eastern Daylight Time

DUH!!! - Now I feel really stupid

That was it

Wish all fixes were so simple

Thank You

FROM: William Metcalf DATE: 3/20/2013 12:01:28 PM Eastern Daylight Time  
still using 6.3.1 when i try to import this truck file into database it just locksup and I have to force quit virtis. I have attached the xml file.

FROM: William Metcalf DATE: 3/20/2013 3:24:26 PM Eastern Daylight Time  
let me explain further we created a brand new oracle database and tried batch exporting and batch importing many of our structures. This worked fine, but when we trying to import trucks it would either give an error and crash or lockup. So we thought this was an import issue but right after I posted this I went back and tried to create a new truck in the new database, and Virtis locks up when I do that also. It locks up when I try to save it. So the problem is saving trucks in our new database.

FROM: Geoffrey Trees DATE: 3/28/2013 10:57:25 AM Eastern Daylight Time  
From E-Mail to William @ Mon 3/25/2013 2:04 PM:

Hello William,

I very quickly tried to do an import of the vehicle you sent us and it works OK on our end. I did notice, however, that the vehicle is essentially blank. It has a name and description but no axles or other properties are defined. For us to proceed, you will need to ask your database administrator to produce a full dump file of the Oracle database and have them send it to us so we can reproduce your setup. They can send us large files via our ftp website below. Please let me know if you need more information.

FROM: Geoffrey Trees DATE: 4/29/2013 3:26:34 PM Eastern Daylight Time  
William,

We had another user with this issue. He submitted his database to us and we were not able to reproduce it. He discovered on his own that while using 64-bit version of Virits if he didn't have the minimum required ram, that he had this issue. If you are also using the 64-bit version of Virtis, please ensure that you have the minimum required amount of ram.

Also, please let us know if you are still having this issue as I have not heard anything recently.

Thanks,  
Geoff

Importing BRASS.dat file to BrR (Virtis) 6.4.1

.data and .log files attached

When importing a rolled beam .dat file I get an error for STRAND-ST5 "OTH" for other strand types.

This is a rolled beam not a prestressed beam (no strands and no STRAND-ST5 command.

I don't understand how to fix this with the error message given?

Dean is getting the following message:

Import file: C:\Download\Virtis Temp\Steel\b002016.dat

**Description**

FROM: Phil Litchfield DATE: 3/25/2013 6:02:07 PM Eastern Daylight Time  
 Does virtis always calculate the plastic section modulus, Z, of a section? Or does it use the user input value in the library if given? Also, is the calculated Z value shown in the output somewhere? I can't seem to find it.

FROM: Subhadeep Ghosh DATE: 3/28/2013 10:50:36 AM Eastern Daylight Time  
 The analysis uses the plastic section modulus, Z, if provided for a Rolled steel section. It can be checked by running a LFD analysis (with allowing plastic analysis) and checking Article Plastic Moment (Mp) for Noncomposite Section after the analysis. If not provided (or not overridden by the user) the plastic section modulus is not computed separately.

FROM: Krisha Kennelly DATE: 4/2/2013 9:09:28 AM Eastern Daylight Time  
 Here is some more information. Issue 11388 was an enhancement for version 6.4.1 to allow the user input Z value to be used. The following rules are used to determine when to use the user input Z:

4/19/2016 3:25:00 PM

HRS AASHTO

3484

## Complete Issue Information

1. LRFD/LRFR spec articles will not be changed to use the user input Z. The LRFD Spec App D6.1 says to compute Z as the program is currently doing. This will match the BRASS LRFR engine implementation.

2. The LFD article to compute noncomposite plastic moment will be revised to compute  $M_p = F_y * user$  input Z and PNA at mid-height of the rolled section only if:

- a. No cover plates exist
- b. No rebar exists

If a and b aren't met, Z and PNA are computed as they are now.

3. The LFD article to compute composite plastic moment for negative moment will be revised to compute  $M_p = F_y * user$  input Z and PNA at mid-height of the rolled section only if:

- a. No cover plates exist
- b. No rebar exists

If a and b aren't met, Z and PNA are computed as they are now.

4. The LFD article to compute composite plastic moment for positive moment will not be modified since the slab has to be included in the PNA and  $M_p$  calculation.

On the Structure Def window, a member alt type checkbox should be disabled when a member alt of that type exists. This was the original behavior in the window (incident 2053) but somewhere along the way it got broken.

FROM: Herman Lee DATE: 3/28/2013 9:15:34 AM Eastern Daylight Time  
From the Help:

=====  
These types will automatically be selected when a corresponding member alternative type is created. These checkboxes cannot be unchecked if a corresponding member alternative type exists. For example, if a prestressed concrete member alternative currently exists, the P/S box will be checked and disabled. You can not uncheck the box while that prestressed concrete member alternative exists.

### Description

FROM: Katy Grime DATE: 4/4/2013 11:07:30 AM Eastern Daylight Time

Hello. After we have analyzed a bridge and opened the spec check, we select the particular point of interest and specification article that we wish to generate a report for. Once the desired specification reference is highlighted, we click on report tool, select "selected articles" and "bullet list". The report then opens up and it is a blank page with the bridge name on top. The same thing happens even if we try different specification articles, different points of interest, and changing the format to "verbose" from "bullet list". We have attached the xml file. Thank you.

FROM: Herman Lee DATE: 4/4/2013 11:21:00 AM Eastern Daylight Time

You should be able to generate the spec check report after removing the "&" character in the bridge name.

Subject: RE: Virtis 3d FEM analysis

Herman,

It's giving me rating factors of zero for my LRFR load ratings with the 3D FEM. When I do the line girder analysis I get reasonable results. Sorry for not being more clear in my first email.

Thanks,

Cody

Subject: RE: Virtis 3d FEM analysis

Cody,

I tried LFR and LRFR 3D FEM for the bridge. Both analyses completed ok. Please give us more detail on reproducing the error.

Thanks,  
Herman

Subject: Virtis 3d FEM analysis

Hello,

Can you tell me why the following bridge gives me an error when I do the 3d FEM analysis. It works fine for the line girder analysis.

Thanks,

Cody Parker, PE  
Bridge Engineer

Unexpected negative moment was observed at the support position of the PS beam. However, the

4/19/2016 3:25:01 PM

HRS AASHTO

3489

**Complete Issue Information**

negative moment capacity at this location is zero. So a zero rating factor was calculated at this support location. I have 2 possible solutions for this issue.

1. Release the moment at the simple support location for the 3D FEM analysis, make the moment zero. OR
2. Do not rate the moment at the simple support location in the 3D FEM analysis.

FROM: Bin Zhang DATE: 4/9/2013 10:04:48 AM Eastern Daylight Time  
The workaround was sent to the user on 4/9/2013 via bridgeware email.

FROM: Herman Lee DATE: 4/10/2013 7:30:39 AM Eastern Daylight Time  
The model doesn't have mild steel entered at the support locations.

Subject: Fw: Virtis: Zero Elastic Shortening Losses when using Transformed Section Properties

We noticed that the Virtis software routinely se the loss due to elastic shortening to zero, if the transformed section property option turned on.

We think that it is wrong, however, we would like to know the reason for Baker's code it that way. Your explanation might help us understand this issue better, if necessary, we could ask to modify the coding.

Subject  
Virtis: Zero Elastic Shortening Losses when using Transformed Section Properties

Vinacs,

Regarding your observation about Virtis' use of zero elastic shortening losses when using Transformed Section properties:

4/19/2016 3:25:01 PM

HRS AASHTO

3492

**Complete Issue Information**

Virtis sets fpES = 0 when you check the "Use transformed section properties" box. This appears to be an error by Virtis.

Perhaps the people who were programming the code for Virtis were looking at AASHTO BD LRFD Section C5.9.5.2.3a (see below), which says:  
"When calculating concrete stresses using transformed section properties, the effects of losses and gains due to elastic deformations are implicitly accounted for and Delta-fpES should not be included in the prestressing force applied to the transformed section at transfer".  
It's possible that they read this, and then went into their code and used some sort of "if-then" statement that set Delta-fpES = 0 for the entire program. However, they were only supposed to set Delta-fpES = 0 for cases where the beam is subjected to external forces (the prestressing forces are internal). The transformed section properties should never be used to calculate the stresses in the concrete as a result of the prestressing forces, therefore, clicking "use transformed section properties" should not ever affect the stresses in the concrete as a result of the prestressing forces.

## Description

FROM: Todd Thompson DATE: 4/24/2013 1:52:05 PM Eastern Daylight Time  
Using 6.4.1 with SQL Server DB

I have a designer that designed a culvert (with another program) and wanted to do an LRFR rating with Bridge Rating/Design to evaluate his design.

When we do an LRFR HL-93 rating - the application fails to run. (See attached log file).  
When we do a Design Review HL-93 - the analysis runs, then when one checks on the Spec Check button - Virtis Opis crashes (See attached screen shot).  
But when we do a LFR HS-20 rating - works fine without any errors, crashes or otherwise no problems.

of course this is the first load rating done by our Bridge Design unit -

I tried to review the support center but didn't see anything similar to this.

FROM: Todd Thompson DATE: 4/24/2013 2:15:48 PM Eastern Daylight Time  
As followup - I can't seem to get any of my culverts to work in LRFR.

4/19/2016 3:25:03 PM

HRS AASHTO

3499

**Complete Issue Information**

I even took a culvert that worked in the sample DB during Beta testing and it works with LRFR just fine in that DB, but when I export and import it into my SD DB - the LRFR (and LRFD Design Review) fails to run.

Baker did convert and migrate our Sybase to SQL Sever DB and if I had to guess the source of the problem - it might be DB related?

FROM: Todd Thompson DATE: 4/24/2013 2:19:14 PM Eastern Daylight Time  
And one more bit that leads us to a DB problem.

I exported the problem culvert and imported it into the sample DB and I can do an LRFR rating without any problems.

But - Virtis Opis still crashes when I do a Design Review and click on the Spec Check button with the sample DB

FROM: Herman Lee DATE: 4/24/2013 4:12:43 PM Eastern Daylight Time  
The issues are duplicates of Incident 12032 (LRFR Culvert Analysis Error) and 12141 (Culvert LRFD Spec Check).

I emailed Todd the package for fixing Incident 12032 and 12141.

Crash when viewing distribution factor calculations for an RC slab in 6.4.1.

- Using the attached example, go to the 'Live Load Distribution' window.
- Go to the 'LRFD' tab
- Click on the 'Compute from Typical Section' button
- Enter 28' for 'Overall slab width' and '2' for 'Number of lanes':
- Press 'Continue' button
- Analysis completes successfully
- Click on the 'View Calcs' button
- Virtis crashes.

(see attached)

FROM: Melanie Berry DATE: 4/29/2013 4:10:07 PM Eastern Daylight Time  
 I ran the LRFD Dist Factors for both the Exterior and Interior Line Girder Slab Strips. The factors calculate but when you try to view the calcs, it tells you that the report does not exist. I was able to locate the file on my C: drive though. Attached are the screen shots and the .xml file.

FROM: Srujana Thogaru DATE: 5/2/2013 11:43:21 AM Eastern Daylight Time

This is release issue in 6.4.1. Fixed in 6.5 beta 1.  
 12409 is duplicate of this issue.

FROM: Subhadeep Ghosh DATE: 5/7/2013 2:02:03 PM Eastern Daylight Time  
 Verified for 6.5 beta 1.

FROM: Melanie Berry DATE: 5/29/2013 9:42:01 AM Eastern Daylight Time  
 Verified that you are now able to calculate the distribution factors for the Exterior and Interior Line Girder Slab Strips and also able to view the calcs after.

### Description

FROM: Brenda Crudele DATE: 5/7/2013 11:45:22 AM Eastern Daylight Time  
Program crashed when choosing LRFD Analysis Output in the report tool. This happened on two different bridges. One bridge attached. Screen shot attached.

FROM: Subhadeep Ghosh DATE: 5/7/2013 3:58:13 PM Eastern Daylight Time  
This is release bug which is existent in 6.4.1. We do not support Brass\_LRFD but when the user runs with Brass\_LRFD they are prompted to run to run with AASHTO LRFD. But in the report tool, when it looks for the AASHTO LRFD spec check report in the system, the path where the report is searched gets assigned as "Brass LRFD" instead of "AASHTO LRFD". This is because the user selected "Brass LRFD" in the GUI.  
(Developer's note: Look at "GetInputOutputFilePath" function in "UiAnalysisOutputReport").

FROM: Joseph Ihnat DATE: 5/22/2013 2:16:22 PM Eastern Daylight Time  
Changed folder to Support Center.

FROM: Joseph Ihnat DATE: 4/8/2014 2:42:53 PM Eastern Daylight Time  
Workaround is to either install BRASS-LRFD or change analysis module to AASHTO LRFD in member alternative window.  
Fixed in version 6.6 (added code to report error instead of crash).

FROM: Hanjin Hu DATE: 4/17/2014 9:16:34 AM Eastern Daylight Time  
Backchecked for V6.6.0 Beta Build 1.

**Complete Issue Information**

from happening so that users don't lose unsaved work.

FROM: Herman Lee DATE: 5/21/2013 4:31:23 PM Eastern Daylight Time  
The comment on 5/10 is not a resolution.

FROM: Herman Lee DATE: 6/21/2013 7:55:33 AM Eastern Daylight Time  
Fixed the crash for the 6.5 release. The fix will be available in Beta 4/Acceptance Build for testing.

Please note that with 0.000002 difference in the left edge distance between start and end. BrR is not able to adjust the framing plan for the user.

FROM: Brad Wagner DATE: 7/17/2013 10:37:03 AM Eastern Daylight Time  
In the same model, I changed left edge at start to 23.75001. I get an error "unable to find girder bay". When I leave the structure typical section screen and come back, I get the warning "Girder display type is set to "Perpendicular.....". It seems to be treating the structure as curved. Same thing happens if I change the left edge at end only to 23.75001.

If start and end are the same, I have no issues. If start and end are different by more than 0.0001 or more, I have no issues.

This may seem like a trivial thing, but it corrupts the model.

|------|---------------|---------|
|------|---------------|---------|

### Description

FROM: vinacs vinayagamoorthy DATE: 5/7/2013 2:12:53 PM Eastern Daylight Time  
This issue was found when we were using 6.4.1.

Users are allowed to enter the longitudinal distances using % of web depth. Unfortunately, software displays it as straight, instead of following bottom flange when the bottom flange is on parabolic profile.

We would like to know how the specification check utilizes the proper distance.

Structure Definition: Span 2-4 (MDL 1 of 1)

FROM: Subhadeep Ghosh DATE: 6/7/2013 10:05:33 AM Eastern Daylight Time  
I ran a LRFD HL 93 design review to investigate your question:

For sections with longitudinal stiffener depth entered as % of web - (Bottom Flange) Article 6.10.1.9.2 was checked at the following locations:

Support Distance  
#  
from

|   | Support (ft) | Flex type (in) | Web Depth from bottom flange (in) | 20% of web depth ds (in) (6.10.1.9.2) |        |
|---|--------------|----------------|-----------------------------------|---------------------------------------|--------|
| 2 | 20           | Neg            | 127.375                           | 25.475                                | 25.476 |
| 2 | 50           | Neg            | 96.875                            | 19.375                                | 19.376 |
| 2 | 230          | Neg            | 96.875                            | 19.375                                | 19.376 |
| 2 | 250          | Neg            | 112.375                           | 22.475                                | 22.476 |
| 2 | 270          | Neg            | 147.25                            | 29.45                                 | 29.452 |
| 3 | 20           | Neg            | 127.375                           | 25.475                                | 25.476 |
| 3 | 30           | Neg            | 112.375                           | 22.475                                | 22.476 |

Column#5 and 6 above, does not match up in the span of the girder where the display is wrong. Hence, the specification check does use the proper distance.

But, since the schematic is wrong, I am entering this as a bug.

FROM: Joseph Ihnat DATE: 10/15/2013 12:55:06 PM Eastern Daylight Time  
The bottom profile of the attached bridge is defined as a series of segments with linear variation, not parabolic. The schematic works OK for parabolic profile.  
Fixed for 6.5.1.

### Description

FROM: vinacs vinayagamoorthy DATE: 5/7/2013 3:46:17 PM Eastern Daylight Time

I used the wizard to create the shear stirrup spacing. When I fired up the wizard, it checks whether shear stirrups exists for the girder and warn me about it. It was great.

After I generated the shear stirrup spacing, i figured I did not enter the values within wizard properly. I adjusted the spacing and then click the wizard to regenerate the spacing for me.

It tried to add to the existing shear rebar spacing. It should either require user to "Overwrite" the existing shear spacing.

FROM: Bin Zhang DATE: 5/8/2013 1:52:30 PM Eastern Daylight Time

You are right, Vinacs. Each time you run the Stirrup Wizard, the existing stirrup reinforcement will be deleted. It will be a nice enhancement to have the option to add to the existing shear rebar spacing besides the "Overwrite" option.

**Description**

FROM: Brad Wagner DATE: 5/7/2013 4:48:19 PM Eastern Daylight Time

I understand that the incident that this enhancement was based on only specifies materials and beam shapes, but I feel that it would be helpful to have this functionality for trucks, appurtenances and other library items. Can these be added?

FROM: Herman Lee DATE: 5/11/2013 10:22:42 AM Eastern Daylight Time

I changed this incident to an enhancement request.

FROM: Brad Wagner DATE: 5/21/2013 12:40:08 PM Eastern Daylight Time

How much effort is it to add a few additional fields? I think they would be very helpful, and they are in keeping with the intent of the incident, even though they were not clearly stated.

### Description

FROM: Todd Thompson DATE: 5/8/2013 8:59:09 AM Eastern Daylight Time

I was testing 6.5.0 Beta 1 and was evaluating the VI 11562 enhancement to allow top flange lateral support points.

I was able to add these individual points, ranges of points. But when I view the graphic of the beam - none of the point loads are displayed on the graphic.

In example - I added a range of points every 5 ft for 6 spaces. But the graphic does not display anything.

I was using Training Bridge 1 - Girder G2

I removed the uniform top flange lateral support and added the point supports.

**Complete Issue Information**

This is missing on the schematic for both girders and floor beams.

FROM: Todd Thompson DATE: 5/8/2013 10:00:41 AM Eastern Daylight Time  
Stringer schematic also does not reflect the point lateral points entered

FROM: Joseph Ihnat DATE: 5/13/2013 12:08:21 PM Eastern Daylight Time  
This wasn't in the initial scope/estimate. Changed to enhancement request.

FROM: Todd Thompson DATE: 5/13/2013 1:56:30 PM Eastern Daylight Time  
This is clearly a case that demonstrates the TAG should have seen the scope, mockups and given a chance to review.

I think we'll need to seriously consider adding this. We can't just display hit and miss lateral supports.

FROM: Todd Thompson DATE: 6/18/2013 4:05:34 PM Eastern Daylight Time  
Please add this for consideration for 6.5.1 - this was something that was really overlooked and the TAG was not given an opportunity to review this mockup or scope.

## Complete Issue Information

FROM: Brad Wagner DATE: 5/8/2013 1:54:24 PM Eastern Daylight Time

When testing the point capacity override enhancement, it was noted that when adding an override to a hinge, I must create a point of interest that corresponds to the point of interest automatically generated by Virtis for the hinge location. However due to differing number of units allowed in the span length field, the hinge location field, and the point of interest field, it is virtually impossible to have the point of interest override location be at the exact location as the hinge.

I think it would very beneficial to have the ability to automatically place the point of interest in the POI list either 1) if selected or 2) always for hinges.

I've attached a model that demonstrates the two POI's that are .02 feet apart from each other, one overridden, and the other not.

FROM: Krisha Kennelly DATE: 6/9/2013 10:04:26 AM Eastern Daylight Time

I used structure def 'Spans 1 and 2 Girderlines' and 'Typical Interior' girder in the attached bridge for my testing.

BrDR does not automatically create an analysis point at hinge locations.

I suspect you think that the analysis point at Span 2 6.88' (58.1850') is an automatically generated point for the hinge. But it is not. It is automatically generated because it is at the mid-point of the unbraced length.

The user is responsible for entering a Point of Interest at the hinge location if he wants that point to be rated.

For this example, I entered a POI at 58.18767'. that matches the hinge located at 6.88767' into span 2.

I then see in the spec check details the following locations into span 2 were evaluated: 6.85 (POI created by you), 6.88 (analysis point generated at middle of unbraced length), 6.89 (POI that I entered).

Note that these locations are dependent on the System Defaults:Tolerance found in the Configuration Browser. I'm using the default tolerance for feet which is 0.001. That means points that are within 0.001' of each other are 'merged' into 1 point. You might be using a different tolerance.

Please respond in this issue if you would still like a POI to be created for you at the hinge locations. I'm thinking that would best be handled by a button on the hinge window 'Create POI's at Hinges'. That would be an enhancement request subject to TAG/TF approval.

FROM: Brad Wagner DATE: 6/10/2013 11:21:32 AM Eastern Daylight Time

Thank you for your response. It is as you suspected.

I would like a POI to be created, but I think it would be better handled as a POI wizard similar to what is available for reinforced concrete bridges. This would give us the ability to override locations other than hinges such as shear at supports of prestressed concrete bridges.

If I recall correctly, I thought we discussed this at the Beta TAG meeting in May. Is the POI wizard already a planned enhancement?

FROM: Krisha Kennelly DATE: 6/11/2013 12:45:34 PM Eastern Daylight Time

## Complete Issue Information

### Description

FROM: Jeff Olsen DATE: 5/9/2013 9:20:35 AM Eastern Daylight Time

It would be helpful to be able to input lengths as feet, inches, and fractions in input fields because many plans are shown that way. I would save input time by not having to convert to decimals.

FROM: Jeff Olsen DATE: 5/9/2013 11:07:42 AM Eastern Daylight Time

Related to VI 11838. This option should be available in all fields including grid entries. Once entered, the field could be shown in decimals, then when you hover over the field, it could show the inch/fraction equivalent.

FROM: Herman Lee DATE: 5/13/2014 2:04:26 PM Eastern Daylight Time

Implemented feet-and-inches input for length and dimension in the upcoming 6.6 release.

FROM: Herman Lee DATE: 5/10/2013 4:30:28 PM Eastern Daylight Time  
Submitted on behalf of Michael Taylor, MassDOT.

Received Bridgeware email:

=====  
Hi

Here is the second issue/question. This bridge's members run transversely and have been modeled as girder lines. Some of the floorbeams only have a partial deck and the remaining portion are exposed beams. I have attached two sheets of the plans and the xml file in zip format.

Here is the issue as emailed to me: "To sum up, floorbeam 4-3 is rating near zero. The floorbeam line model does not allow for brace points so we modeled them under the points of interest. This works up until point 0.7L. At this point, the program changes the unbraced length from what is defined to the full beam length and the allowable drops accordingly. This behavior remains consistent through the end of the beam. I have tried to re-enter the points of interest but there is no change."

Thanks again.

Michael Taylor  
Ratings and Overloads

=====

Reply email:

=====

Michael,

I'm not able to complete the analysis for Floorbeam 4-3. What are the tolerance settings in your database? Could you also let us know the rating method (ASD or LFD) and the vehicle you used?

I have submitted Incident 12513 for further investigation.

Thanks,  
Herman Lee

=====

FROM: Subhadeep Ghosh DATE: 5/16/2013 8:56:18 AM Eastern Daylight Time  
Sent email to the user after investigation:

=====

Hi Michael,

I have analyzed the floorbeam 4-3 in version 6.4.1 with the following settings:

Tolerance used was 0.000999' . HS20-44 was used for ASD analysis.

I checked the "Allowable Stresses" for all the POI under consideration and below is what I found:

1- The unbraced length for regions for all POI is as defined under "Bracing". I checked for points beyond 0.7 L and they display the right unbraced length.

4/19/2016 3:25:07 PM

**HRS AASHTO**

3520

**Complete Issue Information**

2-The allowable stress (Fb) for the tension and the compression flange is consistent along the length of the beam.

Attached are the results for few of the POIs along the length of the beam.

Please let me know if I am missing something.

Thanks,  
Subhadeep

**Description**

FROM: vinacs vinayagamoorthy DATE: 5/15/2013 4:47:14 PM Eastern Daylight Time  
I was trying to ignore shear in PS-I girder bridge at a location by utilizing the feature available within POI. Unfortunately, as soon as I set to ignore the shear, moment capacity reported at that location dropped as well. It seems that the software assumes the girder becomes non-composite at that analysis point.

Please check. It is nothing to do with 6.5. This problem exists within 6.4.1

FROM: Krisha Kennelly DATE: 5/20/2013 12:07:58 PM Eastern Daylight Time  
To specify that a ps section is composite, the user has to either define vertical bars extending into the deck or horizontal shear stirrups. Even if you want to ignore shear at the poi, you should enter a value for the horizontal shear reinf. so the section will be considered composite for flexure.

FROM: vinacs vinayagamoorthy DATE: 7/2/2013 11:01:57 AM Eastern Daylight Time  
I recommend that the HELP discuss this issue in detail. User may not aware of this issue at all. While user is trying to ignore shear (by override shear schedule), they are making a section "non-composite", which will result in very low rating factor.

FROM: Krisha Kennelly DATE: 7/2/2013 1:18:19 PM Eastern Daylight Time  
folder changed to support center since it exists in 6.4.1 and previous versions.

Please add the following to the help for Point of Interest: Shear:

In the 'Override schedule', add the following sentence shown in quotes between the 2nd and 3rd sentences:

...must be completed. "If this box is checked, horizontal shear reinforcement must be entered for the section to be considered composite." If this box.....

### Description

FROM: Phil Litchfield DATE: 5/16/2013 6:01:15 PM Eastern Daylight Time  
When running a culvert analysis from the top of the tree in the bridge workspace, the analysis report and spec check are not viewable at the culvert segment level.

Also, the culvert segment window when fully expanded is too large to view on a standard 1366x768 screen.

FROM: Joseph Ihnat DATE: 5/20/2013 1:36:10 PM Eastern Daylight Time  
I'm not able to reproduce the first issue.

4/19/2016 3:25:07 PM

HRS AASHTO

3523

**Complete Issue Information**

FROM: Joseph Ihnat DATE: 5/21/2013 12:41:50 PM Eastern Daylight Time  
The size of the culvert segment window has been reduced, in beta build 2. The window sizes are stored in the registry, so delete this registry key before opening the window in beta 2:  
HKEY\_CURRENT\_USER\Software\AASHTOWare Bridge Design/Rating\Bridge Design/Rating/Settings\UiCulvertSegmentView

FROM: Joseph Ihnat DATE: 5/21/2013 12:48:52 PM Eastern Daylight Time  
Can you view the spec check and report if you run just the segment? Are you able to reproduce the first problem above every time? Is it just culverts?

FROM: Phil Litchfield DATE: 5/30/2013 12:56:30 PM Eastern Daylight Time  
Yes this is just culverts and happens everytime. If I run just the segment, I can view the spec check and report. Problem still exists in beta 2 also.

FROM: Joseph Ihnat DATE: 5/30/2013 1:07:12 PM Eastern Daylight Time  
What type of analysis? 32-bit or 64-bit BrDR? What does "not viewable" mean? Are the buttons enabled? Nothing happens when you click the button? What is your Analysis Output Folder set to? (View, Preferences, Analysis tab).

FROM: Phil Litchfield DATE: 5/30/2013 1:53:39 PM Eastern Daylight Time  
LRFD Line Girder, using 64-bit. Toolbar buttons are grayed out. The analysis output folder has been set to C:\.

FROM: Joseph Ihnat DATE: 5/30/2013 3:20:58 PM Eastern Daylight Time  
Both problems exist in version 6.4.1. Changed folder to Support Center.

FROM: Joseph Ihnat DATE: 4/15/2014 9:13:05 AM Eastern Daylight Time  
Fixed for version 6.6.0

FROM: Hanjin Hu DATE: 4/17/2014 10:01:12 AM Eastern Daylight Time  
Backchecked for V6.6.0 Beta Build 1.

=====

Herman

One of our engineer created this PS-I girder model. However, when we tried to rate this bridge using LRFR, it crashes. Can you please check this model and let me know what data is entered incorrectly?

Thanks

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer

=====

The PS beam top and bottom flange widths are the same as the web end block width (19"). I'm able to complete the analysis after I changed the web end block width a bit smaller (18.99") than the flange width. There's a defect in computing the coordinates of the cross section when the web end block width is equal to the flange width.

FROM: Srujana Thogaru DATE: 6/3/2013 9:41:36 AM Eastern Daylight Time  
Above mentioned error has been fixed in 6.5 Beta 3

FROM: Kane Gyovai DATE: 6/12/2013 10:49:19 AM Eastern Daylight Time  
Verified for V6.5 Beta 3. Analysis completes successfully when top and bottom flange widths are the same as the web end block width.

FROM: vinacs vinayagamoorthy DATE: 6/21/2013 11:56:28 AM Eastern Daylight Time  
YES, it is working

FROM: Subhadeep Ghosh DATE: 7/8/2013 3:57:25 PM Eastern Daylight Time

FROM: Todd Thompson DATE: 5/20/2013 11:54:28 AM Eastern Daylight Time  
 We installed Virtis Opis 6.4.1 on a machine that has never had the product before.

But when we try to log onto any DB - we get the attached screen shot - error message about not being

4/19/2016 3:25:08 PM

HRS AASHTO

3526

**Complete Issue Information**

able to create an instance.

I can not track down what the problem might be.

I tested and a user account that works on another machine produces same error message on this other PC. So it does not appear to be a DB error.

Our IT support used the same instructions to install on this PC as they did on other PC's where the product works.

So evidently there is some other issue that is causing the problem.

FROM: Joseph Ihnat DATE: 5/20/2013 12:14:32 PM Eastern Daylight Time  
To fix the "Unable to create instance of system" message, you need to re-register the Virtis DLLs.

On Windows XP, run the "register.bat" file in the folder where Virtis is installed.

On Windows 7, open Start, Programs, Accessories and right-click the Command Prompt menu item and select "Run as administrator".  
Then change directory to the folder where Virtis is installed and run "register.bat" from the command line.

Make sure all the DLLs register with "succeeded".

The cause was most likely permissions-related.

FROM: Todd Thompson DATE: 5/20/2013 3:29:10 PM Eastern Daylight Time  
Thanks - that was the problem.  
Ran the register process and works now.

### Description

FROM: Aaron Kemna DATE: 5/20/2013 3:51:46 PM Eastern Daylight Time

I entered a uniform load in the member loads window. Later, I opened the window and the load was missing. It shows up in the BWS report. I'll attach the bridge. This is a curved girder. I think this has to do with the model changes, but it may be real subtle. I changed the bridge offset at one point and this would have changed the girder length. I changed the offset back, and added a new load. I could then see the first load as distributed, but the new load was missing. Anyway, somethings off. Is there anyway we can keep uniform loads as uniform loads regardless of changes to the model?

FROM: Krisha Kennelly DATE: 6/1/2013 3:07:05 PM Eastern Daylight Time

Disappearing uniform load fixed for beta 3 (it was not related to the mbr length changing).

As for keeping uniform loads when the girder length changes, this window is behaving the same as it does for a straight girder system. When the member length of a straight girder changes, the uniform loads are not kept as uniform. Their length stays the same and they become distributed loads. Changing that behavior for straight and curved girders is an enhancement.

FROM: Aaron Kemna DATE: 6/24/2013 4:05:20 PM Eastern Daylight Time

Disappearing load seems to be fixed. As for the enhancement it would be better for the user to keep uniform loads separate from distributed loads, but I would not want to make this change if it was too much work or if it would adversely affect outside engines. Accepting this incident.

From: Grime, Katy [mailto:KGrime@VHB.com]  
Sent: Monday, May 13, 2013 2:53 PM  
To: Bridgewater,  
Subject: 3D FEM Analysis

The structure we are rating consists of two different rolled beam sections. Section 6.10.8.2.3 of the LRFD code states that when the beam is non-prismatic within an unbraced length the Cb value of that section shall be 1.0. When analyzing using the line girder option under analysis settings, Virtis recognizes this transition and uses the correct Cb value of 1.0 when computing the capacity. However, when I take the same model and analyze using the Virtis 3D FEM, the program does not recognize the transition. Therefore the calculated Cb values greatly increase the capacity. Is there a reason that the code provision is ignored when using the Virtis 3D FEM analysis?

Thanks,

FROM: Subhadeep Ghosh DATE: 5/31/2013 2:54:47 PM Eastern Daylight Time  
Investigated and found the following bug as explained below:

Below are the findings for this incident:

I checked the 3D analysis on 6.4.1 release.

The following are the same between 2D and 3D.

Start Brace location = 41.5'  
Mid Location = 52.125'  
Right brace location = 62.75'

Un-braced length = 20.75'.

Section change occurs at 50'. The section change transition to a smaller section at 50'. Hence, the 2nd bullet (below) may apply.

The difference between 2D and 3D analysis are as below:

The section to the right of the brace point is being considered as prismatic .  
The section change location from the brace point is not less than 20% of the un-braced length

**Complete Issue Information**

(4.15' from 41.5'), hence the check for the smaller moment on the left does not apply.

Hence, the only difference between the two analysis (2D and 3D) is that the section being considered prismatic (for 41.5' (RIGHT)).

When debugged with 6.5 64-bit:

In PopulateDiaphragmInfo for the a 3D analysis the following always return zero. The below functions return finite values (Area and Izz) for 2D.

```
pBeamFiniteElement->GetBeamOnlyA()
pBeamFiniteElement->GetBeamOnlyIzz()
```

For any analysis, the change in A and Izz of the section (between dStartLoc and dEndLoc), is used to determine the section as prismatic or not. (line # 18498).

Since the above two functions are returning zero for 3D analysis, this check is not working.

User's bridge takes a while to run in 3D 64 bit debug. I have created a smaller bridge, which is attached, to highlight that the above functions are returning zero for 3D analysis..

Run Member: G1, Member Alt: Rolled SC.

FROM: Subhadeep Ghosh DATE: 6/11/2013 9:58:11 AM Eastern Daylight Time  
Fixed as per suggestions from Krisha. Fixed for 6.5 beta 3.

For testing run a 3D LRFR, and check at 41.5 (RIGHT) where the section should be considered non-prismatic and Cb = 1.0. Run this iin 64 bit.

### Description

FROM: Brad Wagner DATE: 5/23/2013 10:58:18 AM Eastern Daylight Time

As I was performing some testing for incident 11889, I noticed an issue. In order to attempt to break the I/J requirements for a side by side box beam live load distribution factor, I manually changed the moment of inertia for a box beam. Virtis allowed me to save the changes, but when the live load distribution factor was calculated, it was based on the calculated moment of inertia for the beam, not the manually entered value. I assume that the calculated value is still being used in other parts of the program, but I did not test this. If Virtis is not going to use the hand entered value, you should not be allowed to change it.

FROM: Herman Lee DATE: 6/19/2013 10:16:04 AM Eastern Daylight Time

The PS Box Beam window's Properties tab specified that "Note: Analysis engine computes section properties based on the dimensions given on the 'Dimensions' tab.".

Brad, is it ok to change this incident to an enhancement request for the capability of overriding the computed properties during analysis with user entered section properties in the UI?

**Complete Issue Information**

FROM: Brad Wagner DATE: 6/19/2013 3:08:14 PM Eastern Daylight Time  
I think that the Properties Tab should be made "Read Only" by default, and that having the ability to change and save a value that is not used in the program is a BUG. I also believe that this statement applies to all prestressed beam shape Properties tabs.

I do agree that adding the capability to override dimensions may not have been intended and thus would be an enhancement.

FROM: Herman Lee DATE: 6/20/2013 7:46:43 AM Eastern Daylight Time  
The original concept of BrDR is to enter the bridge model as complete and detail as possible and the model is independent of the capabilities of the analysis engine. This becomes confusing when it's hard to figure out what are used during analysis. In the coming rewrite and redesign of the software architecture, we need to implement some feedback mechanisms for both the inputs and the analysis messages.

**Description**

FROM: Subhadeep Ghosh DATE: 5/23/2013 11:12:08 AM Eastern Daylight Time  
Submitting this incident on behalf of Vinacs:

The incident is described in detail in the attached Shear reinforcement update for PS.pdf (that contains the email chain).

Adding to the email chain:

The BWS report shows the section of deleted span length for the shear reinforcement ranges (even when all the shear reinforcements are deleted manually). This only happens when the beam length/span length is modified for the copied bridge.

The validation for G1 (for 11 0096 play), after changing the beam length and the corresponding shear reinforcement detail shows an error (ERROR: Shear reinforcement definition is outside the beam). This is probably due to existent deleted span length shear reinforcement detail in the model.

FROM: Subhadeep Ghosh DATE: 7/15/2013 2:19:19 PM Eastern Daylight Time  
Resolved for 6.5.1.

FROM: Kane Gyovai DATE: 11/14/2013 12:01:27 PM Eastern Standard Time  
Verified for V6.5.1

- 1) Schematic displays properly after changing span length and reconfiguring shear reinforcement ranges. Notation from base bridge (the bridge from which the copy was created) no longer displayed on the schematic.
- 2) When copying G1 to G2 and removing the shear reinforcement ranges for G2, the expected Error message displays and the analysis does not complete.
- 3) Shear reinforcement ranges for the copied bridge display correctly in the BWS report.
- 4) Validation for G1, after copying and updating shear reinforcement ranges, no longer displays an error message related shear reinforcement that was removed.

### Description

FROM: Krisha Kennelly DATE: 5/24/2013 1:26:49 PM Eastern Daylight Time  
Submitted on behalf of Vinacs via the comments received for the Post Tension mockups vesion 1:

Currently we have problems with the data entry with "Frame Structure Option." A brief explanation is given here: a user enters values for the elastic support with the "Frame Structure Option" is turned on. Later (after realizing his/her mistake), user turns off (or de-link) the "Frame Structure Option", the support constraint entered in the support does not get changed to "Roller" support and this may yield erroneous analysis (unless user corrects it). So, please provide warning whenever user changes the "Framing option" after saving the data. If the user "de-links" the substructure from superstructure, support condition should be changed to "Roller."

FROM: Herman Lee DATE: 7/16/2013 10:19:44 AM Eastern Daylight Time  
Added a message box for the user to review Supports window when frame connections are changed on the Superstructure Definition window or the Member window.

Resolved for 6.5.1 release.

## Description

FROM: Load Rater Shanon Murgoitio DATE: 5/24/2013 3:03:30 PM Eastern Daylight Time  
We received a bridge model containing a culvert definition from a consultant that was done in V6.4.1. I imported the xml file into both V6.4.1 and V6.5Beta1. Every time I try and launch the LFR spec checker in either 6.4.1 or 6.5Beta1 for the culvert definitions BrR shuts itself down and gives the following message details.

### V6.4.1 Details

Files that help describe the problem:

- C:\Users\smurgoit\AppData\Local\Temp\WERFAFE.tmp.WERInternalMetadata.xml
- C:\Users\smurgoit\AppData\Local\Temp\WERF59.tmp.appcompat.txt
- C:\Users\smurgoit\AppData\Local\Temp\WER1295.tmp.mdmp

### V6.5 Beta 1 Details

Files that help describe the problem:

- C:\Users\smurgoit\AppData\Local\Temp\WERFA85.tmp.WERInternalMetadata.xml
- C:\Users\smurgoit\AppData\Local\Temp\WER1028.tmp.appcompat.txt

## Complete Issue Information

C:\Users\smurgoit\AppData\Local\Temp\WER127A.tmp.mdmp

When I go to the file location listed I can't find the WER files. This did not happen to the consultant we received the file from so I am wondering if there is something wrong with the import/export process. Please find the xml file attached.

Thank you,  
Shanon Murgoitio

FROM: Herman Lee DATE: 5/26/2013 7:36:22 AM Eastern Daylight Time  
I tried the attached bridge using 6.4.1. For both culvert definitions, I'm able to open the Spec Check Viewer after the LFR analysis.

Please give more details on how to reproduce the problem. For example, which item in the Bridge Workspace tree selected for analysis and which item selected before opening the Spec Check Viewer. Thanks.

FROM: Load Rater Shanon Murgoitio DATE: 5/28/2013 1:12:11 PM Eastern Daylight Time  
Hello Herman.

I have attached a second file with screen shots from V6.4.1 showing the icons I am clicking on and how I am trying to launch the spec checker. I am running Windows 7 on a 64 bit machine and using the AASHTO LFR engine. The attached xml contains a Superstructure Alternative that is not a culvert definition and the spec checker launches just fine for that. Only the Culvert Definitions are causing BrR to shut down.

Thank you,  
Shanon Murgoitio

FROM: Load Rater Shanon Murgoitio DATE: 5/28/2013 1:28:49 PM Eastern Daylight Time  
I forgot to mention everything shown in the attached word document is the same for V6.5 Beta 1 with the exception of the file names listed that describe the problem under "details". Those are shown above. I have V6.5 beta 1 loaded on a different machine than v6.4.1, but it is also running the 64 bit version of Windows 7.

FROM: Herman Lee DATE: 5/29/2013 10:06:25 AM Eastern Daylight Time  
Following the instructions in the Word document, I'm able to reproduce the crash.

FROM: Joseph Ihnat DATE: 5/29/2013 1:34:10 PM Eastern Daylight Time  
The analysis output is being written to the wrong location:  
AASHTOWARE\BrDR65\17855\PosM-CulvertModule12RCF\ITDMethod-12SectionofRCFCornerNegativeMoment\ITDMethod-StifflegNegativeMoment  
Should be:  
AASHTOWARE\BrDR65\17855\PosM-CulvertModule12RCF\PosM-CulvertModule12RCF\PosM-CulvertModule12RCF

FROM: Herman Lee DATE: 6/19/2013 8:42:52 AM Eastern Daylight Time  
Fixed the output path when the analysis has both superstructure and culvert. The fix will be available in 6.5 Acceptance Build for Beta testing.

Resolved for 6.5 release.

## Complete Issue Information

FROM: Load Rater Shanon Murgoitio DATE: 6/19/2013 1:33:16 PM Eastern Daylight Time  
This issue still exists in 6.5 Beta 3. I think it has something to do with having a superstructure definition in the same file with a culvert definition. If you delete the superstructure definition the spec checker launches normally for the culvert definition. From the above comment it looks like the intention was to resolve the issue before the acceptance build, but I thought I would mention my discovery regarding the superstructure definition.

FROM: Bin Zhang DATE: 6/4/2013 9:13:06 AM Eastern Daylight Time  
 Error in adding the shear connectors  
 I submitted this incident on behalf of Sean Hart from Baker (SHart@mbakercorp.com). The communication email was listed below. The error message and the bridge XML file were attached in the document.

\*\*\*\*\*

From: Hart, Sean  
 Sent: Thursday, May 30, 2013 12:26 PM  
 To: Lee, Herman  
 Subject: Virtis Help

I'm getting the attached errors when running the attached file for G6 & G7. I messed around with the diaphragm locations to move some of the concentrated loads around and I'm still getting the errors.

4/19/2016 3:25:11 PM

**Complete Issue Information**

Any insight as to what the issue is?

\*\*\*\*\*

Please use AASHTO LRFR, member alternative of G6 to reproduce this issue. The error message was listed in figure 1.

Figure 1 Error message for AASHTO LRFR, G6

There are 2 bugs need to be fixed here. The 1st one located in the GUI for the Shear Connectors. The shear connectors information cannot be updated if I change the Support Number (figure 2).

Figure 2 GUI error for the Shear Connectors

The 2nd bug located in the AbaSpecCtrl, the AddShearConnectorMaxZeroMinMomentLocations function (figure 3). There is no code to handle the situation when all the positive LL moments are zero within a span (figure 4).

Figure 3 AddShearConnectorMaxZeroMinMomentLocations()

Figure 4 All the positive LL moments in span 1 and span 3 are zero

Please read the attached WORD document for details (12612-Error in adding the shear connectors.docx).

**Description**

FROM: vinacs vinayagamoorthy DATE: 6/5/2013 9:41:35 AM Eastern Daylight Time  
I understand that Member Alt Type is only used to display the Virtis Tree.  
However, I would like to have the similar behavior of displaying/not displaying member alternative choices made by the user.

FROM: Herman Lee DATE: 6/5/2013 10:02:32 AM Eastern Daylight Time  
Vinacs, could you clarify what you meant by "displaying/not displaying member alternative choices made by the user"? Thanks.

FROM: vinacs vinayagamoorthy DATE: 7/2/2013 11:29:30 AM Eastern Daylight Time  
I have attached a wrong document for you. Here is the write up on the issue (Member Alt Type choice).

FROM: Herman Lee DATE: 7/7/2013 10:42:40 AM Eastern Daylight Time  
From the Help:

=====  
These types will automatically be selected when a corresponding member alternative type is created. These checkboxes cannot be unchecked if a corresponding member alternative type exists. For example, if a prestressed concrete member alternative currently exists, the P/S box will be checked and disabled. You can not uncheck the box while that prestressed concrete member alternative exists.  
=====

Joe, please mark this as duplicate if this is the same as Incident 12278.

FROM: Joseph Ihnat DATE: 10/16/2013 9:27:41 AM Eastern Daylight Time  
Not the same as 12278. Fixed in 6.5.1

FROM: Bin Zhang DATE: 11/15/2013 11:09:07 AM Eastern Standard Time  
Verified for version 6.5.1 aplha 2, the program behaves as described in the help now.

**Description**

FROM: Todd Thompson DATE: 6/7/2013 2:33:26 PM Eastern Daylight Time

Our designers have requested that it would be very useful in design to include moment and shear envelopes for Strength I, Strength II, Service I and Service III. Currently, only Strength I is shown under critical loads.

We should also make sure this falls in the "reports" bucket of enhancements.

**Description**

FROM: Herman Lee DATE: 6/11/2013 7:26:11 AM Eastern Daylight Time  
Submitted on behalf of Alex Pence (Alex.Pence@dot.wi.gov), WisDOT.

Part of the received Bridgeware email on 6/10/2013.

=====  
1. As you are aware, the transverse deck results do not show up in the Rating Summary Table (incident #11149). Is there a way to view them in a BWS Report? In my timber deck-girder bridge, I was only able to figure out how to add the rating summaries for the girders, but not the deck.  
=====

### Description

FROM: Srujana Thogaru DATE: 6/11/2013 10:44:14 AM Eastern Daylight Time  
Based on the attached email, from Vinayagamoorthy, Murugesu@DOT  
[mailto:murugesu.vinayagamoorthy@dot.ca.gov] this incident is created

1. Diaphragm Definitions attributes has been added to the BWS report tool.
2. Frame connection attributes has been added to the BWS report tool. Frame Connections Indicator attribute has been removed.
3. AC Thickness field measure attributes already exists
4. Ignore the positive moment at supports is Under Member Alt Definition
5. Mild Reinforcement Attributes has been added to the report toll

Above fixes are made in 6.5 Beta 3

FROM: Srujana Thogaru DATE: 6/12/2013 8:40:29 AM Eastern Daylight Time  
Geoff please implement the sql script I have send to you in DB.

FROM: vinacs vinayagamoorthy DATE: 6/12/2013 12:52:26 PM Eastern Daylight Time  
Analysis Envet - Rating Summary Attributes does not contain Location by Span-(%) as well. Can we include that as well?

FROM: Geoffrey Trees DATE: 6/12/2013 1:15:42 PM Eastern Daylight Tim  
Changes prior to 6/12 are implemented.

FROM: Girish Bhanushali DATE: 6/12/2013 3:24:41 PM Eastern Daylight Time  
Hi Vinacs,  
We have created a separate incident (VI# 12655) to reflect your above request regarding - Span - (%) in rating summary report.  
Thanks.

FROM: Srujana Thogaru DATE: 6/13/2013 3:23:41 PM Eastern Daylight Time  
Other than 12655, this issue has been fixed in 6.5 Beta 3

I have tested the BWS report on diahragm. It needs improvement  
(1) Attributes should include the name of the diaphragm definiton, type of diaphragm selected  
(2) It is somehow not recognizing the concrete diaphragms and reporting incorrect data. Please see the attached word document and bridge file, where Interior diaphragms and Interior Concrete diaphragm are included.

FROM: Srujana Thogaru DATE: 6/26/2013 3:05:43 PM Eastern Daylight Time  
Name of the diaphragm, type of diaphragm selection attributes are under Diaphragm Def. I have missed concrete name, Concrete Height and Concrete Thickness. These three attributed implemented for 6.5 Beta4/ acceptance build under Diaphragm Def.

FROM: Kane Gyovai DATE: 7/9/2013 8:50:06 AM Eastern Daylight Time  
Verified for V6.5 Beta 4/Acceptance Build

Diaphragm Def Includes: Name and Type, Concrete Diaphrams reporting correctly.

## Description

FROM: Berhanu Woldemichael DATE: 6/21/2013 12:27:15 PM Eastern Daylight Time  
For 6.5 Beta 3, AASHTO LRFD run for a prestressed Girder has an error. For a simple sapan the Strength envelop should change signs around the mid-span. The case was reported for a steel run in the previos versions.

FROM: Srujana Thogaru DATE: 6/26/2013 9:28:55 AM Eastern Daylight Time  
This issue exists in 6.4.1 release. Hence it is a release bug.  
Reason for above issue is due to, considering absolute value of shear in 5.8.3.3 article.

**Complete Issue Information**

Berhanu, can you tell me specifically where you're seeing positive shears but think they should be negative. If you click on the "View Analysis Charts" button, you will get shear diagrams showing just what you're describing above. If it's the articles you're talking about, most have been written to work with positive shear values (they take the absolute value of whatever the shear is, positive or negative). Those values are reflected in the summary reports. Changing all those would be a large task.

Beta 3

Notice in my screen shot I have a duplicate bar mark (S14)  
As far as I can tell they are identical  
The program does give an error and allows this

Should duplicate bar mark names be allowed?

FROM: Krisha Kennelly DATE: 6/27/2013 9:07:42 AM Eastern Daylight Time

It looks like the current behavior is to not allow duplicate names for appurtenances but duplicate names are allowed for everything else (eg materials, beam shapes, diaphragm definitions, factors, weld definitions, shear connector definitions, stiffener definitions, stirrup definitions, bar mark definitions were tested and allowed to have duplicates). Folder changed to Support since this is not new to beta testing of 6.5.

FROM: Herman Lee DATE: 10/14/2014 8:50:44 AM Eastern Daylight Time

Duplicate of BRDRSUP-452.

### Description

FROM: vinacs vinayagamoorthy DATE: 6/26/2013 10:55:25 AM Eastern Daylight Time  
When I create the BWS report, I noticed that the span length of individual girders cannot be reported. Please note the span length along the reference line does not always equal the span length of girders (for curve bridges and bridges with differing skewed support). When the data of individual girders are reviewed, span length of individual girders become an important item.

As a result, we would like to generate the span length of individual girder in the BWS report.

### Description

FROM: vinacs vinayagamoorthy DATE: 6/26/2013 12:08:49 PM Eastern Daylight Time  
When we create the report, the BWS report round the values to nearest two or four decimal point (depending on display setting). Values should be reported as entered by the user or values established by the software, instead of truncating to the nearest tolerance.

**Description**

FROM: Bin Zhang DATE: 6/27/2013 5:05:23 PM Eastern Daylight Time  
 I submitted this incident on behalf of Scott E. Cavanaugh from HNTB. The communication email was listed below. Please use AASHTO LFR, type 3 vehicle, member alternative of G1 to reproduce this issue.

AASHTO considers the shear force signs in the grid. However, AASHTO applied the worst combination of the stage 2 shear forces in the spec check. This made the AASHTO rating conservative when the user applied the negative stage 2 uniform load for the member. The bridge model was attached in the document.

 To: Bridgewater,  
 Subject: RE: load direction in virtis

Herman,  
 Based on my review a few minutes ago, I saw the same sign for shear when running both POSITIVE and NEGATIVE uniform loads. Rating results are the same for shear for these two cases when viewing the VIEW ANALYSIS REPORT button.

I have attached the file for your review. I will direct the consultant to use POSITIVE dead loads (positive downward) for all ratings. Please let me know if you do confirm a bug in the program.

Thanks

To: Scott Cavanaugh  
Subject: RE: load direction in virtis

Scott,

The sign of the shear should be taken into account also. Is the DL shear used in the rating computation the same for both the positive and negative uniform load? How about the shear actions listed in the Analysis Results window? Are the signs listed there the same or opposite? Please send us the bridge if you suspect there's a bug in the system.

Herman

From: Scott Cavanaugh [mailto:SCavanaugh@HNTB.COM]  
Sent: Thursday, June 27, 2013 3:20 PM  
To: Bridgeware,  
Subject: RE: load direction in virtis

Herman,

You are correct. My initial quick run showed the same rating results for both POSITIVE and NEGATIVE uniform load, however, that was because shear was controlling. Does virtis consider the absolute value for shear?

For flexure I confirmed using SPEC CHECK that there is a difference between the POSITIVE and NEGATIVE runs (virtis is considering the sign here).

Thanks  
Scott

To: Scott Cavanaugh  
Subject: RE: load direction in virtis

Scott,

I think Virtis will take the sign of the load into account. Have you check into the rating computation in the Spec Check Viewer?

Herman

negative load for DC1, DC2, etc. Review of the output using both + and – values returns the same rating.

So, it seems virtis will always assume the loading is downward regardless of sign? This particular load was a uniform load.

Please let me know if I am understanding this correctly.

Thanks  
Scott

Sent: Thursday, June 27, 2013 10:38 AM  
To: Scott Cavanaugh  
Subject: RE: Riveted steel girder haunch

Scott,

The haunch width is not used to compute section properties. The haunch depth, represented as a gap between the deck and the beam, is used to compute the section properties. You have to compute and enter the haunch load separately.

Herman

From: Scott Cavanaugh [mailto:SCavanaugh@HNTB.COM]  
Sent: Thursday, June 27, 2013 10:14 AM  
To: Bridgeware,  
Subject: Riveted steel girder haunch

Herman,

Can you please confirm that haunch dead load is not automatically computed by Virtis based on input in the CROSS SECTION / HAUNCH tab? I have this information jotted down, but upon review of the CROSS SECTIONS: HAUNCH help information, I find it a little confusing, with some indication that “you must enter haunch dead load separately”, but in other areas it says “The haunch width is used to compute dead load only”.

Can you please clarify?

FROM: Krisha Kennelly DATE: 6/28/2013 9:14:49 AM Eastern Daylight Time

1. Loads acting downward on the member should be entered with a positive sign on the Member Loads window. A negative sign on these loads means the load is an uplift load. BrDR will take into consideration the sign entered here when applying the load.

BrDR considers the absolute value for the shear force when evaluating the Spec articles. This is not a bug as indicated in the email from Ben on 6/27. Shear does not have a sign when evaluating spec articles.

2. The AASHTO engines compute the haunch dead load based on the haunch width and depth entered by the user. The AASHTO engines only consider the gap between the deck and beam (haunch depth) for section property calculations. The AASHTO engines do not include the area of concrete haunch in the section properties.

The note in the BrDR help for Cross Sections:Haunch instructing the user to enter the haunch dead load separately is incorrect. It appears this note is left over from when the BRASS engines were the only engines available in BrDR.

a. The BrDR help should be revised to say:

**Haunch Depth**

Enter the haunch depth, measured from the bottom of the slab to the top of the girder flange or web, as previously selected and as shown in the sketch. Refer to the Engine Related Help and Dead Loads topics for how this data is used by the analysis engine.

**Haunch Width**

Enter the haunch width. Refer to the Engine Related Help and Dead Loads topics for how this data is used by the analysis engine.

b. The BrDR Engine Help for Cross Sections:Haunch should be revised to say:

**Haunch Depth**

This data is used to compute the haunch dead load. This data is also used to determine the gap between the concrete slab and steel beam when computing the section properties. The area of the

**Complete Issue Information**

concrete haunch is not considered in the section property calculations.

**Haunch Width**

This data is used to compute the haunch dead load. This data is not used when computing the section properties. The area of the concrete haunch is not considered in the section property calculations.

FROM: Krisha Kennelly DATE: 6/28/2013 12:04:38 PM Eastern Daylight Time  
Note that item #1 is actually a bug. BrDR should be using the absolute value of the sum of the shears for each stage and load type (DC, DW) not the absolute value of each individual load effect when determining what shear force to use in the spec articles.

Subject: RE: Release Bug Fix for the 6.6 Alpha Build 4 (March 24) Testing

I believe this is the same as BRDRSUP-39 which Wayne worked on fixing back in September. The fix however caused some problems in the LFR rating and we were trying to include this fix in the critical patch to 6.5.0 but didn't want to risk breaking anything in the patch so we rolled back Wayne's changes.

We should make this fix for 6.6 now. I think Wayne should take the lead on this issue since he worked on BrDRSup-39.

Wayne – can you review 12725 and BrDRSup-39 and verify that they are the same problem? Then you can add this 12725 and BRDSup-39 to your list of items to work on for 6.6.

Thanks.

FROM: Wayne Skow DATE: 4/8/2014 10:28:18 AM Eastern Daylight Time  
Yes, they are the same problem.

FROM: Herman Lee DATE: 5/29/2014 2:02:50 PM Eastern Daylight Time  
Fixed for 6.6 Release.

### Description

FROM: Amanda Jackson DATE: 7/3/2013 3:44:24 PM Eastern Daylight Time

In the attached bridge, superstructure named Spans 3 and 4, whenever I try to add the Span 3 stringer group definition to Unit 1 and the Span 4 stringer group definition to Unit 2, I get the attached error message. I'm guessing it is a rounding error somewhere, but I'm not sure where the rounding error is happening. I verified that I am also getting this error in version 6.5, beta 3.

Also, regardless of how much I change the skew lengths and span lengths, whenever I try to choose a stringer definition for Unit 1 Stringer 1 in the Stringer Unit 1 layout, I get the following error:

Stringer Definition length mismatch. The stringer definition length of xx.xxxx ft assigned to this stringer member alternative does not match the stringer member length of 72.9721 ft.

The xx.xxxx varies depending on the definition I use, but the stringer member length of 72.9721 never changes. It should get recalculated every time I make a change that affects it. This is also happening in 6.5 beta 3.

FROM: Herman Lee DATE: 7/3/2013 3:48:11 PM Eastern Daylight Time  
Amanda, please attach the bridge to this incident again. Thanks.

FROM: Herman Lee DATE: 7/8/2013 10:48:21 AM Eastern Daylight Time  
Please see below for a workaround.

1. Modify support skews in the Structure Framing Plan window.
  - Change Support 1 Skew from 3.2129 to 3.2130
  - Change Support 2 Skew from -14.3664 to -14.3660
  - Change Support 2 Skew from -3.1774 to -3.1770
2. Reselect skew angles in Span 3 and Span 4 Stringer Group Definitions.
3. Assign Span 3 Stringer Group Definition to Unit 1 and Span 4 Stringer Group Definition to Unit 2 in the Floor System Geometry window.

#### Developer Note:

Need to keep all decimal places when saving skew angles in the Stringer Group Definition Geometry window.

FROM: Subhadeep Ghosh DATE: 9/12/2013 12:03:38 PM Eastern Daylight Time

As per Herman's note, all the decimal places will be saved for the skew angle as mentioned in the

4/19/2016 3:25:16 PM

HRS AASHTO

3573

**Complete Issue Information**

Framing Plan window.

For the second issue that the user has reported about the member length not changing with the skew or the span length change, please do the following:

- Deassign Stringer Group Definiton to "None" for stringer unit affected by the span or skew change in Floor System Geometry window
- Select the Stringer Group Definiton Geometry affected by the span or skew change and reselect the Possible Floorbeam Spacing, select the skew angle as appropriate.
- Hit OK
- Reaassign the Stringer Group Definiton for stringer unit affected by the span or skew change in the Floor System Geometry window
- Create Stringer member alternative for the affected unit.

The above steps update the member length.

Resolved for 6.5.1.

Requesting an enhancement that allows the user to enter custom section properties for a steel girder, floorbeam, or stringer. The user enters all section properties at each cross-section, and those section properties are used in the analysis. The need for this occurs when there are bridges with girder configurations that are not supported by BrDR. For example, we have several bridges in Montana with

### Complete Issue Information

what we call a Transverse Girder. I've also heard of it as a Straddle Girder. It can be modeled as a floorbeam and faked in as a built-up steel section, but the section we have is truly a box shape. Modeling it as an I shape works for bending analysis, but the I shape has a much lower lateral and torsional stiffness than a box section, which can be problematic. If we were allowed to enter custom section properties that we hand-calculate, we could get around these types of problems without having to do a more complex enhancement that creates a completely new type of section to analyze. It would be useful in many situations where the bridge in the field doesn't quite match the type of configuration we are able to define in BrDR.

Subject: RE: Virtis Problem 1

Richard,

For the warning message (first screen capture), the BRASS Engine does not come with BrR (formerly Virtis) since version 6.3. Please contact the agency that you do your work for whether to switch to the AASHTO Engine.

For the crash problem when using the AASHTO Engine (second screen capture), please send us the bridge for further investigation.

Thanks,  
Herman Lee

Joe,

Thank you for your patience and assistance during the upgrade.

The 6.4 program is working.

However, we encountered an error message while analyzing a prestress beam (multi-beam system).

Attached are two print screens with the associated error message shown and refer to below email.

Please reply to all so that the engineers copied are informed of your response.

Thanks

Sincerely Yours,  
Richard Y. Ng, P.E.

**Complete Issue Information**

Subject: Virtis Problem 1

Hi Richard,

When I was running the program for Pre-stress Beam (multi-beam system) the 2 sheets that you see in the attachment is what I got and It did not run.

When I run the program for regular steel multi-girder system the first sheet shows up, but once you press continue it run normally.

Thank you,  
Jose.

=====

This incident is for the crash problem when using the AASHTO Engine. See the second screen capture in the attached PDF file.

To reproduce the problem, rate the G1 member in the Spans 1 and 2 superstructure definition with the AASHTO LFD Engine.

The PS box beam assigned to the G1 member doesn't have a bottom thickness.

FROM: Subhadeep Ghosh DATE: 9/19/2013 12:33:20 PM Eastern Daylight Time

Here are the findings:

- The crash in Virtis 6.4 was caused by box dimension bottom slab thickness = 0.0.
- Bottom slab thickness = 0.0 for rectangular void ps box beam classifies it as an inverted U beam.
- BrDR 6.5 does not have the capability to handle a PS inverted U beam.
- This can be an enhancement.
- For the time being we can generate a message and abort the analysis when the bottom slab thickness = 0.0 to avoid the crash

Workaround for the issue in 6.4:

- Define the bottom slab thickness = 0.001 in
- The only impacted component will be Torsional Constant "J". Other cross sectional properties vary by an average of 0.5%
- Running girder G1 for Span 1 and 2 with AASHTO LFD shows critical section due to "Design Flexure".

FROM: Herman Lee DATE: 9/19/2013 3:15:05 PM Eastern Daylight Time  
Please add an error message and return analysis failed when the bottom slab thickness is zero.

FROM: Subhadeep Ghosh DATE: 9/23/2013 11:55:31 AM Eastern Daylight Time  
Added an error message "Cannot define beam cross section! Please check beam dimensions." and returned analysis failed.

Since Krisha will be out office till July 29th, I am sending this to you:

From: Vinayagamoorthy, Murugesu@DOT  
 Sent: Monday, July 22, 2013 7:13 AM  
 To: Mccracken, Mike B@DOT  
 Cc: 'Kennelly, Krisha'  
 Subject: RE: potential Virtis Issue

Mike

This issue came up many times when we load rated steel girder bridges. Source of the problem is the tolerance. We have reported this issue many times to Bakers. Bakers had tried their best; for some reason, fixes do not completely removes all these little issues. Bakers may need to tweak the source code that is used within Framing Plan View routine.

In your case, instead of entering 72.849556, you enter 72.849555 (just 0.000001ft less), software will place the end diaphragm. Similarly, I was able to show the end diaphragms in Abutment 2 by adjusting the point by reducing by 0.000001ft.

For Flared girder bridges, my recommendation is to use the Virtis estimated girder length (as you said in the email) and then adjust the length by 0.000001ft either side so that the Diaphragm is displayed in the Framing Plan View.

I don't think this will affect the 3D analysis, since 3D model generator will be separate from Framing Plan View generator and that could be adjusted to have larger tolerance.

Vinacs

**Complete Issue Information**

Krishna:

1. Could you please whether you could check this model and see whether source code could be improved in Framing Plan view.
2. Whether 3D Model

From: Mccracken, Mike B@DOT  
 Sent: Friday, July 19, 2013 2:06 PM  
 To: Vinayagamoorthy, Murugesu@DOT  
 Subject: potential Virtis Issue

Vinacs,

Here's a potential Virtis Issue:

For splayed bridges, Virtis calculates the span length for each girder.  
 For splayed bridges, "Diaphragm Wizard" is not available, and the user has to manually calculate the location of the end diaphragm at the second support.  
 Typically, we put the end diaphragm directly over the support. Therefore, it would make sense to copy and paste the Virtis-calculated "Span Length" into the "Start Distance" field when the diaphragm locations are being specified.

This is what I did, and the resulting framing plan did not show the presence of the end diaphragms. I'm not sure if this is merely an error in the way that the framing plan is displayed, or if the model is actually not recognizing the diaphragm.  
 If the later is true, then this could potentially pose a problem for any future 3D analysis.

Here are images that represent the data that was copied and pasted, and the resulting framing plan.

Span 1:

### Description

FROM: Krisha Kennelly DATE: 7/29/2013 4:08:28 PM Eastern Daylight Time  
the help doesn't contain any info on the new fields added for curved girder systems. this can't make it into 6.5.0 but should be updated in case users ask for it before 6.5.1 is released.

1.

#### Spacing Reference Type

Select the method of defining the diaphragm spacing as being defined along the left girder, right girder or both girders of the bay. If 'left girder' is selected, enter the start distance and spacing along the left girder. The program will determine the start distance and spacing along the right girder of the bay by casting a line perpendicular to the left girder at each diaphragm location along the left girder. Selecting 'right girder' has a similar procedure to determine the diaphragm locations along the left girder of the bay. Select 'both girders' when the diaphragms are not radial to either girder. This field is only available for curved girder systems.

2. add the following to the end of the Diaphragm Spacing section:

For curved girder systems the spacing is entered along the left and right girders of the bay as described in the Spacing Reference Type.

3. add the following to the end of the length section:

For curved girder systems the length is computed along both the left and right girder of the bay.

**Description**

FROM: Bryan Silvis DATE: 7/30/2013 8:19:21 AM Eastern Daylight Time

The Compute from Typical Section button for LRFD/LRFR Live Loads needs a check box for Concrete Beams (e.g. voided slabs) used in Multi-Beam Decks connected only enough to prevent relative displacement at the interface (AASHTO LRFD Table 4.6.2.2b-1). This addition would make the Compute from Typical Section button functional for all Type f and g structures. Based on earlier Support correspondence, I believe this functionality is categorized as an enhancement.

To: Bridgeware,  
Subject: Virtis problem with resistance factor for flexure

My current Virtis Version is 6.4.1.3001. When I run attached file which was imported from Version 6.2.0.3001, I got all zero value for LFR loading rating at 90% of Span 1 and I found the Resistance factor at that point is 0.0 (should be 1.0).  
Can you help me take a look?  
Thanks.

Jiangong Xu, P.E., Ph.D.

FROM: Srujana Thogaru DATE: 3/17/2014 1:35:12 PM Eastern Daylight Time  
Reason for zero value for LFR loading rating at 90% of Span 1 is that for negative moment there are no harped strands and flexural capacity is zero.

Please see beam capacity summary report for details.

## Description

FROM: Mark Mlynarski DATE: 7/31/2013 9:56:07 AM Eastern Daylight Time

If diaphragms are assigned on the 'Diaphragms' tab of the 'Structure Framing Plan Details' window (see below) they are not transferred when the bridge is copied/pasted from the bridge workspace. This was discovered near the end of testing of 6.5 but was an existing issue in 6.4.1.

You can test the behavior with BID 26 in the sample database.

### Description

FROM: Creightyn McMunn DATE: 8/1/2013 3:04:26 PM Eastern Daylight Time  
In the attached file, there is pedestrian load applied to Girder D. Per the AASHTO LRFD code, pedestrian live load and full vehicular live load need not be considered concurrently. For girder D, it does not appear as though the reduced live load distribution factor shown in the detailed calculations (also attached) is being used when the pedestrian load is applied.

FROM: Bin Zhang DATE: 8/16/2013 4:17:52 PM Eastern Daylight Time  
The Live Load Distribution Factor (LLDF) was calculated based on the travelway the user defined. The vehicular live load actions in the rating summary grid have included the LLDF. The pedestrian load actions do not include any LLDF.  
What does the "reduced live load distribution factor" mean in your description?

FROM: Herman Lee DATE: 10/24/2013 8:52:10 AM Eastern Daylight Time  
Information Needed E-mail sent on 10/24/13.

3595

**Complete Issue Information**

FROM: Creightyn McMunn DATE: 11/1/2013 4:12:53 PM Eastern Daylight Time  
Hi,

I believe the reduced live load referred to is based on AASHTO 3.6.1.1.2-1, "The multiple presence factor of 1.20 for single lane loads does not apply to the pedestrian loads." mpf = 1.0 for truck + ped load. Since the 1.2 is already factored in to the equations from the 4.6 tables for single lane loaded, it should be divided out when BrR is calculating the R.F.'s for truck + ped loads. i.e.

Axle Load LLDF's: Moment - 0.293 Shear - 0.567  
Truck + Ped LLDF's: Moment - 0.244 Shear - 0.473

The same thing should have happened if the lever rule was used:  
Axle Load LLDF's: Moment/Shear - 0.287  
Truck + Ped LLDF's: Moment/Shear - 0.239

**Complete Issue Information**

FROM: Rachel Sharp DATE: 8/5/2013 9:04:31 AM Eastern Daylight Time  
This same bridge ran with the same OL4 and OL11 vehicles successfully in LFD.

FROM: Mark Mlynarski DATE: 8/6/2013 5:19:45 PM Eastern Daylight Time  
Wayne, You can get this to fail using 2 deck elements between girders and the Type 3 vehicle under operating. Use LRFR 3D-FEM. Mark

FROM: Wayne Skow DATE: 8/7/2013 7:19:36 AM Eastern Daylight Time  
Run this bridge with analysis settings set at lowest level for fastest processing speed. Set the cursor on superstructure def so all girders are processed. Set a breakpoint in CAba3DController::ComputeContraflexureRanges(). The problem is that one of the girders (IMbrObjectld == 2427) isn't getting a contraflexure range and so it's left out of the m\_MbrNegContRange list. This is problematic in CAba3DController::ProcessInfluenceSurfaces() where it is expecting to find 2427 in the list at line 7812.

FROM: Wayne Skow DATE: 8/16/2013 9:27:51 AM Eastern Daylight Time  
Two problems were discovered and fixed:

1. The FeModel copy function was not copying the inclined supports.
2. Uniform member loads used to create moments in the girders for contraflexure ranges were changed to nodal forces.

Fixed in v6.5.1. This fix will also be included in a special v65 patch.

FROM: Rachel Sharp DATE: 8/29/2013 4:19:43 PM Eastern Daylight Time  
Backcheck is okay.

FROM: Bin Zhang DATE: 11/15/2013 2:40:40 PM Eastern Standard Time  
Verified for version 6.5.1 alpha2.

### Description

FROM: Rachel Sharp DATE: 8/6/2013 5:06:10 PM Eastern Daylight Time

The LL shear (kips) for certain points don't match the live load in the analysis results table. For example, Girder 2 Span 2 89.20 ft (location = 186.98ft). For OL11, the negative shear is -26.44 kips and the positive shear is 10.11 kips in the analysis table but in the spec article the negative shear is -163.64 kips and the positive shear is 200.11 kips. The OL4 is different too.

Also, in the spec article, I believe the LL should be labeled LL + I.

FROM: Mark Mlynarski DATE: 8/6/2013 5:35:45 PM Eastern Daylight Time

Srujana, I think we need to determine if this was an existing issue or is specific to 3D curved girder.  
Mark

FROM: Srujana Thogaru DATE: 8/20/2013 3:20:42 PM Eastern Daylight Time

Positive and Negative live load values switch in the article has been fixed.

Wayne is working on the differences in the values between analysis results table and article.

FROM: Wayne Skow DATE: 8/22/2013 5:28:55 PM Eastern Daylight Time

This problem was specific to 3d curved girder. The problem was in new code added to function CSCSuperStructureGirderElement::FindFiniteElement to determine where the current (x,y) point is relative to an element's start end. The error produced a DistFromElementStart value that was longer than the length of the element. This created an amplification effect when unfactored action values were set through interpolation between the start and end of the element. The error became greater relative to the distance away from the start of the girder, the amount of curvature in the girder and the shortness of an element.

Fixed in v6.5.1 This fix will also be included in a special v65 patch.

### Description

FROM: Krisha Kennelly DATE: 8/13/2013 1:00:21 PM Eastern Daylight Time  
The Truck Pair loading is not being considered in multi-span bridges for 3D LRFD/LRFR analysis.

FROM: Wayne Skow DATE: 8/21/2013 3:35:03 PM Eastern Daylight Time  
Intermediate piers were not being added to the load manager for curved girders. Therefore, all load cases were treated as single spans.

Fixed in v6.5.1.

FROM: Bin Zhang DATE: 11/15/2013 11:26:26 AM Eastern Standard Time  
Verified for version 6.5.1 alpha 2.

FROM: Subhadeep Ghosh DATE: 8/13/2013 1:53:48 PM Eastern Daylight Time  
 For updating article 6.10.11.3.3 we need to add a field (for curved girders) indicating on which side of web do we have the longitudinal stiffeners to compute (shown below).

All the other values are available in the article. The implementation is similar for all the editions. The article implementation flowchart is attached.

**Description**

FROM: Brenda Crudele DATE: 8/15/2013 12:20:00 PM Eastern Daylight Time

With the 3D engine the lateral deflections (or X deflections) are listed as zero in the view analysis report (tabular report giving moments/shears/deflections for each load case. Also since this is a 3D model there will be more than one lateral deflection at each POI along the bridge. Each node will have it's own XYZ deflections.

Request that all the nodal deflections be put together in a useful report. I don't want a list of the xyz deflections for every node number. I would like to see a meaningful report similar to the tabular reports so that it shows the distance along the girder and it is easily readable.

### Description

FROM: Rachel Sharp DATE: 8/15/2013 3:14:17 PM Eastern Daylight Time

The lateral moments, fl and LL shear are very different from the left and right location. Please verify the correct values are being pulled from the raw data into the spec checks.

Also, can the rows in the lateral moment tables be labeled for the clarity? Is it a difference in location along beam? It is unclear to me.

FROM: Rachel Sharp DATE: 8/15/2013 3:28:13 PM Eastern Daylight Time

The live load shear in the specs do not appear to match the live load shear tables.

## Description

FROM: Phil Litchfield DATE: 8/19/2013 3:57:54 PM Eastern Daylight Time

I'm having trouble getting this structure to model correctly. Part of the problem is the skew is detailed in reference to the tangent near midspan. I believe that I have that figured out but my beam lengths are still not correct? I attached the plans and my model.

FROM: Krisha Kennelly DATE: 8/20/2013 3:04:09 PM Eastern Daylight Time

Hi Phil. There are no plans attached to the issue so I'm not sure how to review your input. I did notice that 'Distance from superstructure definition refererence line to leftmost girder' on the Framing Plan Details: Layout tab is not entered. Maybe that is causing the girder radii to be computed incorrectly which would in turn cause the member lengths to be computed incorrectly. Please attach your plans if that does not fix your problem.

FROM: Phil Litchfield DATE: 8/20/2013 3:13:43 PM Eastern Daylight Time

Sorry about that, plans should be attached now.

FROM: Krisha Kennelly DATE: 8/21/2013 1:08:55 PM Eastern Daylight Time

Please see attached calcs for the BrDR skew calculation using the Ramp G BL as the superstructure definition reference line.

I've also attached some screen shots showing how I modified the input so the Ramp G BL is the superstructure def ref line. Modified xml file also attached. BrDR girder lengths match the plans taking into consideration the plans "L" value includes the projection beyond the cl brg and the BrDR span lengths do not.

FROM: Phil Litchfield DATE: 8/22/2013 12:15:10 PM Eastern Daylight Time

Program crashes and closes when I try to import the modified xml.

FROM: Krisha Kennelly DATE: 8/22/2013 1:47:30 PM Eastern Daylight Time

Sorry about that, I exported from the 6.5.1 debug build. The 6.5.0 release can't import from a future build. The screenshots 12821 1.bmp and 12821 2.bmp show the only changes I made for the bridge. You can follow those screenshots to modify your data.

4/19/2016 3:25:23 PM

**HRS AASHTO**

3612

**Complete Issue Information**

"uniform load contraflexure points" (see attached screenshot). I have checked this with several different steel bridges and I cannot verify where these numbers are coming from. I have zeroed out all of the loads except the steel and the deck and they still don't add up to this load. I have searched around in the help menu and method of solutions for LRFD and cannot find an explanation.

Please provide an explanation of how this is calculated and what it is used for.

FROM: Herman Lee DATE: 8/26/2013 11:20:48 AM Eastern Daylight Time  
The Uniform Load Contraflexure Points load case is used only for locating the contraflexure locations for continuous span. Simple span analysis will also have this load case. The contraflexure locations are used internally in the AASHTO Engine.

FROM: Herman Lee DATE: 8/26/2013 11:50:43 AM Eastern Daylight Time  
=====  
Brenda,

The uniform load used for that load case is fixed to 1 k/ft. The span length is 108.27 ft on the screen shot.  $M_{max}$  is  $1 * 108.27^2 / 8 = 1465.30$  k/ft and  $V_{max}$  is  $1 * 108.27 / 2 = 54.14$  k. It's a side effect for displaying that load case in the user interface. The user interface is independent of the analysis engine, it just displays what have analyzed. We will take a look to see whether something can be done inside the AASHTO Engine to prevent that load case from showing up. If there's a need for the user to know the locations of the contraflexure points (confirming distribution factor ranges...), perhaps we should keep it there and clarify this load case in the AASHTO Engine Method of Solution. Please let me know your comments.

Thanks,  
Herman

Subject: RE: AASHTO Virtis/Opis - Michael Baker Jr., Inc. - priority has been resolved.

Herman,  
Why can't I verify the moments/shears? If it is used internally is it appropriate to show in the output?  
Thanks,  
Brenda

Herman,  
I think the most appropriate course of action would be to take it out of the tabular results where it is now

4/19/2016 3:25:23 PM

**HRS AASHTO**

3613

**Complete Issue Information**

and add an article to the spec check that lists where the contra-flexure points are. This would get rid of the confusion.

Thanks for your help.  
Regards,  
Brenda

## Complete Issue Information

### Description

FROM: Paul Campisi DATE: 8/26/2013 4:06:59 PM Eastern Daylight Time

We were able to initially automate our installation using "setup.iss" in a LANDesk package. But lately our installs are failing on almost every machine. Our Information Technology Services Group is now requesting more information about this error. I am also attaching the "setup.iss" files that we use in automating the install. The install will go through till the end and fails giving Result code= -3 error.

Thanks

Description

from: Gale date: 7 jan 99

No BRASS XSECT-G commands are created by EXPORT for slab rebar in the negative moment area of an imported or new created composite bridge.

FROM: bgoodrich DATE: 1/15/99

The XSECT-G commands are not generated because BRASS-LFD does not accept both a slab and rebar in the same cross section. I added a warning message to indicate when both a slab and rebar exist. We will address this issue in the future.

Fixed for Beta Build 3

From Gale 17 Feb

The messages help, but we still need to make the EXPORT smart enough to know when the section is in a negative moment area & should use the slab rebar.

FROM: bgoodrich DATE: 02/26/1999 17:14:00

BRASS may be modified, so a slab and rebar can be specified. BRASS would determine the cross section data depending on positive or negative flexure.

FROM: jduray DATE: 03/03/1999 19:04:08

This is a problem in BRASS LFD/ASD. BRASS needs to know if slab or rebar and this is dependent on + bending or - bending at the section.

FROM: bgoodrich DATE: Thursday, May 23, 2002 10:24:05 AM

The BRASS engine properties were expanded to include locations of contraflexure along each span. These locations are utilized to establish where positive and negative bending regions are located. The slab (if defined) is exported in positive bending regions and the rebar (if defined) is exported in negative bending regions. This change was implemented in version 3.0. However, BRASS still does not support a slab and rebar at the same location.

3

Complete Issue Information

them.

FROM: gale DATE: 12 jan

I guess it falls back on whether we support ASD ratings and if we Post at Operating levels for LFD ratings.

BARS allows Posting ASD stresses to be different than Operating, but as far as I know, BARS forces Posting to be the same as Operating for LFD.

We may need to wait until the Users meeting & see what the majority wants and then change it as an enhancement.

| 890.8536 | Discard       | BETA 4 - Import of gross A & I - not in detailed data section |

### Description

From Gale 12 March BETA 4

I'll enter this so we don't forget it. I'll accept the solution to Incident 56 (set an import preference for a text string for BRIDGE NAME) for now, but I think we need to see what the users want. My solution would be to let the preference be a pick list of - BRIDGE ID, BARS CT05 DATA, BARS 6 DIGIT ID - (Ed - Jim & I talked about this)

Description

From Gale 17 march BETA 4  
Now that we are doing a section look-up for A & I in the detailed data, can we expand that to include the non-detailed data ?? Again, I know it's late in the game, but this would really make the Import pretty robust & make believers out of most of the BARS folks. The attached data file comes from Ohio.

|------------|---------------|--------------------------------|
| 1091.10288 | Suspended     | Need "Fishbelly" web variation |

### Description

For 2 spans @ 75', the following Points of Interest were entered:

- Span1 0.0'
- Span1 30.0'
- Span1 75.0'
- Span2 30.0'

The rating results showed the following:

- Axle rating at 30.0'
- Lane rating at 75.0'

Also, the output doesn't specify which span the rating values correspond to.

FROM: bgoodrich DATE: 03/23/1999

The rating results only show the critical rating factors and the corresponding location (for each vehicle) from all the points of interest specified. You would have to look at the BRASS output summaries to find the critical rating factor for each vehicle at each point of interest.

The rating location references the left end of the bridge, however, it does not indicate the "side" (Left or Right) as is input on the Point of Interest window. Jim - Does this need to be addressed? If so, the results object will need to be modified and the BRASS DLLs will need to be modified to pass the "side" to the results object.

FROM:jduray DATE:03/24/1999 08:47:57

We should not modify at this time. We should ask the users/TF if they want rating values at all POI. This is an enhancement.

4/19/2016 3:02:18 PM

HRS AASHTO

10

Complete Issue Information

FROM:bbeerman 3/24/99

The Rating Summary doesn't appear whenever a POI is not entered. If a POI is entered the Rating Summary appears and only the controlling rating point(s) is shown. The POI entered does not appear in the table.

