### Description

FROM:kkennelly DATE:8/9/2005 1:40:29 PM  
Submitted on behalf of Li Zhang, Caltrans.

I got another problem here. When I try to change the "start distance" for the Type 2 rebar to 4ft (refer to Girder "G2-1937" in "Typical Span for Span 1,2,3,4 (MDL 1) 08/05"), I got the following error message. What's wrong? I thought it might be the round off problem at the end of rebar. But it give me the same error message even if I try to get it start at 3.5ft.

FROM:kkennelly DATE:8/9/2005 1:43:05 PM

I think this is a bug in Virtis. When it is validating that the bar is within the beam length, it is including the length of the sloped portion of the bar as if it were a true horizontal length.

Description

FROM:hlee DATE:8/18/2005 11:25:17 AM

Submitted on behalf of Cincia Zeng. Received via bridgeware e-mail.

=====

Dear Support Group,

I have a floorbeam stringer system model for a two span bridge. Each span is simply supported. When I use user defined dead load DC2 in the stringer definition loads input, floorbeam won't run and all stringers ran. I got the following message:

- Error generating LFD/ASD load commands
- Error generating load group commands
- Error in the loads utility
  - Error getting stringer dead load reaction
- Error preparing stringer dead load reactions

Using the same model and input the same amount of load using user defined dead load DC1 instead of DC2 in the stringer definition loads input. All stringers and floorbeams ran without any errors. But 2 floorbeams rate zero and only the third floorbeam rates.

Please check the attached bbd file.

Does this mean I can't use user defined dead load DC2 for floorbeam stringer system model?

Cincia

=====

Reply e-mail:

=====

Cincia,

When you used user defined dead load DC2 in the stringer definition loads input, floorbeam didn't run and all stringers ran due to a bug in 5.3.0. This bug had been record in Incident 6543 and has been resolved for 5.4.0.

The two floorbeams rated zero are due to the fact that there are not enough capacity. I increased the thicknesses of the beam and they rated ok. Please note that the max shear on the second floorbeam is two times that of the third floorbeam. The inv rating for the third floorbeam is 0.12 already.

Complete Issue Information

Please let me know if you have more questions.

Regards,  
Herman Lee

Do you have authorization to change them. Ask your administrator.

FROM:mordoobadi DATE:11/15/2006 3:01:38 PM  
I found out what is causing both issues. (6650 and 7691)

You have an Integrated database (Virtis/Opis/Pontis). There is a record missing from your COPTIONS

4/19/2016 3:04:52 PM

Complete Issue Information

table that is required by Virtis/Opis. It defines the location of multimedia server (MULTISERVER option in Pontis). The migration did not populate the record because you had an integrated database and we do not change PONTIS table contents for integrated databases.

You can fix the problem by adding a record to the COPTIONS table by executing the attached SQL command in Interactive SQL.

- (0) Save the attached file to a folder on your hard disk drive.
- (1) Start Interactive SQL and login to the database.
- (2) Select File/Open and open the SCOptions.SQL file.
- (3) Select SQL/Execute.
- (4) Close the Interactive SQL.

After this you should try to duplicate the problems by:  
A) attempting to open the System Defaults Window  
B) Trying to attach a file to a bridge.

| 6682.14658 | Resolved      | Increase number of vehicles in a single run in Virtis Std Engine |

Description

FROM:bgoodrich DATE:Friday, August 26, 2005 3:43:54 PM

I found a problem with the P/S shear settings in the latest service pack for 5.3. For existing member alternatives, the P/S shear option for controlling how Vci is calculated is actually set in the BRASS domain. The problem is that the variable is initialized to 1, which means to ignore P/S shear. So, for any existing bridges that did not choose to ignore shear, it will be ignored anyway. The only work around is to open the member alternative engine properties window and OK it.

FROM:jduray DATE:8/29/2005 11:48:08 AM

It should default to the the old BRASS default.

FROM:jihnat DATE:5/8/2006 2:02:10 PM

This got fixed in 5.4.0 (incident 7049)

Description

FROM:kkennelly DATE:9/13/2005 3:14:30 PM  
Submitted on behalf of Cincia Zeng, Lichtenstein via email:

Hi Krisha,

I am working on a simple span bridge. It has 8 stringers. I set up a floorbeam stringer system model for this bridge in virtis 5.3. Please see the attached bbd file. It took me 4 hours to run 4 trucks (HS20, H20, Type 3, Type 3S2) or 1.5 hours to run HS20 to rate the floorbeam. Is this normal? How long does it take you to run the same model? Is there anything can be done to speed up the process?

Appreciate your help.  
Cincia

### COMMENTS:

FROM:dteal DATE:Wednesday, September 14, 2005 3:19:04 PM

Is it possible to print actions at user defined POI's (with or without 10th points) in RC structures. I have tried and can't seem to figure how.

FROM:kkennelly DATE:9/15/2005 8:19:08 AM

I think this works. I added a POI at a location other than a tenth point in the first structure def in BID 11 (single span RC bridge), ran BRASS LFD and I see the moments and shears at the point in both the Analysis Results window in Virtis and in the BRASS output text file. Are you looking for some other type of information?

FROM:dteal DATE:Monday, September 19, 2005 10:19:39 AM

I attached a RC bridge for an example, I used the Member for 2.5" clear for my testing

With Member Alt Description – Engine Data, POI control set to Generate @ user defined points.  
With Analysis Settings – Engine Properties – Output Control – Print Actions @ 10th Points.  
The above setting resulted in Analysis Results at 10th points

Now change the Analysis Settings – Engine Properties – Output Control – to print actions @ all node points.

Now the Analysis Results window = No Data Available, it's blank.

Now go back and change the Analysis Settings – Engine Properties – Output Control – Print Actions @ 10th Points again.

The Analysis Results window still = No Data Available, it's blank

After the second time doing this I had to not only exit Opis but I had to reboot to get the Analysis Results window to populate using 10th points again.

I never did get any results in this window other than 10th points – no user defined points.

FROM:kkennelly DATE:10/7/2005 9:27:01 AM

I am able to reproduce this in Opis. I think something got broken in the service pack for 5.3.1.

Following Dean's steps:

4/19/2016 3:04:56 PM

HRS AASHTO

789

## Complete Issue Information

1. With Member Alt Description – Engine Data, POI control set to Generate @ user defined points.  
With Analysis Settings – Engine Properties – Output Control – Print Actions @ 10th Points.  
The above setting resulted in Analysis Results at 10th points

This run results in the following BRASS LRFD commands being generated:

```
OUTPUT 1, ON, OFF, OFF, 1, , , , , , , OFF  
OUTPUT-STAGE ON, ON, ON
```

2. Make following changes and re-run BRASS LRFD:

Now change the Analysis Settings – Engine Properties – Output Control – to print actions @ all node points.

Now the Analysis Results window = No Data Available, it's blank.

This run results in the following BRASS LRFD commands:

```
OUTPUT 2, ON, OFF, OFF, 1, , , , , , , ON  
OUTPUT-STAGE OFF, ON, ON
```

The last parameter in the OUTPUT command is for the camber output. Looks like it is being switched from OFF to ON when no changes were made to that input on the Analysis Settings window.  
The first parameter in OUTPUT-STAGE is for printing stage 1 output. It is being switched from ON to OFF. That is why no Analysis Results are available.

The only difference in the commands between the 2 runs should be the first parameter in the OUTPUT command.

FROM:sboukamp DATE:10/11/2005 2:24:54 PM

It looks like the order for the properties passed to BRASS is getting mixed up: when I uncheck Camber in the GUI actually Stage 1 is set to OFF when the BRASS LRFD commands are generated.  
A temporary work around would be to have the Camber and all Stages checked.

FROM:sboukamp DATE:10/12/2005 10:18:02 AM

Resolved for next Service Pack.

FROM:dteal DATE:Thursday, December 01, 2005 10:08:35 AM  
Accepted in 5.4 beta 2

FROM: Dean Teal DATE: 8/7/2008 12:30:53 PM Eastern Daylight Time

This appears to be broken againJim,

Please follow the frustration I have been having in trying to create a camber report that contains DL camber data by stages at 10th points for RC. What I mean by stages is to separate out total deck DL camber before the rail or FWS is applied.

Not only can this not be done in RC, in steel and PS you can't get DL reports at 10th points without other points be added in.

4/19/2016 3:04:56 PM

HRS AASHTO

790

## Complete Issue Information

This is what the designer needs and what he has to work with when it comes to available Dead Load Camber (deflection) reports (needed at 10th points).

Not unique to any specific bridge type

1. Steel bridges
  - a. Blocking diagrams (shop details)
  - b. Fillet (haunch) amounts in Rolled beams
2. Prestressed
  - a. Fillets (haunches)
3. RC
  - a. DL Camber diagram to place form boards

Examples: I did this with RC so I could test both the current version 5.6 and the beta 3 version for 6.0.

Items that "need reporting" for the dead load camber only

For a common RC Slab (at 10th points only)

1. Girder Weight DL (slab DL)
2. Slab Sacrificial Wear DL (the rest of the slab DL)
3. Corral Rail DL
4. FWS DL

Items 1 & 2 are added together to make up the DL camber of the fluid concrete that will be supported by the wooden form boards. This value is multiplied by 3.5 to arrive at the amount needed to pre-camber the form boards (this camber will creep out of the slab within the first year). If the slab is skewed the camber is reduced by the % of the skew.

## Complete Issue Information

Item 3 is added in to check total deflection – not a very good check because it is assumed that rail loads are distributed over the entire deck when it should be just over the first 6 feet or so. Both items 3 & 4 are only used for final design checks, not to set concrete forms.

Steps to get one span of camber data to a set of production plans.

(using version v5.6 or v6.0 beta 3 the way things are right now)

Using the Report Tool:

1. Assuming that VI #8443 is completed to report to 4 decimals
2. This report can't be copy/pasted into excel – it will paste into one column only (useless if you want to perform any calculations). You would have to hand type all the values into your spreadsheet cells.
3. All the DL values lumped (deck, rail, FWS) together don't aid the designer being all these loads aren't applied at the same time. The top header of the report should list a column for each DL case that Opis included in the analysis.
4. The report is not in 10th points and I can't make it output in 10th points.
5. I had accepted VI #7453 as the camber report being there, I should have looked at its content much closer.

Using the Analysis Results Report for Dead load Actions:

1. This is available for each DL case (good thing)
2. I have a spreadsheet made with the same headers shown on this report (Span, Location, %, Mu, V, Axial, Reaction, X Defl, Y Defl). Using the tool bar only, you can copy from Opis and paste in excel. Yes, the tool bar is the only copy command that will work with excel!
3. Being you can't get POI's at 10th points only for RC (You used to be able to , #8442). I copy/paste the DL Actions for each DL Case to excel. Being I can't generate by 10th points only you then have to highlight the rows in excel that are 10th points and copy/paste them to another sheet. These values are used to do comps on.

So in a nut shell

The DL reports available are not readily usable by the designer for production work without jumping

Complete Issue Information

through a bunch of hoops.

10th point output alone is impossible to get. I tried RC, PS and Steel. All user defined POI's have been deleted. All LRFD engine properties set to 10th point's (can't set Opis Engine, no controls, you have to take what it gives you), Everything I try ends up with output more than just 10th points. I sent in a VI on the 10th points (1/24/08, #8442, no action has been taken). I think it was fixed for release 5.4 (VI #6693) – appears to be broken again.

If anybody has a-work around, I'm all ears.

Description

FROM:kkennelly DATE:9/16/2005 10:09:46 AM  
Submitted on behalf of Elizabeth Balcha, Mass. DOT via email:

Hi Krisha

I have a question about secondary moment for the bridge A-09-023 (2J5) . The unfactored stress due to secondary Moment is zero while secondary moment value is 14.02k-ft .

- 1) Is there any relationship between the moment and the stress ?
- 2) How could Virtis come up with the number can you show me the calculations ?
- 3) Is secondary moment applicable to simply supported structures ?
- 4) Why is secondary shear zero ?

I have attached the BBD file.

With regards

Elizabeth Balcha

Response sent via email:  
Elizabeth,

Since these questions refer to the internal computations of the BRASS LFD engine, they would be better answered by someone more familiar with that engine. I have entered your question as incident 6697 on the Virtis/Opis Technical Support website.

There appears to be a bug with BRASS reporting a secondary moment for a simple-span structure. The variable that is used to store the secondary moment is also used to store a centroid distance. This is why the stress and shear due to secondary effects are zero. I have forwarded this issue to WYDOT for assignment to a BRASS problem log.

### Description

FROM:kkennelly DATE:9/16/2005 3:43:01 PM  
Submitted on behalf of Vinacs, Caltrans via email:

Krishna and Brian

(IN ORDER FOR TO SEE THE BRAASS OUTPUT CLEARLY, I SET THE FONT TO COURIER. IF THE COLUMNS DOES NOT ALIGNED PROPERLY WHEN YOU GET THIS E-MAIL, PLEASE READJUST THE FONT TO COURIER)

We have come across this problem by accident. When we had entered a set of rebars, we wondered about the development of the bar. As a result, we tried both ways to see what would be the end result. As expected the moment capacity reported at the 0.9th point of span 1 of two models were different. Unfortunately, capacity of the section where rebars considered fully developed produced smaller moment.

As a result of detail review of the results, we believe that the problem exists in the export routine of the VIRTIS program.

Attached is the bbd file, where you will find member G1 has two alternatives; they are: 1. 20.5 ft wide RC Slab (1971) 2. Copy of 20.5 ft wide RC Slab (1971)

4/19/2016 3:05:00 PM

HRS AASHTO

798

Complete Issue Information

As I mentioned earlier, difference between the two alternative is the rebar layout. In first alternative, one set of rebars (SET #9) is considered NOT developed at the end and in the 2nd alternative (Copy of..), the same set rebars (SET #9) is considered FULLY developed at the end.

The detail output of the moment estimated at the 0.9th point of Span 1 (copied below) shows the problem

Alternative 1: For 20.5 ft wide RC Slab (1971),

Flexural Resistance Summary:  
 beta 1 = 0.850                      phi f = 0.900  
 c = 2.248 in                      Mn = 13441.178 in-k  
 a = 1.910 in (from bottom)                      = 1120.098 ft-k  
                                                                          phi\*Mn = 12097.060 in-k  
                                                                          = 1008.088 ft-k  
 f<sub>c</sub> = 3.000 ksi (stem)

Notice the Area of top reinforcement. For the first alternative, area is 34.59 and the 2nd alternative top area is 22.432. Bar that was adjusted between the two alternative is the bottom reinforcement bar and therefore, the top area should have remained the same.

Also note that I could not match the area reported for R5 in either case with my hand calculation. Area reported for R1 in the First alternative also did not match with my hand calculation.

Please verify the numbers and investigate the problem.

My Estimation of top reinforcement area for first alternative:

0.9th point is 22.95 feet away from first support and 2.55 feet from 2nd support.

- 2 #10 bars are continuous for whole length = 2 x 1.27 = 2.54 sq inch
- 13 # 7 bars continuous for the whole length = 13 x 0.60 = 7.80 sq. inch
- 13 # 7 bars Starts at 10 feet from support 2. Thus, dist from start point to 0.9th point = 7.45 feet, development length of #7 bars = 1.46 feet. Thus area = 13 x 0.6 = 7.80
- 13 # 11 bars; starts at 6 feet from support 2. Thus, dist from start point to 0.9th point = 3.45 feet, development length 0 #11 bars = 3.80 feet,

### Complete Issue Information

Thus, it is 3.45/3.80 (90.7%) developed. Therefore area =  $13 \times 1.56 \times 0.907 = 18.39$  sq inch.

So total top reinforcement area =  $2.54 + 7.80 + 7.80 + 18.39 = 36.53$  sq inch (BRASS reported it as 34.59 sq inch)

My Estimation of BOTTOM reinforcement area for first alternative:

0.9th point is 22.95 feet away from first support and 2.55 feet from 2nd support.

1. 2 #10 bars are continuous for whole length =  $2 \times 1.27 = 2.54$  sq inch
  2. 13 # 7 bars goes whole length of 1st span and considered fully developed =  $13 \times 0.60 = 7.80$  sq. inch
  3. 13 #7 bars starts 2 from support 1 and ends at 23.75 feet away from support 1 (meaning 0.8 feet from 0.9th point). The development length = 1.46 feet. Thus its 0.8/1.46 (54.8%) developed at 0.9th point. Thus area of steel =  $13 \times 0.6 \times 0.548 = 4.27$  sq inch
- Thus total area of bottom reinforcement =  $2.54 + 7.80 + 4.27 = 14.61$  sq inch. (BRASS reported it as 10.34, as if the 3rd set of bar never existed)

Please let me know your findings and possible fixes for this problem

Response sent:

Hi Vinacs,

I think Virtis is correctly generating the cross sections for the BRASS export based on what was input for the 2 alternatives. I've attached a file that contains sketches of the cross section ranges generated for BRASS based on your input. It also contains the calculations Virtis uses to determine how much of the rebar is developed in these cross section ranges.

In your first alternative, Set 9 is not marked as fully developed. Virtis computes that Set 9 is fully developed at distance 22.21'. The presence of this pt of development causes Virtis to create a cross section range at this point and compute the percentage of bars developed at this point. In the copy of the first alternative, Set 9 is fully developed so Virtis does not create a cross section range at 22.21' like it did in the first alt.

Keep in mind that the amount of rebar cannot vary over the length of a range. So anything that introduces a cross section range into the Virtis export (like pts of rebar development or points of interest or web depth changes) causes different cross sections to be generated.

The development lengths listed in your calculations below also do not match what Virtis computes. You

4/19/2016 3:05:01 PM

HRS AASHTO

801

## Complete Issue Information

have listed the development length of the #7 bar in Set 3 as 1.46'. This value is the basic dev length, Virtis considers any applicable modification factors which in this case result in the development length of Set 3 being 1.64'. Refer to the "StdReinfDevLengthCalcs.log" file in the Analysis Output window in Virtis (where you can also open the BRASS output file) to see where Virtis considers the bars to be developed and what modification factors it used.

Please refer to example 3 in the "Schedule Based Reinforcement Cross Section Export Examples" in the Virtis help for additional explanation on how Virtis generates cross sections.

Please let me know if you have any further questions.

Email:  
Krisha

I will review the output as you suggested.

However, the results does not makes sense. I expected that negative moment capacity at the 0.9th point be more or less same for the alternate models, especially when the area bottom rebars between alternative have very minimal effect on the capacity. Yet, the results show a large difference (1481 k-ft vs 1008 k-ft) between the reported by BRASS. This difference is not acceptable. At this point, I am not sure what is the source of the problem, however, we need to resolve this.

FROM:kkennelly DATE:9/16/2005 4:30:46 PM  
Hi Vinacs,

I haven't checked the BRASS capacity calcs but this is what I suspect is happening:

First alternative: At 22.95' top rebar in cross section 12 is 31.07 in<sup>2</sup> because the section at this point is taking into account Set 4 being 64% developed since the first section to the left of 22.95' is at 22.21'. At 22.21', Set 4 is 64% developed and rebar has to be constant along a cross section range.

Second alternative: At 22.95' top rebar in cross section 10 is only 22.43 in<sup>2</sup>. First section to left of 22.95' is 20.4'. At 20.4', Set 4 is only 21% developed and since rebar has to be constant along a cross section range, it is still only 21% developed at 22.95' in this model. Thus this alternative has a lower negative moment capacity.

An engine that can internally compute the percentage of developed rebar at a point from a schedule of rebar would solve this problem.

Regards,  
Krisha Kennelly, PE

### Complete Issue Information

Set 1 and 2 bars are continuous for the whole length - Set 1 = 2#10 = 2.54 sq inch, Set 2 = 14#7 = 8.4 sq inch

Set 3 is fully developed at these two points, 13.5 # 6 = 5.94 sq inch

Set 4 is also fully developed at these points (according to StdReinfDevLengthCalcs.log), 13 # 10 = 16.51 sq inch. TOTAL area = 33.39 sq inch

When I reviewed the area of section used at these points,

Area (R5) used within section 200 pt was 33.39 (this matches my hand calculation)

However Area used within Section 200.22 point was 24.509 sq inch. (This area is the estimated area at a section that is 3 feet away from the support).

This bridge rating calcs also illustrated the problem in OUR bridge modelling using BRASS program. I am at a loss as to how to fix the problem. After reviewing the bridge, I am inclining to your suggestion where BRASS linearly interpolates the area of the rebar between sections provided that a variable section option is selected.

(See attached file: 38 0122L.bbd)

FROM:kkennelly DATE:9/20/2005 1:36:42 PM  
Email from Brian Goodrich 9/20:

BRASS is calculating the flexural resistance based on the input sent to by the export. I see no problems with the BRASS tools that calculate the flexural resistance. Based on the exported data, the first alternative has nearly 40% more top steel than the second alternative, so the negative flexural resistance is going to be significantly different between the two. However, the bottom steel only slightly affects the negative flexural resistance by about 9 ft-kips in this case.

Now there is an issue happening within the engine that should be noted. BRASS performs specification checks and resistance calculations at a point of interest, which is located at the end of one element and the start of another. BRASS must choose which element end to obtain the section properties for the analysis. BRASS currently compares the gross moment of inertia between the two and chooses the section with the smaller I. For R/C, if the gross moments of inertia are equal, BRASS compares the total reinforcement area and chooses the section with the smaller As. For the first alternative, the section on the right side of the POI had a smaller area of steel. For the second alternative, the section on the left side of the POI had a smaller area of steel. This is part of the reason for the large difference in top steel. I'm basically saying that even though you can specify a "Side" on the Point of Interest window, BRASS does not use it to select the section properties. We recently added the area of steel check to address symmetry issues, which was an improvement. Note that before BRASS always chose the properties to the left of the POI. Incident 6532 is already in Visual Intercept requesting this change to use the side specified by the user. WYDOT put this on the enhancement list to be prioritized by the users.

Regards,

Brian Goodrich

## Complete Issue Information

It seems to me that when the user defines a point of interest Virtis/Brass should be determining the capacity from the (rebar and section properties) at that point of interest, otherwise the point of interest concept is not that useful. Does Virtis/Brass do that?

Response from Brian Goodrich, 9/20:

Virtis allows the user to specify a point of interest and the side to examine, i.e., left or right. That means that there can be two points of interest at the same longitudinal location with different properties.

However, BRASS has always automatically determined which properties to use for a point of interest because there was no mechanism to specify the side. Furthermore, the recent requests for this capability are the first of which I have heard.

Email from Vinacs, 9/20:

Brian

You are correct! BRASS is doing the rating based on the "mathematical" model created by the export program and Virtis Export program is the one needs revision!

In your e-mail, you have correctly pointed out that

"BRASS is calculating the flexural resistance based on the input sent to by the export. I see no problems with the BRASS tools that calculate the flexural resistance. Based on the exported data, the first alternative has nearly 40% more top steel than the second alternative, so the negative flexural resistance is going to be significantly different between the two. However, the bottom steel only slightly affects the negative flexural resistance by about 9 ft-kips in this case."

Problem:

We have entered data of a bridge into the Virtis program using as-built details (as we saw them). In the First alternative, we entered the POSITIVE bar as "undeveloped" and in the second Alternative, we stated the bars are FULLY developed. Other than this minor difference, everything is the SAME.

Now, as you have already stated this positive bar has very minor effect on the negative moment capacity and therefore the capacity at the point of concern is "practically" the SAME. I am sure that you will agree with me.

VIRTIS EXPORT program generated two mathematical models for the rating and capacity reported by ONE mathematical model is about 46% more than the SECOND model (1481 k-ft vs 1008 k-ft).

Only logical explanation for the difference (since BRASS does rating based on the input sent to by the export program), is that the VIRTIS EXPORT program did not produce an accurate mathematical model to REPRESENT the bridge. In other words, the logic used to create the RC sections for the BRASS program needs revision. We want this problem recognized and fixed ASAP.

If you would like discuss this further, please give me a call.

## Complete Issue Information

Hi All-

An interesting and useful dialog. Hopefully, we can get a work order to fix this -- I think that we need the left/right option as well.

Jay

FROM:kkennelly DATE:9/21/2005 4:17:48 PM

Email from Vinacs:

I am responding with regards to left/right option here. (See attached file: AREA of Rebars to be used.doc)

FROM:kkennelly DATE:9/21/2005 4:18:46 PM

Response sent by me to Vinacs 9/21:

Hi Vinacs,

Jim Duray, Brian Goodrich and I had a conference call today to discuss how to address the problem you are having with schedule based reinforcement. We determined that the Virtis generation of cross sections and cross section ranges is correct and does not need to be revised. We also determined that introduction of the Left/Right parameter for a point of interest in the BRASS program will solve the problem by giving the user control over the amount of rebar to be considered at a point of interest.

We are proceeding with the process to get the Left/Right parameter into the BRASS LFD program. I do not yet know the timeframe required to incorporate this parameter into BRASS LFD. We will keep you informed on our progress. Also, Illinois DOT entered incident 6532 on the Technical Support website regarding usage of Left/Right in BRASS. The users may have voted on this at the 2005 User Group meeting but we do not yet know the results of that voting.

I have also entered this problem as incident 6704 on the Virtis/Opis Technical Support website.

FROM:kkennelly DATE:10/6/2005 2:27:06 PM

Based on phone call conference on Sept 26 between Jim Duray, Krisha Kennelly, Brian Goodrich, Vinacs and Anthony Gugino we agreed on the following solution:

1. Enhance BRASS to allow the amount of rebar to vary over a cross section range length.
2. Change the Virtis export to export cross section ranges with different amounts of rebar at the start and end of a cross section range. See attached VI6704 Proposed Change.bmp for sketch.

With these changes we will be able to accurately model how the amount of rebar varies in the development length areas.

FROM:kkennelly DATE:11/30/2005 10:37:35 AM

For #2 above, modify code in DoGirderMbrAlt::ComputePercentDev(). This is where we force the amount of rebar to be the same at start and end of a cross section range.

3. Modify example problems in Virtis/Opis Help and training examples.

FROM:kkennelly DATE:12/16/2005 12:52:09 PM

2. Is done. DoGirderMbrAlt::GenerateReinfConcCrossSectionInfo() now has a parameter "bVaryReinflnRange". Set this variable to TRUE if the engine allows the area of rebar to vary over the length of a cross section range.

Description

FROM:kkennelly DATE:9/21/2005 8:09:02 AM  
Submitted on behalf of Ken Teng, RQAW via email:

I got two questions. Please also check my attached file.

Question#1:

Please show me how to get the ES Loss = 12.414 ksi (I got ES Loss=12.76 ksi)

Below is my calculations:

Basic Info from BRASS Output (Beam #2 @ Span #2 - Mid-span)

Eci= 4496.06 ksi

Ab (Area of Beam) = 924.5 in<sup>2</sup>

As (Area of Strand) = 0.167 in<sup>2</sup>

C.G. = 21.1266 in

Ixx = 216980.11 in<sup>4</sup>

Mb (beam self weight moment) = 1044.0 k-ft

Immediate Loss = 0 ksi (Does VIRTIS use it for LFD? I know LRFD use it, right?)

Then my calculations:

Trial/Guess ES loss = 12.76 ksi (Actually I tried three times) :)

$\text{Psi} = (0.75 \cdot 270 - 0 - 12.76) \cdot (38 \cdot 0.167) = 1204.090 \text{ kips}$

$\text{Fcir} = (\text{Psi}/\text{Ab}) + (\text{Psi} \cdot (21.09 - 3.21)^2) / \text{Ixx} - (\text{Mb} \cdot (21.09 - 3.21)) / \text{Ixx} = 2.049 \text{ ksi}$

$\text{ES} = (28000/\text{Eci}) \cdot \text{Fcir} = 12.76 \text{ ksi}$  (Converged)

\*\*\*\*\*

Question #2:

What is the "IROW" on the BRASS Loss output? There are five (5) IROW for every tenth POINT?

By the way, is there anyway that the loss detailed calculations (Fcir & Fclds) can be shown on the BRASS output?

Please Advise. Thank you very much.

FROM:bgoodrich DATE:Wednesday, September 21, 2005 4:39:21 PM

BRASS LFD does not use an iterative method to determine the elastic shortening loss. Instead, an estimate of  $0.69 \cdot f_s$  is used to determine the strand stress as allowed in the definition of fcir on page 234 of the Standard Specifications (17th edition). Therefore:

4/19/2016 3:05:02 PM

HRS AASHTO

808

### Complete Issue Information

$\text{Psi} = (0.69 \times 270) \times (38 \times 0.167) = 1182.3 \text{ kips}$   
 $\text{Fcir} = 1.99 \text{ ksi}$   
 $\text{ES} = 12.414 \text{ ksi}$

Also, IROW is the row number of the prestressing strands. There are five rows: 3 straight rows @ 40", 38", and 36"; 2 harped rows @ 40" and 38". BRASS calculates strand stress, losses, etc. at each of these rows individually and then superimposes the results.

Attached is a 15-21-18.5 m prestressed bridge. I am rating member #2 using an HS20-44 truck. The LFD engine properties for POI control is set to #1 (10th points) along with the Analysis Settings Engine properties set to "print actions at 10th points.

Run Virtis on member #2 with this HS20-44 truck and look at the "Analysis Results – Rating Results Summary". The controlling Inventory point for the Design Truck is at 16.8m (8.6% of span 2). This is not a tenth point? Where did this point come from?

This point is at 1.8 m into span #2. The first 10th point should be at 2.1m?? Am I reading this wrong?

FROM:bgoodrich DATE:Friday, November 11, 2005 1:49:44 PM

This is a duplicate of Incident 3141. See that incident for details.

REPORTED BY:

DESCRIPTION:

COMMENTS:

FROM:dteal DATE:Thursday, September 22, 2005 9:19:51 AM

Is there any way to ignore a rating controlling point – to move on and get the next controlling point?  
Would this have to be done manually by using User Defined POI's only?

FROM:bgoodrich DATE:Friday, November 11, 2005 1:50:53 PM

There is currently no automated mechanism for obtaining the next controlling point or the next controlling limit state at a point for that matter. Virtis only captures the critical rating and the corresponding point. If Virtis obtained the rating factors for every point for every limit state, it would be possible to filter these for any number of reports. For now, the only way to NOT consider a particular point would be to use the user-defined POIs and not use the tenth points option.

Jim - I think this is more of an enhancement request than a bug.

Description

FROM:kkennelly DATE:10/4/2005 4:17:54 PM  
Submitted on behalf of Cincia Zeng, Lichtenstien via email:

I attached the virtis file I am working on. Basically, I tried to copy the superstructure definition "FS system for sp 36NB - FB rating" and paste under superstructure definition. After I did that, the file can't be saved. The error message I got is "unable save the bridge data". Please take a look the file and let me know any solutions for this problem. Thanks.

FROM:jihnat DATE:10/5/2005 8:58:34 AM  
Duplicate of 6702.

This is fixed for 5.4.0, but there doesn't seem to be any workaround that would allow the bridge to be saved after doing this copy.

FROM:jihnat DATE:10/5/2005 9:11:51 AM

If you delete all the member loads from the original structure def before copying it, then the bridge can be saved after the structure def is copied.

Description

FROM:sneubauer DATE:Tuesday, October 11, 2005 11:07:47 AM  
 REPORTED BY: Scott Neubauer

DESCRIPTION: Selected rating vehicles are cleared

COMMENTS: When I change the rating analysis method under the Analysis Settings, the trucks that I had selected to rate get cleared out and I have to reselect them from the list. Previous versions did not do this. I am running Virtis 5.3.1.