FROM:jduray DATE:05/03/1999 10:58:05

This needs to be coordinated with Brian. First modify the results object, then add to BRASS, then modify GUI.

| 1267.10117 | Resolved      | Import of composite beam |

Description

FROM: snshah DATE: 6/10/1999 4:34 PM

When we rate a bridge from the bridge explorer, only the rating factors are displayed. It would be convenient if the load rating in tons was also displayed and a column showing which member(s) are being rated. We would also like to see a table which shows all of the bridge members rated with their rating in tons and rating factors rather than having to select each member individually.

FROM: jduray DATE: 06/11/1999 11:49:57

You can get to the members by selecting the bridge(s) and clicking View Structure Rating Results button. Then select all structures and click View Member Rating Results. The Member Rating Results window displays more info including the rating in tons.

### Description

FROM: rmbest DATE: 7/9/1999 11:36 AM

VIRTIS - Import of feet & inches are converted to decimal values of 6 or more places. This can be a problem when editing a VIRTIS file because some things like section ranges have to add up perfectly. It would be nice if these values were rounded to two decimal places automatically.

FROM: jduray DATE: 07/20/1999 10:31:45

We have tried to deal with this issue by placing a tolerance on the comparison.

FROM: jduray DATE: 04/18/2000 08:43:22

We need to limit the number of decimal digits (precision) permitted in the grids and edit controls.

This was approved by the TF 4/13/00.

I would like to finish this work and include it in a service pack in the near future.

| 1322.10063 | Discard       | BRASS Import doesn't recognize new commands |

Description

FROM: rmbest DATE: 7/9/1999 11:39 AM

The cross section for a Riveted Plate Girder does not import into VIRTIS successfully. If holes are input in BARS as part of the section, then VIRTIS does not know how to handle them.

FROM: jduray DATE: 07/20/1999 10:30:45

Is this true? What do you suggest we do?

FROM: emartin DATE: 7/22/1999 8:15 AM

Yes.

Virtis enhancement.

FROM: jduray DATE: 12/9/02 3:32:59 PM

The preferred way to describe hole within Virtis in order to be consistent with describing a bridge is to describe the holes, not just A and I. However, since BARS may not have that detail how do you suggest we implement this request?

BRASS does not handle holes.

Description

FROM: rmbest DATE: 8/2/1999 4:11 PM

As a test, we imported Pontis Data for 10,900 existing structures into VIRTIS. The All Bridges folder in the Bridge Explorer became incredibly slow in retrieving and updating bridge list. In fact screen updates take almost 1.5 minutes with a Pentium III / 450. Operations were much improved when small groups of these bridges were placed in sub folders, as long as the All Bridges folder was not engaged. Something needs to be done to drastically speed up the update process?

FROM: jduray DATE: 08/03/1999 10:11:08

Version 2.1 (to be released in a few weeks) saves (to the registry) the name of the last folder used in the Bridge Explorer. When the Explorer is initially opened that most recent folder will be the current folder. You should be able to operate without using the All Bridges folder. We are also looking at ways to improve the performance, however.

FROM: jduray DATE: 08/03/1999 12:27:52

Paul Jensen and Gale also reported this problem.

## Complete Issue Information

The following are things to consider/investigate:

- 1) provide an option to not display checkout status. The checkout status results in four outer joins and one join.
- 2) denormalize the checkout and store a flag in abw\_bridge to indicate status and perhaps owner name.
- 3) enable retrieval of a subset of rows, continue fetch when list is scrolled - this would disable the database disconnect feature which is planned.
- 4) investigate the use of indexes and tune the queries (again).
- 5) get bulk fetches working (problems are in MFC record sets)

Try solution 3 above.

FROM:jduray DATE:08/04/1999 14:25:43

Solution 3 is implemented in the GUI and works well to improve performance once the server has buffered the results of the query. However, it still takes the server too long. The majority of the time is spent by the server because of #1 above. That needs to be improved. Indexing seems to be correct.

FROM:jduray DATE:08/04/1999 14:29:46

The GUI changes may be in version 2.1 but more likely 3.0 because they need to be tested more thoroughly.

FROM:jduray DATE:08/04/1999 14:34:20

According to ISQL the current view with four joins for the checkin/out info takes approx. 20 times more I/O (295615, vs 13812) for 12925 rows.

When we implement this we will need to add a Retrieve All to the menu/toolbar.

The view uses the Distinct keyword which causes the poor performance. It is needed so that we don't get the same bridge\_id returned for each structdef checked out.

Performance may be improved by doing the checkout info in memory within Virtis (as a lookup into a map of checked out bridges (incl. owner)). This may be better since it is expected that not many bridges would be checked out so the list to process for each bridge would be small and fast.

Description

FROM: rmbest DATE: 8/23/1999 9:24 AM

In the bearing stiffener location folder, for each support, the user must set the offset to zero instead of leaving it blank, or an error results. It would be nice if the user could leave this blank in order to indicate zero. This would be consistent with other fields where a blank field means zero.

FROM:jduray DATE:08/23/1999 11:32:07  
Joe - let's make this change for 3.0.

FROM:jihnat DATE:08/23/1999 12:50:55

4/19/2016 3:02:20 PM

HRS AASHTO

Complete Issue Information

Maybe we should default to zero instead of blank (i.e. show the zero in the cell instead of a blank cell). Fields that are blank get set to null, which is distinct from a value of zero.

FROM:kkennelly DATE:7/2/01 9:26:19 AM

I think this was resolved, if you open this window for the first time now it defaults to 0 not blank.

FROM:jduray DATE:09/16/1999 11:59:26  
We need to discuss this.

FROM:bgoodrich DATE: 9/16/1999 7:27 PM  
Jim - When a wide flange section is specified, BRASS does not allow the cover plates to taper along the range. Jay, Dan, and I discussed this issue a while back and felt that it would not occur that often. However, it looks like it has. We cannot address this issue with BRASS funds until after Oct. 1 as we are out of funds now.

FROM:jduray DATE:2/4/02 4:41:06 PM  
is this an enhancement for BRASS or a bug?

FROM:bgoodrich DATE:02/04/2002 17:30:51  
Jim - This issue is an enhancement if addressed in the BRASS engines. However, we may be able to address this issue in the export. We could detect when the cover plates tapered and then force the export to generate plate girders with cover plates instead. This would be similar to what is done when deterioration is specified in a rolled beam.

FROM:jduray DATE:2/5/02 9:39:44 AM  
Please discuss with Jay and provide an estimate and recommendation. My preference is to handle in the export if the cost is the same as handling in BRASS and if the results are the same.

FROM:bgoodrich DATE:Wednesday, February 20, 2002 12:16:26 PM  
Brian and Jay discussed this issue with WYDOT on 2/19/02. WYDOT indicates this is not a priority for

4/19/2016 3:02:20 PM

HRS AASHTO

24

Complete Issue Information

BRASS. Therefore, we will have to address it in the export.

FROM:bgoodrich DATE:Wednesday, February 20, 2002 12:18:07 PM

Jim - I can set a flag in the export when a rolled beam with tapered cover plate is detected. Then, instead of exporting a rolled beam, I can export an equivalent plate girder instead. This should only take a couple hours to implement and test. The logic will be similar to that for exporting a rolled beam as a plate girder when deterioration is specified.

FROM:jduray DATE:2/25/02 8:33:46 AM

What will the user see in the BRASS output file? Will they be confused when they see a plate girder description for their wide flange beam? Actually, it doesn't matter, if WyDOT isn't willing to fix BRASS then our only choice is to handle in the export. That is better than not handling at all.

Do it!

Can we get this into this service pack?

FROM:bgoodrich DATE:Tuesday, February 26, 2002 2:42:23 PM

I will implement this change in time for the service pack.

FROM:bgoodrich DATE:Thursday, February 28, 2002 1:38:00 PM

I modified the export to generate an equivalent plate girder when tapered cover plates are detected. The export issues the following message:

"Rolled beams are exported as equivalent plate girders when tapered cover plates are detected."

Fixed for Version 4.1 Service Pack 1.

| 2113.11244 | Resolved      | Import and Export of bridge files |

Description

FROM: bboucher DATE: 12/30/1999 9:40 AM

I'm trying to weed through the yards of data provided by the virtis rating summary. I've found that the rating summary retains all runs for each bridge. When I use the "up to date" option, all runs which have been performed under the current version of the bridge (last saved) are displayed. I was wondering if there is any way to restrict what is shown to the last run performed. This would make debugging the bridges much easier.

I've also noticed that when I try to look at the specific beams for more than one bridge at a time, the program is not selective (or it won't let me be). I get the one bridge or all the bridges, nothing in between.

FROM: jduray DATE: 01/05/2000 08:38:47

At the present time there is no way to restrict what is shown. Suggestions are welcome as this is an area that we recognize needs improvement.

| 2114.11243 | Resolved      | Bearing Stiffeners in plate girders |

### Description

FROM: bboucher DATE: 12/30/1999 9:59 AM

I have tried to export a bridge from the bridge explorer and import the file into a different bridge explorer (on another machine). Either of these actions will cause the program to not permit the saving of files. The file can be imported to the other bridge explorer (again, it cannot be saved), modified, and analyzed but that's it.

What can I do?

FROM:jduray DATE:01/05/2000 08:41:56

Version 2.1 does not support import into a different database. 3.0 will.

Description

FROM: bboucher DATE: 12/30/1999 10:11 AM  
 I have a plate girder bridge (2-span continuous) that is failing in shear at the center support. I have significant bearing stiffeners at this point but it still fails. I tried varying the size of the stiffeners and the number but the rating did not change.  
 Does BRASS not take these into account?

FROM: bgoodrich DATE: 1/5/2000 11:11 AM  
 BRASS does rate the bearing stiffeners, but it does so separately from shear. If the bearing stiffeners are causing the rating to fail, the BEARING STIFFENERS will be listed for the limit state. If shear is the lowest rating, then the ULTIMATE SHEAR CAPACITY will be shown. You should turn on the BRASS intermediate output for the pier point of interest on the Engine tab of the Point of Interest window. Then look for the detailed shear output in the BRASS output file to help find out what is causing shear to control.

| 2210.11149 | Resolved      | rel 2.1 - BRASS export doesn't seem to create correct bracing schedule |

## Description

FROM: gbarnhill DATE: 1/10/2000 2:52 PM

The 4th parameter of the STEEL GIRDER CONTROL command provides for certain conditions of plastic section analysis (it's the same control as on the POINT-OF-INTEREST command).

# 492 STEEL-GIRDER-CONTROL 1, 0.0000, 37.9167, 4

The allowable inputs include:

4 = Composite steel & concrete section where dead load moment is positive (tension in bottom of section). See Note 1.

5 = Composite steel and concrete section where the dead load moment is negative (tension in top of the section). See Note 1.

41 = The steel girder cross section at this point may be compact and the girder cross sections at the adjacent pier(s) are compact or moment released (i.e. hinge or pin connected) and you desire the program to check AASHTO Equation 10-129b and 10-129c. If you want the section at this point to be analyzed as non-compact, code 4. See Note 2.

I can't find an ENGINE TAB that allows me to force the parameter to "41" for a positive moment range of the STEEL GIRDER CONTROL command. I can do it on the ENGINE TAB of the POI WINDOW, but that doesn't override the settings on the STEEL GIRDER CONTROL command.

FROM: jduray DATE: 01/12/2000 10:30:11

Can you address this?

FROM: bgoodrich DATE: 1/12/2000 10:37 AM

The export uses the contraflexure percents to determine if the 4 or 5 option should be exported to the STEEL-GIRDER-CONTROL command. There is no place on the engine tabs to indicate if the 4 or 41 option should be used. We could add an option to the engine data for the user to choose which one to use (4 or 41), but it would have to be used in every positive moment region. Would this be enough or would a user want to use option 4 for the positive moment region of one span and option 41 for the positive moment region of another span?

If BRASS-LFD allowed the point of interest commands to override the schedules, this would not be as

4/19/2016 3:02:22 PM

HRS AASHTO

34

Complete Issue Information

big of a problem. Please discuss this issue with Jay.

FROM: gbarnhill DATE: 1/12/2000 12:42 PM

The POI override of the schedules seems to be the best solution. Some positive areas may qualify for 41 and some may not, so setting all to 41 would give incorrect results.

FROM:jduray DATE:01/17/2000 14:27:21

This is an enhancement to be discussed with the TF.

FROM:bgoodrich DATE:Friday, January 24, 2003 12:31:20 PM

The BRASS-GIRDER export utilizes the corresponding engine properties to determine if the adjacent pier sections are compact or not. Then, for each positive bending region in which the the adjacent pier sections are compact and there is a slab, the 41 code is exported. If the user does not want to take advantage of Mp, then, the adjacent pier sections for each span should be marked as non-compact in the engine properties.

BRASS-GIRDER should therefore support plastic section capacity based on AASHTO Equation 10-129b and 10-129c, however, it doesn't appear that 10-129b is considered. I will forward this issue to WYDOT immediately.

| 2288.11073 | Resolved      | LFD-Live Load Distribution Factor |

Description

FROM: gbarnhill DATE: 1/18/2000 4:23 PM

I'm trying to input bracing for a composite rolled beam 3 span bridge.

The spans are 60 ft, 78 ft, 60 ft.

I've tried to input so the pier diaphragm is placed only once, using the spacing in spans 1 & 3.

I've attached a bitmap showing the bracing input tab, the BRASS output and the BRASS help. Also the exported bridge workspace.

FROM:kkennelly DATE:01/19/2000 13:40:38

I think the export is correct based on your input.

Your input:

| Span | Start Dist | Spacing | # spaces | Length | End Dist |
|------|------------|---------|----------|--------|----------|
| 1    | 0          | 20      | 3        | 60     | 60       |
| 2    | 26         | 26      | 1        | 26     | 52       |
| 3    | 0          | 20      | 3        | 60     | 60       |

A diaphragm is not located at the start distance you put in Virtis so the above input translates into this framing plan:

Span 1 Diaphragm at 20', 40', 60' (the one at 60' is the diaphragm at the pier). Note that you do not have a diaphragm at the beginning of the member (0').

Span 2 Diaphragm at 52'. This is the only one in span 2. One does not exist at the start dist = 26'.

Span 3 Diaphragm at 20', 40', 60'. Note that you do not have a diaphragm at the beginning of this span (0').

I think the BRASS bracing schedule generated by the export matches the framing plan I described above.

FROM: gbarnhill DATE: 1/20/2000 10:37 AM

I think I now see how to set the ranges for what I want.

See Incident 2214 for a follow-up.

### Description

FROM: dkoenig DATE: 2/9/2000 11:59 AM

I have found what appears to be a problem with the calculation of the live load distribution factors for an exterior girder when the bridge has been input using metric. The bridge data is as follows: girder spacing=2.92m, curb width=.41m, overhang width=1.21m, and the number of girders=6. The system calculated distribution factor shows up as being 1.5205 for shear, shear at the supports, and moment. Using the standard AASHTO formula for an exterior girder (with english units) gives a DF of 1.4981 for moment and shear. Using the simple beam model, I came up with a distribution factor of 1.493 for shear at the support (this assumes the first wheel line is .6m from the face of the barrier curb). For the interior girders, I was able to match what the system had calculated. This is only a small difference. However, I thought that since I was able to match the programs calculations on the interior girder, I should be able to also match the programs calculations on the exterior girder. Also, the fact that all three distribution factors were showing up the same seemed a little odd to me. By the way, I have not encountered this problem whenever I have put the structures in the system

using english dimensions.

FROM:kkennelly DATE:02/09/2000 14:31:52

W1 is 0.2m to left of ext girder and W2 is 1.6m to right of ext girder.

by simple beam calculations, 
$$\text{Ext DF} = \frac{W1(2.92+0.2) + W2(1.32)}{2.92} = 1.5205W$$

FROM: dkoenig DATE: 2/9/2000 4:32 PM

Your basically using a lever principle to come up with the DF. We have always assumed the wheel line on the cantilever to contribute 100% or 1.0.

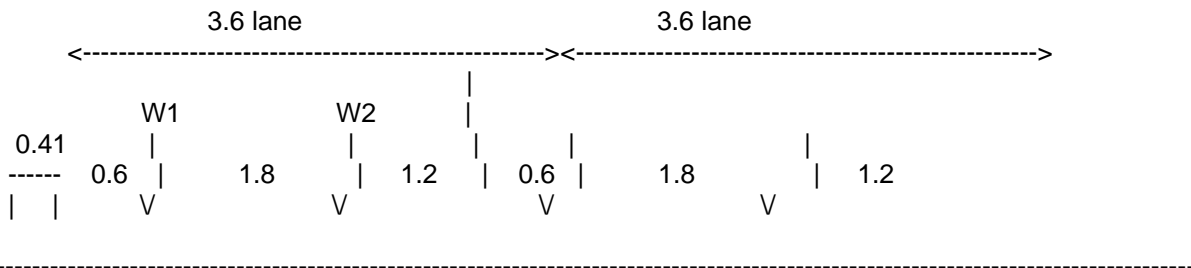

As a side note, based on a 3.6m wide design lane, I believe that there would actually be a third wheel line at .12m from the interior girder. This would result in a final DF of 1.5616. Let me know if you agree.

Thanks for your help.

FROM:kkennelly DATE:02/10/2000 08:08:17

We use the lever rule for the wheel on the cantilever since it's more conservative. Some states might want the more conservative DF and others might want to use 1 for DF. We don't currently have a mechanism to change the calculation of the DF contribution of this wheel. If more users want to use 1 for its DF maybe we can have an enhancement to add this choice of calculation but I don't think anyone else has asked for this so far.

The next wheel line has to be 0.6m into the lane so that puts it 0.48m to the right of the interior girder and it doesn't contribute to the DF.

-----

FROM:kkennelly DATE:02/10/2000 08:20:24

FROM: dkoenig DATE: 2/10/2000 7:57 AM

Actually, what I conveyed above was not quite the way I calculated the contribution from the third wheel line. Some of our designers (including me) space the trucks transversely across the bridge based on the .6m dimension. As a result, I placed the third wheel line 1.2m from the second wheel line and ignored the 3.6m design lane width.

As far as adding this as an option in Virtis, I don't believe that it is real important. The difference between the way the program calculates it and the way we calculate it is small. There both conservative numbers anyway when compared to actual field measurements. If we decide that we want to use our numbers versus what Virtis calculates we can always input them manually.

Thanks.

Description

How do I turn off the rating analysis based on Bearings within Steel Module.

FROM: bgoodrich DATE: 3/15/2000 3:16 PM

The only way to get BRASS to neglect rating of bearings is to not enter any bearing data in Virtis. You need to set the number of pairs of bearing stiffeners to zero for each support. If any points of interest are specified, do not override the bearing stiffener schedule.

FROM: VVinayagamorthy DATE: 3/17/2000 11:38 AM

It looks like that we need to modify BRASS program to ignore rating based on bearing. Consider a scenario where a bridge is designed using OPIS and passed on to VIRTIS. Bearings details will be there and erasing this data is an Option at this point. When we route extra legal trucks, user may want to ignore the effects on bearings; as a result, user may want to ignore the rating based on bearing plates. This cannot be accomplished with the present BRASS.

(Enhancement for BRASS)

FROM: bgoodrich DATE: 3/23/2000 5:23 PM

Notes for later: A checkbox could be added to the engine data or to one of the Virtis/Opis windows to indicate that rating of bearing stiffeners. If an option was added to BRASS to ignore bearing stiffener analysis, this flag could be exported directly to a BRASS command. However, the ignore bearing option is not implemented in BRASS, the export could use this flag to know when to skip over generating bearing stiffener related commands, so BRASS would not consider bearing stiffeners in the rating.

FROM: bgoodrich DATE: Tuesday, February 26, 2002 2:51:04 PM

Not a short-term priority to WYDOT. WYDOT considers this a possible long-term enhancement.

FROM: bgoodrich DATE: Monday, September 08, 2003 3:34:05 PM

Ute Ganjanathavat (OK DOT) submitted the following:

I ran a bridge data and got moments and shears but all ratings are zeros. Would you please look at the attached file. Thanks. (See attached file: virtis.bbd)

FROM: bgoodrich DATE: Monday, September 08, 2003 3:36:08 PM

I did an LFD rating of Member 1 and bearing stiffeners are controlling. The output shows the bearing stiffener rating as:

Bearing Strength 10-132 (BS) = 394.42 (kips)  
Dead Load Reaction (DLR) = 643.13 (kips)  
Live Load Reaction (LLR) = 68.55 (kips)

$$\text{R.F.} = \frac{[\text{BS}] - \text{DLR}}{\text{LLR}}$$

## Complete Issue Information

\*\*R.F. = -3.6280

As you can see, the resistance is less than the applied dead load. BRASS-GIRDER calculates the rating as negative and then sets the rating to zero. The bearing stiffeners at the first interior support are 18 inches apart. One of the limitations of BRASS-GIRDER is that it only supports ONE line of bearing stiffeners, so the export merges multiple lines into one, thereby causing the area of the web between the stiffener lines to be neglected. This results in a lower bearing resistance. Even if BRASS-GIRDER calculated the resistance correctly (686 kips), this still would not be enough to get a bearing stiffener rating greater than 1.0. This issue is the same as Incident 4626.

This issue could also pertain to Incident 2513, which requests that the rating of bearing stiffeners be ignored.

The virtis.bbd file is for Virtis 5.0.1.

CONSULTANT

Michael Baker Jr., Inc.  
Phoenix, AZ  
Joseph McKool, P.E. (Baker's Coraopolis, PA office)  
(412) 269-6362

Virtis is reporting that the bearing stiffeners control the inventory and operating rating for both HS-20 truck and lane loadings. However, upon closer inspection of the BRASS output file it appears that in the Load Rating Summary Report, BRASS is reporting the rating from the right side of the support (point 300.00), but it is only using point 210.00 (the left side of the support) to define the bearing stiffener. We know this because if you look at the "Section Dimensions" reports in the BRASS output, at point 210.00 it lists a 5.63"X0.75" bearing stiffener, but at point 300.00 there is no bearing stiffener listed. Also, under the Bearing Stiffener Report for point 210.00, the "Available Reaction" (i.e. strength) is 265.00 kips, while at point 300.00 it is 221.11 kips. Since points 210.00 and 300.00 are the left and right sides of the same support node, we would expect the bearing stiffener strength and rating factors to be the same.

Because of this apparent bug, we are unable to obtain a correct rating for this bridge.

FROM: bgoodrich DATE: 3/20/2000 2:13 PM

Joe sent me the BRASS input and output files, which I have attached. I have forwarded this incident to WYDOT.

FROM: bgoodrich DATE: 3/23/2000 5:14 PM

Using the Virtis 3.0 acceptance build and the corresponding BRASS-LFD DLL, I do not get any difference in the rating factors for bearing at the 210 and 300 points. This issue appears to have been fixed sometime after the Virtis 2.1 release. There are some BRASS output issues that we are working on, but they will not be ready for the version 3.0 release. The bearing stiffener summary data may be missing for some of the points of interest.

43

### Complete Issue Information

When I reviewed the member for my data entry to see correct data was entered, I noticed that the program did not write the load case that was assigned for the settlement. I would like to see the load case name assigned to the settlement written within the review report.

Because of this lack of written information, I revisited to the GUI to make sure the correct load case was assigned or not.

| 2700.10677 | Duplicate     | Copying Problems on Girder Line Definition |

### Description

FROM: dkoenig DATE: 5/22/2000 2:10 PM

We have encountered a problem that we can't figure out. We have just moved Virtis into a production environment. I have gone in on the production version of the database and have been deleting all of the sample bridges etc. that we don't want in the production version of the database. I have been able to delete all of the bridges. However, whenever I select the empty deleted bridges folder command on the edit menu it will not allow me to delete two of the structures. The error message that we are getting is shown below.

Unable to delete bridge from the database!

01:14:22 PM - Line 2562 in source file D:\Virtis\gui\abgdtop\UiDescDtopGridView.cpp.

Error deleting record from database record set.

01:14:22 PM - Line 1099 in source file E:\virtis\Dev\data management\abmbrdg\DmStructDefRefLine.cpp.

No rows were affected by the update or delete operation.

These two bridges have run for us without any errors. They were checked in and the user authorization was set so that I have access to the structures. My user ID is setup so that I have full access to the software. What I thought was a little odd about the above error message was that it is

4/19/2016 3:02:25 PM

HRS AASHTO

47

## Complete Issue Information

referring to the E drive. On my machine, the E drive is the CD drive. I also have copied the structure and have imported it into one of our testing versions of the database. In both of these instances, I was able to delete it. I don't think that the error is related to our database setup because I get the same error in our production database and one of our testing databases.

FROM:jduray DATE:05/24/2000 14:38:34

The reference to the E drive is a result of how we built the executable and is not referring to anything on your PC. Which two sample bridge cause this? The version referred to above is 2.1. Is that correct or are you working with 3.0?

FROM:dkoenig DATE: 5/24/2000 3:48 PM

We are using Version 3.0 for our production and testing versions of the database. The two bridges that are causing this error are not any of the sample structures that were sent with Virtis. They are structures that we have input in the system.

FROM:kkennelly DATE:05/26/2000 10:49:08

Can you export and attach the bbd files for these bridges to this incident so I can test them? I'm not able to reproduce this.

FROM:dkoenig DATE: 5/30/2000 11:02 AM

The two files are attached. You can look at them and see if you can find anything. My guess is that you won't have any problems with them because we have copied these and imported them into the other versions of our database and did not previously have any problems deleting them. We did try something new this morning. We imported these bridges directly from our production database into one of our other databases and could not save these files. We have been discussing this problem with Jim. You may want to visit with him about this again because there may be some connection between this incident and the saving problem.

FROM:kkennelly DATE:05/31/2000 15:16:01

You were right, I can't reproduce this by importing your bridges. When you tried to save these bridges, what type of error message did you get? Do you know if spans and/or girders were added or deleted to these bridges?

FROM:dkoenig DATE: 6/1/2000 1:20 PM

We figured out the saving problem. We had not made both the NBI number and the Bridge ID unique. As far as I know, we have not added or deleted spans/girders to these structures. We have three Oracle databases in place for Virtis. One is for production, and the other two are for testing. On A584d.bbd, we can't delete it from any of our databases. Structure A4141 can not be deleted from our production database and from one of our testing databases. The only testing database that it can be deleted from is out on a server by itself. I exported both files again and have attached them below. You can try the newly imported files and see if it makes a difference. We first encountered this problem on our production database. Our DBMS group migrated our testing database to a production environment. Once they did this, I went in and selected all of the structures from explorer and selected delete so as to clean out the testing bridges. When I went in to empty the deleted bridges folder, it would delete everything down to one of these structures. I would then have to remove this bridge from the delete folder before I could delete anymore structures. In the end, I was left with the two structures that wouldn't delete. We are not sure what to do with this problem.

FROM:kkennelly DATE:06/02/2000 12:49:01

Still no luck reproducing this problem. Could you try validating one of the bridges you are trying to delete (Bridge, Validate) and see if the validation lists any error messages? Also try exporting the

48

## Complete Issue Information

bridges to a .txt file (File, Export, Save as type .txt) so I can check for irregularities.

FROM: dkoenig DATE: 6/5/2000 12:29 PM

The text files are attached below. No errors show up when the bridges are validated. We do get some warning messages, but they are the same ones that we have been getting on other structures. Is it possible to open a file in version 3.0 that was created in version 2.1? I was wondering if maybe these two files were not included whenever our IS staff backed up the earlier version of the database to load the 3.0 database. I don't know enough about the Oracle myself to know whether this could happen or cause a problem. It is just something else that I thought of that may have happened to these two files.

FROM: dkoenig DATE: 6/14/2000 3:36 PM

We have another structure that we have found that we can't delete. It was one that we have just created. The only thing that we have done on this structure that was a little different is the diaphragms were first created manually, then the manually created ones were replaced with wizard defined diaphragms. I have attached both of the files below. The bridge is A3344 Test. The errors that we get are the same as on the other structures.

FROM: dkoenig DATE: 6/15/2000 8:12 AM

One of our IS people has tried deleting these bridges also. The error message that she gets is slightly different than the one that I get. It is shown below.

Unable to delete bridge!

10:06:14 AM - Line 2715 in source file  
D:\Virtis\gui\abgdtop\UiDescDtopGridView.cpp

Error deleting record from database record set.  
10:06:14 AM - Line 1099 in source file

management\abmbrdg\DmStructDefRefLine.cpp.

No rows were affected by the update or delete operation.

FROM: jduray DATE: 06/19/2000 09:02:42

I spoke with Tamara Clutts (573-526-3959) and had her open the BWS for one of the problem bridges. I had her do the following:  
delete the bridge alt  
save (this was successful)  
delete the structdef  
save (this failed with the above error)  
export the bbd and txt files and email them to me

We were working with version 3.0.

I am hoping that the bbd file shows the faulty reference line.

FROM: jduray DATE: 06/20/2000 09:17:16

The following sql showed the export and the db matched:

```
select bridge_id, struct_def_id, struct_def_ref_line_id, b.display  
from abw_struct_def_ref_line a, abw_sys_type b  
where b.sys_type= a.line_type and bridge_id= XXXXX
```

Description

FROM: dkoenig DATE: 5/22/2000 3:09 PM

I believe that this problem is the same issue as in Incident 2653, and you may already have this corrected. I figured that I would provide some more specific information on this so that you could make sure that it is fixed. What we have found is that this copy problem only shows up on the girder line structure definition. We define the initial member within the structure definition. If we copy this member for use in defining another member, then we have the following problems when copying. Using the cross-section based input method, if the following items on the second member's member alternative are changed, then they are also changed on the first member's member alternative. The items are the additional self weight, Cross-Section Data(name), splice locations, cross-section ranges, and the bearing stiffeners(name). In a similar manner for schedule based input, the following are the items: additional self weight, splice locations, girder profile data, and the bearing stiffeners(name). Hopefully, all of these were fixed with the solution to incident 2653. I just thought that I would provide some more detail so that the fix could be tested more if you so desired.

FROM: jduray DATE: 05/24/2000 14:25:24

The fix for this is in Service Pack 2 (soon to be released). Do not copy members until you get the service pack.

| 2720.10657 | Resolved      | Enhancement Request - GUI not engine dependent please |

### Description

FROM: dkoenig DATE: 5/22/2000 4:22 PM

When entering the strand layout window, Virtis will crash if you try to enter the radius of the bend without having the appropriate harped point radial button selected. The crash happens whenever you try to apply or okay the window. This is annoying because you can lose some data if you have not recently saved. My suggestion would be to have this box grayed out and non-enterable unless you have the radial button for that particular harped point selected. This would keep the user from accidentally entering it and causing the program to crash.

FROM:kkennelly DATE:05/23/2000 12:59:35

I cannot reproduce the crash but I found something else. I can only change the radius if I select the Modify button first and enter a harp distance then enter the radius. Symmetry not checked.

FROM: gbarnhill DATE: 5/23/2000 4:23 PM

I crashed. I have a beam with harped strands defined. I entered a number for the radius for the LEFT HARP PT and click APPLY. OK so far. Then I clicked the LEFT END radio button, typed a new number in the RADIUS for the LEFT HARP POINT, click APPLY and the program crashes.

FROM:kkennelly DATE:05/24/2000 07:50:33

I am able to reproduce what Gale submitted.

I would like to be able to enter the bridge as found on the plans and then if necessary, let the export utility do any massaging of the data to allow the data to work. It can be very frustrating getting all the data enter as found on the plans, only to find when running the analysis, that there are (in this case) all

Complete Issue Information

the section range lengths are not valid for BRASS.

FROM:jduray DATE:05/31/2000 15:06:24  
Brian - I thought we did something about this?

FROM:bgoodrich DATE: 6/8/2000 4:08 PM  
Jim - This issue was reported in Incidents 545 and 2498, however, we suspended them. Significant export or engine modifications will be necessary to address the short element issue.

FROM:bgoodrich DATE:Thursday, May 23, 2002 10:41:43 AM  
Both BRASS programs were modified so node points are not placed any closer than the short element length (about 0.12 feet). Therefore, the short element error should no longer occur. This incident is a duplicate of 545 and 2498.

Description

FROM: tthompson DATE: 5/31/2000 8:03 AM

I'm not sure if this is intended to work this way or not. But, If I sort the bridge list by bridge id (for example) and I then highlight a structure and then check out the bridge. After I check out the bridge, the bridge explorer resorts the bridge list based on the user preference of either ascending or descending BID. I don't like this behavior because the user then has to re-sort his/her bridge list. The only purpose I see for the BID is knowing the order bridges were created or imported - nothing more.

As a side issue, it would like to see the list be sorted by bridge id rather than BID as a default. Or better yet, a more robust explorer to let the user create his/her own items to sort by.

FROM: jduray DATE: 05/31/2000 15:22:14

Investigate not requerying the db after the checkout. The other suggestions are enhancements. After the requerying after checkout is resolved change this to an enhancement request and mark as "Suspended".

### Description

FROM: dteal DATE: 6/27/2000 11:14 AM

I think Virtis is passing on the wrong structural thickness to BRASS for calculating stiffness for girder distribution factors.

Girder System Example(attached):

180 mm Total Deck Thickness on the Struc Typ Sec, Deck (Cont'd) tab

40 mm SFO Thickness on the Struc Typ Sec, Wearing Surface tab

210 mm Structural Thickness on the Deck Profile Deck Conc tab

180 mm deck + 40 mm SFO - 10 mm wear = 210 mm Structural Thickness

When you go to the \*.DST output you find 180 mm for both structural thickness (ts) and for the thickness used to compute the dead load.

For computing the dead load it should use 180 mm deck + SFO of 40 mm and then the thickness used to compute stiffness should be ts = 210 mm.

FROM:jduray DATE:06/27/2000 16:14:51

Brian - please check this. Krishna checked on this and thinks we are passing the correct value and she checked with the engineers that are doing the ADOT ratings and they agreed. Please confirm.

FROM: dteal DATE: 6/27/2000 3:37 PM

I am not referring to an LFD rating. I am looking at the \*.DST file created from a LRFD design review.

FROM:kkennelly DATE:06/28/2000 10:54:02

What I looked into is which deck thickness BRASS LFD and LRFD use when determining the stiffness of the member when calculating the moments and shears along the member. I found that by greatly varying the structural thickness on the deck profile window, I could achieve different LL moments and

shears in Stage 3.

I did not check what is used in the .dst file.

FROM: bgoodrich DATE: 7/5/2000 1:28 PM

The export has no way of knowing that the information entered on the wearing surface tab is structural or just an overlay. There is no field in Opis for which to enter this information. Also, BRASS does not support a structural contribution from a wearing surface. For this case, you need to compute distribution factors by hand and enter them into Opis.

Jim - Do you agree?

FROM: jduray DATE: 08/18/2000 14:40:21

Brian - please check with Jay on this. We discussed at User Grp mtg and I think he said the computation of DF is not very sensitive to this. I agree that if the user doesn't like the way BRASS or Virtis/Opis computes the distribution factors he/she should compute his/her own.

FROM: jduray DATE: 08/22/2000 14:48:01

E-mail from jay:

Hi Jim:

It appears to me that we need to establish a workplan for this, gain approval for any engine-related changes. Note that this is related to TennDOT's issue where they want to remove a layer significant layer of concrete and then redeck. We should examine both issues at the same time. This will likely take modifications in the database, domain, GUI, and engines.

Jay

FROM: jduray DATE: 09/15/2000 13:03:19

From Jay:

This is definitely an enhancement as far as BRASS is concerned to get a correct analysis and perform the spec checks. I can think of two options:

Option 1:

Enhance BRASS to provide another construction stage where the top concrete or wearing surface layer is considered as a structural element. Enhancing BRASS will not be a trivial issue because it effectively adds a construction stage. This means array subscripts have to be increased, hard-coded conditionals have to be found and changed, and the section analysis has to be carefully reworked. New commands or parameters have to be added and the manuals and help files have to be updated. I think this enhancement is on the order of 4+ weeks for each BRASS program. The export could most likely be enhanced in 2-3 days depending on the new commands or parameters.

Also, if Virtis is modified to allow several (not just two) structural layers, modifying BRASS as described above will be of little help. I don't think we should just increase the number of stages by some arbitrary value.

Every time we add a stage to BRASS-GIRDER(LRFD), we increase the amount of memory required for each point of interest, which is already large.

4/19/2016 3:02:27 PM

HRS AASHTO

62

Complete Issue Information

Option 2:

The export could be modified to merge the two structural layers (of different thickness and material) into an "effective" structural layer. This would require no changes to BRASS. Export work would take 3-4 days.

----- end of Jay's response-----

FROM:jduray DATE:11/08/2000 12:44:02

I think we need to discuss this with the Task Force since it is an enhancement.

FROM:dteal DATE:Thursday, March 06, 2003 2:28:22 PM

I think #4315 is the same subject

## Description

FROM: kfulton DATE: 7/6/2000 2:09 PM

When importing BRASS files I have found the following problems.

- 1) The rolled beam section designator in the XST command has to be in all caps.
- 2) If a file has a span copy command with the third parameter set to 0 (zero) the structure will not be imported in. If the third parameter is blank or a 1 then the import works fine.
- 3) When additional loads are in the data set and the load group name (LDE comand 4 parameter)is

4/19/2016 3:02:27 PM

HRS AASHTO

66

### Complete Issue Information

close to the number of allowable characters or larger, I get the following error message:

Unable to do save of bridge object!

Assignment of data to recordset variables failed.

Trying to set NAME to NULL in table ABW\_SUPER\_LOAD\_CASE, but the field is not allowed to be NULL.

The log file does not show any problems and has the saving bridge... at the end, but the bridge is not saved in the DB. i have attached the data set and log file.

FROM: bgoodrich DATE: 7/19/2000 3:59 PM

I have corrected the three issues from above and will send the modified source code to Jim.

1. I modified the FindBrassXSection import function so it converts the section strings to uppercase before comparing them.
2. I modified the import function that interprets the SPAN-COPY command. It checked if parameter 3 was a positive integer and zero is not considered a positive integer. I added another section to check if a zero is entered.
3. The load case name is limited to 32 characters within Virtis database. The BRASS load case name is now trimmed before populating the load case name in the domain.

Description

FROM: gbarnhill DATE: 7/17/2000 4:10 PM

I imported a BARS file with bracing ranges described. I added tranverse and bearing stiffener definitions and updated the schedule as needed. When I tried to rate the bridge, I get the following message from the BRASS run.

Input Errors (1878) - BRACING-SCHEDULE: The first range used for defining cross bracing for a span, must begin at 0.0 feet.

----- Contents of BRASS Error File -----

File: D:\VirtisOpis30\S089L\_\_02110\Girder\_1\G01\Mbr\_Alt\_1.ERR

Fatal Error Encountered - Unexpected Termination

\*\*ERROR\*\* BRACING-SCHEDULE

The first range used for defining cross bracing for a span, must begin at 0.0 feet.

----- End of Contents of BRASS Error File -----

I've attached the BARS file I started with and the BBD file with stiffeners added.

FROM:jduray DATE:07/19/2000 13:25:57

Krishna - please investigate to determine where the problem is (import or export).

FROM:kkennelly DATE:07/26/2000 09:39:31

FROM:kkennelly DATE:07/26/2000 10:56:58

I think the problem is in the import. I'm not too familiar with BARS or the import but Card 16 in the BARS file has "SPSP" in columns 28-31 which I think means the range has a support at both the left and right ends of the range. The import needs to create a diaphragm set with distance = 0, spacing = 0', 1 space since in Virtis a diaphragm does not exist at the start of a range. Seems funny nobody noticed this before.

FROM: emartin DATE: 10/30/2000 2:02 PM

FROM: emartin DATE: 10/30/2000 3:46 PM

Added check for "SP" code on first range of structure and if found add diaphragm at start of structure (at 0' with spacing of 0')

Added check for "NS" code on left end of range and reduce number of spaces by one or skip adding if only one.

FROM: gbarnhill DATE: 12/12/2000 8:22 AM

OK in V4.0 Beta 2

### Description

FROM: gbarnhill DATE: 7/17/2000 4:16 PM

Now that we are storing the beam shape data with the bridge workspace, BARS import should create a beam shape for the bridge instead of creating plates when it finds a match in the shapes library for detailed AIS data in BARS.

I've attached a BARS file with AIS data that matches the standard library and another BARS file with

4/19/2016 3:02:28 PM

HRS AASHTO

69

Complete Issue Information

AIS that matches my agency library prepared from NY data.  
(Jim, you should have a copy of my DB on the CD I gave you at the IBC.)

FROM:jduray DATE:07/19/2000 13:43:07  
Ed - I need an estimate for doing this.

FROM:jduray DATE:08/08/2000 11:55:10  
Ed's estimate is 4-5 days plus testing.

Gale - I will need a more detailed description of what is needed here so the TF understands the issue. I think it is important to do this given that there are so many BARS files yet to be imported and this can save time. Can you help with such a description?

FROM: gbarnhill DATE: 8/8/2000 12:47 PM  
When Import finds AIS that matches a shape in the library, we see the following message:

```
>>>>>
The detail element number 0 of section number 1
was specified by A & I
(Area = 20.020000, Inertia = 1478.300000)
The element will be changed to three plates based on a W 21x68
Flange plates: 8.270000 x 0.685000
Web plate: 19.760000 x 0.430000
>>>>>
```

Instead of creating a plate girder MEMBER ALTERNATIVE with CROSS SECTIONS using flange and web dimensions, Import should create a BEAM SHAPE - STEEL BEAM SHAPE - I SHAPE and then create a rolled shape MEMBER ALTERNATIVE.

A word of caution. This will only work when the entire member is made up of rolled shapes (with or without cover plates). Import will have to "check ahead" or "review previous data" to see if part of the member is a plate girder.

### Description

FROM: dkoenig DATE: 7/21/2000 10:23 AM

A 3-span continuous plate girder bridge was created and analyzed in Virtis. The rating report shows that the operating rating is below the inventory rating. This is impossible. BRASS is getting confused when an analysis point is located at a contraflexure point (Before now, I did not know that the contraflexure points needed to be input manually. Locating the contraflexure points, or differentiating between positive and negative moment, seems to be an easy task for engineering software). For different load cases (all positive moment), BRASS is using composite and non-composite properties. This creates the unusual operating rating. More information along with plans on this bridge were given to Brian Goodrich at the recent user meeting.

The Virtis and BRASS files are attached.

FROM: dkoenig DATE: 7/21/2000 10:36 AM

The bbd file is attached along with the BRASS files for Girder 8.

FROM: bgoodrich DATE: 7/21/2000 9:28 AM

I gave Dan Glandt the plans and he is currently working on this issue.

FROM: bgoodrich DATE: 9/5/2000 2:56 PM

I attached a document from Dan Glandt that discusses this issue.

FROM: bgoodrich DATE: 9/5/2000 3:10 PM

I submitted Incident 2824, which was spawned from this incident.

FROM: bgoodrich DATE: 9/22/2000 10:37 AM

This issue appears to be resolved as far as BRASS goes. Jim - Please review and mark accordingly.

### Description

FROM: dkoenig DATE: 7/21/2000 10:56 AM

There is a problem with pasting data into Virtis. A specific example is pasting from Excel into the Framing Plan – Diaphragms tab.

More specifically, this error occurs from pasting data over previously applied data. The pasted data will seem to be pasted over the previous data. After adjusting the data and applying, visually the data can be found to be absolutely correct. After accepting this data and looking at the schematic, the framing plan diagram will be incorrect. Looking at the diaphragm tab will show the incorrect data. This data includes the original data sometimes with an additional line or two from the pasted data. It seems that the pasted data is being pushed behind the original data, but the user cannot see this. At least while the data is being entered.

Additional problems occur if a user tries to paste data into Virtis when too few lines have been created originally. It would be nice if Virtis could create the additional lines needed when the data is pasted. I am not sure how difficult this would be.

Complete Issue Information

FROM:jduray DATE:07/28/2000 16:21:38  
I thought we disabled pasting into our grid?

FROM:jihnata DATE:08/02/2000 15:20:00  
We disabled selecting a range of cells within our grids, but this doesn't prevent someone from pasting from another program (like Excel).

I added a check so that a user cannot paste a grid that is bigger than the destination grid (allowing this would be incompatible with our grid class). Also, the modify flag is now updated so that the data will save correctly.

These changes are completed for Version 4.0.

Description

FROM: gbarnhill DATE: 8/2/2000 4:23 PM

In comparing Load Factor Virtis Operating Ratings to BARS for some PS members, I've noticed that Virtis rating factors are higher. In investigating, I've found that BARS (by default) for an operating level checks the criteria for 0.90 of yield point stress for the lowest tendon. Virtis (BRASS) only checks for ultimate strength.

The Manual for Condition Evaluation of Bridges - 1994 edition, 1996 Interim, in section 6.6.3.3 implies that the 0.90 limit should be checked for all members. In previous versions of the manual, the check was recommended for only "SITUATIONS OF UNUSUAL DESIGN WITH WIDE DISPERSION OF THE TENDONS".

In BARS, the check can be turned off.

If states want to include the check (which they have been doing if they let BARS do the default analysis), then we need to consider allowing a user option to do the check in Virtis.

### Description

FROM: snshah DATE: 8/18/2000 10:40 AM

I am having problems analyzing a 3 span continuous steel plate girder using girder system. The same information runs using girder line, but for some reason it fails to run using girder system. The exported bridge data file is included.

FROM:kkennelly DATE:08/23/2000 13:01:11

When I try to analyze the 540' Interior Beam member alt for Member G2 with BRASS LFD, it gives an error in the Analysis Progress window as follows: "ERROR - Splayed girders and/or tapered overhangs are not allowed!" (That is a BRASS LFD limitation as indicated in the BRASS LFD Engine Related Help in the Structure Framing Plan Details: Layout topic.)

If you go to the Structure Typical Section window and place the cursor in the Start Left Overhang edit control, you will see the value of the overhang is 2.4167'. The End Left Overhang value is only 2.42'. If you change the End Left Overhang to 2.4167', BRASS LFD will run.

(FYI, We are currently working on an enhancement to Virtis/Opis version 4 to let the user enter a tolerance when comparing numbers. For example, in the next release you will be able to enter a number like 0.01' for the tolerance on feet and then 2.4167' will be evaluated the same as 2.42' and

Description

FROM: rmbest DATE: 8/18/2000 4:30 PM

The following may be a source discrepancy in ratings between BARS and BRASS for conditions where shear controls in concrete girders. The problem lies in the use of AASHTO 8.16.6.2. BARS uses equation 8-48 while BRASS uses the simplified equation 8-49 for the computation of the shear capacity for concrete. The difference in ratings would become more pronounced when the girder is under-reinforced for shear and capacity is therefore relying more on the strength of the concrete. This should be investigated or at least BARS users should be aware.

FROM: jduray DATE: 08/21/2000 11:58:12

FROM: bgoodrich DATE: 8/23/2000 1:15 PM

BRASS only uses the simplified equation 8-49. I forwarded this issue to WYDOT to determine if they would like to address this issue with an enhancement to BRASS or by adding some discussion to the

Complete Issue Information

manual and help.

FROM:bgoodrich DATE:08/09/2001 13:24:10

I am suspending this incident until we get a directive from WYDOT to perform this work.

FROM:bgoodrich DATE:02/01/2002 15:02:39

Dan Glandt has enhanced BRASS-GIRDER to utilize Equation 8-48. This will be available in BRASS-GIRDER 5.8.5, which should be included in the first patch for Virtis 4.1.

Jim - Note that there is currently no way in Virtis to set the new Parameter 4 (Reinforced Concrete Shear Equation) on the ANALYSIS command. An initial option would be to leave the parameter blank as is done in the export now and the new BRASS default (AASHTO Equation 8-48 method) would be used. In the next major release, a new field could be added to Virtis itself or to the BRASS engine properties. These last two options would require database changes, which we are trying to avoid between major releases. How should we address the export?

FROM:jduray DATE:2/4/02 4:24:48 PM

The export should do whatever it has to do to produce exactly the same ratings as before the change in BRASS. The user should not have to change the description of a bridge after a release because of a new feature in BRASS. The only time a user may not get the same rating is if the original rating was wrong because of a bug in Virtis/Opis or BRASS. If the new BRASS default causes a new method of analysis then the export should specify the option that uses the old method.

Adding new data items to Virtis/Opis or the engine data tabs is an enhancement and should be entered in a separate incident. This incident should deal with fixing either BRASS or the export so users get the rating they got with 4.0. I think we should add this data to the engine data. We can do that anytime because that does not require a db change.

FROM:bgoodrich DATE:02/06/2002 19:00:12

The latest release notes indicate that Equation 8-48 will not be available in BRASS-GIRDER 5.8.5. The equation is scheduled for release in BRASS-GIRDER 5.8.6, but no release date has been established.

FROM:bgoodrich DATE:Thursday, March 07, 2002 11:08:22 AM

The shear capacity changes have now been made to BRASS-GIRDER 5.8.5, which should be released with Virtis 4.1 Service Pack 1.

### Description

FROM: snshah DATE: 8/25/2000 9:28 AM

I am having problems trying to copy a girder, created under Girder Line, to a matching girder under Girder System. Is it possible to do this, or am I required to enter the girder into a Girder System from scratch? This option would be beneficial in order to easily convert the imported Girder Line BARS files into VIRTIS Girder System files.

Attached is a file that illustrates my problem. It allows me to copy a girder from the Girder Line model to the Girder System setup, but then VIRTIS will not run.

FROM: jduray DATE: 08/28/2000 12:38:12

You may not copy a member. You may copy the member alternative.

FROM: kkennelly DATE: 08/28/2000 13:16:23

Your girder system member alt is not running for the following reasons: Your girder system structure def "Continuous Steel Span" has 158.7917' as the length for span 3. Your girder line mbr alt "Continuous Steel Plate Girder, 540' Interior Girder" has 158.7900' for Span 3's length. The girder profile, deck profile, and haunch profile data under Continuous Steel Span that you copied from the girder line mbr alt all have ranges ending at 158.79'. When you try to run the girder system, BRASS thinks the beam ends at 158.7917' in span 3 but the plates, deck and haunch don't end there. You have to be consistent with the precision you use throughout the structure definition.

## Description

FROM: bmccaffrey DATE: 8/29/2000 10:00 AM

When entering an allowable strand grid for voided prestressed slabs, the horizontal spacing is not reflected in the strand layout window.

This results in strands showing up in the voids.

FROM: jduray DATE: 08/29/2000 10:30:45

You are correct about ignoring the horiz spacing. We use the horiz spacing for the bottom row. The

4/19/2016 3:02:30 PM

HRS AASHTO

79

Complete Issue Information

other rows (I'm not sure of hand what we do for the other rows that are below the voids) are based off the bottom row. If that doesn't fit within the box we center them within the width which causes them to appear within the voids. This doesn't matter (other that the annoyance) for straight strands and debonded strands but it is a problem for harped strands because we don't allow harping to a position that is not directly above the mid-span strand location.

The problem is we don't know the cover to the side of the box or the cover at the voids so we don't really know where the strand positions are horizontally. Most programs don't care where they are horizontally. Only the number of strands per row matter and most programs describe cross-sections instead of a schedule as we are trying to do so they don't care how a strand is harped.

We probably should handle this more exactly by storing the exact position in the db and provide a wizard for describing the strand location grid. Do you have any other suggestions for displaying the strand positions?

| 2838.10541 | Resolved      | BARS Import login |

## Description

I have imported a concrete t-beam, 3 span, structure that was entered in BARS with the symmetrical code. VIRTIS does not handle this well at all. After I went into the shear reinforcement range folder and added the reinforcement that was missing, I receive a message when I apply the changes. The message says that the end distance is shorter than the beam length. After checking the numbers several times, I found that the numbers I entered do add up to the beam length. There must be a glitch in the programming. FROM: sneubauer DATE: 9/12/2000 2:57 PM

FROM: jduray DATE: 9/14/2000 11:14 AM

The values you enter must be to at least 4 decimal places.

For example, if you entered (or is imported from BARS) the beam length as 34.667 and the sum of the ranges is 34.6667 The two numbers are not equal and you may get the message you describe. You must be consistent in the number of decimal places used.

We are making some improvements in Version 4 relative to this issue.

| 2921.10458 | Closed        | 3.0 - SP 4a -- schematic view does not update for bearing stiff and shear conn changes |

### Description

FROM: rmbest DATE: 9/14/2000 8:33 AM The import facility tool in Bridge Explorer requires the user to login for a second time. This should not be necessary and can be a source of frustration if the user specifies the wrong database. Virtis/Opis should pass the login information to the import program.

FROM: jduray DATE: 9/14/2000 10:24 AM

This is reasonable to do on the command line for the import when opened from within Virtis.

Joe - please modify Virtis to pass the username, password and data source on the command line. Then in the BARS and BRASS import read the command line and pass to the login dialog in the import. The user will still have to click Ok on the dialog. Perhaps we can bypass the dialog.

Do for Version 4.

FROM: tthompson DATE: 9/14/2000 3:43 PM

Just a comment. Some users may wish to use the BARS import tool when they're not logged on/into VIRTIS/OPIS. So we still want this to run "stand-alone".

FROM: rmbest DATE: 9/15/2000 9:20 AM It is not a big deal, but there should be a way to make work both ways.

### Description

FROM: gbarnhill DATE: 10/25/2000 1:21 PM

Please work this one with Incidents 2918 and 2785.

With a zero/zero start/space line in the BRACING RANGES table and then a line with numbers for start/space, an extra diaphragm is shown on the schematic. It corresponds with the start distance of the second line in the table. In accordance with Virtis rules, there is not a diaphragm at the start distance of any range.

FROM:gbarnhill DATE:12/28/2000 12:53:22

Just so you don't forget this one, here's what Virtis HELP says in 4.0 Release.

#### Start Distance

Enter the distance from the selected support to the left end of the range. A diaphragm is not located at the start distance. However, it is located at all other locations within the range, including the end distance. For an example illustrating the locations of diaphragms within this range, go to Ranges Example.

Enter a table like this:

support 1, start 0, space length 0, 1 space

support 1, start 4, space length 4, 1 space

This shows 3 "X" in the schematic. There should only be 2.

Description

FROM: gbarnhill DATE: 10/25/2000 4:01 PM

I created two transverse stiffeners. tr1 is a single and tr2 is a pair. I built a STIFFENER RANGE table with single stiff between the abut and the first diaphragm, a pair at the diaphragm, a single between diaphragms and a pair at the next diaphragm.

Export created a schedule of spaces with only single stiff up to the second diaphragm and then a single spaced pair at the next support (this pair does not show on the schematic).

The attached bitmap shows the table, schematic and export log.

FROM: bgoodrich DATE: 10/31/2000 7:55 AM

In Virtis/Opis, the user enters the physical locations of the stiffeners, however, on the BRASS transverse stiffener schedule commands, the user defines the spacing of stiffeners and the stiffener dimensions within a start distance and range. For your case, there was a stiffener pair (tr2) with single

## Complete Issue Information

stiffeners (tr1) on each side. The export exported the stiffener group with the smallest area because of the way the BRASS command is structured. This is why you have single stiffeners up to the second diaphragm. There must not be any stiffeners right of the second diaphragm, which is why the pair shows up from 12 to 60 feet.

I checked the export and I don't think any warning message is output. We will have to issue a warning and update the engine help to indicate how the export generates the transverse stiffener schedule commands.

FROM: bgoodrich DATE: 11/1/2000 9:26 AM  
I added the following warning message in the export:

WARNING: For span X, a different Virtis/Opis transverse stiffener definition was detected at the start and end of a BRASS stiffener range. Therefore, the stiffener group with the smallest area will be exported.

I also added a similar warning when BRASS stirrup schedules are generated because an algorithm similar to the transverse stiffeners is used.

Krishna – Please add the following information to both BRASS engine helps for the transverse stiffener and vertical shear reinforcement topics. If you think it belongs somewhere else, let me know.

For transverse stiffeners, add:

The BRASS transverse stiffener schedule command is used to define the stiffener spacing and stiffener group within a particular start distance and range. Therefore, the export superimposes all Virtis/Opis stiffener schedules and searches for consecutive stiffeners with common spacing and stiffener definition (group). When a transverse stiffener is located between two transverse stiffeners of one or more different groups, the stiffener schedule command will be generated such that the stiffener group with the smaller area will be exported for the corresponding range. The search process continues for the remaining Virtis/Opis schedules.

For vertical shear reinforcement, add:

The BRASS stirrup schedule command is used to define the stirrup spacing and stirrup group within a particular start distance and range. Therefore, the export superimposes all Virtis/Opis vertical shear reinforcement (stirrup) schedules and searches for consecutive stirrups with common spacing and stirrup definition (group). When a stirrup is located between two stirrups of one or more different groups, the stirrup schedule command will be generated such that the stirrup group with the smaller area will be exported for the corresponding range. The search process continues for the remaining Virtis/Opis schedules.

### Description

FROM: gbarnhill DATE: 11/2/2000 3:45 PM

I think this came up before, but I could not find a previous incident regarding hinges for V3.0. I imported a 3 span comp(CSC) girder with 2 hinges in span 2. In the BWS hinge window, 4 hinges are shown, 2 at the left location and 2 at the right.

I imported a 3 span non-comp(SS) girder with all else the same. Only 2 hinges are shown.

I imported a 5 span non-symm comp girder with 2 hinges in span 3. Only 2 hinges are shown in span 2. There are also hinges in span 1 and 5.

I imported the same 5 span girder with the hinges in span 2 and 5. Now 4 hinges are shown in span 2 and 1 in span 5.

Description

FROM: gbarnhill DATE: 11/15/2000 4:01 PM

In reading Incident 2969, I checked the ADVANCED button on the ANALYSIS SETTINGS tab.

Virtis Help says:

Impact

For the displayed vehicle, enter the impact factor as a factor by which the live load is to be multiplied to obtain both live load and impact. For example, enter 1.30 if the impact is 30%.

Export creates the following for 1.30 entered on the tab:

TRUCK-IMP 30.00, 30.00

From BRASS Help for Truck-Imp

Example:

Assuming that trucks #4 and 8 are special overload trucks that are restricted to 35 mph over structures and impact is to be reduced by 1/2 (50%)

TRUCK-IMP , , , 50

TRUCK-IMP , 50

Therefore, BRASS takes the entered percent times the standard impact factor calculated and takes the result times live load to generate live load + impact.

Entering "1" or "0" results in no impact added.

Entering "2" results in standard impact.

FROM: bgoodrich DATE: 11/28/2000 2:50 PM

The UI should definitely not allow an impact override less than 1.0 because 1.0 equals 0% impact.

Otherwise, there would be a negative impact factor.

Gale - You are correct that entering 1.0 results in 0% (no) impact and entering 2.0 results in 100% (full) impact. I need some more information regarding what exactly is wrong.

## Complete Issue Information

I spoke with Gale today. The issue is that the BRASS export is using this factor as a modifier on the standard impact entered on the impact windows. The Virtis help says the impact override is effectively the impact factor on a per truck basis. The impact override will be used for permit trucks, but I'm not sure how this issue is handled by rating engineers. Should it be used as indicated in the Virtis help or as described by BRASS on the TRUCK-IMP command. The problem is that BRASS does not directly support an impact factor for each individual truck. We may be able get the information into BRASS by doing the following:

1. Setting the global impact factor on the LIVE-LOAD command to that specified on the Impact windows.
2. Setting the percent impact to zero for each truck for which a impact override factor was specified.
3. Adjusting the wheel fractions on the TRUCK-WFR command by the impact override for each truck. This command is currently generated using the wheel fraction for moment set on the LL Distribution window for the appropriate number of lanes loaded, which depend on the Single Lane vehicle override.

The problem with mixing impact and wheel fraction is that is may confuse the user if just looking at the BRASS output.

FROM:jduray DATE:12/12/2000 12:25:50

I think we should submit to WyDOT for enhancement to BRASS. Until the enhancement is completed we should change the Help to match what BRASS is doing.

FROM:jduray DATE:12/13/2000 08:53:33

Discussion with Gale - fix the Help to match what is currently being done within BRASS. Submit modification of BRASS as an enhancement request with Wyoming.

FROM:bgoodrich DATE: 12/14/2000 10:28 AM

I will forward the enhancement request to WYDOT via Jay.

FROM:kkennelly DATE:12/14/2000 13:30:32

Virtis helped revised to say:

Impact

For the displayed vehicle, enter the factor by which the standard impact factor is to be multiplied to obtain both live load and impact. For example, if the vehicle is a permit vehicle restricted in speed and the standard impact is to be reduced by  $\frac{1}{2}$  (50%), enter 1.50.

Let me know if that is not correct. Revised for Version 4.0 Release.

FROM:gbarnhill DATE: 12/19/2000 2:08 PM

What Krisha wrote is in fact what has to be done to accomplish the end result. B-U-T, it seems a little backwards to say "enter the factor..." and ask the user to input "1.5" to get the end result of "0.5" as a multiplier.

Wouldn't it be more straight forward to change the variable definition so the user can enter "0.5" to get 50% ??

If this is a bit much to work on this close to release, I'd be willing to wait until V4.1 to resolve this and just do the HELP the way it's written for now. Since this variable isn't written to the database, it will just be a matter of user education later.

Complete Issue Information

HELP write-up OK in Version 4.0 Release

FROM: bgoodrich DATE: 06/08/2001 13:40:58

Jay and I discussed this issue regarding BRASS. WYDOT has approved a BRASS enhancement to allow fixed impact factors on a per truck basis. We will try to get this into the Version 4.1. When this feature is available in BRASS, we suggest that the name of this field should be changed to "Impact Factor" or "Impact Factor Override". How these factors are entered (say 1.3 for an increase of 30%) should be discussed and documented, so the UI and export can interpret them properly.

### Description

FROM: bgoodrich DATE: 12/12/2000 10:02 AM

Mike Perham, Bayside Engrs. inquired about where he could find any loss output computed by BRASS-LFD. This output is available from BRASS-LFD, but a control parameter has not been implemented in the engine properties. Parameter 1 on the SYSTEM-1 command controls this output as well as other prestress concrete related computations. I request that these options be implemented in the Analysis event engine properties for BRASS-LFD.

FROM: jduray DATE: 12/18/2000 11:59:45

FROM: bgoodrich DATE: Monday, November 04, 2002 12:03:55 PM

This issue has been assigned to BRASS Problem Log 366. Ideas for the format of a prestress loss output report for BRASS-GIRDER were prepared and submitted to WYDOT for review.

FROM: bgoodrich DATE: Thursday, November 21, 2002 12:48:40 PM

A new loss report was implemented in BRASS-GIRDER 5.8.6. I updated AboBrass and AbxBrass2, so the user can control if they want the loss report or not. The default is no report. I updated AbxBrass to export the SYSTEM-1 command, which controls the loss report in BRASS. Fixed for Version 5.0.

### Description

FROM:rkelley DATE:01/03/2001 12:52:03

We are upgrading to 4.0 and have the following problems:

1) We cannot log onto the 4.0 sample databases shipped with the product. I tried to get into the 4.0 database via the Virtis application, by the Sybase ISQL tool, and using Infomaker. NONE of these worked.

2) We cannot upgrade the 3.0 sample database using the script supplied. We connect using the ISQL, and run the Sybase script and encounter the message: Error at line 1 communication error. This happens at the ALTER TABLE pontis\_bridge MODIFY struct\_num VARCHAR(15) NOT NULL;

It appears to us that the 4.0 sample database either is corrupt or there is a username/password that we simply don't know. We tried virtis/virtis as the key for lack of better information.

Please contact us as soon as possible to help us through this. My number is (517) 322-1398.

Description

FROM:rmbest DATE:01/04/2001 15:52:11

Version 4.0 - There is an error in the section properties that BRASS is using in the attached example. This is a 3 span built up steel girder. It seems that BRASS is not seeing the flanges over portions of the beam. Span points 1.0 – 1.7, 2.3 – 2.7, and 3.3 – 4.0 are shown in the Output (Beam Properties) to be web only in all stages. I have tried to simplify the example by using just one section over the entire bridge.

FROM:jduray DATE:1/4/01 4:09:17 PM

FROM:bgoodrich DATE:01/11/2001 16:57:32

I found the problem in the export (BrassStdCrossSections.cpp). The GenerateSteelCmds function issued a warning and exited the function without having generating the XSECT-H command. I corrected the file and sent it to Baker.

Description

FROM:bgoodrich DATE:01/17/2001 08:51:32

The engineer at MASS Highway (Binh T. Ha, P.E., (617) 973-7561, binh.ha@state.ma.us) found the allowable flexural stresses for an ASD steel rating are not correct. There is not a problem with the BRASS export from Virtis. I have forwarded this issue to Dan Glandt for investigation.

FROM:bgoodrich DATE:01/17/2001 08:53:19

Dan Glandt corrected this issue in BRASS. I will request approval from WYDOT for release this in a Virtis patch.

FROM:kkennelly DATE:5/31/01 3:43:18 PM

Unable to test this.

### Description

FROM:bgoodrich DATE:01/17/2001 08:55:37

Several users at the Boston training requested that BRASS be enhanced to utilize shear distribution factors and not just moment DF. This should be extended to include shear, reaction, and deflection distribution factors.

FROM:bgoodrich DATE:02/26/2001 14:09:22

I have forwarded this issue to Jay Puckett/WYDOT for their consideration.

FROM:bgoodrich DATE:08/01/2001 10:58:33

Implementing additional wheel fractions in BRASS-GIRDER is planned for the Spring 2002 release. Suspended until then.

FROM:jduray DATE:5/23/02 11:52:33 AM

Based on email from Brian:

Waiting on approval from WYDOT to begin work.

Expecting a response very soon.

Description

FROM:bgoodrich DATE:01/17/2001 08:57:33

An engineer at MASS Highway (Binh T. Ha, P.E., (617) 973-7561, binh.ha@state.ma.us) would like BRASS enhanced to exercise AASHTO 10.38.1.6 (1996 spec), i.e., use the positive section properties for the entire girder when performing the structural analysis, but then use the appropriate section properties (positive or negative) when performing section analysis and specification checks. BRASS would need to be enhanced to so both a slab and rebar can be specified within the same cross section. We have had similar requests before.

| 3064.12284 | Accepted      | Bracing at beam ends not handled by BARS import |

Description

FROM:gbarnhill DATE:01/24/2001 16:40:57

In a schedule based member alt, I wanted to force a compact analysis at POI 104. I coded the engine tab for the POI for SECTION TYPE 41. The engine tab for MEMBER ALT is set at POI CONTROL = 5. The analysis log includes the following message:

WARNING (High):

The POI control parameter on the ANALYSIS command indicates to generate points of interest from the schedule data. BRASS currently does not allow the generated data to be overridden with the data entered on the point-of-interest commands.

I took the BRASS data file created by Virtis, added the STEEL 1 and STEEL 2 commands and then ran it in WYDOT BRASS Rel 5.8.2. The results include the "41" code from the STEEL 1 command.

BRASS HELP for the STEEL 1 command, NOTE 3, seems to indicate that I should be able to add the STEEL 1 command to schedule based input.

I've attached the Virtis BBD file, the Virtis log file from the analysis run and the BRASS data file with STEEL commands added.

FROM:jduray DATE:01/25/2001 08:56:52

FROM:bgoodrich DATE:01/30/2001 18:04:14

The export was not modified to allow the POI override, yet. This enhancement should be considered in the next release.

FROM:bgoodrich DATE:Friday, July 02, 2004 3:23:42 PM

Incident 5102 is a duplicate of this incident.

| 3090.12258 | Resolved      | Bearing Stiffeners |

### Description

FROM:ttompson DATE:01/30/2001 17:44:21  
Virtis/Opis 3.0 Release Service Pack 4a

I was entering Transverse Stiffener Spacing for the end span of a structure.

The Span length was 110 ft and I entered the following:

| Start | # | Spacing | End Dist  |
|-------|---|---------|-----------|
| 0     | 8 | 45      | 30 ft     |
| 30    | 5 | 48      | 50 ft     |
| 50    | 8 | 60      | 90 ft     |
| 90    | 4 | 48      | 106 ft    |
| 106   | 1 | 39      | 109.25 ft |

The last tranverse stiffener is located 9 inches from the End of the girder. But I keep getting an Error message that says End Distance is 639.25 ft. Beam Distance is 640 ft. Do you want to change the spacing? Yes or No. (I attached WORD doc with snapshot).

What am I doing wrong? Seems that I've entered dozens of structures simliar to this, but haven't had this problem. I've also tried adding 1 additional stiffener as:  
109.25 1 9 110

But I still get the same error message? What's up?  
I've also attached the bbd file for this structure.

FROM:kkennelly DATE:1/31/01 8:09:18 AM

Part of the validation in Virtis checks if the last stiffener or diaphragm, etc. is within 1' of the end of the beam. If it is, Virtis asks if you want to change the spacing. If you answer yes, Virtis will change the spacing for you so that the end distance matches the end of beam length. If you answer No, the window will close without changing the spacing. This is not an error message that prevents you from running Virtis or BRASS. Just answer No to close the window. This Validation was added to Virtis to help the user when entering data for a bridge with a beam length that ends in many digits beyond the decimal place and maybe the spacing the user entered doesn't exactly match the beam length. A lot of users had problems with getting BRASS to run when they had gaps in their Virtis input (before we added the tolerances to Version 4.0) The distances you are getting (639.25' and 640') are measured

4/19/2016 3:02:36 PM

HRS AASHTO

108

Complete Issue Information

from the leftmost CL Brg (Support 1).

Incident 3017 and 2931 also deal with the message being issued for rows of data that are not the last rows in the grid. Data can be entered out of order so the Validate does this check for all rows not just the last row. That's why you got the message when you entered a stiffener at 110. Incident 3017 addresses changing the Validation so it only checks this 1' distance for the rightmost piece of data entered.

Description

FROM:sneubauer DATE:02/01/2001 15:03:57

When bearing stiffeners are entered for a steel beam, the analysis usually has the bearing stiffeners controlling the rating. Many times the rating is very low or 0. The governing factor is the compression or bearing capacity. I believe that the bearing and compression areas used for the calculation are incorrect. Please look into these calculations.

FROM:kkennelly DATE:2/5/01 10:18:09 AM

## Complete Issue Information

Please export one of the bridges that is having this problem and attach it to this incident so I can investigate this.

There have been several previous incidents entered for problems with bearing stiffeners in BRASS. Refer to incidents 2690, 2660, 2547 to see if they have any info useful to you.

You can turn on the BRASS intermediate output for the support points of interest on the Engine tab of the Point of Interest window. Then look for the detailed output in the BRASS output file to help find out what is causing this problem.

FROM:sneubauer DATE:02/07/2001 11:52:20

The bearing stiffener sizes are as follows:

Abutments = 2-6x 5/8" plates

Piers = 2-8x 3/4" plates

Intermediate stiffeners are a single 4 x 5/16" plate

FROM:kkennelly DATE:2/7/01 12:08:48 PM

Can you export the Virtis information and attach it to this incident so I can be sure I am checking the same bridge you have entered in Virtis. You can export Virtis data by opening the Bridge Workspace of the bridge in question, then selecting File/Export. This will create a \*.bbd file that I can then import into Virtis. Also, are you running BRASS ASD or LFD? And what version of Virtis are you running?

FROM:sneubauer DATE:02/07/2001 12:57:15

I am running release 3.0. The incident 2547 issues are not resolved in release 3.0. The right side of the pier is not being recognized as having stiffeners present.

FROM:kkennelly DATE:2/7/01 1:38:42 PM

I imported your bridge into Virtis, ran BRASS LFD on member G02 and got a controlling rating of 0.698 due to brg stiffeners at span 2 100%. I added a point of interest at Span 3 0% to this member and re-ran BASS LFD. I looked in the BRASS output file for the detailed intermediate BRASS calculations for point 2 100% and point 3 0%. The calculations for the bearing stiffener strength at these 2 points is the same. I've attached a file to this incident that contains this output, interior\_girder\_lfd.txt. This file contains an abbreviated version of the BRASS LFD output file that you can view after running BRASS in Virtis. The BRASS calculations for the bearing strength appear to be correct.

I did similar things for a BRASS ASD run, got similar results (brg stiffs control). Interior\_girder\_asd.txt attached to this incident shows the same brg stiff strength at point 2 100% and point 3 0%.

I know it seems unlikely that bearing stiffeners should control the rating of an existing bridge but they do according to these calculations. If you want to ignore the bearing stiffener rating factors, you can remove the bearing stiffeners from Virtis. BRASS will run and you will probably get moment or shear to control the rating. There currently is no option in Virtis or BRASS to turn off these bearing stiffener rating factor calcs.

### Description

FROM:dteal DATE:02/15/2001 11:50:02

In the highlighted row in the attached Word document, Span Location Point 1.118, there is 6120 sq mm of re-steel. According to my x-section input, I only have 4080 sq mm at this point. This point is where the steel from the previous section is terminated. ie: At span location 1.025 there is 6120 sq mm. This section range goes from point 1.025 to 1.100 where the section changes to 4080 sq mm.

I have found this discrepancy at other points also?

FROM:dteal DATE:02/16/2001 14:09:14

I believe that this example better explains the situation.

An example at one point:

4/19/2016 3:02:36 PM

HRS AASHTO

## Complete Issue Information

POI 109.36 and 300.64 below are identical points. Both are the first bar termination points from the centerline of the pier beam into Span 1 from Pier 1 and into Span 3 from Pier 2. The x-section at these two point should both contain 12 bars in the top of the slab. Point 109.36 shows 8 bars while point 300.64 shows 12 bars. To eliminate the symmetry errors I entered all the x-sections for all three spans.

### PERFORMING AASHTO SPECIFICATION CHECKS - 5.7.3.4 Control of Cracking by Distribution of Reinforcement

Point of Interest : 109.36

Determining fsa for NEGATIVE Flexure:

Input Parameters:

ds = 60.500 mm      No. Bars = 8.000  
b = 1800.000 mm      Z (top) = 23000.000 N/mm  
dc = 60.500 mm      fy = 420.000 MPa

Calculated Values:

A = 2 \* ds \* b / No. Bars = 27225.000 mm<sup>2</sup>  
Limit = 0.6fy = 252.000 MPa  
fsa = Z / (dc \* A)<sup>(1/3)</sup> = 194.754 MPa [AASHTO (5.7.3.4-1)]

Limiting Tensile Stress:

fsa = MIN(fsa, Limit) = 194.754 MPa

### PERFORMING AASHTO SPECIFICATION CHECKS - 5.7.3.4 Control of Cracking by Distribution of Reinforcement

Point of Interest : 300.64

Determining fsa for NEGATIVE Flexure:

Input Parameters:

ds = 60.500 mm      No. Bars = 12.000  
b = 1800.000 mm      Z (top) = 23000.000 N/mm  
dc = 60.500 mm      fy = 420.000 MPa

Calculated Values:

A = 2 \* ds \* b / No. Bars = 18150.000 mm<sup>2</sup>  
Limit = 0.6fy = 252.000 MPa  
fsa = Z / (dc \* A)<sup>(1/3)</sup> = 222.938 MPa [AASHTO (5.7.3.4-1)]

Limiting Tensile Stress:

fsa = MIN(fsa, Limit) = 222.938 MPa

## Complete Issue Information

FROM:kkennelly DATE:2/16/01 4:11:59 PM

I think there is a problem with your input. In the cross section ranges window, you have the following range in span 1:

| Start Sec | End Sec | Start Dist | Length | End Dist |
|-----------|---------|------------|--------|----------|
| 1.110     | 1.120   | 10.945     | 3.1    | 14.045   |

Cross Section 1.110 has 8 bars in the top layer and Cross Section 1.120 has 12 bars in the top layer. I don't think you should be able to vary the number of bars within a cross section range cause Virtis doesn't know where the 4 new bars start. I thought we had code that would give you an error message about this, I don't know why it's not giving an error. I'll look into that on Monday morning.

FROM:kkennelly DATE:2/19/01 8:49:14 AM

These cross sections are generated by the BRASS LRFD export, not the domain. Brian, should the export give a warning if the user has a cross section range with a different number of rebars in the start and end sections?

FROM:dteal DATE:02/19/2001 11:59:16

I have rechecked my sections and ranges – they are correct. Ranges are going from left to right. Looking at top steel only over pier 1 and pier 2.

Pier 1:

Section 1.100 has 4 bars that run from 1.100 to 1.110 (bars change in the bottom)

Section 1.110 has 8 bars that run from 1.110 to 1.120

Section 1.120 has 12 bars that run from 1.120 to 1.130

Section 1.130 has 12 bars that run from 1.130 to 2.000

Now Pier 2:

Section 3.000 has 12 bars that run from 3.000 to 3.130

Section 3.130 has 12 bars that run from 3.130 to 3.120

Section 3.120 has 8 bars that run from 3.120 to 3.100

Section 3.100 has 4 bars that run from 3.100 to 3.090

See attached xls spread sheet

FROM:dteal DATE:02/19/2001 12:00:48

FROM:kkennelly DATE:2/19/01 1:17:26 PM

The data that is entered into Virtis is as follows:

In the cross section ranges window, you have the following range in span 1:

| Start Sec | End Sec | Start Dist | Length | End Dist |
|-----------|---------|------------|--------|----------|
| 1.110     | 1.120   | 10.945     | 3.1    | 14.045   |

Cross Section 1.110 has 8 bars in the top layer, slab is 565.8mm deep and Cross Section 1.120 has 12 bars in the top layer, slab is 737.7 mm deep. Based on the data you entered in the cross section ranges window, you are saying that the section varies from Section 1.110 at 10.945m to Section 1.120 at 14.045. It's ok for the slab depth to vary over this range but the number of rebars cannot vary over the length of the range. When do the additional 4 bars appear in this cross section range?

4/19/2016 3:02:36 PM

HRS AASHTO

113

## Complete Issue Information

FROM:dteal DATE:02/19/2001 16:28:26

The additional 4 bars you are asking about begin at sections 1.110 and then again at 1.120. I think the excel spreadsheet drawing shows this.

The number of bars didn't vary over this range. But they can and do vary from section to section. Sect. 1.110 has 8 bars. These 8 bars go from Sect. 1.110 to Section 1.120. This is correct. At Sect. 1.120 we start a new bar count of 12 bars. These 12 bars go from Section 1.120 to Section 1.130. This is correct.

When you enter sections, you enter as many sections as it takes to define the points where the bars are terminated, thus a change in bar counts (top & bottom) and change in geometry. Each section represents a change in something or a critical POI. Your ranges are entered from left to right only. What ever rebar count is present in Section 1.110, will extend to the next section, which is section 1.120. Now at section 1.120 we have a different bar count, this bar count will extend to the right to the next section (1.130) where it's bar count could change again.

FROM:bgoodrich DATE:02/23/2001 18:28:08

Dean - When applying cross sections to the cross section ranges, the starting cross section is that which is just right of the starting distance, while the ending cross section is that which is just left of the ending distance. If the slab dimensions are different between the starting and ending cross sections, then the dimensions will be interpolated accordingly. However, the number and size of reinforcing steel MUST remain constant throughout the range, i.e., the starting and ending cross section for a range must have the same number and size of rebar.

Krishna – I cannot find any place in the export that detects when the rebar is different between the starting and ending cross sections in a range. This check is not really engine-specific because it pertains to a user error with specifying fundamental bridge geometry to Opis, so I suggest adding this check to the validation. If this validation is done at the window level, we will probably have to implement some validation in the export because other 3rd parties may not use a different input method. Alternatively, this validation could be included in the global validation. Then export could call this validation check once in place, so we do not have to write the same code twice. Please discuss with Jim and let me know if I need to implement something in the export. I already have some code in place to detect unique BRASS cross sections, so it would not take me long to detect if the rebar is different between two sections.

FROM:dteal DATE:02/26/2001 13:07:57

I really think the point is being missed here.

The user has no instructions to anything different. They will first enter x-sections at bar termination points and change in slab geometry points. Now they would connect these x-sections starting at the left and moving to the right, assuming that what ever x-section you had on the left would be used until you give it another x-section (change point). This obviously would be a bad assumption.

Brain, you stated that: "the number and size of reinforcing steel MUST remain constant throughout the range, i.e., the starting and ending cross section for a range must have the same number and size of rebar." If this is the case then you can never change the amount of steel, it would be constant.

There two aspects that need to be considered.

First – as a designer:

I need to establish 2 things regarding rebar. The need to establish and check that the area of steel provided is adequate and the need to determine where the bars may be terminated. In a three span

4/19/2016 3:02:36 PM

HRS AASHTO

114

## Complete Issue Information

RC Haunched Slab there are many bar termination points that need checking. With a 3 bar top pattern and 4 bar bottom pattern we could have as many as 6 top and 8 bottom termination points per span. That would be 14 points plus a span start and end point and the point the slab changes form uniform to parabolic. I have found that you can not arrive at economical designs using tenth points. Our longest standard span would have over 7 feet between tenth points.

During the design process, the first time you enter your data (x-sections and ranges) it will only be a guess. To find economy we must start moving these sections. When you move parabolic sections, you are changing the section depth with each move. I have not come up with a reasonable method of modeling these structures properly.

In a nut shell – you can not use Opis for design if you can not define where the bars should terminate. If you can not use Opis to find bar termination points then we are back to using BRASS to find design moments and then using spreadsheets (like what we have done in the past) to calculate the area of steel required and find bar termination points.

### Second – as a rating

This first thing we would like to do is use the input we used for Opis. This is impossible. Virtis will not let you have any more than 15 sections per span (Incident #3132). Now I have to have a second input file with less sections, one that would ignore some sections that you know would not be critical for a rating. The work around for the problem described for design is to add another x-section very close to the bar termination point. The problem with this is not enough sections allowed by Virtis. We already had too many.

The second problem is what is described in incident #3133. Design uses a structural “d” that does not include the sacrificial wear. The 1” of concrete that was noted as sacrificial wear was accounted for as additional self weight. But in our bridge ratings we would use the entire depth of the section to calculate capacity.

I have spent much time in trying to describe RC Slab problems. It may be best if I was to send you a typical slab bridge we use here in Kansas and have you code up a suitable design and rating in Virtis & Opis so we can see how BRASS intended for the software to be used and so you can really see first hand the problems we are experiencing here.

## Description

FROM:spunkay DATE:02/19/2001 16:35:36

We tried to use the sidewalk command on a P/S 7-girder system bridge to act as a median barrier in the Structure Typical Section. The schematic depicted what features are in existence. The Brass output does not appear to reflect the additional 6" slab weight or the non-standard (GS/5.5) Live Load Distribution (LLD) Factors. It appears that manually overriding these items is the only solution at present. It is my understanding that the LLD's and loads for sidewalks (and other similar appurtenances) should be calculated by Virtis and pushed into BRASS. Where do we go from here?