FROM:sneubauer DATE:Tuesday, October 11, 2005 11:07:48 AM

FROM:kkennelly DATE:10/18/2005 12:08:15 PM

I tested this in Version 5.1 and found this behavior when I switch to/from "Member Alternative" as the Rating Method on the Analysis Settings window. If I switch from LFD to ASD and vice versa, the vehicles are not removed from the selected vehicles list.

FROM:jihnmat DATE:5/24/2006 9:07:51 AM

I see the same behavior in every version I checked (5.1.1 through 5.4.0).

FROM:jihnmat DATE:10/13/2005 3:46:01 PM  
Ken informed me that the bridge was originally entered in version 5.1.0 and has been migrated forward. I think that when the rolled beam member alt was deleted, the spng mbr def object was not deleted, and this is what has the shape still assigned.  
The bug that caused the problem has been fixed since 5.1.0, but I don't think it's possible to clean this

Description

FROM:gbhanushali DATE:10/13/2005 11:47:46 AM

To handle this command , we would require changes to FE engine. Changes would be to convert member loads to nodal loads for truss element. It was decided for now not to incorporate this command in rating (for now). Should we remove it from the language?

FROM:jduray DATE:10/13/2005 2:43:05 PM

Remove it since the FE engine does not support it and we do not have a task to enhance the engine to handle it. After the command is removed change this incident to an enhancement and set the status to Suspended.

### Description

FROM:gbhanushali DATE:10/13/2005 11:53:31 AM

Additional Self Load <force\_per\_lenght> <percentage>

We are not sure right now how to incorporate the effects of this command so that engine takes into consideration this load . (with the fact that we don't handle member loads).

FROM:jduray DATE:10/13/2005 2:44:43 PM

Perhaps we can comput an equivalent nodal load. If not remove the command since the FE engine does not support it and we do not have a task to enhance the engine to handle it. After the command is removed change this incident to an enhancement and set the status to Suspended.

FROM:hlee DATE:7/19/2006 11:06:55 AM

Changed Project to Support Center/Virtis.

FROM:jduray DATE:7/20/2006 4:47:04 PM

The FE engine should be enhanced to handle truss member loads.

### Description

FROM:bmccaffrey DATE:Monday, October 17, 2005 9:15:01 AM  
REPORTED BY:

DESCRIPTION:Could someone try running this bridge? It has 256+- superstructure definitions - mostly girder system. It's a 5 girder, multigirder steel bridge, mostly simple spans. A consultant modeled it and we ran it a few years ago and it took overnight to finish. We just re-inspected it and updated Virtis and we're trying to run it again. I'm having a tough time trying to even get it to import and save (over an hour) into an MSDE database. I tried the existing model in Oracle and it ran for 4 hours before I killed it. It does start analyzing but it takes about 5 minutes to run one member alt. None of the members are linked. The odd thing though - if you run an individual SD in the workspace it runs in seconds.

Description

FROM:bmccaffrey DATE:Monday, October 17, 2005 1:38:15 PM  
 REPORTED BY:

DESCRIPTION: See Superstructure Definition 15 (called Location 15 in the workspace), member alt 5 (fascia beam) on the attached bridge. My calcs show the eff fl width should be controlled by the beam spacing ( $0.5 \times 7.67' + 0.5 \times 2.0833 = 58.44"$ ). The wizard is using  $0.25L$  ( $0.25 \times 23' = 69"$ ) as the controlling eff width.

COMMENTS:

FROM:kkennelly DATE:10/18/2005 12:21:07 PM

For the fascia beam, the effective flange width is the minimum of the following:

beam spacing:  $0.5 \times 7.67' + 2.0833' = 71"$  (overhang doesn't get multiplied by 0.5)

span length:  $0.25 \times 23' = 69"$  <=== controls

Description

FROM:bmccaffrey DATE:Wednesday, October 19, 2005 8:51:56 AM  
REPORTED BY:

DESCRIPTION: See attached error and .bbd file - this worked in 5.2.

COMMENTS:

FROM:jihnat DATE:5/2/2006 3:39:52 PM  
I can't confirm if/why it worked in 5.2.  
It doesn't run in 5.3.1 or 5.4.0, but it'll work if I change the Transfer Length to 32".  
I found two older incidents (4884, 5131) that talk about the same error message.

FROM:bgoodrich DATE:Thursday, May 04, 2006 2:20:13 PM  
I confirmed that 5.3.1 is issuing the error message. There must be a reason why BRASS requires that the debond+transfer must be greater than the overhang length. However, I haven't found the reason.

Subject: Re: FW: Virts/Opis Incident 6790

Brian,

If memory serves me the reason why we recommended that the debond+transfer must be greater than the overhang length is because users were inputting P/S girder span lengths for a double bearing pier as centerline point of bearing to centerline point of bearing. Then they were inputting the debond length measured from the end of the girder. For example, if a girder spans from pier 1 to pier 2 using a 100 foot girder, for simply supported girders made continuous for live load, the span length from center of bearing from pier to pier may only be 99 feet. If the girder is debonded for 2 feet from the end of the girder, users were inputting the debond distance as 2 feet and not 1.5 feet (debond length 2.0 feet minus the 6" overhang length). Because of this error, girders were being analyzed with a debond length greater than the design. The same applies for transfer length also.

I think this is a fundamental problem with continuous spans vs. simply supported spans made continuous for live load. When the girders are analyzed as simply supported, BRASS analyzes the girder from bearing to bearing and does not analyze any actions in the overhang resulting in the end of transfer or debond regions. If the user wants to see the effects of debonding or transfer in the BRASS output, it will only analyze the actions between the point of bearings. If the user wants an analysis of debonding or transfer, the lengths would need to be longer than the overhang length.

When the girder is made composite for live load, the span length theoretically should change to centerline pier to centerline pier. Obviously BRASS does not change the span length for this Stage.

I hope this information helps.

Micheal J. Watters, P.E.  
Principal Bridge Engineer  
Special Assignments Squad

FROM:bgoodrich DATE:Monday, January 29, 2007 1:42:57 PM  
The error that BRASS is giving (with respect to Incident 6790) is:

4/19/2016 3:05:12 PM

HRS AASHTO

826

Complete Issue Information

**\*\*ERROR\*\*** In all cases, the debond length + development/transfer length must be greater than the overhang length. Check input.

I don't see how we can handle this in the BRASS export because transfer length is set for a particular set of strand properties not on a row basis. I think we need a problem log to modify BRASS to allow input of a transfer length that is less than or equal to the beam overhang. All this means is the strand has reached full strength outside the region that BRASS is analyzing. We could detect if the end of the transfer is within the overhang and not add a node.

FROM:bgoodrich DATE:Tuesday, January 30, 2007 5:45:00 PM  
 First of all, for a 0.5" diameter strand, the transfer length is generally 25" for LFD and 30" for LRFD. Most overhangs that I've heard of are anywhere from 6" to 12". Larger overhangs are not as common, but I have heard of these structures built in California. Obviously, because Brian McCaffrey submitted this issue, New York has some structures with the longer overhangs. If the user wants to enter this type of structure with stand-alone BRASS or with Virtis/Opis, he has to fudge the input by shortening the beam overhang, increasing the transfer length, or adding some fictitious debond length. None of these options are appealing (at least to me).

FROM:bgoodrich DATE:Tuesday, February 27, 2007 9:53:43 AM  
 WYDOT indicated this is not a high priority. Will AASHTO fund this task?

### Description

FROM:dteal DATE:Thursday, October 27, 2005 2:13:26 PM  
REPORTED BY:

DESCRIPTION:When running TrainingBridge1 with a HS20 truck I compared BRASS to Virtis Std Engine. The values are not comparable.

#### BRASS:

Truck – I=1.462, O=2.441, Lane – I=1.376, O=2.298

#### Virtis Std:

Lane/Axel – I=1.069, O=1.782 - Shear

Lane/Axel – I=1.380, O=2.380 – Pos. Moment Overload

Being Virtis Std engine doesn't break apart truck and lane we can't make direct comparisons

FROM:kkennelly DATE:10/28/2005 10:53:58 AM

I compared the BRASS and Virtis Std output files and found the following:

1. Composite section properties are slightly different because Virtis Std internally computes the eff flange width and BRASS uses what is input. Virtis Std computes the eff flange width as 114", eff flange width input in Virtis is 125". Difference is not substantial.

4/19/2016 3:05:13 PM

HRS AASHTO

828

## Complete Issue Information

2. DL1 moments are pretty close (at midspan Virtis Std MDL1 = 5909.6 kft, BRASS MDL1 = 5954.1 kft)  
DL2 moments very close (at midspan Virtis Std MDL2 = 1710.8 kft, BRASS MDL2 = 1709.8 kft)
3. DL1 shear exactly same (at support 1 Virtis Std VDL1 = 146.8 kip, BRASS VDL1 = 146.8 kip)  
DL2 shear exactly same (at support 1 Virtis Std VDL2 = 42.5 kip, BRASS VDL2 = 42.5 kip)
4. LL moments values very close at midspan  
Virtis Std Lane MLL = 2948.8 kft (we know it's lane because output file has an "L" after the value.)  
BRASS Lane MLL = 2947.3 kft
5. LL shear very close at support 1  
Virtis Std Lane VLL = 81.7 k (we know it's lane because output file has an "L" after the value.)  
BRASS Lane VLL = 81.6 k
6. Both engines produce same rf due to overload at midspan:  
Virtis Std Inv RF = 1.38  
BRASS Inv RF = 1.376
7. Difference is Virtis Std finds moment shear interaction RF = 1.069 at 32.2' while BRASS finds moment shear interaction RF = 1.72 at this point.

FROM:jduray DATE:11/1/2005 1:52:34 PM

Currently investigating Std engine. We need to determine if Mu should equal Fy or not. BRASS appears to be computing Mu and the Std engine is using Fy. PennDOT investigated and believe Mu=Fy is correct.

FROM:jduray DATE:11/3/2005 10:45:47 AM

I would like to get some direction from the TAG and/or Task Force in this issue.

FROM:kkennelly DATE:11/30/2005 8:11:36 AM

The following suggestion came from the Task Force meeting:

1. Add a checkbox to the Mbr Alt: Engine tab to let user pick if they want My used in the moment shear interaction rating equations.
  - Default in Virtis is this box is not checked. That means the default is to use Mu in the equation (if the section is compact).
  - Note: If the section is non-compact, My will be used internally in Virtis Std Engine regardless of the status of this check box.

2. Add an input parameter to the Virtis Std Engine for this indicator if My or Mu should be used.

FROM:kkennelly DATE:11/30/2005 9:04:36 AM

3. The default in Virtis Std Engine will be to use My since that is currently the default.

FROM:jduray DATE:1/16/2006 11:06:18 AM

We do not have authorization from the TF to resolve this issue. It is on the list being reviewed by the TAG.

### Description

FROM:bmccaffrey DATE:Wednesday, November 02, 2005 3:13:39 PM

When I try to copy/paste any Superstructure Definition in the attached file, I get the attached error message.

FROM:mordoobadi DATE:2/1/2006 4:28:12 PM

It appears that the structure def "Copy of 2005 LR - BIN 1061441 Span 1" has a problem. After removing that structure def I was able to save the bridge.

I copied the original structure definition and attempted to save and the save failed. It seems that copying of the SD "2005 LR - BIN 1061441 Span 1" has some problems.

I'll migrate this to 5.4 (Beta 4) and try to find out whether this issue still exists.

FROM:mordoobadi DATE:2/1/2006 4:57:47 PM

The problem was that Weld Defs got copied after Stiffeners.

Fixed in 5.4 Beta 5.

## Description

FROM:dhorton DATE:Thursday, November 03, 2005 12:13:39 PM

During some test imports, errors were received for card 12 entries that defined deterioration or holes in BARS. This applies to a multitude of older structures and is crucial during import.

Is this a new issue or does the import ignore all deterioration specified in the existing file? If not - is there a work around other than entering all deterioration again manually?

4/19/2016 3:05:14 PM

HRS AASHTO

832

Complete Issue Information

What would it take to modify the import?

(Can't believe Gale didn't complain about this, but saw no evidence)

FROM:hlee DATE:11/11/2005 1:57:14 PM

Card 12 column 57 identifies Plate code (P), Exception code (E), Defect code (D), Hole code (H), and blank. Only blank is supported in BARS import. Import will display "These data columns cannot be imported into the Virtis database." when the code is P, E, D, or H. BARS manual specifies that all defects and holes must be entered as area and moment of inertia. There is no work around to enter these information. Deterioration in Virtis is entered as % width and/or % thickness losses and also on a particular component (top flange, web, bottom flange, top cover plate, or bottom cover plate).

Complete Issue Information

When working with tutorial PS1, Strand layout window does not show x for possible strand locations. Believe this occurred in another class, but forgot fix. All input was verified as shown in tutorial.

Is there a setting on the machine that needs to be toggled?

FROM:kkennelly DATE:11/7/2005 12:56:32 PM

Does the beam shape you are using have the possible strand locations defined on the PS I Beam: Strand Grid window? If you created the beam shape from scratch instead of copying the shape from the library, the strand grid locations will be empty.

FROM:dhorton DATE:Tuesday, November 08, 2005 7:55:56 AM

The shape used is the same as in example PS1 and thus was copied from the library. The strand pattern was reviewed on two different machines, so it does not appear to be a machine setting issue. All other users (13) had the pattern x's show up.

FROM:kkennelly DATE:11/9/2005 11:15:43 AM

If it was only 1 or 2 users that had this problem, I have to think that they did not copy the shape from the library and instead just entered the shape dimensions on the first tab of the PS I Beam window and didn't enter a strand pattern on the Strand Grid tab because the tutorial does not show the Strand Grid tab. Do you have a bbd file from these users?

### Description

FROM:jihnat DATE:11/21/2005 7:21:21 AM

I am having problems analyzing the attached file.

1. Girder G1 will not yield rating results. The program cannot seem to calculate the yield moment (My) for G1.
2. G2 does not give me a rating. The program says the bearing stiffeners fail.

Is there something that I have overlooked?

Thank you for your assistance

Issue 1: Due to the cross section ranges that are input, there is a small cross section range of 0.0005 feet that is exported to BRASS. I adjusted the cross section range at the end of span 1 so has a length of 11.62448 feet. This eliminates the short range and allows BRASS to run.

Issue 2: For G2, the bearing stiffeners at Support 3 are not sufficient, so they control the rating. If bearing stiffeners are input, they are rated. Place a point of interest at 184.6 feet, i.e., the right end of Span 2 for span 2. Then, rate the member alternative and review the BRASS output file, which illustrates how the bearing resistance is calculated. Let us know if you are questioning the bearing resistance or the inclusion of the bearing stiffener ratings in general.

Complete Issue Information

Hi Krisha,

Based on the Technical website - Tutorials:

\* VIRTIS does not interpret the second sentence of Article 8.10.1.1 to mean that the thickness of the web is added to the six times the thickness of the slab. The six times the thickness of the slab is taken from the centerline of the beam.

When I click the "Compute from Typical Section", it shows 85 inches for effective width which is included the web thickness. Please advise. Also, please check the attached bridge. Thanks a lot!

Complete Issue Information

Hi Krisha,

Got it! Thanks a lot.

Could you please tell me why the BRASS/VIRTIS does not consider the width of box beam/girder for effective width (or entire slab width)?

Please refer to the AASHTO 8.10.2.1 and AASHTO 9.8.2.1. It all states that the effective width should be used the entire slab width.

Please check the attached file and VIRTIS only shows 78 inches for effective width (too conservative) and I think it should be 105.375 inches.

Please advise. Thank you,

FROM:mteng DATE:Monday, November 28, 2005 8:50:57 AM

FROM:kkennelly DATE:12/6/2005 11:03:01 AM

Virtis assumes that 8.10.2.1 applies to cast in place reinforced concrete boxes which are not supported by Virtis. 9.8.2.1 states that it is for cast in place box girders which are also not supported by Virtis. Therefore 8.10.1 is followed for precast boxes.

If you think the effective flange width computed by Virtis is too conservative, you can enter a different value yourself instead of using the Compute button in Virtis.

### Description

FROM: bgoodrich DATE: Monday, December 05, 2005 12:50:26 PM  
Submitted on behalf of Amin Islam (Arizona DOT):

Mr. Islam is receiving a low shear rating for a prestressed concrete girder. He reports that CONSPAN is giving an Inventory shear rating of 2.14, while BRASS reports 0.463.

Complete Issue Information

FROM:bgoodrich DATE:Monday, December 05, 2005 12:53:58 PM

During my initial investigation, I noticed that although the structure is symmetrical, the shear ratings at the 100 and 210 are different, and the 210 POI controls with the 0.463 rating factor. The rating difference is due a difference in the stirrup spacing at these points. One of the points may be incorrect. Next, the CONSPAN rating of 2.14 is 3 feet away from the support, which is not the same location as the critical BRASS shear rating. The user may be assuming that BRASS is calculating the support POI shear at some distance away from the support, which it is not. If the spacing at the 100 POI is correct (4.5 inches), the shear rating factor would be 1.07. The CONSPAN rating at this same location is 1.24. I do not know what assumption CONSPAN makes in determining the shear rating.

FROM:pszustak DATE:Thursday, December 22, 2005 4:23:10 PM

I have just run into a similar problem comparing BRASS with PENNDOT's PS3. PS3 assumes that you can follow AASHTO 9.20.1.4 and design for the shear at a distance h/2 from the support, rather than designing for the shear at CL brg. It seems that BRASS is rating the bridge using the forces at the 100 POI, which seems unnecessarily conservative. Is there a way to rate the ends of the girder using the shear at h/2?

FROM:bgoodrich DATE:Sunday, March 05, 2006 1:35:29 AM

A decision by WYDOT regarding prestress shear is posted in Incident 3143. Therefore, I am marking this incident as a duplicate.

Description

FROM:pjensen DATE:Thursday, December 08, 2005 6:25:28 PM

I have been trying to upgrade the VO database for testing (5.4) and having problems with the angle adjustment program in 5.1.1. the program is not running to completion because of several bridges with large skew angles. attached is a typical bridge. these structures would not have been found in the original testing because these are new entries into the system. (our production is still 5.1).

FROM:hlee DATE:12/28/2005 11:05:23 AM

The version of the attached bbd is 5.1.1. Since the angle adjustment program is used in the 5.1.0 to 5.1.1 database migration. Please attach a 5.1.0 version of the bbd so we can reproduce the problem. I have attached the Scan Angle Conversion Utility Read Me file. It details the process and have some suggestions on how to identify and fix those problem bridges in 5.1.0.

FROM:jduray DATE:6/11/2008 11:54:17 AM

Is this still an issue?

Description

FROM:tarmbrecht DATE:Wednesday, December 21, 2005 11:50:56 AM

Could you please verify that Viris calculates the correct distribution factor for roadway widths between 20' and 24'? In the attached model (a 4 girder steel composite structure w/28' deck and 22' roadway) Virtis calculates the live load distribution factor based on it carrying only one lane. According to AASHTO Std. Spec. for Highway Bridges, Article 3.6.3 bridges with "...roadway widths from 20 to 24

4/19/2016 3:05:17 PM

HRS AASHTO

848

Complete Issue Information

feet shall have two design lanes..."

FROM:xli DATE:1/17/2006 10:54:44 AM  
Viris calculates correct distribution factor.

In attached bridge, member alt "N Int", Girder spacing is 8.29'. According to AASHTO 3.23.1, Concrete deck on steel I beam,  
Bridge designed for one traffic lane, distribution factor =  $S / 7.0 = 8.29 / 7.0 = 1.184$ ;  
Bridge designed for two or more traffic lanes, distribution factor =  $S / 5.5 = 8.29 / 5.5 = 1.507$ .

In Virtis, open the live load distribution window of member alt "N Int", click "Compute from typical section button", the calculated shear and moment distribution factors match the values calculate according to AASHTO.  
See attached screen shot of the Virtis calculated values.

FROM:tarmbrecht DATE:Wednesday, January 18, 2006 2:46:30 PM

OK, I see that we had the wrong specification checked, i.e. Manual for Condition Evaluation of Bridges (MCEB). When I check the Standard Specs, I get the results for two lanes, as you did. However, shouldn't the results be the same for MCEB and Standard Specs? MCEB 6.7.2.2 says the number of lanes loaded should be in conformance with the design specs plus that in rating evaluation, raters should assume that two lanes are loaded for as little as 18 feet of width. Therefore, it shouldn't matter which one I check, I should get separate distribution factors for one and two (i.e. multi) lanes. I attached the screenshot of the distribution factors when we select the MCEB option. Because I don't think there should be a difference in this case, I'm resubmitting for review.

FROM:tarmbrecht DATE:Wednesday, January 18, 2006 3:02:59 PM

FROM:jduray DATE:Thursday, March 02, 2006 9:53:55 AM  
Is this new to 5.4?

FROM:tarmbrecht DATE:Tuesday, March 07, 2006 3:07:56 PM  
Jim, we don't think so. My consultant reports that this issue existed in 5.3.1 also.

FROM:jduray DATE:Monday, March 27, 2006 9:36:22 AM

FROM:jduray DATE:Monday, March 27, 2006 9:37:32 AM

FROM:jduray DATE:Monday, March 27, 2006 9:37:54 AM  
Change to a Support incident since the issue existed in 5.3.1 release.

FROM:kkennelly DATE:3/27/2006 9:59:40 AM  
This has existed since the user preference was added in version 5.1.

We currently follow this procedure:  
If user has checked follow 3.6.3:  
Travelway between 20' and 24' ==> number of lanes = 2.  
otherwise ==> number of lanes = int(travelway width/12').

4/19/2016 3:05:17 PM

HRS AASHTO

849

Complete Issue Information

If user has checked follow 6.7.2.2:

Travelway between 18' and 20' ==> number of lanes = 2

otherwise ==> number of lanes = int(travelway width/12'). For a 22' travelway, this results in 1 lane.

User is requesting that if they have checked 6.7.2.2 and travelway width is 20' to 24' we should use 2 lanes, each 1/2 the travelway width.

I agree with Tim that based on the wording in 6.7.2.2, we should still follow 3.6.3 if they have selected 6.7.2.2 in Virtis.

Discuss with Jim and Herman since I didn't do the original coding.

FROM:dkoenig DATE:Thursday, April 20, 2006 9:08:11 AM

We had noticed this same issue at MoDOT. I agree with Tim. Roadway widths from 20 to 24 feet should have distribution factors based on two lanes of traffic, regardless of which specification is checked. Even though it is not specifically stated in the MCEB, this is the only thing that would pass the common sense test. You wouldn't use two lane factors for 18 to 20 foot roadways and then turn around and assume one lane factors for roadways from 20 to 24'.

FROM:hlee DATE:6/29/2006 3:30:41 PM

Modified procedure based on the above suggestion.  
Resolved for 5.5 Release.

FROM:tambrecht DATE:Wednesday, September 13, 2006 12:07:31 PM

Accepted.

851

Complete Issue Information

FROM:kkennelly DATE:5/1/2006 11:46:28 AM  
7127 marked as duplicate of this incident.

FROM:kkennelly DATE:8/15/2006 10:09:41 AM  
I think the problem is the following:

In UiRoutingResultsDlg the following call is made to get the minimum rating results  
DoMemberRatingSummaryPtr->GetMinRatingResultsSummary()  
with TYP\_IMPACTLOAD\_ASREQSTD and TYP\_LANELOAD\_ASREQSTD passed in. The value that  
gets returned from this call is always for the multi lane since it has a higher DF.

When I try to pass in TYP\_LANELOAD\_SINGLE to GetMinRatingResultsSummary() I don't get any  
match for the results so no minimum results are returned.

In the routing each vehicle can have a different specification for the Lane Load type (single or multi). I  
don't see anywhere that I can specify I want only TYP\_LANELOAD\_SINGLE considered for a vehicle  
in the analysis.

Can I somehow get the minimum rating results by specifying TYP\_LANELOAD\_SINGLE or does the  
window have to look through all the results and search for the lowest with TYP\_LANELOAD\_SINGLE ?  
FROM:kkennelly DATE:8/15/2006 10:21:02 AM

FROM:mordoobadi DATE:8/15/2006 10:29:33 AM  
Use TYP\_LANELOAD\_SINGLE or TYP\_LANELOAD\_MULTI with NULL for impact.

FROM:kkennelly DATE:8/15/2006 10:58:49 AM  
That works.

FROM:kkennelly DATE:8/15/2006 1:08:15 PM  
Fixed for 5.5

### Description

FROM:bmccaffrey DATE:Monday, February 13, 2006 9:33:40 AM

The attached bridge is a through girder with only floorbeams. The sidewalk load and resulting actions are much higher than what you get by hand comps. This is happening on all our girder-floorbeam bridges without stringers.

FROM:gbhanushali DATE:2/15/2006 9:59:01 AM  
Can you tell me if you are analysing a floorbeam or girder?  
Also which load case values you are refering to?

FROM:bmccaffrey DATE:Tuesday, February 28, 2006 8:50:09 AM

It's the sidewalk load on the floorbeam that I'm concerned about. Looks like it's taking the two sidewalks and making a uniform load across the entire floorbeam using the actual thickness of the sidewalk, not an equivalent smaller load..

FROM:kkennelly DATE:5/10/2006 8:35:07 AM  
Brian, I checked into this and found the following. In LoadsUtility.cpp Prepare(), line 417.

```
dForce = (DistributedLoad.dForcePerLengthStart +  
          DistributedLoad.dForcePerLengthEnd) / 2.0 *  
          DistributedLoad.dLength * dDeckLength;           <<=====
```

DistributedLoad.dForcePerLengthStart and DistributedLoad.dForcePerLengthEnd were already multiplied by DistributedLoad.dLength so they should not be multiplied by that value again in line 417.

FROM:kkennelly DATE:5/10/2006 8:41:17 AM  
I've attached a version 5.5 xml file of this bridge

4/19/2016 3:05:18 PM

HRS AASHTO

853

Complete Issue Information

FROM:kkennelly DATE:10/30/2006 3:03:29 PM

Line 417 used by other loads not just the sidewalk so fix would be around line 3248

DistributedLoad.dForcePerLengthStart = dWeight \* dAvgWidth; <== being multiplied by  
 dAvgWidth  
 DistributedLoad.dForcePerLengthEnd = dWeight \* dAvgWidth; <== being multiplied by  
 dAvgWidth  
 DistributedLoad.dDistance = dLocation;  
 DistributedLoad.dLength = dAvgWidth; <== will get multiplied  
 by this again in line 417 so change this to = 1.0 so has no effect???  
 DistributedLoad.sName = sAppurtenanceName;

FROM:bgoodrich DATE:Monday, October 30, 2006 3:45:54 PM

The CLoadsUtility::PrepareDeckAppurtenanceLoads function was originally written for longitudinal (girder/stringer) analyses, so the force/length values calculated therein are for longitudinal members. This function is now used for a floorbeam analysis, where the longitudinal force/length and load width values determined. To get the total force from the sidewalk on the floorbeam, the force/length must be multiplied by the deck length (dDeckLength), i.e., the sum of the tributary width on each side of the floorbeam. The average force/length was being mulitplied by the the DistributedLoad.dLength (sidewalk width) as well, which was incorrect. I updated LoadsUtility.cpp file.

FROM:kkennelly DATE:11/1/2006 11:38:10 AM

File was put in Sourcesafe for an update to beta 6.

### Description

FROM:bgoodrich DATE:Monday, February 13, 2006 11:28:38 AM

E-mail from Tim Armbrecht:

Hi Brian,

I was wondering if you could take a look inside BRASS for me. The attached structure is telling me that for the "3- 2nd W Int member" of the "2-Span Continuous PSI – Prop." Superstructure, concrete tension controls. By looking at the output, it appears that the controlling equation is in AASHTO 9.15.2.2 and is  $6\sqrt{f'c}$ . The rating factor is 1.0. However, if I change the  $f'c$  property of the beam to 7000 psi (from 6000 psi), I still get the same rating factor. Is this correct? Unfortunately, the output doesn't provide the equation for the serviceability checks (like concrete tension), so I can't check the answers. Could you please verify how this rating factor is determined? Is there something in the help that describes the calculations? Thanks,

Tim

FROM:bgoodrich DATE:Monday, February 13, 2006 11:30:34 AM

I ran your bbd file with 6000 psi concrete and BRASS gave an Inventory rating of 0.945 with concrete tension controlling. Then, I ran it with 7000 psi concrete and BRASS gave an Inventory rating of 1.000. These ratings refer to the HS 20-44 truck.

You're correct that there is no detailed output for the concrete tension check like there is for the concrete compression check. Only the rating factors for concrete tension are reported. You could use the stresses reported in the 9.15.2.2(b) and 9.15.2.2(c) checks to calculate the concrete tension rating factor. I hope this helps.

FROM:mordoobadi DATE:3/20/2006 9:00:02 AM

Comments From Tim Armbrecht:

-----  
4. Incident 7101 (related): (see 0450082x(531).bbd)  
Stress Limits - The concrete material specified in Stress Limits can be changed without the Girder Material under Beam Details being changed. If this is done, unexpected/erroneous results can occur.

4/19/2016 3:05:18 PM

HRS AASHTO

855

### Complete Issue Information

Prestress Properties - The Jacking stress ratio (JSR) is not updated to the correct value when the P/S strand material is changed. e.g., If the strand material had been entered wrongly, say as LR (for which the JSR = 0.75) and is corrected to SR (JSR = 0.7), the JSR stays as it was for the originally entered strand material.

Rating Factor - For v. 5.4.0 (Beta 6) the controlling inventory rating factor is 0.767 @ 57.05' (69.4%) of Span 1 (Member "3 - 2nd W Int"/Alternative "48" PS I-Beam(x)) but for v. 5.3.1 it is 1.246. (Shear is the mode for both.) Same location, same member, different versions, different results.

It seems it should be able to consider the scenario that produces a RF greater than 1.0 by evaluating in the following order:

- Multi-lane with impact - no restrictions
- Multi-lane without impact - probably requires an escort
- Single-lane with impact - probably requires an escort and bridge closing
- Single-lane without impact - probably requires an escort and bridge closing

FROM:jduray DATE:2/22/2006 11:01:50 AM  
Can accomplish this by modifying:

MemberRatingSummaryPtr->GetMinRatingResultsSummary(ICurrentVehicleId,  
TYP\_IMPACTLOAD\_ASREQSTD, TYP\_LANELOAD\_ASREQSTD, .....

to request TYP\_LANELOAD\_SINGLE and TYP\_LANELOAD\_MULTI and selecting the appropriate RF based on above suggested order.

| 7190.16142 | Resolved      | Problems with Listing of Stirrups in RC Beams |

### Description

FROM:dteal DATE:Tuesday, March 07, 2006 1:08:11 PM

Beta 6

In verifying another incident I came across a short coming in the Virtis Std Engine. When I changed my end support to Fixed the std engine will fail to run. Is this a known shortcoming? Fixed end conditions are fairly common, ei: Steel girders embedded in the abutments.

For my example I used the "As Rated" superstructure definition and member #2 of the attached .xml.

FROM:jduray DATE:3/7/2006 1:34:54 PM

Hasmukh - can you verify this?

FROM:dteal DATE:Tuesday, March 07, 2006 5:13:46 PM

I am attaching another example of fixed supports not being handled, this one is a RC bridge, the other one was a welded plate.