Thanks for reviewing!  
Stephen Punkay

FROM:jduray DATE:02/27/2001 14:08:36

FROM:kkennelly DATE:3/2/01 1:30:26 PM

I imported your bridge and saw the sidewalk entered on the Structure Typical Section window. When I ran BRASS, the BRASS input file had the following commands in it:

```
COMMENT      Sidewalk Load
DECKC-LODU   3, 0.0750, 36.3750, 8.9583, 2
```

You entered the width, thickness etc of the sidewalk into Virtis and the export created the above DECKC-LODU command for BRASS. The 0.075 value is the weight/sf of the sidewalk based on the sidewalk thickness you entered. The BRASS output doesn't contain output for just the sidewalk, it combines all of the superimposed stage 2 dead loads into one load case. For your case, BRASS combined the parapet and sidewalk loads into the "SUPERIMPOSED UNIFORM DEAD LOAD ON TOP SPANS" and that is where you can find the dead load forces due to the parapet and sidewalk. The following warning message is given in the log file when you run BRASS to alert you to the fact that BRASS doesn't use the load case names you entered into Virtis:

WARNING (High):

BRASS cannot apply the loads specified on the Structure Typical Section window, such as the concrete deck, appurtenances, sidewalks, and wearing surface, to the load cases assigned to them. Instead, BRASS

internally applies them to the appropriate Superstructure Dead Load case for the stage specified in the original Virtis load case.

I'm not sure what you are questioning regarding the non-standard LL distribution factors. BRASS LFD uses the live load distribution factors for the member entered on the Live Load Distribution window in Virtis. You can use the Compute from Typical Section button on that window to have Virtis calculate the DF for you. It will calculate them based on the location of the beam, type of beam, beam spacing and location of the travelways as entered on the Lane Position tab of the Structure Typical Section window. If you want to use a different DF, you have to enter that value in the Live Load Distribution Window instead of using the Compute button.

## Description

FROM:jihnat DATE:3/6/01 3:02:10 PM

Reported by Sylvester Yongho of Stone & Webster. Phone: 617-589-7048 Email: sylvester.yongho@stoneweb.com

This is actually 3 different problems.

1) When he starts Virtis he gets an error: Program failed to initialize properly. 0xC0000043. This is not a Virtis message as far as I can tell.

2) Error messages when rating the first member of his bridge (m-06-010(299).bbd in the docs directory). I'm not sure if this is a precision problem or a problem with his input.

Error generating LFD/ASD load commands!

02:50:33 PM - Line 158 in source file D:\Virtis\GUI\abxbrass\BrassStdLoadControl.cpp.

Error generating load group commands!

02:50:33 PM - Line 775 in source file D:\Virtis\GUI\abxbrass\BrassLoadControl.cpp.

Complete Issue Information

Error preparing distributed load for BRASS commands!  
02:50:33 PM - Line 289 in source file D:\Virtis\GUI\abxbrass\EngineExport.cpp.

Unable to determine span where range ends!  
02:50:33 PM - Line 289 in source file D:\Virtis\GUI\abxbrass\EngineExport.cpp.

Error determining start distance and range!  
02:50:33 PM - Line 4785 in source file D:\Virtis\GUI\abxbrass\EngineExport.cpp.

3) If these messages refer to his uniform loads, he thinks message should say uniform instead of distributed.

FROM:kkennelly DATE:3/7/01 2:22:45 PM  
2. Think problem is with gui for uniform and member loads. His bridge has 4 mbr\_distrib\_loads in db with 2 rows in the db having a span length slightly longer than actual span length so FindSpanByDistance() fails. (If you do BWS report for member 1, you'll see 4 mbr distrib loads reported not the 2 that are visible in the gui) Not sure if these rows with long span length were created by user entering loads as distrib loads with slightly longer span lengths or entered as uniform loads and then span length changed. Jim found if enter distrib load with length slightly too long, hit OK, reopen window and load doesn't appear on either uniform or distrib tabs. So distrib load window needs fixed, should still find out if somehow changing span length or skew contributed to this problem.

FROM:kkennelly DATE:3/7/01 2:38:35 PM  
I removed the 2 rows that I think are causing the problem in the db and exported the bridge to revm06010(299).bbd and attached this export file to this incident. Sylvester, try to import this bridge and verify that Member G1 has the correct uniform loads that you want.

FROM:kkennelly DATE:3/8/01 1:52:03 PM  
GUI fixed for patch 3, added tolerances to uniform load tab.

FROM:jduray DATE:5/25/01 4:15:15 PM  
Gale tested and found to be ok.

FROM:gbarnhill DATE:05/31/2001 12:18:40  
All loads now appear after input.  
NOTE: When DISTRIBUTED LOADS are input as the same magnitude at start and end and over a length exactly equal to total structure length, when the window is reopened the load appears in the UNIFORM LOADS tab. This makes sense, since the load should have been entered as UNIFORM in the first place, but it's confusing to see it reported under a different tab than where it was input.  
OK in Service Pack 3 for version 4

### Description

FROM:rmbest DATE:03/20/2001 13:17:20

The attached bbd file will not run. We are getting an error generating load group - "Error getting start distance and range for distributed dead load". The BWS report shows that a distributed load was input twice. Actually it was entered as a uniform load. This duplication doesn't show up in the Member Loads windows and we can't delete them (if they really exist). I also noticed that if the user changes a span a length then his uniform loads get switched to distributed load window. This could account for how the duplication happened in the first place.

FROM:jduray DATE:3/22/01 8:34:45 AM

FROM:kkennelly DATE:4/2/01 8:24:39 AM

This incident is the same as incident 3152. Virtis only stores distributed loads in the database, the gui then has to determine if the load is uniform (same load at start and end and applied over an entire span) or distributed. The uniform load window was not using tolerances when determining if the load was uniform or distributed so the loads don't show up on the uniform tab but the distributed tab did use the tolerances so the load doesn't show up there either. This has been fixed for Service Pack 3.

FROM:kkennelly DATE:4/2/01 8:47:51 AM

I removed the 2 extra distributed loads and attached the bbd as rev-0540049.bbd. After I removed the

4/19/2016 3:02:39 PM

HRS AASHTO

125

Complete Issue Information

2 extra dead loads, I was still unable to run this member. I got the error about distributed dead loads again, this time it was due to the Deck Concrete Profile. When the export tried to generated the dead loads for the slab it appears to have a problem with the deck being entered as 583.48953 ft long. The span lengths as entered on the Member window add up to 583.4895 ft. If I change the deck profile to 583.4895 ft long, BRASS LFD runs. The steel web plate was also entered as 583.48953 but BRASS didn't complain about that dimension so I'm not sure if we're not consistent with tolerances.

Brian, my debug version is not working so I can't step through this. Can you verify that the export is using the correct tolerances when it creates the dead load command for the slab? Also, can you issue a different error message when the export has a problem creating the dead load command for the slab? The current message is now the same message as for a user input distributed load and it is misleading if the problem is with the export calculated slab.

FROM:bgoodrich DATE:04/16/2001 10:05:43

The export internally stores the distances for loads (input by the user or generated from say slab dimensions) in inches or millimeters. I increased my tolerance for inches to 0.001 and the export ran fine. At the point that the error messages are issued, the export does not know where the load originally came from, so a detailed error message cannot be issued as you requested. However, I did add some wording (to BrassLoadControl.cpp) that outputs the load case name in the error message, so the user knows to look at distributed loads in that particular load case, which may come from loads input by the user or from loads generated from section dimensions.

Krishna - I will send updated source to Joe.

### Description

FROM:dkoenig DATE:03/23/2001 12:21:34

I created two girderline bridges, a 3 span continuous P/S I, and a 3 span continuous Box Girder. Both bridges are modeled as simple span for non-composite loads made continuous for composite loads. I entered barrier and wearing surface loads in the Member Loads window. The load case descriptions are for stage 2 (I also tried stage 3). When I analyzed the bridge, I found that all loads were applied to stage 1 – Simple span. I can select any of the options in the Member Alternative Engine Properties window and I will still get these results.

Unfortunately I am still working with 3.0, so maybe this has been rectified for 4.0. I would like to know if this is a problem with Virtis/Brass or am I doing something wrong.

I have attached the P/S I .bbd file.

FROM:bgoodrich DATE:04/10/2001 09:58:40

I corrected a problem in the export with the determining the stage when load cases are combined to fit within the number load cases allowed by BRASS. This correction should be available in the next 4.0 Service Pack.

Description

FROM:bmccaffrey DATE:04/19/2001 10:26:17

The bridges that I've sorted by district and county do not get placed in the folders that I created for them in the bridge workspace - I'm using Oracle for my database. I have all the appropriate settings in place in the configuration browser to sort our bridges. I can find my data in the 'all bridges' folder in the bridge workspace.

FROM:jduray DATE:4/25/01 11:57:03 AM

Did you create static (yellow) folders or dynamic (red) folders?

### Description

FROM:snshah DATE:04/20/2001 12:08:24

I imported a continuous prestressed bridge into Virtis from a BARS file. After comparing the results, I found that the inventory rating in Virtis falls below the HS-20 design loading (R.F. = 0.933), however, when running the same file in BARS the inventory rating meets the design requirement (R.F. = 1.0358) at the negative section, see G23 for details. I was wondering what could be causing the difference in rating? I have attached the BARS file for your analysis. Thanks for your help.

FROM:snshah DATE:04/20/2001 12:11:59

FROM:jduray DATE:4/25/01 11:47:06 AM

Have you reviewed the Virtis bridge description to determine if it is correct?  
Have you reviewed the BRASS output file and compared things like actions, properties and capacities?

FROM:snshah DATE:04/26/2001 12:22:20

I looked at the BARS output and it seems to match up with the data in Virtis. I then looked at the information exported to BRASS from Virtis. I noticed that the depth of the negative reinforcement was not exporting correctly. According to my calculations the distance from the bar center to the top of the top flange should be 5.8", however, in the file exported to BRASS it says that the distance to the center of the bar is 4.8". (see XSECT-G for details) I did look at other prestressed girders that have steel in the deck, however, I did not notice the same behavior. What could be causing this to occur in this particular file?

FROM:gbarnhill DATE:05/03/2001 12:30:40

I asked Jim to send me the BARS file that Shyam attached. I imported & got similar results. As far as I can tell, the IMPORT process is good. For G23, the REINFORCEMENT tab of DECK PROFILE shows the rebar at 3.2 inches from top of structural slab, which agrees with the BARS input dimension of 59.8 inches from bottom of PS girder. (54" girder, 2" haunch, 7" slab)  
EXPORT shows on XSECTG top-of-girder to rebar as 4.8".  
It appears EXPORT is dividing the HAUNCH dimension Y1 by 2. Y1 shows as 2" in the HAUNCH PROFILE, but XSECTC shows 1" for dimension between top-of-girder and bottom-of-slab.

## Complete Issue Information

FROM:gbarnhill DATE:05/03/2001 17:56:57

More information.

Check PCITrainingBridge5 in the Database.

It seems EXPORT uses the correct Y1 dimension for haunch on XSECTC. (0.5")

Maybe there is something different about an imported bridge.

FROM:bgoodrich DATE:05/03/2001 21:15:05

There are two dimensions that Virtis supports for describing the haunch thickness (Y1 and Y2). The Y2 dimension is only available for exterior girders. If Y1 and Y2 both contain a value, then the export averages them to get the BRASS haunch depth. If the Y2 value is null (left blank), then the Y1 value is used for the BRASS haunch depth. The BARS import sets the Y2 value to zero, which is not null. Therefore, the average of 2" and 0" is computed by the export as 1". At any rate, the BARS import should not be setting Y2 to zero because I don't think the BARS data file supports this dimension. The Y2 dimension should be left null or set the same as Y1 during import.

I found a work-around to delete the Y2=0.0 values for your imported bridge. Open the member window for G12, change the Member Location radio button to Exterior, and click the Apply button. Then, for the member alternative under the G12 member, open the PS Haunch Range window (Haunch Profile in the tree), delete the values in the Y2 column, and click the OK button. Now, return to the G12 member window and change the Member Location back to Interior, and click OK. Finally, repeat this for the G13, G22, and G23 members.

Jim - I am not sure why we decided to use the average, but the export and the domain function that converts schedules to cross sections both average the Y1 and Y2 values as described above. Maybe it makes more sense to always use the Y1 value for the haunch depth. The Y2 value is used to specify the depth of the slab at the edge of the deck, which the export uses for determining dead loads. What should we do here?

FROM:kkennelly DATE:5/7/01 9:44:29 AM

FROM:kkennelly DATE:5/11/01 2:23:50 PM

I think we should continue using the average of Y1 and Y2 for the haunch depth in the export and domain. The import should be changed so that the Y2 value is set as Null, not zero.

FROM:snsah DATE:05/25/2001 11:04:46

I cannot locate in the BARS file where it defines the haunch to be anything other than 2". Where is the BARS importing program getting a Y2 value of 0.00?

Also, I agree that Y1 and Y2 should be averaged, however, this should only apply for an exterior girder. Since Y2 is not available and cannot even be changed for an interior girder, it should not be exported to BRASS to be analyzed.

FROM:jduray DATE:6/6/01 8:49:35 AM

Ed - change the import so the Y2 value is set as Null, not zero.

FROM:kkennelly DATE:9/26/01 9:04:41 AM

I've changed my mind. Y2 should not be used in the export and domain for an interior beam. Since girderline mbrs can toggle between interior and exterior beam in UI, user could get a Y2 dimension in the database for an ext mbr, then change mbr location to int mbr and the Y2 is still in the db but not

4/19/2016 3:02:40 PM

HRS AASHTO

132

Complete Issue Information

visible to user.

FROM:kkennelly DATE:9/26/01 11:00:41 AM

Code fixed for Beta Build 1. Import changed to set y2 = null. Domain changed to check if mbr is interior or exterior when it computes the haunch depth for a generated cross section. Y2 not used if the member is an interior member. If member is exterior beam, haunch depth = 1/2(y1+y2) unless if y2 = null then haunch depth = y1.

Brian, Do you need to make any changes to the export to match what the domain is doing?

FROM:bgoodrich DATE:09/26/2001 15:06:39

I modified the export to determine if the member is interior or exterior and use the Y1 and/or Y2 dimensions as specified by Krisha. I sent Joe the export modifications.

FROM:gbarnhill DATE:10/12/2001 17:26:18

OK in V410 Beta 1

FROM:bgoodrich DATE:10/22/2001 11:33:21

Closed.

Description

FROM:spunkay DATE:04/27/2001 09:51:06

I received an error message when I tried to generate a rating for a type IV P/S girder span modeled as girder system. I have tried to modify a copy of an existing file that runs successfully and also create a new file from scratch. I get the same error message for both, see below.

Error generating LFD/ASD load commands!

Error generating load group commands!

Unable to get adjusted distance of load (P/S beams)!

Error preparing concentrated load for BRASS commands!

Unable to compute span where load is applied!

Please review this error message and send me feedback wrt a solution.

Thank You!

Stephen

FROM:jduray DATE:5/1/01 8:48:10 AM

Is this still an issue or did you resolve it by adjusting lengths?

FROM:spunkay DATE:11/07/2001 09:01:15

Adjusting lengths resolved the error message. Sorry for the delayed response!

### Description

FROM:spunkay DATE:05/01/2001 11:06:22

I encountered another error message while modeling a prestressed girder system made continuous for live load. Please direct me to a solution to remedy this problem. The error message reports as follows:

Error filling general change point array!

One or more properties are not valid!

Error retrieving LFD/ASD engine specific member alt properties!

An invalid contraflexure location was specified!

Error retrieving LFD/ASD engine specific member alt properties!

FROM:bgoodrich DATE:05/02/2001 08:07:36

I believe the structure definition started out as a simple span and then the number of spans was increased to five. The default engine properties were set according to the original one-span structure. After increasing the number of spans, the engine properties were internally adjusted for the new spans, but the contraflexure locations for span 1 remained blank (i.e., set to NULL). The contraflexure locations are only applicable to steel, so I modified the export (BrassStdEngineData.cpp) to bypass checking for valid values for concrete member alternatives. For steel member alternatives, the check will still be performed because the user is allowed to change these locations. This issue will be available in a future service pack.

Description

FROM:snshah DATE:05/21/2001 08:51:21

When importing a bridge with stiffeners from a BARS file, a stiffener definition is not populated. This should be done automatically.

FROM:kkennelly DATE:5/22/01 9:29:35 AM

We cannot create a stiffener definition for you when importing a BARS file because the BARS file does not contain any data about the stiffener plate or angle sizes. We don't even know how many different stiffener definitions exist for the structure. We would really be making up data if we tried to create stiffener definitions.

Jim and I discussed this on 5/17 based on another user's questions and we decided the import cannot create the stiffener definition for the user. Incident 3219 is going to add a warning to the BARS import that the user is responsible for creating a stiffener definition and applying it to the appropriate transverse stiffener ranges.

After you import, you should create a stiffener definition based on the plans and apply it to the appropriate stiffener ranges. If you don't have the plans, you can enter 0 for the stiffener width and thickness and BRASS LFD will run. The width/thickness ratio for the stiffeners won't be satisfied but it shouldn't control the rating. BRASS LRFD will not run if the width or thickness is 0 so you have to enter the actual plate sizes.

### Description

FROM:baboosono DATE:05/23/2001 14:26:54

I've encountered an error 2101 while trying to rate a 900-ft 5-span continuous steel plate girder span. Can somebody explain to me what this error-msg means and tips on how to fix it?

Error No.: 2101

Type : Structural Analysis Error

Location : meshds.for

ERROR: A fatal error occurred generating the finite element mesh distances.

FROM:baboosono DATE:05/23/2001 16:23:21

BTW, I included the bridge file. It's Span P1-P5 continuous span.

FROM:bgoodrich DATE:05/24/2001 13:47:34

This error message means that BRASS was unable to create a structural analysis model because a short element exists. On the Web tab of the Girder Profile window, the second range for span 1 has a Start Distance of 120.833' and a Length of 14.42', which sums to 135.253'. The next range then has a Start Distance and Length of 135.253' and 14.75', respectively, and sum to 150.003'. Hence, the ranges for span 1 exceed the span length, which throw off the web ranges for the rest of the bridge. The best advice I can give is to make sure you are consistent when entering digits right of the decimal. I changed the Start Distance of the second range from 120.833' to 120.83' and the Length of the last range from 120.827' to 120.83'. BRASS then got a little further in the analysis, but gave another error message regarding transverse stiffeners. The first transverse stiffener range in span 5 starts at 0.00002' from the support. Change this to 0.0'.

Complete Issue Information

Finally, BRASS issues the following error:

Input Errors (1203) - Web segment depth invalid

Error No.: 1203

Type : Input Error

Location : new\_paraabola.for

\*\*\*\*ERROR\*\*\*\* In span 1 the input web depth of adjacent parabolas does not equal the depth of a single parabola at that point. Input parabolic segments can not be converted to a single parabola. Distance to point from left end of span = 125.820 ft

BRASS tries to merge adjacent parabolic segments when the web depth at the junction is the same. BRASS then computes what the web depth at the junction assuming a continuous parabola and compares it to the value input by the user. You must make sure the web depth between adjacent parabolic segments are correct. In this case, the web depth at 125.82' was generated by Virtis/Opis and given to the BRASS export.

Jim - Why is the web depth computed by the domain not consistent with BRASS? BRASS incorporates the slope of the linear segment adjacent to the parabolas when computing the web depth. I don't think the domain is doing this, but it probably should.

Also, I tried viewing the girder profile schematic for the member alt. The Fit to View option does not work and there are no scroll bars to pan the view. Maybe this has been fixed in Service Pack 3.

FROM:jduray DATE:5/24/01 3:41:39 PM

Are you using Windows NT or 2000? I've seen this behavior in the schematic window on 95 and 98 but not NT/2000.

FROM:baboesono DATE:05/25/2001 09:31:21

I'm using Windows NT 4.0 SP6

FROM:bgoodrich DATE:05/25/2001 10:29:10

I am running Windows ME.

FROM:kkennelly DATE:6/1/01 3:48:24 PM

Code changed in domain to take slope of adjacent web range into account when calculating depth of parabola. Code changed for 4.1 and 4.0.4 (if there is a service pack 4).

FROM:gbarnhill DATE:07/06/2001 12:30:11

4.0.4 - OK for the situation with a linear slope followed by two parabolas.

OK in Service Pack 4 for version 4

### Description

FROM:bgoodrich DATE:06/21/2001 14:46:27

Entered on behalf of Brian Boucher:

Analyzed Spans 1 & 3, S1-Exterior in attached bridge and received critical rating factor of 99.0.

FROM:bgoodrich DATE:06/21/2001 14:49:32

Comments from e-mail from Krisha:

I ran BRASS ASD for Spans 1 & 3, S1-Exterior and also got a rating factor of 99 at span 1 - 100%. I looked in the BRASS output file for the calculations used to compute this rating factor. In the BRASS output for this point I see the rating factor for bearing stiffeners (bearing) is being printed as \*.\*.(. If I look into the output further I see that the actual bearing stress in bearing is printed out as \*\*\*\*\*. That leads me to believe BRASS can't calculate the bearing stress. Further review of the BRASS output file shows that the bearing stiffener dimensions are input as: width = 6", thickness = 0.5" and clip

4/19/2016 3:02:42 PM

HRS AASHTO

141

Complete Issue Information

= 6". With a clip of 6" and width of 6", the bearing stress cannot be calculated. I believe BRASS prints out the 99 rating factor as a flag to the user that they should investigate their input and the rating factor calcs further.

As for the message in Virtis that the shear in the cover plate governs, I will ask Brian Goodrich to investigate if BRASS is sending the correct message back to Virtis for display when Brian gets back from vacation.

FROM:bgoodrich DATE:06/21/2001 14:49:32

Krishna is correct in her assessment of the problem. The inside clip of the the bearing stiffener equaled the stiffener width, so the underlying issue seems to be an input error. However, BRASS should output something other than ".\*.,(" for the rating factor. I added a check to the export (BrassStifBearScheduleGroupCmd.cpp) to make sure the inside clip is not greater than or equal to the stiffener width.

In general, a rating factor of 99 means N/A (not applicable). For this bridge, the 6.0 clip causes a problem with how the controlling rating is determined, so I forwarded this issue to the engineer who maintains the BRASS-ASD code. The "SHEAR - BOT COV PLATE" text is used for horizontal shear, but it was never implemented. When vertical shear controls, the text will read "VERTICAL SHEAR".

I have forwarded this issue to Dan Glandt for investigation.

FROM:dteal DATE:07/13/2001 12:04:05

I used MatrixBridge13. In the bearing stiffener definition I set the top and bottom clips to 1" and 5". Now with a 6" wide stiffener we have no bearing area left. I ran a Validate – Number of error messages = 0. I ran a design review – no errors where reported. It did have zero for several Rating Factors.

FROM:bgoodrich DATE:07/16/2001 13:57:18

Dean used a different bridge than the one attached to this incident, which is why he encountered the problem. I had not reviewed built-up beam results in detail. Therefore, I revised the export checks in BrassStifBearScheduleGroupCmd.cpp to detect clip dimension errors for all steel beam types. I do not have Service Pack 4 GUI files, so I cannot comment on the validation issue.

FROM:dteal DATE:07/16/2001 16:26:10

I received a new dll to try - BRASS successfully produced the error message when there was no no bearing width left after the clips where deducted.

### Description

FROM:snshah DATE:08/17/2001 10:18:47

Recently, I installed service pack 4. I later attempted to perform a rating using one of our agency-defined vehicles. The reported rating factor from VIRTIS was a 99.

Upon further investigation, I've determined that any rating performed with an agency-defined vehicle returns a rating factor of 99. This definitely was not the case before service pack 4.

I have uninstalled and reinstalled VIRTIS from my machine, and the problem continues to occur after installing service pack 4.

FROM:bgoodrich DATE:08/29/2001 16:37:05

I have run steel, R/C, and P/S bridges both ASD and LFD with Standard and Agency vehicles, but I cannot duplicate the rating factor of 99. Please attach the BBD file of your 4.0.4 bridge, so I can see exactly what you are experiencing.

FROM:snshah DATE:09/12/2001 09:31:07

After further investigation, it seems that the error is caused only when the agency-defined vehicle is selected by double-clicking the vehicle in the vehicle selection window. If I select inventory in the vehicle summary window, then select the truck in the vehicle selection window and hit the add to rating key, it works (all single clicks). The same procedure works for operating.

At this time it appears no further action is necessary.

FROM:bgoodrich DATE:09/18/2001 17:11:38

Status set to Not Reproducible.

| 3328.12022 | Resolved      | BARS import Card 15 contains zeros for voids |

Description

FROM:tleatherwood DATE:08/22/2001 14:17:18

We have attempted to set up our rating engineers as virtis users. Our database administrator set them up for our Oracle 8 database. We then went into virtis and set them up and assigned them to the rating engineers category. However, virtis will still not let them log on. When they attempt to log on they get an error message that says "Unable to verify database schema! Please contact database administrator." Our DBA has no idea why it does not work. We have bypassed virtis and connected to the database directly using the new user ID's and an SQL tool and it works OK. Therefore, the problem seems to be on the client (Virtis) end rather than on the server (Oracle database end. Did we miss a step in setting up the users within Virtis?

FROM:jihnat DATE:8/22/2001 3:51:17 PM

I emailed the latest ReadMe file to Rob Benshoof. This has instructions for setting up an Oracle database for Virtis/Opis. Let us know if this doesn't solve the problem.

Complete Issue Information

FROM:jihnat DATE:8/23/2001 11:36:35 AM  
See the VirtisOpis help topic "Adding Users to the Virtis/Opis Database"

FROM:jihnat DATE:8/23/2001 1:06:10 PM  
Try applying Service Pack 1. You can view the SP1 ReadMe file on the Virtis web site.

FROM:tleatherwood DATE:09/12/2001 10:41:51  
We upgraded Virtis, on all our computers, to version 4.0.4 and this seems to have fixed the problems. Our bridge rating engineers can now log on and use Virtis successfully. This incident can be considered resolved. Thanks.

Description

FROM:kkennelly DATE:8/28/01 1:17:18 PM  
Submitted on behalf of Travis Fox, ABMB Engineers, via email on 5/11/01:

Complete Issue Information

If Card 15 of BARS file contains zeros for void dimensions, BARS import creates a box beam for the member with no void. Based on other input dimensions, shape resembles an Ibeam.

Resolution: (will be in Virtis 4.1 Release)

Import follows BARS manual, if section doesn't have voids, columns 19-31 should be blank. Having a value entered in these columns makes import think original BARS input was meant to model something like a box with no voids.

Warning will be issued in import that user should verify the correct beam shape type.

### Description

FROM:bgoodrich DATE:08/29/2001 16:07:40  
Entered for Terry Leatherwood (TN DOT):

I have been using Virtis some since our training session. I tried putting in a little continuous 2-span timber bridge. Since the beams are not spaced evenly, I used the girder-line method of analysis.

I got the bridge to run OK. I ran the H-15-44, HS-20-44, Type 3, Type 3S2 and Type 3-3 trucks over the bridge.

The ratings all look reasonable except for the H-15-44 Lane Load ratings. The lane loading is shown as controlling which should not be possible for this bridge. Furthermore, the tonnage figures do not match the rating factors. For example, the inventory rating factor is less than 1.0 which should give a rating of less than 15 tons. Instead the rating is over 20 tons.

I don't have a password or user name so I can't log on to your web site and enter the bug report there. Therefore, I thought I would just email the information to you.

I have exported the bridge and attached the BBD file. I have also scanned a sketch we have of the bridge into a adobe PDF file which is also attached.

If you have time (I know you will be getting ready for the User Group Meeting) perhaps you can check out this problem and see if there is a bug in Virtis or in the Madero analysis engine or did I just goof up the data input.

Complete Issue Information

Madero has a hard-coded lane load of 0.64 k/ft, which must be factored to get the magnitude of the H-15 lane load as 0.48 k/ft. The 0.75 factor is exported to a command parameter in Madero for lane impact. This was done so only the lane load is adjusted and not the trucks within the same Madero group. It appears that Madero does not utilize the 0.75 factor for an ASD analysis. I will try to address this issue in the Madero engine as I have exhausted any export options.

Note that TimberTrainingBridge1 produces the same problem with an H-15 vehicle.

FROM:bgoodrich DATE:09/04/2001 12:56:56

I corrected the Madero engine to apply the lane impact factor to the live load actions. This correction has been made to the Madero engines 1.0 and 1.1 for Virtis 4.0 and 4.1, respectively.

Description

FROM:kkennelly DATE:8/30/01 8:31:16 AM  
Submitted on behalf of Ming Teng, via email:

Attached bridge has a point of contraflexure at 27.127%, run BRASS LFD and get error from BRASS regarding zero cross sectional area. Change point of contraflexure to 27.13% and BRASS runs.

Ming Teng  
RQAW Corporation  
4755 Kingsway Drive, Suit 400  
Indianapolis, IN 46205-1547

FAX (317) 255-8354

FROM:bgoodrich DATE:09/04/2001 14:17:44

I am able to duplicate the problem with 4.0.4 and 4.1.0. The problem is caused by inserting a change point close to an existing change point in span 3. The additional change point is derived from the contraflexure locations, which is 21.9999978 feet, however, there is a point at 22.0 feet where the wide flange changes from a W36X232 to a W36X194. When generating the cross sections and ranges, the export gets the cross section (from the domain) to the right of 22.0 feet, which the domain returns as the one to the right of 21.9999978 feet because that distance is within the tolerance set in the UI. The resulting range has a W36X232 at the left and a W36X194 at the right, which BRASS cannot handle, nor is this the intended range described by the user. If the contraflexure location is set to 27.13% (22.00243 feet), then the 22.0 feet change point is reached first and everything works fine.

I created a derivative of this RQAW structure, in which I adjusted the deck ranges so a change point was located at 21.999997 feet in span 3 and I moved the contraflexure location in span 3 to 30%. The export and domain produce the same type of problem. Therefore, this is NOT just a contraflexure location issue.

Krishna - Do you have any suggestions?

FROM:kkennelly DATE:9/21/01 1:03:45 PM

First part of problem where domain returns section to right of 22 ft as the section which is really to right of 21.9999978' is due to the export adding the contraflexure point of 21.9999978' to the array of change points originally created by the domain. The AddChangePoint() in DoGirderMbrAlt checks to see if the point being added is the same as an existing change point. It is based on the tolerance, so then AddChangePoint() deletes one of the points and it deletes the point at 22.0'. So the array of unique change points used from then on has a change point of 21.9999978', we don't see that in the BRASS input file cause 21.9999978' gets rounded to 22.0000'.

FROM:kkennelly DATE:9/21/01 3:03:23 PM

I can't see anyway around this for the second case where Brian entered a deck range that ended at 21.9999978 and then a girder range that ended at 22. I think the user has to make the tolerance a larger number so 21.9999978 and 22 are the same number when the domain creates the unique change points.

## Complete Issue Information

FROM:kkennelly DATE:9/24/01 1:39:44 PM

There is a bug in the AddChangePoint() code when checking if two points are the same location. Export passing points in inches but internal domain array is in feet. When comparison is made between point passed by export and point in internal domain list, inches unit used to get tolerance when it should be using ft tolerance. That seems to fix the problem of the export generating cross section ranges with the last range in span 3 having a different section at the beginning and the end which is what caused the 0 area error. Export is still generating extra duplicate cross sections and unused cross sections though when it calls FillBrassCrossSection().

FROM:kkennelly DATE:9/24/01 2:16:32 PM

Workaround is to increase inch and foot tolerance in the System Defaults window to 0.001. Will be fixed when 4.1.0 is released.

FROM:kkennelly DATE:9/24/01 3:21:03 PM

Resolved for 4.1.0.

Brian, if you run this problem with a user input tolerance of 0.001 for inches and feet the end result will be correct. But the export generates 2 extra cross sections that it doesn't apply to any ranges: Section2 W36x232, Section 6 W36x232 with a deck. Section 6 is the same as Section 1. The cross section list and ranges generated by the domain functions GenerateCrossSectionInfo() are correct, only 5 unique cross sections generated by the domain. I guess the export doesn't use the cross sections from this list since FillBrassCrossSection() calls DoGirderMbrAlt->GetSectionAtDistance(). I'm thinking the export is getting these 2 extra sections based on some checking it does if the section is in a composite region or positive bending. Can you verify that the export is creating its cross sections correctly? It seems to be creating the cross section ranges ok in the SPAN commands.

FROM:bgoodrich DATE:09/26/2001 15:10:13

After I change the tolerance to 0.001 inches and feet, the export only generates five cross sections - all of which are used. I cannot find any problems.

FROM:gbarnhill DATE:10/05/2001 13:02:02

V410 Beta 1 - I still need to set tolerances at 0.001 for feet and inches to get this bridge to analyze. Is that the final answer ??? If so, we need to publish that in the release notes & help file.

FROM:kkennelly DATE:10/5/01 1:32:54 PM

It should work at any tolerance. How many cross sections are you getting in your BRASS input file? Can you attach a copy of your BRASS input file that shows the cross sections and their ranges?

FROM:gbarnhill DATE:10/09/2001 11:51:10

Sorry I missed the message last Friday. I've attached the data and error files with tolerances set at 0.0001 for ft and in. V410 B1

FROM:kkennelly DATE:10/9/01 2:49:34 PM

Brian, I've attached Beta41tolerances.bbd which is pretty close to the original bridge in Beta1 for version 4.1 (I think the only section property difference from the original bridge and this bridge is the number of rows of rebar in the deck.) Set tolerances at 0.0001 for feet and 0.00001 for inches. Run BRASS LFD. I get the same BRASS data file as Gale attached. Cross Section 3 is a W36x232 with no deck or rebar. The domain's GetSectionAtDistance() returns a cross section with a deck for every point that it is called for. I think this Section 3 is created by the export when it checks if the section is in pos

HRS AASHTO

154

Complete Issue Information

or negative bending. Can you check into this?

FROM: bgoodrich DATE: 10/18/2001 12:42:08

I made some modifications to the CDoGirderMbrAlt::AddChangePoint function, which I have forwarded to Krishna for review.

FROM: kkennelly DATE: 10/22/2001 10:40:57 AM

I incorporated the changes you sent and it does maintain the original points in the m\_ChangePtArray but there is still a problem with the sections generated by the export. Run the attached Beta41Tolerances.bbd with the changes to DoGirderMbrAlt and the export generates a cross section 1 which is W36x232 with no deck and applies that section over the first 59.5' of span 1. CBrassCrossSections::IsRangeInPositiveBendingRegion() is returning false for the first 59.5' of span 1 when it should be returning true.

FROM: bgoodrich DATE: 10/22/2001 12:50:50

During my testing, I slightly changed the contraflexure location for span 1 (originally at 73.006104%). I changed the location to 73.006135% (59.5/81.5\*100) to coincide with the wide flange change at 59.5 ft. The tolerances for inches are used to determine if a range is within a positive bending region. The range change is at 714 in (59.5 ft) while the original contraflexure location was at 713.999697 in (73.006104/100 \* 81.5\*12). The difference between these distances is 0.0003 in, which was greater than my inches tolerance of 0.00001 in. Users are going to have to adjust their BRASS engine properties to get the desired result, which in this case is a composite section in positive bending.

FROM: kkennelly DATE: 10/22/2001 1:09:41 PM

Can you change the comparison of pts to use the distances in feet? For the attached bbd file, the user has entered a poc location that produces a poc at 59.5000' if you round to 4 decimal places like the BRASS input file uses. I don't think the user would ever be able to figure out on his own that the inches tolerance is causing this problem.

FROM: bgoodrich DATE: 10/24/2001 12:12:27

I modified the export to use feet or meters for the comparisons. Fixed for 4.1 Beta 2.

FROM: gbarnhill DATE: 11/07/2001 14:37:48

OK in V410 Beta 2

### Description

FROM:gbarnhill DATE:09/04/2001 14:40:30

I received a question and info from Ming Teng, RQAW Corp in Indianapolis.

A 3 span composite girder was modeled to change steel material at the splices. Grade 36 in positive moment ranges, Grade 50 in negative ranges. BRASS Export was creating a Grade 50 section for the middle range of Span 2. I imported the BBD file and confirmed the error.

I was also working on another problem and changed my INCH tolerance from 0.00001 to 0.0001. When I went back and reran Ming's problem, the Grade 50 section did not appear with the 0.0001 setting. I changed the setting back to 0.00001 and was able to duplicate Ming's results.

I've attached the bbd file and a Word file from Ming showing a drawing of the girder profile.

FROM:kkennelly DATE:9/5/01 1:43:05 PM

This is very similar to incident 3339.

FROM:kkennelly DATE:9/24/01 2:07:34 PM

Description

FROM:bgoodrich DATE:09/29/2001 00:29:04  
 E-mail from Richard Best:

Pat Clausen, one of our design engineers, points out some problems in a recent VIRTIS (LFD) run. Attached is a summary of the errors including a print out of two selected pages from the output file. Also attached is bbd file of his model. We are using VIRTIS/OPIS 4.0.4. Can you take a look at our model and the output? It looks like something is wrong in the computation of unbraced length as Pat points out in his memo.

Complete Issue Information

FROM: bgoodrich DATE: 10/02/2001 14:36:10  
WYDOT assigned this issue to Problem Log #305.

FROM: bgoodrich DATE: 10/04/2001 10:49:17  
Entered for Dan Glandt:

An error was found in the 5.8.3 release of BRASS-Girder (LFD) The error was fixed in 5.8.4 and the attached output was ran on 5.8.4 which is currently being beta tested. This error fix corrected errors 1, 2 and 3, however, see below for error 3.

From version 5.8.4:

At the 2.0 (200.0 poi), M1 left = -852.57 ft kips.  
M1 right = -778.74 ft kips.

I believe this is correct for load level 1, truck 2.

At the 1.8

Stage 1 dead load moment = -100.4 kip ft  
Stage 2 dead load moment = -57.3 "  
Live load moment, truck 2 = -258.1 "

Factored moment =  $1.3 ( (100.4 + 57.3) + 5/3(258.1) ) = 764.22$  kip ft

At the 1.9

Stage 1 dead load moment = -271.3 kip ft  
Stage 2 dead load moment = -155.0 "  
Live load moment, truck 2 = -358.7 "

Factored moment =  $1.3 ( (271.3 + 155.0) + 5/3(358.7) ) = 1331.37$  kip ft

The bracing point 11.5 ft left of the 2.0 point, is at the 1.8153 point.

By interpolation, the moment at the 1.8153 is  $(1331.37 - 764.22) * .153 + 764.22 = 850.99$  which compares to the 852.57 reported.

Right of 2.0, the first bracing is as 11.5 feet.  $11.5/80 = 1.4375$  so the bracing falls .4375 of the way between the 2.1 and the 2.2. The factored moments at the 2.1 and 2.2 are 1074.3 and 370.2. By interpolation, the moment at the 2.14375 is 778.72 which matches the output.

Fixed for version 4.1 beta 2.

### Description

FROM:bha DATE:10/02/2001 10:36:20

We selected some bridges on the Bridge Explorer to do an overload analysis. After the analysis was performed for the bridges selected, the Virtis program just allows to view the Bridge Rating Results. We want to print the Bridge Rating Results. Can you provide this function? Thanks

FROM:jduray DATE:5/17/02 8:32:13 AM

Description

FROM:gbarnhill DATE:10/11/2001 14:43:23

Assuming the basis for this new feature is to allow a quick overload analysis for a one time vehicle, here's my first round thoughts.

The NEW, EDIT, DELETE buttons are easy enough to interpret, but SAVE was confusing (until I read the HELP). I see the purpose for Saveing to the Library, but that means I need to give a Rating Engineer authority to write to the Libraries. I'm not sure I want to do that.

Could we set up an OVERLOAD TRUCK LIBRARY file that resides on the users hard drive (like the

Complete Issue Information

CDATA file for BARS import) ??? I'd rather have the rating person use something separate from the library that designers will see. The agency library could get quite full if a rater decided to save every overload they processed.

Why is there a CLOSE button instead of OK, APPLY, CANCEL ???

The LIBRARY-VEHICLE dialog is too busy for just a quick input overload truck. I don't need the MIN,MAX axle spacing. GAGE DIST & WHEEL CONTACT aren't used for LFD, so could they be moved to after an AXLE SPACING column ?? If I'm entering 15 or so axles, the easier the better. Since this is a rating tool, could the RATING methods be pre-coded so I don't have to check them off ??? The TANDEM & LANE tabs aren't needed.

FROM:kkennelly DATE:10/22/2001 8:57:59 AM

1. Overload Truck Library is an enhancement. We won't be able to get that into 4.1 so I'll label this as suspended enhancement.
2. The Close button is appropriate since this dialog does not contain data like one of the typical gui windows. It is a way to get to data in the Vehicle window.
3. Library-Vehicle dialog too busy: We are reusing the vehicle window we have now since the user is able to save the vehicle to the library. Gage Dist, Wheel contact appear in the same order as they do on the Library Vehicle window.
4. We added this window so the user could add vehicles as they needed when they were in the Analysis Settings window instead of them getting to the Analysis Settings window, not having a vehicle, then having to go back to the Library window, add a vehicle, then go back to the Analysis Settings window. It is not necessarily just a rating tool. It can also be used in Opis for design review.

FROM:jduray DATE:6/17/02 10:12:24 AM

The enhancement request is for an overload truck library that is owned by the user. One approach would be to store the info on the user's loacl drive instead of the db.

FROM: Jim Duray DATE: 6/11/2009 3:37:04 PM Eastern Daylight Time

Description

FROM:rmbest DATE:10/12/2001 09:22:52

Enhancement request - Make it easier to change span lengths. Some automation is needed to cascade the corresponding changes to all affected members in a logical fashion.

FROM:kkennelly DATE:10/16/01 12:51:33 PM

I'm not sure what type of automation you are asking for. If you change the span length, skew, or girder spacing for a girder system Virtis will automatically compute the new lengths of members. By this I mean that after you make such a change, the new span length will be shown in the Member window. The entire Virtis system then knows the span lengths of the members so Validate will let you know if something like the Deck Concrete profile is not defined over the entire member length. We don't make any changes to the data you have entered in a window like the Deck Concrete profile because you may have multiple ranges describing the deck profile and we don't know which one should be changed.

FROM:rmbest

You are correct that it is best left to the user to decide what to change but it can be very tedious tracking down and changing things like diaphragm spacing, beam stirrups, slab rebar etc.

FROM:bgoodrich DATE:10/16/2001 15:23:00

There are rating codes on the Rating Results window. Although the help defines each, I think a short text description (Pass, Pass\*, Fail, N/A) would be more consistent with the rest of the GUI. The spec check results are reported as Pass, Fail, N/A, etc. and not with 1, 2, 3, etc.

4/19/2016 3:02:46 PM

HRS AASHTO

164

Complete Issue Information

jduray>> I agree but this may be what MinnDOT wanted...Krisha - please check.

kkennelly>> We present the codes that Minnesota gave us. The Code Explanation column on the window gives a text description of the code so you don't have to open the help.

FROM:bgoodrich DATE:10/16/2001 15:23:00

Every agency may not agree with the MinnDOT codes. Can Virtis maintain a master set of codes that can be mapped to those specified by an agency? Maybe the agency could set these somewhere in the configuration browser like what is done for districts, counties, etc. The alternative would be to hide the Code column of the grid for everyone except MinnDOT.

FROM:jduray DATE:10/18/01 4:08:09 PM

What I would like to do in the future is allow a COM-based plugin (like the analysis engine) for much of this interface. This was not part of our scope and there was no budget for this at this time. What we have is what MinnDOT asked for. Others can use the codes as is, wait for AASHTO to make enhancements or fund the enhancement themselves.

| 3495.11855 | Discard       | unrecognized stiffener in Rating - Overlapping longitudinal stiffeners not handled by BRASS |

Description

Enhancement Request – This may be a low priority but it needs to be mentioned. VIRTIS allows the input but BRASS only supports one concrete material and one rebar material for the entire girder line. For concrete bridges, the export chooses the first f'c value due to this limitation with BRASS. We have at least one multi-span prestressed I-beam bridge that falls into this category that has different f'c values in different spans. This should be considered for BRASS enhancement. Until it is fixed in BRASS, VIRTIS should either not accept the input or it should give a meaningful warning message. As it is now, the users are unaware unless they pour over that massive output file.

FROM:jduray DATE:10/22/01 10:29:12 AM  
The export should warn the user of this (if it doesn't already).

FROM:bgoodrich DATE:10/22/2001 12:58:02  
I have forwarded this issue to Jay Puckett/WYDOT. On hold until approved by WYDOT.

FROM:jduray DATE:1/10/02 4:13:06 PM  
We should, at a minimum, fix the export to warn the user. If WyDOT wants to enhance BRASS that's

Complete Issue Information

ok too but let's fix the export asap.

FROM:bgoodrich DATE:01/16/2002 12:08:33

I modified the export (CheckForUnsupportedData function in BrassCmd.cpp) to detect when the concrete material is not the same for all prestress spans. The following warning is issued when this condition is not met:

"BRASS does not support different concrete materials for each span.  
The concrete material from the first span will be utilized."

Setting status back to On Hold until WYDOT makes a decision.

FROM:bgoodrich DATE:Wednesday, February 20, 2002 12:36:10 PM

Brian and Jay discussed this issue with WYDOT on 2/19/02. WYDOT indicated that this may be a possible long-term issue, but there are no short-term plans to address this issue.

FROM:bgoodrich DATE:Saturday, January 25, 2003 4:19:45 PM

WYDOT has placed this issue on the BRASS enhancement list.

FROM:bgoodrich DATE:Sunday, August 01, 2004 1:43:46 PM

This same issue was also submitted in Incident 5251.

FROM:hlee DATE:4/30/2008 2:26:16 PM

Discarded by TAG 12/07.

| 3497.11853 | Resolved      | calculation of the moment capacity by Virtis |

## Description

FROM:jihnat DATE:11/7/2001 12:01:57 PM

On 11-2-01, received an email from Travis Fox of ABMB with the following:

The attached file, Bridge128.bbd, is for the structure that I talked to you about yesterday. Also, attached is a word document describing the problem we are having in getting the correct rating for members G11 and G12. Basically, Virtis seems to not be recognizing the longitudinal stiffeners in its calculations, however, I could be overlooking something as well. Please have someone take a look at the problem and let me know what you find.

I forwarded this to Brian Goodrich who responded:

Mr. Fox is correct about the longitudinal stiffeners not being recognized. The issue pertains to both the export and the BRASS engine. The BRASS engine only supports one longitudinal stiffener location at any given point. In this particular bridge, there are two longitudinal stiffener locations at the same point. The export attempts to overcome this engine limitation by finding the midway point between overlapping longitudinal stiffeners, where it stops the first stiffener and starts the second one. This has worked fine until now, but for this case, the two lines of longitudinal stiffeners overlap completely, i.e., they have the same start distance and range. Therefore, the export is unable to choose which one to use. The .LOG file gives the following warnings:

### WARNING (High):

The export detected overlapping longitudinal stiffener ranges!  
BRASS does not allow this condition!  
One longitudinal stiffener range is entirely within another.  
Therefore, the current range cannot be added.

### WARNING (Medium):

If overlapping truly exists, and you do not agree with the export assumptions, override the longitudinal stiffener schedule for each point of interest in the overlapping range(s).

The user cannot override the point of interest for BRASS-LFD unless he overrides everything (transverse/bearing/longitudinal stiffeners and racing (lateral support & diaphragms)) and sets the POI control option on the member alternative engine properties to 0 (zero). This is a nine-span structure, so this option is not appealing. However, it may be the only work-around.

Please add this as an incident. We should followup with Jim and Jay Puckett to see if they have any suggestions.

4/19/2016 3:02:47 PM

HRS AASHTO

168

Complete Issue Information

FROM:bgoodrich DATE:11/07/2001 14:57:04

After discussing this issue with Jay, we suggest the following work-around:

1. Make a copy the existing member alternative.
2. Modify the longitudinal stiffener schedules such that there is only one stiffener present at any given location (generally on the compression side).
3. Document the member alternative accordingly using the description fields.
4. Analyze the bridge using BRASS.

I tested this work-around and recieved a rating of 1.15 for the HS-20 truck and 0.87 for the HS-20 Lane, which is better than the extremely low ratings without the stiffeners.

As a followup, we need to determine how many structure there are in which two lines of longitudinal stiffeners are present along the entire length of a span. This may fall outside the 85-90% of bridges that we are targeting.

In a future release, we might be able to modify the export address this issue. However, we must proceed with caution. The types of structures for which this issue is a concern are most likely major crossings with large traffic volumes. The export should not make blanket judgements for these types of issues.

FROM:bgoodrich DATE:Tuesday, February 26, 2002 2:46:00 PM

WYDOT is currently deciding if this issue will be addressed. Set to On Hold until they respond.

FROM:bgoodrich DATE:Friday, February 27, 2004 11:19:42 AM

This issue is on the BRASS enhancement list. Status set to Suspended.

### Description

FROM:jihnat DATE:11/8/2001 8:11:51 AM

In an email received from Travis Fox of ABMB:

In the calculation of the moment capacity by Virtis, the following calculation is always performed:

F critical for compression flange  
[4400 t/b]\*\*2

This value is checked against the yield strength and the lower of the two values is used in calculating the moment capacity. Where does the above equation come from? I have not been able to find this equation in the AASHTO Standard. (I may just be overlooking it, probably) It is causing a number of steel plate girder bridges to rate lower than they were previously rated in BARS.

If you need me to send an example please email me back.

Thanks for the help.

| 3515.11835 | Resolved      | Transverse Stiffener Definition window - Bolt Definition combo box |

### Description

FROM:dkoenig DATE:11/09/2001 13:41:01

I have found a problem with the third Haunch Type method for steel girder bridges. The Z values should be referenced from the edge of the flange like the schematic displays. Instead, the Z values are being referenced from the center of the girder. This can readily be seen on the structure typical section schematic. I can not be sure what data is actually being sent to Brass since the haunch load is not being calculated. Plus, I can not find any haunch data in the Brass Output. I thought I could for 3.0?

I am attaching a bbd file in case you need it.

In addition to the problem above, I was wondering if Incident 3140 would be fixed. Maybe this issue has already been resolved.

FROM:dkoenig DATE:11/09/2001 13:59:26

I am sorry about this, but the bbd file I gave you has two structure definitions on it. The second definition, "Structure Definition Check", contains this input type.

FROM:kkennelly DATE:11/16/2001 12:55:12 PM

I imported your bridge into 4.0.4 and then migrated it to Version 4.1. The export is correctly calculating the haunch dead load in version 4.1. It is entered as a Uniform-DL1 command in the BRASS LFD input file. The Structure Typ Section schematic now correctly draws the haunch in Version 4.1.

### Description

FROM:bgoodrich DATE:11/12/2001 18:15:49

The Bolt Definition combo box (in the Transverse Stiffener Definition window) allows text to be input using the keyboard. This combo box should only allow the user to select one of the preset options.

FROM:jihnata DATE:11/13/2001 9:36:53 AM

Fixed for Version 4.1 Beta build 3.

FROM:bgoodrich DATE:11/30/2001 11:43:51

I found more combo boxes that should only allow the user to select one of the preset options. They are:

1. Bolt Definition window: Bolt diameter
2. Weld Definition window: LFD/ASD Fatigue stress category
3. Weld Definition window: LRFD Fatigue stress category
4. Weld Definition window: Electrode classification
5. Bearing Stiffener Definition window (Angle): Bolt Definition

FROM:jihnata DATE:8/10/2005 1:09:20 PM

Most of these have been fixed for some time. Except for Bolt Definition window, where the behavior seems to be intentional and I have left this window alone.

| 3539.11811 | Resolved      | Embedding a flange and web in the deck slab - BRASS LFD |

Description

FROM:mteng DATE:11/30/2001 11:32:33

Hello,

Attached is the bbd file. From my bbd file, I run four POIs. The info is below:

For POI at Span 3 √ 19.05ft, I think do=51j", but VIRTIS use the previous one do (VISTIS) = 76.855j".

For POI at Span 3 √ 25.0ft, I think do=36j", and so does VIRTIS. (P.S. but the previous do=51j")

For POI at Span 2 √ 124ft, I think do=52.5j", and so does VIRTIS. (P.S. but the previous do=75j")

For POI at Span 2 √ 126ft, I think do=26.25j", but VIRTIS use the previous one so the do (VIRTIS) = 52.5j".

As we know, the bigger the do, the smaller the Vu. I just do not understand sometime VIRTIS will check the previous one but sometimes doesn't. If POI is near the web stiffener, VISTIS does check previous (only previous, not next one). But if POI is not near web stiffener, VIRTIS only use the exact do. Wired, isn't it?

THANK YOU VERY MUCH! :)

Ken (P.S. Do not know how to insert my bbd file.)

FROM:bgoodrich DATE:12/10/2001 12:04:00

I have forwarded this issue to WYDOT. It has been assigned Problem Log 317.

FROM:bgoodrich DATE:12/12/2001 10:06:49

Entered for Dan Glandt:

For checking shear, I built in a tolerance of 6" within a change of transverse stiffener spacing. Based on this the program is conservative. My thinking was:

If you have a transverse stiffener at 80' on a 100' span and the first stiffener to the left of that is 40 inches away and the first stiffener to the right is 20 inches away, what is the shear strength at the 1.8, 6" to the left of the 1.8 and 6" to the right of the 1.8. Realistically, I reasoned that for rating they should be the same and to be conservative, we would take the shear value based on the 40" stiffener spacing. The 6" was arbitrary. Maybe it should be more scientific like 1/2 of the smaller spacing?? or maybe we

Complete Issue Information

don't need it.

I can see now, an explanation in the intermediate output is needed if we keep the tolerance. This can easily be changed.

FROM:bgoodrich DATE:12/12/2001 10:06:49

A future release will provide an explanation in the output, the appropriate manual section, or both.

FROM:bgoodrich DATE:12/12/2001 16:19:34

The BRASS-GIRDER Command manual was modified to provide an explanation of how the transverse stiffener spacing is selected. See the examples and notes on the STIF-TRAN-SCHEDULE command for details.

Description

FROM:kkennelly DATE:12/14/2001 9:31:38 AM

Submitted via email on behalf of Francisca Karyadi 12/12/01. This incident pertains to the second question in the email regarding haunches.

Ms. Kennelly,

Currently I am rating a simple span COMPOSITE bridge supported on 33WF130 stringers with bottom cover plates. At mid-span, the exterior stringer has distortion caused by a collision damage. My question is whether or not VIRTIS is able to account for this loss. I calculated the distorted section properties of the stringer manually. Please advise me on how to input this loss to the section properties. VIRTIS has a cell for inputting "the deterioration profile," but it only accounts for percentage of loss to web, flanges, etc., NOT percentage of the overall capacity (section modulus).

My second question is:

I am rating a simple span COMPOSITE bridge supported on 20" I 65# stringers. My problem is that the top flange and part of the web are embedded 4" in the slab (4" from the bottom of the slab) (b eff. = 48", t slab = 9"). In the "Haunch" cell, I input the top flange to be embedded in the slab (Y1= -4 inch). Virts calculated the section capacities for stage construction 2 (3n) and 3 (n) assuming that the slab is ON the stringer. Therefore the c.g. of the composite section is higher than it is supposed to be. My question is whether VIRTIS has the capability to calculate section properties with the top flange embedded 4 inches in the slab.

Your help is greatly appreciated.  
Thank you and have a great day.

Francisca Karyadi

Brian, Can BRASS analyze a section as described with the flange and web embedded in the slab?

Complete Issue Information

Dan Glandt indicates that BRASS-GIRDER engine should support an embedded flange. However, the export does not currently allow the haunch distance to be negative. The BRASS-GIRDER(LRFD) engine does NOT currently support an embedded flange.

Krishna - Should I modify the export as a first step?

FROM:bgoodrich DATE:Tuesday, July 22, 2003 1:29:14 PM

I assume the user's first question was answered by Krishna. The second question has been addressed by modifying the export to permit a negative haunch depth, which results in an embedded flange. Fixed for Version 5.0.1.

FROM:kkennelly DATE:7/24/2003 2:30:50 PM

Version 5.0.1 tested. Export gets correct negative haunch (I didn't check if BRASS computes section properties correctly.)

Description

FROM:gbarhill DATE:01/09/2002 16:49:16

I input a new 3 span continuous ps I girder. In the LFD results for the moment effects due to ps force, the numbers in span 3 are not the same as span 1. All other moment effects show symmetry.

I did an LFD analysis of PCITrainingBridge5 supplied with the 4.0.0 DB. I see similar results.

I have attached the bbd file for my input structure. I analyzed Member 2 of the ps system.

FROM:bgoodrich DATE:01/16/2002 11:10:12

The input looks symmetrical to me. The results within each span are symmetrical, but Span 1 and 3 are different in magnitudes. I have forwarded this issue to Dan Glandt for investigation.

FROM:bgoodrich DATE:02/01/2002 15:20:04

Dan Glandt has addressed this issue in BRASS-GIRDER 5.8.5, which should be available in the first patch for Virtis 4.1.

### Description

FROM:bha DATE:01/15/2002 11:01:13 We have found the calculations of section properties for PS Shape (especially for deck and box beams) are not accurate and consistent. First, we use the Library to input the dimensions of the deck beam (file enclosed), then use the compute button to compute the section properties automatically or we enter the numbers of our own. But when we analyze for rating solution the Brass engine recalculating and overriding the properties, which we have created on the Library.

SECTION PROPERTIES CALCULATED BY LIBRARY BASED ON THE DIMENSIONS GIVEN IN THE DIMENSION TAB:

AREA = 723.7 in<sup>2</sup>  
MOMENT OF INERTIA = 32760.4 in<sup>4</sup>  
Yb = 9.8801 in  
St = 2946.1 in<sup>3</sup>  
Sb = 3315.8 in<sup>3</sup>

SECTION PROPERTIES CALCULATED BY BRASS ENGINE:

AREA = 735.5 in<sup>2</sup>  
MOMENT OF INERTIA = 33953 in<sup>4</sup>  
Yb = 9.94 in

We suggest this problem should be fixed as soon as possible

FROM:jduray DATE:1/29/02 12:49:04 PM

Please check the BRASS engine-related help for the section properties. I think you will find that it states that BRASS computes the properties and does not use the properties from Virtis/opis.

## Complete Issue Information

### Description

FROM:bboucher DATE:01/17/2002 14:50:25

In the past (i.e. Versions 2.0 thru 4.0), Virtis would analyze a section as noncomposite when no structural slab was defined. Furthermore, Virtis would analyze a section as composite when a structural slab was defined.

In the earlier versions of Virtis, the presence of shear connectors flagged "warnings" stating that BRASS did not incorporate the shear connectors in the analysis. Therefore it was not an issue if shear connectors were modelled. the program worked.

Now, with Version 4.1, Virtis requires the user to define the slab regardless of whether the section will be analyzed as composite or noncomposite. In addition, it will only analyze a section as composite IF the shear connectors have been defined.

This change in the program is an expensive and devastating blow to my firm. Hundreds of bridges will need to be revised to fix the problem.

Is there a way to make all the old files run correctly (the old way) under the new version? Otherwise our entire database will be reduced to no working files.

FROM:rmbest DATE:01/18/2002 12:02:57

Illinois DOT has the same problem and the same concerns.

FROM:jduray DATE:1/22/02 2:59:19 PM

We are working on resolving this in a way that will not require that you make changes to bridges that were input prior to 4.1.

FROM:jduray DATE:2/5/02 12:11:57 PM

We are going to write a utility to update the database. The utility will look at ranges where a deck is specified and add rows to the shear connector ranges table to correspond.

Brian is preparing a list of the dependencies that we must check before adding rows to the shear connector ranges table.

We must also check girderline.

FROM:kkennelly DATE:2/15/2002 9:29:06 AM

Attached Incident3571 Composite Sections.doc with my method for determining where to add shear connector ranges. Attached CompositeDetectionFlowchart.doc with Brian's items to check.

FROM:jihnat DATE:3/1/2002 1:59:58 PM

AddShearConnRanges utility program is finished.

FROM:gbarnhill DATE:Friday, March 29, 2002 12:20:42 PM

I've tested the utility against several variations of composite/non composite ranges. It correctly identifies partial composite ranges and also merges overlapping definitions of composite slab and rebar

Complete Issue Information

ranges into a single composite range.

FROM:jduray DATE:4/4/02 2:52:03 PM

I have done extensive testing by analyzing 281 bridges from Illinois DOT, Arizona DOT, NY DOT, Michigan DOT and MassHighway. Comparisons were made of rating factors and rating capacities for a Type 3 vehicle before and after running the utility. A special version of the export (abxbrass.ocx) was used to simulate 4.0.4 rating results. Less than 20 bridges showed differences. All differences were explainable.

A product validation feature was added to the Bridge Explorer to facilitate this comparison of large groups of bridges. The feature is not user friendly at this time and so will not be available in the Service Pack for end-users. It is planned to make it available in 5.0 to enable users to do there own product validations as they implement new releases of Virtis.

### Description

FROM:bmccaffrey DATE:01/27/2002 14:48:49

I defined a P/S rectangular box and set my default units to metric in the 'Member Alternative' window. In the strand layout grid, the strands closest to the wall are centered right at the wall. If the default units are set to english in the 'Member Alternative' window, the strands appear inside the box. I-beams work fine.

This was in 4.0.x also.

### Description

FROM:eplakotos DATE:02/01/2002 13:57:42

Before I installed VIRTIS 4.1.0 I was running VIRTIS 4.0.3. Importing BARS files into VIRTIS. All files consisting of simple and continuous prestressed girder spans were analysed and rated without any problems. After I installed VIRTIS 4.1.0 and run again the same files I found out that only the simple spans were analysed and rated. The continuous span members or the multispans members run as well but the rating results for inventory and operating load ratings were all zero. Please advise me of what I need to do to resolve this problem and thank you in advance.

If you need to contact me, you can call me at (504) 443-3437 or e-mail me at eplakotos@bh-ba.com

FROM:kkennelly DATE:2/1/2002 3:59:02 PM

Major changes were made in the BRASS LFD program regarding the rating of PS bridges. Some of the changes include:

1. The ASD rating calculations are now performed when BRASS LFD is run as per AASHTO Maintenance Manual 6.6.3.3. These ASD ratings may now control your beams.
2. Changes were made in the way BRASS computes the shear capacity of PS beams made continuous for live load. In Virtis Version 4.0.4, BRASS LFD computed the shear capacity of PS beams near interior supports using the current AASHTO spec. In Virtis Version 4.1, BRASS LFD computes the shear capacity of PS beams near interior supports using the 1979 or RC specs since the export generates a command to use the BRASS default. Please refer to incident 3574 for background on these changes.
3. Incident 3576 indicates BRASS LFD has an internal error in calculating the shear capacity. Please

4/19/2016 3:02:51 PM

HRS AASHTO

refer to that incident for more background.

Any of the above changes could be causing your ratings to fall to zero.

It appears that items 2 and 3 will be addressed in the first service pack for Virtis 4.1.

FROM:jduray DATE:10/14/2003 4:21:40 PM

This incident is being closed because 4.1 resolved the problem. Buchart Horn no longer licenses Virtis so we cannot confirm resolution.

| 3585.11765 | Suspended     | Add Reinforced Concrete Box Girder Bridges to Live Possibilities |

### Description

FROM:rpierce DATE:02/05/2002 18:19:27

Incident 2, Please add the ability to handle varying bottom slab thickness in Parabolic Haunches. (Reinforced Concrete)

FROM:jduray DATE:2/12/02 8:39:38 AM

I don't understand this request. We only handle one slab...what do you mean by a bottom slab?

FROM:rpierce DATE:02/13/2002 11:29:05

Jim the structure I am analyzing is a Reinforced Concrete Box Girder that has top and bottom slabs. The bottom slab in the Parabolic Haunch varies in Thickness.

FROM:kkennelly DATE:2/14/2002 10:42:51 AM

I spoke with Ron about this issue by phone a couple of weeks ago. I think he is modeling the rc box girder as an rc I beam. Our gui lets the user vary the bottom flange thickness but BRASS doesn't accept that.

FROM:rpierce DATE:Thursday, February 21, 2002 2:27:21 PM

Jim I am referring to Reinforced Concrete Box Girder Structure. I modeled the Cross Section as an I section with variable bottom Slab thickness at the Pier that is in a parabolic Haunch. this can not be modeled by

Virtis Because the web is not parabolic shape because of the bottom slab thickness.

Description

FROM:rpierce DATE:02/05/2002 18:23:45 Incident 4, Hinges in the reinforced concrete slabs, and reinforced concrete box girders. Please include Hinges in slab bridges, this possibility is already available for steel girders and it is possible with BRASS Girder. It should not be to terribly difficult to add. With our local slabs Bridges with hinges we can run them with BRASS girder but can not store them in the Data base. This makes running overload permits alot more labor intensive.

### Description

FROM:rpierce DATE:02/05/2002 18:27:43

Please add Transformed Area Method to the options for Prestressed girder Bridge Ratings. Currently in Arizona all New Prestressed Girder Bridges are being design this way. We would like our HS20 bridges designed for HS20 to rate for HS20 as well. I believe that using the cover plate option in BRASS girder might facilitate this. The transformed prestressing strand could coded as a cover plate with a d in the bottom flange.

| 3592.11758 | Patch Test    | Reinforcement multiple layers is averaged |

### Description

FROM:rpierce DATE:02/05/2002 18:51:37

When coding in A slab Bridge 1 ft width is used. The number for reinforcement is a decimal equivalent to i.e. #9's at 8 inchs would be coded number of bars as  $12/8 = 1.5$ . When the cross section is displayed to verify input it shows 2 bars at six inches. If 1.2 bars was put in it would show 1 bar at 12 inches. The internal calculator is rounding up and down and not giving the same as coded. The analysis is performed correctly but if the input is going to be verified by this graphic it would display an incorrect section.

## Description

FROM:rpierce DATE:02/05/2002 18:57:22

If there are two mats of reinforcement in BRASS output it shows that only one layer top and bottom slabs of Reinforced Concrete I girder Section. Should every layer be shown with its correct d.

FROM:bgoodrich DATE:02/13/2002 09:29:25

Within the Virtis/Opis GUI, the location of rebar is entered. Virtis/Opis does not assign rebar groups/rows. Therefore, if the rebar is located in the bottom half of the beam, it is exported to BRASS Row 1. If the rebar is located in the top half of the beam, it is exported to BRASS Row 5. BRASS will then average the rebar assigned to each row. BRASS is limited to three rows of bottom rebar and two rows of top rebar. It might be possible to fill each of these rows when the rebar distances are different. Any rebar at locations that do not exactly match those that are filled first would have to be assigned to the most appropriate row, which may or may not be how the user would like them grouped.

Complete Issue Information

Jim - This is an export issue, not an engine issue. Should the export be modified?

FROM:jduray DATE:2/14/02 7:28:33 AM

I think the export should map what the user has defined to whatever BRASS is capable of doing in the most exact way possible. If there are five different d dimensions input by the user and BRASS can handle five rows, I think the user should see five rows in the output. If the user enters a sixth row and BRASS cannot handle that the export should either (1)issue an error message that BRASS cannot analyze the member or (2) the export should add an equivalent set of reinforcement to the most appropriate of the five rows and issue a warning to the user. I think we should do number (2). If users don't like that then BRASS should be enhanced to be more general.

I don't understand Ron's question...are there two mats defined, one top and one bottom? If s, based our what Brian says above, BRASS and the export should be able to handle that. What is the problem?

FROM:bgoodrich DATE:02/15/2002 13:33:22

Ron - Please elaborate and attach the BBD file.

FROM:bgoodrich DATE:Wednesday, February 20, 2002 6:14:32 PM

I attached the BBD file (1345.bbd). Ron entered two or three rows in the top and three rows in the bottom, all of which have different distances. I will modify the export as indicated above by Jim D.

FROM:bgoodrich DATE:Friday, June 28, 2002 12:24:49 AM

I modified the export (BrassCrossSections.cpp, BrassLrfdCrossSections.cpp, BrassStdCrossSections.cpp) to fill as many BRASS rows as possible and merging rebar at similar distances into the same row. Fixed for the version released after 4.2.

Description

FROM:eplakotos DATE:02/11/2002 17:52:02

As of two days ago we have had a problem with Vertis 4.1. The program takes 20 minutes to start after a valid user ID and Password is entered in the Virtis login window. After Virtis start, opening a bridge data file takes just as long. We do not know what is the cause of this. Have you encountered a similar problem before?

We are using Oracle 8.1.7. We can login to oracle and look at tables and other information just fine.

Prior to this happening we modified some parameters in the Configuration Browser (in Virtis). We are not certain about the default parameters and are thinking that perhaps that might be a problem. Any ideas to help resolve this problem will be appreciated.

Regards

P.S. We reinstalled Virtis 4.1. That did not help.

FROM:eplakotos DATE:02/11/2002 18:02:28

### Description

Please add parabolic harping for strand layout in Virtis. BRASS Girder will perform stress calculations with this type of Harping. Please make it available in virtis.

FROM:awaheed DATE:Monday, September 08, 2003 12:30:48 PM

Can Virtis handle parabolic prestressing strands in post-tensioned concrete girders? Is there any enhancement planned to handle transverse post-tensioning of the slab on girders?

### Description

FROM:dteal DATE:Wednesday, February 20, 2002 10:08:54 AM

As our User List grows to over 50 users we need a way to re-sort the user list alphabetically using User ID and not last name. I know the User List is sorted by Last Name right now. When you look at the User List in that order it appears not to have any order. With a growing user list it is becoming harder and harder to remember the last names associated with a user ID.

FROM:jduray DATE:2/20/02 1:54:19 PM

Add a Configuration Browser tab to the preferences dialog. On that tab put radio buttons for the sort order (Lastname, UserId).

Description

FROM:rpierce DATE:Thursday, March 14, 2002 9:59:38 AM

Currently, It is not easy to use the find function and then it to a rating folder. For instance, I had an overload permit that three structures on the same route between two mile posts. I used the find function to locate the files I wanted, but I could not copy them to special folder to run the overload vehicle on. It seems that this should be an avialbe option. I talked to Gale Barnhill and he agreed that this should be an option as well. The work around was I had to use the copy and paste from the edit window. It would be easiler like if the copy and paste were avialbe on the right click event as with most MS applications. The on line help did not discuss this option very well.

FROM:gbarnhill DATE:Thursday, March 14, 2002 2:05:30 PM

Is it possible to add a button for ADD TO CURRENT FOLDER on the FIND BRIDGE dialog ??

FROM:jduray DATE:3/20/02 7:50:34 AM

You can use the New Folder dialog to create a new folder.

I agree you should be able to ...We will check on why we can not.

FROM:jduray DATE:3/20/02 3:49:30 PM

Ron is asking for a button on the Find Bridge dialog to add the result set bridges to the current folder (only for list folders).

FROM:rpierce DATE:Wednesday, March 20, 2002 5:32:19 PM

Jim , thats is exactly what I was talking about. What is going to take to add this?

Description

FROM:eplakotos DATE:Monday, April 08, 2002 11:27:58 AM

I am sending you two files. One is a BARS input text file that I have imported to VIRTIS 4.1 and the other is the VIRTIS file that was created by the BARS file. In order to verify the ratings from VIRTIS I calculated them manually and unfortunately they did not match. I could not find the calculated Mu (ultimate moment) to compare it with the one I calculated. I also noticed that the operating rating factor was not equal to:

$IRF*(5/3)$  as per AASHTO and the bridge design Manual of LADOTD. I would like to know how virtis calculates the Ratings. I like to add that my calculated dead load and live load moments did match VIRTIS's. I will appreciate it if you can send me the formulas and the procedure VIRTIS is using. If you

## Complete Issue Information

need my hand calculations please let me know I can fax them to you. For member G71 of the file I am sending you, my hand calculations results are as follows:

Mdead load = 955.8 ft-kips (Mdlnc)  
Msuperimposed dl = 215.29 (Mdlc)  
Mll+l (axle) = 650 ft-kips  
Mu = 6869 ft-kips

$$\text{IRF} = \{[(\text{Mu}/1.3) - \text{Mdlnc} - \text{Mdlc}] * (3/5)\} / (\text{Mll} + \text{l}) = 3.7$$

$$\text{ORF} = \text{IRF} * (5/3) = 6.3$$

FROM:jihnat DATE:4/8/2002 12:41:55 PM

Note to programmer: The files were emailed to Bridgeware@mbakercorp.com

FROM:jduray DATE:4/9/02 8:25:44 AM

Please refer to the online help for BRASS for the details regarding analysis and rating computations.

FROM:kkennelly DATE:4/9/2002 1:23:29 PM

In the Analysis Results window of Virtis, I see that the controlling inventory rating is due to "Concrete Tension" and the controlling operating rating is due to "Ultimate Strength Flexural". The Concrete Tension limit state is checking the serviceability stresses. The different governing limit states is why the  $\text{ORF} \neq (5/3)\text{IRF}$ . The AASHTO Manual for Condition Evaluation of Bridges, Article 6.6.3.3 states that at inventory level, the rating must consider the allowable stresses at service load as specified in Article 9.15.2.2 of the AASHTO Design Specifications. That is why "Concrete Tension" is only checked for the Inventory rating and not the Operating rating.

The Mu for the controlling point 105.0 is shown as follows in the BRASS output file:

Moment Section Capacity

Phi \* Mn (pos): 0.674792E+04 (ft-kips)

There is no detailed info in the BRASS output as to how this section capacity is calculated.

Brian, is there any way to get more detailed output from BRASS as to how it computes this moment capacity? The user does have a point of interest with Detailed Output turned on at this point. I thought we could get detailed output for the section capacity calcs like we can for a steel girder?

FROM:bgoodrich DATE:Tuesday, April 09, 2002 5:59:42 PM

In general, Virtis users have little control over the prestress output. There is a way to get more intermediate output using the SYSTEM-1 command, but that command has never been generated by the export. We should be able to generate this command for prestress bridges, but I will have to consult with Dan Glandt regarding how the applicable parameter should be coded. Note that Incident 3010 pertains to the lack of loss output, which is also controlled by the same parameter on the SYSTEM-1 command.

FROM:kkennelly DATE:4/10/2002 8:18:49 AM

Emmanuel, are you satisfied with the BRASS computed moment capacity as 6747 kft vs. the hand calc of 6869 kft or do you want to request an enhancement to show more intermediate output re: computing the moment capacity in BRASS?

FROM:eplakotos DATE:Monday, April 22, 2002 4:53:22 PM

I would like to request an enhancement to show more intermediate output computing the moment capacity in BRASS.

### Description

FROM:tleatherwood DATE:Thursday, April 18, 2002 3:17:42 PM

I have input the data for a steel beam bridge with coverplates and concrete deck. The deck is composite in the positive moment areas. However, when I try to analyze this bridge, I get 0.00 for the resulting rating factors. I have reviewed the data but cannot locate any error that is causing this problem. I have attached a BBD file for the bridge. Can you help me locate any errors in the data?

FROM:kkennelly DATE:4/22/2002 3:21:18 PM

I ran BRASS LFD for member G1 and noticed the following in the BRASS output file:

In the section listing the Stage 2 dead load moments and shears I see "GIRDER ACTIONS DUE TO APPLIED STATIC LOAD OF 125.00 KIPS/FT". Your stage 2 dead load moments are way more than the capacity of the beam so the rating factor is 0. Your railing is entered with a load of 250 kip/ft, you probably want to enter 0.25 kip/ft.

Also, the BRASS output file lists some warnings at the beginning of the output file regarding if your points of interest should be composite or non-composite. You should check into these warnings and be sure you have modeled the structure like you want.

### Description

FROM:sneubauer DATE:Friday, April 26, 2002 9:17:35 AM

After we upgraded to version 4.1 and converted our database, I get an error message when I open a bridge file that says "System Error - Unexpected rows found." I hit O.K. and the file opens and there does not seem to be any problem with the file. Did the database conversion not work correctly or is it because there are some format changes that were made between version 4.0 and 4.1?

FROM:mordoobadi DATE:5/2/2002 9:08:23 AM

Could you please give me the Debug description of the error. To do so, when you get the System Error window select "Debug" in the drop down list control, copy the error text and paste it in your response.

FROM:sneubauer DATE:Friday, July 12, 2002 10:33:51 AM

This is the debug message:

No rows returned from database when expecting one row.

Description

FROM:bmccaffrey DATE:Monday, May 20, 2002 1:11:22 PM

When I try to 'fit to view' in the girder elevation schematic, Virtis crashes and I get disconnected. This was a 4 span P/S continuous for live load broken into two, 2 span continuous for live load structures. The attached .bbd file only has the first structure. The schematic behaved fine until I changed the number of spans from 4 to 2.

FROM:jduray DATE:4/13/2005 3:22:42 PM  
May be same as 6138.

FROM:jihnat DATE:9/6/2005 11:06:45 AM  
This problem appears to be fixed in version 5.3.1 (but not in 5.3.0 or earlier versions)  
Virtis no longer crashes. An error message is displayed when you try to open the schematic window. The DeleteSpan function appears to have been fixed to prevent this from happening. This is not exactly the same as 6138, since that problem is still occurring.

4/19/2016 3:02:56 PM

HRS AASHTO

217

Complete Issue Information

To fix this particular bridge:

- 1) In the Structure Def window, change the number of spans back to 4, enter span lengths and click OK.
- 2) Then reopen the Structure Def window, change number of spans to 2 and click OK.

For testing, I've attached a version of the BBD file migrated to 5.3.1

### Description

FROM:ttompson DATE:Thursday, May 23, 2002 10:04:34 AM  
Using Virtis 4.1.1 with ASA 7

I keep getting an error for too many distributed loads on a structure. The Load Case is SLAB. Which isn't one that I created. But I can't figure out how to reduce the number of distributed loads. This is only a 6 span structure.

I've attached the bbd for the structure. You can look at Girder 3 - Member G 3. (28035151.bbd)

FROM:ttompson DATE:Thursday, May 23, 2002 11:27:16 AM

I'm getting the same problem now on 69390535.bbd (Girder 1 - Member G 4).

Both of these structures ran okay with the previous version(s) of Virtis but not now. Evidently something has changed in the modeling?

Description

FROM:mhasan DATE:Thursday, May 23, 2002 1:35:46 PM  
 When using Virtis's utility to import BARS files, Virtis uses incorrect dead load (i.e., BARS input composite dead load as non-composite dead load in Virtis) in the analysis and thereby produces erroneous rating results. This problem occurred after completion of a successful importation process for a 1-span Tee-Girder bridge(i.e., cast-in-place concrete slab and girder bridge).

If you would like a copy of the BARS text file, please let me know.

Complete Issue Information

The BARS file is attached.

FROM:kkennelly DATE:6/4/2002 8:07:52 AM  
Card08 for this member has RC in columns 48-50. That is a Reinforced Concrete member. There is no composite stage for such a member type. If Card08 had CRC in columns 48-50 the member would then be Composite Reinforced Concrete and it would have composite loads.

### Description

FROM:dteal DATE:Thursday, May 23, 2002 2:42:48 PM

For LRDF Spec Check 6.10.3.7, Minimum Negative Flexure Slab Reinforcement the Input Parameter f (slab) appears to be 4 times larger at mid-span than what the minimum service II moment would cause. How is f(slab) calculated? Is this calculation shown someplace in the output?

FROM:bgoodrich DATE:Wednesday, June 05, 2002 6:09:03 PM

Dean - Please update Incident 3754 with a BBD file. Also, indicate exactly which POI you are investigating and any other pertinent information.

FROM:dteal DATE:Thursday, June 06, 2002 10:38:30 AM

The specific concern is the specification check failure of AASHTO 6.10.3.7.

The first POI where this occurs is 105.

When I calculate f(slab) at that POI I get  $f(\text{slab}) < \phi * f_r$ . OPIS says  $f(\text{slab}) > \phi * f_r$  and so I need 1% steel per AASHTO 6.10.3.7. I can't find the f(slab) calculation in the output.

Complete Issue Information

FROM:bgoodrich DATE:Friday, June 07, 2002 12:28:21 PM

I was able to duplicate the failure code reported for LRFD 6.10.3.7. Using the minimum factored Service II moments for stages 2 and 3 and the section moduli corresponding to the sign of the factored moments, I confirmed the slab stresses that BRASS reported. These stress calculations are not printed in the output. BRASS computes the slab stress as  $M2/S2 + M3/S3$ , where M and S are the factored Service II moments and section moduli, respectively, for the subscripted stage number. Note that BRASS includes the modular ratio (3n or n) in the section modulus values. For the 105 POI, the M2 is positive, while M3 is positive for the maximum actions and negative for the minimum actions. If this does not resolve the issue, please attach an illustration of your computations.

FROM:dteal DATE:Wednesday, June 12, 2002 9:53:57 AM

Brian - I got the following reply from our staff engineer that generated the question. Attached is an excel sheet with calcs:

From Shannon:

I am still not able to duplicate the slab stress BRASS calculates for POI 105. OPIS shows  $f(\text{slab}) = 5.056 \text{ MPa}$  on the spec. check failure notification. I don't get anything close to that. I have included an Excel spreadsheet with my calc's in it. I applied the min. actions to the composite section transformed in the positive sense. (Then I applied the min. actions to the composite section transformed in the neg. sense. Then I applied the max. actions to each sense. I couldn't come up with the  $f(\text{slab})$  value BRASS gets. It seems the correct way to do it would be to apply the min. actions to the composite section transformed in the positive sense. I was just doing the other calc's to try to get an answer that matched what OPIS showed.)

Maybe I am missing the boat completely. Maybe he could send his calc's for  $f(\text{slab})$  so I can see what values BRASS uses to get  $f(\text{slab})$ .

Shannon W. Moore, P.E.

Resubmit 6-12-02

FROM:bgoodrich DATE:Thursday, June 13, 2002 12:32:11 PM

I attached a spreadsheet illustrating the slab stress computations (Incident3754.xls). It is a copy of the originally submitted spreadsheet with a sheet named "BRASS". For clarification, BRASS uses positive properties when the moment for a stage is positive and the negative properties when the moment for a stage is negative. Therefore, the stage 2 moment yields a compressive stress in the slab, while the stage 3 moment yields a tensile stress in the slab. Also, I believe the original spreadsheet is double-accounting for the modular ratio when computing the slab stress. The BRASS section modulus is computed as  $S = n \cdot I/c$ . Then, the slab stress is computed as  $f = M/S = (M \cdot c/I)/n$ . So, the modular ratio is already considered.

### Description

FROM:gbarnhill DATE:Thursday, June 13, 2002 11:22:55 AM

I was looking into some of the messages in the LFD analysis log file and stumbled across this.

I did an LFD analysis of a member alt. Selected BRIDGE-OUTPUT from the menu to bring up the window of the output file tree. The LOG FILE was not available on the tree. I checked the folder on my drive and found the file in the proper place with the other LFD output files. I checked another member alt in a different superstructure definition in the same bridge workspace. That log file appeared in the tree. I discovered that by REDUCING the number of characters in the name of the first superstructure definition, the LOG FILE appeared in the tree. I also discovered that by ADDING a dash "-" or decimal "." to the first sup def name, the LOG FILE also appeared.

I've attached the bbd file for release 4.1.1.

(I checked the same database in 4.2.0 beta 1 and get the same results.)

Here's a brief synopsis of which names do and don't work.

2 span plate HPS 5 @ 3000 FIRST SUPR DEF NAME THAT DIDN'T WORK.  
2 span NU1800 5 @ 2900 2ND SUPR DEF NAME THAT DID WORK.  
zyx2 span NU1800 5 @ 2900 2ND SUPR DEF NAME REVISED & DIDN'T WORK.  
z-yx2 span NU1800 5 @ 2900 2ND SUPR DEF NAME REVISED & DID WORK.

each page are also copied. I am not sure is there any method I can use to copy only the content without page break?  
thanks.

FROM:jihnat DATE:6/20/2002 7:49:43 AM

You can generate the reports without page breaks. Just be sure "Begin each topic on a new page when printed" is not checked. It is checked by default.

FROM:hxu DATE:Thursday, June 20, 2002 9:09:16 AM

Are you talking about the function in "report tool", I tried that, but the format did not change in "BRASS\_LFD" "OUTPUT FILE". the analysis report, I am talking about, is not generated by using "Generate" icon in "report tool" window. The output file I am talking about can be reviewed by "view latest analysis output" (the icon of a glasses). Do you have experience on that? thanks.

| 3805.11550 | Resolved      | Can Virtis run the rating for Prestressed Concrete Slab Bridge? |

### Description

FROM:bgoodrich DATE:Wednesday, June 26, 2002 2:34:55 PM

Entered for Ming (Ken) Teng:

I ran special trucks (attached file - special; trucks.doc) and I got wired results (attached file - special; trucks.doc). One shows a rating value but another one shows ZERO. I know (trial-error) that it may be contraflexure problem. I change my splice location a little bit, and it works for both cases. But I do NOT have this situation for version 4.1.0, and I just updated my Virtis yesterday. Is there something new for contraflexure locations for version 4.1.1?

FROM:bgoodrich DATE:Wednesday, June 26, 2002 2:43:50 PM

I investigated this issue and found that there is a bug in BRASS. The load shedding factor is incorrectly computed for composite sections at or near contraflexure loads for certain live loads. I have forwarded this issue to Dan Glandt to correct.

The work-around for now is to change the POI Control option in the member alternative engine properties to option 5. Then add points of interest to Virtis for the points you wish to rate. But, leave out the Span 1 - 80% point as this is the point at which the BRASS bug occurs.

FROM:bgoodrich DATE:Thursday, June 27, 2002 10:42:23 AM

E-mail from Ken Teng (6/27/02):

Not sure what you meant. If leave out the Span 1 - 80% point, everything will be OK (a non-zero rating factors). Why I need to set "POI Control option in the member alternative engine properties to option 5. Then add points of interest to Virtis for the points you wish to rate"?

But the wired thing is if you copy B2 into B1 and run Span 1 - 82%, which BRASS bug occurs in B2,

4/19/2016 3:02:59 PM

HRS AASHTO

231

## Complete Issue Information

you will find that this bug does not bother B1 at all (no matter what % you input). The only issue it bothers B1 is the rating factor is smaller than B2 which is not allowed (please set the Span 1 - 80% on both B1 and B2, and set/compute B1 Live Load Dist, and then run).

Could you also please investigate this two issues - why the bug does not bother B1, and why rating factors B2>B1?

FROM:bgoodrich DATE:Thursday, June 27, 2002 10:42:57 AM

The reason I suggested adding you own points of interest is because the Span 1 - 80% point is giving an incorrect rating of zero. By adding only those you want to rate, you eliminate the problem point at Span 1 - 80%. Moving the contraflexure location changes the generation of the STEEL-GIRDER-CONTROL command, which is used to indicate the type of bending (positive or negative) at a section. This may be why the rating changed from zero to a non-zero.

Regarding copying B2 to B1, the dead loads and live load distribution factors are different for B1. The Rb (load shedding) factor is dependent on Dc (depth of web in compression), which is in turn dependent on the superposition of stresses from each stage. In short, the 480k overload did not cause any problems in B1, but it did on B2 because of the stresses induced.

Even after I changed the contraflexure location from 82% to 80%, the ratings for B1 were almost identical to (0.670 vs. 0.671).

Dan and I are investigating this issue further. We will let you know when we have more information and when a patch will be available.

FROM:bgoodrich DATE:Thursday, June 27, 2002 11:07:54 AM

E-mail from Ken Teng (6/27/02):

I think you missed one of my questions.

I agree with "Even after I changed the contraflexure location from 82% to 80%, the ratings for B1 were almost identical to (0.670 vs. 0.671).", but the B2 (for 80% and 480k overload) is around 0.74 which is not allowed (AASHTO 3.23.2.3.1.4). Why?

FROM:bgoodrich DATE:Thursday, June 27, 2002 11:08:19 AM

I reviewed your bridge input and found you assigned your parapets to the DC1 load case, which is applied in stage 1 (non-composite). I believe the parapets should be assigned to the DC2 load case (stage 2). If this is done, the critical rating factor for the exterior girder is more than the interior girder, which satisfies AASHTO 3.23.2.3.1.4. Note that I had to change the contraflexure locations to 80% for both B1 and B2 to get a rating.

FROM:bgoodrich DATE:Friday, June 28, 2002 12:38:11 AM

Dan Glandt has corrected the zero rating issue in the development version of BRASS-GIRDER 5.8.6, which will be released sometime after Virtis 4.2.

### Description

FROM:hxu DATE:Wednesday, July 03, 2002 3:17:43 PM

I know Virtis can do the rating for regular concrete slab bridge. I am not sure if Virtis can do rating for a simple span prestressed concrete slab bridge?

thanks.

FROM:kkennelly DATE:7/8/2002 8:04:27 AM

Try entering your prestressed beam as a box beam with circular voids and enter the number of voids = 0. Also enter the diameter of the void and distance from the center of the void to the bottom of the beam as zero.

Description

FROM:bgoodrich DATE:Monday, July 08, 2002 12:58:07 PM

Entered for Brian Boucher (6/24/2002):

Attached is a Virtis bbd file for a plate girder bridge. Also attached are the shear/web stiffener comps as designed. If you can contact me as to whether BRASS has a bug in this respect or if it works fine.

FROM:bgoodrich DATE:Monday, July 08, 2002 1:03:00 PM

After reviewing the BBD file and BRASS output, I was able to determine that BRASS is using a form of Equation 10-26 to compute the allowable shear. The BRASS allowable is:  $F_v = C * F_y / 3$ . For BRASS to use the full Equation 10-26, the Tension field action flag must be set to account for combined shear and bending. This setting is located on the ASD tab of each Point of Interest window. Currently, the

## Complete Issue Information

BRASS export does not allow schedules and point of interest data to be passed to BRASS at the same time. This is only an export limitation, which we are working to address. Therefore, the only way to get the desired shear rating from BRASS/Virtis is to do the following:

1. Change the POI Control option (member alternative engine properties) to 0, which means no stiffener schedules will be generated, however, the POI you entered manually will be exported.
2. For each POI you have specified in Virtis:
  - A. Enter the necessary stiffener, lateral support, and diaphragm information by overriding the schedules.
  - B. Enter and select the appropriate ASD information.
  - C. Adjust the POI engine properties (particularly the Section Type). When POI Control option 5 was selected, the export generated code 41.

We (the developers) intend to enhance the export to allow both schedules and POI data to be exported to a BRASS data file, so I would continue to enter the various schedules as you have done for this bridge.

The issue of overriding the schedules is addressed in other incidents.

Description

FROM:hxu DATE:Friday, July 12, 2002 1:51:36 PM

I have a question about Virtis 4.1.1. I am rating a 3-span continuously steel girder with non-composite concrete deck bridge using BRASS ASD Engine. Since this is a continuous span bridge. My question is do we need input the INV and OPR rating allowable stresses manually, it means we need use the formula shown in Table 6.6.2.1-1 to calculate the Fb (for case B, compression flange is partially supported or unsupported). I am not sure if Virtis will do that for us, or we need do that. Could you tell me how to deal with this case using Virtis?  
Thanks in advance.

FROM:bgoodrich DATE:Monday, July 22, 2002 11:48:32 AM

If you leave the allowable stress ratios blank for structural steel in Virtis, the BRASS defaults will be used, which are 0.55 and 0.75 for Inventory and Operating, respectively. Therefore, you will need to calculate Fb from the equation, determine the stress ratio (Fb/Fy), and manually input the ratio if it is less than 0.55 (Inventory) or 0.75 (Operating).

FROM:kkennelly DATE:7/22/2002 1:59:32 PM

Can't this Fb value vary along the length of the beam? Shouldn't BRASS be able to compute this Fb?

### Description

FROM:smample DATE:Friday, July 26, 2002 12:04:03 PM

I am having problems with the moment capacity based on 90% yield stress in extreme tension row of strands. When I input a value on the "Point-of-Interest Properties: Miscellaneous (P/S)" tab, the PRESTRESS-2 line is not generated in the BRASS file.

Also, when I run the analysis and select on the "Point-of-Interest Properties: Miscellaneous (P/S)" to not override the Moment Capacity (Based on 90% Yield Stress) I always get "N/A" for this condition in the output report. Why doesn't BRASS produce a rating factor for this condition?

FROM:bgoodrich DATE:Tuesday, August 13, 2002 1:17:42 PM

The export currently does not generate both schedule commands and point of interest commands to BRASS. This issue should be addressed in a future release. Incident 3062 is similar to this incident.

FROM: snshah DATE: Friday, August 02, 2002 9:29:07 AM

Complete Issue Information

In rating some of our ramp structures I have noticed a possible problem with the way Virtis calculates distribution factors for structures rated in girder system. Virtis calculates single lane distribution factors for clear roadway width less than 20' (per current AASHTO design specs.). Existing structures with clear roadway width between 18' and 20' should be loaded with two design lanes (per AASHTO Manual for Condition Evaluation of Bridges 6.7.2.2) therefore the Multi lane distribution factor should be used in the rating. Shouldn't Virtis calculate the multi lane distribution factors for structures with clear roadway width of 18' to 20'? Currently we have to calculate them by hand and go back and put them in manually.

William J. Metcalf  
LADOTD - Bridge Rating Unit

FROM:jduray DATE:8/12/02 9:51:10 AM

FROM:kkennelly DATE:8/12/2002 11:06:08 AM

We will need to add an option to the Live Load Distribution Factors window to compute the dist factors based on either the Standard Specs or the Manual for Condition Evaluation. The Help for this window currently states that Virtis uses the "Standard Specs" for computing dist factors using the Compute button.

### Description

FROM:hxu DATE:Wednesday, August 07, 2002 3:09:00 PM

I am having two questions about virtis,

1. I am confused about the live load distribution factor which Virtis used for rating. I input different live load distribution factors for moment, shear and end shear. But after checking the output file, I found Virtis picked the distribution factor for moment for shear rating. Do you know how can we let Virtis use different distribution factors for shear and moment?

4/19/2016 3:03:01 PM

HRS AASHTO

242

Complete Issue Information

2. The bridge I am rating has a very wierd geometry, none of girders are not parallel each other, the two supports have different skews. BTW, it is steel plate girders with composite concrete deck. I guess, the girder-line method is better for this bridge than girder system, how do you think? at the same time, the distribution factor and effective deck width varies through the span. so I am not sure can Virtis handle a case like this, and if it can, what is the best way to do it?  
thank you so much!

FROM:kkennelly DATE:8/12/2002 10:49:14 AM

1. The BRASS LFD program currently only uses one distribution factor for both shear and moment. If you open the Virtis help file for the Live Load Distribution Factor window you will see a link called "Engine Related Help". This link will open the engine related help that tells you what BRASS LFD will do with the data on this window. Each Virtis window help topic has such a link. (Incident 3058 was submitted by a user requesting that the BRASS LFD program be changed to use a shear dist factor instead of using the moment shear factor)

2. You can enter such a bridge into Virtis however, the export to the BRASS LFD program does not handle such a structure. You should enter such a structure as a girder line. Virtis help has a topic titled "Limitations" that lists the limitations in Virtis. This topic also has an Engine Related Help link that lists the limitations of BRASS. That engine related help topic states that splayed girders are not supported.

Description

FROM:bgoodrich DATE:Tuesday, August 13, 2002 12:38:49 PM  
E-mail from Ken Teng (8/12/02):

My questions are below:

1. Why 'Lambda' is 12500 instead of 15400 (AASHTO 10.48.4.1)?
2. Why do two Dc be checked with two different values (one is 21.265 - 'Stage III' and another one is 19.54 - 'x-bar computation')?
3. What is 'f\_comp(used for braced sect)'? Could you give me more detailed info about it?

Dan and I reviewed his BRASS output at the user group meeting and Item 1 is definitely a bug. We believe Item 2 has been addressed in the development version of BRASS-GIRDER, but we will check just to make sure.

FROM:bgoodrich DATE:Tuesday, August 13, 2002 12:44:30 PM  
I have forwarded this issue to WYDOT to assign BridgeTech a work order.

FROM:bgoodrich DATE:Thursday, August 29, 2002 11:22:39 AM  
WYDOT assigned this issue to BRASS Problem Log #362.

FROM:bgoodrich DATE:Tuesday, October 22, 2002 4:24:40 PM  
From Dan Glandt:

Attached is the output file for your data set, GIRDER\_\_2\_(EBL).dat ran on the alpha version for the next release. I think this may clarify the output for several of your questions.

Specifically, lambda is 12500 because Dc is greater than D/2. Now there is only one calculation of Dc for a composite girder. F\_comp(used for braced section) is fb.

FROM:bgoodrich DATE:Tuesday, October 22, 2002 4:30:40 PM  
Ken's questions were answered. The next BRASS release will have enhanced output. Fixed for Virtis Version 5.0.

### Description

FROM:bgoodrich DATE:Tuesday, August 13, 2002 12:47:38 PM  
E-mail from Ken Teng (8/12/02):

There shows a lower rating value for a PS bridge w/ rebars in deck for Land Loading. Attached is the bbd file and result file. Please see beam #2.

FROM:bgoodrich DATE:Tuesday, August 13, 2002 12:49:03 PM  
I have forwarded this issue to WYDOT to assign BridgeTech a work order.

FROM:bgoodrich DATE:Thursday, August 29, 2002 11:24:15 AM  
WYDOT assigned this issue to BRASS Problem Log #363.

FROM:bgoodrich DATE:Tuesday, October 15, 2002 11:29:17 AM  
From Dan Glandt:

I have reviewed this problem from Ken Teng. The data set works better on the current beta version, but has produces some "NaN's so there are some issues that need resolved. We may need to add a warning or an error as well. Ken has tried to rate an I beam prestressed girder three span, simple span for dead load, continuous for live load. All the strands are straight.

He ran it without deck rebar and with deck rebar. The data set without rebar in not realistic as then it is

4/19/2016 3:03:02 PM

HRS AASHTO

245

Complete Issue Information

just 3 simple spans. It should have rated 0 for neg moment. In 5.8.5, it prints a warning that there is no tension steel and that the rating for negative moment will govern. However, the 0.0 rating didn't carry through to the summary for some reason. In 5.8.6 it does and gives a zero rating which is correct. I'm thinking that if it is continuous for live load, we should probably output an error and stop if there is no deck rebar.

FROM:bgoodrich DATE:Monday, November 04, 2002 1:03:45 PM  
Dan Glandt has addressed this issue. A conditional statement that outputs an error message when inputting deck reinforcement was corrected. Fixed for Version 5.0.

Description

FROM:dkoenig DATE:Thursday, August 15, 2002 1:32:11 PM  
We have found a peculiar thing going on with the plate girder schematic. We have a four span bridge that has hinges in the outer spans near the intermediate piers. The outer spans are 27" girders and the inner spans are 44" girders. When we put in the web, it gives us a message about the tolerance between the web dimensions being to great. I believe that this happens because the program wasn't modeled for the situation of having abrupt web depth changes instead of linear or parabolic changes. Whenever we view the schematic for G2 in the attached file, it draws a straight line from the first web range end point to the beginning of the third web range. This only happens at the beginning of the

Complete Issue Information

bridge. On the other end of the bridge this is not happening (note that the bridge is symmetrical). If we go in and insert a section with small length (ie. .0001), this problem with the schematic goes away (see G3). There appears to be some type of bug in the schematic in relation to how it interprets the data on G2 since it is not consistent on both ends of the girder. Also, the program needs to allow for the situation where you can have abrupt changes in web depth.

| 3854.11501 | Suspended     | Transverse Stiffener Wizard - input multiple groups of equal spacing |

## Description

FROM:dkoenig DATE:Thursday, August 15, 2002 1:48:07 PM

The current diaphragm wizard is basically worthless if you don't have the same spacing within a span. We would like to see the diaphragm wizard enhanced to allow the user the option of inputting multiple groups of equal spacing along a girder. For example, we would like to be able to input 5 spaces at 20', 4 spaces at 15', 5 spaces at 18', etc. and have the program apply the spacing and determine the proper locations. Having this would mean that the wizard would apply to most situations encountered versus only working for occasional situations. Most of our continuous steel bridges will not have the same diaphragm spacing throughout a given span. This makes the wizard unusable for us.

Description

FROM:dkoenig DATE:Thursday, August 15, 2002 2:33:59 PM

We would like to see a wizard developed for input of transverse stiffeners on plate girders. We would like to see it have the same functionality as the diaphragm wizard with the changes we have proposed in the previous incident. Example: be able to input multiple groups of stiffeners along the length of a girder.

Description

FROM:dkoenig DATE:Thursday, August 15, 2002 2:36:13 PM

We would like to see a wizard developed to input stirrups on prestressed concrete and reinforced concrete bridges. The wizard should allow for the input of multiple groups of stirrups at constant spacing along the length of a girder. This would have the same functionality as the transverse stiffener wizard mentioned in the previous incident. Having a wizard would make the input of stirrups go a lot quicker. At the present time, this is probably the most tedious and difficult part of a structure to enter.

FROM:dkoenig DATE:Thursday, August 30, 2007 3:45:19 PM

I have attached the files that I presentated at the 2007 Users Group Meeting.

FROM:dkoenig DATE:Thursday, August 30, 2007 3:58:13 PM

Ignore the first three files. I put them on the wrong incident.

FROM: Herman Lee DATE: 10/13/2009 1:15:29 PM Eastern Daylight Time

Resolved in 6.1 Release.

### Description

FROM:mteng DATE:Thursday, August 15, 2002 2:52:04 PM

My question is that one of my Operating rating results is zero (the Inv. is not zero). Could you explain this for me? Please see attached files. Thank you so much!

I email to Krisha, and below is the answer I got:

"I created a point of interest at the 10% point of span 1 to determine why you are getting a zero operating rating. The BRASS output shows a negative moment capacity at that point for the H20 vehicle in Load Level 3. That appears to be an error to me. Please enter your problem as an incident on the Support Center website so Wyoming DOT is notified of the problem."

FROM:mteng DATE:Thursday, August 15, 2002 2:55:49 PM

FROM:bgoodrich DATE:Friday, August 16, 2002 11:28:11 AM

I have forwarded this issue to WYDOT for assignment to a BRASS Problem Log.

FROM:bgoodrich DATE:Thursday, August 29, 2002 10:50:30 AM

WYDOT assigned this issue to BRASS Problem Log #365.

Description

FROM:tleatherwood DATE:Saturday, August 17, 2002 2:59:48 PM

Permit vehicle analysis is an important function of the Virtis System. Many States have documented sharply increased demand for overweight permits. Many of these vehicles are heavy enough to require a detailed analysis with a bridge rating program such as Virtis.

However, each State has a different set of rules and laws which govern the permit process. This makes it almost impossible for a single system to meet the needs of all the States. As a result, solutions from Bentley, CW Beilfuss, Cambridge Systematics, etc. plus various custom systems are used.

Virtis needs the ability to work with all these different systems. It needs the ability to receive truck configuration and routing information from an external system. Once the bridge analysis is complete, it needs to be able to pass the results back to the external system. As the Minnesota enhancement

## Complete Issue Information

shows, XML provides one method to accomplish this data sharing.

To be truly useful, the XML data feature must remain current with the analysis functions built into Virtis. As these functions are enhanced, the XML import/export tool needs to be enhanced as well.

For example, Virtis 5.0 will introduce the ability to handle multiple distribution factors and impact level. This will allow Virtis to analyse a permit request under several restriction levels.

The XML import/export feature needs to also be enhanced to support this feature. It should allow the multi-level analysis and allow multiple restriction levels to be exported to an external permit system. Other proposed enhancements also could be effected. For example, it has been proposed that Virtis might calculate custom distribution factors based upon the truck axle gage. If this enhancement is implemented, the XML feature should also be updated to support it.

Basically, I am proposing an enhancement to Virtis that continually seeks to keep the XML feature updated and consistent with any new Virtis function that could support the permit vehicle analysis process.

Note that I first suggested this enhancement at the 2002 Virtis/Opis/Brass User Group meeting. I was asked to formally submit the suggestion as a Virtis incident.

FROM:jduray DATE:8/25/2003 3:30:48 PM

Based on discussion with Ed Lutgen of MnDOT we are going to hold on this request until MnDOT has had an opportunity to review the permit restrictions enhancements in 5.0.1 and reassess their needs. Ed thought eventually we should just return all of the ratings so as to allow the calling program decide how to issue the permit.

### Description

FROM:hlee DATE:9/11/2002 8:39:15 AM

When using only Type 3S2 in rating, Live Load Actions report for Type 3S2 has only Axle type. (See attached 1Vehicle.bmp)

When using both Type3S2 and HS 20-44 in rating, Live Load Actions report for Type 3S2 has both Axle and Lane type. (See attached 2Vehicles.bmp)

FROM:kkennelly DATE:2/21/2003 3:15:46 PM

This combo box gets updated when the user changes the Live Load selection. Line 4676 in UiMemberResultsReportVw.cpp gets the Vehicle Type (lane or axle) from the results object for this vehicle and stage id. For some reason the results object has both Lane and Axle for the Type3S2 vehicle when the analysis also included an HS20 vehicle. The gui can't filter out the Lane type for this vehicle, I think it has to come from the results object.

For Ahmad Bahari

PS Beam Schematic, Horizontal Sear bars not being displayed properly.

In the attached .bbd file you will see that both the vertical and horizontal shear bars have identical spacing according to the PS-Shear Reinforcement Ranges windows. But when I view the schematic the horizontal shear bars are not displayed properly. Especially note that the ends of each span are correct, the beginning of all spans except span 1 are incorrect. They show a bar at the beginning of the span instead of 3 inches in like the vertical shear shows.

FROM:jduray DATE:Wednesday, October 02, 2002 5:55:50 AM

FROM:jihnath DATE:8/12/2005 4:00:50 PM  
For future testing, a version 5.3.1 BBD file is attached.  
Fixed for 5.4.0

Description

FROM:dkoenig DATE:Tuesday, October 01, 2002 5:25:54 PM

This is probably the same problem as the other incidents of this nature, but I thought I would submit it just incase it wasn't. On the attached bridge, I am getting zero ratings for inventory and operating at multiple points along the structure. I reviewed point 1.2 and noticed that it is coming up with a negative rating factor. My guess is that the summary is taking a negative rating factor and coding it as zero. At the 1.2, there shouldn't even be a negative rating factor or negative moment.

FROM:jduray DATE:Wednesday, October 02, 2002 5:54:06 AM

FROM:bgoodrich DATE:Tuesday, October 22, 2002 5:16:52 PM

Dan Glandt addressed issues related to negative rating factors in BRASS-GIRDER 5.8.6. Fixed for Virtis Version 5.0.

Complete Issue Information

FROM:bgoodrich DATE:Thursday, December 04, 2003 1:22:20 PM  
E-mail from David Koenig (12/4/03):

We have looked at the point of interest calculations for this structure. While looking at the point of interest calculations, we noticed that the stage 1 dead load stress was 37000+ psi which was above the yield of the girder. Because it was stage 1 loadings, we went back and looked at the girder properties for the wide flange girder. We found that the moment of inertia was incorrect for the girder at this cross section. The moment of inertia was 110 in^4 which was off by a factor of 10. My assumption all along was that we had copied the girders from the library. After finding this mistake, it appears that this girder was actually input by the user. I apologize for not having found this earlier. After making this correction, we are now able to get decent results on this structure. Go ahead and mark this incident as resolved. Thanks for your efforts on this matter.

## Complete Issue Information

The mockups do not currently contain a window for users to enter bearing stiffeners for floorbeams.

Bearing stiffeners for floorbeams could exist for the following conditions:

Floorbeam in a Girder-Floorbeam-Stringer or Girder-Floorbeam structure definition: Intermediate supports of floorbeam could have bearing stiffeners.

Floorbeam in a Floorbeam-Stringer structure definition: Any of the floorbeam supports could have a bearing stiffener. (This type of fb does not have intermediate supports.)

Changes required to add bearing stiffeners to floorbeams:

1. Floorbeam Definition window (GFS & GF structure type): Add a checkbox to indicate intermediate supports exist. Then the BWS tree could be built including the Bearing Stiffeners if intermediate supports exist.
2. Add bearing stiffener window. Window will use different domain objects depending on the type of structure it belongs to (GFS,GF structures will use intermediate supports and FS will use all supports).
3. Add db, dm, de and do for tables to store the bearing stiffeners. (not sure if we can use the bearing stiffeners we have now or if we need new tables since they will be referencing the intermediate supports)
4. Export and help

### Description

FROM:kkennelly DATE:10/17/2002 11:52:27 AM

For Floor System Floorbeam and Stringer Definitions, the user interface does not provide a way for users to specify elastic support conditions. Floor Line does allow entry of elastic support conditions for Stringers but not for Floorbeams.

The following is required to provide a way for users to enter elastic supports:

1. Add db,dm,de, and do for elastic supports to the BmDefIntermediateSupport and BmDefSupport objects.
2. Revise the Intermediate Support and Support windows to display the elastic support conditions.

Complete Issue Information

3. Export and help.

Description

FROM:dteal DATE:Thursday, October 17, 2002 2:41:04 PM

Is there a way to search my database for a specific NBI Structure ID or did I miss something?

The NBI number as you know is unique to each bridge. I have a bridge someplace in our database that has the wrong NBI number. It just so happens that we need to enter a new structure but the NBI number for this structure is already in use. How do I go about finding it?

FROM:jduray DATE:10/17/02 5:09:26 PM

Mehrdad - I think you are going to have to explain how to find it at the database level. I don't see anyway in Virtis to do it.

4/19/2016 3:03:06 PM

HRS AASHTO

265

Complete Issue Information

FROM:mordoobadi DATE:10/21/2002 4:00:20 PM  
Dean you can query the database to find your bridge:

```
SELECT * FROM abw_v_sql_bridge_group WHERE struct_num = 'Example7';
```

if you get any results from this SQL statement, the value listed as bridge\_id is the BID (virtis/opis bridge identification number) shown in the bridge explorer.

Once you find the BID of the bridge:

- (1) Open Virtis/Opis application and
- (2) Find and Open the bridge with the matching BID.
- (3) Go to bridge description window
- (4)
  - A) If the bridge is linked to Pontis:
    - A-1) Select BridgeWare Association button and reassign the bridge to be linked to another Pontis Bridge.
  - B) If the bridge is not linked to Pontis:
    - B-1) change the value for NBI Structure ID in the bridge description window.

FROM:dteal DATE:Tuesday, October 22, 2002 8:54:15 AM

This would mean that the only way to search on an NBI number is to get our computer services group, Oracle Database Administrator, involved? This is something that should be available within Virtis or at least by somebody with virtis administrator privileges?

FROM:mordoobadi DATE:11/5/2002 1:15:26 PM  
Yes there is no EASY way to do this in GUI yet.

FROM:dteal DATE:Monday, November 25, 2002 9:13:11 AM  
Are there plans to make this easier?

FROM:dteal DATE:Wednesday, January 15, 2003 8:10:54 AM  
Can we mark this as an enhancement request - Thanks, Dean

FROM:dteal DATE:Thursday, March 06, 2003 12:23:11 PM  
We had to search for an NBI number again - a user input the wrong number

FROM:dteal DATE:Wednesday, September 03, 2003 10:30:18 AM  
And it happened again - the NBI number is cumbersome. Input errors happen. We need this enhancement.

FROM:dteal DATE:Wednesday, October 27, 2004 7:58:48 AM  
Had to search for one again - the HARD way!

FROM:jihnat DATE:12/22/2005 1:50:18 PM  
Search by NBI Structure ID is implemented on the Find Bridge - Attribute Text window, for version 5.4.0 (Beta 4)

### Description

FROM:dteal DATE:Friday, October 25, 2002 8:54:00 AM

I have a structure that was created on Oct. 16, 2002 , and rated. When I look at Recent Rating Results from the toolbar menu it indicates that the last rating was on Sept 29, 1999 at 8:39 with me as being the rater, I wasn't.

I checked a good sampling in our database and found this date of Sept 29, 1999 at 8:39 with me as the rater to be on every bridge I checked, including the sample bridges provided?

FROM:dteal DATE:Friday, October 25, 2002 8:54:35 AM

The bad thing is - any current rating history dates are gone!

4/19/2016 3:03:06 PM

HRS AASHTO

268

Complete Issue Information

FROM:mordoobadi DATE:11/5/2002 10:22:40 AM

This option shows the latest rating results regardless of selected bridges in the grid. If you have rating results in memory they will be displayed, if not the saved rating results in the database will be displayed.

This means that last time you saved rating results (and did not delete them) on your database was Sept 29, 1999 at 8:39.

FROM:mordoobadi DATE:11/5/2002 10:30:54 AM

Krishna, maybe we need to describe in the help different ways the bridge rating results window is opened and what is displayed for each option.

I noticed there is no help for the checkbox "Show the most recent results only".

FROM:dteal DATE:Tuesday, November 05, 2002 2:28:14 PM

The database is giving rating results for bridges that where NEVER rated?? It has also overwritten current rating results with this date. If I ran a rating on a bridge today, it will give me a rating results history from 1999 for that bridge?? It didn't exist in 1999??

FROM:jduray DATE:11/8/02 11:58:06 AM

Mehrdad - please check into this immediately.

FROM:mordoobadi DATE:11/15/2002 9:39:14 AM

Dean could you please send me your database?

FROM:dteal DATE:Friday, November 15, 2002 12:06:11 PM

Database is attached

FROM:dteal DATE:Friday, November 15, 2002 2:38:55 PM

I couldn't attach the 5 meg zip file so I sent it by email to mordoobadi@mbakercorp.com

FROM:mordoobadi DATE:11/18/2002 2:55:11 PM

This is related to incident 3572. As indicted in the incident 3572 if there are bridges that have names with lengths greater than 24 characters the "Rating Results", "Recent Rating Results" Do Not work properly.

I imported Dean's database into an Oracle database and made all bridge names shorter than 25 characters. The recent rating results now returns this:

|                     |                         |       |       |     |     |   |   |                       |

15:44:49 Bridge6  
061-098 2 K Type 3 1.329 1.887 LFD LFD 0 1 Friday, July 19, 2002  
15:44:49 Bridge6

which seems right.

You have two options:

(1) Wait until you move to version 4.2.0

(2) Make bridge names in the database shorter by executing the following command in SQL\*Plus:

```
UPDATE abw_overflow SET STRUCNAME = SUBSTR(STRUCNAME,1, 24) ;
```

After doing this there is still an issue with bridges that have Single Quote character ' in their BRIDGE\_ID. When you open "Manage Analysis Events" window for such bridges no results would show up in the window although there are results stored in the database. This issue is not addressed in version 4.2 yet. If you want to fix it you can replace all occurrences of single quote in BRIDGE\_ID with another character by executing a SQL script like this:

```
UPDATE abw_overflow SET BRIDGE_ID = REPLACE(BRIDGE_ID, "'", '_');
```

The above command replaces the single quotes with underscore "\_" characters.

FROM:mordoobadi DATE:11/18/2002 4:32:32 PM

FROM:dteal DATE:Tuesday, November 19, 2002 10:01:49 AM

If I read this right, when migrating to version 4.2 this problem will go away. Is that correct?

We are very close to moving to 4.2 - it's been an internal (KDOT) thing with our computer services that has held us up.

FROM:jduray DATE:11/19/02 12:48:54 PM

Yes, except for the single quotes in the bridge id which is causing a problem with viewing events in the "Manage Analysis Events" window.

Email from Dean:

The best solution for all is to live with it for now. I have already fixed the one bridge with the single quotes. So it appears that migrating to 4.2 will solve the rest of our problems.

-----end of Dean's email-----

FROM:mordoobadi DATE:11/19/2002 3:09:57 PM

The problem with single quotes in BRIDGE\_ID is resolved in version 5.0. (Alpha 3)

### Description

FROM:dteal DATE:Thursday, October 31, 2002 8:55:37 AM  
For Michell LaRoche, P.E.

With the attached .bbd, member 2, member Alt 1600 mm web, Stage III, LL 1.

In the BRASS output Line 4913 the member is listed as "COMPACT" and on Line 5974 the same member is listed as "NON-COMPACT". I don't think we can have it both ways?? The BRASS output has been included with the .bbd file.

FROM:bgoodrich DATE:Friday, November 01, 2002 10:32:45 AM  
I reviewed the output and noted the following. The section is compact for positive flexure and non-compact for negative flexure.

Complete Issue Information

FROM:dteal DATE:Friday, November 01, 2002 3:09:44 PM

In the BRASS Output where compact or non-compact is determined I am assuming that Maximum Actions means Positive Flexure and Minimum Actions means Negative Flexure. So in my example output I understand that for Positive Flexure it is compact and for Negative Flexure it is non-compact.

My question has to do with when BRASS does the calculations for Shear Resistance. Under Max Actions (Pos. Flex) the question "Is Section Compact" is answered correctly with YES. When I look at Min. Actions (Neg. Flex) the question "Is Section Compact" is answered with a YES which I thought should be answered NO since the previous calculations determined the section to be non-compact for Min Actions (Neg. Flex).

FROM:bgoodrich DATE:Friday, November 01, 2002 4:53:25 PM

BRASS determines compactness for the shear computations by determining the factored moment (from maximum and minimum actions) with greatest magnitude. The compactness code corresponding to the factored moment with the greater magnitude is utilized and reported. This is why the compactness is shown as compact for both maximum and minimum shear computations, which is separate from maximum and minimum moment computations. What do you think BRASS should be using for the compactness codes in question?

FROM:dteal DATE:Monday, November 04, 2002 1:39:03 PM

Thank you for your explanation of how BRASS determines compactness for the shear computations. I understand that by determining the factored moment with the greatest magnitude defines the positive and negative moment areas which in turn defines the compactness requirements for the shear calculations by using the controlling section. I just got confused comparing the Maximum and Minimum (Positive and Negative) Actions from the moment to the shear computations. I think what BRASS does makes sense.

FROM:bgoodrich DATE:Monday, November 04, 2002 1:40:56 PM

Marked as Accepted on 11/4/02.

### Description

FROM:dteal DATE:Friday, November 01, 2002 2:39:20 PM

See the attached .bbd, Member #2 and BRASS Output line #80. The Virtis Opis input doesn't have a deck on it (non-composite). The BRASS input on line #80 shows parameter #4 for composite instead of parameter #3 for non-composite. Can this be explained?

FROM:bgoodrich DATE:Tuesday, November 05, 2002 9:26:01 AM

On the Generic tab of the Structure Typical Section window, there are railings assigned to the DC2 load case, which is applied to the composite (long-term) stage. Therefore, the export generates the ANALYSIS command with the sequence type of 4, rather than 3. This sequence (4) only indicates that the structure will be analyzed by BRASS in three stages rather than one. The sequence code itself does not make the steel beam composite. A slab or rebar must be present on the XSECT-C or XSECT-G commands, respectively, to be considered composite.

For this structure, I think the way you have defined it in Virtis is fine because the deck is applied to the girder by the tributary area method and the railings are uniformly distributed to all girders, as specified in the DL Distribution tab of the Superstructure Loads window.

Error No.: 1308  
Type : Input Error  
Location : uwmain.for

\*\*\*\*ERROR\*\*\*\* A tapered load was input that does not start or stop at a node point.  
See page 13.6. Program stopped

=====

E-mail from Brian Goodrich:

You may need to place a point of interest or cross section change point at the locations where the tapered load starts and stops. I printed the corresponding help command to a PDF file, which is attached. This topic is identical to the manual page in content.

E-mail from Brian McCaffrey:

Thanks for the help file - I found it under the BRASS help file also that came with Virtis. Maybe the error message should refer to the help file not the manual. Anyway, I had POI's at all the points as the help file says but I still got the error. It turns out that one of my POI's was within .1' of a 10th point - the error message never said that. After moving the POI's around a few inches it worked fine.

E-mail from Brian Goodrich:

Brian McCaffrey makes a point of how error messages that refer to a specific BRASS command manual page are difficult to find in the command help file. Should the programs be referencing commands or chapters rather than manual pages specifically? This would help users who only have access to the on-line help, specifically Virtis users.

FROM:jduray DATE:11/4/02 1:27:12 PM  
Sounds like a good idea to me.

FROM:bgoodrich DATE:Monday, November 04, 2002 1:43:18 PM  
WYDOT assigned this issue to BRASS Problem Log 379.

FROM:bgoodrich DATE:Monday, November 11, 2002 10:27:26 AM  
The tapered load message issue from above has been addressed for Virtis Version 5.0. There are other messages within the BRASS engine that should be addressed in a similar manner. However, WYDOT has not authorized this work. The incident status has been set to Suspended for this reason.

### Description

FROM:bgoodrich DATE:Friday, November 01, 2002 5:30:54 PM  
 Entered for Ron Pierce:

Ron was not aware that the stress limits and corresponding schedule input in Virtis are not utilized by BRASS-GIRDER. The ASD stress limits must be set using the ASD Factors section of the Factors tab of the Member Alternative Description window. Ron would like some way to set some global defaults for these factors. Arizona DOT uses 3\*SQRT(f\*c) for the tensile stress limit rather than the BRASS

4/19/2016 3:03:08 PM

HRS AASHTO

276

Complete Issue Information

default of 6\*SQRT(f\*c). They have 500+ bridges that they may have to change. Could these be added to the System Defaults window (Bridge Workspace tab - PS Values section)?

A more elegant solution might be to enhance BRASS-GIRDER to utilize the stress limit schedule as specified in Virtis.

FROM:jduray DATE:11/4/02 1:24:46 PM

It seems to me that BRASS should be enhanced if the factors are already available within Virtis.

FROM:bgoodrich DATE:Monday, November 04, 2002 1:44:17 PM

Jim - Even if the P/S stress limits were implemented in BRASS, the overall issue of ASD factor defaults still remains for steel and R/C structures.

FROM:bgoodrich DATE:Monday, November 04, 2002 1:44:17 PM

FYI WYDOT: The ASD factors are utilized by BRASS in the service level ratings as part of an LFD rating. Within Virtis, the concrete stress limits are set as stresses, not ratios. Each group of stress limits is then assigned to one or more regions along the length of the girder. This method was implemented in BRASS-GIRDER(LRFD). See the CONC-STLIM-GROUP and CONC-STLIM-SCHEDULE commands.

### Description

FROM:snshah DATE:Thursday, November 14, 2002 1:20:23 PM

Dear Mr. Shah

Can this be confirmed or denied

William j. Metcalf

I have researched the discrepancy in serviceability ratings between BARS and VIRTIS. Specifically, for structure #048172, based on the BARS and VIRTIS program documentations and manual

4/19/2016 3:03:08 PM

HRS AASHTO

279

## Complete Issue Information

verification of the relevant computer outputs. It is evident that each program implements different design approach in computation and application of the section properties in conjunction with the stress computations. The differences are:

### 1) Noncomposite Section Properties:

Bars --> Section properties are based on the "transformed" section that takes into account a difference in a modulus of elasticity (E) between steel and concrete.

Virtis --> Section properties are based on the beam's shape, exclusively.

### 2) Composite Section Properties:

Bars -> Composite section properties based on "n" and "3n" are used in stress calculations for the live load and superimposed dead load, respectively.

Virtis -> Composite section properties based on "n" are used in stress calculations for both, live load and superimposed dead load.

The program differences described above amount to 3.4 tons discrepancy in inventory ratings for HS vehicle (32.1 tons per BARS vs 28.7 tons per Virtis).

It is evident that several of our structures are falling into this category and this is the explanation for the lower ratings on those structures.

If you have any questions please call me.

Emmanuel D. Plakotos E.I.  
Civil Engineer  
Buchart Horn, Inc.  
3330 West Esplanade Ave. Suite 201

fax 504-831-2981  
email: eplakotos@bh-ba.com

FROM: bgoodrich DATE: Thursday, January 23, 2003 3:40:21 PM

I spoke with Mr. Plakotos on the phone and established that the structure in question is a prestress concrete bridge, not steel as originally thought. Therefore, both his statements are correct regarding BRASS. 1) BRASS uses gross section properties for the non-composite stage. 2) BRASS uses the "1n" section properties for both superimposed dead load and live load, i.e., BRASS does not consider a "3n" or "2n" stage for prestress structures.

Mr. Plakotos indicated that this issue is of concern because the ratings for some of the bridges he is rating are on the border between success and failure depending on how the dead load stresses are computed.

I have changed the Category from a bug to an enhancement. Considering an additional composite stage in BRASS would require a fair amount of work. This issue has been forwarded to WYDOT.

 When trying to do a LRF design review on Member #2 of the attached .bbd file I get the following error.

Error converting Virtis/Opis steel cross sections or schedules to 'general' cross sections!  
 01:08:13 PM - Line 3578 in source file D:\Virtis\GUI\abxbrass\EngineExport.cpp.

Unknown exception in the Analysis Module.  
 01:08:13 PM - Line 3577 in source file D:\Virtis\GUI\abxbrass\EngineExport.cpp.

Complete Issue Information

What does it mean and how do I correct it?

FROM:dteal DATE:Thursday, November 14, 2002 3:03:45 PM

As near as I can tell, Member 1 and Member 2 have the same steel beams. Member one runs and member 2 doesn't?

FROM:kkennelly DATE:11/15/2002 12:53:42 PM

Member 1 and Member 2 are different due to the different deck reinforcement schedules. There is a problem in the way the domain generates the cross sections for BRASS. Since BRASS is limited in the number of cross sections a user can input, the domain looks for duplicate cross sections and deletes the duplicates so BRASS gets a smaller number of cross sections. The domain is having a problem deleting these duplicates and the problem involves the cross sections starting at 2.55 and ending at 4.55 m.

I tried migrating your bridge to 4.2 and that doesn't solve the problem.

You can try this workaround to get this member to run while we fix this problem:

Trick the program into thinking the range between 2.55 and 4.55 is unique. Do this by:

1. Create a copy of your concrete material (Grade 30...). Make sure the copy material has a different name than your original concrete material.

2. In the Deck Profile window for member G2, create 3 ranges for your deck concrete as follows:

| Concrete Material | Start | Length |
|-------------------|-------|--------|
| Grade 30          | 0.0   | 2.55   |
| Copy of Grade 30  | 2.55  | 2.00   |
| Grade 30          | 4.55  | 56.95  |

FROM:dteal DATE:Monday, November 18, 2002 8:30:25 AM

I tried the suggested workaround - it made no difference. I get the same error.

FROM:kkennelly DATE:11/18/2002 2:23:18 PM

Can you attach the bbd file of the bridge after you made the change?

FROM:dteal DATE:Tuesday, November 19, 2002 9:58:55 AM

I attached the file as Incident 3991.bbd.

I don't need a workaround, I changed the bar pattern instead. I guess we just need a fix hopefully for the next release.

FROM:kkennelly DATE:1/21/2003 9:05:05 AM

### Description

FROM:dteal DATE:Friday, November 15, 2002 2:36:38 PM

Can you provide a definition that explains the difference between Failed and Not Satisfied in the Spec Checker?

FROM:bgoodrich DATE:Wednesday, November 20, 2002 1:46:55 PM

From the Output Syntax topic of the BRASS-GIRDER(LRFD) Technical Manual:

#### Not Satisfied (NSAT)

The specification check is not satisfied. This term is used only for compactness checks for steel structures. This term implies that the specific specification check is not satisfied, but an alternative specification check may be used to satisfy the requirement.

#### Failed (FAIL)

The specification check is not satisfied and therefore fails.

The failed code is issued when there are no other alternatives for satisfying the specification.

FROM:dteal DATE:Thursday, November 21, 2002 9:50:01 AM

Below is a spec check from a PS girder run. Notice the last line states "Not Satisfied". The answer you gave me said that "Not Satisfied" ONLY comes up for compactness checks for steel structures???

PERFORMING AASHTO LRFD SPECIFICATION CHECKS - 5.8.3.5 Longitudinal Reinforcement

Point of Interest : 100.00

Construction Stage: 1

#### Input Parameters:

Mu = 0.000E+6 mm-N dv = 838.142 mm

Nu = 0.000 N phi f = 1.000

Vu = 172486.422 N phi a = 1.000

Vs = 4591476.000 N phi v = 0.900

Vp = 7012.677 N theta = 22.139 deg

4/19/2016 3:03:09 PM

HRS AASHTO

285

Complete Issue Information

Summary:

Mu Nu / Vu \

T = ----- + 0.5 ----- + | ----- - 0.5 Vs - Vp | cot(theta) [AASHTO LRFD 5.8.3.5-1]  
dv\*phi f phi a \ phi v /

Calculated Value: T = 218293.344 N

AASHTO Limit : T(Cap) = 213323.047 N (See Flexural Resistance)

Result Code: NSAT

Notes:

=> Vs exceeded Vu / phi v, so Vs = Vu / phi v was used to compute T.

=> A Result Code of NSAT indicates that this POI is within the distance to the critical section for shear and this check was Not Satisfied (probably due to partially developed reinforcement).

The Spec Check says "!5.8.3.5 Longitudinal Reinforcement Strength-IV N/A Not Satisfied"

FROM:bgoodrich DATE:Tuesday, January 28, 2003 3:31:02 PM

Track field marked as "Resubmit 11/21/02".

FROM:bgoodrich DATE:Tuesday, January 28, 2003 3:58:25 PM

From the note in the output:

"A Result Code of NSAT indicates that this POI is within the distance to the critical section for shear and this check was Not Satisfied (probably due to partially developed reinforcement)."

BRASS assumes that any longitudinal rebar is fully developed if input. So within the shear distance from a support, there may actually be more rebar that was not input. Therefore, this check is set to NSAT and it is left up to the engineer to determine if this check truly fails at a POI within the shear distance. This check is set to FAIL when the tensile force is not adequate and the POI is located outside the shear distance.

### Description

FROM:dteal DATE:Tuesday, November 19, 2002 1:08:16 PM

After repeated analysis runs we are getting warnings for low virtual memory. It appears that opis on an XP operating system is not freeing up the memory. I don't recall getting these warnings when KDOT was using NT 4.0. After the Low Virtual Memory warning, exiting opis takes a very long time. This is not an isolated case, I have several other designers experiencing the same thing.

My pc is a 2.4 Ghz with 512 Ram on Windows XP

FROM:jduray DATE:11/22/02 9:27:19 AM

We will investigate this when we support XP.

FROM:dteal DATE:Friday, November 22, 2002 11:50:07 AM

I was wrong above when I said we didn't have any NT problems.

Please look at Incident 3705 - this one was for NT. Will we be carrying over the memory problem from NT to XP?

In the attached 3 span welded plate – member 2 – HL-93 Design Review

At Pier #2 Rating Factor and Design Ratio computations indicate that the resistance was zero. Looking at AASHTO computations for 6.10.3.1.3 (Plastic Moment (Composite) Stage 3 says "WARNING: The iteration procedure failed to find a solution, so Mp was set to zero!".

What is the explanation for this?

FROM:dteal DATE:Thursday, January 16, 2003 10:05:37 AM  
Not fixed in 5.0.0 Beta 2

FROM:bgoodrich DATE:Monday, January 20, 2003 5:12:05 PM

4/19/2016 3:03:10 PM

HRS AASHTO

288

Complete Issue Information

The plastic moment iteration procedure failed to find a solution because the plastic neutral axis is near the bottom row of reinforcement when there are two rows. When the PNA is below the bottom rebar row, there is too much compressive force in the section. When the PNA is above the bottom rebar row, there is too much tensile force in the section. Therefore, when this condition is encountered, the rebar will be combined into a single equivalent row, for this procedure only. The output will show the original summary that failed followed by a successful summary. Fixed for Version 5.0 Beta 4.

|------------|---------------|---------------------------------------------------------------------|
| 4029.13316 | Duplicate     | rating values drop when add rebars in deck for prestressed concrete |

### Description

FROM:dteal DATE:Thursday, November 21, 2002 9:52:02 AM

The Shear Reinforcement Definition – Horizontal GUI is misleading. The help file for this GUI clearly shows Set 1 and Set 2 extending into the deck. The GUI only shows one set extending into the deck. I have several questions from designers about this GUI. For clarity the GUI should show the same image as the help file.

FROM:jduray DATE:4/8/2005 11:32:55 AM

Change the bitmap to show two like the help topic.

FROM:jihnat DATE:8/2/2005 10:57:15 AM

Done for 5.4.0

FROM:jihnat DATE:12/8/2005 7:15:37 AM

Track field Accepted.

Complete Issue Information

rebar in the slab (deck).

I found out this problem for steel bridge last year and you and Dan fixed it. Now it happens in prestressed bridges. Could you guys fix it quickly using the same way as fixed in steel bridges before?

Besides, I have debonding strands on the top and I know there is no way to do this kind of debonding in VIRTIS now. Do you have any better suggestions?

Please see attached files.

FROM:bgoodrich DATE:Friday, November 22, 2002 11:51:56 AM  
This issue is the same as Incident 3849, which has already been addressed.

Description

FROM:bgoodrich DATE:Thursday, November 21, 2002 2:52:31 PM  
E-mail from Seung-yeol Lee (Arizona DOT) (11/21/02):  
During the rating of a continuous prestress multi-box beam, I found that the fpe calculation for shear is

4/19/2016 3:03:11 PM

HRS AASHTO

293

Complete Issue Information

not zero (in ver 4.2), which suppose to be and used to be zero for negative moment region. It seems to give low rating for shear than it suold be.

I set the Requested field to "pyang" because he is also with ADOT.

FROM:bgoodrich DATE:Thursday, November 21, 2002 5:15:31 PM  
E-mail from Brian Goodrich (11/21/02) to S. Lee:

I investigated your prestress issue (Incident 4032) some more. I analyzed PCITrainingBridge5 from the Virtis sample database. For this bridge fpe is reported as zero for some points of interest. I placed points of interest at 0.5 ft intervals from the end of the beam. The export generated BRASS POIs at 109.86, 109.91, and 109.95. Only the 109.86 POI reports an fpe. The others compute the shear capacity as a reinforced concrete section. Points of interest from Span 2 reported both zero and non-zero fpe values. More investigation is necessary to determine what BRASS is doing for your bridge. WYDOT must review and approve the investigation of your request before any BRASS engine work can be performed.

FROM:jduray DATE:11/22/02 10:16:38 AM  
Are you going to discuss this with WyDOT?

FROM:bgoodrich DATE:Friday, November 22, 2002 12:41:28 PM  
I forwarded this issue to WYDOT yesterday and they assigned it to BRASS Problem Log 381.

FROM:bgoodrich DATE:Monday, January 20, 2003 5:01:41 PM  
Several improvements were made to the intermediate output, which helped. However, Seung-Yeol Lee is still questioning the process. Therefore, the dialogue with Mr. Lee is continuing.

FROM:bgoodrich DATE:Tuesday, March 25, 2003 8:56:02 AM  
This BRASS problem log was marked as "complete", so setting status to Resolved. Fixed for Version 5.0 release.

Description

FROM:bgoodrich DATE:Monday, December 02, 2002 10:56:14 AM  
 Entered for Seung-Yeol Lee (Arizona DOT) (contact is P. Yang):

I got an another problem in PS multi- and spread box type beam bridges.

The ASD rating for compression seems not to be correct according to the stresses Brass generating.

Could you check this out and get back to me.

4/19/2016 3:03:11 PM

HRS AASHTO

295

Complete Issue Information

I attached a bbd file and a statement of the problem (MathCAD).

FROM:bgoodrich DATE:Monday, December 02, 2002 11:01:33 AM  
I converted the MathCAD file to an RTF and attached it to this incident.

The AASHTO 9.15.2.2(b) rating seems to be incorrect.

FROM:bgoodrich DATE:Monday, January 20, 2003 5:04:18 PM  
Changes were made to the intermediate output and to the service load rating report to clarify the process. The modified output was reviewed by Seung-Yeol Lee, and he was satisfied.

Description

FROM:kobeidat DATE:Wednesday, December 04, 2002 8:14:41 AM

Hi

The program gives a value of My=0 incorrectly. It seems that the program assumes a value of zero for My if the section has yielded in the previous stage. My value shouldn't be affected by yielding of the section and should be based only on section properties. Let me know if you need more information or a copy of the input and output files.

Thanks

Description

FROM:wnajjar DATE:Wednesday, December 04, 2002 1:39:09 PM

We would appreciate your review of the attached export file G56-4.bbd by Virtis 4.4.1, specifically in regard to calculations of positive moment capacity of a three-span, pre-stressed concrete box girder, made continuous for live load.

At analysis point 202 the positive moment capacity is 0.1E-04 ft-kips, from page 77 of the output file for the attached file. At nearby analysis points 201 and 203, the positive moment capacities are 0.342345E+4 ft-kips and 0.113490E+4 ft-kips, respectively. The capacity at analysis point 202 should not be zero, because the girder section in that region is the same, except for some debonding of tendons. We assume that this problem has nothing to do with the location of inflection points.

FROM:bgoodrich DATE:Friday, January 24, 2003 6:15:26 PM

The version of BRASS-GIRDER (version 5.8.6) to be released with Virtis 5.0 does not give zero moment capacity at the 202 POI. It is now showing a capacity of 1134.9 ft-kips.

### Description

FROM:jcarney DATE:Tuesday, December 10, 2002 11:45:58 AM

The rating results that I am getting from Virtis are a bit lower at inventory stress level and a bit higher at operating stress level as compared to manual calculations. In reviewing the Virtis output, I noted that the DL and LL moments checked exactly with the hand calculations. However Virtis indicates that the inventory rating is governed by the concrete compressive stress at the top of the beam. Our manual calculations indicate tension in the bottom rebar governing at both inventory and operating stress levels with the concrete stress well within allowable stress (564psi<800psi) when the tension steel reaches its allowable stress of 18 ksi. Can you please review and let me know if there is a problem in the way Virtis is calculating the stresses or if there is a problem with the input. I am e-mailing the bdd file to Krisha.

Description

FROM: snsah DATE: Monday, December 16, 2002 11:25:40 AM

I noticed a problem with P/S structures when they import from bars. On the prestressed properties screen there is a field jacking stress ratio this should be .70 for SR strands and .75 for LR strands. There is another field for P/S transfer stress ratio this should be .63 for SR strands and .69 for LR strands. However I've noticed that on many structures that Virtis has put the jacking stress ratio value for both of these. This effects the rating approximately 2 tons. Is this due to an error in our bar data or and error in the import utility? I have include the bars file.

Complete Issue Information

FROM:hlee DATE:12/27/2002 11:21:36 AM

This is an error in the BarsImport utility. BarsImport has been revised according to AASHTO Standard Spec 9.16.2.1.2.

Fixed for 5.0 release.

FROM:hlee DATE:12/27/2002 2:05:35 PM

OK in BrassImport utility.

### Description

FROM:rmbest DATE:Wednesday, December 18, 2002 8:58:21 AM

The attached example is a 3 span WF composite bridge. We are running two cases, one with and one without future wearing surface. When we analyze without the FWS (by not assigning to load case) we are getting an inventory rating of zero, which is a program error. When we run the analysis with future wearing surface assigned to load case FWS then the result is reasonable. The problem seems to be related to the positioning of the point of contraflexure as we can also get a reasonable answers for both cases by moving the contraflexure point a few feet. There is obviously a bug in the VIRTIS/BRASS programs. We are using Virtis 4.1.1 and the LFD analysis was run on girder G2.

FROM:bgoodrich DATE:Tuesday, January 28, 2003 1:32:50 AM

I ran the bridge with the version of the BRASS-GIRDER engine that will be released with Version 5.0. BRASS now provides a non-zero rating that appears reasonable.

### Description

FROM:tthompson DATE:Friday, December 20, 2002 2:31:13 PM

I have a user that keeps getting an expired license - please notify AASHTO message when he attempts to log on. We have the unlimited Virtis/Opis license and have only installed that version.

It gave these 2 numbers:

258131707

8505372

Then it asks for 2 key values.

How can we get him going again? Or do we need to uninstall - reinstall.

FROM:jihnat DATE:12/20/2002 3:57:45 PM

I called Todd with new Registration Keys.

Not sure what caused this to expire prematurely, though.

FROM:tthompson DATE:Friday, December 20, 2002 4:15:04 PM

Those keys didn't work.

It's now showing:

### Description

FROM:dteal DATE:Tuesday, January 07, 2003 10:37:17 AM

When we migrated to 4.2 on our test server (before making it our production server) we had a problem. I had 2 folders in the explorer that where RED (BID's are placed in these folders automatically by the filtering/sorting criteria), we where not able to view the contents of these two folders.

The fix our DBA received from you deleted the folders???

Below is the line of communication our DBA has had with you up to the morning of 1/7/03.

Dean,

The problem with the folders in Virtis/Opis 4.2 on dt00mh41 has been corrected as per the instructions from Mehrdad at Michael Baker Jr., Inc. Let me know if there are any other problems. Thanks, Brian.

## Complete Issue Information

Brian,

Please do the following:

- 1- Login to the SQL Plus as the owner of Virtis/Opis database tables.
- 2- at the prompt type the following commands:  
set linesize 800;  
set pagesize 800;  
select GROUP\_ID, NAME, USE\_SQL\_IND, SQL\_TEXT from ABW\_GROUP WHERE ITEM\_TYPE = 22501 AND LOWER(SQL\_TEXT) LIKE '%design\_ind%';
- 3- If it returns any rows. The bridge folders with names returned by the above SELECT statement have problem. If step 3 returns any rows you need to delete the Bridge Folders corresponding to those rows (Bridge Folders with names that match the names returned by the SELECT statement above).

There are two ways you can do this (You might prefer to use the second approach)

(1) Using Virtis/Opis application:

Delete folders one by one:

- 1-a Select the folder that you want to delete
- 1-b Select Menu item Edit/Delete

(2) Using SQL code:

run the following SQL command.

```
DELETE FROM abw_group AG1 WHERE AG1.group_id IN (select AG2.GROUP_ID from ABW_GROUP AG2 WHERE AG2.ITEM_TYPE = 22501 AND LOWER(AG2.SQL_TEXT) LIKE '%design_ind%')
```

Regards,

>>> Jim Duray 01/06/03 04:50PM >>>  
Mehrdad

Call Brian regarding this problem after you have the deck rating stuff done.

Brian,

We are using version 4.1.1 on the production server until we get version 4.2 to run properly on the test server. As soon as version 4.2 is running properly and tested on the test server it will be moved to the production server. If it is not fixed this week (and verified) we can not begin using version 4.2 until after Jan. 17th or 20th at the earliest. I would like to get this up and running before I leave on Jan 12th.

Dean

Brian

How urgent is it that we investigate this problem? If possible I would like to check into this later this week or early next week. We are busy preparing for the start of beta testing for our next release. The testing begins next week and the person who would help you with this problem is very busy preparing for that testing. If you need help sooner I will try to work it in but since it is not a problem with a production database I suspect you can wait a few days.

Unless I hear otherwise from you we will wait until later this week or early next week to investigate.

Thanks  
Jim

Jim,

Hello, I'm one of our DBA's here at KDOT and am in need of your assistance. We have migrated to Virtis Opis version 4.2.0 in our test environment and we are receiving the following error messages when trying to open 2 of our folders ('2 PE - Design Phase' and '3 Template Bridges' - see attached). I'm confused since the source file DmBridgeList.cpp is not on my PC and the error message doesn't provide the table and column name in question.

Unable to open m\_pDbBridgeListSet in CDmBridgeList::OpenRecordset! 12:51:00 PM - Line 597 in source file D:\Virtis\data management\ABMSYS\DmBridgeList.cpp.

Error opening database record set.  
12:51:00 PM - Line 594 in source file D:\Virtis\data management\ABMSYS\DmBridgeList.cpp.  
State:S0022,Native:904,Origin:[Microsoft][ODBC driver for Oracle][Oracle]  
ORA-00904: invalid column name

Please help, thanks, Brian.

Below is the message our DBA sent to me after talking with you.

Dean,

I've got bad news. Mehrdad says you need to recreate those deleted folders (see below). I'm not sure if that will get the data back or not? I guess at this point it might be better if you take over the communication with them. You know the application and what you need out of it.

It seems to me that something didn't go right with the migration and they should look into it. Hopefully you can explain what's going on better than I can. In any case, I'm here and ready to help with any database stuff that might come up. Good luck, Brian.

FROM:dteal DATE:Tuesday, January 07, 2003 2:13:39 PM  
We have been able to re-enter the folders that got removed for in the migration to 4.2. At this point we are getting our test server up and running before we do our production server. I assume we will also loose these folders when we migrate our production server to 4.2.

Will there be a fix for this migration error?

FROM:dteal DATE:Tuesday, January 07, 2003 2:16:39 PM

The folders that got eliminated - is it possible that the problem has to do with the sorting selection. These folders sorted on the check boxes "Design and Template". The design checkbox got removed in version 4.2.

FROM:jduray DATE:1/22/03 9:40:49 AM

Mehrdad - we need a script or utility that searches the folder where clause and corrects it.

FROM:mordoobadi DATE:7/1/2003 1:43:07 PM

SQL scripts created to fix the problem. Fixed for 5.0.1.

Description

FROM:bmccaffrey DATE:Thursday, January 23, 2003 8:20:07 AM

I have a simple span P/S box beam bridge with a mix of adjacent 3' and 4' sections. When I hit the 'Compute from typical section' button in the live load distribution window I get the attached warning

4/19/2016 3:03:15 PM

HRS AASHTO

313

Complete Issue Information

(lIdf.bmp). The LLDF should be calculated using section 3.23.4, but Virtis thinks its a spread box and uses the equations in section 3.28 and generates the warning. This is happening in members G3, G5 and G7 (all 3' sections) - the .bbd file is attached.

FROM:kkennelly DATE:1/23/2003 12:48:08 PM

The logic we use to determine if the structure def has spread or adjacent box beams doesn't work if the box shapes have different widths.

Herman,

Change the code in abgtools LfdLiveLoadDistributionFactorCalcs:: PSBeamAdjacent() to call DoGirderSystemStructDef::IsPsBoxGirderSystemAdjacent().

Then in DoGirderSystemStructDef::IsPsBoxBeamAdjacent(short iGirderNo), change the code to check the gap between beams taking into account the width of the beams adjacent to "iGirderNo". (Right now the code only uses the box width of "iGirderNo".)

Thanks. (Maintenance since this exists in 4.2) "AdjacentPSBeams.bbd" is 5.0 version resembling the bridge Brian attached.

FROM:hlee DATE:2/5/2003 9:33:37 AM

Fixed for 5.0 Beta Build 4.

FROM:mordoobadi DATE:2/19/2003 4:17:45 PM

I do not think the validation warning and the analysis error are related.

FROM:mordoobadi DATE:2/20/2003 10:35:33 AM

There are several concrete railing location objects present in the list that do not show-up in the typical section window because the concrete railing id is null (See below). The warnings are because of this.

CDmConcRailingLoc

### Description

FROM:bmccaffrey DATE:Friday, February 07, 2003 10:37:18 AM

I'm assuming this also applies to 5.0 beta 3 - this was caught in 4.2:

The allowable stress for reinforcement in Virtis is computed based on 0.4 and 0.6 Fy for the inventory and operating levels respectively. The MCEB 2nd edition article 6.6.2.3 bases the allowables on 0.55 and 0.75 Fy. I know that the ASD specs are not being supported anymore but this worked in previous versions of Virtis. See the attached .bbd file from 4.2.

FROM:jduray DATE:Thursday, February 13, 2003 11:25:42 AM

FROM:bgoodrich DATE:Tuesday, February 25, 2003 4:54:36 PM

The BRASS defaults for the allowable stress of rebar are 0.4 and 0.6 for inventory and operating, respectively. These defaults have not changed within the BRASS engine for as long as I've worked with it. The BRASS defaults are fixed and they do not change with the year of construction as allowed in the MCEB. The philosophy in the export so far, is that if the user leaves a field blank in Virtis, the BRASS default will be used. The work-around is to enter the allowable stress ratio. One suggestion is to add a "Compute" button to the Factors tab or revise the export to compute the allowable stress ratio, where both suggestions would be based on the MCEB.

### Description

FROM:bmccaffrey DATE:Wednesday, February 19, 2003 12:27:16 PM

I've found that either Virtis or BRASS is adding an additional 5% dead load to the sidewalk comps. Is anyone aware of this, and if so, why???

You can check this on any bridge that has a sidewalk. I've attached a file that contains portions of two output files with a summary of the extra 5% below each one.

Both sidewalks are 80" x 10" and on one side of the bridge only. One uses a unit weight of concrete of = 150 lb/ft<sup>3</sup> and one uses 105 lb/ft<sup>3</sup>. Both have 7 girders and have been set to stage 2 loading.

FROM:kkennelly DATE:2/21/2003 2:09:46 PM

I took a quick look at this and I think the portion of the output you are looking at isn't the load per girder, it is the load of the sidewalk on the deck (it's part of the BRASS deck geometry summary).

80" x 10" x 0.150 kcf /144 = 0.833 k for a 1' long strip along the length of the bridge for the 80" sidewalk.

Spread this force over the width of the sidewalk = 0.833 k/ft / (80"/12"perft) = 0.125 k/ft

Further below in the output you should see this load distributed to each of the girders.

4/19/2016 3:03:16 PM

HRS AASHTO

319

Complete Issue Information

That's what I think is happening but I'll let Brian have the final say.

FROM:bgoodrich DATE:Friday, February 21, 2003 5:18:58 PM

Krisha is correct. However, the uniform loads are incorrectly reported in k/ft and should be reported as k/ft^2, which correspond the the Uniform Load input parameter on the DECK-LOAD-UNIFORM command.

WYDOT assigned this issue to BRASS Problem Log 403. I have corrected the units accordingly. Fixed for Beta 5.

Description

FROM:bgoodrich DATE:Friday, February 28, 2003 4:55:31 PM

Submitted for Brian McCaffrey:

Can you tell me where the 'CLV' term comes from in the following intermediate BRASS output:

Checking AASHTO 10.48.8.2 - Interaction - Combined shear & Bending Moment  
Strength Rating Factor - Flexure (Negative Action) - TOP OF SECTION

4/19/2016 3:03:16 PM

HRS AASHTO

320

Complete Issue Information

Applied Actions:

Dead Load Moment (DLM) = -2558.94 (ft-kips)  
 Live Load Moment (LLM) = -828.27 (ft-kips)  
 Dead Load Shear (DLV) = 103.15 (kips)  
 Live Load Shear Concurrent  
 w/ Critical Moment (CLV) = 52.14 (kips)

What is the 'Critical Moment'???

I've attached the Virtis 4.2 .bbd file.

FROM:bgoodrich DATE:Friday, February 28, 2003 4:58:18 PM  
WYDOT has assigned this issue to BRASS Problem Log 412.

FROM:bgoodrich DATE:Monday, March 10, 2003 2:06:50 PM  
Dan Glandt wrote the following response:

"The critical moment is the maximum live load moment (either positive or negative) at the point of interest. CLV is the shear that occurs with that moment. I.e., it is the shear caused by the truck sitting in the position that causes the maximum moment). We refer to it as the concurrent shear with the max moment.

Concurrent actions can be output by coding a 3 or 4 in parameter 1 of the DEAD-LOAD command."

FROM:bgoodrich DATE:Monday, March 10, 2003 2:09:22 PM  
In Virtis, the concurrent actions are controlled by the engine properties for the analysis event. See the Action Output Level drop-down box on the Output tab of the BRASS-Standard Analysis Event Properties window.

Stability factor shares the calculation with the flat factor. Both values should be exposed for edit and use in Madaro.

FROM:kkennelly DATE:3/13/2003 8:59:16 AM

FROM:jduray DATE:3/13/03 2:25:06 PM  
Kirsha - Is this with regard to timber decks?

FROM:jduray DATE:3/13/03 2:26:45 PM

FROM:kkennelly DATE:3/13/2003 3:39:56 PM  
It's just for beams, not decks. We use to have this attribute but removed it. See Incident 2878. (I'm not sure what Paul means when he says "Stability factor shares the calculation with the flat factor". They seem to be 2 distinct items to me. Beam stability factor from AASHTO 13.6.4.4 and flat use factor from Table 13.5.1A)

FROM:pjensen DATE:Friday, March 14, 2003 10:49:58 AM  
in the output of the Madaro, the column for stability and flat are the same with different headings. in the timber girder and the decks the flat attribute is in both screens. We are questioning why is the stability factor is not showing up in the grider screen and the flat removed?

FROM:jduray DATE:3/14/03 3:18:48 PM

FROM:kkennelly DATE:3/14/2003 3:51:30 PM  
As incident 2878 explains, Virtis has never had the Beam Stability Factor. The stability factor should be entered on a per span basis but Madero does not accept the stability factor on a per span basis. So a decision was made in the development of Virtis Version 4.0 to not have that attribute. I guess it's an enhancement if you want to add it to Virtis. Madero will also need enhanced to use this factor properly if Madero still doesn't accept it on a per span basis.

I'm still not sure what you are asking about the flat factor. Are you saying we should remove the flat factor from the Beam Details window?

Description

FROM:pjensen DATE:Monday, March 17, 2003 6:49:46 PM  
Well we are getting better- the calculation for the non-overhang (and probably the overhang) is not using the correct value for the span. It looks like it is using the actual span distance instead of the value in 3.25.1.2 (clear span + one stringer not to exceed clear span + depth of flooring).

4/19/2016 3:03:18 PM

HRS AASHTO

327

Complete Issue Information

FROM:jduray DATE:3/18/03 2:45:31 PM

Krishna - is there enough info here for you to know what Paul is referring to?

FROM:kkennelly DATE:3/18/2003 4:01:31 PM

AASHTO 3.25.1.2 regards the distribution of wheel loads on transverse timber flooring. This problem must be with the span length either the Madero export or Madero uses to compute the bending moment in the deck for rating the deck.

FROM:bgoodrich DATE:Wednesday, March 19, 2003 11:30:04 AM

Madero follows AASHTO 3.25.1.2 for the main deck span and reports the Effective Deck Span in the output file.

For the overhang, Madero computes the effective span length as:

$$L(\text{eff}) = \text{Overhang} - b/2 + b/4 = \text{Overhang} - b/4$$

where b = Stringer Width

The overhang distance is reported in the output file, but not the effective overhang span, which is used to calculate the dead load moments.

The new Madero DLL and OCX files posted on the FTP server correct the tire width problem, which was causing high live load moments.

Please send specific information that illustrates where Madero may be wrong with respect to this incident.

FROM:pjensen DATE:Wednesday, March 19, 2003 12:04:54 PM

using the timber/timber definition from 4457, the span is 32", the girder width is 7.75 wide, deck is 2.75 thick. The clear span (span from edge of girder to edge of girder) is  $32 - 7.75 = 24.25$ . Now for the span def from the code it is:

$24.25 + 7.75$  (2-1/2 girder widths) NOT TO EXCEED  $24.25 + 2.75$  (depth of the deck)  
 $32 > 27$  so the span width is 27".

FROM:bgoodrich DATE:Wednesday, March 19, 2003 12:40:17 PM

Here is what I get when running Madero (see => below):

WHEEL LOAD DISTRIBUTION WIDTH CALCULATIONS (per AASHTO 16th ed. 3.25)

Input Data:

Number of Lanes = 1  
Deck Type = Plank Deck  
Deck Thickness = 2.750 (in)  
Deck Member Width = 10.000 (in)  
Stringer Spacing = 2.670 (ft)  
Stringer Width = 7.750 (in)

Output data:

=> Effective Deck Span = 2.253 (ft)  
Distribution Width Perpendicular to Deck Span = 11.500 (in)  
Distribution Widths in Direction of Deck Span:

4/19/2016 3:03:18 PM

Complete Issue Information

|           |            |        |             |
|-----------|------------|--------|-------------|
| CUSTOM I  | Load Group | HS Trk | 20.000 (in) |
| CUSTOM II | Load Group | HS Trk | 20.000 (in) |

$$L(\text{eff}) = 2.67 - 7.75/12 + 2.75/12 = 2.253 \text{ ft} = 27.04 \text{ in}$$

Do you get these same results?

FROM:bgoodrich DATE:Wednesday, March 19, 2003 2:15:03 PM

E-mail from Paul:

that is what the output says but when the non-factored LL moment is calculated it appears to be using 32".

I get:

32" => 5.5 ft-kips (Madero 5.65)

27" => 4.25 ft-kips

I am using  $R(a+r/(2w))$  for the moment calc.

FROM:bgoodrich DATE:Wednesday, March 19, 2003 2:15:41 PM

I am getting the following HS20 live load moments from Madero:

| Live Load | one  | multiple |
|-----------|------|----------|
|           | lane | lanes    |
| HS Trck   | 4.26 | 0.00     |

For the H20 truck, Madero gives 5.68 ft-kips.

FROM:bgoodrich DATE:Wednesday, March 19, 2003 2:57:15 PM

E-mail from Paul:

that is after the .8 reduction for continuous- I am saying is that the 5.68 value is too high- the 5.68 is based on what values for load,span, wheel width and moment equation?

FROM:bgoodrich DATE:Wednesday, March 19, 2003 2:59:14 PM

Madero determines the moment for the H20 truck using the following:

Wheel Load (P) = 16 kips

Effective Span Length (L) = 2.253 ft = 27.04 in

Tire Width (T) = 20 in

The moment calculation considers the wheel load to be distributed over the tire width and applied to the effective span length, which yields the following equation for the reaction and moment:

$$R = P/2$$

$$M = R(L/2 - T/4)$$

Plugging the terms into the equations yield:

$$R = 16 / 2 = 8 \text{ kips}$$

$$M = 8 (27.04/2 - 20/4) = 68.16 \text{ in-kips} = 5.68 \text{ ft-kips}$$

Madero does NOT consider the footnote in AASHTO Figure 3.7.6A for the H type trucks. However,

4/19/2016 3:03:18 PM

HRS AASHTO

329

## Complete Issue Information

Madero does consider the 24-kip axle part of the footnote in MCEB Figure 6.7.2.1, which applies to HS type trucks. Could this be the source of the difference?

Also, note that the 0.8 factor is only applied if you check the "Deck continuous over more than 2 spans" box on the Deck window.

FROM:bgoodrich DATE:Wednesday, March 19, 2003 3:36:02 PM  
E-mail from Paul:

'looking closer to your input file the problem is in the input file- HS 20 truck on timber has a load of 24 kips. The note on the bottom of Figure 3.7.7a says:  
"In design of timber floors and orthographic steel decks (excluding transverse beams) for H 20 loading, on axle load of 24,000 pounds or two axle loads 16,000 pounds each, spaced 4 feet apart may be used, whichever produces the greater stress instead of the 32,000-pound axle shown."

We are using that as the controlling value for the axle loads for an HS 20 truck.'

this will cause a problem with our ratings- What is the workaround solution?

FROM:bgoodrich DATE:Thursday, March 20, 2003 5:23:29 PM

I think we are narrowing down the issue. It appears you would like Madero to consider the "In the design of timber floors..." footnotes associated with AASHTO Figures 3.7.6A and 3.7.7A with respect to the H20 and HS20 trucks, respectively. Madero already uses the 24 kip axle part of the footnote for an HS20 truck instead of the actual 32 kips. However, Madero uses the actual 32 kip axle for an H20 truck. The export could detect the H20 truck and modify the axle weights for the deck rating only. However, what if a user does not wish to exercise the footnotes? Robert Fulton does not want Madero to reduce the HS20 axle weight for the deck rating, so it looks like the user need to have control over which axle weight is used. Am I correct in stating what you want Madero to do?

I cannot come up with any work-around that would affect the deck rating only. If the axle weights are modified to correct the deck ratings, all the girder ratings would then be in error.

FROM:bgoodrich DATE:Thursday, March 20, 2003 5:24:07 PM  
E-mail from Paul (3/19/03):  
yep-

FROM:bgoodrich DATE:Thursday, March 20, 2003 5:24:54 PM

We have one user that wants Madero to take the H20/HS20 axle weight reduction for deck rating and another who does not. Therefore, the user must be able to control the H20/HS20 axle weight reduction for deck rating. The most likely solution to this is adding an option to the engine properties. I suggest using the structure definition engine properties and just adding a Deck group box to the engine properties dialog that is displayed. The export would then generate a command that Madero would interpret to determine if the full or reduced axle weight should be used. I will prepare an estimate on what it will take to implement this.

FROM:bgoodrich DATE:Tuesday, March 25, 2003 1:58:04 PM

The following discussion outlines the technical issues related to implementing control over the footnotes of AASHTO Figures 3.7.6A and 3.7.7A.

4/19/2016 3:03:18 PM

HRS AASHTO

330

Complete Issue Information

1. Modify the Madero engine to consider the footnote for the H20 truck. This would be controlled by a new parameter on the CONTROL command. Madero would have to detect the H20 truck as one of the three special trucks permitted in Madero.
2. Modify the Madero engine properties with a field for specifying if AASHTO Figures 3.7.6A and 3.7.7A are to be exercised when appropriate. This would include modifications to the AboMadero and AbxMadero2 projects.
3. Modify the Madero export to write the new parameter to the CONTROL command.

I estimate 16 hours to implement this capability.

Assumptions: Only the "one axle load 24,000 pounds" portion of the footnote will be considered in this implementation. The "two axle loads of 16,000 pounds each" will NOT be.

FROM: bgoodrich DATE: Tuesday, March 25, 2003 3:24:51 PM

For the version 5.0 release, the footnotes of Figures 3.7.6A and 3.7.7A will not be considered. The full axle weight will be utilized by Madero in the deck ratings. The work-around is to specify an H or HS type truck with reduced axle weights as defined in the library or the temporary vehicles.

I spoke with Jim and he has decided to make the footnote options an attribute of the deck in Virtis. This will probably not be available in the initial Virtis 5.0 release, but may be available in the first service pack. Due to this decision, my estimate for the engine and export work will be about 4 hours.

Mehrdad - Jim will be discussing this incident with you regarding the attribute. The attribute could be named "Axle Weight Reduction" for deck rating. It pertains to the figures discussed above.

FROM: jduray DATE: 3/25/03 3:45:29 PM

Mehrdad - can we get this into the db for future use? If it is a big deal to do now then we should add it for the Sept release after 5.0 is finished.

Description

FROM:gbarnhill DATE:Thursday, March 20, 2003 5:22:24 PM

I received the attached file from LA County (Ken Ho).

Look at Member G2, Mem Alt Interior I Beam.

This is a 6 span composite steel with 2 hinges in span 2 and span 5.

Ken gets a very low ASD Inv rating at 4/10 span 6.

It appears BRASS is checking stresses for Negative Liveload at that point. In this case, the Negative HS20 Truck Liveload is -307.42 kf. The total stage1 and stage2 deadload is +306.86 kf.

Virtis reports an ASD Inv RF of 0.518

I copied the MemAlt and increased the Haunch Z1 and Z2 dimensions by 1/2 inch in span 6. This increased the total deadload moment to +314.9 kf. Virtis now reports an Inv RF of 1.626

The bbd attached is 5.0.0 beta 6.

FROM:bgoodrich DATE:Friday, May 09, 2003 6:05:41 PM

WYDOT will assign this issue to BRASS Problem Log 433.

## Complete Issue Information

BRASS-GIRDER™ was using the sign of the total moment to determine if the rating factors for positive and negative bending should be calculated for steel sections. By using the total moment, a critical rating factor was not being calculated. When calculating rating factors, the sign of only the live load moment should be considered. This issue was corrected. Now increasing the dead load reduces the rating factor at the interior support, which is the expected result. This issue has been addressed in BRASS-GIRDER 5.8.7, which is to be released with Virtis 5.0.1.

FROM:gbarnhill DATE:Thursday, July 10, 2003 2:12:27 PM

In 5.0.1 Beta - 7 July - I now see the same RF (0.518) even if I increase the haunch dimensions to increase the DL to more than neg LL.

I tried a different approach. I changed the Counterflexure location in Span 6 to .41 instead of .30 (Engine Prop of Member Alt). Now I get a very high RF (3.295) at 4/10 span 6. The neg LL moment is still more than the total DL pos moment.

FROM:jduray DATE:7/10/03 2:58:59 PM

Changed status to Resubmit for Gale.

FROM:bgoodrich DATE:Monday, July 14, 2003 12:50:01 PM

When the dead load contraflexure location is changed from 30% to 41%, the section at 4/10 of span 6 changes from one that includes the slab+beam to one that only includes the rebar+beam. Additionally, section codes generated for the STEEL-GIRDER-CONTROL commands change for the range that includes the 604 POI, i.e., section code 4 (positive flexure check) changes to 5 (negative flexure check). There are shear connectors defined over the entire 6th span, so it seems like the composite section (slab+beam) should be considered. The bottom line is how you want BRASS to analyze the 604 POI, i.e., for positive flexure or negative flexure.

FROM:bgoodrich DATE:Tuesday, July 15, 2003 2:39:45 PM

The original issue has been addressed. The new issue will require more investigation and possibly modifications to BRASS. I moved this new issue to Incident 4687.

FROM:gbarnhill DATE:Tuesday, July 15, 2003 3:59:02 PM

The original issue report is OK in 5.0.1 July 7 beta

FROM:bgoodrich DATE:Tuesday, July 29, 2003 1:21:32 PM

Track field marked with "gale OK 5.0.1 July 7 beta".

FROM:bgoodrich DATE:Tuesday, July 29, 2003 1:21:44 PM

Closed.

FROM:bgoodrich DATE:Monday, October 13, 2003 10:04:40 AM

The correction to the BRASS engine that addressed this incident has been removed as directed by WYDOT in the following e-mail:

Begin e-mail -----

Please undo the fix which was performed for Problem Log #433 and create a new BRASS-GIRDER DLL using version 5.8.7.1. If work is done on ASD in BRASS-GIRDER, Problem Log #433 will be reinstated and the bugs it created will be fixed. This also pertains to Virtis Incidents 4687, 4772, and 4794. Problem Log #433 will remain open.

### Description

FROM:gbarnhill DATE:Thursday, April 10, 2003 11:34:03 AM

This bridge came from Ken Ho in LA County.

It's a two span RC Tee constant 48 inch deep section.

In an HS20 LFD analysis (member G2), shear at 0.7 governs.

The "d" value used at C.P. 0.6, 0.7 and 0.8 is 24.956.