FROM:dteal DATE:Tuesday, March 07, 2006 5:19:37 PM

This RC structure I added - keep in mind that to test this you will have to add shear DF's and shear bars to make it run after you fix the non-supported end condition.

FROM:hlathia DATE:Wednesday, March 08, 2006 3:24:21 PM

PennDOT's BAR7 (and hence AASHTO Engine) does not handle structures with fixed ends. All supports must be hinged or roller supports. To handle fixed supports, CBA will require major revisions

4/19/2016 3:05:19 PM

HRS AASHTO

858

Complete Issue Information

FROM:dteal DATE:Monday, March 13, 2006 10:54:05 AM  
In VI #7159 you added the following for the shear limitations:

"Add a summary of limitations topic to the StdEngine engine help file and a note to the mbr alt in the StdEngine engine help to indicate ignore shear is ignored and the analysis may fail without shear reinforcement."

Can we have this topic also listed as a limitation there?

FROM:hlee DATE:3/13/2006 12:05:20 PM  
This will be included in the limitation topic.

FROM:dteal DATE:Tuesday, March 28, 2006 11:24:33 AM  
Due to this limitation of the Std Engine - KS can't rate it's 1024 RC Parabolic Slab structures. All of this type of structure has a monolithic abutment, we assume a fixed abutment support and us a spring to simulate true behavior.  
In order to use the Std engine for this type of structure we would have to modify every file with this type of fixed support.

FROM:kkennelly DATE:3/21/2006 11:29:56 AM  
 Submitted by Tim Armbrecht as part of 5.4 beta testing:

4. Incident 7101 (related): (see 0450082x(531).bbd)  
 Stress Limits - The concrete material specified in Stress Limits can be changed without the Girder Material under Beam Details being changed. If this is done, unexpected/erroneous results can occur.

FROM:kkennelly DATE:3/21/2006 11:32:12 AM  
 This situation has existed since prestress was introduced in Virtis/Opis. Do 1 and 2 for 5.5 since 5.4 almost out the door.

Complete Issue Information

1. The validation performed by the Domain should warn user of this situation.
2. Stress Limit window should check if concrete material matches that used for girder concrete in Beam Details window if the stress limit is assigned to a stress limit range for the mbr. If concretes don't match, don't let user save the stress limit.
3. For Virtis, the allowable stresses entered on the Stress Limits window are not used by either BRASS or the VirtisStd Engine. Those analysis engines internally compute the allowable stresses based on the concrete f'c, etc. Therefore this bug wasn't causing a problem in Virtis.
4. For Opis, these allowable stresses are used by the BRASS LRFD engine.

FROM:kkennelly DATE:3/21/2006 11:42:34 AM

FROM:kkennelly DATE:5/3/2006 11:32:47 AM

1 and 2 are done for version 5.5. 3 and 4 are just informational notes that don't require action.

Complete Issue Information

FROM:kkennelly DATE:3/21/2006 11:33:54 AM  
Submitted by Tim Armbrecht in 5.4 beta testing:

Prestress Properties - The Jacking stress ratio (JSR) is not updated to the correct value when the P/S strand material is changed. e.g., If the strand material had been entered wrongly, say as LR (for which the JSR = 0.75) and is corrected to SR (JSR = 0.7), the JSR stays as it was for the originally entered strand material.

FROM:kkennelly DATE:3/21/2006 11:44:06 AM  
This situation has existed since prestress was introduced in Virtis/Opis. We compute the JSR when user selects the strand material when they create a new Prestress Property. User is requesting we re-compute the JSR if they change the strand material selection on that window. We'll have to prompt user with a question asking if they want us to change the JSR if they change the strand material and the strand type changes from LR to SR and vice versa.

FROM:hlee DATE:5/28/2008 11:09:23 AM  
BUG 12/07 by TAG

FROM: Joseph Ihnat DATE: 6/5/2009 9:45:41 AM Eastern Daylight Time  
Done for version 6.1.0 (Beta Build 2).

FROM: Tim Armbrecht DATE: 7/24/2009 3:00:41 PM Eastern Daylight Time  
The prompt is fine. However, there is still a problem. When you change the strand specification under Materials (which is likely when changing from a wrong material that may have been selected, or if you are using a previously coded model to start a new model), the JS is not recomputed at all. This still needs to be taken care of.

FROM: Joseph Ihnat DATE: 1/29/2010 10:09:40 AM Eastern Standard Time  
Added a message that pops up if the user changes the Strand Type.  
There was never any intent to update the domain under the structdef. We aren't doing anything similar elsewhere in the GUI.  
Could possibly be an enhancement.

Submitted on behalf of Steve Mample, via email:

>>> "Steve Mample" <Steve.Mample@itd.idaho.gov> 03/24/06 10:59 AM >>>  
Hello, Krisha.

I am having trouble with a new bridge file in Virtis. After entering all the data for the exterior girder (16675e - G1), I had the program run a load analysis on the exterior girder to make sure I had not goofed up any on the input data. The program analyzed the girder without any problems. I then in put the data for the interior girder (16675 - G2), some of which I copied from the ext girder. When I saved and validated the data, no error messages were generated. But now the program will not analyze any member. I get the following error message; ERROR - Unable to open input file!

Would you please look at the bridge file, and tell me what I need to do.

Thank You, Steve.

## Complete Issue Information

It looks like the directory structure and file name created for the member alts in your bridge has too many characters. Try to shorten the name of either your members or your member alts. For example, I removed the word "Branch" from the end of your member alternative names and I was able to analyze your members.

Please let me know if you need additional information.

Regards,

|------|---------------|---------|
|------|---------------|---------|

Description

FROM:kkennelly DATE:3/28/2006 12:51:06 PM

Enter the superstructure shown in training example PS3.

Superstructure contains adjacent ps box beams. We only have 1 mbr alt defined and a box beam shape assigned to that mbr alt in the Beam Details window. Hit the Compute from Typical Section button on the Live Load Distribution tab, Virtis tries to use the beam shapes assigned to the adjacent mbr alts to determine if the boxes are spread or adjacent. Since no adjacent mbr alts exist, DoGirderSystemStructDef->IsPsBeamGirderSystemAdjacent() returns false as an error. The code in the Compute function just thinks it returned false because it is spread. So the Compute button uses the Spread Box section of the spec to compute distribution factors.

We should change DoGirderSystemStructDef->IsPsBeamGirderSystemAdjacent() to pass a variable to signify if the beams are adjacent. If the function itself returns False, that should be handled as an error, not spread beams.

Compute button code should determine if adjacent mbr alts exist and if they have beam shapes assigned to them. If they don't, we issue message saying Compute button doesn't know if beams are spread or adjacent and don't compute any distribution factors.

FROM:kkennelly DATE:4/11/2006 3:16:47 PM

Fixed for 5.5.

Two new functions added to DoGirderSystemStructDef to return variables to signify if the beams are adjacent and if all mbr alts are defined.

CheckAdjacentPsBeamSystem() and CheckAdjacentPsBeam().

Compute button on Live Load Distribution Factors window fixed.

Brian, you may want to investigate your use of IsPsBeamGirderSystemAdjacent() in BrassLrfdControl.cpp. That function returns false if there is an error, such as member alternatives not existing for all members, that may be causing you to incorrectly assume the beams are spread. I don't know how strict you want to be (if all beams have to have mbr alts and ps boxes assigned to them or just the adjacent beams have ps boxes assigned to them) when you determine if the structure is spread or adjacent.

FROM:bgoodrich DATE:Thursday, October 12, 2006 2:40:17 PM

The export has been revised accordingly. Fixed for version 5.5.

| 7279.16055 | Duplicate     | Utilization of rebar development length not possible in the analysis of concrete structures using BRASS. |

### Description

FROM:kkennelly DATE:3/29/2006 11:00:29 AM

If I sit on a bridge that contains a floor superstructure definition (or truss for 5.5), the "View BWS Report" toolbar button is enabled. Click on the button and get Assertion because these superstructure definitions aren't handled. Report contains data up to where the superstructure definitions would be displayed. That's ok but we should probably put a message in the report that says these structure types aren't handled by this report and user should use the Report Tool instead.

FROM:jduray DATE:4/10/2006 9:34:12 AM

I agree. This is fixed cost maintenance.

FROM:kkennelly DATE:4/10/2006 12:17:49 PM

3. Utilization of rebar development length not possible in the analysis of concrete structures using BRASS.

FROM:kkennelly DATE:5/1/2006 9:51:04 AM

I'm assuming this refers to the fact that the area of rebar cannot vary over the length of a range so the analysis ends up being overly conservative. Duplicate of 6704.

Description

FROM:kkennelly DATE:5/1/2006 9:50:17 AM  
 This incident split out from 7193:

From Tim Armbrecht:

Other suggested issues that should be addressed w/program enhancements.

4. For non-composite structures Stage 2 loads cannot be specified as uniformly distributed. AASHTO specifies that superimposed dead loads (SDL's) such as parapets & wearing surface are distributed uniformly to all beams w/o regard to composite or non-composite beam action. Virtis should be modified to allow system computation of uniformly distributed SDL's for non-composite structures.

FROM:kkennelly DATE:5/1/2006 10:04:25 AM  
 I believe this is an enhancement to either BRASS or the BRASS export.

FROM:kkennelly DATE:5/1/2006 10:53:16 AM  
 Duplicate of 6179

FROM:kkennelly DATE:6/19/2006 10:17:19 AM  
 Not a duplicate of 6179. Can't find what it is a duplicate of so re-opened.

FROM:jduray DATE:12/21/2006 9:01:20 AM  
 Need an est. before we begin dev.

FROM:kkennelly DATE:1/3/2007 11:29:24 AM  
 Only applies to reinforced concrete structures and timber. VirtisStdEngine already handles stage2 loads like user is requesting. I think BRASS export has been adjusted for 5.6. Brian to verify.

I think we have to change Madero to accomodate this request if user wants it for timber bridges.

Complete Issue Information

Duplicate of 6971

FROM: bgoodrich DATE: Monday, January 08, 2007 11:22:10 AM

I reviewed the export source and found VI 4643 was addressed for R/C. This appears to be the same issue as VI 7280. For Madero, nothing has been done. The Madero export issues the following message for girder systems:

"Madero does not utilize the dead load distribution methods specified with Virtis! Madero automatically distributes the deck and wearing surface dead loads based on the tributary width. Madero automatically distributes appurtenance loads to exterior stringers."

Because the Virtis dead load distribution methods are not considered in the Madero engine or export, the dead load distribution calculations will have to be done in the export and then exported to the engine. Madero does only supports one component dead load and one wearing surface dead load per stringer, so dead loads will need to be lumped together. Then, the export must be modified such that the deck loads are ignored when the loads are included on the stringers. I think the only file that will change is MaderoDeadLoads.cpp.

FROM: jduray DATE: Wednesday, January 10, 2007 3:25:11 PM

TF decided not to complete this at this time since the issue with the BRASS export has been resolved.

FROM: tarmbrecht DATE: Wednesday, September 19, 2007 2:02:28 PM

We checked the BRASS export in the 5.6 beta. It appears to be working with PPC I-beams and RC T-beams, but not with PPC "box" beams (which we call "deck beams" in Illinois). Please verify.

FROM: hlee DATE: 9/19/2007 2:55:01 PM

Tim, please attach your PPC "box" beam bridge so we can verify.

FROM: tarmbrecht DATE: Thursday, September 20, 2007 10:52:08 AM

Done. Thanks.

FROM: bgoodrich DATE: Thursday, September 20, 2007 11:44:36 AM

I confirmed Tim's observation regarding the PPC "box" beam. Any non-composite P/S beam will behave the same way.

FROM: Herman Lee DATE: 6/9/2011 2:56:46 PM Eastern Daylight Time

As determined by the TAG (April 2011), this issue has been resolved.

## Description

FROM:kkennelly DATE:5/17/2006 8:04:45 AM  
Received via email to Bridgeware:

Hello,

I'm currently rating a 7 span continuous multi-cell reinforced concrete box girder bridge, modeled at continuous I-girders. I've completed the model, except for the input of required additional points of interest. When i try to open the points of interest window i get the following error: "VirtisW.exe has generated errors and will be closed by Windows. You will need to restart the program. An error log is being created." I've attached the exported .bbd file for you information. What is the problem?

Thanks,

I was able to reproduce this in the 5.3.1 release. I believe the following reproduced the error: I created points of interest for each of the girders and then went back to G1 and tried to create a POI. I then got the error and Virtis closed. When I re-open Virtis and try to open the POI window, get error and Virtis closes. When I open BID11, create an RC I beam alternative and try to open the POI window for that mbr alt, get error and Virtis closes.

Cannot reproduce in 5.4 release or 5.5 debug.

Description

FROM:jihnna DATE:5/18/2006 7:37:56 AM  
via email:

I was wondering if it is possible to have Virtis 5.4 report the actual member capacity as it did in previous versions.

Previously it would report:

Member Capacity  
DL Effect

Capacity for (LL+I)  
Actual (LL+I)

Rating

I am just trying to verify that the capacity being calculated by Virtis matches what I am calculating by hand.

Thank you-  
Laura Thompson  
Laura.Thompson@tshengineering.com

FROM:bgoodrich DATE:Friday, June 16, 2006 11:39:50 AM  
There have been no recent changes to BRASS-LFD to stop this information from being generated. Please send me some screenshots of what was previously reported, what is now reported, and also where this information was reported, i.e., the BRASS output file or the Virtis GUI. This information should help me better understand the issue.

FROM:bgoodrich DATE:Friday, June 16, 2006 1:52:23 PM  
I attached a PDF file from the user that illustrates the BARS output and the latest output available from within Virtis. This clarified the request. Currently, Virtis only allows the critical rating factor and location to be passed back from the BRASS engine. This is why the reports contain the information they do. For now, this information can be obtained from the BRASS output file.

The user would like to see the member capacity, dead load contribution, and live load contribution in the Virtis reports. I believe this was an enhancement request that was discussed but never approved.

|------------|---------------|------------------------------------------------------------------------------------------------|
| 7328.16006 | Suspended     | Reporting Virtis Std Engine LL Impact in the Virtis Analysis Results window and canned reports |

## Description

FROM:kkennelly DATE:5/24/2006 10:03:40 AM

The impact factor entered on the Advanced Vehicle Properties window on the Analysis Settings window is not being handled correctly.

Virtis help states the following for this impact factor:

### Impact

For the displayed vehicle, enter the factor by which the standard impact factor is to be multiplied to obtain both live load and impact. For example, if the vehicle is a permit vehicle restricted in speed and the standard impact is to be reduced by ½ (50%), enter 0.50. If the vehicle is restricted in speed such that the impact is to be zero, enter 0.0. Leave blank to use the standard impact factor.

The Virtis Std Engine cannot handle this input, it cannot multiply the impact factor internally computed by the engine to get a different IF to use. You can however get the Virtis Std Engine to use no impact.

So we should not use the impact factor on this window if it is a value other than 0.0. If the value is zero the value input to the Virtis Std Engine should be 1.0 which results in no impact.

The following is an explanation of how this number is to be used. (It is being correctly used by the BRASS LFD export.)

For Training Bridge 1,  $IF = 1 + 50 / (161 + 125) = 1.17498$

4/19/2016 3:05:22 PM

HRS AASHTO

875

Complete Issue Information

Enter 2 as impact factor on this window. That means the AASHTO impact factor is to be multiplied by 2. Therefore  $IF = 1 + 2.0(.1748) = 1.3497$

Enter 0 as impact factor on this window. Then  $IF = 1 + 0(.1748) = 1.0$

Description

FROM:kkennelly DATE:5/24/2006 3:13:39 PM

The Virtis Std Engine output file shows the impact factor used for pos/neg moment and shear. It would be nice to be able to view that data in the Virtis Analysis Results window and in the canned LFD analysis output report available in the Report Tool. The canned LFD analysis output report shows \*\* as not available for these impact factors since they weren't available for BRASS.

| 7363.15971 | Resolved      | Virtis Std Engine export needs to compute additional deck load ... |

### Description

FROM:kkennelly DATE:6/5/2006 12:32:27 PM

Attached bridge was submitted by Ron Love. The following bug in generating reinf concrete cross sections from user input profiles was exposed in their work with the API.

At 206.9269', right side, the Set #24 reinforcement is determined to be zero percent developed. That is correct.

At 207.92708' left side (end of beam), the Set #24 reinforcement is determined to be 100 percent developed due to tolerances not being used in CDoGirderMbrAlt::ComputePercentDev() when comparing the point in question (207.92708') with the end of the bar (207.9269).

FROM:jduray DATE:Monday, June 05, 2006 12:43:14 PM

FROM:kkennelly DATE:8/16/2006 11:31:40 AM

Better fix is to not use tolerances when determining if a point is within the length of the bar. I tested this fix by running schedule based alts in RCTrainingBridge1 and bridge attached to this incident with and without this change. BRASS output files were the same for both with and without this change.

More testing with more scheduled based rc alts is desirable.

I got this from one of NYSDOT's consultants - see the attached database error message.

I am getting a database error in VIRTIS 5.4. This has happened twice now. I have attached a screen shot of the error message. When I get this message I am unable to save the VIRTIS file that I am working on and any unsaved data is lost. Have you seen this before and do you know of something I can do to prevent this from happening again? Thanks!

FROM:mordoobadi DATE:6/9/2006 3:48:08 PM  
The error indicates "Communication Link Failure". It means connection to the database was lost. One of the ways that this could happen is if the database server was on the network (not user's machine) and the network connectivity was disrupted. Another way that this can happen is if the user is using local MSDE database and the Database engine service was terminated (this could be because of a crash in Microsoft SQL Server engine or if the running service was terminated)

If the database server is on the network you may want to ask your system administrator if any network disruptions occurred during the time you had problem.

### Description

FROM:rfulton DATE:Wednesday, June 14, 2006 3:17:26 PM  
Std Engine will run LF but not ASD for RCDG bridges. Sample model attached.

FROM:jduray DATE:6/14/2006 4:24:32 PM  
This is probably a 5.4 issue. We need to determine if it was supposed to do ASD.

FROM:hlee DATE:6/15/2006 9:21:51 AM  
This is a 5.4 bug.  
Resolved in 5.5 Beta 2.

=====  
 Herman,

Thanks for your prompt response. Article 10.38.3.2 of the AASHTO Standard Specifications is applicable to the effective flange width of deck over fascia girder, independent of an adjacent interior girder as required by the AASHTO LRFD Specifications. The LFD and ASD methods in the Standard Specifications will continue to be used for load ratings of existing

Subject: Re: Fwd: Virtis Incident on Effective Flange Width for Two-Girder System

Waly,

Your observation is correct. The "Compute From Typical Section" button is only available for a girder system with more than 2 girders. This button is also not available for prestressed U beam member alternatives. The LRFD effective flange width of an exterior girder is dependent on the effective flange width of the adjacent interior girder. There is no specific guidance in the spec for a 2-girder system, so the button is not available for a 2-girder system.

Sincerely,  
Herman Lee

>>> "Walid Najjar" <wnajjar@chashsells.com> 06/21/06 10:41 AM >>>  
Dear Mehrdad,

The Virtis software in its current version (5.4) does not calculate an effective flange width (of deck) for a two-girder span system. In other words an input value must be calculated manually, because there is no "Compute from Typical Sections" select-box in "Member Alternative/Girder/Deck Profile/Deck Concrete", as is the case for three or more girder systems.

Since our brief phone conversation yesterday, I verified this observation on a newly created rolled-steel two-girder simple-span system. Initially I thought that the issue is due to the fact that the subject bridge span was created with an earlier version of Virtis, at a time when manual calculation of effective flange width was required; but it seems that this issue remains in the current version of the program.

4/19/2016 3:05:23 PM

HRS AASHTO

Complete Issue Information

I would appreciate it if you could confirm my observation, using any simple-span parameters you may choose. Perhaps a Virtis incident in this regard or suggestion for improvement should be reported to AASHTOWare.

Sincerely,

Waly

Complete Issue Information

FROM:ttompson DATE:Tuesday, June 27, 2006 8:30:02 AM

I created a Girder System using SI units - but when I'm forced to enter the span lengths and # of spans in the Superstructue window - I'm only given the option for US units.

We really need to get this window to be automatically populated and/or be able to toggle between US and SI units.

Right now, I seem to be somewhat stuck.

FROM:ttompson DATE:Thursday, June 29, 2006 11:58:19 AM

Appears to NOT be able to toggle between US and SI units UNLESS you maximize the Superstructure Window. Once I maximized that window, I could then toggle between units.

Appears to be a parent-child problem (check with Paul Jensen on complete explanation) with the GUI not working correctly unless the one window gets maximized. I'm past my sticking point - but there is still the GUI problem.

FROM:jihnmat DATE:7/11/2006 3:51:51 PM

I haven't been able to reproduce this.

### Description

FROM:ttompson DATE:Tuesday, June 27, 2006 12:14:00 PM

I have a structure that was entered with SI units and analyzed successfully in previous versions of Virtis.

But starting with Virtis 5.3 - the BRACING SCHEDULE that is created gives an error (See attached PDF) that the spacing must be evenly divisible into the Range range +/- ft.

It almost appears to be a problem in converting from the nice SI meters to US feet and not enough significant digits in the BRASS export.

Seems to be a problem in spans 1 and 4.

Was a diaphragm spacing of 7 @ 6.090 meters (sum = 42.63 meters) but the brass commands has 19.9803 ft - sum = 139.8458 ft (but 7 times 19.9803 equals 139.8621)

Again - it worked in previous versions, but not sure if it's a rounding problem or an export problem.

FROM:ttompson DATE:Tuesday, June 27, 2006 12:22:15 PM

Same problem still occurs with 5.5 Beta 2 - noticed this bridge didn't run here and went back to my 5.3.0 production where I noticed it also. But it did run ok in previous versions, just don't remember which one.

FROM:ttompson DATE:Wednesday, September 27, 2006 8:26:37 AM

Problem continues in 5.5 Beta 4.

FROM:ttompson DATE:Wednesday, December 06, 2006 1:39:57 PM  
It's been 5 plus months - any progress or work on this issue?

FROM:jduray DATE:12/21/2006 4:39:41 PM  
Email sent to Brian asking him to investigate.

FROM:hlee DATE:1/5/2007 8:29:50 AM  
We have performed the following investigations:

- [1] Imported the 5.3 BBD and successfully analyzed both interior and exterior girders.
- [2] Migrated the 5.3 database to 5.5 and successfully analyzed both interior and exterior girders. Rating results agree with those in [1].
- [3] Imported the 5.5 XML and successfully analyzed both interior and exterior girders. Rating results agree with those in [1].
- [4] Compared Todd's BRASS data file with the one generated in [1]. Differences are in SPAN-D, BRACING-SCHEDULE, STEEL-GIRDER-CONTROL, and UNIFORM-DL1 commands.

We suspect the unit tolerances set in Todd's database may be the cause of the problem.

Todd: What are the unit tolerances you set in System Defaults?

FROM:hlee DATE:1/22/2007 2:46:25 PM  
E-mail from Todd:

=====

I have the units set to  
ft 0.1  
in 0.01

I believe I had to set these due to some problems I was having with stiffener spacing. If I have to change spacings again now, I'm afraid my stiffener problem(s) will start showing up.

=====

FROM:hlee DATE:1/22/2007 4:00:35 PM  
E-mail from Todd:

=====

Here are 3 other bridges that have the same problem with Bracing. They all used to work but don't anymore.  
The original one I reported was in SI units. All of these others are English units.

5.3.1 bbd files

=====

Attached sd\_14092199.bbd, sd\_16732234.bbd, and sd\_32531001.bbd.

FROM:hlee DATE:1/23/2007 9:38:55 AM  
The problem is stated in the attached 55BracingSchedule.pdf file.  
E-mail sent to Brian for further investigation.

FROM:bgoodrich DATE:Thursday, February 22, 2007 8:37:13 AM

4/19/2016 3:05:24 PM

HRS AASHTO

889

### Complete Issue Information

At the end of January, I added a spacing tolerance similar to method for transverse stiffeners in the code that generates the bracing schedule commands (BrassBracingScheduleCmd.cpp). The new files from Todd will be used to verify these changes.

FROM: bgoodrich DATE: Tuesday, February 27, 2007 11:13:24 AM

I verified the export changes by running Todd's original bridges as well as the three additional bridges. The tolerances were set according to Todd's settings. Fixed for version 5.6.

FROM: tthompson DATE: Monday, April 02, 2007 2:34:31 PM

I checked it with 10 different bridges that I get this failure message with V 5.5 - testing with 5.6 Beta 2 - appears to be fixed. I'll double check when we have an acceptance release.

### Description

FROM: dteal DATE: Tuesday, June 27, 2006 1:53:51 PM

It is common place in RC to have bars that extend into the abutments or past the centerline of bearings at abutments. We have two choices, hook the bar or tell opis that it is fully developed.

The problems we will run into here are common among many types of RC slab structures. Bars at the structure ends.

4/19/2016 3:05:24 PM

HRS AASHTO

890

### Complete Issue Information

If we hook them – they are not fully developed at the end of the bar – See VI#7462, so this isn't an answer.

If we check the box on the Reinforcement Tab, we have full development – but at both the start and the end. In many, many case we need full development at the start and not the end on the left end of the structure and visa versa on the right end.

When doing schedule based RC, we can hook the bar at either end or both ends.

We need the same thing with development, we should have 2 check boxes for development, one for the right end and one for the left end.

With out that feature, how can I start a bar at the right end abutment (fully developed – knowing that a hook is not fully developed) and let the bar be actual length at the left end (checking development lengths there). Then set a t POI at the face of abutment (common spot for design). Right now I will get a spec check failure at that POI.

FROM:kkennelly DATE:6/28/2006 8:01:21 AM

The request to allow fully developed at start or end instead of both is a duplicate of 5299.

### Description

FROM:mordoobadi DATE:6/29/2006 2:37:50 PM  
Received by email from Brian McCaffrey: NYDOT

Getting the error on orp2 server:

ORA-01795 maximum number of expressions in a list is 1000.

FROM:mordoobadi DATE:6/29/2006 2:41:58 PM

When does the error happen? Does it happen when you select a certain folder in the bridge explorer (which folder, how many bridges)? Or it happens when you try to open a bridge?

Could you also send me the Debug Description of the errors?

FROM:mordoobadi DATE:9/28/2006 1:33:10 PM  
I received this email from Brian on 7/17/2006.

Mehrdad,

As soon as it shows up again, I'll send you the 'debug ' message. It dosen't happen all the time.

Brian

FROM:mordoobadi DATE:9/28/2006 1:41:23 PM  
It is probably related to maximum number of open cursors setting on the Oracle Server.  
Increasing this setting from 1000 to 2000 may fix the problem.

| 7522.15812 | Resolved      | Virtis Std export should allow LL distribution factors to be computed if they are not entered for RC slab bridge. |

Description

FROM:pwhite DATE:Monday, July 24, 2006 3:50:45 PM

I am getting low shear ratings on a 3 span prestressed concrete beam bridge. The low rating occurs at 200.1 under positive flexure. I also ran the structure using Conspan and found that it is calculating a higher value for Vci.

By creating a POI I was able to determine the difference in the two calculations is the sign of the live load shear acting concurrently with the maximum moment. The maximum moment at the POI is a positive moment, due to stage 1 dead loads combined with maximum positive live load moment. Since the positive live load moment is caused by loading in span 3, the shear concurrent with the max live load moment is negative.

In the calculation of Vi, the live load shear holds its negative sign and therefore is reducing the value of Vi ( $V_i = 1.3V_d + (-)2.17V_i - V_d$ ). I agree with the shear values and their corresponding signs, but I want to double check that VIRTIS should not be using the absolute value of Vi, as is being done in Conspan.

Thanks,

Pete White, P.E.

Complete Issue Information

FROM:bgoodrich DATE:Tuesday, September 05, 2006 11:20:59 AM  
WYDOT assigned this issue to BRASS Problem Log 696.

FROM:bgoodrich DATE:Tuesday, November 21, 2006 10:15:12 AM  
This issue was discussed with WYDOT. WYDOT has decided to document how BRASS calculates the Vi term in the intermediate output and the manual/help. The Vi term is calculated based on the dead load shears and live load shears (considering sign). The absolute value of the Vi term is taken before it is used to calculate the shear capacity.

FROM:bgoodrich DATE:Monday, January 29, 2007 1:14:27 PM  
The BRASS output and help was updated with the following:

"The Vi term in Equation 9-27 is calculated based on the dead load shear (Vd) and the live load shear concurrent with maximum moment (VI). Both of these shears carry sign. The absolute value of the Vi term is taken before it is used to calculate Vci. The Vi term is calculated as:

$$Vi = \text{gamma} * (\text{beta}(\text{DL}) * Vd + \text{beta}(\text{LL}) * VI) - Vd$$

where:

- gamma = load factor
- beta(DL) = dead load coefficient
- beta(LL) = live load coefficient

Issue ID: 7522  
Subject: Virtis Std export should allow LL distribution factors to be computed if they are not entered for RC slab bridge.

## Description

FROM:dteal DATE:Tuesday, July 25, 2006 9:53:47 AM

I think we have some confusion in definitions on the GUI and in the help.

On the Structural Typ. Section: Deck (Cont'd) help we can find definition for Total Deck Thickness which makes reference to the structural thickness used to compute section properties. This I think is correct and not confusing.

On the Deck Profile:Deck Concrete help we can find definition for Structural Thickness which is used to compute the section properties. It also makes reference to "effective slab thickness" checkboxes on another GUI. Isn't Structural Thickness and Effective Slab Thickness one in the same? Shouldn't the "Consider Effective Slab Thickness" be changed to "Consider Structural Thickness"?

Following the same issue in the Deck Profile: Reinforcement help we have the definition of Row. This definition contains the wording "Top of slab is the effective deck slab thickness". Here again shouldn't this read structural thickness instead? We have never defined "effective slab thickness" in the GUI?

4/19/2016 3:05:27 PM

HRS AASHTO

903

Complete Issue Information

Again following the same issue on the Superstructure Definition: Analysis help and GUI we have Effective Slab Thickness and whether or not to consider it for rating and/or design. This contains references to Effective Thickness (which doesn't have a entry field in the GUI) , Total Thickness and Section Properties but never mentions Structural Thickness (which does have an entry field in the GUI)

Effective slab thickness is also referenced in the RC Slab Girder Profile:Section help.

So in the end – is Effective Slab Thickness and Structural Slab Thickness one in the same?

FROM:kkennelly DATE:8/8/2006 3:54:10 PM

Fixed for 5.5 beta 4. All instances of Effective slab thickness have been changed to structural slab thickness.

FROM:dteal DATE:Wednesday, September 06, 2006 10:00:19 AM

Accepted in 5.5 beta 4

When defining section depth and locating the rebar with in the section is somewhat confusing. Here is

4/19/2016 3:05:27 PM

HRS AASHTO

904

Complete Issue Information

my question and scenario.

I am looking at a RC slab bridge. I have an 8" total depth of slab. I have a 1" sacrificial wearing surface. My top rebar are to be placed 3" from the top of the slab. For the rebar I would use the "Measured From" set at From Top of Slab. I would enter a Distance of 3" less 1" wear = 2 inches (correct?).

Then when I uncheck the option to consider effective slab thickness for rating or design in the Superstructure Definition: Analysis GUI the 1 inch of wear would be added back in to make my rebar 3" from the top of the slab instead of the 2" (correct?).

FROM:jduray DATE:7/26/2006 1:51:45 PM

I would assume the location of the rebar relative to the top of the slab is independent of the sacrificial wearing surface, i.e. it is 5" from the bottom. So, for the rebar I would use the "Measured From" set at From Top of Slab and I would enter a Distance of 3" . We need to confirm this.