At 0.9 and 2.0 the "d" is 45.650.

FROM:bgoodrich DATE:Friday, May 09, 2003 5:58:27 PM

WYDOT will assign this issue to BRASS Problem Log 428.

FROM:bgoodrich DATE:Friday, November 28, 2003 8:16:47 PM

This issue has been moved to BRASS Problem Log 447.

FROM:bgoodrich DATE:Monday, January 12, 2004 11:39:35 AM

This issue is currently being worked on in the BRASS engine. Incident 4950 was submitted and pertains to the same issue as this incident.

FROM:bgoodrich DATE:Friday, January 30, 2004 3:58:22 PM

Anthony Gugino reported this issue with several of Caltrans R/C bridges. Jim Duray requested the BBD files for those bridges.

E-mail from Vinacs (2/4/04):

Brian

I am sending four models with this e-mail. Please use these to check the latest version of the Virtis. I am going over every bridge that our engineers identified as problem bridges prior to send you.

As we mentioned earlier to Jeff, we are trying to analyze the bent caps for a SUPER LOAD. We used our Caltrans' standard software to rate the superstructure. Since our software will not rate the sub structure, we use the Virtis/BRASS program.

For the bent cap analysis, we created a fictitious truck that has the gage width of the Actual SUPER LOAD truck as the rating truck. See the word document. The wheel load is kept as 100 kips for simplicity.

(See attached file: BridgeDescription.doc)(See attached file: 54-0772RCal.bbd)(See attached file: 54-0780RCal.bbd)(See attached file: 55 0524Cal.bbd)(See attached file: 56-0175LCal.bbd)

If you have any questions, please feel free to call me at 916-227-8657 or e-mail to me.

I will send other files as soon as I checked them

### Description

FROM:snshah DATE:Thursday, April 17, 2003 11:32:26 AM

This is a R/C concrete deck girder bridge. The Girder spacing is 12'. According to AASHTO table 3.23.1 (footnote f) the distribution factor should be the reaction at the girder from treating the deck like a simple beam between the girders. The value for "multi-Lane" Virtis computes from the typical section is not correct. Not only is it not correct but also it is less than the single lane distribution factor Virtis calculates (Virtis single lane distribution factor is correct). I think Virtis may be doing some thing wrong in calculating the multi lane distribution factor when the aforementioned footnote f applies. If not then I have something set wrong, could you please look into it for me. Thank you.

FROM:kkennelly DATE:4/18/2003 9:55:14 AM

A work around to your problem is to input only one travelway on the StructureTypical Section: Lane Position tab instead of the 3 you have defined. The 1 travelway's left distance should be -18 and the right distance is +18.

I'll try to figure out why the 3 travelways doesn't work right.

FROM:kkennelly DATE:4/18/2003 10:08:41 AM

Code is not checking for adjacent travelways. It assumes that if there is more than 1 travelway, it is because there is something like a median separating the travelways so it only searches for the travelway directly above the member. The way the travelways are defined for this bridge causes there to be only 1 12' lane considered.

FROM:kkennelly DATE:4/18/2003 11:32:21 AM

Code fixed for Version 5.0 Service Pack 1.

FROM:gbarnhill DATE:Tuesday, June 24, 2003 5:39:54 PM

I created a girder system with 4 girders at 15 ft spacing and defined 3-12 ft travelways centered over the girders.

In 5.0.0, the multilane DF computed at 1.533 for Girder 2 (Virtis used only the one 12 ft lane over that girder).

In 5.0.1, the multilane DF computed at 2.667 (the original lane over the girder plus the lane in between Girders 2 and 3).

If this is a test of the situation described, then this incident is fixed in 5.0.1.

HRS AASHTO

341

Complete Issue Information

My approach: ftop

Stage 1:  $M=1.3*24.4$  (T)

Stage 2:  $M=1.3*4.3$  (T)

Stage 3:  $M=1.3*1.67*286.6$  (C)

Using  $f$  (stress) =  $M*c/l$  where  $l$  &  $c$  are different for each stage.

$f_{top} = f_1 + f_2 + f_3$

Thank you,

Regards,

Ken Teng  
RQAW Corp.

FROM: bgoodrich DATE: Wednesday, April 23, 2003 11:28:42 AM  
From Dan Glandt:

BRASS calculates the stress at the top and bottom of the steel girder for each stage using the factored loads and the  $I$  and  $c$  for each stage.

Note that in this case the moments in stage one and stage 2 are negative but for the situation questioned, the positive live load moment is used.

Therefore in stage 2, since the moment is negative, the section is considered non composite as the deck does not have rebar and is ineffective for negative moment. This is a limitation of BRASS in that a cross section must either be considered as composite for positive moment or composite for negative moment. The cross section at the 3.5 is coded without rebar. The moment of inertia used for stage 1 and stage 2 is 9040 in<sub>4</sub>.

I think this may explain the question.

Note that running the data set and using an HS20 truck from our library and a rolled section WN36x150 from our library, the following results were obtained on version 5.8.6.

This begins the analysis for moment capacity for truck no. 1, Load Level No. 1

Stage No. 3 Analysis point number 305.000

This begins the analysis for positive moment capacity

PERFORMING AASHTO SPECIFICATION CHECKS - 10.50(b) Depth of Web in Compression Dc

Input Parameters:

4/19/2016 3:03:20 PM

HRS AASHTO

342

Complete Issue Information

Depth = 35.850 in Distance to Web Bot = 0.940 in f bot = 9.964 ksi

Distance to Web Top = 34.910 in f top = -1.042 ksi

x-bar Computation: (Similar Triangles)

x-bar = Depth \* f bot / (f bot - f top) = 32.456 in

If this does not answer the concern, please advise and we will investigate further.

Complete Issue Information

E-mail from Richard Best (5/2/03):

I was wondering if someone can explain the "Compactness at the Pier" check off option which is found in the Engine properties for LFD. The short paragraph on the F1 - Help screen isn't too explanatory. We have a new bridge that was designed having plastic section in the positive moment region. VIRTIS is giving a low rating and the output suggests that  $M_p$  was not used in the determination of  $\mu$ . When I check off the Compactness at Pier option then the analysis does seem to give us the correct rating and  $M_p$  was used in the output as prescribed by AASHTO equation 10-129c.

Should we assume that we need to check off this option whenever we want the analysis to consider 10-129a and 10-129c? Attached is a copy of the bridge in question (VIRTIS / OPIS 5.0).

FROM: bgoodrich DATE: Friday, May 02, 2003 12:44:39 PM

The answer to your question is yes. You must check the compact checkbox for each span in which the pier sections are compact, so BRASS will utilize equations 10-129b and 10-129c. If you don't check these, then the non-compact moment capacity will be determined. The link to the STEEL-GIRDER-CONTROL command is helpful if you review the Section Type parameter description.

Update the "Member Alternative Properties: Analysis - Compactness at the Pier" help topic for the BRASS LFD engine help to be more descriptive.

FROM: bgoodrich DATE: Thursday, July 10, 2003 1:29:20 PM

I updated the help topic with the following:

"By default, the piers are considered to be non-compact in the engine properties, which causes BRASS to analyze the section at this point as non-compact. If however, the section at this point is compact and the adjacent pier sections are selected as compact, BRASS will utilize AASHTO Equations 10-129b and 10-129c to achieve a capacity somewhere between the yield and plastic moments."

I forwarded the new "GIRDER(LFD) PROPERTIES.HLP" help file to Baker (dated 7/10/03). Fixed for version 5.0.1.

### Description

FROM:bgoodrich DATE:Wednesday, May 07, 2003 12:05:29 PM  
E-mail from Ed Lutgen (5/5/03):

Hello Brian,

Kevin Western just came back from a Virtis/Opis TAG meeting and mentioned to give you a buzz on some problems we are having validating the upgrade from 4.2 to 5.0. From my initial comparisons it appears steel bridges compare quite well but prestressed beam bridges seem to generally rate lower. About 35% of prestressed bridges rate lower by atleast 5%. Some of the reductions I have traced to improvements like AASHTO equation 9-27 for prestressed girder shear. Causes for other reductions I have not been able to track due to lack of output calculations. I have attached identical Virtis files that the inventory rating factor reduces in the upgrade from 0.916 to 0.763. In this example the moment due to prestressing reduced from 2039k' to 1938k'. Also the compression stress at the bottom of beam due to prestressing reduced from 3265 psi to 3103 psi. This would lead me to believe there is less effective prestressing due from more losses since the input is the same. I talked to Dan Glandt on his last day before retirement and he said the stage 2 creep prestress loss affects have been fixed. This adjustment would only increase the rating (decrease creep thus increase prestress). Also according to your release notes Bridgetech fixed several errors in prestressing bridges based on New Mexico SHTD testing. Dan thought that this was Fcr in the Elastic shortening formula. I

4/19/2016 3:03:20 PM

HRS AASHTO

345

have included an export file from virtis for version 4.2 and 5.0. Could you take a look at the two attached files and tell me what calculations changed from the versions? If you want I can run a mathcadd program or conspan that calculates the prestress losses. Hopefully there is an explanation that makes sense for the reduction that I can correct.

Thanks in advance for your time and effort.

Ed Lutgen  
MnDOT Asst Rating Engineer  
651-747-2124

FROM:bgoodrich DATE:Wednesday, May 07, 2003 12:07:39 PM  
I have reviewed the bridges and there is nothing really different with the data files generated by the export of each version. The difference in the ratings is definitely with the actions due to prestress. The dead and live load actions are the same.

FROM:bgoodrich DATE:Friday, May 09, 2003 5:35:29 PM  
WYDOT has assigned this issue to BRASS Problem Log 427. I suspect there was a bug induced in the loss calculations between the 5.8.5 and 5.8.6 releases of BRASS-GIRDER.

FROM:bgoodrich DATE:Monday, June 23, 2003 3:18:47 PM  
BRASS-GIRDER has been corrected to include all the applicable dead load moments, which corrects the stress used to determine the creep loss. Fixed for version 5.0.1.

FROM:hlee DATE:7/24/2003 10:00:11 AM  
Patch test ok.

## Description

FROM:bgoodrich DATE:Wednesday, May 28, 2003 2:09:16 PM

The critical ratings for the floorbeams in FLine GF TrainingBridge3 are high (99.0). I found that there are two identical travelways specified for each floorbeam. This causes BRASS to incorrectly determine the live load actions. BRASS considers every truck position to be invalid due to the identical travelways. Two things need to be done.

1. Correct the training bridge in the GUI by deleting one of the travelways. Then, users will at least get a valid rating.
2. Enhance the engines to detect travelways that overlap, so both BRASS and Virtis/Opis users can benefit.

FROM:jduray DATE:6/5/03 4:43:45 PM

I would like to implement number 2 above within Virtis or the export if possible.

FROM:hlee DATE:6/11/2003 3:46:16 PM

Deleted duplicate travelways for all floorbeams.

In 5.1.0.

Using the Wizard:

1. Steel Multi-Girders are only options for composite are "Partially composite" or "Fully composite". There is no option for "Non composite". How do I work through this?

2. Concrete Box Beams: where do I select the type of composite action? it does NOT ask for Shear Connectors anywhere that I can see.

FROM:kkennelly DATE:6/3/2003 9:19:37 AM

1. After you use the wizard to create your structure definition, you can visit the "Deck Profile" window for each member alternative and delete the ranges on the Shear Connectors tab. That will remove the

Complete Issue Information

composite action created by the wizard.

2. The Wizard does not create the composite regions for you for concrete members. After you use the wizard, you must create either a Vertical or Horizontal Shear Reinforcement Definition and then visit the "Shear Reinforcement" ranges window for each member alternative and either create Vertical Shear Reinf ranges that extend into the deck (and thereby create composite action) or create Horizontal Shear Reinf ranges that cause composite action.

Description

FROM:pyannoni DATE:Friday, June 06, 2003 3:21:41 PM

I am trying to perform a rating on a two span continuous steel stringer (plate girders) bridge using the Virtis Program (version 5.0). This bridge has a set of bearing stiffeners at the center pier. When we run the program we get a zero rating which is controlled by the stiffeners at the pier. By looking at the Brass output file it appears the calculated stresses in the bearing stiffeners are greater than the allowable, but when we performed a quick hand calc we found the stresses in the bearing stiffeners to be considerably less than the allowable. We are wondering how the Brass program computes the stresses in the Bearing stiffeners and if it is being done correctly. I have attached the .bbd file named "newbury.bbd"

FROM:pyannoni DATE:Friday, June 06, 2003 3:29:33 PM

FROM:bgoodrich DATE:Wednesday, June 11, 2003 1:47:21 PM

BRASS calculates the following for the interior pier of the G1 member alternative:

4/19/2016 3:03:22 PM

HRS AASHTO

351

Complete Issue Information

ALLOWABLE STRESSES, PSI

|                         | INVENTORY | OPERATING |
|-------------------------|-----------|-----------|
| 1. BRG STIF COLUMN      | 16907.    | 21084.    |
| 2. BRG STIF BEARING     | 28800.    | 32400.    |
| 3. BRG STIF-COMPRESSION | 19800.    | 27000.    |

ACTUAL STRESSES, PSI

1. BEARING STIFFENERS, COMP.(AS COLUMN) = 20465.
2. BEARING = 24782.
3. COMPRESSION (STIFFENERS ONLY) = 24782.

The allowable stresses for each case above are calculated as follows (respectively):

1. Fa equation in MCEB Table 6.6.2.1-1
2.  $0.80F_y$
3.  $0.55F_y$

The actual stresses for each case above are calculated by dividing the bearing by the following (respectively):

1. Area of bearing stiffeners and web strip
2. Area of bearing stiffeners minus any clip
3. Area of bearing stiffeners

The actual stresses are greater than the inventory allowables for Case 1 and 3, thereby resulting in a zero rating. Please submit your hand calculations, so we can further investigate this issue.

FROM:pyannoni DATE:Monday, June 16, 2003 10:41:07 AM

We arrive at similar values for the allowable and actual stresses for the exterior girder G1 at the center pier. We were wondering, even though the inventory allowables for Case 1 and 3 are less than the actual stresses, shouldn't the program give some rating, even if it is less than 1 ? Wouldn't the rating factor for member G1 be  $16907/20465 = .826$  ?

FROM:bgoodrich DATE:Monday, June 16, 2003 1:17:20 PM

I investigated the incident this morning and offer the following on how BRASS is calculating the rating factors.

BRASS calculates the reactions at the interior pier as:

- Stage 1 DL Reaction = 181.8 kips
- Stage 2 DL Reaction = 82.8 kips
- Stage 3 LL Reaction = 32.8 kips

The area of the bearing stiffeners and web strip are:

$$\text{Area} = 0.75 * 8 * 2 + 0.375 * (18 * 0.375) = 14.53 \text{ in}^2$$

Therefore, the stress in the bearing stiffeners + web strip is:

$$f_{DL} = (181.8 + 82.8) \text{ kips} / 14.53 \text{ in}^2 = 18.21 \text{ ksi}$$

$$f_{LL} = 32.8 \text{ kips} / 14.53 \text{ in}^2 = 2.26 \text{ ksi}$$

The resulting rating factor is then:

4/19/2016 3:03:22 PM

HRS AASHTO

352

## Complete Issue Information

$$\begin{aligned} \text{RF} &= (\text{Allowable} - \text{DL}) / \text{LL} \\ &= (16.907 - 18.21) / 2.26 \\ &= -0.58 \text{ (negative ratings are set to 0.0)} \end{aligned}$$

As you can see, the dead load stress is greater than the allowable which leaves no additional capacity for live load, hence the zero rating.

Now, there should be no reason why the bearing stiffeners should rate at zero for a bridge built in 1976. Therefore, I reviewed the Virtis input some more and noticed that there are actually four bearing stiffeners present at the interior pier. BRASS does not consider multiple lines of bearing stiffeners, so the BRASS export merged the stiffeners into one line and issued a warning (see the .LOG file). By considering the web between the stiffeners in addition to the 18\*tw web strip, the area used to calculate stresses increases to 18.14 in<sup>2</sup>. Then, the stress in the bearing stiffeners + web strip is:

$$\begin{aligned} f_{DL} &= (181.8 + 82.8) \text{ kips} / 18.14 \text{ in}^2 = 14.59 \text{ ksi} \\ f_{LL} &= 32.8 \text{ kips} / 18.14 \text{ in}^2 = 1.81 \text{ ksi} \end{aligned}$$

The resulting rating factor is then:

$$\begin{aligned} \text{RF} &= (\text{Allowable} - \text{DL}) / \text{LL} \\ &= (16.907 - 14.59) / 1.81 \\ &= 1.28 \end{aligned}$$

How would you like to proceed from here? If you would like BRASS to be enhanced to consider multiple lines of bearing stiffeners, please update the incident. I hope this helps.

FROM:bgoodrich DATE:Thursday, July 10, 2003 10:52:48 AM  
Stacy Weaver [SWeaver@fstinc.com] is the engineer that actually submitted this incident. Paul Yannoni is the point of contact for their agency.

Category changed from "Bug - BRASS" to "Enhance BRASS".

FROM:bgoodrich DATE:Thursday, July 10, 2003 10:58:53 AM  
I have forwarded this issue to WYDOT for assignment to a BRASS Problem Log.

FROM:bgoodrich DATE:Thursday, July 17, 2003 1:44:20 PM  
WYDOT has added this issue to the BRASS enhancement list, which will be voted on at the Users' Group Meeting in August 2003.

FROM:bgoodrich DATE:Monday, September 08, 2003 3:34:05 PM  
Ute Ganjanathavat (OK DOT) submitted the following:

I ran a bridge data and got moments and shears but all ratings are zeros.  
Would you please look at the attached file. Thanks. (See attached file: virtis.bbd)

FROM:bgoodrich DATE:Monday, September 08, 2003 3:36:08 PM  
I did an LFD rating of Member 1 and bearing stiffeners are controlling. The output shows the bearing stiffener rating as:

$$\begin{aligned} \text{Bearing Strength 10-132 (BS)} &= 394.42 \text{ (kips)} \\ \text{Dead Load Reaction (DLR)} &= 643.13 \text{ (kips)} \end{aligned}$$

4/19/2016 3:03:22 PM

HRS AASHTO

353

Complete Issue Information

Live Load Reaction (LLR) = 68.55 (kips)

$$R.F. = \frac{[BS] - DLR}{(LLR)}$$

\*\*R.F. = -3.6280

As you can see, the resistance is less than the applied dead load. BRASS-GIRDER calculates the rating as negative and then sets the rating to zero. The bearing stiffeners at the first interior support are 18 inches apart. One of the limitations of BRASS-GIRDER is that it only supports ONE line of bearing stiffeners, so the export merges multiple lines into one, thereby causing the area of the web between the stiffener lines to be neglected. This results in a lower bearing resistance. Even if BRASS-GIRDER calculated the resistance correctly (686 kips), this still would not be enough to get a bearing stiffener rating greater than 1.0. This issue is the same as Incident 4626.

This issue could also pertain to Incident 2513, which requests that the rating of bearing stiffeners be ignored.

The virtis.bbd file is for Virtis 5.0.1.

### Description

FROM:bhoover DATE:Thursday, June 12, 2003 2:45:32 PM

Hello,

I'm using Bobie's account to enter this ticket. Please call me at 573-526-8957 or email me at winkid1@modot.net to contact me.

Now to the problem:

Whenever the users try to enter the PS double tee shapes in the library, they get a unique constraint violation (XPKABW\_LIB\_PS\_TEE\_BEAM). There are currently six shapes in the table ABW\_LIB\_PS\_TEE\_BEAM, and I guess it is conflicting with these. The user said that he had entered six shapes, and was trying to enter a seventh when he got the first error. He was able to enter them correctly in another database. He tried deleting them all and then readding them, but he cannot add one at all now, he continually gets the constraint violation. It looks like maybe the delete in the application doesn't clean up the database.

We need to resolve this issue so they can enter the Prestressed double tee shapes. We've thought about deleting the rows from the database table manually, but don't know what other tables there could be remnants of these shapes in, and the users are leery of testing this until they hear what you have to say.

Let me know if you need an export of our database so you can see the error yourself. We've worked with Mehrdad in the past in this manner, and he does an excellent job with the database errors.

Thanks,  
Dennis Winkie

How is this going?? Do you need us to ftp an export of the database up?  
Thanks,  
Dennis

FROM:mordoobadi DATE:6/25/2003 12:28:22 PM  
It looks like the referential integrity constraints for the ABW\_LIB\_PS\_TEE\_BEAM table are not in place. Please execute the following SQL command in SQL Plus and send me the results:

```
SELECT TEE.ps_shape_id FROM abw_lib_ps_tee_beam TEE WHERE TEE.ps_shape_id NOT IN  
(SELECT SH.ps_shape_id FROM abw_lib_ps_shape SH);
```

If this returns any rows. That's the cause of your problem. In that case you should run  
DELETE FROM abw\_lib\_ps\_tee\_beam TEE2 WHERE TEE2.ps\_shape\_id IN (SELECT  
TEE.ps\_shape\_id FROM abw\_lib\_ps\_tee\_beam TEE WHERE TEE.ps\_shape\_id NOT IN (SELECT  
SH.ps\_shape\_id FROM abw\_lib\_ps\_shape SH));  
to delete the orphan rows.

4/19/2016 3:03:22 PM

HRS AASHTO

356

Complete Issue Information

Then you should establish the needed referential integrity constraint. by executing the following command.

```
ALTER TABLE abw_lib_ps_tee_beam
ADD ( FOREIGN KEY (ps_shape_id)
REFERENCES abw_lib_ps_shape
ON DELETE CASCADE ) ;
```

FROM:mordoobadi DATE:6/30/2003 9:14:10 AM

FROM:mordoobadi DATE:7/1/2003 9:05:56 AM

I found out that the Database Compare Utility is not able to detect and create Subtype Foreign Keys (for an ORACLE database) which has caused this problem.

I examined databases that were originally of versions 2.0, 2.1, 3.0, 4.0, 4.1, 4.2 and were migrated to version 5.0.0 to find out the missing sub-type FKs. Here is the results:

| Original version | number of missing sub-type FKs |
|------------------|--------------------------------|
| 2.0              | 94                             |
| 2.1              | 94                             |
| 3.0              | 65                             |
| 4.0              | 50                             |
| 4.1              | 32                             |
| 4.2              | 31                             |

I created a PL/SQL script to create the missing sub-type FKs if they don't exist.

FROM:mordoobadi DATE:7/1/2003 9:25:15 AM

Fixed for 5.0.1.

Description

FROM:bgoodrich DATE:Friday, June 13, 2003 1:15:37 PM

When PCITrainingBridge5 is rated, a low rating for shear controls. This does not look very good in the example/sample problems. The POI at the first interior support controlled because BRASS considers the section at this location is as reinforced concrete and the shear directly at the support is the highest. The support POI is set to "ignore shear", but that field is not exported to BRASS. First, there is no corresponding POI command on which to put it. The BRASS-GIRDER point of interest commands for prestress need to be enhanced to include parameters similar to those on the CONCRETE-1 and CONCRETE-2 commands. Second, the export does not permit the point of interest data to override the schedules (this is already an incident).

### Description

FROM:dkoenig DATE:Wednesday, June 18, 2003 9:13:38 AM

We have encountered problems with the lengths updating on structures. On the attached bridge, the lengths on the structure definition window are not the same as the lengths on the member window. This structure was either copied from an existing one and had the lengths updated, or it was entered from scratch with the wrong lengths and the user went back and updated the lengths. When the lengths are updated on the structure definition window, they are not updating on the member window. We have seen this on some other structures, but they always seemed to eventually update. The bbd file is attached.

FROM:kkennelly DATE:6/23/2003 8:40:30 AM

The girders in the attached bridge are not parallel to the structure definition reference line so the span lengths of the members don't match the span lengths of the structure. The girders are not parallel to the structure definition reference line because the start and end left overhang is different on the

Description

FROM:dkoenig DATE:Wednesday, June 18, 2003 9:21:34 AM  
 We have noticed on the girder profile window that when we select a material, save it, and exit the window, the material is not being saved for the structure. When you come back into the window, the material that was previously selected shows up as blank. Based on some experimenting with this, it appears to be isolated to one material on this structure. The material is ASTM A709 Grade 36. This will happen for all elements on the Girder Profile window. We had noticed this in the past, but it would always correct itself if we deleted the element and then reentered it. On this structure, this does not seem to correct it. The bbd file is attached.

Complete Issue Information

FROM:jihnata DATE:6/19/2003 1:41:56 PM

The material that you mention has an extra space character at the end of its name. Edit the material and remove the space, then the girder profile window works OK.

### Description

FROM:dkoenig DATE:Wednesday, June 18, 2003 9:34:06 AM

We had previously sent in a structure with zero ratings (Incident 3893). This problem was supposed to have been corrected with Version 5.0. I reran this structure after we updated to Version 5.0, and I am still getting zero ratings on this structure. A copy of the bbd file for Version 5.0 is attached.

FROM:kkennelly DATE:6/19/2003 3:15:42 PM

Member G1 shows 0 rating at 4.5'. I added a point of interest there and in the BRASS output see the yield moment for positive moment is computed as -96.37 kft.

FROM:bgoodrich DATE:Thursday, June 19, 2003 4:29:02 PM

I forwarded this issue to WYDOT.

FROM:bgoodrich DATE:Wednesday, July 02, 2003 11:46:23 AM

The same negative yield moment issue was submitted in Incident 4672.

FROM:bgoodrich DATE:Monday, October 27, 2003 12:44:08 PM

WYDOT assigned this issue to BRASS Problem Log 459.

Complete Issue Information

Hi David,

I'm working on addressing Incident 4649 and would like to get some more information from you. I imported the R01041ZeroRatingProblem.bbd file with Virtis 5.0, added the Span 1: 1/10 point of interest, and analyzed the G1 alternative as Krisha had done. I was able to get the same negative moment capacity as she reported in the incident. The moment capacity is set to the yield moment, which was calculated incorrectly as a negative value. The sample of the rating factor output follows:

Strength Rating Factor - Flexure (Positive Action) - BOTTOM OF SECTION

Dead Load Moment = 48.16 (ft-kips)

Live Load Moment = 158.18 (ft-kips)

Nominal Capacity = -96.37 (ft-kips)

$$\text{R.F.} = \frac{[(\text{Phi}(\text{flexure}) * \text{Mn}) - (\text{Gamma} * \text{Beta}(\text{DL}) * \text{DLM})]}{(\text{Gamma} * \text{Beta}(\text{LL}) * \text{LLM})}$$

\*\*R.F. = -0.4630

Next, I did the same thing with the development version of Virtis and BRASS-GIRDER. The negative yield moment (capacity) has been addressed, but the capacity is still less than the factored dead load moment. Therefore, the rating factor at the 101 POI is still negative (and later set to zero) as shown the following output:

Strength Rating Factor - Flexure (Positive Action) - BOTTOM OF SECTION

Dead Load Moment = 45.14 (ft-kips)

Live Load Moment = 132.45 (ft-kips)

Nominal Capacity = 31.73 (ft-kips)

$$\text{R.F.} = \frac{[(\text{Phi}(\text{flexure}) * \text{Mn}) - (\text{Gamma} * \text{Beta}(\text{DL}) * \text{DLM})]}{(\text{Gamma} * \text{Beta}(\text{LL}) * \text{LLM})}$$

\*\*R.F. = -0.0937

Please verify that the dead loads are correct for this structure and submit your calculation of the moment capacity at this location.

FROM:bgoodrich DATE:Monday, December 01, 2003 11:34:11 AM

E-mail from David Koenig (12/1/03):

I will have someone start working on this and get back with you as soon as we have something.

FROM:bgoodrich DATE:Thursday, December 04, 2003 1:23:46 PM

E-mail from David Koenig (12/4/03):

We have looked at the point of interest calculations for this structure. While looking at the point of interest calculations, we noticed that the stage 1 dead load stress was 37000+ psi which was above the yield of the girder. Because it was stage 1 loadings, we went back and looked at the girder properties for the wide flange girder. We found that the moment of inertia was incorrect for the girder at this cross section. The moment of inertia was 110 in<sup>4</sup> which was off by a factor of 10. My assumption

4/19/2016 3:03:23 PM

HRS AASHTO

363

Complete Issue Information

all along was that we had copied the girders from the library. After finding this mistake, it appears that this girder was actually input by the user. I apologize for not having found this earlier. After making this correction, we are now able to get decent results on this structure. Go ahead and mark this incident as resolved. Thanks for your efforts on this matter.

Description

FROM: dkoenig DATE: Wednesday, June 18, 2003 3:55:20 PM

We have discovered what appears to be a problem in the effective width calculations for prestressed I-girders. On the first bbd file, the bridge has 9.75' girder spacing and an 8.5" slab. Using AASHTO 8.10.1.1 on the interior girder, the controlling value would be the web width plus 6\*(Slab Thickness) on each side. This results in a value of 108". Virtis shows 102". On the exterior girder, we get 100" and Virtis gets 97". It appears that it is not adding in the width of the web of the prestressed member whenever it is doing this calculation. The web of the prestressed member is 6".

On the second bbd file, we have been trying to match what Virtis is doing for the effective width on some prestressed double tee girders. We can get close, but are not able to match it. We were looking

4/19/2016 3:03:23 PM

HRS AASHTO

364

## Complete Issue Information

for an explanation on how Virtis is doing this calculation on double tees. We were using AASHTO 8.10.1.1.

FROM:kkennelly DATE:6/23/2003 9:47:55 AM

For your PS I beam question, Virtis does not interpret the second sentence of AASHTO 8.10.1.1 to mean that the thickness of the web is added to the 6\*slab thickness. The 6\* slab thickness is taken from the CL of the beam.

In response to a previous user's request, we are developing an example problem to illustrate the interpretations of AASHTO that this Compute button uses. AASHTO is not completely clear or consistent in the specs for effective flange width and it appears that users have varying interpretations also. So this example problem should clear up any questions as to how Virtis computes the effective flange width.

FROM:kkennelly DATE:6/23/2003 10:20:27 AM

For double tee girders, the "clear distance to the next web" in AASHTO 8.10.1.1 is computed by Virtis as the clear distance between the tops of the webs. So for G2, the clear distance to the left beam's web is 27.5" and the clear distance to the right beam's web is 36".

The eff. flange width for G2 is computed as follows:

Check 1:  $1/4$  span length = 123.75"

Check 2: 6\*slab thickness = 36" on each side of web

Check 3:  $1/2$  clear distance to next web = 13.75" to left. The actual flange width to left of tee = 21.5" -  $1/2$  web = 16.5".  $13.75" < 16.5"$  so use 13.75"

$1/2$  clear distance to next web = 18" to right. The actual flange width to right of tee = 21.5" -  $1/2$  web = 16.5".  $18" > 16.5"$  so use 16.5".

For portion to left of left tee:  $\min(36", 13.75", 16.5") = 13.75" + 1/2$  left web = 18.75"

for portion between the tees = 48"

for portion to right of right tee:  $\min(36", 18", 16.5") = 16.5" + 1/2$  right web = 21.5"

Sum up to get effective flange width =  $18.75 + 48 + 21.5 = 88.25"$

FROM:dkoenig DATE:Monday, June 23, 2003 11:45:45 AM

The way AASHTO 8.10.1.1 seems to be pretty clear to me that you would add the web width into the calculations for the 6\*ts as well as the  $1/2$  the clear distance on each side of the web. I checked my textbook from college, and it shows it being done the way we have described on I-girders. It is an interesting issue that you would probably not get agreement on from various people. This might be something to put out to the users to see what everyone is doing. If a large amount of them are doing it a certain way, then I would suggest that consideration be given to making Virtis do it that way. Thanks for you time on this matter.

Description

FROM:pjensen DATE:Thursday, June 19, 2003 7:00:12 PM  
HOW DO I GET THE CHANNEL ROLLED SECTION THAT I PICKED IN THE STEEL SECTION TO THE GIRDER ALT?

FROM:kkennelly DATE:6/23/2003 7:58:35 AM  
Right now Virtis only lets you use rolled I shapes as member alternatives.

FROM:kkennelly DATE:6/23/2003 8:02:40 AM  
Incident 3864 is a previous enhancement request to allow channels to be used for the member alts.

### Description

FROM:gbarhill DATE:Wednesday, July 02, 2003 12:11:38 PM  
I got this from LA County. They input a 6 span RC tee section. Shear stirrups are defined for each span. The analysis shows zero rating for shear at CP 210.  
The analysis shows zero shear capacity at 210 and 510, all other CP show N/A for shear ratings. 210 and 510 are the only two locations that show zero for stirrup spacing.

Use Member G1.

## Complete Issue Information

FROM:gbarnhill DATE:Wednesday, July 02, 2003 5:16:50 PM

This is a dimension/tolerance issue. Because of the stirrup spacing entries in inches, the export must miss the last stirrup space in span 2 and 5. I made an adjustment in the 43.75' start distance in span 2 (changed from 43.749167 to exactly 43.75). The analysis now finds all ranges and gets a critical rating for moment.

The clue here is that the last start distance entry for span 2 looks like 44.00 ft (the span length) while it's actual value is 43.999167. Normal Virtis nomenclature would show that line as distance 0.0 for span 3.

The tolerance for ft is at 0.001 which reports a critical zero rating at cp 210.  
If I change the tolerance to 0.01 ft, then the critical zero rating reports at cp 200.

I don't think there is any solution to this other than user experience. By the time I figured this one out, the LA county user had already made the adjustments in start distances and got the results he needed.

FROM:gbarnhill DATE:Thursday, July 03, 2003 8:51:52 AM

The only suggestion I have for this situation is a preference setting to view entries in cells at more than 2 decimals without having to put focus on the individual cell. It may get a user's attention to see an entry like 43.999167 instead of 44.00.

Probably a good topic for discussion at the Users Group Meeting.

FROM:jduray DATE:7/3/03 10:30:36 AM

Krishna - let's discuss this.

FROM:gbarnhill DATE:Thursday, July 03, 2003 12:30:25 PM  
NEW INFORMATION

In looking deeper into this, I find the following.

With tolerance for ft at 0.001

Export sees a start distance of 43.749167 in span 2 with range of 0.25 gives an end distance of 43.999167 which is within tolerance of 44.000 span length.

Export stops with this as the last stirrup schedule for span 2.

BRASS evidently doesn't like having any gap in the schedule, so BRASS assumes no stirrup spacing for that last 0.000833 and therefore fails the shear rating.

If I set the tolerance to 0.0001 ft, then this bbd runs with a critical rating for moment. Export now creates an additional schedule with space of 0.01, start dist 43.9992 and range 0.0008. BRASS is happy.

FROM:jduray DATE:7/3/03 1:24:48 PM

It seems that the export should control the precision of the values written to the BRASS input file based on the tolerance. I'm not sure how to do this since the tolerance can be user-defined. One possibility is for the number of decimal digits to be one greater than the number of zeros to the right of the decimal between the decimal and the first non-zero digit. For example if the tolerance is .00123 then the number of decimal digits written by the export should be 2+1=3.

| 4687.12659 | Suspended | ASD - Rating factor changes significantly when contraflexure location changed |
|------------|-----------|-------------------------------------------------------------------------------|

Description

FROM:dteal DATE:Wednesday, July 02, 2003 3:49:07 PM

In the attached files we received the following errors that we didn't get with previous versions. The error is listed as file system error.jpg.

I generated this error from 2 existing PS structures. The first being Rating Fail.bbd using girder 2. The second from Rate Fail 2,bbd using girder 1.

What has changed that created these errors? The first was created in version 4.0 I think. The second in version 5.0.

FROM:dteal DATE:Thursday, July 03, 2003 8:48:35 AM

I get the same errors in 5.0 SP1

FROM:bgoodrich DATE:Thursday, July 10, 2003 9:50:03 AM

The error checks were added to address Incident 3618. The error should only have been issued if no continuity steel was present. I have corrected the problem for the service pack 1. Fixed for 5.0.1.

Dean - This change will only be in the beta version of the service pack dated after July 10.

FROM:hlee DATE:7/24/2003 10:53:03 AM

Patch test ok.

FROM:dteal DATE:Thursday, July 24, 2003 12:32:46 PM

## Description

FROM:bgoodrich DATE:Tuesday, July 15, 2003 2:35:39 PM  
This incident is from an issue noted in Incident 4493.

Comments from the other incident include:

FROM:gbarnhill DATE:Thursday, July 10, 2003 2:12:27 PM  
I tried a different approach. I changed the Counterflexure location in Span 6 to .41 instead of .30 (Engine Prop of Member Alt). Now I get a very high RF (3.295) at 4/10 span 6. The neg LL moment is still more than the total DL pos moment.

FROM:bgoodrich DATE:Monday, July 14, 2003 12:50:01 PM  
When the dead load contraflexure location is changed from 30% to 41%, the section at 4/10 of span 6 changes from one that includes the slab+beam to one that only includes the rebar+beam. Additionally, section codes generated for the STEEL-GIRDER-CONTROL commands change for the range that includes the 604 POI, i.e., section code 4 (positive flexure check) changes to 5 (negative flexure check). There are shear connectors defined over the entire 6th span, so it seems like the composite section (slab+beam) should be considered. The bottom line is how you want BRASS to analyze the 604 POI, i.e., for positive flexure or negative flexure.

FROM:bgoodrich DATE:Tuesday, July 15, 2003 2:42:22 PM  
Gale also noted that the slab dead load stress is compressive, so it should be added to the allowable compressive stress of 1000 psi. It is currently being subtracted.

The contraflexure locations entered in the engine properties control when the slab or rebar is exported with the steel beam. When the slab is not present, the allowable rebar stress of 16 ksi (0.4 \* 40 ksi) and associated rebar stresses are used to calculate the rating factor. When the slab is present, the allowable compressive stress of 1000 psi and the associated slab stresses are used to calculate the rating factor.

FROM:bgoodrich DATE:Wednesday, July 16, 2003 10:54:24 AM

4/19/2016 3:03:25 PM

HRS AASHTO

375

## Complete Issue Information

When a slab is present in this structure, the allowable concrete stress is a COMPRESSIVE stress of 1000 psi (0.4 \* 2500 psi). The only time a rating factor should be calculated is when the live load stress is compressive. In the case of this structure, the rating factor for negative live load moment is being calculated as 0.52. However, the live load moment is negative, which causes a tensile stress in the deck, for which a rating factor for compressive slab stress should NOT be calculated. This is a bug. For the structure in question, a rating for the deck rebar should be calculated at the 604 POI. However, BRASS-GIRDER only allows the slab OR rebar to be input, but not both. Therefore, it is currently impossible to get the deck rebar rating when a slab is present. Similarly is not possible to get the slab stress rating when only the deck rebar is present.

FROM:bgoodrich DATE:Wednesday, August 06, 2003 4:24:50 PM

I discussed this incident with WYDOT. Because it pertains to ASD, no funds will be expended to investigate or address this issue. WYDOT indicated they would add this issue to the list of ASD requests. I am therefore changing the status of this incident to suspended.

FROM:bgoodrich DATE:Thursday, August 28, 2003 12:45:51 PM

Binh Ha (MassHighway-Bridge Section) reported this same issue. His e-mail follows:

Hi,

Due to the technical problem of our network I am not able to use Visual Intercept to report the incident which is very urgent. For continuous steel girder, from Virtis version 5.0 and older versions the control elements used to be top or bottom flange flexure, but for new version 5.0.1 the control elements are mostly "Flexure-compos slab or rebar" category. The new analysis results have ruined every continuous span steel bridge rated before.

Attached are some bridges were rated form older versions: (For HS20 Truck)

1. L-02-023: 3-continuous span steel bridge - G2: the control element at location 50% of span 2 (limit state: Bottom Flange Flexure - Inventory) - Analysis results under version 5.0.1 - the control element at location 70% of span 2 (limit state: Flexure-compos slab or rebar - Rating Results Summary enclosed).
2. S-25-025: 3-continuous span steel bridge - G2: the control element at location 90% of span 2 (limit state: Vertical Shear - Inventory) - Analysis results under version 5.0.1 - the control element at location 50% of span 3 (limit state: Flexure-compos slab or rebar - Rating Results Summary enclosed).
3. H-12-040: 5-continuous span steel bridge - G30: the control element at location 50% of span 2 (limit state: Bottom Flange Flexure - Inventory) - Analysis results under version 5.0.1 - the control element at location 27.5% of span 3 (limit state: Flexure-compos slab or rebar - Rating Results Summary enclosed).

Please use the enclosed .bbd files (exported under ver 5.0.1) to run under new version and reproduce them to run with older versions for comparison. Please have a quick response for this problem.

Thanks,

<<RESULTS - VER5.0.1.xls>> <<h-12-040.bbd>> <<L-02-023.bbd>>

Description

FROM:rfulton DATE:Tuesday, July 15, 2003 4:50:47 PM

Previous versions of virtis allowed user to override default percentages of brass which is defaulted to grade 60 steel. different grade steels have different percentages due to fatigue considerations. Why was it removed?

FROM:kkennelly DATE:7/16/2003 1:41:37 PM

Robert, Can you tell me in which window you were previously able to enter these override factors? It sounds like something that should have been entered on an Engine tab in Virtis but I don't see any differences in Version 4.2 and 5.0 Engine tabs in Virtis for BRASS ASD.

FROM:rfulton DATE:Tuesday, August 26, 2003 5:55:04 PM

It was under the Girder Superstructure Definition on the analysis tab on the right side. You could put in override factors to multiply by f'c to get fc (INV = .4 & oper = .6) and override factors to multiply by Fy to get fs (for both shear and flexural reinforcement). There were some other overrides for ASD but I do not know if we ever used the others. Our bridge inventory has a large percentage of bridges with RCDG spans built prior to 1954. This may be the only type bridge where ASD rates higher than LF.

FROM:rfulton DATE:Tuesday, September 02, 2003 9:27:53 AM

FROM:kkennelly DATE:9/2/2003 3:03:15 PM

We have such data values on the Factors tab of the Member Alternative window. Can you use those values? I don't recall such values ever being on the Structure Definition window.

Description

FROM:bgoodrich DATE:Thursday, July 17, 2003 1:13:50 PM  
E-mail from Vinacs (7/16/03):

I am getting the following error message within BRASS output file when I rated the member using ASD methodology.

In this particular model, we have rolled beam and therefore, there is no transverse stiffeners specified.

```
0      *** WARNING ***
      TRANSVERSE STIFFENER SPACING AT ANALYSIS POINT 100 FOR TRUCK
# 1 DOES NOT SATISFY CURRENT
      AASHTO CRITERIA. ENGINEER SHOULD REVIEW.
```

Although several similar messages popped up, Should I need to worry about this?

When I reviewed rest of the BRASS file, it appears that slenderness of the web satisfy the AASHTO requirement. I am at a loss here.

Complete Issue Information

You may have this bridge already, however, I attach the bbd file for your infor.

(See attached file: 09C0006.bbd)

Vinacs M Vinayagamoorthy  
916-227-8657

FROM: bgoodrich DATE: Thursday, July 17, 2003 1:16:51 PM  
BRASS is reporting the transverse stiffener warnings because the input file was missing a parameter for indicating that the beam was rolled. A default value for the missing parameter is for a plate girder. I have corrected the export to generate the missing parameter. Fixed for Version 5.0.1.

Programming note: Parameter 10 on the STEEL-GIRDER-CONTROL command was not being generated.

FROM: hlee DATE: 7/24/2003 11:11:10 AM  
Patch test ok.

Description

FROM:mhasan DATE:Friday, July 18, 2003 4:29:04 PM

When using BARS import utility in Virtis, data files consisting of multi-lane LL DF's, Virtis incorrectly populates the assigned single lane DF area with the multi-lane LL distribution factor.

This is a minor bug in the program and it needs to be fixed.

FROM:jduray DATE:7/25/2003 10:29:16 AM

Herman - please confirm what Mac is reporting. As I recall we populate both single and multi-lane with the value we find in the BARS file because we don't know which it is.

FROM:hlee DATE:7/28/2003 1:20:01 PM

BARS import utility populates both single and multi-lane load distribution factors with the same value in the BARS file (Card Type 08, Columns: 61-65).

### Description

FROM:mhasan DATE:Friday, July 18, 2003 4:50:53 PM

Virtis allows the use of a single analysis engine per analysis event. When analyzing different structure types (i.e., steel, concrete, timber & prestressed concrete structures) in a batch mode, the availability of multiple engine in Virtis would be of benefit to many State Permit agencies.

FROM:jduray DATE:7/25/2003 10:31:34 AM

The analysis engine is selected at the member alt level not the analysis event. If, within an analysis event, members using different engines are selected Virtis will process them using the appropriate engine.

### Description

FROM:bmccaffrey DATE:Thursday, July 24, 2003 3:41:13 PM

Why are stage 2 loads now only being applied to fascia members in v/5.0? They were being distributed to all members equally (in every previous version) no matter what you specified in the 'DL Distribution' window, but now we're not getting any railing/barrier loads distributed to the interior beams.

4/19/2016 3:03:27 PM

HRS AASHTO

Complete Issue Information

We've checked about 10 bridges and this is the case in all of them.

Every bridge we rate with 5.0 has different results than 4.2 now.

FROM:bgoodrich DATE:Friday, July 25, 2003 11:43:45 AM  
Please send me the 4.2 and 5.0 BBD files for a few of the bridges in question, so I can confirm your findings.

FROM:bgoodrich DATE:Friday, July 25, 2003 11:44:36 AM  
E-mail from Brian McCaffrey (7/25/03):

Here's one in Virtis v/5.0. We're getting a few more together right now. The text file is part of the output. You'll see that the load due to the 0.052 k/ft railing is only applied to G1 and G5.

I don't have any 4.2 .bbd's handy but SDL was always divided up equally among the girders no matter what you specified on the 'DL Dstribution' window. I'll get some 4.2 files together for you as well.

FROM:bgoodrich DATE:Friday, July 25, 2003 11:45:34 AM  
I imported your BBD file and confirmed that the railing is applied only to the exterior girders. I then reviewed the Structure Typical Section window and found that the railing is assigned to the DC1 load case, which is for stage 1. This is why the railing is applied only to the exterior girders. If the railings were assigned to the DC2 load case (stage 2) in version 4.2, then there may be a problem in the migration utility. I should know more when you send me the 4.2 BBD files.

FROM:bgoodrich DATE:Friday, August 08, 2003 12:12:07 PM  
Brian M. sent me the BBD files I requested. See attached Composite.zip file for version 4.2 and 5.0.

FROM:bgoodrich DATE:Friday, August 08, 2003 12:47:37 PM  
For version 5.0, the export was modified so only one stage was exported for non-composite steel structures. However, this prevented the dead loads from being distributed differently, i.e., uniformly for long-term loads. The export (BrassEngineProperties.cpp) has been revised to utilize the method employed prior to version 5.0. Fixed for version 5.1.

FROM:bgoodrich DATE:Thursday, August 14, 2003 1:29:56 PM  
The work-around is to specify a 3-stage loading sequence in the engine properties for the member alternative.

### Description

FROM:bgoodrich DATE:Friday, July 25, 2003 10:12:02 AM  
E-mail from Vinacs (7/17/03):  
Brian

When I rated girders of this bridge [structural definition (Span 1 MDL1 Sp 4), G2, Interior Girder], the allowable inventory and operating stress at the extreme fiber for a section at midspan was estimated (by BRASS) as 18.15 and 24.75 ksi.

Lateral supports are provided at the supports only. Therefore, unsupported girder length for this girder will be 30.20 feet. Hand calculations based on equation given in Table 10.32.1A yields an allowable

4/19/2016 3:03:27 PM

HRS AASHTO

386

Complete Issue Information

inventory stress of 9.9ksi. (Much lower than that was reported by BRASS)

Could you please check the BRASS output and let me know whether I made any error in the modelling?

Vinacs M Vinayagamoorthy  
916-227-8657

FROM:bgoodrich DATE:Friday, July 25, 2003 10:14:00 AM  
Virtis and BRASS do not obtain the allowable stress from Table 10.32.1A. Instead, the user is responsible for entering the fraction of the yield stress to use for the allowable, i.e., 0.3 in your case. These can be entered in the ASD Factors fields on the Factors tab of the Member Alternative Description window. When any of these factors are left blank, the BRASS default is used, which is 0.55 and 0.75 for structural steel inventory and operating, respectively.

FROM:bgoodrich DATE:Friday, July 25, 2003 10:14:42 AM  
Jay indicated that BRASS should be decreasing the stress automatically for the unbraced length. I reviewed the BRASS code and found the reduction he mentioned. This part of the code is not being exercised because the STEEL-2 command is not generated. Although the unbraced lengths are being exported to the BRASS schedule commands, the POI arrays are not being populated with this data (within BRASS). Only the arrays associated with LFD are being populated. This looks like a definite BRASS bug in the conversion of the schedules to POI data.

FROM:bgoodrich DATE:Friday, July 25, 2003 10:43:03 AM  
I have forwarded this issue to WYDOT for assignment to a BRASS Problem Log.

FROM:bgoodrich DATE:Wednesday, August 06, 2003 4:29:10 PM  
I discussed this incident with WYDOT. Because it pertains to ASD, no funds will be expended to investigate or address this issue. WYDOT indicated they would add this issue to the list of ASD requests. I am therefore changing the status of this incident to suspended.

Complete Issue Information

FROM:gbarnhill DATE:Friday, August 01, 2003 5:40:30 PM

This is a two span PS lbeam from LA County.

They noticed a low rating at 8/10 span 1.

In the original Super Def, analyze Mem 2 alt for HS20 LFD.

I've set POI for 8/10 span 1 and 2/10 span 2.

The Vp value in span 1 reports -62.5 kips. This results in a Vcw value of +80.6 kip.

For the span 2 POI, Vp reports as +62.5 and therefore Vcw is +205.7 kip.

The Span data for the beam is given as CG and force.

I copied the Super Def and changed the beam to strands in rows (tried to simulate the CG's, close at midspan, not close at ends).

Now analyze and the Vp at 8/10 span 1 reports as a positive number.

FROM:bgoodrich DATE:Tuesday, September 09, 2003 3:14:25 PM

I forwarded this issue to WYDOT for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Monday, October 13, 2003 10:29:03 PM

WYDOT has assigned this issue to BRASS Problem Log 455.

FROM:bgoodrich DATE:Friday, November 28, 2003 8:04:06 PM

The incorrect mapping of an argument between two prestressed concrete subroutine caused one subroutine to incorrectly determine the sign of the prestress shear component. The correct variable was used and the shear components became symmetrical. This issue was corrected in BRASS-GIRDER 5.8.8. Fixed for version 5.2.0.

## Description

FROM:dkoenig DATE:Tuesday, August 12, 2003 2:38:18 PM

I tried typing this incident in earlier, but it does not appear that it saved.

We have a structure that will not allow us to open up the framing plan and the structure typical section windows. The structure was previously working fine. The user was editing the structure to make some changes. He made some updates on the deck profile window with no problems. He then went to the framing plan window and copied Bay 1 to Bay 3 with no problems. He later came back and tried to open up the framing plan window and it will not open. The structure typical section window will not open either. If you select either one and try to open them, Virtis does nothing. Also, I noticed that the schematic button will not do anything for the structure typical section.

The bridge does have an error when you try to analyze it. The error is shown below.

Splayed girders and/or tapered overhangs are not allowed!  
01:41:45 PM - Line 1013 in source file D:\Virtis\gui\AbxBrass\EngineExport.cpp.

Error generating deck commands!  
01:41:45 PM - Line 244 in source file D:\Virtis\gui\AbxBrass\BrassDeck.cpp.

I believe that the user probably has the cantilever lengths varying down the bridge, which would be an error. However, you should still be able to open these windows up. The bbd file is attached.

FROM:dkoenig DATE:Tuesday, August 12, 2003 2:45:10 PM

FROM:kkennelly DATE:8/13/2003 8:59:10 AM

You are unable to open these windows because some bad data has been saved in your database. In a girder system in Virtis, each girder has a reference line that locates the position and direction of the girder (as seen in the framing plan). In the Framing Plan Details window, your structure has been specified to have a "Girder Spacing Orientation" that is "perpendicular to the girder". That means that all girders must be parallel for this type of girder spacing to be valid. Somehow the data in your database has been saved such that girder 1 is not parallel to the rest of the girders. So the Framing Plan and Structure Typical Section windows are returning an error because they think the girder spacing should be perpendicular to the girder but the girders aren't parallel so they won't open.

I've attached a bbd file that has the correct data so that all of your girders are parallel and these windows can be opened. I don't know what could have caused the data for girder 1 to be saved slightly

4/19/2016 3:03:29 PM

HRS AASHTO

393

### Complete Issue Information

different from the other girders such that they aren't parallel. The user can enter their data in so many different ways (and the significant digits entered in the data can also have an effect) so I don't think we have a realistic way to prevent this bad data from being saved.

I think a way to solve this problem of being unable to open these windows when the girder spacing is perpendicular but the girders aren't parallel is for Virtis to issue a message to the user that Virtis is going to change the girder spacing orientation for the structure to "Along Support" so these windows can be opened and user must check the data on these windows after they open them.

I've marked this incident as resolved so you can get the revised bbd file and can continue your work. I'll reopen this incident later and make the above changes.

FROM:kkennelly DATE:8/27/2003 4:16:29 PM  
Fixed for Version 5.1

FROM:hlee DATE:2/9/2004 3:42:50 PM  
For a database that has checkin/checkout enabled, Virtis should also check whether the bridge or structure def has been checked out by the user. The bridge or structure def will not get saved if not checked out first.

FROM:jihnat DATE:8/31/2005 3:24:07 PM  
Added check for checkout for version 5.4.0  
For testing, I've attached a copy of the BBD file migrated to version 5.3.1

## Description

FROM:bgoodrich DATE:Thursday, August 14, 2003 3:20:52 PM  
Submitted on behalf of Binh Ha, MassHighway-Bridge Section.

Attached bbd, Excel file with screen captures, and rating vehicle.  
This incident is for Virtis/Opis 5.0.1.

E-mail from Binh Ha:

"I have set wheel advancement denominator = 15 and lane advancement Increment = 4' and run with one vehicle (HS20 - with truck load and no lane load) for FB1 (floorbeam 1), time for completed analysis approximate 6 minutes (Rating Result Summary enclosed for both ASD and LFD).

Through Rating Result Summary for ASD the control element is Vertical Shear at location 0.18' (very weir location for shear! - from output at that location: ALLOWABLE WEB SHEAR STRESS = 0. BASED ON INPUT SPACING???)..."

FROM:bgoodrich DATE:Thursday, August 14, 2003 3:23:57 PM  
The version 5.0.1 work-around for this particular structure is to specify a 3-stage load sequence in the

4/19/2016 3:03:29 PM

HRS AASHTO

396

Complete Issue Information

engine properties for the floorbeam definition. This forces BRASS to exercise certain sections of the code that are not exercised for a 1-stage structure. This is a non-composite floorbeam in which the dead loads are fixed regardless of the number of stages. Therefore, the ratings should be the same. The export in Version 5.1 will determine load sequence as three stages, so Mr. Ha's floorbeam can be analyzed.

The main issue now is the bug that exists when only one stage is specified. Because this problem is in the BRASS ASD module, WYDOT will not authorize any work on it.

FROM:bgoodrich DATE:Tuesday, September 09, 2003 4:08:03 PM  
I forwarded this issue to WYDOT for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Wednesday, September 24, 2003 11:21:37 AM  
I am suspending this issue until WYDOT decides to address ASD issues.

397

Complete Issue Information

Attached bbd. This incident is for Virtis/Opis 5.0.1.

If I set 4 vehicles (HS20, H20, TYPE 3, TYPE 3S2) for analysis: 25 minutes needed (with WAD = 15 - LAI = 4'), if we need more accurate with WAD = 50 and LAI = 1' I do not know how long it takes (maybe it takes several hours).

It is really not convenient for time consuming like that for a single analysis.

FROM:bgoodrich DATE:Thursday, August 14, 2003 3:46:59 PM  
This is a fairly wide floorbeam. Up to four lanes can fit within each of the two travelways, so there are numerous combinations of positions that must be checked. The user controls this with the advancement increment (LAI) setting. When there are several lanes involved, the floorbeam analysis becomes more computationally intensive, hence the time of analysis increases. It may be possible to enhance BRASS to speed up this process.

FROM:bgoodrich DATE:Tuesday, September 09, 2003 4:17:51 PM  
I have forwarded this issue to WYDOT to be added to the BRASS enhancement list.

| 4735.12611 | Resolved      | Defining Floorbeams that don't span the whole structure- (fbs frame into end fbs) |

### Description

FROM:dkoenig DATE:Friday, August 22, 2003 9:14:28 AM

We are getting an error that we can't figure out on a continuous three span girder floorbeam structure. The structure we have has the end floorbeams skewed along the support like what would typically be done. The interior floorbeams are perpendicular to the main girders as would typically be done. When you try to analyze an interior floorbeam, Virtis gives an error saying it can't determine the span length range. The program is checking the length of the floorbeam as 29'-4". The input length is 22'-0". The plan view and typical section schematics show the structure correctly. The text of the error is shown below and the bbd file is attached.

Error generating LFD/ASD load commands!

08:17:40 AM - Line 237 in source file D:\Virtis\gui\AbxBrass\BrassStdLoadControl.cpp.

Error generating distributed load commands!

Review input for items included in Load Case: DLW - Wearing Surface

This would include uniform or distributed dead loads or the section dimensions used to generate dead loads (slab, haunch, etc.).

08:17:40 AM - Line 1066 in source file D:\Virtis\gui\AbxBrass\BrassLoadControl.cpp.

Error getting start distance and range for distributed dead load!

08:17:40 AM - Line 1013 in source file D:\Virtis\gui\AbxBrass\EngineExport.cpp.

Error preparing distributed load for BRASS commands!

08:17:40 AM - Line 1013 in source file D:\Virtis\gui\AbxBrass\EngineExport.cpp.

| 4736.12610 | Discard       | Increase Maximum Number Spans on Floorsystem Structure |

### Description

FROM:dkoenig DATE:Friday, August 22, 2003 9:30:09 AM

We have encountered a situation on a highly skewed structure where we can't define an interior floorbeam. The first interior floorbeam on this structure starts at the main left girder and actually frames into the exterior floorbeam near the center of the structure. Is this a scenario that was thought of when the floorsystem models were developed?

FROM:kkennelly DATE:8/25/2003 9:12:48 AM

This type of structure was considered during development of the floor system module. Review of the system by the Task Force and contractor resulted in the decision that floorbeams framing into end floorbeams did not fall into the 80% of bridges rule and must be defined using the line approach. The system approach can be used to define any interior portions of the structure where the floorbeams frame into the girders but the skewed end panels in this type of structure require a separate superstructure definition using the line approach.

| 4737.12609 | Patch Test    | Error Generating Stringer Reactions on Some Floorbeams |

### Description

FROM:dkoenig DATE:Friday, August 22, 2003 9:41:51 AM

We have encountered an error with exceeding the maximum number of spans. We have a two span continuous slab/floorbeam/girder structure. The slab portion of this structure is continuous across the floorbeams and ends up with sixteen spans. Brass has the limitation of 13 spans. This is an issue that is going to have to be addressed for floorsystem bridges. On continuous span floorsystems, you will frequently encounter this error because there will routinely be more than 14 floorbeams on a structure which will mean that the slab or stringers will exceed the span limitations of Brass. The program information indicates that Virtis will rate simple and continuous floorsystems. The reality is that this is not true. There will frequently be continuous floorsystems that Virtis won't rate because of the limitations of Brass. We need to get WYDOT to enhance Brass to allow more spans. It would be nice if it matched Virtis's maximum number of spans of 50. I would think that this would be a fairly simple thing to do.

FROM:bgoodrich DATE:Thursday, October 23, 2003 4:55:01 PM

I forwarded this issue to WYDOT for consideration.

\*\*\*\*\*

We know that this error has something to do with the maximum number of spans allowed on a floorsystem structure. The attached bbd file has stringers that span 12 spans. If we rework the structure to where the stringers spans 10 spans, everything works fine. Brass's limitation on spans is supposed to be 13. Why does it kick out on 12 spans here? Also, we noticed that the last two floorbeams do not show any computed stringer reactions on the window that these are displayed on. There seems to be a bug in the program somewhere.

FROM:kkennelly DATE:8/25/2003 11:26:30 AM  
I've attached a version 5.0.1 file to this incident.

4/19/2016 3:03:31 PM

HRS AASHTO

405

Complete Issue Information

The virtual stringer analysis runs for 12 spans but when I look in the BRASS output file for the dead and live loads, the reactions are blank for Span 11 right end and both ends of Span 12. So these last 2 reactions aren't being passed back to Virtis.

FROM:bgoodrich DATE:Wednesday, August 27, 2003 1:29:18 PM  
I have confirmed Krishna's findings that BRASS is not passing some of the reactions back to Virtis. I examined the BRASS engines and found a bug in the loop that writes out the reactions. This bug is present in both BRASS-GIRDER and BRASS-GIRDER(LRFD). I will forward this issue to WYDOT.

FROM:bgoodrich DATE:Thursday, September 04, 2003 11:25:12 AM

FROM:bgoodrich DATE:Wednesday, October 08, 2003 3:51:46 PM  
WYDOT assigned this issue to BRASS Problem Log 448, but authorization to begin work is still pending.

FROM:bgoodrich DATE:Monday, November 03, 2003 5:39:10 PM  
This issue has been addressed for BRASS-GIRDER Version 5.8.8. It is not clear when this version will be released. Possible for version 5.2.

Description

FROM:dcoenig DATE:Monday, August 25, 2003 10:25:36 AM

We have encountered an interesting error on floorsystem structures. We were looking at the deadload moment diagrams on the attached 2-span continuous floor system structure. All of the diagrams look okay except for the two load cases: Barrier & Curbs and Railings. On these two load cases, the second span moment diagram is a straight line. We went back and redefined these two loadings as member loads and the moment diagrams are correct. Based on our experimenting with this, we believe that on the case of continuous floorsystem structures, the export program for BRASS is not exporting these two loadings beyond the first span. This problem is happening on the main girders. The bbd file is attached.

FROM:kkennelly DATE:8/25/2003 11:42:09 AM

I see the same problem when I run BID13, left plate girder. The BRASS input file contains 2 lines for DC2, UNIFORM-DL1 but both are for span 1, there is no span 2 DC2 load applied.

FROM:bgoodrich DATE:Wednesday, August 27, 2003 2:39:51 PM

I modified the export (LoadsUtility.cpp) to apply the distributed load to the entire length of the girder member. Fixed for Version 5.1.0.

| 4768.12578 | Resolved      | Error on Skewed End Panels of Floorsystem |

Description

FROM:bmccaffrey DATE:Wednesday, August 27, 2003 11:19:17 AM

See attached error. We license the full unlimited version.

This has only happened on one machine out of 50.

FROM:jihnat DATE:8/27/2003 12:13:27 PM

I spoke to Brian on the phone and generated new Registration Keys for this PC.  
Not sure what caused this, though.

Complete Issue Information

FROM:bmccaffrey DATE:Wednesday, August 27, 2003 12:20:18 PM

The new codes worked. You can resolve this incident.

Description

FROM:dkoenig DATE:Friday, August 29, 2003 1:13:03 PM

We put in the example problem with the skewed end panels. When we finished and tried to rate the structure, we got the error shown below. The program basically will not rate the longest exterior stringers on the skewed end panels. We experimented with this some by adding more girders and modifying the skew. What we have found is that the structure has to have three or less stringers in the skewed end panels for the error not to occur. Also, if the structure is not skewed it will run. Attached are to bbd files. The first one has the skewed end panel with four stringers. The fourth or longest stringer does not run. The second bbd file has five stringers. This error shows up for the two longest stringers on the skewed end panels.

Based on our experimenting, the error has something to do with cross sections, the skew, and the number of stringers on the skewed end panels. Two errors actually show up with a run. The debug version of each error is shown below.

Complete Issue Information

12:19:37 PM - Line 2349 in source file D:\Virtis\DOMAIN\laborslt\DoMemberResults.cpp.

FROM:dkoenig DATE:Friday, August 29, 2003 1:21:28 PM

FROM:kkennelly DATE:8/29/2003 3:43:00 PM

I suspect this is somehow related to tolerances. I ran Unit 1 Stringer 4 in FS5Example1.bbd and the following SPAN commands are generated:

COMMENT Span 1  
SPAN-A 1, 24.0000, 5  
SPAN-C 1, 23.9998, 1,

FROM:bgoodrich DATE:Tuesday, September 02, 2003 12:26:37 PM

The stringer member length along the reference line for "Stringer 4 AtI" in "Unit1 Stringer4" is computed by the domain as 23.999763061965 ft. The user has input all ranges as 24.0 ft, which is correct. When the ResetChangePointGeneration function is called, the domain member length is merged into the list of change points. How is the 23.999763061965 ft member length calculated?

FROM:kkennelly DATE:9/2/2003 2:57:42 PM

The domain is setting the member's reference line length to 23.999763 in DoFlrSystemUnitGeometryList->UpdateStringerMemberPositions() when it calls ComputeGroupDefMbrLength(). That function finds the coordinates of the intersections of the fb and stringer in the group def. It looks like the angle of the floorbeam is not exactly 45.0 degrees when it is converted to radians. That causes the start coordinate of the fb and stringer intersection to be slight off from what it should be to result in a stringer length of 24'. Requires more investigation as to best way to fix this problem.

FROM:kkennelly DATE:9/3/2003 10:07:38 AM

Conversion factor in db for radians is 0.017453. This factor needs more significant digits. Factor changed to 0.01745329252, Superstructure re-entered and reference lines are then stored correctly. We'll need to write a utility to re-compute the direction angles for the reference lines in table abw\_struct\_def\_ref\_line using the original conversion factor and the new, more precise conversion factor. We really need to test the effects of these changes.

FROM:kkennelly DATE:9/3/2003 10:27:10 AM

FROM:hlee DATE:9/24/2003 10:39:59 AM

This incident will be resolved in 5.1.0 SP1. The conversion factor stored in db for radians need to be changed in 5.1.0 SP1.

direction\_angle\_x, direction\_angle\_y, and direction\_angle\_z are allowed to be null.  
The direction angles pi, pi/2, and 0 are not affected by the conversion factor.

FROM:hlee DATE:9/24/2003 12:44:31 PM

Script for 5.1.0 SP1:

```
=====
UPDATE abw_struct_def_ref_line
SET direction_angle_x = (direction_angle_x / 0.017453) * 0.01745329252
```

)

```

=====

FROM:jduray DATE:11/3/2003 8:52:11 AM

The above script is not correct and should not be used.. The problem is much more complicated and cannot be resolved by a script. A utility is being written to make the necessary adjustments.

FROM:hlee DATE:11/21/2003 8:25:15 AM

The utility is done. Please see the attached document for the details of the utility. It is scheduled to be released in 5.1.1.

FROM:gbarnhill DATE:Monday, January 12, 2004 11:16:21 AM

OK in v5.1.1 I see equal lengths for SPAN-A and SPAN-C commands in the export for skewed FB members and skewed supports for girder members. I've verified this in existing bridges in a database migrated to 5.1.1 and in a new superstructure created in 5.1.1.

## Description

Email from Aran Lessard, Bayside Engineering received 9/4/2003:

Here is the .bbd file for the bridge we spoke about on the phone.

As I had mentioned, the 5-span girder system produces rating results indicating a limit state of flexure-compos slab or rebar.

For instance in running the HS20 truck for Girder G31 (interior girder), the governing location is in a region of both negative and positive live load moment (27.5% of span 3).

As a guess, the inventory rating factor of 0.508 seems to be derived from taking the negative moment live load stress (not divided by modular ratio of 10) at the top of slab location (location one), and dividing by the allowable compressive stress in the concrete.

Like I said, it is just a guess but my hand calc indicates  $1200/2276 = 0.527$  (it is close to 0.508 but not

## Description

FROM:kkennelly DATE:9/4/2003 3:41:09 PM

Submitted on behalf of Felton Suthon, Modjeski & Masters via email from Bridgewater email 9/2/2003:

I printed out the output for the stringers in question and located the problem, although a solution is not readily apparent.

The computer is correctly assigning the deck weights to the stringers.

The computer is correctly assigning the parapet loads to the external stringers.

The graphics from "Framing Plan Detail" and "Structure Typical Section" look exactly right.

But...

For some reason, the computer is disregarding the "left edge of deck to first stringer". Because this is a through girder, the distance from left edge of deck to the first main member is -0.75' (the graphics correctly read this as 9" left from edge of deck to Right Main Girder). I also input 1.67 feet as the distance from left edge of deck to first stringer. The graphics look perfect except that there is no distance from stringer to edge of deck. At the start of analysis, the warning "No left cantilever length was input. BRASS set to 1/2 supporting top girder width" and the stringer spacing, which appears throughout the input as 5 spaces at 5'-10" (again correctly on the "Typical Section" graphic) is suddenly 2'-5" and 4 spaces at 5'-10". Thus, the dead load for stringers 1, 2 and 6 is wrong:

Stringer 1 should be supporting 1'-8" (overhang) plus 2'-11" of deck plus the parapet. The computer has it supporting 1'-2 1/2" of deck plus the parapet.

4/19/2016 3:03:32 PM

HRS AASHTO

415

Complete Issue Information

Stringer 2 should be supporting 5'-10" of deck. The computer has it supporting 1'-2 1/2" plus 2'-11".

Stringer 6 should be supporting 2'-11" plus 1'-8" (overhang) of deck plus the parapet. The computer has it supporting 2'-11" of deck plus the parapet.

This seems particularly cruel of the computer. All inputs seem to be correct and yet the information shifts as the analysis runs. There is a warning stating "BRASS cannot apply the loads specified in the Structure Typical Section window, such as the concrete deck, appurtenances, sidewalks and wearing surface, to the load cases assigned to them. Instead, BRASS internally applies them to the appropriate Superstructure Dead Load case for the stage specified in the original Virtis load case."

Any assistance will be greatly appreciated.

Thank you,  
Felton Suthon

FROM:kkennelly DATE:9/4/2003 3:45:39 PM

FROM:bgoodrich DATE:Friday, September 05, 2003 3:13:45 PM  
Added BBD file saved in 5.1.0.1002 format.

FROM:bgoodrich DATE:Friday, September 05, 2003 3:14:22 PM  
I modified the export (BrassCmd.cpp and BrassDeck.cpp) to correctly generate the BRASS deck commands. The export was generating the commands using the bay spacing considering the main girders, instead of just considering the stringers. This caused both the deck cantilever lengths and the first bay spacing to be in correct. This issue has been corrected.

Jim - Please indicate the version in which this issue will be released.

FROM:hlee DATE:9/8/2003 4:10:00 PM

## Description

FROM:bha DATE:Thursday, September 18, 2003 1:43:39 PM

When we open Virtis and go to the subdirectories (Bridge Explorer) to create the new bridge, after we complete the process of input and save, the file will appear at main directory (Bridge Explorer) automatically with Virtis 5.0 and earlier versions but not for version 5.0.1. I just do not know why. Can you help on that matter?

FROM:jihnat DATE:9/24/2003 1:19:06 PM

I'm not sure I understand. Which subdirectories and main directory in the Bridge Explorer are you referring to?

Do you have "All Bridges" selected in the tree on the left side of the Bridge Explorer?

Complete Issue Information

FROM:bha DATE:Wednesday, September 24, 2003 3:58:29 PM

Enclosed is the screen captured from my PC, the main directory is 'All Bridges', the subdirectories are like I-93 NB (Northbound) or SB (Southbound)...so now you know what I mean

FROM:jihnat DATE:9/24/2003 4:17:27 PM

When I create a new bridge it appears immediately, whether I'm running 5.0.0 or 5.0.1.

I see that you have more than 500 bridges in your database. Does your new bridge appear if you Retrieve Next Group? (It's under Bridge on the menu bar.)

FROM:bha DATE:Thursday, September 25, 2003 7:58:07 AM

I went to I-495 (SB) and created a new bridge and save to that subdirectory (or subfolder), the bridge's name was still in that subdirectory (or subfolder)(SB) but its name was not automatically appear on main directory (or main folder) "All Bridges" like version 5.0 and earlier versions.

FROM:bha DATE:Thursday, September 25, 2003 8:08:18 AM

FROM:jihnat DATE:9/25/2003 9:35:30 AM

I haven't been able to reproduce that.

FROM:bha DATE:Thursday, September 25, 2003 9:55:04 AM

Let me simplify the incident: When you use Window Explorer to save a certain file to certain sub-folder, the filename is stored on that sub-folder but its name will not on main folder. But for Bridge Explorer of Virtis (version 5.0 and earlier versions) is different if the file is created and saved to certain sub-folder, its filename is stored on that folder and also on main folder "All Bridges". But for version 5.0.1 thing is the same to window explorer. I suggest you try to practice on your system: you open Virtis and go to certain sub-folder and open a new bridge and then you save the file on that sub-folder, then you open main folder "All Bridges" to see if the name of new bridge on main folder or not.

### Description

FROM:jparisian DATE:Monday, September 29, 2003 9:02:29 AM

I can't figure out how to add users to the MSDE database, Virtis50\_SQLServer. I've read the Virtis help, but I don't know how to start the OSQL program in a command prompt window. When I explore C:\MSSQL7\Binn\osql.exe, it prompts me for a password but won't let me enter anything. What am I doing wrong?

FROM:jihnat DATE:9/29/2003 10:14:41 AM

To start osql in a command prompt window, type "osql -U sa", then just hit return for the password.

FROM:jparisian DATE:Tuesday, October 14, 2003 5:38:14 PM

OK, but what's the password? I've tried "virtis", "bridgeware", and "virtisadmin".

FROM:jihnat DATE:10/15/2003 7:41:24 AM

There is no password. Just hit return.

FROM:jparisian DATE:Wednesday, October 15, 2003 11:39:08 AM

but then i get a message that the login failed and i can't complete the steps necessary to add the user

## Complete Issue Information

While working on inputting some floorsystem structures, we have discovered a problem with how Virtis is distributing stage 2 deadloads. On these floorsystem examples, we set the stage 2 deadload distribution to be equally to all members. When the program runs, all of the stage 2 deadloads are being moved to stage 1 deadloads and being distributed based on transverse continuous beam analysis, which is what we had set for stage 1 loads.

After seeing this on floorsystems, we went back and looked at some simple span steel girder bridges to see what was happening on them. What we found on these structures was that the program was inconsistent. On composite structures, the program will take the stage 2 loadings and distribute them according to what was entered on the dead load distribution tab. For noncomposite structures, the program will move all stage 2 loadings to stage 1 and distribute them based on continuous beam analysis regardless of what was entered for stage 2 loads on the DL distribution tab. We have entered a large number of noncomposite steel structures and were not aware that the program was doing this. We were aware that it was happening on RC deck girder bridges and that it has been fixed in the service pack for 5.0 for RC structures.

For steel structures, this is a serious problem that needs to be addressed quickly. It is fairly common for our structures to be a mixture of composite and noncomposite spans. This basically means that you could have one of these structures defined using multiple structure definitions and the dead load distribution will be different for each structure definition. I suspect that most people are not aware that this is happening. I have attached a bbd file for a structure that has a simple span composite and simple span noncomposite structure definition in it.

FROM:bgoodrich DATE:Monday, October 06, 2003 4:56:01 PM

I have begun investigating this issue. The slab selfweight may be getting applied twice, so I will be verifying this as well.

FROM:bgoodrich DATE:Tuesday, October 14, 2003 2:16:20 PM

The slab selfweight issue was submitted as Incident 4845.

FROM:bgoodrich DATE:Tuesday, October 14, 2003 2:29:19 PM

The DL distribution issue was addressed in Incident 4695, so this incident is a duplicate. For version 5.0, the export was modified so only one stage was exported for non-composite steel structures. However, this prevented the dead loads from being distributed differently, i.e., uniformly for long-term loads. The export (BrassEngineProperties.cpp) has been revised to utilize the method employed prior to version 5.0. Fixed for version 5.1. The work-around is to specify a 3-stage loading sequence in the engine properties for the member alternative.

## Description

FROM:dkoenig DATE:Tuesday, September 30, 2003 4:53:36 PM

We have encountered an issue on girder/floorbeam/slab structures. We have entered one of these structures using the girder line definitions. The program requires that the live load distribution factors be entered for both the main girder and the floorbeam. We have entered a value for the floorbeam and it does not seem to do anything. We tried varying the value of this factor from .15 to 10 and no change in the rating was found for the floorbeam.

We also entered the same structure as a girder system definition. Whenever the compute button is used, it gives the warning message saying the distribution factor can't be computed because the

4/19/2016 3:03:34 PM

HRS AASHTO

423

## Complete Issue Information

spacing of the floorbeams is greater than 6 feet. We tried manually entering values and had the same result as for the girder line definition.

There appears to be two issues that need to be dealt with. First, if the values for a floorbeam distribution factor are going to be ignored, then why are we allowed to enter them? Secondly, exactly how is the analysis engine determining the factors when the spacing is greater than 6 feet?

A bbd file is attached.

FROM:kkennelly DATE:10/6/2003 3:35:16 PM

Your user entered distribution factors are not being used because the floorbeam spacing in your structure is > 6'. As per AASHTO Table 3.23.3.1, for a concrete deck on a floorbeam if the floorbeam spacing is greater than 6' ".. the load on the beam shall be the reaction of the wheels loads assuming the flooring between beams to act as a simple beam." When you analyze your floorbeam and open the "View latest analysis output" window for the fb, you will see two BRASS files listed with the text "(Virtual Analysis)". These are the BRASS input and output files for the "virtual" analysis that determines the LL reaction on your floorbeam assuming the deck to act as simple beams between the floorbeams. The actual BRASS input file for the floorbeam analysis will use this reaction in the " FLOORBEAM-TRUCK-AXLE" command.

Virtis typically tries not to prevent users from entering data. In this case, the usage of the distribution factor is dependent on the AASHTO spec saying don't use it if the spacing is greater than 6'. If the spec changes to say don't use the distribution factor if the spacing is greater than 7', we would have to maintain the user interface based on what spec the user is going to use to analyze the floorbeam and we don't do that.

The export should issue a warning that the user entered distribution factors will not be used (since the export knows it is creating an input file for the current AASHTO spec and the 6' spacing is critical) and a "virtual" analysis will be run to determine the wheel reaction due to simple beam distribution between fb's.

FROM:bgoodrich DATE:Friday, October 10, 2003 2:39:25 PM

The export (BrassStdLoadControl.cpp) was revised to issue the following warning message:

"Distribution factors input for the floorbeam will not be used when the floorbeam spacing is greater than 6 ft. A 'virtual' analysis will be performed to determine the wheel reaction due to simple beam distribution between floorbeams. See AASHTO Table 3.23.3.1."

FROM:gbarnhill DATE:Tuesday, January 13, 2004 11:24:40 AM

OK in 5.1.1 -- I see the new message issued for FB spacing greater than 6 ft and DF calculated by Virtis. For FB spacing 6 ft and less, the DF entered in the LiveLoad Dist dialog is used.

FROM:bgoodrich DATE:Thursday, September 23, 2004 11:04:20 AM

Track field marked with "gale OK". Accepted.

### Description

This is a steel plate girder w/ stiffeners that gets drastically different results if I change the spacing of the last range of stiffeners by 0.003". 1.bbd has a spacing of 46.243" and was generated by the stiffener wizards (see 1.bmp) and generates HS ratings of 23.38T INV and 39.04T OP. 2.bbd has a spacing of 46.24" (see 2.bmp) and generates HS ratings of 60.22T INV and 100.57T OP. If I change the spacing to 46.25" I get HS ratings of 60.22T and 100.57T as well. Shear controls for the low ratings, servicability for the higher values. All are attached in a zipped file.

In summary, here are my results:

| spacing | IN     | OP      | control/location       |
|---------|--------|---------|------------------------|
| 46.240" | 60.22T | 100.57T | servicability/mid-span |
| 46.243" | 23.38T | 39.04T  | shear/end              |
| 46.250" | 60.22T | 100.57T | servicability/mid-span |

I set the tolerances to 0.01'/0.1", 0.001'/0.01", and 0.0001'/0.001" all with the same results.

FROM:bmccaffrey DATE:Wednesday, October 08, 2003 2:22:40 PM

FROM:kkennelly DATE:10/9/2003 8:26:00 AM

Member G4, LFD rating. I found the following differences in the BRASS input file generated by the export:

If the last stiffener spacing is 46.243" the following is the last Stif-Tran-Schedule command generated:  
STIF-TRAN-SCHEDULE 1, 1, 46.2430, 70.2837, 23.1215 This results in the last range ending at 70.2837+23.1215 = 93.4052'

If the last stiffener spacing is 46.24" the following are the last 2 Stif-Tran-Schedule commands:  
STIF-TRAN-SCHEDULE 1, 1, 46.2400, 70.2837, 19.2667  
STIF-TRAN-SCHEDULE 1, 1, 46.2652, 89.5504, 3.8554 This results in the last range

4/19/2016 3:03:35 PM

HRS AASHTO

427

Complete Issue Information

ending at 89.5504+3.8554 = 93.4058'

The span length in the SPAN-A command is 93.4058' for both cases. So I think that BRASS thinks the right end is unstiffened in the first case cause its range ends at 93.4052' not 93.4058'. The logic applied in the export to create the Stif-Tran-Schedule command with the 46.2652" spacing (which was not input by the user) should also get triggered when the spacing is 46.243". I think the export should check that the end of the last range in case 1 exactly matches the span length in the SPAN-A command to the 4th digit required by BRASS.

FROM:bgoodrich DATE:Tuesday, January 06, 2004 1:58:45 PM

I modified BrassCmd.cpp to adjust schedule ranges to coincide with the end of the span. Fixed for version 5.1.1.

### Description

FROM:dkoenig DATE:Wednesday, October 22, 2003 2:04:22 PM

We have a structure that will not allow us to delete a P/S shape. This is a bridge that we copied from another one and then updated. The copied bridge had a narrow flange girder and the new one had a wide top flange. We copied a wide top flange from our library and then updated all of the beam details windows to pick the newly copied library item. We then tried to delete the other shape that we did not want and it will not allow us to do it. It tells us that the object is in use by another thing in the workspace. We have checked the windows, and this shape is not being referenced in any other windows. The bbd file is attached.

FROM:mordoobadi DATE:11/10/2003 10:12:59 AM

David, could you please export the bridge and send it to me. My e-mail address is mordoobadi@mbakercorp.com.

Complete Issue Information

We have come across another bridge that has the same problem as Incident 4853. On this structure we can't delete a steel shape that has been added. The steel shape is a W36x170. Also, we have a material, and bearing stiffeners that we can't delete. The material is ASTM (18,000 Allowable) A-7. The bearing stiffeners are Bearing Stiffener Bent #1 & #5, and Bearing Stiffener Bent 2, 3 & 4. This seems to be a more general problem within the system. Also, note that this structure was copied from another bridge. The bbd file is attached below.

The problem with not being able to delete a material has occurred before. We submitted that one as Incident 2943 which has previously been resolved.

Thanks.

There is an OLD beam definition that is hanging around although it is not connected to a member alternative.  
I am not sure how this has happened.  
It might be because of some problem in a previous version of Virtis/Opis.

I am not able to duplicate this. (making a beam def left behind)

| 4855.12492 | Discard       | Final Allowable Tension, LFD Rating |

### Description

FROM:dteal DATE:Wednesday, October 22, 2003 2:40:48 PM

In the System Defaults we set the value for the Stress Limit Coef. This value is then used to calculate the Allowable tension in the stress limits for both LFD and LRFD. Our state, like others, uses a different allowable tension stress limit for design and rating. So after using the wizard to create your bridge you will have to edit the allowable tension in the stress limit for either the LRFD or the LFD column along with entering the value for the allowable slab compression.

To solve this problem we would like to have a PS Value System Default for each. One for LFD and one for LRFD.

We currently use Zero tension for LFD and  $3 \times \text{SQRT}(f'c)$  for LRFD

### Description

FROM:dteal DATE:Wednesday, October 22, 2003 2:41:27 PM

Currently we have one value for Final Allowable Tension for and LFD Rating. This value is used for both Inventory and Operating. Through the software implementation process I have been informed that we use different values for Inv. And Operating. In order to rate a PS structure the engineer will have to make 2 runs. One with Zero Allowable Tension for Inventory and then run it again with  $6 \cdot \text{SQRT}(f'c)$  Allowable Tension for Operating. This switching back and forth causes problems and errors. By errors I mean making runs and not knowing which value is being used – "Is this an Inventory run or and Operating run"?

According to our bridge ratings engineer this is not a unique thing for Kansas only. Other states change the allowables also.

To solve this problem we would like to have a 2 Final Allowable Tension Value Fields, one for inventory and one for operating.

Do you have any suggestions for a work-a-round?

Krisha - do you have any suggestions?

FROM:kkennelly DATE:10/24/2003 8:06:20 AM  
I can't think of any work around. There is one important fact though, BRASS does not use any of the allowable stresses the user inputs in the Stress Limits window in Virtis so adding a new Final Allowable Tension field will not help. Maybe Brian has some suggestions.

FROM:bgoodrich DATE:Friday, October 24, 2003 1:42:43 PM  
BRASS uses the ASD Factors from the Factors tab of the Member Alternative Description window to set the allowable stress for concrete tension. There are fields for both inventory and operating, however, BRASS only supports the inventory field. This is not documented in the engine help, so this needs to be done.

More importantly, the Manual for Condition Evaluation of Bridges only specifies concrete tension under the inventory rating section. Therefore, BRASS does not calculate an operating rating for concrete tension. It is obvious from your comments that KDOT is doing this, so this is a valid concern. I will forward this issue to WYDOT for consideration.

FROM:bgoodrich DATE:Monday, October 27, 2003 10:42:46 PM  
E-mail from Mike Watters:  
I will add this to the enhancement list for consideration and prioritization by the BRASS users.

Micheal J. Watters, P.E.

E-mail from Jay Puckett:  
I agree that Dean's approach/request is traditional among several DOTs. Jay

FROM:bgoodrich DATE:Monday, October 27, 2003 10:44:34 PM  
Changed Category to 'Enhance BRASS' and status to 'Suspended'.

FROM:smample DATE:Thursday, July 21, 2005 11:21:27 AM  
This incident is the basic problem that propted incident 3862, that I submitted at the meeting in New Mexico.  
Idaho uses  $3 \cdot \text{SQRT}(f'c)$  for Inv rating and  $7.5 \cdot \text{SQRT}(f'c)$  FOR Opr rating. Therefore, at this time I can not use Virtis is load rate any of Idaho's prestressed concrete girder bridges, or efficiently use Virtis for over legal truck permits.

### Description

FROM:bgoodrich DATE:Wednesday, October 22, 2003 2:32:14 PM  
Submitted for Ron Pierce (ADOT):

Ron is trying to analyze a steel bridge, but is getting an error. He indicated that this bridge used to run fine and he is only now getting this error. The following error occurs once BRASS-GIRDER begins its analysis:

**\*\*ERROR\*\*** On the BRACING-SCHEDULE command, the Spacing must be evenly divisible into the Range Length +/- 0.01 ft.

The bracing commands generated by the export are:

BRACING-SCHEDULE 1, 23.8200, 0.0000, 166.7500  
BRACING-SCHEDULE 2, 23.5700, 0.0000, 164.9800

4/19/2016 3:03:37 PM

HRS AASHTO

436

Complete Issue Information

BRACING-SCHEDULE 3, 23.3100, 0.0000, 139.8600  
BRACING-SCHEDULE 3, 23.2800, 139.8600, 23.2800

The second command does not conform to a requirement in BRASS that the range must be evenly divisible by the spacing (within a tolerance). BRASS calculates the following:

Spaces(integer) = (164.98+0.01)/23.57 = 7, however due to floating point accuracy, BRASS calculates 6.

Difference = Spaces \* 23.57 - 164.98 = -23.56

The absolute value of the difference is compared to a tolerance of 0.011, and in this case the difference is obviously greater. Hence, an error message is triggered and BRASS halts the analysis. If I change the spacing to 23.569, BRASS is able to perform the analysis, but this is only a work-around.

I reviewed the BRASS engine and export source and cannot find any modifications that would have led to this problem. I recommend modifying the BRASS tolerance so the correct number of spaces is determined. I will forward this issue to WYDOT.

FROM:bgoodrich DATE:Wednesday, October 22, 2003 3:24:37 PM  
I added Ron's bridge as a 5.1 BBD file and added a screenshot of his tolerances.

FROM:bgoodrich DATE:Thursday, October 30, 2003 1:46:48 PM  
WYDOT assigned this issue to BRASS Problem Log 464.

FROM:bgoodrich DATE:Monday, November 03, 2003 5:47:01 PM  
This issue has been addressed for BRASS-GIRDER Version 5.8.8. It is not clear when this version will be released. Possibly for version 5.2.

### Description

FROM:bgoodrich DATE:Tuesday, October 28, 2003 12:51:57 PM  
E-mail from Vinacs (10/9/03):

Problem Statement: Entering contraflexure points for continuous composite steel girder bridge which is required by the BRASS Engine is somewhat confusing. If the user fails to enter correct contraflexure points, the rating results reported may be erroneous and the user wouldn't know about his mistake.

We have experienced this problems in one 11 span continuous steel girder bridge, where every 3rd span has a drop in span (or two hinges). Our engineers did not enter the contraflexure points correctly and got very low rating factor. We spent about 2 days worth of our time in investigating it. Here, in order to illustrate the problem, I am considering a two span continuous structure here and give the methodology used by the BRASS. (If the methodology used by the BRASS is different, please let us know). For the discussion purposes, please assume there is no deck rebars over the bents.

I believe that the methodology used by BRASS is as follows:

1. User enters the contraflexure points based on dead load moment diagram. If the user forgets to enter the actual contraflexure point, BRASS takes the default values (typically 0.3rd and 0.7th point of a span). In many cases, especially if there are hinges in the span, the contraflexure points will be at the hinge location, not at the default locations.

Average user may not aware that the contraflexure points needs to be entered since it is at a hidden data entry location. Sure enough, our engineers did no know the implications of not correcting the default numbers listed by the BRASS.

2. Based on the contraflexure points described by the user, BRASS creates a mathematical model for the analysis. When creating the section properties over the bents, Brass ignores the deck concrete between the contraflexure points over the bent and uses the steel section alone (includes the rebars, if they are included within the deck). To illustrate this, I show the moment diagram of two span bridge below and corresponding BRASS model.

Typical mathematical model created for the BRASS analysis is shown here. Concrete deck is shown in gray color.

## Complete Issue Information

(Embedded image moved to file: pic16857.pcx)

3. Once the mathematical model is created, BRASS uses the sections described in the mathematical model to rate the bridge. This is where the error occurs.
  - Note that BRASS program rates the bridge at every point (of interest) using positive and negative moment demand. The section described in the mathematical (BRASS) model is used to estimate the positive and negative moment capacity at a point.

IS THIS A CORRECT? Answer is NO. We believe the program should use composite section property when it evaluates the girder for positive moment and use the non-composite section property when it evaluates the girder for negative moment.
  - For example, It rates the girder using non-composite steel section over the bent regardless whether positive or negative moment demand is used to rate the girder. To be correct, it should use non-composite section when it rates the girder using negative moment demand, and use the composite section when it rates the girder using positive moment demand.

However, since the positive moment demand is very low at the bent, rating based on positive moment may not control and therefore, using non-composite section for both positive and negative demand IS ACCEPTABLE.
  - On the other hand, if the BRASS program rates the bridge at 0.3rd point, positive moment demand might be high enough, where using non-composite girder property might yield the controlling rating. In our opinion, it should use appropriate girder section that is applicable for the load demand that is used for rating. If the BRASS rate it using positive moment demand, it should use the composite girder.

In the above example, if you notice, the positive and negative moment demand for permit truck at the actual contraflexure point (0.746th point) is approximately equal (856 and -840 kip-ft respectively)

Instead of using exact contraflexure point, if a user assumed the inflection point is at 0.7th point (JUST 0.046th point away and many users may think it is acceptable), the positive moment demand (1140 kip-ft) is much higher than the negative moment demand (-784 kip-ft). In this case, if we use the non-composite girder section capacity to rate the bridge for positive moment, we may get lower than the actual rating factor.
- It is our opinion that BRASS needs to be modified so that it rates the girder using appropriate sections for the load demand it is checking/rating. This may require modification to the BRASS program. Until the bug is fixed, a work around the problem should be put in place. A few suggestions are:
  1. Once the analysis is performed, BRASS program would know the exact location of the contraflexure points, and if the assumed/entered contraflexure points are different, export program should spell out the difference once the analysis is completed. User will then be able to modify the contraflexure points and rerun the analysis.
  2. Whenever hinges are placed in a span, export program automatically places the contraflexure points at the hinge location and over-write users initial values.

### Description

FROM:kkennelly DATE:10/31/2003 8:51:03 AM  
Submitted on behalf of David Koenig, Missouri DOT via email:

We have been working on setting up slab/girder/floorbeam type structures in our system. As part of that process, we have been looking at the calculation of distribution factors for the floorbeams. AASHTO indicates that when the floorbeam spacing is greater than 6', you compute the distribution factor by determining the wheel load reaction assuming simple spans between floorbeams. My understanding is that Virtis is doing this by using a virtual analysis. We have been trying to match the reactions that Virtis is coming up with and have not been able to do it. We did notice that the virtual file is placing hinges on the floorbeams in some cases. The hinges are apparently placed at .11 feet from the support. The person that has been looking into this is Jose Garcia. He has made up a word document to indicate how we are doing it and what Virtis is coming up with. I have attached that document as well as the bbd file for the example structure. We were wondering if you could explain to us exactly how the program is coming up with the reactions and what it is doing with the hinges?

FROM:kkennelly DATE:10/31/2003 8:54:32 AM  
For the interior floorbeams, the Virtual analysis models the 2 floorbeam spans on either side of the

4/19/2016 3:03:37 PM

HRS AASHTO

442

## Complete Issue Information

floorbeam that is being analyzed. The hinge is being placed adjacent to the middle floorbeam so that the wheel loads will be distributed using a simple beam analysis. If the hinge did not exist, the BRASS model would be composed of a 2 span continuous beam and the wheel loads would be distributed using the continuous beam. The hinge introduces a zero moment constraint so that the wheel loads are distributed using simple beam analysis as per the AASHTO spec.

Brian will have to explain why the export is placing the hinge at 0.11' as opposed to the 12' specified in the BRASS Help manual.

I cannot explain the differences in the wheel load reactions between your hand calcs and the BRASS output. I suspect it has to do with the number of significant digits being carried through by BRASS but Brian should be able to answer your question more definitively.

FROM:kkennelly DATE:10/31/2003 9:08:24 AM

FROM:bgoodrich DATE:Friday, November 07, 2003 12:36:04 PM  
The location of the hinge should have been 0.12 ft, so I modified the export accordingly.

I investigated the differences in the wheel line reaction (WLR) for each structure. I did find an error with the user computations for the 16 ft and 18 ft simple-span structures - the lead 5 kip axle was not included. Therefore the WLRs for them should be:

Structure 3, Ext Floorbeam: 13.875 kips (was 13.5625 kips)  
Structure 4, Ext Floorbeam: 14.611 kips (was 13.7778 kips)

This brought the two highest percent differences down. The largest difference is now 1.2%. The reason for these differences is that BRASS does not position axles directly on the peaks of the influence line. It moves the truck across the structure in increments controlled by the wheel advancement denominator. The wheel advancement denominator is set at 100 for this type of analysis and is sufficient to prevent problems interpolating between influence ordinates. Additionally, when a hinge is present, the influence ordinates are affected slightly, as the hinge is not located directly at the support.

FROM:bgoodrich DATE:Monday, November 10, 2003 2:22:12 PM  
Comments from David Koenig (11/7/03):

I think that should answer the questions we had. We did not have much experience in this area and were looking at it more in depth to have a better understanding of what is being done. It seems like the floorsystem area of the program has been a lot more buggy than other parts of Virtis. We have found quite a few problems in doing some of our research, hopefully we have about got it debugged. I know that a lot of this is because the complexity of the analysis increases tremendously when you have to worry about load transfer between the stringers, floorbeams, and main girders.

FROM:bgoodrich DATE:Monday, November 10, 2003 2:24:18 PM  
Comments accepted by David Koenig. Issue regarding distance to hinge must be patch tested for Version 5.1.1.

Complete Issue Information

I see the Hinge location of 0.12 for the Virtual analysis of an interior floorbeam.

HOWEVER, see the following clips from log files.