FROM:bgoodrich DATE:Monday, August 28, 2006 9:38:55 AM

For a total slab thickness of 8", where 7" is effective and 1" is sacrificial, and rebar located 5" from the bottom of the slab, you would enter 2" measured from Top of Slab. The top of slab measurement choice references the top of the effective thickness. If the option to consider the effective slab thickness is unchecked, the export would generate the cross section commands with 8" for the slab thickness and 3" for the distance to the rebar from the top of the section.

FROM:dteal DATE:Wednesday, September 06, 2006 9:39:54 AM

I think an example in the Help would be beneficial here.

Description

FROM:hlee DATE:8/17/2006 1:07:13 PM  
 E-mail received from Wes Kellogg, OK DOT.

=====

Mr. Lee -

My name is Wes Kellogg. Walt asked me to take a look at the Virtis 5.5 Beta using the sample BAR7 files that we also gave Michael Baker. In doing so I encountered a few problems that would not allow the bridges to be rated. I discussed these problems with Brian Windsor and he was able to help me determine why the Virtis files had these problems. I went through and fixed these problems and the files would rate. The problems I encountered are as follows:

Steel Sections - The effective flange width had to be entered before the files would rate. This is not entered in the BAR7 files because BAR7 automatically calculates this value for you.

Complete Issue Information

RC Slabs - The distribution factors had to be entered before the file would rate. BAR7 calculates the distribution factors automatically.

RC "T" Beams - A fillet dimension had to be entered. This is due to the fact that BAR7 does not include this dimension in the cross section properties. It is included in the dead load. Also the effective flange width had to be entered due to the fact that BAR7 automatically calculates this value.

Upon fixing these problems, the files would rate. Of the eight files that I have imported into Virtis 5.5, four of them had ratings that were not consistent with the BAR7 ratings. I tried to find the reason for this by deleting the bridges and re-importing them. After doing this, and fixing the problems with the import, I still got the same ratings. I had Brian Windsor check the bridges using BAR7 which resulted in the appropriate numbers. I have included these ratings in the attached word document. I am unsure as to why this is happening and was hoping you could help me to find the cause.

Also, I have recently had Virtis 5.4 installed on my computer and have been importing a few steel bridges and I have discovered that I don't have to enter the effective flange width for the file to rate. This is confusing since in Virtis 5.5 I could only get the file to rate when I did enter this value. Any help or information you could offer would be greatly appreciated.

- Wes Kellogg

Wes,

I have entered your questions into the Support Center as Incident 7565.

1. In Virtis, the number of rebars entered is located within the effective width. Since Virtis Std Engine requires the rebar area to be defined per foot width of the slab, the effective width is required. BAR7 Import reads a BAR7 input data file and put the input data in a Virtis bridge. When you rate the bridge with Virtis Std Engine, the bridge is treated as a Virtis bridge since users may change the data after the bridge is imported.
2. Support Center's Incident 7522 (Virtis Std export should allow LL distribution factors to be computed if they are not entered for RC slab bridge) has been resolved for 5.5 Release. I don't think the fix is in 5.5 Beta 3 (the version that you have).
3. I imported "0512 0799 X", it is a CTB structure with the fillet dimension A not entered. Virtis Std Engine only complains the effective flange width. Please e-mail us the bridge with the fillet dimension

Complete Issue Information

problem or attach that bridge (XML file) to Incident 7565 so we can take a look.

- 4. Some suggestions for investigation when the rating factors are not close:
  - a. Compare the BAR7 input file with the input file that generated by Virtis to see whether they are equivalent to each other.
  - b. Compare section capacities, dead load actions, and live load actions reported by BAR7 and Virtis Std Engine output files.

Please let us know after you have located the discrepancy and e-mail us the BAR7 input data file and the exported Virtis bridge (XML file) for us to investigate.

Let me know if you need additional information. I will be out of the office tomorrow and Wednesday to Friday next week. If you need immediate assistance, please e-mail [bridgeware@mbakercorp.com](mailto:bridgeware@mbakercorp.com).

Herman

E-mail from Wes Kellogg, Oklahoma DOT:

=====

Mr. Lee -

I have a question regarding the Virtis Standard Engine that is included in Virtis 5.4. We have noticed some inconsistent ratings between Virtis 5.4 and BAR7. Brian Windsor and I found that the Virtis Standard Engine calculates the dead loads on a beam by calculating the total dead load and dividing that value by the number of beams, effectively distributing the dead loads evenly among the beams. In the version of BAR7 we are using, the dead loads are calculated by the tributary area of the beam and entered accordingly. This difference has led to the Virtis Standard Engine rating bridges higher than the BAR7 software. I am curious if the method Virtis uses to calculate dead loads is standard practice, and if it is not, will this problem be addressed in the next release of Virtis? Any information you could give would be greatly appreciated.

- Wes Kellogg

Reply e-mail:

=====

Wes,

Based on your descriptions, I assume you have a structure (with 2 or more members) entered in Virtis 5.4 using the girder system description and you also have a member of that structure entered in BAR7. The stage 2 dead load distribution computed by Virtis 5.4 is uniformly distributed to all members. In Virtis girder system description, you can select how you want stage 2 dead load distributed for the analysis in the Superstructure Loads window (attached).

Please let me know if I misinterpreted your question.

### Description

FROM:tarmbrecht DATE:Wednesday, September 13, 2006 12:39:42 PM

VSE will not analyze a steel composite structure with an integral wearing surface (where the deck Structural Thickness is greater than Total Deck Thickness). (See StrSlabGTTotDk(0860037).xml)

FROM:jduray DATE:Thursday, September 14, 2006 8:27:38 PM

How can the structural thickness exceed the total deck thickness?

FROM:tarmbrecht DATE:Friday, September 15, 2006 8:55:21 AM

Jim, this refers to where the original deck has been scarified and a concrete overlay has been added, which the rater wishes to consider as structural, and therefore part of the composite section. Since this can be done in BRASS for P/S and steel composite structures, VSE should be modified to accept this. We also recommend allowing this for R/C structures also.

FROM:hlee DATE:9/15/2006 12:19:33 PM

BRASS requires Total Deck Thickness and Structural Thickness as inputs whereas Virtis Std Engine requires Total Deck Thickness and Integral Wearing Surface Thickness as inputs. Since a negative Integral Wearing Surface Thickness is not a realistic input for the Virtis Std Engine, Jim decided that the export should exit with error message.

## Complete Issue Information

Tim - after the overlay is placed isn't the total deck thickness increased? Which thickness is used to compute the deck DL?

FROM:tarmbrecht DATE:Wednesday, October 04, 2006 4:32:40 PM

Here is my consultant's response:

To the first question, the answer is NO. That is, if one is considering "total deck thickness" in terms of the Virtis data field "Total deck thickness" (under the "Deck (Cont'd)" tab of the "Structure Typical Section" window). This "total deck thickness" is actually reduced by the depth of deck surface scarification. When the new concrete wearing surface is added, the roughness caused by the scarification provides for a mechanical shear bond between it and the reduced thickness original deck, thus the two act together to provide composite structural support for the live load. Therefore, under "Deck Profile" the data field, "Structural Thickness (in)" is entered as the sum of the "Total deck thickness" and the data field "Wearing surface thickness" (under the Wearing Surface tab of the "Structure Typical Section" window). This is not a perfect structural representation of what's going on (since it makes the new wearing surface as part of the support for the Stage 2 DL when in fact it only supports the LL), but it is close enough.

To the second question, The Stage 1 DL uses the value entered for "Total deck thickness" and the Stage 2 DL uses the value entered for "Wearing surface thickness".

Response to hlee (9/15/06 12:19:33 PM):

In part - "BRASS requires Total Deck Thickness and Structural Thickness as inputs whereas Virtis Std Engine requires Total Deck Thickness and Integral Wearing Surface Thickness as inputs."

I know of no field in Virtis that would correspond to entry of VSE's "Integral Wearing Surface Thickness". Where is it? It seems that, for both BRASS and VSE, there could/should be a check box to indicate that a wearing surface is integral with the deck. This would make it so that, when the user does a "Compute Deck Profile from Structure Typical Section", the Structural Thickness field would be computed as the sum of the two data fields, "Total Deck Thickness" and "Wearing Surface".

Additional thought "The term "Total Deck Thickness" should be changed to something like "Base Deck Thickness" or "Stage 1 Deck Thickness" or similar.

FROM:jduray DATE:10/10/2006 1:18:43 PM

The integral wearing surface is computed by subtracting the structural thickness from the total deck thickness.

FROM:jduray DATE:10/10/2006 2:07:37 PM

The intent of the three deck thickness attributes is as follows:

Wearing surface - the thickness of a non-structural overlay

Total Thickness - the total thickness of the deck

Structural thickness - the total thickness minus a thickness to account for sacrificial wearing - so the integral wearing surface is the difference between total deck thickness and structural thickness.

The export for StdEngine was developed based on these thicknesses.

In order for the StdEngine to handle the situation described above it should be enhanced to accept the structural thickness (like BRASS) and it would have to allow the structural thickness to be greater than the total thickness.

4/19/2016 3:05:28 PM

HRS AASHTO

912

Complete Issue Information

FROM:dteal DATE:Wednesday, October 18, 2006 2:37:40 PM

I had entered a duplicate of this incident (#7629)

We have a very similar situation. Every structure that has a silica fume overlay (SFO) in our database will not run in VSE for this reason. Here is how we come up with our thicknesses.

Deck total thickness = 170 mm

SFO = 40 mm

Therefore 170 +40 210 mm

Structural Thickness = 210 – 15 wear = 195 mm

FROM:dteal DATE:Friday, November 03, 2006 10:36:37 AM

Why not come up with a work around or way this can be handled in the migration. We have 1,112 current structures with Silica Fume Overlays (SFO) that would have to be edited to comply with VSE input.

FROM:jduray DATE:11/3/2006 2:41:25 PM

The data entered into Virtis/Opis should describe the bridge. It should not be for a particular engine. If you have massaged data to get results you want from a particular engine then you have to accept that it may not work for another engine.

Why isn't the total deck thickness 210 and the structural thickness 195? I still don't understand how or why the structural thickness can be greater than the total. Is there something going on here with when the loads are applied that forces you to do this way?

I think this is a problem for StdEngine because the input does not include structural thickness. If you want StdEngine to work for this situation (Total < Structural) we need to modify the input commands and the internal computations.

FROM:jduray DATE:11/3/2006 3:05:51 PM

Neither engine handles this scenario correctly.

For BRASS: You specify the load due to SFO as DL2 but the structural properties for DL2 already include the thickness - not exactly correct but maybe acceptable.

You can't use StdEngine at this time because the input to the engine is total thickness and sacrificial thickness (not structural thickness). The StdEngine export defines the total thickness as 7" (which isn't what you want) and computes the sacrificial thickness by subtracting the structural thickness from the total thickness which is negative for this case and is not allowed to be negative so it aborts.

I think if you want to be able to analyze this situation Virtis, BRASS and StdEngine need to be modified.

### Description

FROM:tarmbrecht DATE:Wednesday, September 13, 2006 12:55:57 PM

In order to enter welded "I" shapes as truss members users must ...

1. Define them as NonDetailed sections

or...

2. Enter them as Steel Beam I Shapes for the Bridge Workspace and then define them as rolled sections

It would be better if they could be directly entered by coding them something like a built-up truss member section.

FROM:kkennelly DATE:10/2/2006 8:16:12 AM  
Submitted on behalf of Vinacs, Caltrans:

Jim / Krisha / Brian

I have created the attached model. I am able to analyze the stringers. When I tried to analyze the Floorbeam, I am getting the error message which states crosssectional area of Zero in Span 4. I could not locate any error in my input.

Could someone look at the bridge model and let me know where do I go wrong?

I analyzed Span 1 to 3 MDL 1 of 1 (09/06), Floorbeam1, BC1.

It appears to me that the input commands for BRASS are being computed properly. Cross Section 1 is applied over the length of Span 4:

COMMENT Span 4  
SPAN-A 4, 0.4200, 5  
SPAN-C 1, 0.4200, 1,

I think the problem is an internal BRASS problem when it tries to deal with Span 4 being only 0.42' long. When I changed the length of Span 4 to 15', BRASS ran to completion.

FROM:bgoodrich DATE:Tuesday, October 03, 2006 2:16:37 PM

I reviewed the structure and found one of the end spans to be a cantilever that is 0.42 feet in length. BRASS tries to put nodes at tenth points, i.e., every 0.042 feet (0.504 inches) which is less than the small element length tolerance in BRASS. BRASS adds tenth points to the mesh without checking if they are too close to another node, which leads to the area not being calculated for some nodes.

It appears this issue could be avoided if BRASS could detect these "small" span lengths and generate the mesh with fewer nodes. BRASS could be modified to add node points at some minimum interval when tenth points are less than the small element length.

I forwarded this issue to WYDOT.

FROM:bgoodrich DATE:Monday, October 16, 2006 10:09:00 AM  
E-mail from Mike Watters:

That sounds like a good idea, but I would modify the code in the merged engine only. It seems like an easy check to make. I think Vinacs should be instructed to take out that short span.

Micheal J. Watters, P.E.  
Principal Bridge Engineer  
Special Assignments Squad

FROM:bgoodrich DATE:Friday, October 20, 2006 9:57:00 AM

Please review Mike Watters comments below. WYDOT did not authorize the short span issue in the BRASS-GIRDER engine to be addressed. Floor systems are complicated enough without trying to eliminate a short span in the export or even having the user remove it.

Is this something that could be funded by AASHTO? We are only looking at 16 hours.

Complete Issue Information

It would be beneficial at some point for the truss LLDF to be calculated based on the geometry of the floor-system similar to how a through-girder LLDF is calculated via the GUI?

Description

FROM:bmccaffrey DATE:Thursday, November 02, 2006 8:54:43 AM

It appears that the floorbeam LLDF wizard is still following the Standard Specs even if the MCEB method is selected.

This bridge has a 19' roadway which should be two lanes according to the MCEB but it's using one lane.

FROM:jduray DATE:11/2/2006 2:27:19 PM  
Is this for 5.5 beta 6 or was it a problem in 5.4 and earlier?

4/19/2016 3:05:30 PM

HRS AASHTO

918

## Complete Issue Information

FROM:bmccaffrey DATE:Thursday, November 02, 2006 3:20:15 PM

I believe this was an existing problem in 5.4. I never really looked into this or ran the numbers before now so I'm not sure if there's a history of incidents. I had only heard that it wasn't working properly in 5.4 and I confirmed it with in 5.5 Beta 6.

FROM:kkennelly DATE:11/6/2006 9:22:04 AM

Are you questioning the actual number computed on the Floorbeam Mbr Alt: Live Load Distribution tab?

The floorbeam LLDF's from AASHTO Table 3.23.3.1 don't indicate if they are for 1 or multi lanes. So I think the DF being computed by the "Compute" button in Virtis is ok.

The export to BRASS is creating Floorbeam-MPT commands with just 1 lane of vehicle. I think that instead the MPT command should contain 2 vehicles each using the floorbeam DF computed on the Floorbeam Mbr Alt: Live Load Distribution tab.

FROM:bmccaffrey DATE:Monday, November 06, 2006 1:33:27 PM

I think you're correct. The output file has it as one lane. I was able to get the wizard to change but it wasn't reflected in the export and you can't tell if the wizard is generating a one lane DF or a multi-lane DF.

FROM:kkennelly DATE:11/6/2006 2:38:49 PM

Based on Table 3.23.3.1 there is no single lane and multi lane DF for floorbeams. That is why the UI only shows 1 DF for the floorbeam unlike the girders where the UI shows both a single and a multi lane DF.