```
FB spaced at 5.5 ft, DF entered as 1.0
FLOORBEAM-CONTROL 1.000, 100, 100.00, , 0
FLOORBEAM-TRAVELWAY 1, 0.000, 20.000
COMMENT Reactions computed using AASHTO Table 3.23.3.1
FLOORBEAM-TRUCK 1, TYPE_3____~1, , 10.000, 10.000,/
, 1, 25.000,/
Truck: AASHTO Type 3
FLOORBEAM-TRUCK-AXLE 1, 8.500, 6.000, 8.500
FLOORBEAM-MPT 1, 10.000, 10.000, 8.500, 6.000, 8.500
```

FB spaced at 5.5 ft, DF entered as 2.0

```
FLOORBEAM-CONTROL 1.000, 100, 100.00, , 0
FLOORBEAM-TRAVELWAY 1, 0.000, 20.000
COMMENT Reactions computed using AASHTO Table 3.23.3.1
FLOORBEAM-TRUCK 1, TYPE_3____~1, , 10.000, 10.000,/
, 1, 25.000,/
Truck: AASHTO Type 3
FLOORBEAM-TRUCK-AXLE 1, 17.000, 6.000, 17.000
FLOORBEAM-MPT 1, 10.000, 10.000, 17.000, 6.000, 17.000
```

My question is: based on the COMMENT, shouldn't the Distribution of the truck be based on S/6 ??  
Virtis apparently uses the input DF since the results of these ratings give a RF of 3.44 for DF=1 and 1.72 for DF=2.

I've attached a BBD for V5.1.1

FROM:bgoodrich DATE:Thursday, January 15, 2004 4:06:32 PM  
The lane reactions are calculated either by the simple-beam method (spacing > 6 ft) or by AASHTO Table 3.23.3.1 (spacing <= 6 ft). The distribution factors entered for the floorbeam member alternative (i.e., the 1.0 or 2.0 entered for shear and moment) are applied to the reactions. Note that the weights on the FLOORBEAM-TRUCK-AXLE and FLOORBEAM-MPT commands are factored by the distribution factors, i.e., lane reaction / 2 wheels \* DF. The user is required to enter the distribution factor, which could be S/6 or the 1.0 or 2.0 entered. In short, the export doesn't automatically calculate the distribution factor.

FROM:gbarnhill DATE:Friday, January 16, 2004 4:35:33 PM  
OK in 5.1.1 - I understand the situation based on Brian's comments.

FROM:bgoodrich DATE:Thursday, September 23, 2004 11:07:08 AM

### Description

FROM:smample DATE:Wednesday, November 05, 2003 4:27:33 PM

I am receiving an error that the prestressed concrete section I am trying to import into Virtis cannot be found in the E57PSC.PRN file. I have the E57PSC.PRN file located in the c:\Program Files\AASHTOWARE\Virtis51 directory.

I have attached a copy of the file I am trying to import and my E57PSC.PRN file.

### Description

FROM:mhasan DATE:Thursday, November 06, 2003 12:19:35 PM

When horiz. shear controls the rating at a desired POI, the Rating Result Summary Report does not report rating values correctly. This is not a problem when flexure controls rating.

FROM:bgoodrich DATE:Friday, November 07, 2003 3:06:14 PM

Mac Hasan sent me some a screen shot of the rating summary window and the Madero input and output files. They are attached.

FROM:bgoodrich DATE:Monday, November 10, 2003 12:32:31 PM

E-mail from Mac Hasan (11/10/03):

Brian,

Here are the files.

For timber structures, Vertical shear does not control since the allowable stress is many times higher than the horizontal shear stress. Note the following for structure D-22-C:

For the Modified Tandem vehicle, summary report lists critical RF at the abutment(Code does not require this check) and not at the POI (Used lesser of 3d or L/4). The correct RF should be 1.10 due to flexure at 105 point.

For the Colorado Permit vehicle, flexure controls rating and listing on the summary report is okay.

4/19/2016 3:03:39 PM

HRS AASHTO

448

Complete Issue Information

For the HS20-44 vehicle, summary report for the INV level is okay. For the OPR level, the correct RF should be 1.20 due to flexure at 105 point.

Thanks,

Mac

FROM:bgoodrich DATE:Monday, November 10, 2003 12:34:42 PM  
Thanks for the files. They were useful and clearly identified the issue.

I reviewed the specification and the Madero engine. I found that Madero determines the shear at the critical live load shear distance (lesser of 3d or L/4 as stated in AASHTO 13.6.5). Madero then sets the live load shear at points of interest between the support to this critical shear. A similar adjustment is made for the dead load shear. These adjustments are documented in the output files you sent. Search for the header:

STRINGER SHEAR ENVELOPE ADJUSTMENT CALCULATIONS  
(per AASHTO 16th ed. 13.6.5)

Therefore, the shear ratings near the supports are valid. Please let me know if this addresses your concern.

FROM:mordoobadi DATE:11/24/2003 1:28:56 PM  
Since Brian is responding to this incident I assign it to him.

FROM:bgoodrich DATE:Monday, December 01, 2003 11:32:50 AM  
E-mail from Mac:  
Brian,

Your November 10, 2003 reply was very satisfactory.

Thanks,

Mac Hasan,  
CDOT Bridge Branch

FROM:kkennelly DATE:11/10/2003 8:19:30 AM  
Reply email sent:

Hi Francisca,

I've entered your question as Incident 4884 on the Virtis Technical Support website.

The PS strand you are using in Span 4 is the ½" (7W-270) LR strand. It has a transfer length of 25" (this is defined on the Prestress Strand material window). The right end of your beam has an overhang of 25.62" as input on the Beam Details: Span Detail tab. The BRASS Help for the STRAND-ST2 command indicates that the transfer length + debond length(which is zero since your strands are not debonded) must be greater than the overhang length. 25" is less than 25.62" so BRASS issues the error message.

Regards,  
Krisha Kennelly, PE

Email received:

Ms Kennelly,  
Thank you very much for your speedy response. I will probably will change the overhang from 25.62" to 25".

Have a great day, and thank you for your help.

Francisca

## Description

FROM:dkoenig DATE:Thursday, November 20, 2003 12:01:16 PM

We were trying to run the report tool for the bridge explorer. When you run it, you get the list of attributes that can be selected from the bridge description. This listing does not include the NBI ID. Since this is one of the fields that you can fill out on the first description tab, it should also be available to select in the standard bridge report for the bridge explorer. I suspect that it was intended for this to be available, but that it was overlooked. Please add this as one of the attributes that can be selected.

A runtime error was encountered in TrainingBridge1 at the Virtis training for the city of LA. The steps to duplicate the error follow:

1. Open the Girder System Superstructure Definition window.

Complete Issue Information

2. Check the Frame Structure Simplified Definition box.
3. Check the Frame Connection boxes for the either or both supports.
4. Leave the window without clicking OK/Apply or closing the window.
5. Open the Structure Framing Plan window.
6. Go back to the Girder System Superstructure Definition window.
7. Click OK or Apply to get runtime error.

This error was duplicated several times on several different PCs.

| 4908.12440 | Resolved      | Concrete material cannot be selected when the name ends with a space. |

### Description

FROM:hlee DATE:12/11/2003 10:39:18 AM

From LA Virtis training:

The Deck Profile window on "PS1 - Simple Span Prestressed I Beam Example" (pg. PS1 - 31) should have a "Compute from Typical Section" button since it is a system based input.

FROM:hlee DATE:3/9/2007 10:49:13 AM

Please see whether you have this already resolved for the Michigan DOT training.

FROM:xli DATE:3/9/2007 3:05:36 PM

Resolved. It's on page33 now.

From LA Virtis training:

1. Create a concrete material with a space at the end of the name.
2. Select the concrete material in the Deck Profile window and click OK.
3. The selection is gone when you open the window again.

FROM:dkoenig DATE:Friday, December 12, 2003 9:24:26 AM

We had the same problem. It was incident 4647. This can be fixed by removing the blank space at the end. It probably would make sense to setup Virtis so that it ignored spaces at the end of a name on a library member.

| 4916.12432 | Resolved      | Question regarding modeling floor system superstructure in Virtis |

Description

FROM:bmccaffrey DATE:Monday, December 22, 2003 11:20:03 AM

I am still getting the same errors on skewed girder-floorsystem bridges that I got when beta testing. The attached bridge with the attached tolerance settings (0.001 ft) will work fine. Change the tolerance to 0.01' and it will not. We have to keep the tolerance settings at 0.01 ft or other things in Virtis will not work.

You only have to try the first stringer group.

FROM:hlee DATE:1/8/2004 8:43:06 AM

For the attached bridge, the Stringer Member Alt "U1 S1: 13.04" in Stringer Unit 1 Layout will generate the following rating error message when the tolerance for ft is 0.01. No rating error message will be generated when the ft tolerance is 0.001.

```

-----
-----
Fatal Error Encountered - Unexpected Termination
Data File: er1\U1_S1__13_04\BRASS_LFD\U1_S1__13_04'.DAT

Error No.: 1103
Type   : Input Error
Location : prgen.for
      ****ERROR**** A GIRDER CROSS SECTIONAL AREA LESS THAN 0.01 EXISTS IN SPAN
1 SPAN POINT = 20
      RUN STOPPED.
      REVIEW INPUT OF CROSS SECTION DATA AND SPAN DATA.
-----
-----

```

The distance from the superstructure definition reference line to "U1 S1: 13.04" defined in the Structure Framing Plan Details window is 8.685 ft (5.79 + 5.79/2). In the Structural Typical Section window, this distance is 8.6775 ft (14.49 - 5.8125). If the value "Left edge of deck to first stringer" is changed from 5.8125 to 5.805, this distance will agree with the one in the framing plan. No rating error message will be generated for both ft tolerances.

Description

FROM:kkennelly DATE:12/29/2003 2:52:53 PM

Received via email from Aran Lessard, Bayside Engineering 12/29:

I am in the process of trying to build a Floorbeam-Stringer Floor System and am running into all kinds of problems. Essentially what I have is a stringer-floorbeam-truss bridge that I am trying to model in Virtis. The actual bridge has a few oddities, and I am trying to figure out how to make it work for the program. Only 4 out of 17 of the floorbeam bays contain interior simply-supported stringers and both ends of each floorbeam are cantilevered 5.71 ft over the supports at the truss locations. The cantilevered portions of the floorbeams support stringers that are each non-composite and continuous over 4 spans. I am sending you a scan of the framing plan and deck section sheets (via separate

4/19/2016 3:03:41 PM

HRS AASHTO

460

Complete Issue Information

emails) so you may have a better understanding of what I am talking about.

Is it possible to model this bridge in the Floorbeam-Stringer Floor System configuration that Virtis offers? I have already rated the truss and all associated components under separate program (Brass-Truss, etc.), and would therefore only need to rate the unique floorbeams and stringers with Virtis.

If it is not possible with the Floorbeam-Stringer Floor System, is it possible to model each individual floorbeam and stringer as Floorlines and Girderlines?

I am attaching the .bbd file for the model that I have already created.

Please give me a call when you have had a chance to review the information 617-625-4696.

Thank you,

Aran Lessard

FROM:kkennelly DATE:12/29/2003 2:56:46 PM  
Reply sent via email 12/29:

Virtis requires that the number of stringers in the Structure Typical Section of a floor system superstructure be constant along the length of the superstructure. (See the Virtis "Limitations" help topic.) It looks like your bridge has some sections that have stringers and some that do not contain stringers. You cannot use the Floor System Superstructure approach in Virtis but you can use the Floor Line Superstructure approach to define your stringers and floorbeams.

| 4918.12430 | Resolved      | Concrete modular ratio used when ratio varies along length of floorbeam |

### Description

FROM:kkennelly DATE:12/30/2003 2:38:36 PM

Portions of email received from Aran Lessard, Bayside Engineering 12/30/03: (see incidents 4918, 4919 for other portions of email).

2. The allowable compressive stress (Operating) for 5000 psi concrete is given as 2750 psi in the Brass Output file. AASHTO Maintenance Manual allows a compressive stress of 3000 psi. Is there another provision in AASHTO that Virtis is using for allowable stress?

4. How is the live load calculated for the floorbeam analysis? For example, is the number of vehicles (lanes) based on the travel way width?

i.e. : travel way width = 26 ft  
width of 3 vehicles = (6 + 4 + 6 + 4 + 6) = 26 ft  
since travel way width is  $\geq$  3 vehicle width, use 3 vehicles in live load

analysis

5. My hand calculations show the live load moment indicated in Brass Output file to be adequate, yet the live load Shear at the support seems to be a little off for the 3 vehicles.

i.e. : for HS20 Loading :  
shear at support =  $1/2 \times (3 \times 32k) \times 1.30 \times 1.00 = 62.4k$   
Virtis indicates a LL shear of 53.34k.

Am I incorrect in my assumptions?

FROM:kkennelly DATE:12/30/2003 2:45:15 PM

Replies sent to 12/30/03 via email:

2. When I run your floorbeam, my BRASS output file shows the allowable compressive stress does = 3000 psi. This value is computed using the concrete inventory and operating ASD factors you enter on the Floorbeam Mbr Alt: Factors tab. If you had not entered any values for these factors, the BRASS default of  $0.55 \times f_c$  (=2750 psi) would have been used.

4/19/2016 3:03:41 PM

HRS AASHTO

462

Complete Issue Information

4. The number of lanes is computed based on the travelway width and the lane width. A lane is 12' wide and the truck is assumed to occupy 10' of this lane. So a 26' travelway only contains 2 lanes.

5. I did not investigate this as it appears to be related to your assumption concerning the incorrect number of lanes.

Complete Issue Information

Is there another input parameter that I am missing somewhere? This problem does not seem to occur with the stringer analyses that are associated with this floorbeam.

FROM:kkennelly DATE:12/30/2003 2:46:31 PM  
Reply sent 12/30/03 via email:

- 1. I see the following warning in the log file created by the BRASS export:  
"WARNING (Low):  
The slab rebar modular ratio is different between sections!"

You are getting that message because the cantilever sections of the fb don't have any deck on them so the n value in the cantilevers doesn't match the n value of the floorbeam main span. BRASS requires the n value to be constant along the length of the beam.

I think the BRASS export then creates the PROPERTIES-ST2 command using the BRASS default value of n = 8 instead of trying to use the n=6 you input. Our web server is currently down for maintenance but when it comes back on line I will submit this as a bug in the BRASS export.

In the meantime, if you enter concrete deck ranges for your floorbeam in the cantilever portions using slab thicknesses and widths = 0 and n = 6, the floorbeam will then be analyzed using the n=6 you entered. This should not affect your dead load results.

FROM:bgoodrich DATE:Wednesday, January 07, 2004 2:57:01 PM

Through version 5.1.1, the export found the first modular ratio along the member. I have modified the export to determine the modular ratio as the first user-entered or export-computed modular ratio encountered. The export-computed modular ratio is computed if the user leaves the modular ratio field blank in the UI and there is a slab and rebar defined over a particular range. Note that the export-default modular ratio of 8.0 will be used as a last resort. Fixed for version 5.1.2.

Complete Issue Information

I just realized that I made an error in my hand calculation. I was looking at the shear on the left side of the support while Brass is computing the shear on the right side of support. I do agree with the 6.32k of shear on the right side of support. Sorry about the mix-up.

Description

FROM:bmccaffrey DATE:Wednesday, December 31, 2003 11:09:05 AM

I'm having problems importing the attached .bbd. The error is attached also. I exported it from our Oracle database and I'm just trying to reimport it. It runs fine.

FROM:kkennelly DATE:12/31/2003 12:14:18 PM

Brian, Can you export this bridge into a text file instead of a bbd file? Choose File/Export and then change the Save As Type selection to Text File. And how did you migrate this database to Version 5.1? Thanks.

Complete Issue Information

A script was provided in Version 5.0 Service Pack 1 that should have set the SteelCrossSection deck type. I suspect this script was never run.

FROM:bmccaffrey DATE:Friday, January 02, 2004 8:42:30 AM

The database was migrated by our DBA's using the scripts that came on the installation CD. The text file is attached.

FROM:kkennelly DATE:1/5/2004 9:51:55 AM

Do you know when this bridge was first input into Virtis? Was it before or after version 5.01?

FROM:kkennelly DATE:1/7/2004 1:49:28 PM

Mehrdad, Is there anyway to tell if the script MigrateOracle\_Inc\_4551\_500 to 501.sql was run on the database?

FROM:mordoobadi DATE:1/12/2004 10:31:36 AM

Krishna,

Yes, a record is added to table abw\_sys\_db\_maintenance when the SQL Script file is executed.

The following query will show whether the script MigrateOracle\_Inc\_4551\_500 to 501.sql is applied or not:

```
SELECT * from abw_sys_db_maintenance where maintenance_keyword = 'DB_MIG_500_TO_501_INC_4551';
```

If it return a row it indicates that the script is applied.

FROM:bmccaffrey DATE:Tuesday, October 05, 2004 2:24:29 PM

You can close this incident.

DEAD LOADS                      LOAD LEVEL 1 ----- LOAD LEVEL 2 ----- LOAD LEVEL 3 ----- LOAD LEVEL 4

|        |        |        |     |     |
|--------|--------|--------|-----|-----|
| Moment | -16.65 | -16.65 | N/A | N/A |
| Shear  | -44.96 | -44.96 | N/A | N/A |

LIVE LOADS                      LOAD LEVEL 1 ----- LOAD LEVEL 2 ----- LOAD LEVEL 3 ----- LOAD LEVEL 4

| ACTION                         | (pos) | (neg)   | (pos) | (neg)   | (pos) | (neg) | (pos) | (neg) |
|--------------------------------|-------|---------|-------|---------|-------|-------|-------|-------|
| MOMENT AVAILABLE FOR LIVE LOAD | 547.3 | -1060.8 | 547.3 | -1060.8 | N/A   | N/A   | N/A   | N/A   |
| SHEAR AVAILABLE FOR LIVE LOAD  | -26.0 | -26.0   | N/A   | N/A     | N/A   | N/A   | N/A   | N/A   |

| TRUCK NO. | 1     |        | 2     |        | 3   |     | 4   |     |
|-----------|-------|--------|-------|--------|-----|-----|-----|-----|
| 1: Moment | 386.7 | -515.4 | 231.6 | -308.6 | N/A | N/A | N/A | N/A |
| Shear     | 5.9   | -99.0  | 3.5   | -59.3  | N/A | N/A | N/A | N/A |
| 2: Moment | 372.8 | -361.0 | 223.3 | -216.1 | N/A | N/A | N/A | N/A |
| Shear     | 10.3  | -74.2  | 6.2   | -44.4  | N/A | N/A | N/A | N/A |

Controlling shear rating factor later output as 0.20 for Truck 1 and 0.35 for Truck 2.

The shear capacity and shear available for live load are dependent on the vehicle because AASHTO Eq 8-48 was used but only 1 value is shown in the summary output.

Following response sent to Vinacs:  
 Since the shear capacity is found using AASHTO equation 8-48 which includes the Mu of the live load, the capacity varies for each vehicle.

The following is true when you run just the HS20 truck:  
 BRASS is printing out the section capacity as -.70975395E+02 (kips) in the summary you sent me. If you look inside the detailed BRASS output, this capacity is for truck 2. So the rating factor for this truck2 is (70.97 - 44.96 (DL))/74.2 = 0.35.

For truck1, the shear capacity is Phi \* Vn = -64.91 (kips) which is found inside the detailed BRASS output.  
 The rating factor for truck1 is (64.91-44.96)/99 = 0.20. <- controls

I will enter an incident on the Virtis/Opis Technical Support website that the BRASS summary output is misleading since the shear capacity varies for each vehicle but the different capacities are not printed out there.

Complete Issue Information

1. I chose load case DC2 for wearing surface, however, program dumped that with Load case DC1.

FROM:kkennelly DATE:1/9/2004 4:14:36 PM

Reply sent to Vinacs via email:

1.BRASS does not have a stage 2 for reinforced concrete girder structures so work must be done in the export to produce BRASS commands to model this load. It appears that the export was modified to distribute Stage 2 railing dead loads to all girders for rc bridges but a similar change was not made for the wearing surface.

FROM:bgoodrich DATE:Friday, January 16, 2004 11:17:01 AM

I started on the export modifications the day I received the above e-mail from Krisha and finished most of them by Jan. 12, prior to this incident being put on hold.

I modified the export to uniformly distribute the wearing surface load equally to all girders in a R/C girder system. Fixed for Version 5.1.1.

| 4950.12398 | Duplicate     | Question as to how BRASS LFD computes d for shear capacity |

Description

FROM:kkennelly DATE:1/9/2004 4:16:08 PM  
Submitted on behalf of Vinacs via email:

Refer to structure def "Full Bridge" in "56-0175L-Vinacs.bbd" attached to incident 4947.

2. I chose load case DC2 for Barriers. It is supposed to distribute the girders equally. However, it placed the load on the 1st span only

Here is the BRASS input (pertinent to DC2)

```
# 20 COMMENT      DC2
# 840 LOAD-DESCR   2, 1, 0.00, DC2
# 20 COMMENT      Uniformly Distributed Deck Loads
# 850 UNIFORM-DL1  1, 0.0000, 0.0880, 48.0000, 0.0880
```

Other 3 spans are not included here.

### Description

FROM:kkennelly DATE:1/12/2004 10:25:25 AM

Submitted on behalf of Vinacs via email: Refer to "56-0175L-Vinacs.bbd" attached to Incident 4947.

I am still puzzled with the shear capacity calculation, especially "d" distance reported in the detailed calculation.

The location I am considering for the discussion purpose is point 108. According the input, RC Section 6 is used at this location.

## Complete Issue Information

We have top rebars (2# 5 + 4# 11 bars) are placed 2.3 inches from top surface.  $A_{st} = 6.86$  inches  
We have bottom rebars (2#11 bars) are placed 2.3 inches from bottom fiber  
 $A_{sb} = 3.12$  inches  
Total depth of the section 57 inches

Since the location I am considering in the negative moment region,  $d$  is from bottom fiber to centroid of the tension rebar. thus  $d = 57 - 2.3 = 54.7$  inches. Unfortunately the BRASS considers  $d_a$  as 21.57 inches. How did they come up with this number? Am I missing something here?

### BRASS Output:

Description

FROM: gbarnhill DATE: Tuesday, January 13, 2004 11:27:07 AM

In testing Inc 4829, I created a bridge with multiple FB with girderline input. I entered enough data so the bridge would analyze in the Explorer. When the Analysis Results report comes up, FB with spacings 6 feet or less are not reported and the overall bridge rating results does not show the lowest RF.

The attached BBD is V5.1.1

FROM: mordoobadi DATE: 3/11/2004 2:40:27 PM

It appears that for floor beams with distances to adjacent floorbeams greater than 6' we get results but if the distance is less than 6' the BRASS does not populate the results.

I do not think anything in the results object could casue this. I think BRASS is not reporting the results.

### Description

FROM:kkennelly DATE:1/14/2004 8:43:12 AM

Submitted on behalf of SMample via email: (see 18165.bbd attached to V14958)

I have been going over the analysis reports, and analysis charts for this bridge. When I view the results for a superstructure member (say G01) under the Report Type drop down menu - "Dead load Actions", under the Stage drop down menu, only "Non Composite Stage 1" is available. Under the Dead Load Case menu there are three available choices; "Girder Weight", "Superimposed Uniform Dead Load", and "DC 2". In the report and graph, there is output for all three dead load conditions. There should be no dead loads acting on a non composite section, this type of bridge does not have a non composite stage. The only superimposed dead loads are the bridge rail and wearing surface, the

4/19/2016 3:03:45 PM

HRS AASHTO

487

## Complete Issue Information

dead load of both are entered as Load Case "DC 2" on the Structure Typical Section window. No other dead loads are entered separately on the Member Loads window. Is the analysis report correct?

I modified the analysis by going to the Superstructure Loads window, DL Distribution tab, under Stage 1 Dead Load Distribution, clicked off "By tributary area", clicked on " User-defined dead load". The result was that "Non Composite Stage 1" was still the only stage available but the "Superimposed Uniform Dead Load" had been eliminated.

The results seem suspicious to me. But again I may be overlooking something very basic and simple.

Any information you can give me on viewing these results would be most appreciated.

FROM:kkennelly DATE:1/14/2004 8:45:24 AM  
Response sent via email:

BRASS only considers 1 stage for reinforced concrete girder bridges. The stage is called non-composite only because the deck is not combined with the girder using  $n$  and  $3n$  like it is for a deck and a steel girder. (The deck is considered in the section properties in Stage1.) It's just a naming convention that makes more sense for steel and ps girders than for reinforced concrete girders.

The log file produced by the export from Virtis data to BRASS input file contains the following warning:

### WARNING (High):

A load is being applied to Stage 2, which does not exist in BRASS for this structure type! The load(s) will be applied to the last allowable stage (Stage 1).

In the analysis output, the Superimposed Uniform Dead Load is due to the wearing surface and the DC2 is your railing load. You specified the railing and wearing surface to be applied to Stage 2 but that stage doesn't exist for rc girders so the loads were applied to Stage 1.

You specified the Stage 2 dead loads to be uniformly distributed to all girders and the export log produced the following warning:

### WARNING (Low):

Stage 2 deck loads were chosen to be uniformly distributed, however, BRASS only supports one stage for reinforced concrete. Therefore, stage 2 deck loads will be uniformly distributed by the BRASS Export and applied as member loads.

So the DC2 load you see is the load on the girder due to the railing loads being uniformly distributed to all girders.

If you switch Stage 1 DL distribution to "User defined load" that means you will enter any additional deck loads yourself in the Member Loads windows. The export log produces the following warning:

### WARNING (Low):

For stage 1 dead load distribution, the 'User input results...' was selected. Therefore, any deck loads applied to stage 1 in the Structure Typical Section window will be neglected.

Submitted on behalf of Elizabeth Balcha via email:

We are doing a rating analysis for a stringer and floorbeam system . The bending moment diagram of (FB1) for Noncomposite dead load doesn't seem right at the middle support it is ( 3kip-ft ) which we expect it to be (0.0kip-ft).

Could you look at the file please ? I have attached the BBD file the file name is F-04-012 (20M).

FROM:kkennelly DATE:1/14/2004 10:32:48 AM  
Response sent via email:

I've entered your question as Incident 4961 on the Virtis/Opis Technical Support website. Do you agree with the negative NCDL moment at the exterior supports (-16.3 kft)?

FROM:kkennelly DATE:1/14/2004 12:12:36 PM  
email received from Elizabeth:

I agree with the negative moment at that support. On the previous email that I send you it seems odd to get a positive moment over a support.

FROM:bgoodrich DATE:Wednesday, January 14, 2004 10:59:25 PM  
While reviewing the Virtis input, I noticed that there are two concentrated loads (in the NCDL load case) applied to each of the cantilevers. These concentrated loads result in a positive moment at the middle support of the floorbeam. While the distributed load applied to the two middle spans causes a negative moment at the middle support, the superposition of the two loadings give an overall positive moment. Please let me know if you come to the same conclusion.

FROM:bgoodrich DATE:Thursday, January 15, 2004 12:54:44 PM  
Hi Brian

I agree with the conclusion .

Thanks for your time

Elizabeth

## Description

FROM:bha DATE:Thursday, January 15, 2004 10:10:45 AM

We would like to ask you to give us the procedure of live load calculation on floorbeam of all cases except the case which uses DF from table 3.23.3.1 AASHTO (Standard) and how to compute effective flange width of the deck composited to floorbeam.

Thanks,

FROM:kkennelly DATE:1/16/2004 1:51:02 PM

As per AASHTO Table 3.23.3.1, for a concrete deck on a floorbeam if the floorbeam spacing is greater than 6', "... the load on the beam shall be the reaction of the wheels loads assuming the flooring between beams to act as a simple beam."

The BRASS export generates a "virtual" stringer data file (for a longitudinal analysis) in order to get the reaction at the floorbeam due to one lane of live load (without impact and without distribution factors). The resulting reaction is then divided by the number of wheel lines (currently two) and used to generate the BRASS data file for the floorbeam analysis.

When you analyze your floorbeam and open the "View latest analysis output" window for the fb, you will see two BRASS files listed with the text "(Virtual Analysis)". These are the BRASS input and

4/19/2016 3:03:46 PM

HRS AASHTO

491

Complete Issue Information

output files for the "virtual" analysis that determines the LL reaction on your floorbeam assuming the deck to act as simple beams between the floorbeams. The actual BRASS input file for the floorbeam analysis will use this reaction in the "FLOORBEAM-TRUCK-AXLE" command.

The effective flange width of the floorbeam can be computed using the same procedure as for computing it for a longitudinal girder but substitute the floorbeam spacing for the girder spacing and the floorbeam length for the span length.

FROM:kkennelly DATE:1/16/2004 4:07:27 PM  
Email received from Binh:

I am not agree with you about your explanation for incident 4963, the article 3.23.3.2: "If longitudinal stringers are omitted and the floor is supported directly on floorbeams, the beams shall be designed for loads determined in accordance with Table 3.23.3.1", that means the table just applied for through girder floorbeam system but not for floorbeam-stringer or girder-floorbeam-stringer systems. Second, we can not find the explanation of effective flange width is satisfied.

Please give us the right explanation.  
Thanks,

FROM:kkennelly DATE:1/16/2004 4:08:11 PM  
Email response sent to Binh:

For structures that contain stringers and floorbeams, the live load reaction at the floorbeam is obtained using a virtual stringer analysis. This virtual stringer analysis uses the stringer span lengths to determine the reaction at the floorbeam to be analyzed.

The effective flange width is computed as per AASHTO 10.38.3. Substitute the span length of the floorbeam for the girder span length in 10.38.3.1(1) and substitute the floorbeam spacing for the girder spacing in 10.38.3.1(2).

### Description

FROM:kkennelly DATE:1/21/2004 11:16:48 AM  
Submitted on behalf of Steve Mample, Idaho via email:

I have attempted to use the Virtis Frame analysis to rate a one span reinforced box culvert. On the Member Load window - "Distributed Load tab", I have tried to input a negative distributed load to model the moment due to soil pressure on the culvert legs. I get the following error message; "A tapered load was input that does not start or stop at a node point." The error message says to adjust the node points. Is the error message correct, or am I trying to something that is not possible with Virtis? With a simple span reinforced concrete beam bridge, I shouldn't think you should have to adjust the node points to accommodate a distributed load. I appreciate your help.

FROM:kkennelly DATE:1/21/2004 11:25:02 AM  
Response sent via email:

When I analyze your member I see the following message in the export log file created when the Virtis data is exported to BRASS:

#### WARNING (High):

A tapered load was detected. Tapered loads must start and stop at node points of the BRASS structural analysis model. This analysis will be halted if the load(s) do not conform to these restrictions.

The location of the node points of the BRASS structural analysis model cannot be controlled from Virtis. I don't think there is any way for you to even see where these internal BRASS nodes are.

As a workaround, I changed the length of your first distributed load to start at 0' and have a length of 6.92' (as opposed to the 6.907608' you input as the length.) This small difference in length should not affect your analysis and the BRASS program will run with this length.

I've entered your problem as Incident 4968 on the Virtis Technical Support website so we can determine if we can change anything in BRASS to solve this problem. Please let me know if you need

4/19/2016 3:03:47 PM

HRS AASHTO

493

Complete Issue Information

additional information.

FROM: bgoodrich DATE: Wednesday, January 21, 2004 7:30:02 PM

This issue was already submitted as Incident 2361. A decision was made to force the user to conform to the BRASS requirement that distributed load start and end locations must coincide with node points. The user must add a cross section change at the start and/or end of the distributed load or slightly change the distributed load distances. I have marked this issue as a duplicate.

Description

FROM: dkoenig DATE: Tuesday, January 27, 2004 4:31:16 PM

We are having a problem with appurtenance ID's again. The warning is happening on the first structure definition on the attached file. The warning is: No appurtenance id assigned to the appurtenance location. The other structure definitions do not get this message. The first time we had this message,

4/19/2016 3:03:47 PM

HRS AASHTO

494

Complete Issue Information

it was only showing up one time. We tried adding a new parapet and reassigning the new parapet as the parapet for the first structure definition. After making this change, the warning message shows up four times. There are other structure definitions on this bridge that do not get this warning message. If we change back to the previous parapet definition, we still get these same four warning messages. This appears to be the same problem as what we had on Incident 4310. The source of that problem was never found. This bridge was copied from another structure, but the other structure did not have this warning message. The bbd file is attached.

FROM:dkoenig DATE:Tuesday, January 27, 2004 4:39:56 PM

FROM:dkoenig DATE:Tuesday, January 27, 2004 4:47:01 PM

Since this is only showing up as a warning when a structure is validated, it is possible that this is happening on other structures in our database and we have not noticed it. We may want to run a script against our database to check for other instances of this. I know that this same problem happened in another state, so if we find it in other areas of our database, then we may want to have other Oracle users check for this situation happening in their databases.

FROM:kkennelly DATE:1/28/2004 9:17:48 AM

The only way I am able to reproduce such a problem is to assign an appurtenance name with trailing blank spaces in the Structure Typical Section window. The appurtenances in your bridge do not currently have trailing blank spaces at the end of the name but they could have had trailing blank spaces when they were first entered and assigned and then the user removed these blank spaces.

I've attached a bbd file for your bridge that has these invalid database rows removed.

You can use the following script to check for null appurtenance ids:

```
SELECT DISTINCT bridge_id, struct_def_id FROM abw_conc_railing_loc WHERE conc_railing_id IS NULL;
```

I've created incident 4972 to address the trailing blank spaces at the end of names in Virtis.

FROM:mordoobadi DATE:3/12/2004 12:12:29 PM

I sent Dennis Winki an SQL script file to trim the trailing spaces at the end of concrete railing names and to remove duplicate/unnecessary rows in the abw\_conc\_railing\_location table. I asked him to advise their Virtis/Opis users not to use extra spaces at the end of concrete appurtenance names. This issue is addressed in Virtis/Opis 5.1 service pack 1 (software) which is going to be released soon.

### Description

FROM:kkennelly DATE:1/28/2004 11:44:39 AM  
Submitted on behalf of Pankaj Saharia, Fay & Spofford:

Per our phone conversation this morning, I am attaching herewith the export file for the Weston Bridge with flared girders (exterior ones). I can be reached at 781-221-1108 if you have any questions.

FROM:kkennelly DATE:1/28/2004 11:47:05 AM  
Responses sent via email:

I suspect your problem has something to do with bad data entered on your Structure Typical Section window. The computed right overhangs on that window show negative values which means the rightmost girder is located to the right of where your deck ends.

On the Structure Typical Section window you entered 17.0938' from superstructure def ref line to left edge of deck and 18.443' from superstructure def ref line to right edge of deck. That adds up to 35.5368' total deck width at the start of structure as measured perpendicular to the superstructure def ref line. Your girder spacing entered on the Framing Plan Details window are measured along the support. If I use the skew angle to compute the girder spacing measured perpendicular to the support line, the perpendicular distance between girder 1 and girder 6 adds up to 36.3317'. The distance between the exterior girders should not be less than the out-out deck width.

Complete Issue Information

Try to re-enter the data on the Structure Typical Section window and see if that straightens out your bridge. Also be careful to always use the same number of significant digits when you enter data in Virtis.

As I mentioned on the phone, you will not be able to rate the girders in your structure since the structure contains splayed girders and tapered overhangs. Please refer to the "Limitations" topic in the Virtis help file. Select the "Engine Related Help" link on that window to see what limitations BRASS has.

Description

FROM:kkennelly DATE:2/4/2004 8:18:59 AM  
Email received from Steve Mample, Idaho DOT:

Hello, Krisha.  
Attached is the BBD file for a composite steel girder bridge. I don't usually have any trouble with steel girder bridges, but this one has me stumped. I thought it would be easier to just send you the file, rather than trying to describe the error message. If you have the time, I would appreciate it if you could take a look at it.  
Thank you, Steve.

FROM:kkennelly DATE:2/4/2004 8:20:48 AM

Response sent via email:

When I analyze G01 I get the following error message. I assume you get a similar one:

Unable to convert steel beam to BRASS cross sections!  
 Error generating BRASS cross section commands!  
 Unable to get cross section dimensions!  
 Invalid or unsupported cross section!  
 Error filling BRASS cross section!  
 Error retrieving data for generated cross section at 2346.00 in  
 Unable to DoSteelFlangePlateRangeSetPtr->MoveDistance in FillCrossSectionData!  
 Error getting flange plate from steel flange plate ranges to left of 2346.000000000 in!  
 Current tolerance for in is 0.001000000.

The export that takes the Virtis data and creates the BRASS input file is unable to get the flange plate information to the left of the point at 2346" (=195.5'). Your top flange data in the girder profile window has the last flange plate ending at 156.4166' + 39.0833' = 195.4999'. The span length for this member is 195.5' so there is a tiny gap where your flange plate ends and the span ends.

You can fix this problem in one of two ways:

1. Be consistent with the number of significant digits you use when entering data in Virtis so that your ranges always add up to the span length. (The data you entered for the bottom flange has the flange plate correctly ending right at 195.5'.)
2. Adjust the tolerances on the System Defaults window so Virtis and the export to BRASS will ignore tiny gaps such as the one in your top flange plate description. If your inches tolerance is set to 0.01, this tiny gap will be ignored. (The inches tolerance is used because export to BRASS uses inches)

You will also need to adjust the length of your SIP Forms member load to get your beams to run. The SIP Forms member load is currently 195.538058' long, the beam length is only 195.5'. (Adjust that length before you change the tolerances.)

### Description

FROM:kkennelly DATE:2/5/2004 10:51:42 AM  
Email received from Vinacs, Caltrans:

Krishna

Could you please check the following bridge for me.

Another question: Does BRASS rate the bridge points that are within d distance from the support. Specification states that the girder shear needs to be checked at a distance d distance away from the support. In this bridge "substructure", the span length is very small (max 20 feet) and girder depth is 4 to 5 feet. That means we do not rate for shear at 0.00, 0.1 and 0.2 (sometimes) points. Unfortunately, when we specify to rate the bridge at every 10th point, it does the rating at these points. In many instances, controlling location falls at these points.

Thanks

Subject: Could you please check this for me!(Document link: Murugesu Vinayagamoorthy) 02/04/04 11:59 AM Brian,

In this model, we are trying to analyze the bent cap.

When I rated this bridge at the user defined point only, the controlling location came about to be 302.77. At location 302.77, the d for shear is taken as 38.011 inches (instead of about 66.9 inches). Structure Alternative: BENT 3 Member Alternative: Vinacs BENT 3 FOR 100k-DbIWd-585G-45d

When I rated this bridge using every 10th point, rating for shear became to ZERO and the controlling point came about to be 100.00. This is the tip of the cantilever end of the structure. When I review the output, BRASS reported a large dead load at the point, when it rated the bridge. (Note that The analysis results shows a ZERO shear at that point.)

FROM:kkennelly DATE:2/5/2004 11:05:31 AM  
Email response sent back to Vinacs:

I ran member alt Vinacs BENT 3 FOR 100k-DbIWd-585G-45d and I get the same results as you. Unfortunately, I am unable to determine why BRASS computes the d at point 302.77 as 38". I am also unable to determine why the rating factor calcs at point 100 have a dead and live load shear value when the tabular listing of the results shows the shears to be zero as expected. I have entered your problem as incident 4985 on the Virtis Technical Support website. Brian should be able to answer your questions.

As for your question regarding rating at a distance d away from the support, I believe that BRASS does not follow this spec when you have picked the Generate tenth points options (Options 1 or 3) on the Member Alternative:Engine tab. If you select Option 5 - Generate user defined points of interest only, BRASS will only rate at the point of interest locations you've added. To check the rating at a distance d from the support, you should add a point of interest at that distance d from the support.

FROM:kkennelly DATE:2/5/2004 11:29:12 AM  
Response received from Vinacs:

With regards to the rating at points within d distance from the support, I have the following comment.

When the girders are continuous over a support, user needs to rate the girder at 0.0, 0.1 and 0.2 points for negative moment. At the same time, user need not rate the girder for shear at these locations (if these falls within d distance from the support). It is a problem for us.

## Complete Issue Information

In order to work around this problem, we are creating two alternatives - one for Moment rating (where we tell the program to ignore shear - luckily we have this option within Virtis) and the other where the analysis points are picked by the user to make sure the program does rate for shear at appropriate locations only.

FROM:bgoodrich DATE:Thursday, February 05, 2004 12:00:05 PM  
My response to Vinacs:

I investigated the shear issue at the 100.0 point of interest. By default, BRASS is obtaining the dead and live load shear at "d" away from the support. The problem is that this is 6 ft, which is longer than the actual length of span 1 (5 ft). Therefore, BRASS is getting the shears on a completely different span. I believe the deep beam and short span (due to the structure being a pier cap) are a unique situation. I will forward this issue to WYDOT for approval.

You have found a good work-around, so at least your not stopped cold.

FROM:bgoodrich DATE:Friday, February 06, 2004 10:39:48 AM  
My e-mail to Vinacs (2/5/04):

I would like to get some more information from you on the zero shear rating problem, which Krishna entered as Incident 4985. How many structures do you have that are exhibiting this problem? They appear to be the same structures that are exhibiting the reduced shear depth problem (Incident 4549). If the number of these structures is large, performing the work-around in Virtis for each of these structures will be time consuming and you will have to maintain two alternatives with different points of interest.

Jay and I meet with WYDOT management next week. I have formulated a plan to correct this issue in the BRASS-GIRDER engine, but I will need to discuss it with WYDOT and get their approval. Hopefully, we can get this issue resolved quickly.

FROM:bgoodrich DATE:Friday, February 06, 2004 10:40:33 AM  
E-mail from Vinacs (2/6/04):

This is somewhat a long story, however, to make you understand, I will try to give brief history and the dilemma that we are in.

In the past, we rated bridge superstructures for heavier loads prior to allow them to go over the bridges. These heavier permit trucks used to resemble the Caltrans design permit truck. As a result, we typically assumed the bent caps are OK. Total weight of these typical heavier permit trucks + loads ranges from 130,000 to 400,000 lbs.

After the power crisis hit our state, power companies has started to build several new power plants. The transformers are being built in Europe and Japan. These are huge Transformers (Total weight Transformer + transport Vehicles ranges from 800,000 lbs to 1.1 million pounds). These will be brought to our port very soon and needs to be transported to various locations in California. When we compare the load demand from these Permit trucks to our design trucks, these permit trucks places very large negative moment (over the bents) and large reaction at the bent. The ratio of the Permit demand to our design demand ranges from 0.7 to 1.78. Higher

4/19/2016 3:03:48 PM

HRS AASHTO

502

## Complete Issue Information

reaction to the bent means, higher demand on the bent cap.

Checking the superstructure (negative moment demand) has been done in the past and therefore, that is not a problem, other than a huge task. Checking the bent cap is totally a different story. We haven't done any rating on the substructure (bent cap and columns) in the past and do not have a good, reliable and tested tool. The best suitable tool at our disposal is the Virtis/BRASS.

because, VIRTIS/BRASS allow us to rate a member using any user defined vehicle at any specified location. Many of the bridges were designed in the past (prior to 1972) using allowable stress method using HS20 truck only. During that time, many of the rebars were terminated using HS20+DL envelop demand chart. The permit demand may have different moment envelop and therefore the sections closer the bar cut off points need to be checked. Again BRASS can rate a bridge any specified location. As we press on using the Virtis/BRASS model, we found many problems: 1. BRASS incorrectly report the shear capacity 2. Difficulties in modelling the members (skewed bents and rebar layout) 3. Different skewed bents needs different factious trucks (gage of the fictitious truck is different for different skewed bents). and so on.

Overall BRASS handles the situation well.

Rating factors for some bridges came about to be low for this permit truck. Rating factor is based on the worst loading on the member (that is what the rating factor is all about). Here, we are trying to find a way to allow the vehicle to go over the bridge. In a few bridges, we are able to make the vehicle go over the bridge by straddling it closer to the barrier rail (so that it lower the demand of bent cap). Locating a truck in a bridge so it could travel over a bridge is a very time consuming task.

Since transformers need to go to different locations from different port, there are many bridges that need to be checked. For example, currently we are working on one (about 800,000 lbs) move that involves about 100 bridges, of which we identified 20 bridges need review of substructures. (Ideally, we like to rate all the bent caps, however, because of limited time, we picked the worst case bridges). There are 4 more variances to be checked. These variances have several (different route) bridges. The next permit variance weighs about 1.1 million pound one and may produce much larger demands than the one we currently working on. If I need to guess, I would say probably about 80 bridges to be done within 4 months from today.

I hope it makes sense

If you know of any other tool or any other methods that could help us rating bent caps, let me know

FROM: bgoodrich DATE: Thursday, February 12, 2004 10:12:52 AM

There is no method for setting the shear distance within Virtis for each span; however, this distance can be specified on a point of interest (POI). The only problem is that the BRASS export does not permit point of interest overrides when the user opts to generate point-of-interest data from the schedules. The manual alternative is to specify the desired points of interest, override the schedule data by entering stirrup area and spacing, shear distance, etc. for the point of interest, and select the option to not generate point of interest data from schedules. Data for one POI could be entered and then that POI could be copied over and over. The biggest headache is determining and specifying the stirrup area and spacing for each POI.

Complete Issue Information

FROM:bgoodrich DATE:Thursday, February 12, 2004 10:15:42 AM

I discussed this issue with WYDOT on Feb. 11, and the request for modifying BRASS to address this issue was denied. WYDOT felt that the structure was really outside the scope of the BRASS-GIRDER superstructure engine. Therefore, if this issue is to be addressed, it must be done within the Virtis framework.

Alternatives include:

- 1) Modify Virtis to collect the shear distances at the ends of each span (on the member alternative), which is consistent with providing this information on the point of interest window.
- 2) Automatically set the shear distance to zero for spans in which the section depth is greater than the span length. The user can always do the work-around discussed above. This alternative would take a couple hours to implement.

For either alternative, the shear distances could be exported to the STIRRUP-SCHEDULE commands.

FROM:jcarney DATE:Friday, February 13, 2004 9:08:22 AM

Just a thought- but one possible solution in the meantime may be to input dummy stirrup steel (high area) for the region of the cap beam which is within "d" distance from the pier. This should get rid of the problem with these points governing the shear ratings and provide governing shear ratings beyond the "d" distance from the support.

FROM:bgoodrich DATE:Wednesday, February 25, 2004 7:41:42 PM

I made the necessary export modifications to address the shear distance problem. I also added some text to the "Point of Interest: Shear" topic in the engine help files. Fixed for version 5.1.1.

FROM: bgoodrich DATE: Monday, February 09, 2004 11:26:25 AM

I analyzed the member alternative in question with the development version of BRASS-GIRDER (5.8.8). The "d" value has been corrected, which results in a much better rating at the 100.0 POI. I suspect this issue was similar to Incident 4549, which was recently addressed. The output from the new version follows:

PERFORMING AASHTO SPECIFICATION CHECKS - 8.16.6 Concrete Shear  
CONSTRUCTION STAGE: 1  
ANALYSIS POINT : 100.00

Input Parameters:

$$\begin{aligned} b_w &= 18.000 \text{ (in)} & d &= 56.161 \text{ (in)} \\ A_v &= 0.800 \text{ (in}^2\text{)} & s &= 1.000 \text{ (in)} \\ f'_c &= 3000. \text{ (psi)} & f_y &= 40000. \text{ (psi)} \end{aligned}$$

Description

FROM:kkennelly DATE:2/10/2004 8:39:33 AM  
Submitted on behalf of Vinacs via email:

Krishna

In this particular bridge, we tried to create bent cap. Since there are a lot rebar get terminated and tried to rate the bridge at the bar termination point. We identified ten possible sections for a bent. However when the export program generate the input file, it used only 5 sections. Why did the program ignore some of the user defined sections? Please check this for us. If the BRASS export ignore some of the section as we saw in this example, we may have wrong rating results for the previously rated bent caps and need to revisit them as well

Thanks

----- Forwarded by Murugesu Vinayagamoorthy/HQ/Caltrans/CAGov on 02/09/04

11:51 AM ----- Li Zhang To: Murugesu Vinayagamoorthy@dot.ca.gov  
02/09/04 11:49 cc: AM Subject: BRASS program

concerns

Hi, Vinacs,

I have a problem with the attached bridge. My concerns to the BRASS program:

1. This bridge has total of 10 cross sections. It looks like the BRASS recognized/reported and is using only 5 of them.
2. In the BRASS output file, reported cross sections 1 to 4 are correctly representing those user defined, but the cross section #5 reported jumped to the 10th user defined.
3. It looks that the section moment capacities are estimated using those 5 sections reported accordingly, which gave wrong capacity at point of interested.

(See attached file: 54-0781R.bbd)

Li Zhang

FROM:kkennelly DATE:2/10/2004 8:52:00 AM  
Response sent to Vinacs:

It appears that there is a bug in the export that takes the Virtis data and produces the BRASS input file. Since BRASS has a limit on the number of sections the user can enter, the export tries to reduce the total number of cross sections sent to BRASS by comparing the sections and not creating sections for duplicates.

Complete Issue Information

It looks like the export is incorrectly determining that your sections 5, 6, 7, 8 and 9 are duplicates of sections 3 and 4. I've entered your problem as Incident 4993 on the Technical Support website.

As a workaround, you can revise your input as follows so the export won't think you have duplicate sections. The following rebar data was entered for section #05:ABCFG

top of girder 4 # 14 @ 7.3"  
top of girder 4 # 14 @ 7.3"  
top of girder 4 # 14 @ 7.3"  
bot of girder 8 # 14 @ 6.4"  
bot of girder 4 # 14 @ 6.4"

Revise this input to the following:

top of girder 12 # 14 @ 7.3"  
bot of girder 12 # 14 @ 6.4"

Make similar changes (try to input just 1 line of data for each row of rebar instead of entering multiple lines of data for each row of rebar) for sections 6 7,8 and 9 and all of your sections will be exported.

FROM:bgoodrich DATE:Tuesday, February 10, 2004 5:19:57 PM  
I corrected the problem in the export (BrassCrossSections.cpp). Now all 10 cross sections are exported. Fixed for Version 5.2.0.

### Description

FROM:pjensen DATE:Thursday, February 12, 2004 10:42:23 AM  
THE PROGRAM IS STILL NOT CALCULATING ALL OF THE MEMBERS ON THE ALTERNATE METHOD. DECKS ARE STILL USING THE SPEC WHEN CALCULATING THE RATING. THIS WAS DISCOVERED WHEN REVIEWING THE DETAILED MADERO OUTPUT. I DISCOVERED THE PROBLEM WHEN I WAS TESTING THE PATCH AND REVIEWING THE RESULTS OF THE TRAINING TIMBER BRIDGE. IS THERE SOMETHING ELSE THAT I MISSED OR SHOULD THE LABEL AND THE CALCULATIONS IN THE DETAILED REPORT BE LISTED IN THE MULTI-LANE COLUMN?

FROM:kkennelly DATE:2/24/2004 2:04:15 PM

FROM:bgoodrich DATE:Monday, March 15, 2004 11:27:23 AM  
Only the member alternative for Member G2 is specified. Therefore, Members G1 and G3-G13 are not analyzed. Was this the concern from your first sentence?

For the deck rating, only 1-lane loaded results are calculated by Madero.

We need some more information on the deck rating comments:  
"DECKS ARE STILL USING THE SPEC WHEN CALCULATING THE RATING."

Please elaborate.

### Description

FROM:bgoodrich DATE:Tuesday, February 17, 2004 4:48:16 PM  
E-mail from Ken Teng (2/17/04):

Another question regarding to the prestressed beam. As I notice (actually I checked), VIRTIS uses the negative moment caused by prestressed strands and add to total girder actions for all dead loads and maximum live loads. Why? I checked the PCI manual and found that they do not use this moment when calculates the Mu.

Please advise. Thank you,

Ken Teng  
RQAW Corp.

FROM:bgoodrich DATE:Wednesday, February 25, 2004 7:30:37 PM  
I requested the BBD file from Ken via e-mail. I also requested he identify the locations in the output or Virtis results to assist in the investigation of this issue.

FROM:bgoodrich DATE:Thursday, February 26, 2004 10:05:56 AM  
I attached the files from Ken.

FROM:bgoodrich DATE:Thursday, February 26, 2004 10:37:15 AM  
E-mail to Ken (2/26/04):

The BRASS report you included in the Prestressed Forces.doc file is a standard report provided for all materials (steel, R/C, P/S, etc.). This report really isn't that helpful for prestressed concrete because the actions are unfactored as noted in the heading: DEAD LOAD + CONTROLLING UNFACTORED LIVE LOAD ACTIONS. The moments combined at each point in this report are only for reporting purposes and are not used directly in any calculations. BRASS does not include the moment due to prestress in the factored loads that are compared to the ultimate moment capacity of a prestressed concrete section. Please let me know if this answers your questions.

FROM:bgoodrich DATE:Thursday, February 26, 2004 3:14:58 PM  
E-mail from Ken Teng (2/26/04):

Thanks for the help.

I just pick one of output as an example. Actually, I need to have negative moment to design my slab reinforcement over support. But if I use the Min moment the output (factored) gives me, it will have a large of negative moment because it includes the moment caused by prestressed forces.

What should I do in convenient way? Please advise.

FROM:bgoodrich DATE:Thursday, February 26, 2004 3:15:46 PM  
E-mail to Ken (2/26/04):

For simple-span structures made continuous, there is no moment due to prestress over the support when AASHTO losses are specified. There should be no contribution from an stage 1 loads because the spans are simply supported. The only loads you have to find are those applied to the composite structure. You could manually pick out the unfactored dead and live loads and calculate the factored moment.

Another alternative is to find the TOTAL GIRDER ACTIONS AND DISPLACEMENTS FOR ALL DEAD LOADS AND MAXIMUM LIVE LOADS report in the BRASS output file or the LFD Critical Loads tabular report in Virtis. These moments are factored and include prestress moments. You should be able to pick a moment from this report and remove the prestress moment contribution. Be careful to account for the gamma factor, which is applied to all actions.

The easiest solution is to find the ANALYSIS POINT summary near the end of the BRASS output file. The factored dead and live load moments are listed here and do not include prestress moments.

In the Report Tool we have an LRFD Analysis Output report that may contain up to 5 items like LL Reactions, LL Moments, LL Shear, LL Flex Analysis and LL shear Analysis.

How do I, if it's possible, create a report that contains Dead Load reactions, moments and deflections. Did I miss something?

FROM:kkennelly DATE:3/3/2004 8:08:00 AM

If you pick the report type as "LRFD Analysis Output" you cannot add any additional items to the report. That is a hardcoded report that we developed to deliver with Opis before the Report Tool was

Complete Issue Information

fully developed. You can pick the report type as "BWS Report" and add the "Anaysis Event" group under the member alternative to be able to create a customized report of the analysis output. The "Analysis Event" group has an attribute for "Dead Load Actions" that lets you report on the dead load.

FROM:dteal DATE:Tuesday, March 16, 2004 9:50:26 AM  
I hae been playing with this off and on for days and can't do it. I have report type selected as BWS Report - How do you add the "Analysis Event" group, where is it???

FROM:dteal DATE:Tuesday, March 16, 2004 10:23:13 AM  
Do analysis events have to be saved first??

FROM:kkennelly DATE:3/17/2004 9:35:48 AM  
No, the analysis events don't have to be saved. The analysis event belongs to the Member Alt and it can be found below the member alt label, eg. "Member Alt - Steel Plate I Beam Schd". For example, look under "Superstructure Definitions", "Girder System Structure Def", "Girder Member", "Member Alt - Steel Plate I Beam Schd" and then Analysis Event is available.

I think I'm getting erroneous results for the rating calculation for this structure. It tells me that shear controls at the 303 point with a 1.26 rating factor for truck 1 at Load Level (LL) 1. However, if I put a point of interest at 303.03, the rating factor is 1.88 for truck 1, LL1. Furthermore, the rating factor for truck 1, LL1 at point 107 for this symmetrical bridge is 1.88. Therefore, I'm questioning the 1.26 rating factor. What caught my eye for this is that the final Inv/Opr ratings for this structure were calculated to be HS25.3/HS38.6, but with a 4 inch wearing surface, the rating reduced only to HS25.2/HS38.2. Something appears to be wrong. Any help would be greatly appreciated. Thanks,

Tim

FROM:bgoodrich DATE:Thursday, March 18, 2004 9:31:26 AM

I investigated the issue and found that the shear resistance is lower at the 303.0 POI than at the 303.03 POI. The  $V_i$  term in the shear equation is different. The  $V_i$  term is calculated using the live load shear concurrent with the maximum moment. Therefore, I turned on the output to list concurrent actions using the engine properties in the Analysis Settings window. The live load shear concurrent with the maximum moment at the 303.0 POI is only 10.8 kips, while the shear for the 303.03 POI is 34.5 kips. This difference in concurrent shears is enough to ultimately cause a large difference in the shear resistance, which affects the rating significantly. I have not verified the concurrent shears at this point. I will need to get WYDOT approval to investigate this issue further as the issue resides in the engine.

FROM:bgoodrich DATE:Friday, March 19, 2004 2:57:40 PM

E-mail from Tim Armbrecht (3/19/04):

Thanks Brian, I appreciate it. I figured it was something in BRASS. The only thing in your reply you may want to verify is that you're referencing point 300 when comparing with 303.03, and I'm wondering if you mean to reference point 303 when comparing to 303.03. Please keep me posted as soon as

WYDOT allows you to investigate further. Thanks again,

Tim

FROM: bgoodrich DATE: Friday, March 19, 2004 2:58:44 PM  
I corrected my original response to refer to the 303 POI instead of 300.

FROM: bgoodrich DATE: Wednesday, March 24, 2004 10:41:15 AM  
Preliminary investigation notes:  
It seems odd that the shear concurrent with maximum moment is so much different when there is only 0.18 ft between the two POI. I ran the same bridge with BRASS-GIRDER(LRFD) and BRASS-GIRDER after making the distribution factors consistent. Note the dip in the BRASS-GIRDER shear concurrent with maximum moment even though the distance to the lead axles are about the same. I am simply looking at the result trends at this point in the investigation.

| Point No.           | Distance to Lead Axle (ft) | Max Moment (ft-kips) | Conc. Shear (kips) |

FROM: bgoodrich DATE: Wednesday, March 24, 2004 10:43:12 AM  
WYDOT has assigned this issue to BRASS Problem Log 493.

FROM: bgoodrich DATE: Monday, April 05, 2004 2:08:42 PM  
I have found that the concurrent shears are different depending on the wheel advancement denominator that is specified. The default is 100 and that is what is used for your bridge. I changed this value to 200 in the member alternative engine properties and shear at the 303 no longer controls because the shear concurrent with maximum moment at the 303 changed. The process used by BRASS to incrementally move the truck across the bridge uses linear interpolation when an axle is between influence ordinates, which leads to this particular difference. Please try a higher wheel advancement denominator, and let me know if this addresses your concern.

Subject: Incident 5042

Brian,

I apologize for the delay. I finally had time to review your solution to incident 5042. Yes, by changing the wheel advancement denominator (WAD) to 200, the results are what I would expect. My only concern is: Is this really a solution? Do we really need to use a default WAD of 200 for all our ratings from now on? If we change all our analyses to use a WAD of 200, would there be a case where the

Complete Issue Information

WAD should have been 300 or 500 in order to avoid erroneous results? In order to get more accurate results for live load shear, perhaps a better solution would be to have BRASS automatically place the truck axles directly to the right and left of the POIs (user and 10th points). I would just like to be confident enough in the program to know that if the output spits out a suspicious rating, that the reason is likely a user input error. Thanks again for looking into this for me.

Tim

FROM:bgoodrich DATE:Tuesday, April 27, 2004 12:38:23 PM

I have forwarded your concerns regarding the "solution" to Incident 5042 (BRASS Problem Log 493). WYDOT understands your concerns, but revising the live load positioning algorithm would be a major enhancement. The suggestion for increasing the WAD is the best solution for the current implementation of the live load positioning algorithm in BRASS. WYDOT has added your request to the list of BRASS enhancements. I am setting the status of the incident to Suspended until the enhancement is voted on by the user group and ultimately authorized by WYDOT.

Does anyone why the Mcr/Mmax term in equation (9-27) is set to one if Mmax < Mcr??? I can't find this provision in the specs anywhere.

See below...

Shear Computations:

d >= 0.8h = 55.244 in

4/19/2016 3:03:51 PM

HRS AASHTO

521

Complete Issue Information

$$Mcr = (l / Yt (6 * \text{SQRT}(f'c) + fpe - fd)) / 12000 \quad (\text{AASHTO 9-28})$$

$$= 4176.71 \text{ kip ft}$$

$$Vci = 0.6 * \text{SQRT}(f'c) b'd + Vd + Vi * Mcr / Mmax \quad (\text{AASHTO 9-27})$$

$$= 260.6 \text{ kip}$$

$$Vci(\text{min}) = 1.7 * \text{SQRT}(f'c) b'd = 53.8 \text{ kip}$$

$$Vci \geq Vci(\text{min}) \Rightarrow Vci = 260.6 \text{ kip}$$

Note:  $Mmax < Mcr$ , so  $Mcr/Mmax$  limited to 1.0.

$$Vcw = (3.5 * \text{SQRT}(f'c) + 0.3fpc) * b'd + Vp \quad (\text{AASHTO 9-29})$$

$$= 253.7 \text{ kip}$$

$$Vs = Av * fsy * d / s = 67336.2 \text{ lbs} \quad (\text{AASHTO 9-29})$$

$$Vs(\text{max}) = 8 * \text{SQRT}(f'c) b'd = 253026.7 \text{ lbs}$$

$$Vs \leq Vs(\text{max}) \Rightarrow Vs = 67336.2 \text{ lbs}$$

FROM:bmccaffrey DATE:Tuesday, March 30, 2004 11:46:19 AM

I just saw incident 5054 after I posted this. I agree that this should be better documented or taken out all together until AASHTO adds it to the specs.

Description

FROM:hlee DATE:4/8/2004 2:45:39 PM  
E-mail from Brian Goodrich:

=====  
All,

I think there is a problem with the BRASS moment capacity. It's too high. I reviewed the intermediate output and found the lateral bracing check is not satisfied, but the other checks in that section pass. My interpretation is that the moment capacities from Equations 10-99 and 10-103a should be calculated. Then, the smaller of the two should be the final moment capacity. It appears that the 10-99 capacity is not being considered. Do you agree with this assessment?

I think this issue is linked to the modifications that addressed Incident 4525 (BRASS Problem Log 421). What incident number is this new issue assigned?

This is a serious bug that warrants immediate attention. Mike Watters is out this week, but I will contact him on Monday.

Brian

Did you look at the output at all? The same input file run on the latest version of BRASS produces nearly twice the rating factors as the previous version! Did the spec change that much or is there some other problem?

I have forwarded this issue to WYDOT for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Monday, April 19, 2004 3:30:36 PM  
WYDOT assigned this issue to BRASS Problem Log 503.

FROM:bgoodrich DATE:Monday, April 19, 2004 5:36:15 PM  
For steel structures in which Article 10.48.2.1 applies, the moment capacity calculated by  
BRASS-GIRDER 5.8.8 may be incorrect when all checks within that article are satisfied, except the  
spacing of lateral bracing check (Equation 10-101). When this condition occurs, the moment capacity  
from Equation 10-99 and Equation 10-103a should be considered. However, Equation 10-99 was not.  
The use of both equations is now implemented in BRASS-GIRDER 5.8.9. This is the only issue  
addressed in this interim version. This DLL should be used to replace the BRASS-GIRDER 5.8.8 DLL  
recently released with Virtis 5.1.1.

## Description

FROM:bgoodrich DATE:Tuesday, April 13, 2004 4:04:25 PM

Scott Darling (Lichtenstein Eng.) called with a question regarding the correctness of the floorbeam live load results. His hand calculations show a midspan moment of ~1250 ft-k, but BRASS is giving 1383 ft-k. The floorbeam will accommodate 3 lanes, so a 0.9 multiple presence factor should be considered. The result of 0.9 x 1383 is 1244 ft-k, which is fairly close to the hand calc. Is this just coincidence?

I instructed Mr. Darling to turn on the intermediate output option for the floorbeam, so he can verify vehicle positions, etc. He may call again if this does not provide him with the necessary information.

Complete Issue Information

FROM:bgoodrich DATE:Friday, April 16, 2004 4:00:51 PM  
E-mail from Scott Darling (4/16/04):

Brian,

I have attached the input file for the floorbeam. If you need more files to run the program please let me know. I wasn't exactly sure which files you need.

Below I have pasted output from our run. You can see the over lapping of the lanes. The largest overlap is lane 1 from 6.2 to 18.2, lane 2 from 16 to 28, and lane 3 from 27 to 39. This allows the second axle to be 2.8 feet from the first axle.

Thanks for your help.

FROM: bgoodrich DATE: Friday, April 16, 2004 4:02:17 PM  
 I did some investigating with the files Mr. Darling sent and found the following block of intermediate output is used to determine the critical live load moment at midspan:

Rating Truck in Lane 1 Lanes loaded 3  
 Edges of Lane 1 = 4.25 - 16.25 Truck Edge Dist = 4.00  
 Edges of Lane 2 = 18.00 - 30.00 Truck Edge Dist = 4.00  
 Edges of Lane 3 = 27.00 - 39.00 Truck Edge Dist = 2.00  
 Distance to wheel lines 1 - 12 = 8.25 14.25 22.00 28.00 29.00 35.00 0.00 0.00 0.00 0.00  
 0.00 0.00  
 Weight of wheel lines 1 - 12 = 19.41 19.41 19.41 19.41 19.41 19.41 0.00 0.00 0.00 0.00  
 0.00 0.00

It is obvious from the output that there is a problem in the BRASS engine because the edges of lanes 2 and 3 overlap by three feet. Hence, the user's hand calculation for the midspan moment is probably correct.

FROM: bgoodrich DATE: Monday, April 19, 2004 11:04:51 AM  
 Brian,

I don't believe the location you have found gives the maximum moment. The output you found gives a moment at midspan of 1079 k-ft. The program gives 1383 k-ft.

The output you found does bring up another question. Why is the weight of the wheels 19.41? The output for one truck has a wheel load of 25.6. Then for 3 lanes loaded all of the output I had seen before your example was a wheel weight of 23.1 which is .9 times 25.6 for multiple lanes loaded. We don't understand the output for the 19.41.

What should we do? Wait for an answer from the Support Center? Please let me know.

Thanks.

Scott Darling, P.E.

FROM: bgoodrich DATE: Monday, April 19, 2004 11:05:33 AM

I did send you the wrong output for the critical position, and the wheel line weights were for the lane load, not for the HS20 truck. Below is the correct output for the critical live load moment at midspan:

```

Rating Truck in Lane 1 Lanes loaded 3
Edges of Lane 1 = 6.25 - 18.25 Truck Edge Dist = 4.00
Edges of Lane 2 = 16.00 - 28.00 Truck Edge Dist = 3.00
Edges of Lane 3 = 26.00 - 38.00 Truck Edge Dist = 2.00
Distance to wheel lines 1 - 12 = 10.25 16.25 19.00 25.00 28.00 34.00 0.00 0.00 0.00 0.00
0.00 0.00
Weight of wheel lines 1 - 12 = 23.06 23.06 23.06 23.06 23.06 23.06 0.00 0.00 0.00 0.00
0.00 0.00

```

This position results in a midspan moment of 1067.3 ft-kips. When multiplied by impact of 1.295, the moment is 1382 ft-kips.

I forwarded this issue to the Wyoming Department of Transportation (the owners of BRASS) last week. They will review the issue, assign it to a BRASS problem log, and finally decide when this issue will be addressed. I generally send the user an e-mail when I post new information to the incident, but you can check the status of this issue yourself on the Support Center website.

FROM: bgoodrich DATE: Tuesday, April 27, 2004 4:03:24 PM  
WYDOT assigned this issue to BRASS Problem Log 505.

FROM: bgoodrich DATE: Tuesday, August 03, 2004 11:32:53 PM  
This issue was addressed in BRASS-GIRDER 5.9.0, which will be released with Virtis 5.2. BRASS now calculates a mid-span moment of 1255.9 ft-kips.

### Description

FROM:bgoodrich DATE:Tuesday, April 20, 2004 3:17:52 PM  
Fahred from Lichtenstein Eng. called with questions regarding Virtis.

1. How to account for a truck on the sidewalk when checking the exterior girder? Answer: Override the distribution factors.
2. How to input concrete and rebar section losses for R/C T-beam? Answer: Copy the member alternative and reduce the section dimensions manually or use the % shear field on the point of interest windows.

## Description

FROM:tarmbrecht DATE:Monday, April 26, 2004 2:32:11 PM

Please verify that the hybrid girder factor defined in AASHTO Std Specs 10.53.1.2 is applied twice in

4/19/2016 3:03:53 PM

**HRS AASHTO**

537

## Complete Issue Information

Virtis in certain situations. Specifically, according to the provisions of 10.53.1.3, eq 10-103a in section 10.48.4.1 is replaced by eq 10-148a ( $\mu = MrRbR$ ) and the yield moment is calculated according to eq 10-148b ( $M_y = F_y fSR$ ). However, if  $L_b \leq L_p$ , then  $M_r = M_y$  according to eq 10-103d. It appears that in this situation, Virtis inserts 10-148b into 10-148a to get  $\mu = F_y f^*S^*R^*R_b^*R$ . Is this the case?

File is attached: Unit 1, memb alt 96" WPLG(8A - 2nd S Int), pt 110 with a rating factor of 1.09 Inventory.

Thanks,

Tim

I forwarded this issue to WYDOT.

FROM:bgoodrich DATE:Tuesday, May 04, 2004 5:02:39 PM  
WYDOT assigned this issue to BRASS Problem Log 506.

FROM:bgoodrich DATE:Monday, August 09, 2004 1:44:14 PM  
E-mail from Tim Armbrecht:

Brian,

Thanks for looking into it. You know, I would be real surprised if the intention was for the moment to take a double hit with the reduction factor in this situation. We checked against MDX and Merlin-Dash and neither of those engines apply a double hit. Our consultant's program (which they used to design this structure) also did not apply the double hit. Does Jay have an opinion about this?

I agree that if you plug in the equations as written in the code, it appears to apply the reduction factor twice, but we're talking moment capacity here. Only need to apply the factor once, twice is too conservative. On the bright side, it is conservative. I would ask WYDOT to consider this - maybe check with their own designers and if they usually don't do hybrid girders, perhaps check with other states or analysis engine developers.

Tim

FROM:bgoodrich DATE:Tuesday, August 10, 2004 3:23:49 PM  
E-mail from WYDOT:

Brian:

Keith and I discussed this. We both agree that BRASS should not be applying the reduction factor twice. When you take it out, make sure it is not being removed for other cases where it needs to remain.

Micheal J. Watters, P.E.  
Bridge Engineering Systems Manager

### Description

FROM:dteal DATE:Tuesday, May 04, 2004 7:58:03 AM

Selected a steel material for the top flange of a plate girder – when I “OK’d” the window and then reopened it the material field was blank. In the materials library I found that I had one space after the material name. I removed this space and all worked fine. I notice that many material in my agency library have a space after them, are they going to be a problem also. I didn’t add the space, somehow it automatically got inserted.

Didn’t we have a problem like this before and it was resolved – if so – it’s back!

FROM:dkoenig DATE:Wednesday, May 05, 2004 11:17:12 AM

We have had several issues related to the blank spaces after names in the library. You will need to remove the blank spaces on all of your names in your library. If you don't, you will eventually see other problems. They are supposed to be adding something to an upcoming version that will not allow these blanks to be stored.

| 5137.14206 | Resolved      | Problem with FB analysis in S-FB-G system |

### Description

FROM: bgoodrich DATE: Wednesday, May 12, 2004 12:26:17 PM

Ron Pierce called with a question regarding the relationship between P/S transfer length and the overhang distance. BRASS was issuing a message indicating that the transfer+debond length must be greater than the overhang distance. Ron increased his transfer length from 25 inches to 30 inches in Virtis and was then able to analyze the structure with BRASS.

FROM: dkoenig DATE: Friday, May 14, 2004 2:35:42 PM

We had the same issue come up on a structure that had unusually large overhangs because of some skew issues and other design issues. We resolved it by reducing the overhang until Virtis would run the structure.

### Description

FROM:thompson DATE:Monday, May 17, 2004 12:09:47 PM

I've been working on my first stringer-floor beam-girder system bridge and I keep having problems with the floor beam analysis. When it's running the BRASS analysis, It's showing an error called Time Check at 500 positions and it continues to show this over and over and over in BRASS analysis window.

(I've attached a screen shot of this error.)

## Complete Issue Information

I've reviewed my data, started over, let it run for an extended amount of time but can't seem to locate my data error. Maybe it's a problem with something else.

Bridge Specifics -

Stringer Unit -

7 simple span stringers, framed into floorbeams, all stringers are W24x76, composite with the deck.

Floorbeams -

Plate Girders, each frames into the main member (in my case it's actually a truss, but I'm only interested in analyzing the floor system in Virtis currently). The bottom is flat and the web varies linearly across the top. (Virts assumes the bottom of the web varies - but I don't think this impacts the computations, just looks funny in the schematic)

The stringers analyze okay. The floorbeam appears to do the virtual stringer analysis okay, but appears to hang on the actual floorbeam.

I've attached my bbd with the data set.

FROM:hlee DATE:5/19/2004 10:35:27 AM

The floorbeam analysis will take a while since the floorbeams are quite long.

I performed a HS20-44 inventory rating on the "system" superstructure definition. It took 7 minutes for the whole process. After I changed the Lane Advancement Increment on the Engine tab of "FBB FBC" floorbeam definition window from the default of 1 ft to 2 ft, the time for the rating reduced to 30 seconds.

The following is the description of Lane Advancement Increment in BRASS-GIRDER(LFD) help: "Enter the distance lanes and axles within lanes will be moved each time as they are 'stepped' across the floorbeam as maximum actions are sought. The smaller the number, the finer the analysis, but run time will increase."

### Description

FROM:smample DATE:Monday, May 17, 2004 5:36:57 PM

I have been checking the serviceability output for a composite prestressed girder. I cannot verify the output listed under "AAHSTO Serviceability Check 9.15.2.2(b)." The numbers I am concerned about are the stress in the top (& bottom) of the beam due to prestress. Shouldn't these two stresses be equal when the eccentricity of the strands = 0? Also, shouldn't the stress in the bottom of the beam due to prestress = fpe in the shear calculations?

FROM:bgoodrich DATE:Wednesday, May 19, 2004 12:35:50 PM

The stress in the top and bottom of the beam should be equal to the strand stress (including losses) divided by the beam area. However, you only entered the final loss on the lump-sum losses tab. This means that no losses occur in the non-composite stage when the strand centroid matches the beam centroid. When the losses are applied in the composite stage, the centroids no longer match, so the stress at the top and bottom of the beam becomes different. You will need to enter some or all of the final loss in the Composite Loss field.

FROM:bgoodrich DATE:Wednesday, May 19, 2004 2:23:06 PM

Brian,

Thank you for your help. By inserting a value into the Composite loss field, I am now getting the numbers that I want.

### Description

FROM:bmccaffrey DATE:Wednesday, May 19, 2004 11:40:36 AM

From one of our consultants using Virtis 5.1.1 single workstation version:

We installed VIRTIS 5.1.1, we encounter no problems during installation. However, I keep on getting the same error message when I try to print the bridges. It happens every-so-often (about 80% of the time). Did anyone else encounter the problem?

To reproduce:

Complete Issue Information

1. Open BID 13 Bridge Workspace.
2. Open "Alt #1" ("Floorbeam1" member alternative) schematic window.
3. Open "Floorbeam Def 1" Floorbeam Profile window.
4. Change "Depth Vary" from None to Linear.
5. Hit Apply 2 times.
6. Crash (See attached bitmap).

E-mail from Todd Thompson, SDDOT:

=====

Todd

There is a problem when printing from the tabular reports window that was fixed in 5.1.1. I don't know if that is the problem you are having with printing or not.

We will investigate the problem you describe when changing the floorbeam web profile.

Jim

>>> <Todd.Thompson@state.sd.us> 5/25/2004 2:04:33 PM >>>

Jim,

I've been getting MS Visual C++ Runtime Library error message (followed by Application Error and then Dr Watson) when I attempt to do the following functions:

- A) Print
- B) Change a Floor Beam web profile (web depth)

Any time I try to print or hit apply or OK after changing a floorbeam web profile, I crash out.

I uninstalled and reinstalled from scratch the virtisopis application but still keep getting these error messages. Would you be of any assistance in helping me track down these error message(s).

ASA 8 with VirtisOpis 5.1.0 (w/ updated BRASS dll)

Description

FROM:tthompson DATE:Thursday, May 27, 2004 10:28:06 AM

The GUI displays Recent ADTT but the AASHTO LRFD Spec 3.6.1.4.2 says to use the average daily truck traffic over the design life of the bridge. I have a designer questioning why it says Recent when Opis is using it as per AASHTO. He believes it should say Avg ADTT (or something along those lines).

FROM:kkennelly DATE:5/28/2004 8:25:48 AM

I agree that the label "Recent" is misleading. I think when we first designed the system, we used the term "Recent" in anticipation of providing the ability to determine the estimated remaining fatigue life (we would have to provide additional info to determine the rate of ADTT growth to do that). Since we haven't provided that ability, maybe we should re-name that attribute.

Re: Fwd: Virtis Error

Michael,

We are looking into the errors you got when attempting to run BARS and BRASS Import. We need more information, as stated below, in order to continue our investigation.

1. Are you using Windows 2000?
2. The user-id is a member of which user group or groups (e.g. Power Users, Users, ...)?
3. Are you running BARS or BRASS Import from Virtis?

Thanks,  
Herman

Complete Issue Information

We are receiving the following errors when attempting to run either BARS or BRASS Import.

(Embedded image moved to file: pic22532.jpg)  
(Embedded image moved to file: pic02963.jpg)

The error does not occur on my PC where I have administrator rights, but does happen on our MetaFrame where my user-id does not have admin rights.

Does Virtis require its users to have administrator rights to the computer?  
What is the program attempting to update in the registry?

Thanks,

I have entered Incident 5163 for the reported error message to Virtis Support Center. We are able to reproduce the error message with a Users Group's user on Windows 2000 Professional.

Please see Microsoft Knowledge Base Article 254957 "BUG: Registry Update Code for MFC OLE Server Fails in Windows 2000" (<http://support.microsoft.com/default.aspx?scid=kb;en-us;254957>) for the details of getting those error message. The following is extracted from the article:

1. "In Windows 2000, access to HKEY\_CLASSES\_ROOT is restricted to administrators and power users."
2. "An MFC OLE server, which has previously been registered by a privileged user, continues to run successfully after the error is resolved.". If BARS or BRASS Import has been used by a privileged user (member of administrators and power users) previously, it will run without problem after hitting OK on the error message. This scenario has been tested and confirmed. Both applications successfully

Complete Issue Information

imported bridges to Virtis database.

For now, please ignore the message and continue to use BARS and BRASS Imports. We will resolve this incident in 5.2 release.

For your second question, BARS and BRASS Import will update login information (User Name and Data Source Name) and import's Preferences setting to the registry.

Let me know if you need more information.

Regards,  
Herman

=====  
==

Also tested both Imports in 5.2 Development Release. There is no error message when a Users Group's user login to the Imports.

Complete Issue Information

FROM:sneubauer DATE:Thursday, May 27, 2004 12:06:01 PM

Under a specific point of interest it has a Override Schedule check box. I am assuming that the %shear value is to change the % of concrete area used for the shear calculation. If I am correct, changing the percentage under the point of interest does not work. In the analysis output it always says that 100% of the concrete was used for shear calculation.

FROM:kkennelly DATE:5/28/2004 8:40:44 AM

What have you selected for the POI Control on the Member Alt: Engine properties window for BRASS LFD?

The data on the Point of Interest windows is only used if you have selected the POI Control as Option 0 on the Member Alt: Engine tab for the BRASS LFD properties. The following explanation can be found in the BRASS LFD Engine Related Help topic for the Point of Interest: Shear tab. (You can access this Engine Help by opening the Virtis/Opis help topic for the tab and selecting the "Engine Related Help" link in that topic.)

"BRASS LFD will not use the override data entered in the Point of Interest windows if the POI Control on the Member Alternative Description: Engine (BRASS LFD) window is selected as a "generate" option (Options 1, 3, or 5). Selecting a generate option on that window means that the points of interest will be generated from the schedule data that you have entered in other windows. You must select the "No point of interest data will be generated" option on that window in order for BRASS LFD to use the data entered on the Point of Interest windows. If you select "No point of interest data will be generated" as the POI Control, you must enter all of the information on the Point of Interest windows. The export will not generate any data from other windows for items left blank on the Point of Interest windows."

Also, I don't know if you are analyzing a reinforced concrete girder or a ps girder. The BRASS LFD engine help also states that this tab in Virtis is not considered for ps members.

FROM:sneubauer DATE:Friday, July 29, 2005 4:22:07 PM

I still have a problem. When I enter a % of concrete to consider for shear, the Vc used in the output is now 0. It does not matter what % I enter the Vc is always 0. When I run it using option 5, it calculates the correct value for Vc using 100% of the concrete available. What am I missing now?

FROM:sneubauer DATE:Monday, August 01, 2005 9:59:33 AM

I have found my problem. The Shear factor was set to 0 instead of 1.0.

Error generating LRFD point-of-interest commands!

A duplicate point of interest has been specified at 603.0000 ft/mm.

BRASS only allows the left or right side to be specified for the same location. The same side was specified for one or more identical locations.

Note that on the second line of this error message it says 603.000 ft/mm  
Sh/be 603.0000 in/mm and not ft/mm

FROM:bgoodrich DATE:Thursday, June 03, 2004 10:49:21 AM

I modified the export (BrassCmd.cpp) to display the correct units in the duplicate point of interest error message. Fixed for Version 5.2.

FROM:kkennelly DATE:6/3/2004 7:55:00 AM  
Submitted on behalf of Joseph Wellington, OK via email:

Attached bridges show inv ratings greater than operating ratings.

FROM:kkennelly DATE:6/3/2004 8:01:35 AM  
Response sent to Joseph via email:  
Hi Joseph,

I examined your bridge 06945.bbd for an H2O load and found the following:

1. The Inv and Op ratings you receive do not show the typical pattern of the Op rating = 5/3(Inv rating) because the ratings being reported are not at the same location along the length of beam and are not

4/19/2016 3:03:57 PM

HRS AASHTO

558

## Complete Issue Information

due to the same load effects (ie, moment capacity being reported for Inv rating and shear capacity being reported for Op rating.)

Some states do not rate rc slabs for shear based on AASHTO Article 3.24.4 which states slabs designed for bending moment shall be considered satisfactory in shear. If you don't really want to rate the slab for shear, you can check "LFD Ignore Shear" on the Member Alternative window. If you check this box, then your ratings will have the pattern Op rating = 5/3(Inv rating).

2. If you do want to rate for shear, I've found the following in the BRASS output. I created a point of interest at the 7/10 point of the span, ran BRASS for the H20 load and saw the following in the BRASS detailed output at this point:

BRASS is checking AASHTO Article 8.19.1.1 to determine if a minimum amount of shear reinf steel should be provided. This check compares the factored shear force to  $\frac{1}{2}$  the shear strength provided by the concrete. BRASS computes different values for the capacity of the section based on this comparison.

For the H20 truck Inv rating, the following message is printed out in the BRASS output:

```
** WARNING: At Analysis Point: 107.00
    Load Level   : 1
    Truck No.    : 1 - Truck: AASHTO H 20 Loading, 1944 Edition
    Shear stirrups are required according to AASHTO 8.19.1.2 (8-64). No
    stirrups have been provided. Therefore, section capacity has been
    calculated based on  $\frac{1}{2} * \Phi * V_c$  only.
```

### Calculated Values:

```
Vc = 13.91 (kips)      [AASHTO (8-48)]
Vs = 0.00 (kips)      [AASHTO (8-53)]
```

### Ultimate Shear Capacity :

```
Phi * Vn = -11.82 (kips)      [AASHTO (8-46)]      <<<<< KEK note: This value is not
1/2*phi*Vc
```

For the H20 truck Op rating, the following message is printed out:

```
** WARNING: At Analysis Point: 107.00
    Load Level   : 2
    Truck No.    : 1 - Truck: AASHTO H 20 Loading, 1944 Edition
    No shear Stirrups have been provided. Stirrups are not required under
    AASHTO 8.19.1.2 (8-64) for these conditions. Therefore, section capacity
    has been limited to  $\frac{1}{2} * \Phi * V_c$  only.
```

### Calculated Values:

```
Vc = 13.85 (kips)      [AASHTO (8-48)]
Vs = 0.00 (kips)      [AASHTO (8-53)]
```

### Ultimate Shear Capacity :

```
Phi * Vn = -5.88 (kips)      [AASHTO (8-46)]      <<<<< KEK note: This value is
1/2*phi*Vc, but stirrups aren't required
```

Complete Issue Information

I have the following observations on these spec checks:

- a. Article 8.19.1.1 states that the min shear reinf requirement doesn't apply to slabs so I don't think this Article should be considered by BRASS.
- b. The ultimate shear capacity computed based on checking the shear reinf required does not appear to be correct.

I have entered your problem as Incident 5166 on the Virtis/Opis Technical Support website (<http://aashto.bakerprojects.com>). You can track progress on resolution of this problem on that website. Please let me know if you have any further questions.

FROM:bgoodrich DATE:Thursday, June 03, 2004 12:20:23 PM  
I have confirmed the findings and will forward this issue to WYDOT.

FROM:bgoodrich DATE:Friday, June 04, 2004 11:31:13 AM  
WYDOT assigned this issue to BRASS Problem Log 514.

FROM:bgoodrich DATE:Tuesday, August 03, 2004 12:10:32 PM  
This issue has been addressed in BRASS-GIRDER 5.9.0, which is to be released with Virtis 5.2.

| 5169.14174 | Resolved      | Why are non-composite section properties used at POI? |

### Description

FROM:bgoodrich DATE:Thursday, June 03, 2004 12:13:16 PM  
E-mail from Timothy Armbrecht:

I'm trying to determine why the moment capacity isn't based on equation 10-129c for a composite steel section in the positive moment region. As far as I can tell, compactness isn't even checked at a point of interest just to the right of the 0.4 point. However, when we have another point of interest at the steel transition, compactness is checked. Why check at the one point, but not at the other, and why isn't eq. 10-129c used in positive moment regions for composite beams? File attached. Thanks,

Tim

Timothy A. Armbrecht, P.E., S.E.

FROM:bgoodrich DATE:Thursday, June 03, 2004 12:14:42 PM

To get BRASS to consider equation 10-129c, you need to modify the member alternative engine properties. Check the span box(es) under the "Compactness at the pier" to indicate that the pier sections at the ends of each span are compact. The compactness check is then shown.

FROM:bgoodrich DATE:Monday, June 03, 2004

To: Goodrich@BridgeTech-Laramie.com  
Subject: RE: Incident 5054

## Complete Issue Information

Thanks for the response. I'm not sure I understand. What if the structure is not compact at the pier, but compact in the middle of a span? Shouldn't a compactness check be performed even if the "Compactness at the pier" is not checked?

FROM:bgoodrich DATE:Monday, June 03, 2004

For structures not compact at the piers adjacent to a POI, BRASS takes the flexural capacity as the yield moment when checking positive flexure. Because the 10-129b and 10-129c equations are not considered for this condition, BRASS does not perform the compactness check at the POI because the decision was already made to use the yield moment. Note that my comments reflect the procedure implemented in BRASS. I would rather see the spec check performed. Please let me know if you would like me to forward any requests to WYDOT.

Cc: Best, Richard M.  
Subject: RE: Incident 5054

Brian,

Thanks for the info. You know, now that I'm able to devote my full attention to ratings and Virtis, it's interesting what I'm finding in Virtis/BRASS. If you don't mind, please inform WYDOT that we would like to request this enhancement: As an option, BRASS computes the moment capacity for a positive moment section based on AASHTO 10.50.1.1 provided the section meets the "compactness" requirements. If it's too much trouble to incorporate 10-129d, we can live without it, but we really need 10-129c. Thanks again for your help,

Tim

FROM:bgoodrich DATE:Monday, June 04, 2004

I just want to clarify the BRASS procedure. If the user specifies that the adjacent piers are non-compact, BRASS uses the yield moment as the capacity. If the user specifies that the adjacent piers are compact, BRASS actually performs the compactness check of 10-129. If the POI is determined to be compact, BRASS calculates the capacity from equations 10-129b or 10-129c as applicable. If the POI is determined to be non-compact, the yield moment is used. Therefore, BRASS already performs the calculation you are requesting. Please let me know if I'm misunderstanding your request.

Also, equation 10-129d requires moment capacities at the pier, which may or may not have been input as a POI. Therefore, the second term in the equation cannot be calculated.

Complete Issue Information

To: Goodrich@BridgeTech-Laramie.com  
Cc: Best, Richard M.; Kurtenbach, Tom L.  
Subject: RE: Incident 5054

So if the piers are labeled as compact, the entire span is checked for compactness, and if compact, 10-129c&d applies. If the piers are not labeled as compact, the whole bridge is considered non-compact and moment at first yield applies. That is my understanding. If so, then I'm requesting the option of having BRASS check compactness according to 10.50.1.1 (and apply 10-129c&d) for any points in the composite positive moment region, whether the piers are labeled compact or not.

Back to the example I sent: The intermediate output checked the POI around the 0.7 point for compactness, but did not check the POI near the 0.4 point. Is that because the 0.7 point is in the non-composite region, and the 0.4 point is in the composite region?

FROM:bgoodrich DATE:Monday, June 07, 2004 10:36:47 AM  
I now understand your request and will forward it to WYDOT.

As you suspected, the 0.7 point was checked for compactness because it is in the non-composite region.

FROM:bgoodrich DATE:Tuesday, June 15, 2004 1:30:58 PM  
WYDOT has assigned this issue to BRASS Problem Log 515.

E-mail from C.J. Riley (WYDOT):  
"...The agreed solution is to have BRASS produce a note indicating that the compactness checks are skipped if the user codes this in the analysis command. ..."

FROM:bgoodrich DATE:Tuesday, August 10, 2004 3:22:26 PM  
BRASS-GIRDER 5.9.0 has been revised as described above. Fixed for Version 5.2.0.

Entered for Travis Fox:

>>> "Travis Fox" <TFox@abmb.com> 6/3/2004 5:26:28 PM >>>  
Joe Ihnat,

It appears that for a composite, braced non-compact steel plate girder Virtis calculates the moment capacity using the noncomposite section properties. I have attached a .bbd file as an example. The structure definition to view is "820' Comp Steel Span - Girder". The member is G2 and a Point of Interest has been defined at the point in question. Please note in the BRASS output that the Dc and Afc are for a non-composite section at the POI, even though the POI is within the composite section range. Please contact me if further information is needed. Thank you.

Travis A. Fox  
ABMB Engineers, Inc.  
225-765-7400

FROM:bgoodrich DATE:Friday, June 04, 2004 10:50:49 AM

The point of interest in question is located at a cross section transition where the section is non-composite on the left side and composite on the right side. The point of interest within Virtis was specified as the right side, however, BRASS does not support specifying the "side". BRASS chooses the cross section with the lowest moment of inertia when this condition occurs, which is why the

4/19/2016 3:03:58 PM

Description

FROM:smample DATE:Tuesday, June 08, 2004 6:32:15 PM

I am trying to input my first G-FB-S system. My structure has 4 main girders. The floorbeams are framed into the main girders. The floorbeams in bays 1 & 3 are the same while the floorbeam in bay 2 is different. Is it possible to input these different floorbeams according to the bay they are located in?

FROM:kkennelly DATE:6/9/2004 10:56:15 AM

Floorbeams are described in a manner similar to girders in that you can define different plates or rolled shapes at different lengths along the member. So you can define different plates or rolled shapes in the bays. One thing that cannot be different between the bays is switching from a rolled shape in bay 1 to a plate in bay 2. The floorbeam must be either plate or rolled shape in all of the bays. We have several floor system examples on the Tutorial page on the website that may help you enter your first floor system bridge.

due to servicability. We set our points of interest so that servicability is not supposed to control the operating rating, but the results show that it still does. Is there any way to fix this? Thanks,

Tim

FROM:kkennelly DATE:7/2/2004 2:33:33 PM

FROM:bgoodrich DATE:Friday, July 02, 2004 3:24:30 PM

This is a duplicate of Incident 3602 in which the point of interest override data is not generated. This feature has been available in BRASS for about two years, but it has not been implemented in Virtis yet.

The work-around is to set the POI Control option to 0 (on the member alt engine properties), so that POIs will not be generated from the schedule data. When this option is selected, the fields on the point-of-interest window must be entered, i.e., stiffeners, bracing, engine properties, etc.

FROM:hlee DATE:10/2/2007 8:59:43 AM

The above mentioned incident should be 3062.

Description

FROM:bmccaffrey DATE:Monday, July 12, 2004 3:09:41 PM

Please look at the intermediate output for section 3 of the main girder (girder 1) that is attached along with the .bbd file. The section is at mid-span and does not control. It is a built up member comprised of angles and plates with a 12"x1" top cover plate. A discrepancy was found in the calculation of equation 10-100 (b/t ratio). It appears that the top flange thickness is being ignored in the equation - only the angle thickness is used.

I believe 't' should be:

top angle thickness + top cover plate thickness  
= 1.0781" + 1.0" = 2.0781"

Thanks, Brian McCaffrey, NYSDOT

FROM:bmccaffrey DATE:Tuesday, July 13, 2004 8:25:56 AM

FROM:bgoodrich DATE:Monday, August 2, 2004  
WYDOT assigned this issue to BRASS Problem Log 520.

FROM:bgoodrich DATE:Monday, August 16, 2004 11:40:49 AM  
E-mail from WYDOT:

Brian:

Keith and I discussed this issue and reviewed the AASHTO Specifications. No where in the spec does it clearly define which is the "flange" in a built up section with angles and cover plates. It has been WYDOT policy to use the cover plate as the flange dimensions since the spec states specifically that the thickness must be equal to or greater than the angle thickness. In this type of built up section, we consider the angles as acting as fillets as shown on page 9.25 of the user manual. If the user disagrees with our interpretation of the code, he can simply code an equivalent I-beam section and use whatever flange dimensions he desires.

This closes out Problem Log 520.

Micheal J. Watters, P.E.  
Bridge Engineering Systems Manager

FROM:bgoodrich DATE:Monday, August 16, 2004 11:50:29 AM  
I modified the export (BrassStdAnalysisCmd.cpp) to transfer the cover plate dimensions to the flange dimensions, which corresponds to the instructions in the BRASS-GIRDER command manual.

FROM:bgoodrich DATE:Tuesday, June 28, 2005 4:05:05 PM  
On April 14, 2005, Herman Lee commented out all the changes for this incident. The changes had lowered the rating factors.

| 5228.14115 | Duplicate     | Point-of-interest override does not work for BRASS LFD |

### Description

FROM:hxu DATE:Wednesday, July 14, 2004 11:24:16 AM

I am rating a Girder-FB bridge. The spacing of the Floor Beams is 7', per AASHTO 3.23.3.2, the deck should be considered as simply supported beam and to get max. wheel reaction on the Floor Beam. It is so obviously, the reaction on the Floor Beam of a H20 truck in this case should be 16 kips. But when I look through the Brass output file, I noticed that the wheel reaction Virtis used is 16.229 kips. Although the difference is small (1.4%), still I want to figure out what happened. I believe it should come from the virtual stringer analysis. The BBD file was attached, please look at Floor Beam #4E. Thanks.

FROM:bgoodrich DATE:Thursday, July 15, 2004 11:55:30 AM

For the virtual stringer analysis, BRASS places a hinge at 0.12 ft from the interior support. This small length effectively becomes a cantilever, which slightly increases the reaction at that support. The wheel advancement denominator is set to 70, so the truck is moved at 0.1 ft increments across the stringers. Therefore, the reaction is:

$$16 \text{ kips} * 7.1 / 7 = 16.229 \text{ kips}$$

Description

FROM:bgoodrich DATE:Thursday, July 15, 2004 2:42:46 PM  
Entered for Alkesh Parikh:

For Girder A, I've defined a point of interest at 6.896' from support and also I've defined the properties of stirrups and concrete area to be used for shear rating. The "Override Schedule" box is checked. But when you look at the output, you'll realize that for some reason, the program does not use the right properties. For example, the area of stirrups for this point of interest is 0.75 sq. in. but the output shows area of stirrups for this point of interest as 1.00 sq. in.

Can you please look in to this and suggest me a solution ?

Thanks,

This issue is a duplicate of Incident 3062.

FROM:bgoodrich DATE:Thursday, July 15, 2004 2:59:41 PM  
The "Point of Interest: Shear" help topic for the BRASS LFD engine explains:

"BRASS LFD will not use the override data entered in the Point of Interest windows if the POI Control on the Member Alternative Description: Engine (BRASS LFD) window is selected as a "generate" option (Options 1, 3, or 5). Selecting a generate option on that window means that the points of interest will be generated from the schedule data that you have entered in other windows. You must select the "No point of interest data will be generated" option on that window in order for BRASS LFD to use the data entered on the Point of Interest windows. If you select "No point of interest data will be generated" as the POI Control, you must enter all of the information on the Point of Interest windows. The export will not generate any data from other windows for items left blank on the Point of Interest windows."

You can either generate points of interest from the schedules or enter your own points-of-interest information for every point of interest. The later is tedious, but it is the only work-around there is.

Description

FROM:awaheed DATE:Monday, July 26, 2004 11:15:00 AM

This is a suggestion for a minor enhancement.

In Virtis/Opis, on a screen that has multiple Tabs (example: Structure Typical Section), highlight the Tab name when it is selected. For example when a user selects 'Lane Position' Tab, the name of the Tab should become bold.

I noticed on some monitors, for some people in our office, it is hard for them to tell which Tab is selected.

Thanks,

### Description

FROM:dteal DATE:Thursday, July 29, 2004 10:18:55 AM

Occasionally when evaluating a RC Slab structure we find that during construction they may have gotten a bad truck or two of concrete that was of lower (or higher) compressive strength (f'c). When performing a rating on this structure you can not model this correctly. With BRASS it will use the first f'c value it finds and then use that throughout (I think).

In a recent construction problem we where to get concrete of f'c = 4000 psi but over the pier area (25 feet on either side) we got f'c = 3000 psi.

In order to rate the bridge I have to use the reduced strength for the entire structure and limit my POI's to the area of concern.

If we can't use differing concrete strengths by areas (sections) why are we allowed to enter differing strengths??

FROM:kkennelly DATE:7/30/2004 8:09:34 AM

Virtis is not designed for a particular analysis engine. It is designed to allow you to describe a bridge without regards to the engine that will be used.

FROM:bgoodrich DATE:Sunday, August 01, 2004 1:35:43 PM

I have forwarded this issue to WYDOT to add to the list of BRASS enhancements.

FROM:bgoodrich DATE:Monday, August 02, 2004 11:06:14 AM

E-mail from WYDOT:

I will add this to the list that I send out this month for prioritization.

| 5251.14092 | Duplicate     | Ability to use different in concrete materials in different spans for ps beams |

### Description

FROM:dteal DATE:Thursday, July 29, 2004 10:23:17 AM  
Submitted for: Stephen G. Burnett , KDOT staff designer

Dean, I have coded a 3 span K3 prestressed beam bridge into VirtisOpis. This bridge is our typical prestressed bridge that is simple beam for stage one and continuous for stage two. When reviewing the BRASS output, I noticed that for the Unfactored Girder Actions Due to Applied Live Loads during Construction Stage 2, the max. actions for Live Load No. 3 (Truck Train) that the Negative Moment is given at the pier only. I believe that this load would produce negative moment at other locations also. According to AASHTO LRFD Article 3.6.1.3.1 "for both negative moment between points of contraflexure under a uniform load on all spans, and reaction at interior piers only, 90 percent of the effect of two design trucks spaced a minimum of 15000 mm between the lead axle of one truck and the rear axle of the other truck, combined with 90 percent of the effect of the design lane load." For a continuous structure with a uniform load on all spans, the points of contraflexure would approximately

4/19/2016 3:04:02 PM

HRS AASHTO

Complete Issue Information

I have this attached file, with five spans , simply supported PCI but assumed continuous for live load with variable girder materials (fc) for each span. At the beam details window, it is not accepting variable girder materials. I assumed as a result, the shear rating is very low for Military loading (HS25) .

Wanley

>>> "Krisha Kennelly" <KKENNELLY@mbakercorp.com> 07/29/04 10:58AM >>>  
Hi Wanley,

The following message is given in the log file that is produced by the export of Virtis data to a BRASS input file when you analyze a mbr alt.  
(You can view this log file by selecting the name of the girder mbr alt in the Bridge Workspace tree and clicking the "View latest analysis output" toolbar button.)

WARNING (High):  
BRASS does not support different concrete materials for each span.  
The concrete material from the first span will be utilized.

Virtis lets you assign different concrete materials to different spans but BRASS LFD does not allow that.

vertical stirrups with inclined stirrups. It is just that the total number of range commands in the BRASS input file exceeds the BRASS limit.

I've entered your problem as Incident 5252 on the Virtis/Opis Technical Support website. Maybe Brian can find a way to combine the range input commands so the BRASS limit is not surpassed (although that is probably unlikely since you have 134 ranges and the BRASS limit is 50. I'd be surprised if 134 can be combined to less than 50) or maybe they will change BRASS to allow more ranges.

FROM:kkennelly DATE:7/30/2004 9:31:58 AM

Thanks Krisha,

I can work around it so it is not critical but I thought you should see it. Unfortunately, the bridges in our state that have this shear detail are all continuous parabolic RCDG construction and it is very common on our interstate system.

Sincerely,  
Robert Y. Fulton

### Description

FROM:ghutter DATE:Monday, August 02, 2004 11:27:47 AM

We are trying to input a girder-floorbeam-stringer bridge. Virtis will not allow us to save and it is giving us the following error.

Unable to save bridge data!

Saving new and modified objects failed while processing

CDmFsysStringerGroupDef (SaveOrder object 101).

Assignment of data to recordset variables failed.

Trying to set NAME to NULL in table

ABW\_FSYS\_STRINGER\_GROUP\_DEF, but the field is not allowed to be NULL.

FROM:ghutter DATE:Monday, August 02, 2004 11:36:34 AM

The bbd file is attached.

FROM:jduray DATE:Wednesday, August 04, 2004 8:36:00 AM

FROM:mordoobadi DATE:8/5/2004 8:49:45 AM

The error indicates that there is a stringer group definition with empty name field.

I reproduced the problem by following these steps.

(1) Open bridge "FSys GFS TrainingBridge1" BID 13

(2) Double click the "STRINGER GROUP DEFINITION GEOMETRY" folder to create a new stringer group def

(3) click the x to close the window.

(4) refresh the BWS by pushing the R key you will see a new stringer group def item without a name in the tree.

(5) save the BWS and get the same errors as Greg reported.

Joe could you please investigate this. Thanks.

Description

FROM:kkennelly    DATE:8/9/2004 8:17:13 AM  
Submitted on behalf of Vinacs, Caltrans via emial 8/6/04:

The bridge that you reviewed yesterday brought up this enhancement request. See whether this one has been reported earlier or not. If not, please enter this as an enhancement request.

First I will mention the problem we faced to in order for you to understand the problem and the request.

We had three steel girders that are different in lengths (256 ft,260 ft, 264 ft), however, most of the details are the same except the length. As a result, we decided to enter first girder from scratch and then copy, paste and modify approach for the other two. We modelled the shorter girder first. Once

## Complete Issue Information

we are satisfied with the rating result, we moved on to the other two. We copied the member alternative (of the shorter girder) and pasted to save time. Later, as I mentioned earlier, we modified the girder, deck, hinge details to match the actual geometry.

All went well, except the Member loads portion.

Member loads on the member that was copied from had a uniform load of 0.262 kip/ft for Load case DL2. Since the span length of the member that was copied from (SL=256) was less than that of the girder that was being copied to (SL=260), the member loads was pasted as distributed load starting from 0 to 256 feet for the load case DL2. When we modified the data after copied, we checked the uniform load tab and found none. SO WE ASSUMED THAT THE uniform load was not copied (probably many users will do the same) and entered the uniform load and DID NOT CHECK THE distributed load (since it is not our practice to place any load in the distributed load and it consumes a lot of time as well -see next para on this subject). This resulted in very low rating factor for the member.

The irony is that there is no easy way to check the member load data. Note that we may have four or five load group (DL1, DL2, DW, SIP and etc) and there are four tabs (Uniform, Distributed, Concentrated, Settlement). That means a user has to open  $4 \times 4 = 16$  UI to check the data once he copied. It is very painful. (Review report is too long since it provide comprehensive report).

I wish that a right mouse click on the UI gives the option to show a table gives all the data entered within the UI only. When I talked to others in our group, they mentioned they noticed that Virtis sometimes put loads in the distributed load WHEN copy and paste, but didn't know how and when it does (it illustrates the point there are others have problem with this copy paste method).

### WHAT I PROPOSE IS THIS:

1. When the program copy and paste a member alternative, if the loads is entered as uniform load, it should go as uniform load (meaning it goes from full length of each span and remain as uniform load even if the user changes the span length in Member UI).
2. Also, provide an option a user could click on any UI that gives an option to show a table that gives data entered in the Members Loads or add the Load Case Name as the table within the UI as shown below.

Uniform Load UI will look the following:

This arrangement will give the overall data entry when a user checks the data.

### DISTRIBUTED LOAD UI WILL LOOK THE FOLLOWING:

This arrangement will give the overall data entry when a user checks the data. If a user copy and paste, if the load moves from uniform load to distribute load UI, one click will be enough to locate the shift. Same thing applies to the Concentrated Load Tab

The Settlement Tab may need to change, where the user have to have option to add the support number. (now user cannot pick the support)

Description

FROM:bmccaffrey DATE:Thursday, August 26, 2004 10:35:33 AM

Is BRASS considering the subject spec provision? - moment redistribution of negative moments for compact sections. If so, is there any documentation or help files pertaining to it - I can't find anything on this.

FROM:kkennelly DATE:8/27/2004 1:26:47 PM

I don't think BRASS considers moment redistribution but I'll let Brian give the answer.

FROM:bmccaffrey DATE:Thursday, September 09, 2004 8:34:48 AM

Any idea at all if BRASS uses this article????? Anyone???

FROM:kkennelly DATE:9/9/2004 8:45:05 AM

The BRASS-GIRDER Capabilities help file lists the following under the Limitations topic:

BRASS contains the following limitations in addition to the ranges of applicability:

- No moment redistribution

FROM:bgoodrich DATE:Thursday, September 09, 2004 10:59:24 AM

Neither BRASS-GIRDER nor BRASS-GIRDER(LRFD) support moment redistribution.

FROM:bmccaffrey DATE:Thursday, September 09, 2004 2:06:28 PM

Why not??? It's part of the spec.

I have been trying to delete a Superstructure Def. from the attached .bbd file. I have tried I think every possibility of checkin's/checkout's – then I got the attach error – which simply stated that the delete failed for reasons unknown, shut down Virtis and contact technical support.

FROM:dteal DATE:Monday, September 27, 2004 10:57:48 AM

FROM:mordoobadi DATE:10/7/2004 5:34:11 PM

You should check-out the whole bridge and then delete the structure def.  
We are not allowing deletion of an individually checked-out structure def. The edit/delete menu item shouldn't have been enabled.  
Fixed for version 5.2 Beta 4 or later.

### Description

FROM:dteal DATE:Monday, September 27, 2004 12:33:44 PM

I imported the attached BRASS file to Virtis – When I run Virtis I don't get the same LFD Load Ratings for the T130 and T170 trucks.

Brass gives me

T130 Inv/ Operating = 59.06/98.64 and T170 Inv/Operating = 67.62/112.93

and Virtis gives me

T130 Inv/Operating = 45.52/76.01 and T170 Inv/Operating = 52.17/87.13

Both should be one lane distribution

T130 – 50% Impact and Fatigue Requirements

T170 – No Impact and No Fatigue Requirements

Can you tell me why they differ? I have enclosed all pertinent files: .bbd, BRASS dat file, along with our truck & sections lib, LLOAD.dat and Kansas.dat

FROM:dteal DATE:Tuesday, September 28, 2004 11:50:44 AM

I also sent my Virtis Vehicle Library, my Analysis settings along with settings under the advanced tab.

FROM:bgoodrich DATE:Wednesday, September 29, 2004 2:47:27 PM

The source of the difference is in the distribution factors. In the original BRASS data file, the T130 and T170 trucks had a lower distribution factor than the other trucks. To compensate for this in Virtis, you need to set the Scale Factor on the Vehicle Properties window (from Advanced button). Because the distribution factor of 1.0152 is imported, you need to set the Scale Factor to 0.7857 (0.7976/1.0152) to effectively get the same live load actions. Additionally, setting the Impact to zero is not working properly as it causes the impact percent sent to BRASS to be -100, instead of zero. If you want no impact enter 1.0. Incident 3145 discusses the problem with deciding what values to input for impact, but no decision was ever made. It would be best to input 0.5 to reduce impact by 50% and 0.0 to remove impact.

Complete Issue Information

FROM:dteal DATE:Thursday, September 30, 2004 7:46:15 AM  
Brian, I am confused here:

The help file states that for 50% impact use 1.50 and for zero impact use 0.0 – are you telling me the Virtis Help file is wrong?

Distribution Factor Question – My BRASS structure that imported into Virtis both have Dis. Factors of 1.0152. Why do I have to adjust the factor? How did I know this? Where did the 0.7976 com from?

FROM:dteal DATE:Thursday, September 30, 2004 8:42:57 AM  
Okay, after some thought I now know where the 0.7976 comes from, single lane dist. factor.

So here's another question (goes back to VI 4731) – is there a work around for this??  
As you can see, our T130 and T170 permit vehicle uses one lane dist. for girders and a 15% increase on slabs. The scale factor that is calculated is only correct for one particular girder spacing. How does one do a batch rating when the scale factor will change form one bridge to another? And then for a slab designed by a unit width (girder line) you can select single or multi lane on the Superstructure Def. window, but only 2 of our 8 trucks are single lane. How does one work around that?

FROM:bgoodrich DATE:Thursday, September 30, 2004 10:20:46 AM  
Track field marked as "Resubmit 9/30/04".

FROM:bgoodrich DATE:Thursday, September 30, 2004 10:22:10 AM  
The help file and export conflict only in the method used to enter zero impact. One of them needs to be changed as discussed in Incident 3145. I asked Jim and Krisha to review that incident and decide what to do.

I cannot think of a work-around to get Virtis to use the single-lane distribution factors for certain trucks. This is what the Single Lane checkbox did prior to its removal as discussed in Incident 4731. I am keeping this incident open until we can get some answers on Incidents 3145 and 4731.

FROM:bgoodrich DATE:Thursday, October 07, 2004 11:30:31 AM  
I am marking this incident as resolved because the additional issues are being addressed in the other incidents.

|------------|---------------|------------------------------------------------------------|
| 5423.13921 | Resolved      | Truck weight associated with Inventory & Operating ratings |

Description

FROM:sample DATE:Wednesday, September 29, 2004 1:49:31 PM

I have a plate girder with two different sections. Section #1 is from 0 - 39'1", Section #2 is from 39'1" - 156'5", and Section #1 from 156'5" - 195'6". At 39'1" both the top and bottom flanges increase in thickness. I do not agree with the dl moment calculated for the girder weight.

BRASS FILE:

# 480 SPAN-C            1, 39.0833, 1, 2  
 # 490 SPAN-D            156.4167, 2, 1, 195.5000, 1

Self-Load Summary:

| Span No. | Beginning of Load |                 | End of Load  |                 |
|----------|-------------------|-----------------|--------------|-----------------|
|          | Distance, ft      | Magnitude, k/ft | Distance, ft | Magnitude, k/ft |
| 1        | 0.00              | 0.3920          | 19.55        | 0.3920          |
| 1        | 19.55             | 0.3920          | 39.10        | 0.4899          |
| 1        | 39.10             | 0.4899          | 156.40       | 0.4899          |
| 1        | 156.40            | 0.4899          | 175.95       | 0.3920          |

Why is the load varying from 19.55' (1st tenth point) to 39'1"? The load should change from 392 plf to 489.9 plf at 39'1". I cannot find anything in my input under "Girder Profile" that would cause the load to vary.

Complete Issue Information

I think the dl moment due to girder weight should be 2265.7 k-ft. Currently, BRASS is calculating the moment to be 2298.6 k-ft.

FROM:bgoodrich DATE:Monday, October 18, 2004 2:21:56 PM

The flange change points are so close to 10th points that the change points are not added. This causes element 2 (start = 19.55 ft, end = 39.1 ft) to have a different area at each end, which translates into a varying selfweight being reported for that range. We cannot simply replace the tenth point because subsequent special points could all be close to each other and the original tenth point would just keep shifting. For this particular case, the section dimensions at the right end of element 2 are not being assigned correctly, which should be investigated. The only work-around within Virtis is to adjust the flange change points, but that would be changing the bridge data to conform to an engine.

FROM:bgoodrich DATE:Tuesday, October 19, 2004 12:39:02 PM

WYDOT has assigned this issue to BRASS Problem Log 546, but has not authorized work to begin.

FROM:bgoodrich DATE:Friday, December 10, 2004 12:19:16 PM

This issue has been corrected in BRASS-GIRDER and BRASS-GIRDER(LRFD). Fixed for Virtis/Opis 5.3.0.

E-mail from Ken Teng:

Hi Brian,

Could you please show me why VIRTIS use 20 kips (H20 truck) for BOTH Inventory & Operating ratings? And 36 kips for HS20?

I know it is one set of wheel but for both Inventory and Operating. I thought Operating will be different than Inventory.

I know you have very good VIRTIS Description of Specification Analysis manuals. Just wonder whether you guys can release those manuals or not.

Thanks for the help.

Ming-Hung (Ken) Teng  
RQAW Corp.  
4755 Kingsway Dr., Suite 400  
Indianapolis, IN 46205-1547

FROM:bgoodrich DATE:Friday, October 15, 2004 5:41:52 PM

I may not fully understand the nature of your question. As you said, the difference in the H20 and HS20 truck weights is the variable axle on the HS truck. Within Virtis, you can apply any truck to any rating group (Inventory or Operating) and run an analysis. The Inventory and Operating ratings for a particular vehicle is based on the actions from that vehicle, but each rating group has its own capacity and its own set of load factors to determine the factored actions. The truck weight is constant and does not change between rating groups. You also mentioned some manuals, but I'm not sure what you are referring to.

FROM:bgoodrich DATE:Wednesday, October 27, 2004 1:36:52 PM

E-mail from Ken Teng:

Hi Brian,

Thank you for the help. About the manual, I remembered that you said you need to check something in the books when I asked you shear questions long time ago. I guess "the book" is the in-house manual that shows lots of details how BRASS does calculations.

About the question, I need to investigate more and I will enter issues followed Incident 5423.

### Complete Issue Information

FROM:bgoodrich DATE:Wednesday, October 27, 2004 1:36:59 PM

There are no in-house manuals that illustrate BRASS calculations. I may have been referring to textbooks that are used as guides. There is a capabilities manual that is released to both BRASS and Virtis users in the form of a help file. In general, the best thing to do to find out how BRASS performs calculations is to turn on the intermediate output for the point of interest in question.

I checked the Virtis Support center and didn't find any open incidents from you that related to BRASS questions. Please add an incident for each of your questions and we will work on getting you the answers.

## Description

FROM:dteal DATE:Tuesday, October 19, 2004 2:10:58 PM  
I imported a dataset from BRASS (attached).

It couldn't import the stirrup schedule, why?

The imported file in Virtis lost the harp point dimensions for spans 2 and 3? They appear in the BRASS output file but not viewable in Virtis.

I attached a jpg of the Stand Layout for span #2. Notice 2 things – The window that should indicate the Harp Point Locations is not correct. It shows what was in the Bridge Explorer window behind it. When I click on the little window it refreshes the window but comes in blank showing blanks for the Distance and Radius. The distances are correct in the BRASS output file. This is true for spans 2 and 3, 1 and 4 are ok.

I included the jpg, the original BRASS dataset I imported and the Virtis .bbd.

FROM:dteal DATE:Tuesday, October 19, 2004 2:13:30 PM  
I did close and restart Virtis - didn't help

FROM:dteal DATE:Tuesday, October 19, 2004 2:15:22 PM  
Also look at the strand locators at the top of the beam. It has a space where it shouldn't and one extra row between two rows.

FROM:dteal DATE:Wednesday, October 20, 2004 7:41:41 AM  
FROM:dteal DATE:Wednesday, October 20, 2004 3:59:57 PM  
Migrated this to 5.2.0 beta 4 - same problems, no change

FROM:hlee DATE:10/28/2004 3:07:25 PM

1. For the STIRRUP-SCHEDULE card, BRASS Import requires that the schedule length divided by the spacing be a whole number. In Virtis's PS Shear Reinforcement Ranges window, the input for "Number of Spaces" is limited to whole number.

2. Virtis requires all the left harp points located at the same distance from the left end of the beam and all the right harp points located at the same distance from the right end of the beam. BRASS Import needs to check for this limitation and report to the user.

Dean, please attach the Sections.LBY file to this incident so I can reproduce the import process.

4/19/2016 3:04:06 PM

HRS AASHTO

Complete Issue Information

Thanks, Herman.

3. I don't understand the space you are referring at the top of the beam. Please give me more detail information.

4. The extra row is there because the distance from the top of the girder to the strands at the left end (2.75 in) is different from the right end (3.75 in).

CABLE-H1 2, 7, 2, 0.153, 2.75, 46  
CABLE-H2 3.75, 33.3333, 66.6667, 1, 1

FROM:dteal DATE:Friday, October 29, 2004 9:18:25 AM  
Reponses to 1-4

1. My big question/problem here is that the original BRASS data set runs in BRASS-GIRDER as is, shouldn't it then import and run in virtis?
2. Attached is my sections library
3. I don't understand the question, what space at the top of the beam are referring?
4. Yes – the strand dimension D1 is not equal to D3, BRASS allows this.

You didn't comment on the screwed up jpg of the strand layout window??

FROM:hlee DATE:11/1/2004 9:08:19 AM

1. A BRASS dataset that runs in BRASS-GIRDER doesn't imply it will import and run in Virtis. Like the STIRRUP-SCHEDULE card, the import will give an error message when the number of spaces is not a whole number.

The screwed up jpg of the strand layout window is caused by the import failed to check for Virtis's limitation mentioned in (2) of my previous reply.

FROM:hlee DATE:11/3/2004 11:06:40 AM

I added a check in BRASS Import to enforce left harp distances of all strands are the same and right harp distances of all strands are the same in a span. The update is for the first service pack of 5.2. I changed the status to Resolved since the bug that caused the screwed up strand layout window is fixed and the stirrup schedule issue is recorded in Incident 5440.

FROM:hlee DATE:1/24/2005 10:22:23 AM

The update is available in 5.2, not the first service pack of 5.2.

FROM:dteal DATE:Tuesday, March 28, 2006 9:32:18 AM

## Description

FROM:kkennelly DATE:10/20/2004 8:48:03 AM

Submitted on behalf of Dan Broekhuizen, URS Corp via email which is excerpted below:

1. The Virtis program does not calculate the value for "J" correctly (the Saint-Venant torsional constant). This beam property J is a variable in the calculation for the live load distribution factor for side-by-side box beams according to section 3.23.4.3 of AASHTO. The bridge that URS is working on for the load rating project has 39" deep by 36" wide box beams. Based on section properties, Virtis calculates a value of J of 16,175 in<sup>4</sup>. URS is calculating that the value should be closer to approximately 155,000 in<sup>4</sup>. We're off by a factor of 10 or so. This actually doesn't change the distribution factor that much. In fact, the distribution factor is higher using the incorrect value of J, but we feel that this information should be brought to the attention of Michael Baker Associates.

FROM:kkennelly DATE:10/20/2004 8:51:06 AM

Virtis is computing  $J = A^4/40lp$  but that equation does not apply to box beams. It should be using  $J=4A_o^2/\sum(s/t)$  as per AASHTO LRFD equation C4.6.2.2.1-3.

Description

FROM:kkennelly DATE:10/20/2004 8:53:48 AM

Submitted on behalf of Dan Broekhuizen, URS Corp via email which is excerpted below:

2. The other issue that we have had with the side-by-side box beam bridge is with the debonding of some of the strands. The bridge we are working on has 4 strands debonded for a length of 17'-0". When we enter a debonding length in the program of 204", the rating factor for the bridge is computed as 0. For some reason, when the debonding length is entered as 204", the output file is saying that there is no section defined at the two-tenths point from support #1. The debonding length can be

Complete Issue Information

defined as 203.95 or 204.05 and the program works fine, but for some reason it doesn't like a debonding length of 204". URS has no idea why the program is doing this.

FROM:kkennelly DATE:10/20/2004 8:55:37 AM

FROM:bgoodrich DATE:Friday, October 29, 2004 3:45:11 PM

When the debond length of 204" is specified, the BRASS mesh is created with two node points that are too close together. A node point at the end of debonding plus transfer is added (204 debond - 8 overhang + 25 transfer = 221" = 18.4167'). The node at 2/10 of the span length is at  $92.6667' * 0.2 = 18.5333'$ . Therefore, the difference between these two points is 0.1167', which is smaller than the 0.12' small element allowed by BRASS. Simply put, the additional point at 18.4167' should not have been added.

FROM:bgoodrich DATE:Monday, December 06, 2004 11:54:00 AM

WYDOT has assigned this issue to BRASS Problem Log 554.

FROM:bgoodrich DATE:Thursday, January 27, 2005 4:13:48 PM

This issue has been addressed in the BRASS-GIRDER 5.9.1 engine to be released in May 2005.

## Complete Issue Information

(Aran,

Brian is more familiar with the BRASS program than I am so he should be able to provide more help with this question than I can. If you have any other questions about Virtis, please let me know.

Thanks, Krishna)

FROM:bgoodrich DATE:Wednesday, October 20, 2004 4:03:57 PM

There is some intermediate output available within BRASS, but the necessary flag is not exposed to the Virtis user at present. Basically, the secondary moment is calculated within BRASS as:

$$M_s = M_1 - M_2$$

where:

$M_s$  = Secondary moment

$M_1$  = Moment on continuous structure caused by losses

$M_2$  = Moment due to eccentricity of prestress force

FROM:bgoodrich DATE:Wednesday, October 20, 2004 4:04:50 PM

E-mail from Aran Lessard (Bayside Eng.):

Hello Brian,

Thank you for your response on the Secondary Moment issue. I am also looking for a good example on how Virtis/Brass generates the nominal moment capacity of prestressed concrete beams. I have produced hand calculations that are close to the moment capacity provided in the Brass Output file but are still a little off. I am just looking to find out where the difference lies.

Please let me know when you get a chance.

Thank you,

Aran Lessard

FROM:bgoodrich DATE:Wednesday, October 20, 2004 4:05:52 PM

BRASS-GIRDER generally produces intermediate output that illustrates calculations. This calculation is provided within BRASS, but the flag to turn it on is not exposed to the Virtis user. BRASS-GIRDER calculates the nominal moment capacity of P/S beams per AASHTO 9.17 and 9.18. I suspect the difference lies in the calculation of  $f^*_{su}$  for which BRASS-GIRDER always follows Equation 9-17 or a simplification of Equation 9-18 ( $f^*_{su} = f_{se} + 15$ ). Please submit your bridge in the form of a BBD file if you would like me to turn on the intermediate output and send this to you.

FROM:bgoodrich DATE:Wednesday, October 20, 2004 4:06:41 PM

E-mail from Aran Lessard (Bayside Eng.):

Brian,

Thank you for the information. I am sending you the bridge file: W-30-025 (3UD) TEST.bbd and would appreciate it if you could turn on the intermediate output. In particular, I was looking at the moment

Description

FROM:dkoenig DATE:Tuesday, November 02, 2004 12:16:08 PM  
We have noticed on some structures that the impact and without impact values on the load rating results are the same. To create this problem, we have rated bridges with the normal analysis settings. We then go to the member alternative and view the results. Once on this window, we select the option

Complete Issue Information

for getting detailed results. On the detailed results, you will see that the with and without impact values are identical. The normal system calculated impact factors were used in the analysis. This seems to only be happening on some of the vehicles that we are rating. We have not been able to find any explanation for it. The bbd files for two structures are attached below. We also have a word document with some screen shots and output from a rating results report to show you what it is giving.

FROM:bgoodrich DATE:Monday, December 06, 2004 2:15:43 PM  
There is a bug in BRASS. I have forwarded this issue to WYDOT.

FROM:bgoodrich DATE:Tuesday, January 11, 2005 11:25:40 AM  
WYDOT has assigned this issue to BRASS Problem Log 558, but they have not authorized the actual work yet.

FROM:bgoodrich DATE:Friday, February 11, 2005 4:13:09 PM  
BRASS-GIRDER was corrected to address this incident. Fixed for service pack 1 of Virtis 5.3.

Description

FROM:tarmbrecht DATE:Tuesday, November 16, 2004 5:15:33 PM

This may be more of a problem with significant digits. File attached. When attempting to assign a stringer group definition to the Floor System Geometry, we get a "Validation Error" message stating the following:

"Floor System Geometry

ERROR: StrgrGrp (Stringer Group Definition) assigned to Stringer Unit 1 has specified a floorbeam at a distance 0.000 ft but a corresponding floorbeam does not exist at this location.

ERROR: StrgrGrp (Stringer Group Definition) assigned to Stringer Unit 1 has specified a floorbeam at a distance 12.1146 ft but a corresponding floorbeam does not exist at this location. ..."

As far we can tell, floorbeams do exist at each location where Virtis says they don't. The only unusual thing about this structure is that the end floorbeams are centered 7" inside of the CL bearing of the main girder. We have attempted to address this by indicating a 7" cantilever at the end of the stringer spans.

Thanks, Tim

FROM:kkennelly DATE:11/17/2004 12:54:57 PM

When you assign your stringer group definition to a stringer unit in the Floor System Geometry window you should enter the "Distance to Stringer Group Definition Workpoint" as 0.5833'. As the help for this window states, "The work point of a stringer group definition is the intersection of the superstructure definition reference line and the first floorbeam of the stringer group definition assigned to this unit." Your first floorbeam mbr location is at 0.5833' in the Floorbeam Member Locations window.

### Description

FROM:jtriezenberg DATE:Thursday, November 18, 2004 11:36:09 AM

The prestress moment reported by Virtis in the results graph seems to be equal to the Initial Stress multiplied by the eccentricity. This is the initial stress without losses.

Is this the moment that Virtis uses to calculate the dead load moment? If so shouldn't it also include prestress losses?

FROM:jtriezenberg DATE:Monday, November 29, 2004 7:55:15 AM

I have included the .bbd file to help.

FROM:bgoodrich DATE:Friday, May 13, 2005 1:37:15 PM

WYDOT has assigned this issue to BRASS Problem Log 599.

FROM:bgoodrich DATE:Friday, November 11, 2005 9:40:24 AM

BRASS has been corrected. Fixed for Virtis version 5.4.

Description

FROM:bmccaffrey DATE:Monday, November 22, 2004 10:50:14 AM

How is Virtis calculating 'J' (Saint-Venant torsion constant) for adjacent voided and non-voided box-section beams and slabs??? I'm using the equations from section 3.23.4 (Standard Specs) and I'm coming up with values 10 to 11 times larger than what's calculated in the box beam 'Properties' tab. A sample .bbd file is attached.

The LLDF's calculated by the 'Compute from Typical Section' wizard are different because of this.

FROM:dkoenig DATE:Monday, November 22, 2004 2:13:21 PM

Brian, a consultant submitted the problems with this in Incident 5434. We have also ran across it in Missouri. As far as I know, they have not done anything with fixing this problem.

FROM:bmccaffrey DATE:Tuesday, November 23, 2004 1:29:11 PM

I didn't catch 5434 before - thanks Dave.

FROM:jduray DATE:12/14/2004 9:22:02 AM

Same as 5434.

FROM:tarnbrecht DATE:Monday, November 22, 2004 3:23:53 PM

Could you please verify how the wheel fractions are calculated for exterior steel beams? Please read my consultant's write-up (attached Word document) on the subject and let me know what you think. For reference, 0280013.bbd is also attached. Thanks,

Tim

FROM:kkennelly DATE:12/1/2004 2:57:01 PM

Virtis is following AASHTO Article 3.23.2.3.1.5 which is for exterior steel beams in a structure with a concrete deck supported by 4 or more stringers. There it specifies the wheel load shall not be less than  $S/(4 + 0.25S) = 6.33/(4 + 0.25(6.33)) = 1.134$

### Description

FROM:bgoodrich DATE:Tuesday, January 04, 2005 4:40:45 PM

E-mail from Brian McCaffrey: 12/31/2004

Jim,

Is there any way to report or view how many trucks (and where they are) are used in a floorbeam analysis?

Thanks, B

FROM:bgoodrich DATE:Tuesday, January 04, 2005 4:41:50 PM

There is some intermediate output that can be turned on in engine properties of the Analysis Settings window. The Floorbeam Intermediate Output Level will report the location and weight of wheel lines for each position at which loads are applied to the floorbeam during analysis for maximum actions. I hope this helps.

FROM:bgoodrich DATE:Tuesday, January 04, 2005 4:42:09 PM

E-mail from Brian McCaffrey: 1/4/2005

Brian,

This was the last position I got from running the intermediate output for my first intermediate floorbeam. I forgot about that option.

Some questions:

Is the last set of numbers the controlling position?

[BG] No. The output show every position considered. The critical truck positions for each point along the floorbeam are not currently reported, but they could be.

and

Is lane loading considered?

[BG] Yes, but with the following implementation. The longitudinal analysis is performed with the lane load as a uniform load with the additional concentrated loads. Once the reaction to the floorbeam is known for this load, the reaction is applied as a two-wheel axle, not a uniform load.

and

4/19/2016 3:04:09 PM

HRS AASHTO

619

Complete Issue Information

Where are these distances measured from? (left side of travelway, left edge of bridge, etc.)

[BG] All distances listed in the intermediate output reference the left edge of the deck. I will make a request to WYDOT to add a note to explain this.

and

If this is the controlling position, why is there 6' between trucks (I got 6' from the 'distance to wheel lines' line)? Shouldn't it be 4'.

[BG] The controlling position is not currently shown. BRASS considers the 10' design lane within a 12' traffic lane. If the design lane is pushed to the left side in each of two adjacent traffic lanes, the distance between axles is 6'. When the design lanes are pushed to the inside of adjacent traffic lanes, the distance between axles is 4'.

and

Why are the wheel lines 14.98k? I was using 16k since my floorbeam spacing is 6' and the other axles wont have any effect.

[BG] The wheel line weights reported in the intermediate output include the multiple presence factor (1.0 for 1 and 2 lanes, 0.9 for 3 lanes, and 0.75 for >3 lanes). I will make a request to WYDOT to add a note to explain this.

I attached the .bbd file also.

Thanks, B

I replied within the above e-mail with [BG]. I also forwarded these issues to WYDOT.

FROM:bgoodrich DATE:Tuesday, January 11, 2005 11:33:22 AM  
WYDOT assigned the work of adding notes to BRASS Problem Log 560. The critical truck positions are already part of Incident 5748 and will be tracked separately there.

Issue ID: 5761

## Complete Issue Information

I have a question regarding the input for Virtis under the Loss Data-Lump Sum tab for Prestress Properties. Input fields are available on this tab for the Final Loss, Composite Loss, and the Continuous Loss. My question is in regards to the Composite Loss and Continuous Loss fields. I am wondering how Virtis/BRASS uses this information in the rating computations and if it is necessary to populate these fields to obtain an accurate result, assuming the rating is being computed based on the AASHTO LFD specifications. I did not find any detailed information or documentation in the Virtis help menu relating to these fields. Any information you can provide would be appreciated.

Reply sent:

I'm not sure if you want BRASS to compute your losses or if you want to input them yourself.

If you want the losses to be computed by the AASHTO method specified in Article 9.16.2.1 of the LFD spec, select "AASHTO" as the loss method on the General P/S Data tab. Then you do not need to enter any data on the Loss Data - Lump Sum tab since that tab is for data only for the Lump Sum method of loss computation.

If you want to use the Lump Sum method to compute the losses, choose "Lump Sum" as the loss method on the General P/S Data tab. Then enter data on the Loss Data - Lump Sum tab. I have submitted your question about leaving the Composite and Continuous loss fields blank as incident 5761 so someone more familiar with BRASS can answer.

FROM:bgoodrich DATE:Tuesday, January 11, 2005 11:59:47 AM

The Composite Loss and Continuous Loss fields are provided to allow for incremental losses to be addressed during the construction process. Any losses that occur between the time the strands are stressed and the time the structure becomes continuous are applied to the non-composite simple spans. Any losses that occur between the time the structure becomes continuous and when it becomes composite are applied to the non-composite continuous spans. And so on. Virtis currently allows only one type of continuous P/S structure: simple spans made continuous for live load. For this case, the structure becomes composite and continuous at the same time when the deck hardens. Note that the lump-sum losses input into Virtis are measured from the time the strand is stressed. BRASS will determine the difference between each step (stressing to continuity, continuity to composite, composite to final). BRASS considers several other P/S structure types than are provided in Virtis, which is why it is structured in this way. If you do enter the Continuous Loss, enter the same loss in the Composite Loss field. If you only enter the final loss, it will be applied to the continuous/composite structure. If you enter the same loss in all fields, all losses will be applied to the non-composite, simple spans. This discussion should provide the necessary information for you to determine how you wish to enter losses.

Complete Issue Information

FROM:jihnat DATE:1/12/2005 12:49:09 PM  
I'm not able to reproduce this. Do I have to enter anything, or just click OK? Any StructureDef/Floorbeam in particular?

FROM:bmccaffrey DATE:Tuesday, January 18, 2005 10:56:21 AM

Just click OK and reenter the window.

FROM:bmccaffrey DATE:Wednesday, January 26, 2005 10:58:23 AM

You have to have a range in there to begin with.

FROM:bmccaffrey DATE:Wednesday, February 02, 2005 9:45:12 AM

- Go into any floorbeam and enter deterioration on either flange - not the cover plates or web, they work fine.

- Hit OK

- Get back into the window and look at the range field.

FROM:jihnat DATE:3/3/2005 3:29:55 PM  
Fixed for version 5.3.0 Release.

Description

FROM:bmccaffrey DATE:Monday, January 24, 2005 8:26:43 AM

A minor discrepancy between the GUI and engine. Not sure what the proper way to display fractions of rebar is.

The following is an e-mail excerpt I sent to one of our users.

...

The engine uses the fractional (or actual) number of bars in the analysis correctly. In this bridge, 2.3 #8 (dia=1.0", area=0.79 in ^2) bars are entered for the bottom of the slab which sets As=1.817 in^2 (2.3\*0.79) and is confirmed in the output file extract below. The schematic only shows 2 #8 bars and is misleading but the analysis is using the correct value.

Description

FROM:bmccaffrey DATE:Wednesday, January 26, 2005 10:59:55 AM

How do I turn on the intermediate output for Mp calculations when it applies? Does BRASS LFD automatically check for this? I have a two span continuous steel plate girder that is compact in the positive moment region but the analysis seems to stop at first yield.

Complete Issue Information

FROM:bgoodrich DATE:Wednesday, February 09, 2005 11:07:16 AM

To get BRASS LFD to consider Mp for a section, you need to visit the Member Alternative Engine Properties window. Review the help for the "Compactness at the Pier" grid. In short, you must check the "Compact" box for each span in which the adjacent pier sections are compact for BRASS LFD to consider Mp. This will export the section type "41". If you are entering your own points of interest without generating schedules, you must select Section Type "41" on the Point of Interest Engine Properties window for the LFD engine.

FROM:bgoodrich DATE:Wednesday, February 09, 2005 11:39:29 AM

E-mail from Brian McCaffrey:

Brian,

That's what I did and it works fine - I had forgotten about that setting. I got confused because it works automatically for simple spans.

Thanks, Brian

 Submitted on behalf of Ken Teng of RQAW Corp.

E-mail to Brian Goodrich:

=====

Brian,

I received a support request from Ken Teng of RQAW Corp. In the attached 5.1.0 bbd, the two member alternatives "BOX BEAM #2 (POI control=0)" and "BOX BEAM #2 (POI control=5)" in member G2 are the same except the POI Control values in the BRASS LFD engine properties. He questioned why the rating results are different. Also, when I compared the BRASS dat files, stirrup schedules only show up in "BOX BEAM #2 (POI control=5)" dat file.

Thanks,  
 Herman

FROM:bgoodrich DATE:Thursday, January 27, 2005 4:05:25 PM  
Option 5 uses the stirrup schedules to populate the points of interest and rates for both flexure and shear. However, option 0 does not use any of the schedules and uses only the overrides on the "Point of Interest" window. The only problem here is that the Override Schedules option does not work for prestressed concrete. This is all documented in the corresponding Engine Related Help: "Point of Interest: Shear (BRASS LFD)" topic. For option 0, BRASS will not calculate the shear ratings in prestressed concrete because stirrups at points of interest cannot be specified in BRASS. Your best bet for prestress is to use a POI control option other than 0, so you get the shear ratings too.

FROM:bgoodrich DATE:Wednesday, February 02, 2005 11:58:29 AM  
More related questions from Ken Teng:

=====

Hi Brian,

Thanks for the help.

Did you notice that the POI locations that I assigned are different than the outputs? For example, if I assign 78ft for POI, then VIRTIS shows SPAN2-1.167ft right but the result shows on span1. Why?

Also, the POI control 0 or 5 will show the different critical locations even though I use exactly POI point (please run H20 and there will be 2ft away for same locations). Could you please tell me why?

If I assign POI using the Span & Fraction tab for Span1 with Fraction=1, the program shows  
"\*\*\*ERROR\*\* A POINT-OF\_INTEREST command is required when parameter 6 of the ANALYSIS command is 3, 4, or 5". Please show me why?

There may be a problem with shear ratings. The design programs (CONSPAN & PCBM) show OK for #4 shear stirrups spacing. But I need to use #5 stirrups for VIRTIS. Please see attached Microsoft

Word file for stirrups spacing. What should I do? Please advise.

FROM: bgoodrich DATE: Wednesday, February 02, 2005 11:59:59 AM  
Here are responses to your questions.

Issue 1: POI location

BRASS does not have the capability to analyze the span length of simple-span bearing for the non-composite stage and a different span length of the continuous span for the composite stage. The prestress modeling method option can be utilized, so the BRASS Export will generate commands associated with the shorter or longer span lengths. You have the "Centerline of Simple-span Bearing" method currently selected, so BRASS will use the span lengths adjusted to remove the bearing offset at each end of the span, i.e.,

- Span 1 = 76.833' - 1' = 75.833'
- Span 2 = 79.666' - 2' = 77.833'
- Span 3 = 76.833' - 1' = 75.833'

Therefore, the POI you specified at 78' (SPAN2-1.167') is adjusted as well:

$$1.167' - 1' \text{ (offset)} = 0.167'$$

$$\text{POI} = \text{Span} * 100 + 10(0.167/77.833) = 200.0215$$

This POI is not placed on span 1.

Issue 2: POI Control 0 or 5

As I wrote earlier, POI control option 0 DOES NOT consider shear, but option 5 does. This is why the locations are different between the two options.

Issue 3: Error message

You entered a point of interest at 76.833', which is directly at the bearing. When the BRASS model is generated based on the "Centerline of Simple-span Bearing" method, this POI is not in that model. The only reason this message is given is there are no other POI entered that actually coincide with the BRASS model. When the flag on the ANALYSIS command is set (long before the POI are generated), the export doesn't know if any of the POI will be eliminated because they are not on the BRASS model. To work-around this issue, please enter another point that will actually be present in the BRASS model you specify.

Issue 4: Possible shear problem

I believe the difference in stirrup size may be due to the method BRASS uses to calculate the factored shear near the ends of the spans. BRASS does not use the shear "d" away from the support. It uses the shear at the POI.

FROM: bgoodrich DATE: Monday, February 07, 2005 5:47:47 PM

=====  
Hi Brian,

Thank you so much for the help. I really appreciate.

But I still can not figure out the issue #4. You mentioned that the BRASS use the shear at POI but usually the POI will be the 10th point and usually is larger than "d". Based on this point of view, it

Complete Issue Information  
should be OK for shear control.

Is anyway that I can assign the BRASS use the shear at "d"?

Please advice. Thanks again for the help.

FROM:bgoodrich DATE:Monday, February 07, 2005 5:48:25 PM

I have reviewed your issue again and here are my thoughts. First, you cannot currently assign BRASS to use the shear at "d" away from the support. To determine why #4 stirrups do not satisfy the shears, you will need to review the BRASS output. Turn on the intermediate output for the "Span 3 - 2.480067 - Right" point of interest. The output will show the shear equations, input parameters, and any assumptions that BRASS makes. If you don't agree with the BRASS output, please let me know where you think the problem might be.

| 5988.13357 | Resolved      | Effective flange width wizard for skewed bridges |

## Description

I have a two span continuous plate girder that rates out fine until I put a POI at a flange transition to check stresses. The ratings drop quite a bit (inv. rating factor without a POI = 1.16 at the pier, .813 with a POI at ~0.275 from the left end).

I thought that the controlling rating was reported out all the time regardless of where it was and without any POI's defined. Am I wrong????? The actions for the transition point are reported but the rating factors are not calculated.

We've assumed that the controlling ratings reported after an analysis were the true controlling ratings.

The girder I'm looking at is member G3. Put a POI at 0.274576 of span 1 and recheck the controlling ratings for the member.

FROM:kkennelly DATE:2/2/2005 7:57:57 AM

BRASS only computes rating factors at tenth points (if you have the POI control on the Member Alt:Engine - BRASS LFD Properties window set to generate poi's at tenth points) and points of interest you enter in Virtis. Neither BRASS nor Virtis look to see if any other points may have more critical rating factors.

FROM:bmccaffrey DATE:Wednesday, February 02, 2005 10:28:52 AM

Thanks, I thought that transition points were included in the check since they are also node points.

This is a good enhancement.

FROM:jduray DATE:4/14/2005 10:42:13 AM

To address this we should improve the POI wizard.

| 6013.15322 | Resolved      | Error messages for schedule based reinf when straight portion of Type3 bar to left of first support |

Description

FROM:bmccaffrey DATE:Thursday, February 03, 2005 1:34:03 PM

What dimension for beam spacing should the eff fl wizard use - perpendicular to girder or along the support? If you have a skewed bridge and change the girder spacing orientation to 'along support' and recalculate the effective flange width, the wizard does not consider the revised beam spacing due to the skew.

4/19/2016 3:04:12 PM

HRS AASHTO

633

Complete Issue Information

FROM:jduray DATE:3/7/2005 10:59:46 AM  
I think it should use perpendicular to the girder.

FROM:kkennelly DATE:3/7/2005 2:54:56 PM  
The effective flange width should be based on the perpendicular spacing. The width measured along the support for a skewed mbr is not the physical width of the concrete along the length of the mbr. The effective flange width can't be larger than the physical width along the length of the mbr.

FROM:bmccaffrey DATE:Wednesday, March 23, 2005 11:48:12 AM

Why can't the wizard calculate the correct eff fl width if the girder spacing is entered along the support since the skew is given? It seems like a simple calculation since many of our bridge plans show this dimension along the support for skewed structures. We have been manually calculating the spacing perpendicular to the members from the skew (length along support x sin(skew)) so we can use the wizard.

FROM:kkennelly DATE:3/23/2005 2:01:37 PM  
The Compute Eff Flange Width button is using the skewed girder spacing along the support when it should really be using the perpendicular spacing.

FROM:kkennelly DATE:3/23/2005 2:18:42 PM  
Fixed for 5.3. If you enter a skewed spacing along the support, the compute eff flange width button will use the perpendicular girder spacing to compute the effective flange width.

### Description

FROM:kkennelly DATE:2/8/2005 12:25:11 PM

Submitted on behalf of Glen Mullings, Prudent Engineering, LLP via email:

Attached is the ".bbd" file for a bridge that I am performing a load rating analysis on.

Whenever I try to run the analysis I get a message saying "The number of deck line loads exceeds the maximum allowed by BRASS". Whenever I remove the concrete parapets that are input in the "Structure Typical Section", the analysis runs fine.

Is there something that I am missing or doing incorrectly?

Thank you for your help.

PS

The file is from VIRTIS 5.1.1

Response sent:  
Hi Glen,

The BRASS LFD program has a limit on the number of deck loads. However, based on your bridge I don't think that your bridge is violating this limit.

I've entered your problem as incident 6027 on the Virtis/Opis Technical Support website. You can track progress on your problem on that website. Please let me know if you need additional information.

Regards,  
Krisha Kennelly, PE  
Michael Baker Jr., Inc.

FROM:kkennelly DATE:2/8/2005 12:30:48 PM  
Problem is not due to export or BRASS. Bridge has extra rows in the concrete railing table with null railing ids. Email sent to Glen:

Glen,

I realized what your problem is after I sent the previous email.

Your problem is not related to BRASS. Somehow your bridge has some extra rows in the railing table but these rows don't have a railing id assigned so you don't see them in the Virtis UI.

I've attached a revised bbd file that has these railing rows removed. Please review your Structure Typical Section window to verify the remaining data is correct.

Do you remember if the Structure Typical Section window experienced any unusual behavior when you were entering your data? Any info you can give us might help us track down the source of this problem. Thanks.

Regards,  
Krisha Kennelly, PE  
Michael Baker Jr., Inc.

FROM:kkennelly DATE:2/8/2005 12:48:41 PM  
User's problem is fixed but have we fixed our system so this doesn't happen anymore?

FROM:kkennelly DATE:2/8/2005 1:06:04 PM  
I suspect this is related to Incident 4971 where appurtenance names have trailing blank spaces. That problem has been fixed for 5.1 service pack 1. Was this bridge entered prior to 5.1.1?

Complete Issue Information

Virtis is having a problem with your bar mark A-8 since it has a zero value for the A and E dimensions. Can you use a Type 2 bar instead of a Type 3 bar mark since the Type 2 bar doesn't have the A and E extensions? Also, your A-2 and A-5 bars do not have the same number of significant digits entered for the angles so the bars do not have the same total length (38.198 and 38.199 ft) which may cause a tolerance problem. You may need to revise the angles for these bar marks so that the total straight lengths of the bars are the same. Please let me know if you need additional information.

### Description

FROM:kkennelly DATE:2/23/2005 8:37:55 AM

Submitted based on email from Martin Smith, Modjeski and Masters:

I am currently working on the rating of a bridge in Michigan and I have a question regarding the rating summaries that I get out of Virtis. I noticed some discrepancies in the output for the interior girder (Girder G2). When I run the bridge with the program calculated multiple and single lane distribution factors, the "Detailed Rating Report Summary Table" lists the Single Lane Operating Rating Factor, including Impact as 2.060 for the HS20 (SI) axle load. If I override the program computed values for the multiple lane factors and input the program computed single lane distribution factors (i.e. - the multiple lane distribution factors are set equal to the single lane distribution factors) the "Detailed Rating Report Summary Table" lists the Single Lane Operating Rating Factor, including Impact as 1.975 for the HS20 (SI) axle load. This is about a 4% difference. I was wondering if you might have an explanation for the difference.

The ratings in question are controlled by the shear strength in Span 2 at a location of 19.4%. After briefly looking at the output, I am guessing that Virtis/Brass calculates the controlling rating factor, which is controlled by the multi-lane distribution factor in the first run, and scales the single lane distribution from this. I am assuming this is the case because I did not find any reference to the single lane distribution factors in the output file. In the second case, both distribution factors are the same, so the Multiple Lane Operating Rating with Impact and the Single Lane Operating Rating Factor with Impact are the same, albeit lower than in the first run. The problem appears to be that the shear capacity assuming a single lane distribution factor is slightly lower than the shear capacity assuming a multi-lane distribution factor at the controlling location.

I have included a \*.BBD file of the bridge for your reference. I would appreciate any thoughts or comments that you may have that could help explain the differences in the rating values. We are currently double checking the input to make sure there are not any mistakes that may account for the discrepancy. Please feel free to contact me if you have any questions.

FROM:kkennelly DATE:2/23/2005 8:41:52 AM  
Hi Martin,

You are correct that BRASS is computing the ratings for the controlling distribution factor and then scaling the results to obtain the rating for the other distribution factor. Since your beam is being controlled by the moment-shear interaction equation for shear, this scaling of rating factors does not produce the exact result since the capacity of the section is dependent on the load on the section.

I've entered Incident 6069 on the Virtis/Opis Technical Support website to add to the BRASS Engine Related Help to describe how BRASS is computing the scaled rating factor and that it is not exact if the rating is dependent on the load on the section.

If you create a point of interest at your controlling point, the BRASS output file will contain detailed calculations for the rating factor that you can review. Please let me know if you need additional information.

Regards,  
Krisha Kennelly, PE  
Michael Baker Jr., Inc.

FROM:bgoodrich DATE:Thursday, March 17, 2005 4:34:59 PM  
Rating Results Summary

If the "Detailed" option is selected as the Lane/Impact Loading Type, ratings are provided for several scenarios: as-requested, single-lane, multi-lane, with and without impact. BRASS LFD analyzes the structure based on the lanes loaded as specified by the user. Once the analysis is complete, the export process scales the original ratings by various combinations of distribution factors (wheel fractions) and impact factors to obtain the ratings for the other combinations of lanes loaded and impact.

Warning: The scaled ratings may not be exact if an interaction rating controlled.

## Complete Issue Information

I am currently working on the rating of a another bridge in Michigan and I have a question regarding the rating summaries that Virtis provides as output. This bridge is a two span, prestressed beam structure that is continuous for live load. The Rating Summary Tables show the controlling ratings as being governed by the limit state of "Ultimate Strength Flexure" due to HS 20 (SI) Lane loading, with the controlling location at 99.5% of Span #1 (over the pier).

My question involves the "Detailed" Rating Report Summary. The detailed summary shows the same rating factor value for multiple lane distribution, with and without impact. Similarly, the rating factors for single lane distribution, with and without impact, are also the same.

I don't think that the impact factor should be equal to one (1.0) in this case. I was hoping that you might be able to explain why the two values are the same. I would also like to know if the values shown include impact. Based on the output file, it appears that they do.

I have included a \*.BBD file of the bridge for your reference. I would appreciate any thoughts or comments that you may have regarding these values. Please feel free to contact me if you have any questions.

Reply sent via email:

Hi Martin,

The single lane and multi-lane results are the same for member G1 because the live load distribution factors for single and multi-lane are entered as the same numbers.

I don't know why you are getting the same values for with and without impact. I've entered that problem as incident 6082 on the Virtis/Opis Technical Support website (<http://aashto.bakerprojects.com/virtis>). You can track resolution of this problem on that website.

If you create a point of interest in Virtis, the BRASS output file will contain detailed information for the rating calculations it performed at that location. This may assist you in evaluating your output. I believe the values output do include impact but that should be verified in the incident on the Technical Support website by someone more familiar with BRASS.

### Complete Issue Information

Brian, I suspect this has something to do with the controlling point being located over the support. BID 9 in the sample database, G2 is a 3 span ps bridge and it exhibits the same behavior. Controlling point is at 99.1% of span1 and the with/without impact results are the same. If I change the beam description so that the controlling point is not over the interior support, the detailed rating results show different with/without impact when the controlling point is not at the interior support.

FROM: bgoodrich DATE: Monday, February 28, 2005 11:13:40 AM

The issue with the results being the same with and without impact was addressed in Incident 5477.

Attached is the bbd – I was doing an Opis Analysis of G1 using HL93 loading. The Engine properties were set for LRFD to find the Service II moments only, see the attached jpegs for the settings. The analysis will begin and then hang at POI #5 giving a system error message that states “Unable to perform Analysis” and the result will close Opis.

Is there any reason that you can't analysis for Service II only??

## Description

FROM:tarmbrecht DATE:Wednesday, March 09, 2005 3:42:23 PM

A simple span RC-Slab is modeled w/#10 bars, hooked at both ends, and spaced at 9"oc, specified as the main bottom-of-slab reinforcement. With the "Fully Developed" box not checked the controlling inventory RF is 0.429 @ .9 of the span. With the "Fully Developed" box checked the control point is at the 5/10 point of the span (as one would expect with hooked bars specified and the "Fully Developed" box not checked). Could you please verify that Virtis/BRASS is correctly taking the development length of hooked bars into account? File attached. Thanks,

Tim

FROM:kkennelly DATE:3/9/2005 4:20:57 PM

Do you agree with the calculations presented in the reinforcement dev length log file created when you analyze the member? You can view this log file from the Bridge/Output command when the name of the mbr alt is selected in the BWS tree (this is where you can also view the BRASS input and output files).

Also note that Virtis does not consider hooked bars to be completely developed over their length just because they are hooked. Virtis will compute the required development length for the hooked bar in

4/19/2016 3:04:15 PM

HRS AASHTO

651

Complete Issue Information

accordance with Article 8.29. Virtis considers the end of the hook to be zero percent developed and then at the end of the req. development length the bar is considered to be 100 percent developed. So if you have not checked the Fully Developed checkbox, Virtis does not consider the very end of the hook to be developed.

Refer to the "Export of Schedule Based Reinforced Concrete Members" help topic for the following:

When Virtis/Opis computes the percent development of a hooked bar at a point within the development length of the bar, Virtis/Opis assumes the bar is developed 0% at the start of the bar and 100% at the end of the development length. Hooked bars are actually developed more than 0% at the start of the bar due to the hook, but this percentage of development is not computed by Virtis/Opis.

FROM:kkennelly DATE:3/21/2005 11:16:47 AM  
Email from Tim:

I appreciate your response. As a followup to this incident, could you please verify that 8.29.3.2 is being followed? We think there is adequate side cover or at least the side cover is not applicable. Should the 0.7 factor be applied in this case? Thanks,

FROM:kkennelly DATE:3/22/2005 9:06:59 AM  
Please refer to the "Export of Schedule Based Reinforced Concrete Members" help topic. This topic lists which specs are considered by Virtis/Opis. Article 8.29.3.2 is not considered by Virtis/Opis.

| 6131.15204 | Suspended     | User shouldn't have to specify PS I Beam shape for Virtis to compute distribution factors |

Description

FROM:tarmbrecht DATE:Wednesday, March 09, 2005 4:14:14 PM

File attached. For this one, for girder G3, which is under a roadway, when we click the Calculate from Typical Section button, it calculates the Live load distribution factor for shear at supports to be zero. Could you please look into this and tell me if we're missing something? We don't think it should be zero and we can't find the reason. Thanks, Tim

FROM:kkennelly DATE:3/10/2005 8:10:34 AM

On the Structure Typical Section:Lane Positions tab, the lane position is only specified at the start of the structure. The dimensions for the lane position at the end of the structure are blank. If you enter values for the lane position at the end of the structure the shear df is computed as non-zero.

### Description

FROM:kkennelly DATE:3/10/2005 8:00:06 AM

This came up at the Virginia training course in January. Member alt is specified as PS I Beam. Go to Live Load Distribution Factor window, hit Compute from Typ Section button. Get message that beam shape has to be specified on Beam Details window. There is no need to specify the I Beam shape before distribution factors are computed. It is necessary to specify beam shape for boxes and tees but I don't think it is necessary for I beams.

I cannot set any of my floorbeams as existing or current, I thought this only happened on floorline models but it applies to girder-system as well.

Try to set any floorbeam in the attached model as existing and/or current, save it and reenter the window to see it hasn't been saved.

Also, when you create a new floorbeam it will be assigned as existing and current but the radio buttons are not checked. If you do check them the settings get dropped.

## Description

FROM:dteal DATE:Thursday, March 10, 2005 11:54:42 AM

Question:

When a report is created in say version 5.2 – then we install a newer version, before installing we have to backup any saved reports – run the install, there will be 4 questions about overwriting the reports directory (do we say yes to this?). After the install we restore our backups of saved reports to the reports directory – or do we keep all saved reports separate from the canned (provided) reports?

Will reports created in version X be upwardly compatible or do they have to be re-created in the newer version?

FROM:jduray DATE:3/16/2005 7:57:43 AM

The report automatically migrates the report definition to the latest format when a report definition is opened. When you save it will be saved in the latest format.

Joe - If the user chooses to overwrite during the install do we delete the files they created or just overwrite the ones we previously delivered?

FROM:jihnate DATE:3/16/2005 8:41:08 AM

We just overwrite the files we previously delivered.

FROM:jduray DATE:4/8/2005 4:03:46 PM

FROM:dteal DATE:Monday, April 18, 2005 12:49:11 PM

I guess I don't understand the process.

When I have a saved report in a current version. How do I make that report available in the newer version? How do I answer the questions the install asks – Yes or No?

FROM:dteal DATE:Friday, April 29, 2005 9:35:55 AM

Ok I get it - the new install only overwrites delivered reports and leaves user defined reports alone and

## Complete Issue Information

Submitted on behalf of Joseph Wellington Oklahoma DOT via phone and email:  
This is the file.

(See attached file: 26636.bbd)

Please review and let me know why we're getting zero rating.

FROM:kkennelly DATE:3/10/2005 4:24:35 PM  
Reply sent via email:

Member Alt EXT for member G1 has the BRASS POI Control set as option 3 on the Member Alternative Description: Engine tab for the BRASS LFD program. This means that the controlling rating will be determined checking the rating at tenth points plus user defined points-of-interest.

Member Alt INT for member G2 has the BRASS POI Control set as option 5 on the Member Alternative Description: Engine tab for the BRASS LFD program. This means that the controlling rating will be determined only from the user defined points-of-interest.

G1's critical rating is 0 at 2/10 point of the span. The 2/10 point is not considered when you rate G2 because the BRASS POI Control option was set to only check user defined points of interest.

You can change the POI Control to Option 3 by opening the Member Alternative Description: Engine tab, select BRASS LFD and then click the Properties button. If you do that for member alt INT and rate it, it will show the critical rating of 0.

I've entered this problem as incident 6137 on the technical support website. Someone will contact you shortly with a user name and password so you can access the website.

Please let me know if you need additional information.

FROM:kkennelly DATE:3/11/2005 9:49:53 AM

I misunderstood what type of problem you were experiencing. I created a point of interest at the 20% location so that BRASS would output the detailed calculation data at the point. When I reviewed the output at this location, I see that BRASS reports the nominal capacity as "-Infinity" and computes the rating factor equal to zero. I also noticed that BRASS reports the stresses for the serviceability checks as "\*\*\*\*\*" at this point.

This appears to be related to the BRASS LFD engine. Someone more familiar with BRASS will have to look into this problem to resolve it. As a side note, I ran this bridge in Virtis 5.2 and get the same results.

Please let me know if you need additional information.

FROM:bgoodrich DATE:Friday, March 11, 2005 3:50:31 PM

After reviewing this issue, it is actually a duplicate of Incidents 5435 and 5564, which were assigned to BRASS Problem Log 554. This issue has been corrected in the BRASS engine, which is scheduled for release this May.

For now, the work-around is to change the debond distance at 248" to 249.4", so the debonding plus transfer length minus beam projection coincides with the 102 POI. You might also be able to leave the

Complete Issue Information

I'm getting an 'Invalid Argument' when I try to view the girder profile for either beam in the second superstructure definition - labeled 1.

FROM:hlee DATE:3/11/2005 11:58:20 AM  
Superstructure definition 1 contains bearing stiffener information in support 5 and 6, but it is a 3 span structure.

To fix the problem in superstructure definition 1:

1. Change number of spans to 5 on the Superstructure Definition window. Enter span lengths for span 5 and span 6. Hit OK.
2. For both G1 and G2, open Support 5 and Support 6 Bearing Stiffener Location window. Enter 0 for "Pairs of bearing stiffeners at this support". Hit OK.
3. Change number of spans back to 3.
4. You should be able to see the girder profile now.

When the number of spans is changed (decrease), Virtis needs to clean up the bearing stiffener locations in those supports that are no longer exist.

FROM:bmccaffrey DATE:Monday, March 14, 2005 1:42:01 PM

It worked, thanks Herman.

FROM:mordoobadi DATE:2/17/2006 8:32:35 AM  
The extra bearing stiffeners are most likely left behind when the number of spans of the structure definition was decreased. Domain is probably not cleaning up the bearing stiffeners in removed spans.

FROM:mordoobadi DATE:2/17/2006 4:02:57 PM  
Fixed in 5.4 Beta 6.

### Description

FROM:bmccaffrey DATE:Wednesday, March 16, 2005 11:17:14 AM

When retrieving a rolled beam in the BWS from an 'Agency' library for rolled shapes that have multiple listings with the same designation, only the shape from the 'Standard' library displays.

Try retrieving a W 30x108 from the library into an active bridge.

Complete Issue Information

Mehrdad - Why don't the names have to be unique?

FROM:mordoobadi DATE:3/16/2005 11:36:20 AM  
The {name, year} combination should be unique.  
I was able to reproduce the problem that Brian reported.

FROM:mordoobadi DATE:3/16/2005 3:08:41 PM  
Currently, if multiple shapes with same designation are present and the user picks one, the shape with the latest year will get copied to bridge. This was by design.

It is now changed so that if you select a shape in the list box either by using mouse or arrow keys then hit OK, the properties of the shape that you requested will be copied.  
If you just type in the shape name and select OK then the shape with the latest year will be copied.

FROM:mordoobadi DATE:3/16/2005 3:15:26 PM  
Fixed for 5.3 Beta 6.

Complete Issue Information

Viewing the 'Structure Typical Section' schematic gives me an 'Invalid Argument' message now.

I cannot increase the number of spans like the fix for 6138 states so it won't work for this case.

FROM:sboukamp DATE:5/17/2005 10:21:25 AM

Number of spans is read-only for Girder Floorbeam Floor System and Girder Floorbeam Stringer Floor System.

Besides the system is trying to add cantilevers to the schematics but failes and produses the above message.

Workaround: If you have to view the 'Structure Typical Section' schematic, temporally uncheck Cantilever in the Floorbeam Definition.

For a final solution see 5.3.0 Service Pack 1.

FROM:sboukamp DATE:5/17/2005 1:55:52 PM

Fixed for 5.3.0 Service Pack 1.

Description

FROM:bmccaffrey DATE:Wednesday, March 16, 2005 11:29:47 AM

I'm having serious tolerance problems on quite a few bridges now in v/5.2 that worked fine in previous versions. These bridges will not run anymore. Attached are a few .bbd's. I have many more if needed.

FROM:dkoenig DATE:Thursday, March 17, 2005 8:58:18 AM

We have noticed some tolerance issues also. What we found was that the tolerances in the configuration browser had been changed. As an example, we had the feet set at .01. It had been changed to .10. These are global settings, there are a limited number of people that have access to change these settings. I can't say for sure that no one changed them. But my instinct is that they were changed by Virtis when it was upgraded. You might check your tolerance settings to see if they have been changed from your previous defaults.

point, the program appeared to give reasonable results for the beams indicated above to have R.F.'s of 0.00. However, the beams with run errors still gave the same error messages when a run was attempted for them.

FROM:kkennelly DATE:3/17/2005 2:20:34 PM

1. Unable to analyze Member 8.

Span lengths on member window add up to 398.06258'. web input up to 398.0626'. Flanges input up to 398.062591.

Programmer solution: DoGirderMbrAlt line 2877 is setting the end pt to end distance = 398.06258' but the 398.0626 still exists due to changes we made for VI5397 for rc schedules. We shouldn't set end pt

to end of mbr length anymore.

2. Haven't investigates rf's = 0 yet.

FROM:kkennelly DATE:3/18/2005 1:46:16 PM

1. Is a duplicate of 6165.This problem has been fixed for a service pack for 5.2. The service pack will be issued as soon as it gets tested thoroughly.

2. Based on the note entered by Tim above, the rf's = 0 appear to be related to the export to BRASS and the bracing entered with negative values. Brian, please investigate.

FROM:bgoodrich DATE:Wednesday, April 13, 2005 12:28:32 PM

No bracing is exported for the first span of Member 10. This causes the unbraced length to equal the span length, which leads to a low flexural capacity.

FROM:bgoodrich DATE:Friday, April 22, 2005 5:03:08 PM

I revised one of the export files (EngineExport.cpp) to address the negative lengths that are entered for the diaphragms. Fixed for version 5.3.

FROM:kkennelly DATE:4/25/2005 8:11:04 AM

The cd's for 5.3 have already been made so this change can't be included in 5.3. It will have to wait for the next service pack or next release.

### Description

FROM:dkoenig DATE:Thursday, March 17, 2005 3:10:48 PM

We have discovered a problem with the security settings in Virtis. We have users setup with differing levels of access to the program. On the configuration browser, we only have administrators setup to be able to read/write/create/delete on the configuration folder under the access privileges. We had a user that was able to go to the tolerance tab on the system default folder and change the tolerances. This user is setup to only have read access to the configuration browser. We played around with some of the different folders in the browser and have found that this is only happening on the tolerance tab. This user should not be able to make these changes. If you need additional information, please let me know.

FROM:jihnmat DATE:3/18/2005 10:16:23 AM

Fixed for version 5.3.0

### Complete Issue Information

floorbeams (Floorbeam Member window) are 0. Export complains the following when I tried to rate the floorbeam member alternative, but the analysis was successful. When there is a distance to next adjacent floorbeam (there is a stringer span), every went fine. Shouldn't the analysis stop when there is an error?

Computed number of virtual stringer spans is zero!

Complete Issue Information

Description

FROM:bmccaffrey DATE:Friday, March 25, 2005 2:55:59 PM

We're getting differences between 5.1.1 and 5.2 for riveted girder section properties. It appears that 5.2 ignores top cover plates. In the attached .bbd files, look at the section property table in the output file for both versions - all girders are affected.

In the export, the XSECT-B and XSECT-C commands are different for each version.

This appears related to VI 5218.

FROM:bmccaffrey DATE:Friday, March 25, 2005 3:17:30 PM

FROM:bgoodrich DATE:Wednesday, April 06, 2005 1:39:42 PM

The bottom cover plate dimensions were transferred to the bottom flange dimensions and the bottom cover plate dimensions were also exported. I fixed the export (BrassStdCrossSections.cpp) and uploaded the file to Incoming/Virtis. Fixed for version 5.3.

FROM:bmccaffrey DATE:Monday, April 18, 2005 11:03:39 AM

Nothing was fixed - this is still wrong. The BRASS engine is generating incorrect results. See previous incidents related to this.

FROM:bgoodrich DATE:Tuesday, June 28, 2005 4:06:39 PM

On April 14, 2005, Herman Lee commented out all the changes for this incident. The changes had lowered the rating factors.

### Description

FROM:tarmbrecht DATE:Monday, March 28, 2005 12:21:19 PM

Please see file attached. We copied this in, using another structure as a template for this structure. Is there any way we can delete "AASHTO M222 Steel" from the Materials folder? We're getting the message "The attempt to delete this object has failed..." We're pretty sure we've removed all references. We're also trying to delete "PL-3/8x5" from the Transverse Stiffener Definition folder and can't.

This isn't a first time occurrence for us. We've also had problems in other files with objects such as beam shapes, appurtenances and bearing stiffeners.

Thanks, Tim

FROM:jduray DATE:3/28/2005 1:25:02 PM

Herman - perhaps generate a report with the report tool (using the bws report) and search the xml file for "AASHTO M222 Steel".

FROM:hlee DATE:4/6/2005 3:43:14 PM

Note for developer:

When deleting girderline member, Virtis has problem deleting objects that belong to the girderline member.

To reproduce:

1. Open TrainingBridge3 Bridge Workspace
2. Delete "Exterior Girder" from "3 Span GirderLine" structure definition.
3. Save the bridge to the database.
4. Delete "Type 1" transverse stiffener will get the message "The attempt to delete this object has failed! This object is in use by another object ..."

The record in abw\_super\_struct\_spng\_mbr has been deleted, but the records in abw\_spng\_mbr\_def, abw\_stl\_trans\_stiff\_loc\_range, abw\_stl\_beam\_assembly, abw\_stl\_flg\_plate, ... have not been deleted.

FROM:mordoobadi DATE:4/7/2005 11:00:59 AM

To prevent this I think we should update the domain code to delete the beam definitions associated with the member alternatives of the member that is being deleted. Otherwise we will get orphaned beam definitions that will be present in the domain and the database and cannot be deleted from the GUI.

This happens for a girder line member, I think we need to investigate whether a similar situation exists

4/19/2016 3:04:20 PM

HRS AASHTO

676

Complete Issue Information

for other types of members. We have one-to-one correspondence between member alts and beam defs in girder line and girder system. So for Girder Line and Girder System structure members we should delete associated beam defs. But we have to be careful not to delete a beam definition of a floorbeam or stringer in a Floor System structure definition.

A domain independent utility program can be created to fix customers' databases and included with the migration wizard.

FROM:mordoobadi DATE:4/7/2005 12:59:03 PM  
Reproducible with a girder system member. Because the beam definition is not removed and it is orphaned.

FROM:mordoobadi DATE:4/7/2005 5:04:08 PM  
The domain is now fixed.

FROM:mordoobadi DATE:4/7/2005 5:04:50 PM  
Jim wants this issue to be addressed in the migration of the old databases (by removing orphaned beam definitions). He wants this fixed in next release 5.4 (pier)

FROM:mordoobadi DATE:4/12/2005 10:35:41 AM  
Attached is an xls file that contains the scripts that are useful for the implementation.

FROM:mordoobadi DATE:8/17/2006 12:24:34 PM  
Created scripts to remove orphaned beam definitions. To be included in 5.5 Beta 4 Migration.

FROM:mordoobadi DATE:8/18/2006 8:12:46 AM  
The two cases mentioned in this incident was fixed after running the SQL scripts to resolve the incident.

FROM:mordoobadi DATE:9/6/2006 10:27:08 AM  
Fixed in 5.5 Beta 4.

FROM:tarmbrecht DATE:Wednesday, September 13, 2006 12:20:58 PM  
My consultant checked this, and in "DeleteBeamDef(0600205).xml", the Structural Material "AASHTO M222" cannot be deleted. A thorough search has been made and this material cannot be found anywhere in the bridge model.

### Description

FROM:smample DATE:Monday, March 28, 2005 4:31:57 PM

Is it possible to view the influence line used to generate the live loads at a specific check point? Also, does the output ever identify where the truck is placed on the member and the direction it is traveling to produce the reported live load?

FROM:kkennelly DATE:3/30/2005 8:34:35 AM

The following is my understanding of BRASS. Brian can confirm/correct my understanding and add additional comment.

1. I don't think BRASS LFD provides the influence line output for girders.
2. I don't think BRASS LFD lists the truck location or the direction it is traveling for live load on girders. It does provide such info for floorbeams by selecting the Floorbeam Intermediate Output Level 1 on the Analysis Settings:Engine tab in Virtis.

FROM:bgoodrich DATE:Wednesday, April 06, 2005 1:58:05 PM

BRASS LFD does not provide the influence line output for girders. However, it does provide the truck location and direction for the live load envelope. Go to the BRASS LFD engine properties on the Analysis Setting dialog (Engine tab). For the Action Output Level, select option 3 or 4, which show the concurrent actions. This report is located at the bottom of the BRASS output file.

Description

FROM:kkennelly DATE:4/29/2005 2:29:52 PM  
Submitted on behalf of Vinacs, Caltrans via email:  
Krisha

One of our guys tried to delete concrete materials (f'c=2.5 ksi) from the data (that was not used anywhere within this bridge). He was able to delete the materials (meaning initial error check within Virtis recognized that this material is not used within the bridge), however, he was not able to save the bridge data.

Error message was:

Unable to save Bridge data!  
Delete process failed while deleting CDmMatlConc (SaveOrder object 93).  
Error deleting record from database record set.

Could you please check this for us

Vinacs M Vinayagamoorthy  
916-227-8657

FROM:kkennelly DATE:4/29/2005 2:45:33 PM  
Email sent back to Vinacs:  
Hi Vinacs,

I've entered your problem as incident 6366 on the Technical Support website.

The following workaround can be used to save this bridge.

1. Virtis shouldn't let you delete the concrete material f'c=2.5 ksi because it is being used in the Supports window for Support 3. Open the Supports:Elastic tab and put your cursor in the "Rotation Spring Constant" cell for support 3.
2. The "View/Compute" button will become active. Select that button. In the View/Compute Column Stiffness window that opens select the f'c = 3 ksi concrete material. Hit Apply.
3. The rotation spring constant value for support 3 will be blank so you'll need to copy it from Support 2.
4. You should then be able to save the bridge.

Please let me know if you need additional information.

FROM:kkennelly DATE:5/2/2005 10:21:47 AM  
Fixed for release in June, 0.9 Sub with 5.3 Super.

### Description

FROM:kkennelly DATE:5/5/2005 11:54:06 AM

Submitted on behalf of Peter Greenberg, Bayside Engrs:

Hi Krisha, here's the bridge that we had spoke about earlier. If you could take a look at it and perhaps come up with some suggestions that would be great.

Thanks very much, Pete

Email sent back to Pete:

Hi Pete,

I am unable to determine why you are getting a zero rating factor at the interior supports. I created a point of interest at 11.06' in span 1 and reviewed the BRASS output file but it only lists the nominal moment capacity as zero without listing any backup data as to how it computed that. It also appears that the capacity at all of your interior supports is zero.

## Complete Issue Information

I've entered your problem as incident 6396 on the Virtis/Opis Technical Support website so someone more familiar with BRASS can look into this. Can you add some more information to that incident as to how you are trying to model a fake deck? For instance, how were these beams made continuous when they were constructed if there is no deck?

As a side note, I noticed that a lot of your shear reinforcement ranges are not on the beam. That is probably not the source of your problem but you should re-examine your data.

FROM:kkennelly DATE:5/5/2005 2:40:52 PM

Email from Pete:

Hi Krisha, thanks for taking a look at the bridge for me. I attached a detail showing how high-strength concrete continuity diaphragms were cast into place after the precast beams were installed. The bridge is comprised of butted deck beams and so there is no deck on the bridge. When I modeled the girder line as if there was no deck, VIRTIS cannot run, and an error message pops up saying "a deck and shear reinforcement must be defined for multiple-span members to achieve continuity over interior supports." To prevent this error message from coming up I modeled the deck as being 4" thick with a haunch of -4" so that I could place the appropriate negative moment steel over the interior piers at the bottom of the slab. The "fake" deck does not contribute to the composite section and the unit weight was input as zero. (I may have mistakenly sent you a version of the VIRTIS run where the deck weight was 0.150 kcf but I still receive the same rating when it is zero.) I forgot that when I define my shear reinforcement ranges for the beams I cannot input negative values for the spacings. Even though the reinforcing looks correct in the beam elevation schematic, BRASS uses those negative values for the spacings - I'll be sure to change that.

Once again thank you for taking a look at this and passing it on to the support website. I hope that this additional information will help.

Pete

FROM:bgoodrich DATE:Friday, May 13, 2005 10:22:04 AM

I forwarded this issue to WYDOT for consideration.

E-mail to C.J. Riley (WYDOT):

C.J.,

Here is an incident from Virtis. For some reason, a negative moment capacity is being calculated when the live load moment is positive as shown in the output below:

### Performing Rating Factor Calculations

Analysis Point: 201.00

Load Level : 1

Truck No. : 1 - AASHTO HS20-44 (MS 18) TRUCK

#### Load Factors:

Gamma = 1.30      Phi(flexure) = 1.00

Beta (DL) = 1.00      Beta (LL) = 1.67

Strength Rating Factor - Flexure (Positive Action)

Strength based on Prestressed section

4/19/2016 3:04:21 PM

HRS AASHTO

682

Complete Issue Information

Stage 1 Dead Load Moment = 113.16 (ft-kips)  
 Stage 2 Dead Load Moment = -9.80 (ft-kips)  
 Secondary Moment = 0.00 (ft-kips)  
 Dead Load M + Secondary M = 103.36 (ft-kips)  
 Live Load Moment = 25.77 (ft-kips)  
 Nominal Capacity = -9426.82 (ft-kips)

$$R.F. = \frac{[(\text{Phi}(\text{flexure}) * Mn) - (\text{Gamma} * \text{Beta}(\text{DL}) * \text{DLM} + S)]}{(\text{Gamma} * \text{Beta}(\text{LL}) * \text{LLM})}$$

\*\*R.F. = 0.0000

The nominal capacity is incorrect because the f\*su variables that are used to calculate it are wrong:

AASHTO 9.17.4.1 Calculation of f\*su for bonded members

|                   |                 |
|-------------------|-----------------|
| "fc"              | = 5.000 ksi     |
| p*                | = 0.108652      |
| fs prime          | = 270.0000 ksi  |
| beta 1            | = 0.8000        |
| gamma *           | = 0.2800        |
| f*su for this row | = -284.4521 ksi |

f\*su should not be greater in magnitude than the ultimate stress. There appears to be a bug with how rho is calculated (rho = p\* \* fs prime), but I believe this issue is occurring because there is essentially no slab. The user would like the structure to be considered continuous for live load using mild beam steel. However, BRASS only supports continuity using mild steel in the slab. The user is trying to fool Virtis and BRASS into thinking there is a deck with mild steel, which throws the rho calculation off because BRASS assumes the slab is present. Note that I added a slab width of 2" so I could see something in the output. The user had entered zero for this. Let me know what you would like to do.

FROM: bgoodrich DATE: Friday, May 13, 2005 1:16:46 PM  
 E-mail from WYDOT:

This is a structure type that is not currently handled by BRASS. Addition of this structure type would be a major effort and will be put on our enhancement list for prioritization by the BRASS users. If it is made a priority, it will be implemented in the merged GIRDER/GIRDER(LRFD) program.

Complete Issue Information

Description

FROM:tarmbrecht DATE:Wednesday, May 11, 2005 12:25:45 PM

Subject (attached) 2-Span continuous superstructure has zero skew at Supports 1 & 2 and 20 degree left ahead skew at Support 3 (see Unit 2 (Spans 1-2) in the example file). When attempting to assign the Superstructure Definition the following error message appears...

Superstructure Definition Length mismatch.  
The span lengths in the superstructure definition assigned to this superstructure alternative do not match the span lengths in the superstructure.

No matter whether the Reference Line span lengths or the span lengths for any of the individual girders are entered, the same error occurs. This did not occur in v. 5.2.

FROM:kkennelly DATE:5/18/2005 10:20:09 AM  
Fixed for 5.3 Service Pack 1. Virtis was using a hard-coded tolerance to compare the span lengths which was too strict. Changed to use user tolerance and issue message about the exact numbers that don't match.

should I do to correct for this message?

Thank you

FROM: bgoodrich DATE: Friday, May 13, 2005 9:39:38 AM

BRASS does not have the capability to check the stresses due to moments for both positive AND negative bending at a point of interest. The dead load contraflexure locations entered in the engine properties for the member alternative are used to generate a schedule of commands that tell BRASS which bending sense to check. Based on the contraflexure locations a positive bending region is determined from 0% to 72.3% along span 1. The 107 POI falls in this region, so BRASS will only check positive bending moments. When the dead and negative live load moments are combined at the 107 POI, they total -1909.02 ft-kips, which is not checked, so a warning is issued. Both BRASS ASD and BRASS LFD currently operate in this manner.

Complete Issue Information

Submitted on behalf of Steve Mample, Idaho:

Hello, Krisha.

Regarding our last E-mail. I have updated the input file. The file is only complete for the floorbeam B2. So far I have been only using one truck when I analyze the member to try a cut down on the information fog. When I look at the analysis chart for dead load moment, what I see is not what I expect. The dead load moment chart does not look like what I would expect for a two span continuous beam, each span uniformly loaded. And the dead load moments near the 1.4 point and at the 2.00 point are not what I calculate using a uniformed load of 224.07 PLF. I calculate the moment near the 1.4 point to be 4.3 ft-K and at the 2.00 point to be 2.4 ft-K. Could you please take a quick look at the file and let me know what you think.

Thank You, Steve.

FROM:kkennelly DATE:5/13/2005 8:24:50 AM

Reply sent back to Steve:

Hi Steve,

I agree that the dead loads produced by BRASS do not appear to be correct. The following is my comparison of the deck dead loads:

Deck weight 0.224 k/ft

| Span | Dist     | My Calc Moment | Brass Moment |
|------|----------|----------------|--------------|
| 1    | 4.66 ft  | 2.43 kft       | ~ 4.1 kft    |
| 1    | 12.42 ft | -4.32 kft      | -0.2 kft     |

I've submitted this as incident 6416 on the Virtis Technical Support website.

FROM:bgoodrich DATE:Friday, May 13, 2005 10:04:15 AM

The floorbeam spans are considered simple spans, not continuous. This is achieved by inserting a hinge very close to interior supports. This is why a small negative moment is reported at the interior support.

### Description

FROM:kkennelly DATE:5/16/2005 12:39:33 PM  
Submitted on behalf of Steve Mample, Idaho DOT

Hello, Krisha.

I don't know who I really need to direct this to. This afternoon a problem developed with the Virtis Program. After I analyze a bridge member and click on the "View analysis report" tool button, The report is not displayed.

No error messages are generated.

The BRASS output file is produced and appears to be correct.

The "Analysis Progress" says the "Data file successfully exported and " Analysis Complete.

I shutdown and restarted the Virtis program and shutdown and rebooted my computer. No change, the report is not displayed.

Email response sent :  
Hi Steve,

I've entered your problem as incident 6421 on the Technical Support website. What version of Virtis are you running and does this occur for a particular bridge or every bridge? If it is a particular bridge, please send me a bbd file for the bridge.

FROM:kkennelly DATE:5/16/2005 1:04:44 PM  
Response received:  
Version 5.2.0  
I've tested about 5 bridges, occurs on each bridge.

FROM:jduray DATE:5/18/2005 9:18:21 AM  
Do the graphs works ok?

FROM:smample DATE:Wednesday, May 25, 2005 4:29:06 PM  
All of the result graphs look OK.

FROM:smample DATE:Thursday, May 26, 2005 11:10:41 AM

FROM:kkennelly DATE:6/6/2005 10:49:09 AM  
Hello, Krisha.  
I found the reason for not being able to view the "Analysis Report" window. When I clicked on the "Analysis Report" button it was minimized for some reason, and was hide by the "Bridge Workspace" and "Bridge Explorer" windows. I had opened up Virtis to send you a bbd file and I was moving the windows around to get to other program icons on my screen, and there it was. When I maximized the "Analysis Report", the window showed the analysis results for the member. End of problem.  
Thank you, Steve.

### Description

FROM:tarmbrecht DATE:Tuesday, May 17, 2005 4:48:17 PM

From my consultant:

1. From the Member Alternative schematic, in a parabolicly haunched girder, the start (or end) point of the parabola defined for a bottom flange range starting (or ending) within the haunch is at the horizontal. It should start (end) at the same slope as the previous (subsequent) section. (See 0970003.bbd, Superstructure Def'n "Spans 1-8 (Main Unit)") Note: I suspect that this same error would occur for a web that changes thickness within a haunch.
2. For the same Superstructure as issue #1, the schematic shows the longitudinal stiffener that starts 106.67' from Support #2 ending 610 feet from its start even tho' it's defined a being 1280' long.
3. The attached file, 0970003x.bbd cannot be saved after it is imported.

I accidentally uploaded the wrong 0970003.bbd file and followed it up with the correct one. The one with the later file date is the one we want. Tim

Another one from my consultant. File attached.

Complete Issue Information

1. Analysis w/POI at 40.95' from left support (Member "3 - 2nd W Int"): RF = 0.0 (or, from output file, infinity). At 40.94 the Inv/Op RF's = 3.896/6.506 and at 40.96' they are 3.739/ 6.244. There is no difference in the section properties between those points. (Note: The intent of specifying a POI at that location was to get results just away from the end of the 16' long #6 reinforcement bars that start and end, respectively, at 24.8333' and 40.8333' from the left support. When those reinforcement bars are removed from the model, the results for analysis at 40.95' become reasonable.)
2. With the Prestress Modeling Method is set to "Centerline of simple-span bearing" (and issue #1 above is addressed), the Analysis Results indicates the location of the controlling points for the ratings improperly. For example, the control point for the inventory rating is said to be in Span 2 at 22.00 ft./46.8%. Regardless of the Prestress Modeling Method, it should be output as at 50.0% and at 23.5' from CL Support 2 since Span 2 is specified as 47.0' in the Girder System Superstructure Definition.

FROM: bgoodrich DATE: Monday, May 23, 2005 1:05:13 PM  
 A new BRASS-GIRDER DLL to be released with Virtis 5.3 Service Pack 1 addressed item 1. Item 2 is a duplicate of Incident 3141.

### Description

FROM:tarmbrecht DATE:Tuesday, May 17, 2005 5:20:38 PM

In the attached Virtis file (LdRebarArea.bbd), for the Approach Span, a 1-Span RC-Slab (Span length = 14.5865'), there are hooked #10 bars @ 8.858" on center (1.72 sq-in/ft). In the output, the bottom steel area at .1 (1.4587') of the span is shown as .216 sq. in/ft, which results in an extremely low RF. According to the StdReinfDevLengthCalcs.log file, the development length for the hooked #10 bars is 24.98", which, based on the start point at .2609' left of CL bearing, results in full development at 1.82' (.125 of the span). By interpolation the area at .1 of the span would be 1.42 sq. in.

How does Virtis determine the area of reinforcement at a point between the end of a bar and the fully developed location?

Why does Virtis generate an area of .216 sq. in for this example?

FROM:kkennelly DATE:5/18/2005 1:34:57 PM

Refer to "Schedule Based Reinforcement Cross Section Export Examples" in the Virtis help file for sketches explaining what Virtis is doing.

At 0', the bars are  $3.132"/24.98" = 12.5\%$  developed.  $.125 * 1.27 \text{ in}^2 * 1.355 \text{ bars} = 0.216 \text{ in}^2$ .  
Virtis does not generate another cross section until it sees that the bar is developed at 21.84" into the span. At this point, the bar is 100% developed and the area of rebar is  $1.72 \text{ in}^2$ .

So from 0' to 21.84" the cross section passed to BRASS contains  $0.216 \text{ in}^2$ . From 21.84" to 12.7946' the the cross section contains  $1.72 \text{ in}^2$ . From 12.7946' to the end of the span, the cross section contains  $0.216 \text{ in}^2$ . The amount of rebar cannot vary over the length of the cross section range.

Since you have a tenth point within the first cross section range (0' to 1.82') you should add a point of interest within that range to get Virtis to generate an additional cross section before the tenth point. Then the percentage of bar developed at the tenth point will be greater than that developed at the start of the span.

HRS AASHTO

697

Complete Issue Information

FROM:kkennelly DATE:6/1/2005 10:27:52 AM

This problem is not related to the Simple Bridge Wizard. It is due to the fact that we only have 2 girders.

VI 4139 hid the Compute button for cases when we have 2 girders but since we have a ps i beam the code in RefreshComputeButton() first hides the button cause there are 2 girders and then executes some code for ps beams and re-shows the button.

If we have 2 girders, always hide the Compute button regardless of the beam material type.

FROM:jihnat DATE:6/1/2005 11:00:27 AM  
Fixed for 5.3 SP1 and 0.9 Beta 11.

FROM:sboukamp DATE:6/8/2005 4:09:44 PM  
ok in Beta 11.

Complete Issue Information

File attached. When attempting to assign the Superstructure Definition to the Superstructure Alternative, the following error message appears...

Superstructure Definition length mismatch  
The span lengths in the superstructure definition assigned to this superstructure alternative do not match the span lengths in the superstructure.

The span lengths entered in both places are the same.

Note: This 3-span continuous superstructure definition was created by modifying a copy of a 2-span continuous superstructure definition.

We didn't need to enter the number of spans and span lengths for the Bridge Alternatives/Superstructures in previous versions. What is the rationale for doing it now?

FROM:dkoenig DATE:Tuesday, May 31, 2005 9:00:34 AM  
We have the same question. This is basically double entry of data, which is contrary to the basic principles of data entry for databases. We have had similar problems with these fields being mismatched. Ours have typically been a tolerance issue, which I believe is addressed in another incident.

FROM:kkennelly DATE:6/3/2005 8:25:32 AM  
This is a duplicate of 6408 which has been resolved for 5.3 Service Pack1. I am able to assign this superstructure def using this service pack.

We added the number of spans and span lengths for Opis Substructure. In Opis Substructure there is additional data for selecting the substructure units supporting the superstructure.

Issue ID: 6477  
Subject: BRASS LFD does not use transformed section properties

### Description

FROM: bgoodrich DATE: Tuesday, June 07, 2005 1:34:02 PM  
Entered for Scott Neubauer:

I have been rating pre-stressed beams using Virtis with the Brass engine and have some questions about the pre-stressed beam analysis.

It appears to me that the transformed section is not used in any of the stress calculations. For the applied loads on a beam we use the transformed section properties and get inventory ratings that are significantly higher than what Virtis outputs. I have attached a Virtis file for a bridge that was designed for HS20 loading, but the Inventory Rating is HS18.3. My calculations show an Inventory Rating of HS26.7. Please review the attached file and let me know if there is something I am missing or a setting that can be changed. I don't know if you are the person I should contact, but I was hoping you could point me in the right direction.

HRS AASHTO

701

Complete Issue Information

09:46:32 AM - Line 867 in source file .\UiBWSDoc.cpp.”

Formerly (prior to some revisions and the deletion of a Superstructure Definition) it could be saved. The file from which Can't Save.bbd came from is also attached and is called "Savable.bbd". (It is suspected that the problem is in some way related to the deletion of former Superstructure Definitions within the Bridge Workspace.)

In order to retain the changes that were meant to be kept, a new bridge workspace was created and the Superstructure Definitions were copied into it. A file for that workspace is also attached. It is called, "Intended.bbd".

Note: This same problem has happened with other bridge workspaces that have had substantial revisions performed.

Description

FROM:tarmbrecht DATE:Thursday, June 09, 2005 11:41:57 AM

When attempting to input the shear reinforcement near the end of the beam there is an error message stating that the shear reinforcement is beyond the end of the beam. In the example, the total length of the beam end-to-end is 70.0 ft. When attempting to enter the shear steel (Bar G2) located at 7.8125' from the end of the beam (69.599' from the start) Virtis erroneously states that the length is 69.5' and will not apply the bar to the input.

Note: This beam was created and modified from a beam that was, originally, 80.8333 ft. in length in a structure that had 7 continuous spans.

FROM:kkennelly DATE:6/20/2005 9:11:36 AM

Looks like data in the Continuous Support Detail table was not deleted for Support 2 when you went from 7 spans to 1 span. The attached bbd file has this extraneous data removed so you can continue working on this bridge.

FROM:kkennelly DATE:6/27/2005 9:55:19 AM

Fixed for 5.3.1. We will be sending you a dll with this fix to test. We are not issuing a beta 2 for this fix.

FROM:kkennelly DATE:6/27/2005 10:00:02 AM

Note that the fix occurs when you delete the spans. It does not repair any existing data that you might have.

FROM:kkennelly DATE:12/16/2005 11:34:34 AM

Closed based on accepted in track field.

### Description

FROM:kkennelly DATE:6/21/2005 3:40:56 PM  
Submitted on behalf of Robert Kelley, Michigan DOT via email:

>>> "Bridgware" <Bridgware@mbakercorp.com> 6/21/2005 2:41PM >>>  
Hi Robert,

Can you export your bridge to a bbd file and email it to us so we can investigate?

Regards,  
Krisha Kennelly, PE  
Michael Baker Jr., Inc.

>>> "Robert Kelley" <KELLEYR@michigan.gov> 06/21/05 2:28 PM >>>  
Thank you again for the fast response. Here's what I did.

- 1- Under Superstructure definitions, open up Span 1.
- 2- open up MEMBERS
- 3- Open up G1

4/19/2016 3:04:25 PM

HRS AASHTO

706

## Complete Issue Information

- 4- Open up MEMBER ALTERNATIVES
- 5- Double click on Exterior steel beam
- 6- Go to Engine tab
- 7- Open up BRASS LFD
- 8- Go to Properties
- 9- Set POI control to zero
- 10- Hit OK for this screen and the previous screen
- 11- Go to Points of Interest for Exterior steel beam
- 12- Create a POI at ½ point of span
- 13- Go to Engine tab
- 14- Go to Properties
- 15- Check the Skip operating rating based on serviceability
- 16- Hit OK for this screen and the previous screen
- 17- Repeat steps 3-16 for G2
- 18- Repeat steps 3-16 for G11
- 19- All other girders linked to these 3 girders
- 20- Repeat steps 1-19 for Spans 2/3
- 21- Repeat steps 1-19 for Span 4
- 22- Highlight Span 1
- 23- Push Analyze button
- 24- Generate Output- Serviceability still controls
- 25- Highlight Span 2-3
- 26- Push Analyze button
- 27- Generate Output- Serviceability still controls
- 28- Highlight Span 4
- 29- Push Analyze button
- 30- Generate Output- Serviceability still controls

All that I did makes not one bit of difference. Where did I go wrong?

>>> "Bridgeware" <Bridgeware@mbakercorp.com> 6/21/2005 1:44:39PM >>>  
Hi Robert,

If you want to override a value on the Point of Interest window, you should set the POI Control to "0" on the Member Alternative Engine Properties window for BRASS LFD. Then you must create Points of Interest for all points that you think may have a controlling rating on the member. (BRASS will only provide ratings for the points of interest under this option.) For each point of interest you create, you must fill in all of the data for that point as the export to BRASS will only use the data on the Point of Interest window when it creates the beam description in the BRASS input file.

The following description is available on the BRASS LFD Engine Related Help that can be accessed from the Virtis help file on the Point of Interest window:

<<BRASS LFD will not use the override data entered in the Point of Interest windows if the POI Control on the Member Alternative Description: Engine (BRASS LFD) window is selected as a "generate" option (Options 1, 3, or 5). Selecting a generate option on that window means that the points of interest will be generated from the schedule data that you have entered in other windows. You must select the "No point of interest data will be generated" option on that window in order for BRASS LFD to use the data entered on the Point of Interest windows.

If you select "No point of interest data will be generated" as the POI Control, you must enter all of the

4/19/2016 3:04:25 PM

HRS AASHTO

707

Complete Issue Information

information on the Point of Interest windows. The export will not generate any data from other windows for items left blank on the Point of Interest windows.>>

Regards,  
Krisha Kennelly, PE  
Michael Baker Jr., Inc.

>>> "Robert Kelley" <KELLEYR@michigan.gov> 06/21/05 12:39 PM >>>

Thanks for the quick feedback. I tried what you said, and here's the message I get:

WARNING (Low):

The POI Control engine property for the member alternative is invalid because only points of interest at tenth points have been specified! The POI Control option was specified as 3 but will be exported as option 1.

I have no idea what to do next. Any suggestions?

>>> "Bridgeware" <Bridgeware@mbakercorp.com> 6/21/2005 12:00:52PM >>>

Hi Robert,

For steel girders, the Point of Interest: Engine tab for BRASS LFD/ASD lets you specify if you want to ignore serviceability for the operating ratings at that point of interest. Other than that, you cannot turn off serviceability.

Regards,  
Krisha Kennelly, PE  
Michael Baker Jr., Inc.

>>> "Robert Kelley" <KELLEYR@michigan.gov> 06/21/05 11:24 AM >>>

I am finding that serviceability is controlling some load ratings. Is there a way to turn off this criterion? If so, please advise.

FROM:bgoodrich DATE:Tuesday, June 21, 2005 6:16:52 PM

I am able to duplicate the user's issue. I have forwarded this issue to WYDOT for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Tuesday, June 21, 2005 8:30:07 PM

After some more investigation, it appears there is a solution. The bracing override was not selected, so the STEEL-4 command was never generated. The serviceability control option is located on that same command, which is why nothing was happening when the ignore serviceability option was checked. At a minimum, the export must issue a message to alert the user to this requirement.

FROM:bgoodrich DATE:Monday, July 18, 2005 5:12:46 PM

I added a warning to the export to inform the user of the bracing and lateral support override requirement.

| 6522.14813 | Rejected by TAG | BARS Import - Problem with circular voids |

### Description

FROM:jduray DATE:Wednesday, June 22, 2005 9:41:11 AM

VA DOT training

C0076088.dat

First section imports correctly (no cover plate), second doesn't (has a cover plate).

FROM:xli DATE:3/16/2007 9:12:05 AM

Bars import can import sections defined by real dimensions or by A and I, but not able to import a section with combined definition method. The second cross section in the attached data file is defined by A and I and cover plate is defined by real dimensions.

| 6527.14808 | Duplicate     | adding superstructure names - wizard to create superstructures for Virtis users |

### Description

FROM:jduray DATE:6/24/2005 10:25:25 AM

The import reads the District from the BARS file and includes it with the bridge description without validating it. I think it should do a lookup in the parameters table and if a match is found it should include the data with the bridge description. If no match then do not include the data. Perhaps a message should be generated if no match.

FROM:xli DATE:4/14/2006 2:07:10 PM

Krishna, do we assume "8" and "08" match?

FROM:kkennelly DATE:4/17/2006 12:43:52 PM

No, I think we should look for an exact match since we are matching strings not integers.

### Description

FROM:tarmbrecht DATE:Friday, June 24, 2005 2:33:05 PM

1) Bridge Alternatives – Superstructure Name: When adding a Superstructure Name to a Bridge Alternative, Virtis forces entry of both number of spans and lengths of spans which must match the Superstructure Definition. It is understood that this is a result of the addition of the substructure module in Opis. However, as far as Virtis superstructure ratings it only requires additional time to enter a structure with no additional benefit. In addition, if the span lengths vary between the Alternative and the Superstructure by even .000001, or perhaps less, the linkage is rejected. Could not this new requirement be eliminated for Virtis superstructure ratings, or, at least, restricted to only files where substructure information exists?

FROM:kkennelly DATE:6/27/2005 9:26:05 AM

The service pack 1 for 5.3 has loosened the tolerance. Are you still getting these messages in 5.3.1? If you are, please attach a bbd file.

FROM:tarmbrecht DATE:Monday, June 27, 2005 12:27:22 PM

No, we're not getting the messages. Sorry, shouldn't have put the "in addition" part in there. We are still questioning the requirement to enter span numbers and lengths twice. Seems like we should be fixing this now before the user's group finds out they're going to need to do this. I'm pretty sure there'll be tears.

4/19/2016 3:04:26 PM

713

Complete Issue Information

FROM:dkoenig DATE:Tuesday, June 28, 2005 9:30:35 AM

We haven't shed any tears yet, but we agree with Tim 100%. This is double entry. If the program requires that these match within the user tolerances, then why would they need to be reentered for the substructure part of Opis? If this extra field is needed, then maybe a good compromise would be to have it default to what was entered the first time with the user having the option to change it if desired. This would at least move away from the double entry for Virtis users.

FROM:kkennelly DATE:8/26/2005 8:14:41 AM

I'm turning this into an enhancement request from Virtis user comments at the 2005 UG meeting and this incident. Virtis users are not happy with having to enter the span lengths on the Superstructure window. These span lengths were added for Opis Substructure. A Superstructure Layout wizard for Virtis users could solve this problem. User could enter the number of superstructures, pick the superstructure definitions they want to assign to the superstructures, and a distance between superstructures if there is more than 1 superstructure and then the wizard could create the superstructures and superstructure alts for the user.

6) In POI entry there is a place for entering whether analysis is to take place to the left or to the right of the POI. This does not work! To insure that an analysis takes place to one side or another of a point, one must set the POI a significant distance (say .2 ft) to the left or right of the actual point in question.

FROM:kkennelly DATE:6/27/2005 12:55:44 PM

The engine help for BRASS LFD for this window states this. This engine help also states the side with the smallest gross moment of inertia is used.

FROM:bgoodrich DATE:Monday, July 18, 2005 6:41:35 PM

Although this is a limitation with the BRASS engines, this may not be the case with future engines. BRASS is point-of-interest based, and technically, it would take a significant effort to change this. I will forward this issue to WYDOT for consideration.

Description

FROM:tarmbrrecht DATE:Friday, June 24, 2005 2:43:45 PM

7) When doing a "Compute from Typical Section" for Deck Profile on an exterior beam where the adjacent girder is defined by a link to another beam, an error message comes up stating, "Adjacent interior girder does not have a current member alternative defined. LRFD effective flange width was calculated using zero for the adjacent interior girder." This is in error since the adjacent interior girder does have a current member alternative defined. Note: this does not happen for an interior beam that is positioned next to another linked beam.

FROM:hlee DATE:6/28/2005 11:17:32 AM  
Fixed for version 5.4.0.

### Description

FROM:tarmbrecht DATE:Friday, June 24, 2005 2:46:09 PM

Submitted on behalf of my consultant. The text runs as follows, graphics are included in the attached Word file. Also attached the supporting bbd file.

1. In the file 0600035-TES, for Superstructure Definition, "Spans 7-10 (WB)", when an attempt to assign Stringer Group Definition, "StrGrp Sp10" to Unit 5 of the Floor System Geometry, a Validation Error, "The stringer group definition Stringer Unit 5 is not located on the structure.", occurs (as follows).

4/19/2016 3:04:28 PM

HRS AASHTO

721

## Complete Issue Information

2. In Superstructure Definition, "Spans 11-14" it is desired to utilize "User-defined dead load" for Stage 2 DL distribution to the exclusion of "Uniformly to all girders" as computed based on the Structure Typical Section. However when attempted the system calculated Stage 2 dead load is being used anyway.
3. When a Concentrated Load Moment is applied to a girder, there is no affect on the analysis. For an example, try Superstructure Definition, "Spans 11-14" where a 500 ft-k moment has been specified.
4. In Superstructure Definition, "Spans 11-14" when attempting to run the analysis of the floorbeam, "Flbm2" the following error occurs...  
Error generating LFD/ASD load commands!  
Error generating load group commands!  
Error in the loads utility!  
Error getting stringer dead load reaction!  
Error preparing stringer dead load reactions!

The stringer dead load reactions have been computed and are displayed as accepted both under the "Computed Stringer Reactions" and "Floorbeam-Stringer Reactions. This seems similar to incident 6045, which had to do w/floorbeam dead load reactions on the main girders.

- 5) Whole Bridge or Superstructure Definition Copy problems (test by copying "Spans 11-14"):  
When copying and pasting a whole bridge file or just the Superstructure Definition of a Floor-System Superstructure, the following errors occur...
  - a) For the Stringer Definitions, there are no supports. Under Supports is the message, "Zero spans were defined for this member". To correct this problem, one must first open the main Stringer Definition window and then select <OK>.
  - b) Under the stringer definitions, "Bearing Stiffener Locations" becomes inaccessible.
  - c) When attempting to analyze a stringer, the following error occurred, "Unknown error initiating member analysis!". Note: Prior to the copy, in the source, the stringer analyzed w/no problem.
  - d) The Bridge file could not be saved after creating a copy of a Superstructure Definition within it.
- 6) In a girder-floorbeam system Virtis by default incorrectly distributes parapet and other Stage 2 dead loads, located on or outside of the main girders, to stringers and floorbeams that are between the girders. These loads should be considered as supported only by main girders, outside stringers and cantilevered portions of floorbeams only. This is due to the much greater stiffness of the main girders relative to the stringers.

FROM:kkennelly DATE:6/29/2005 8:00:42 AM

This incident is being split into several incidents (6541-6545) since there are too many diverse items to address in one incident.

Submitted on behalf of my consultant. The text runs as follows, graphics are included in the attached Word file. Also attached the supporting bbd file.

1. In the file 0600035-TEs, for Superstructure Definition, "Spans 7-10 (WB)", when an attempt to assign Stringer Group Definition, "StrGrp Sp10" to Unit 5 of the Floor System Geometry, a Validation Error, "The stringer group definition Stringer Unit 5 is not located on the structure.", occurs (as follows)

FROM:kkennelly DATE:6/29/2005 8:47:58 AM

This window is adding up the lengths of all of the stringer group definitions and checking that total length against the structure def length. The error message indicates the last stringer unit is off the

4/19/2016 3:04:28 PM

HRS AASHTO

722

Complete Issue Information

structure because StrGrp Sp7 is defined incorrectly. I think StrGrp Sp7 is longer than it really should be.

Based on the span lengths input on the structure def window, span 2 where StrGrp Sp7 is assigned is 143.08' long. StrGrp Sp7 is defined as 165.08' long on the Stringer Group Definition Geometry window. I think it is spanning over 1 too many floorbeams. If StrGrp Sp7 is changed to span over 1less floorbeam (with spacing = 22') the assignment works ok in the Floor System Geometry window.

FROM:tarmbrecht DATE:Thursday, June 30, 2005 10:33:39 AM

We fixed the extra 22' stringer bay. However, when we attempted to assign StrGrp Sp 8/9 to Unit 4 (span 9), we got a message saying "...unit 4 has...a floorbeam at...347.0832 but a corresponding floorbeam member...does not exist at this location." Where it does exist is at 347.0833, i.e. Virtis expects precision to be 0.0001'. We're getting around it by creating seperate stringer group definitons for sp 8 and sp 9, but why do we need such precision? Where are the tolerance settings for this? See Girder-FlbmSystProb2.bbd

FROM:kkennelly DATE:6/30/2005 11:32:03 AM

Virtis is using hardcoded tolerances when it validates the geometry. You will need to use your workaround for this case but we can evaluate relaxing the geometry tolerances for floor systems for a future release.

FROM:kkennelly DATE:6/30/2005 12:44:12 PM

I don't think it's a bug that we use a stringent tolerance to guarantee user input all "fits" together but maybe we should relax the tolerance a bit for floor systems since other people run into this problem as well.

### Description

FROM:tarmbrecht DATE:Friday, June 24, 2005 2:50:25 PM

With the Prestress Modeling Method is set to "Centerline of simple-span bearing" (and issue #1 above is addressed), the Analysis Results indicates the location of the controlling points for the ratings improperly. For example, the control point for the inventory rating is said to be in Span 2 at 22.00 ft./46.8%. Regardless of the Prestress Modeling Method, it should be output as at 50.0% and at 23.5' from CL Support 2 since Span 2 is specified as 47.0' in the Girder System Superstructure Definition. File attached.

Error No.: 2103

Type : Structural Analysis Error

Location : Data File

One or more elements are too small. A change point(s) is within 0.099 ft of another node point. Numerical instability will result.

Adjust the location of the change point slightly away from the conflicting point. See page 10.1 of Vol 1.

----- End of Contents of BRASS Error File -----

FROM:kkennelly DATE:6/27/2005 10:15:48 AM

The epoxy bar has different points of development than the plain does. This must be causing the cross section change points to be too close. Virtis uses the user tolerance to try to eliminate change points that are within the tolerance. This user tolerance must be different than the BRASS tolerance. Not sure we can do anything to fix this.

FROM:bgoodrich DATE:Tuesday, July 19, 2005 1:03:34 PM

I am able to reproduce this issue. The BRASS LFD engine checks for a short element based on the difference between the range to be added and the nodes in the span. However, it doesn't check the range against the first node in the span. I will forward this issue to WYDOT.

FROM:bgoodrich DATE:Wednesday, July 20, 2005 10:02:49 AM

This issue does not occur in BRASS-GIRDER(LRFD) or the merged engines. If this issue is addressed, it will require careful modifications to meshds.for.

FROM:bgoodrich DATE:Wednesday, July 20, 2005 10:03:33 AM

E-mail from C.J. Riley (WYDOT):

From: Charles Riley [mailto:Charles.Riley@dot.state.wy.us]

We will leave this issue alone for now and have it addressed with the merged engine.

Description

FROM:kkennelly DATE:6/29/2005 8:09:59 AM

Originally submitted in incident 6535. See that incident for the bbd file.

2. In Superstructure Definition, "Spans 11-14" it is desired to utilize "User-defined dead load" for Stage 2 DL distribution to the exclusion of "Uniformly to all girders" as computed based on the Structure Typical Section. However when attempted the system calculated Stage 2 dead load is being used anyway.

FROM:kkennelly DATE:6/29/2005 9:20:47 AM

When I analyze a stringer or fb in that structure, I think the Stage 2 DL is handled correctly. I see a message in the export log file that stage 2 deck loads on Structure Typ Section window are ignored.

I think the user has assigned parapets with zero load on the Structure Typ Section window to get the results they want. If I change the assignment of parapets on the Structure Typ Section window to those that do have load, when I run BRASS I don't see that message in the log file and I do see the following load case:

COMMENT Curbs/Parapets  
LOAD-DESCR 2, 2, 0.00, Curbs/Parapets

FROM:bgoodrich DATE:Monday, July 25, 2005 10:19:39 AM  
I see the Curbs/Parapets load commands also, but they are being generated because a 0.211 kips/ft uniform load was entered on the Stringer Definition Loads window for the "Span 12,13" stringer definition. This is identical to the wearing surface load, so I suspect this could be an input error.

FROM:kkennelly DATE:7/27/2005 9:25:29 AM  
I don't think this is associated with user error.

Spans 11-14. If I change the parapet assignment on the Structure Typical Section window to a parapet that has a unit weight and run BRASS, I get a different BRASS input file than if I ran it as the user sent it to us. The second input file contains a curb/parapet load case that did not exist when I ran the file as the user sent it to us. The only difference I made was changing the parapet assignment so I don't think this additional load case has anything to do with the Stringer Def Load.

The Superstructure Loads window has the Stage 2 dead load selection as User Defined, so for both cases I should get a message in the export log that user defined loads are being used. But I don't get that error message.

FROM:bgoodrich DATE:Wednesday, July 27, 2005 9:59:51 AM  
E-mail from Tim Armbrecht:  
I discussed this with my consultant and he said that for this incident he wasn't referring to stringers or FBs, but he was referring to the main girders.

FROM:bgoodrich DATE:Wednesday, July 27, 2005 11:09:59 AM  
I am able to duplicate the issue with the main girder.

FROM:bgoodrich DATE:Monday, March 06, 2006 12:11:21 PM  
The export of a girder in a GFS or GF superstructure definition has been revised to exclude certain dead loads (appurtenance, wearing surface, and sidewalk) when the dead load distribution method for the stages assigned to those loads is set to "user defined." Fixed for version 5.4.

FROM:mordoobadi DATE:3/20/2006 8:55:35 AM

Comments From Tim Armbrecht:

-----  
1. Incident #6541 (Said to be resolved but is not): (See SpstrLdsProb(540B6).xml.) For main girders (not stringers & floorbeams) of a GFS system, when "User-defined dead load" is selected as the Stage 2 Dead Load Distribution method, the resultant Stage 2 Forces are the same as when one selects "Uniformly to all girders". If User-defined is used and Girder Member Loads for Stage 2 loads are not entered, there should be no resultant forces from Stage 2 loading, but there are. Test this by analyzing the GIRDER MEMBER alternately w/Stage 2 DL Distribution selected as User defined and Uniformly to all girders.  
-----

Complete Issue Information

FROM: bgoodrich DATE: Friday, April 14, 2006 12:48:13 PM

I ran the girder member alt (84" WPG-Comp.) with the stage 2 dead load distribution method set to "Uniformly to all girders" and then again with "User-defined dead load". The export generated the following commands for the "Uniformly to all girders" option, but not for the "User-defined dead load" option:

```

## Complete Issue Information

### Description

FROM:kkennelly DATE:6/29/2005 8:12:21 AM

Originally submitted in incident 6535. See that incident for bbd file.

4. In Superstructure Definition, "Spans 11-14" when attempting to run the analysis of the floorbeam, "Flbm2" the following error occurs...  
Error generating LFD/ASD load commands!  
Error generating load group commands!  
Error in the loads utility!  
Error getting stringer dead load reaction!  
Error preparing stringer dead load reactions!

FROM:kkennelly DATE:6/29/2005 9:39:58 AM

This has something to do with the floorbeam stringer dl reactions being up to date but I can't really figure it out. Open the bws, try to analyze Flbm2, get this error cause line 986 in DoFlrbmStringerDLReaction returns false. (Looks like stringer modification status = up to date but fb modification status = not up to date and CDoStringerDLReactionDetailSet::GetTentativeReaction() returns false cause its array is empty). Try to analyze the fb a second time and it works.

FROM:kkennelly DATE:7/14/2005 12:12:09 PM

I've attached "revised span 42nb\_43nb.bbd" from Cincia Zeng at Lichtenstein. This file is having the same problem when FlrbmStringerDLReactionPtr->GetStringerReaction() is called in LoadsUtility.cpp for the stage 2 DL. User has chosen to override stage DL2 on the Superstructure Loads window.

FROM:kkennelly DATE:7/14/2005 12:17:46 PM

Trying to run the floorbeam mbr alt 1 a second time does not work like it did for the workaround to this original incident.

FROM:mordoobadi DATE:7/15/2005 1:33:19 PM

The problem is with the Up-to-date flag of the dead load reactions. DoModificationStatus functions for the Floorbeam and Stringer Members changed so that they do not check the dead load reactions objects.

With this change and cleaning up the dead load reactions in the database for the Cicina's bridge I was able to perform an analysis accept and apply DL reactions and do another analysis successfully.

FROM:mordoobadi DATE:7/15/2005 3:20:53 PM

Fixed for 5.4. and 5.3.2(?).

FROM:bmcaffrey DATE:Tuesday, September 27, 2005 2:29:01 PM

Is there any go-around for this?

FROM:jihnat DATE:10/18/2005 8:45:21 AM

No workaround.

5) Whole Bridge or Superstructure Definition Copy problems (test by copying "Spans 11-14"):  
When copying and pasting a whole bridge file or just the Superstructure Definition of a Floor-System

4/19/2016 3:04:30 PM

HRS AASHTO

734

## Complete Issue Information

Superstructure, the following errors occur...

- a) For the Stringer Definitions, there are no supports. Under Supports is the message, "Zero spans were defined for this member". To correct this problem, one must first open the main Stringer Definition window and then select <OK>.
- b) Under the stringer definitions, "Bearing Stiffener Locations" becomes inaccessible.
- c) When attempting to analyze a stringer, the following error occurred, "Unknown error initiating member analysis!". Note: Prior to the copy, in the source, the stringer analyzed w/no problem.
- d) The Bridge file could not be saved after creating a copy of a Superstructure Definition within it.

FROM:kkennelly DATE:11/7/2005 3:21:19 PM

The problem occurs when we copy a bridge that has Stringer Definitions associated with a Stringer Group Def. When we make that copy, the new Stringer Definition doesn't have any supports defined in the stringer Supports window. When we copy just the Stringer Definition in the BWS, we break the link to the Stringer Group Def in the new copy so that works ok.

Code that was added to DoSteelRolledBeamDef, etc. for VI5461 seems to have turned off the copy of this data for stringers that are associated with stringer group defs.

FROM:kkennelly DATE:11/7/2005 3:36:14 PM

Fixed for 5.4.0, beta build 2.

FROM:tarmbrecht DATE:Monday, December 12, 2005 2:43:24 PM

Beta 2

5 a) and b) appear to have been resolved. However, while 5 c) now runs and appears to give correct results, it generates a system error, "unable to locate data encapsulation objects" repeated 21 times, and then the same error as before. 5 d) has not been resolved - still can't save file after creating a copy of a superstructure definition within it.

FROM:kkennelly DATE:12/16/2005 11:05:05 AM

Assigned to Mehrdad since I will be out of the office for awhile. Thanks.

FROM:mordoobadi DATE:1/31/2006 9:12:52 AM

Fixing of this incident has broken copying of the whole structure definition or the whole bridge. (Incident 7057)

FROM:mordoobadi DATE:1/31/2006 9:29:37 AM

Fixed for 5.4 Beta 5.

FROM:mordoobadi DATE:3/20/2006 8:56:58 AM

Comments From Tim Armbrecht:

-----  
2. Incident 6544 (possibly 7057): (See GFSCopyProb(540B6).xml.) While the results are correct (as also reported for Beta 2 on 12/12/05) and the error "unable to locate data encapsulation objects" repeated 21 times no longer occurs, now appearing is the error message, "Unknown error initiating member analysis! - Line 1041 in source file .\UiAnalysisProgressDlg.cpp." Run Unit1 Stringer 1, N Stringer.

Description

FROM:kkennelly DATE:6/29/2005 8:14:28 AM  
Originally submitted in 6535. See that incident for bbd file.

6) In a girder-floorbeam system Virtis by default incorrectly distributes parapet and other Stage 2 dead loads, located on or outside of the main girders, to stringers and floorbeams that are between the girders. These loads should be considered as supported only by main girders, outside stringers and cantilevered portions of floorbeams only. This is due to the much greater stiffness of the main girders relative to the stringers.

FROM:kkennelly DATE:6/30/2005 8:55:21 AM  
The option to distribute stage 2 DL states that it will be distributed equally to all girders so the system is

Complete Issue Information

working as designed so this is not a bug. It is an enhancement request to add a distribution option based on stiffness of the members. (I think that will be hard for Virtis to determine, user requested outside stringers get load but inside stringers don't. They are probably the same stiffnesses.)

E-mail thread from Ken Teng:

Hi Brian,

Thanks for the help.

But I still can not get the 20.28 kips. I use BOTH the trucks from left to right & from right to left. I can get the Shear=19.66 k (w/Max. Moment).

I also got the Vmax = 48.13 which match the output, but only got the Max M=286.92 k-ft (The output M= 287.2). A little off.

4/19/2016 3:04:32 PM

HRS AASHTO

740

Complete Issue Information

Please see my calculations for details (the attached file – I also make some notes, please double click on the “?” sign).

I am not sure if BRASS uses both directions for truck movements. If so, the second case on my calculation sheet#2 will control. But you said that BRASS shows the truck location at 9.85ft (on my second case of calculation sheet#1).

Please advise.

I appreciate your help.

Regards,

Ming-Hung (Ken) Teng

Subject: RE: Shear - AASHTO 9.20

Ken,

To help understand how BRASS determines the actions and concurrent actions, turn on the output to get a concurrent actions report. Change the "Action Output Level" in the engine properties on the Analysis Settings window to option 4. This report will be printed at the bottom of the output file. The

4/19/2016 3:04:32 PM

HRS AASHTO

741

## Complete Issue Information

report shows the maximum actions, concurrent actions, and the corresponding truck position that caused the actions. The DISTANCE TO LEAD AXLE is somewhat misleading in that is displayed as an integer although a real number is used internally. I was able to determine that BRASS positioned the military truck at 9.85 feet to the lead axle (the other axle was at 5.85 feet). Remember that BRASS moves the truck across the bridge in increments of (span length / Wheel advancement denominator (WAD)) or  $49.25/100=0.4925$  feet in your case. Using this position (barring round-off issues), I was able to match the maximum moment and concurrent shear at a POI of 6 ft. If you use a larger WAD, say 200, you will get different concurrent actions because the axles will be in a slightly different location. Also, BRASS is using an impact for shear at 6 ft of 1.2972. Only the impact for the reaction is shown in the output report that you can get from Virtis.

Subject: RE: Shear - AASHTO 9.20

Hi Brian,

Good Morning! Thanks for the help.

After reviewing the incident 6511 and AASHTO 9.20.2.2, I agree that the concurrent shear shall be used for the maximum moment at the section. I went back to check some POI points and found out something wired.

For Military Loading (easy to check):

12 kips & 12 kips 4-ft apart. Maximum moment happened when putting the 12-kip load right at the POI.

Below is what I found:

BRASS computes the 10th points for shear concurrent with maximum moment WITHOUT subtracting the 12 kips.

4/19/2016 3:04:32 PM

HRS AASHTO

742

## Complete Issue Information

When you assign the POI points (not the 10th points), the BRASS computes the shear concurrent with maximum moment WITH subtracting the 12 kips.

For example, POI=6ft (I checked 4ft, 6ft, and 8ft ==> same conclusions)

### \*\*\*\* Summary of Actions for Calculating Shear Capacity

|                                    |   |                |
|------------------------------------|---|----------------|
| Dead load shear                    | = | 33.58 kips     |
| Dead load moment                   | = | 233.94 ft-kips |
| Live load pos shear                | = | 48.09 kips     |
| Shear concurrent with maximum mom. | = | 20.28 kips     |

I just can not figure out how BRASS gets the 20.28 kips (with Wheel Dist.=1.861 & l=1.2869). Maybe I did it wrong. Please show me the correct approach.

Please advise. Thank you very much.

Have a wonderful weekend!

Ken,

The last sentence of Article 9.20.2.2 states that "... Mmax and Vi, shall be computed from the load combination causing maximum moment at the section."

There is some shear capacity discussion in Incident 6511 that might be of interest.

Complete Issue Information

Hi Brian,

Thanks for the help. But I still do not understand the "Shear Concurrent with maximum Moment". Does it mean the shear value (@POI=6ft) when the maximum moment right at the POI=6ft? Or shear value when the maximum moment at mid span (my case is simple span bridge)?

For truck loading, the "Shear" and "Shear concurrent with maximum moment" are the same for all 10th points.

Also, I double checked with PCI manual and found out there is no "Shear Concurrent with maximum Moment" available there.

Please advise. Thank you,

Ken,

At the 101.218 POI, the MAXIMUM live load shear is 58.91, which leads to your calculation of 171.55 kips for Vu. However, the CONCURRENT shear (22.02 kips) needs to be used here, which results in  $V_{ci} = 57.9$  kips.

Ken,

Refer to incident 5054 on the Support Website. I think there are cases when BRASS limits Mcr/Mmax to an upper boundary of 1.0. Maybe that is the source of your problem. Other than that, I don't have any input into how BRASS internally computes its values. You can try contacting Brian Goodrich but I know he is out of the office for the next 2 days.

Hi Krishna,

Actually, I did. But I can not figure what Vi VIRTIS use. As I mentioned on previous email, the Vi is in the EQ.9-27.

I double check the other POI, and it is correct. I guess maybe VIRTIS (BRASS) does different calculations for different POI. Is it true?

If

so, please refer me to the formula.

Thank you,

Hi Ken,

You should create a point of interest in Virtis, run BRASS and then review the BRASS output file. The BRASS output file will contain detailed calculations that you can follow that should explain what values they are using in the equation.

FROM:bgoodrich DATE:Wednesday, June 29, 2005 2:56:40 PM

There is a problem in BRASS when storing concurrent actions. The integer portion of the truck position causing the maximum actions is stored. The concurrent actions are only stored when this position is different from the previous one. In short, the concurrent actions from the previous maximum are sometimes stored. I have forwarded this issue to WYDOT.

4/19/2016 3:04:34 PM

HRS AASHTO

752

Complete Issue Information

FROM: bgoodrich DATE: Monday, July 18, 2005 4:10:01 PM  
 WYDOT has assigned this issue to BRASS Problem Log 609.

FROM: bgoodrich DATE: Thursday, September 22, 2005 10:44:22 AM  
 The storing of the concurrent actions have been corrected.

FROM: bgoodrich DATE: Friday, November 04, 2005 3:38:29 PM  
 Fixed for Virtis 5.4.0.

FROM: bgoodrich DATE: Tuesday, April 18, 2006 3:29:04 PM  
 The changes to the engine for storing concurrent actions have been undone. The concurrent actions at a point may not be caused by the same truck position that caused the maximum action. BRASS moves the truck across the influence line and looks for a maximum action. When a new maximum is found, BRASS checks if the truck position is at least one foot different from the last position. If so, the concurrent actions are stored directly. If the new position is within one foot of the stored position, BRASS only stores each concurrent action if its absolute value is greater than the previously stored value. This process is done so a particular concurrent action does not greatly vary by moving the truck by a few inches. If this process were not done, moving the truck a few inches would cause concurrent shears to change by the weight of one axle times its wheel fraction and impact. The concurrent actions are sometime used to calculate a capacity, such as in shear capacity of a P/S concrete section per AASHTO Std. Eq. 9-27. A drop in concurrent live load shear can cause a dramatic decrease in the shear capacity, which can lead to a poor rating factor.

## Description

FROM:mmerklinger DATE:Thursday, July 07, 2005 7:02:12 PM

In recent ratings, the Colorado DOT requested to make the controlling rating flexural. Therefore, if a bearing stiffener or shear strength controlled, adding transverse stiffeners or increasing the size of the bearing plate would force flexural to control. However, we did try changing the resistance factors. Changing the resistance factors would not change the ratings. This does not make sense since changing the resistance factors would change the capacity. How would we change our input besides adding stiffeners/falsifying sizes to get the desired results? Changing resistance factors seems like the proper solution but doesn't give desired results...

In rating a prestressed girder, concrete tension was controlling the inventory rating. Therefore, in the stress limits for this particular girder's concrete type and stress limits, we increased the initial and final allowable tension stresses. Once again, we would have thought increasing the allowable stresses would increase the rating. It would not. In trying various things to get the controlling case in the rating to change, the only this which would relieve the concrete tension from controlling was to decrease the Pjack. Of course, you can't decrease the actual Pjack and get a valid rating. Since changing the stress limits did not affect the rating, how would be alter the input in order to achieve our desired results?

FROM:kkennelly DATE:7/13/2005 3:05:28 PM

For the bearing stiffener question: You need to specify that you are overriding the default LFD factors on the Member Alternative: Factors tab. On that tab pick the set of LFD factors in your bridge for which you have changed the resistance factor. Then your resistance factor should be used by BRASS.

For prestressed girders: The BRASS LFD program does not use the allowable tension stresses on the Stress Limits window in Virtis. Refer to the Engine Related Help for that window to see that BRASS LFD does not use this info. BRASS internally computes the allowable stresses based on the strength of the concrete. Does changing the resistance factor in the LFD Factor window and specifying that factor on the Member Alternative: Factors tab work for you?

Note: The ability to have Virtis ignore the rating factors for user specified actions (eg, bearing stiffeners, flexure, etc.) has been on the enhancement list for several years and will be voted on by the

In the attached file SaveTooLong.bbd, it takes an inordinate amount of time (nearly 2 minutes) to accomplish a save after very minimal changes and longer when more substantial changes are made. To test for minimal changes, we went into the Description text and entered a word of text. The file is 5.3, but we're noticing similar delays in 5.3.1.

The bridge has 9 super-structure definitions in it. Considering the size of the bridge, the two minute save time is not too bad. Actually I saved a similar change to the bridge in 45 seconds.

| 6558.14777 | Closed        | Error in shear wheel distribution calculation? |

### Description

FROM:tarmbrecht DATE:Friday, July 08, 2005 2:34:46 PM

Is there any interest in increasing the number of distributed loads allowed by BRASS? In the attached bbd file, when trying to analyze the main girder of Superstructure Definition "Spans 19-23" the following error message appears...

Error generating LFD/ASD load commands!

04:21:25 PM - Line 243 in source file .\BrassStdLoadControl.cpp.

Error generating load group commands!

04:21:25 PM - Line 1328 in source file .\BrassLoadControl.cpp.

Load Case: Deck + Haunches + Stringer+Floorbeam Loads

The number of distributed loads exceeds the maximum allowed by BRASS!

No. of distributed loads = 61 (Maximum = 38)

04:21:24 PM - Line 1120 in source file .\EngineExport.cpp.

It appears that BRASS should be enhanced to substantially increase the maximum number of distributed loads that it can handle.

If there is a better way to analyze the subject structure, I'd appreciate some insight. Thanks.

FROM:bgoodrich DATE:Wednesday, July 13, 2005 2:23:30 PM

I have forwarded this request to WYDOT.

### Description

FROM:tarmbrecht DATE:Friday, July 08, 2005 2:47:01 PM

Could you please explain how the calculation for the shear wheel load distribution is calculated? In the attached bbd file, when doing a "Compute from Typical Section" to get Wheel Distribution Factor, we feel erroneous values (see below) are being generated for Shear at Supports for Member "6 – 7th N Int", Member Alternative "36WF141-NC". This beam is flanked by a beam 6.5' left and a beam 3.0' right. The calculation appears to be correct for all the other beams.

Complete Issue Information

Generated values: 1-Lane – 0.692, Multi-Lane – 2.192.

Correct values: 1-Lane & Multi-Lane – 1.000

FROM:kkennelly DATE:7/11/2005 8:15:57 AM

For the shear at the supports DF, Virtis positions the wheels within the lane positions you have defined. Since you have 2 travelways defined that exclude the median, Virtis is not placing a wheel directly over this member. It places the first wheel 2' from the edge of the lane you have defined. If you want the girders under the travelway to be subject to full live load, define 1 travelway with a left distance of -40 and a right distance of 40.

FROM:tambrecht DATE:Wednesday, July 13, 2005 9:43:03 AM

I understand what you are saying. However, my experience tells me that the multi-lane shear DF for this member cannot be greater than two. Please see the attached doc file which contains the diagram. The circled member is the member in question. It is under the edge of a travelway with a beam three feet away on one side and 6.5 feet away on the other. How can that member be taking more than two wheel loads? Furthermore, how can the DF for this member be greater that the DF for the beam that is 6.5 feet away, completely underneath the travelway and spaced 6.5 feet from the beams on either side of it? Please investigate, because something appears to be wrong here. Thanks, Tim

FROM:kkennelly DATE:7/13/2005 11:02:26 AM

FROM:kkennelly DATE:7/13/2005 11:26:13 AM

You are correct, the single lane shear at support df should be equal to the multi-lane df. The code was using a variable that was not initialized so the 2.192 was a garbage number. Fixed for 5.4 or any 5.3 service packs that come before that.

Invalid analysis module id!  
Unable to retrieve analysis event component id!  
Error retrieving engine specific analysis event properties!  
Invalid analysis module id!

FROM:bgoodrich DATE:Monday, July 11, 2005 7:00:27 PM

Entered for Jim Duray:

Those are the same messages we get...do you have time to investigate?

FROM:bgoodrich DATE:Monday, July 11, 2005 7:00:47 PM

It looks like when the GetAnalysisModuleSysId function gets called for the DeckPanelRangeSetPtr in MaderoBase.cpp, an ID of 0 is returned. When the same function is called in MaderoAnalysisCtl.cpp, an ID of 4 is returned. The addresses of the pointers between the two files are identical, so I don't understand why this is happening. Do you have any ideas?

FROM:kkennelly DATE:7/15/2005 8:37:30 AM

You have to call DeckPanelRangeSetPtr ->MoveFirst() before you can call GetAnalysisModuleSysId(). You have to position yourself in the set before you can call any functions on it.

Note: Even with the above change I can't rate the timber deck in the attached girder line struct def. Looks like the code in CMaderoDeadLoads::ComputeGirderLineDeckLoads() does not support a timber deck on steel beams.

FROM:bgoodrich DATE:Wednesday, July 20, 2005 11:17:51 AM

I added the DeckPanelRangeSetPtr->MoveFirst() function to a few locations and was able to rate the timber deck on a girderline. The Madero export contains a flag (m\_bSteelGirder) to indicate if the deck is supported by steel girders. This flag is used in the CMaderoDeadLoads::ComputeGirderLineDeckLoads() function.

FROM:bgoodrich DATE:Wednesday, July 20, 2005 11:28:52 AM

The analysis now runs, but after rating the deck from the bridge workspace, I cannot open the Tabular Report from the toolbar or menu. I click the button and nothing happens, not even an error.

FROM:jihnat DATE:10/7/2005 1:38:13 PM

The Analysis Report is fixed for 5.4.0 (Alpha Build 2)

Is there a reason the "length" of the longitudinal stiffener range is in inches when the start and end distances are in feet? The only reason I can think of is because the user wants the length to be accurate down to a fraction of an inch. However, it seems like it would be OK if the user were to use fractions of feet. I think that would be accurate enough and it would eliminate the confusion of mixing units.

FROM:hlee DATE:7/19/2006 11:09:55 AM  
Changed Category to Enhancement.

FROM:jduray DATE:12/13/2007 9:14:04 AM  
I disagree (and so does the TAG. Let's just fix it since I suspect it is minor effort.

FROM:hlee DATE:12/14/2007 1:51:21 PM  
Discussed with Jim. We are going to change the default unit in the database.  
Mehrddad, please assign to me for testing after you are done.

FROM:mordoobadi DATE:12/26/2007 1:43:30 PM  
Fixed in the data dictionary.  
US Unit changed from inches to ft.  
SI Unit changed from mm to m.

| 6574.14761 | Duplicate     | Lost stringer supports when copying GFS superstructure definition |

### Description

FROM:dteal DATE:Thursday, July 21, 2005 1:46:50 PM  
REPORTED BY:Dean Teal

DESCRIPTION:I can use BRASS Import to import RC Parabolic Haunched slab bridges. I can rate a Post Tensioned Haunched slab bridge in BRASS Girder LFD (attached data set) So why can't import a Post Tensioned Haunched slab data set into Virtis. The error message I get from BRASS import tells me I can't import a PS section that is not uniform in thickness. It should be the same BRASS engine I am rating with as used in Virtis – right??

### COMMENTS:

FROM:jduray DATE:7/25/2005 9:28:48 AM  
Because Virtis does not support post-tensioned members. Not all BRASS capabilities have been implemented within Virtis.

FROM:dteal DATE:Saturday, August 13, 2005 10:00:52 AM  
Is this BRASS capability going to be added in the future?

### Description

FROM:bgoodrich DATE:Wednesday, July 27, 2005 11:14:03 AM

E-mail from Tim Armbrecht:

On an additional note, you may want to add this to the support board because I think it's a Virtis issue, but when he copied superstructure definition "Spans 11-14" to a new bridge file, he lost the stringer supports ("No supports defined"). After he fixed it, floorbeams would not analyze - said there were no stringer dead loads:

Error generating LFD/ASD load commands!  
Error generating load group commands!  
Error in the loads utility!  
Error getting stringer dead load reactions!  
Error preparing stringer dead load reactions!

| 6587.14748 | Resolved      | Validation of Type 2 bar mark in girder profile |

Description

FROM:kkennelly DATE:8/9/2005 10:16:03 AM  
Request by Steve Mample at the 2005 UG meeting.

He'd like to be able to generate a list of bridges with specific member alt types (like reinforced concrete members).

FROM:smample DATE:Tuesday, August 09, 2005 4:44:13 PM  
I have a need to be able to list analyzed bridges by the type of the main span. Such as composite steel girders, non-composite steel girders, reinforced concrete tee beam girders, reinf conc frames, etc. Using the Member Alt. Types on the Girder System Superstructure Definition window to do that is a good idea. But the four alternative types are too limited for my need.

Would it be possible to add additional data entry boxes to the Bridge Workspace Bridge Window? These boxes would provide a place for user defined data that could be accessed and used to sort by and/or tabulate data not otherwise available in the Bridge Workspace tree. It may be useful to input items 43a & 43b from the Federal Highway Administration's Recording and Coding Guide for the Structure Inventory and Appraisal of the Nation's Bridges.

FROM: Herman Lee DATE: 5/13/2014 1:48:23 PM Eastern Daylight Time  
Implemented Bridge Explorer customization in the upcoming 6.6 release.