The export to BRASS should take into account the setting on the Preferences: Bridge Workspace tab to determine if AASHTO 3.6.3 or MCEB 6.7.2.2 should be used to determine how many vehicles to export in the Floorbeam MPT command.

FROM:bgoodrich DATE:Tuesday, November 07, 2006 11:18:04 AM

The CBrassStdLoadControl::ComputeLaneWidths function in the export must be modified to detect when the MCEB minimum two-lane travelway width are to be used instead of the Standard Spec minimum two-lane travelway width. This flag is set in the user preferences and must be conveyed to the export, probably through the analysis event. I estimate the export changes at about 2 hours, which includes the initial investigation. Jim will need to estimate the analysis event and database changes.

FROM:bmccaffrey DATE:Thursday, November 09, 2006 9:21:27 AM

This is a bug, not an enhancement.

FROM:jduray DATE:2/27/2007 3:31:56 PM

Mehrdad - after the event revision is made assign to Brian for the export.

FROM:mordoobadi DATE:5/10/2007 3:15:12 PM

Added a new method to IDoAnalysisEvent that returns the Standard Live Load Distribution Factor setting.

```
IDeType* GetStandardLISsDistFactComputeType();
```

4/19/2016 3:05:30 PM

HRS AASHTO

919

Complete Issue Information

The function returns an IDeType that may hold:

TYP\_STDLLDFSS\_STDSPECHB for AASHTO Standard Spec for Highway Bridges  
TYP\_STDLLDFSS\_MCEB for Manual for Condition Evaluation of Bridges (MCEB)

FROM:hlee DATE:5/16/2007 3:52:56 PM

Updated Virtis Std LFD and Virtis Truss to use the new method in the analysis event to determine the number of lanes in a system definition.

FROM:bgoodrich DATE:Tuesday, June 05, 2007 6:35:32 PM

Updated the BRASS export to use the new analysis event method. The Floorbeam-MPT command will be generated as before with two wheel lines, but the width of the design and traffic lanes will be reduced so two 9.5 ft lanes will fit during the positioning process in the engine.

FROM:jduray DATE:8/31/2007 8:35:08 AM

From Herman:

I think we still have to do the following:

1. In CEngineExport::GetStructDefLanesLoaded(BOOL& bSingleLaneLoaded), instead of adding GetNumLanes of all lane positions we need to calculate the number of lanes on the bridge based on the selected spec.
2. For Madero, it depends on how the "Number of Design Lanes" in GENLDIM used in the engine. Seems like Madero export passes both single and multi distribution factors to the engine.

FROM:bgoodrich DATE:Wednesday, September 05, 2007 1:18:53 PM

Updated the Madero export (CMaderoDimensions::GetDeckGeometry) to calculate the number of lanes based on the MCEB in addition to the Standard spec.

### Description

FROM:kkennelly DATE:11/8/2006 3:10:03 PM  
Submitted on behalf of Vinacs, Caltrans via email:

When I tried to attach a file to a bridge, Virtis program got terminated. Could you please review the error messages popped up and advise us as to how to fix this problem.

Li who maintains the database tells me that he thinks that this problem came about after we converted the database of Virtis+Opis licence to Virtis only licence database.

(See attached file: multimediaattachment.doc)

FROM:mordoobadi DATE:11/15/2006 2:57:44 PM  
I found out what is causing both issues.

You have an Integrated database (Virtis/Opis/Pontis). There is a record missing from your COPTIONS table that is required by Virtis/Opis. It defines the location of multimedia server (MULTISERVER option in Pontis). The migration did not populate the record because you had an integrated database and we

4/19/2016 3:05:30 PM

HRS AASHTO

921

Complete Issue Information

do not change PONTIS table contents for integrated databases.

You can fix the problem by adding a record to the COPTIONS table by executing the attached SQL command in Interactive SQL.

- (0) Save the attached file to a folder on your hard disk drive.
- (1) Start Interactive SQL and login to the database.
- (2) Select File/Open and open the SCOptions.SQL file.
- (3) Select SQL/Execute.
- (4) Close the Interactive SQL.

After this you should try to duplicate the problems by:

- A) attempting to open the System Defaults Window
- B) Trying to attach a file to a bridge.

FROM:mordoobadi DATE:11/15/2006 2:59:57 PM  
in an email by Li Zhang:

Mehrdad, both problems fixed. Thanks a lot!!!

Li Zhang

|------|---------------|---------|

Description

FROM:hlee DATE:Tuesday, December 05, 2006 7:33:59 PM  
See attached. The first item in the list shouldn't be "ERROR".

FROM:bgoodrich DATE:Monday, January 29, 2007 3:21:14 PM  
This is set in the CDoBrassStdPOIParser::SetCodes function in AboBrass. I am not sure what the intent is here. Jim was the author, so we should check with him.

FROM:hlee DATE:1/30/2007 1:09:56 PM  
"ERROR" is in CDoBrassStdPOIParser::SetCodes since the first version (10/28/99) in SourceSafe. In 5.5, BRASS export will default section type to 2 (Non-composite rolled or welded steel girder) when the section type is "ERROR" in POI engine properties.

FROM: Jim Duray DATE: 11/6/2008 8:04:02 AM Eastern Standard Time  
I don't remember why. Is this causing a problem? If not, I think we should leave it as is. If it is causing a problem we should figure out what is supposed to happen here and fix it.

FROM: Brian Goodrich DATE: 11/6/2008 6:57:18 AM Mountain Standard Time  
Having the "ERROR" option does not appear to cause any problems. Even if the user selects this option, the export will send the conservative non-composite section type to the engine. This engine property option is also only used when NOT generating points of interest, which I believe would be primarily from imported BRASS data files. I assume most users are entering schedule data and generating points of interest.

FROM: Brian Goodrich DATE: 11/7/2008 2:17:04 PM Mountain Standard Time  
Jim Duray directed me to close this issue.

### Description

FROM:bmccaffrey DATE:Wednesday, December 13, 2006 10:48:26 AM

Virtis terminated after I imported the attached 5.4 file and tried to save it. It imports fine and the members do run. I was able to import and save another 5.4 file into 5.5.

FROM:mordoobadi DATE:12/19/2006 10:20:46 AM

The program termination appears to be in the Bridge Validation. As a work around you will be able to save the bridge if you uncheck the "Validate before saving" check box in Bridge Workspace tab of Preferences window.

We will look into the crash problem.

FROM:mordoobadi DATE:12/19/2006 10:48:44 AM

This problem is caused by the code that fixed Incident 7197. The stress limit smart pointer is NULL. So the program crashes.

4/19/2016 3:05:30 PM

HRS AASHTO

924

Complete Issue Information

FROM:kkennelly DATE:1/16/2007 12:59:35 PM  
Fixed for either 5.5 service patch 1 or 5.6 which ever is released first.

Workaround is to either:

1. Specify a Stress Limit on the Beam Details: Stress Limit Ranges tab. You will first have to create a Stress Limit corresponding to the girder concrete material assigned to the beam.

or 2. Just delete the Stress Limit Range on the Beam Details: Stress Limit Ranges tab since a Stress Limit is not assigned anyway.

Note that BRASS does not use this Stress Limit (that's probably why it was left blank) but the Virtis Std Engine does.

FROM:xli DATE:2/5/2007 1:54:08 PM  
It works fine for 5.6 beta 1

FROM:bmccaffrey DATE:Friday, February 23, 2007 9:23:01 AM

Mehrdad's solution worked to import and save in 5.5.

The bridge will import and save in 5.6 Beta 1 without modification.

Incident resolved.

Description

FROM:bgoodrich DATE:Monday, January 08, 2007 6:50:23 PM  
Entered for Dean Teal:

HS vehicles are sometimes not considering the variable rear axle when analyzed with BRASS. Virtis has been relying on the first two characters of the vehicle name to be "HS" to tell BRASS that the rear axle should be varied. As far as I can tell, this is the way it has been coded since the beginning. Now that we are using the SPECIAL-TRUCK command, we can set parameter 6 accordingly.

FROM:dteal DATE:Tuesday, January 09, 2007 11:36:44 AM

FROM:bgoodrich DATE:Tuesday, March 13, 2007 2:15:00 PM  
I revised the ASD/LFD export (BrassStdLoadControl.cpp and BrassStdVehicleExport.cpp) to detect the variable rear axle spacing as was already done for the LRFD export. The "HS Type Truck" flag is now exported on Parameter 6 of the SPECIAL-TRUCK command. Fixed for version 5.6.

| 7765.15570 | Resolved      | Schedule based girder profile reinforcement grid |

### Description

FROM:pwhite DATE:Tuesday, January 09, 2007 2:30:54 PM

When we model a flared beam system with skewed bents, we are forced to specify the beam spacing along the support. This spacing is, of course, larger than the spacing measured perpendicular to the beam. The Virtis std engine output shows that the dead load due to deck concrete is based on the tributary width measured along the supports, when it should be based on the tributary width measured perpendicular to the beam. Is there any way to get around this issue other than simply inputting the deck weight manually?

FROM:hlee DATE:1/16/2007 8:10:43 AM

The bug is fixed and resolved for the 5.6 Release.

I cannot think of any way to get around this issue until the 5.6 Release.

FROM:xli DATE:2/5/2007 11:32:37 AM

For 5.6 beta 1, checked SPACING, perpendicular distance between beams is used.

### Description

FROM:bgoodrich DATE:Tuesday, January 16, 2007 12:06:38 PM  
Entered for Elizabeth Befikadu:

I have a question about the LFD rating method when the strength of steel  $FY < 36$ . There was an issue that we have to use serviceability check for overload provision in AASHTO 10.57. Instead of the normal procedure for LFD rating. Can you tell me how Virtis deal with LFD rating for the specified steel strength. AASHTO provision 10.57 is  $DL+1.67LL$  versus the normal procedure we use is  $1.3DL+2.17LL$ . Thank you

Elizabeth Befikadu

Fax 617-973-7575

FROM:bgoodrich DATE:Tuesday, January 16, 2007 12:12:34 PM

On the engine properties window for each point of interest, there is a checkbox called "Skip Operating Rating Based on Serviceability," which can be used to ignore the serviceability check of 10.57. The only drawback is that this must be set for every point of interest, but in doing so you have to specify everything else at the point of interest as well, i.e., stiffeners, bracing, other engine properties such as section type. Then, on the Analysis tab of the Member Alternative engine properties, you have to select option 0 for the "POI Control" drop-down box.

I don't see an elegant way to get around this issue, short of adding a global "Skip Operating Rating Based on Serviceability" checkbox on the member alternative engine properties. Please let me know if this answers your question.

FROM:bgoodrich DATE:Thursday, January 18, 2007 4:59:13 PM  
E-mail from Elizabeth:

Actually that was not my question. My question is there was an issue between us and

4/19/2016 3:05:32 PM

HRS AASHTO

930

a consultants. The consultants are only checking the serviceability requirement overload Provision of AASHTO 10.57 (DL+1.67LL) versus 1.3DL+2.21LL the normal procedure. The reason they mention is that

for steel FY<36ksi the steel doesn't reach the yield and they said they have only to check the serviceability.

Can you clarify if you are dealing with this is issue this is more of a technical question than an engine. I want to know

how virtis handle structures FY<36ksi for LFD rating

FROM:bgoodrich DATE:Thursday, January 18, 2007 4:59:47 PM

There are currently no options in Virtis that control when or if strength or serviceability checks are performed. Virtis relies on the engines to make this decision. BRASS does nothing different than if the yield strength of the steel is less than 36 ksi. Baker will need to comment on the inner workings of the Standard engine. I couldn't find anything the specification or rating manual to indicate that strength could be ignored under this condition. Is it in the specification or is this based on someone's engineering experience?

FROM:jduray DATE:1/19/2007 3:50:35 PM

Herman - please check wht the StdEngine does relative to this.

FROM:hlee DATE:1/22/2007 1:35:01 PM

There's no option in Virtis to contol when or if strength or serviceability checks are performed in the Virtis Std Engine.

| 7788.15547 | Development   | Truss Rating Problem with Virtis v5.5 |

Description

FROM:hlee DATE:1/18/2007 10:13:01 AM  
 E-mail received from Wes Kellogg, OK DOT:

=====

====  
 Mr. Lee -

We are currently trying to import our Bar7 files into Virtis 5.5 using the import utility. We have encountered a problem described as follows:

Complete Issue Information

When a continuous I-beam Bar7 file is imported, an error message is received upon rating the file. The error message relates to the RC Flexural Reinforcement. Upon researching what the cause of the error was, it was noted that the Effective Flange Width (STD) had not been entered. According to Brian Windsor, this value is calculated by the Bar7 engine. When a value is entered, the file will rate as expected. Please take a look at the attached file.

Any help you could give would be greatly appreciated.

- Wes Kellogg

Reply e-mail:

=====  
===

Wes,

If I remember right, this is one of the problem you described in an e-mail last August. Please refer to Incident 7565 in Virtis/Opis Support Center (<http://aashto.bakerprojects.com/>) for more information.

In Virtis, the reinforcement data entered is located within the effective width. When importing a BAR7 input file to Virtis, the Import Utility will try its best to interpret the data. In this case, the Effective flange width (Std) in the Cross Sections window will left blank since it is not in the BAR7 input file. If you look at the reinforcement data in the Cross Sections window, you will also notice that the areas are the same as those in the BAR7 input file (As and A's) which is based on per foot slab width. After the import, you need to fill in the Effective flange width (Std) and also revise the reinforcement data so the reinforcement area per foot slab width is the same. I cannot think of any way to get around this issue.

When I looked at the imported bridge of your attached BAR7 input file, I suspect something is not right in the imported transverse stiffener ranges. I entered this issue into the Support Center as Incident 7785.

Hope this helps!

Herman Lee

FROM:xli DATE:1/23/2007 9:19:56 AM  
Transverse stiffener ranges in the data file should be input as following, because Bar7 assumes an end of a brace point and stiffener spacing at the right end of each span.

SG1T 2 2000

4/19/2016 3:05:32 PM

HRS AASHTO

934

Complete Issue Information

SG2T 2 1667

FROM:hlee DATE:1/23/2007 2:44:41 PM

If BAR7 doesn't double counted the transverse stiffener when the user entered one already, the import utility shouldn't do that also.

FROM:xli DATE:1/31/2007 9:09:25 AM

Fixed by checking if user has entered first stiffener of the first span before creating one.

Description

FROM:jihnat DATE:1/22/2007 8:05:53 AM

Received via email (Bridgeware):

I'm trying to rate a 38'-4" long thru-truss with 2-interior floor beams

I'm fairly confident that I have all of my sections, geometry, and load correctly defined. Yet when I analyze the truss it is telling me that the failing members are the verticals that aren't at the floorbeams.

4/19/2016 3:05:33 PM

HRS AASHTO

935

Complete Issue Information

Although the failing member is only a single angle (defined as a nondetailed section in my truss file) I'm pretty sure that there should be basically no axial force in these members in the first place.

Could you take a look at this file and tell me what I'm doing incorrectly?

(See attached file: truss\_problem.xml)

FROM:gbhanushali DATE:1/23/2007 4:00:58 PM

It looks like you are not doing anything wrong.  
There are two vertical members ( L2U2 and L4U4) don't end up carrying any live loads. Hence rating results report shows rating factors as "NAN" (Not a Number).  
That is due to denominator of rating equation is zero since live load is zero for those members. There is small dead load which is due to self weight load case.  
You can find it in "Dead Load Analysis Report" under self weight load case and element 11 and 12. (Or analysis log file.)

For other three vertical members ,  
L1U1 -> Element No = 15 ,  
L3U3 -> Element No = 16 ,  
L5U5 -> Element No = 17  
Each shows dead load = 9.3 kips  
live load = 24 kips  
Tensile Capacity = 35.70 kips

You can verify dead load in dead load analysis report under Element Actions.  
Dead load on these members are zero for Floorbeam load case but other super-structure load cases are also contributing to total load. These loads are applied as a point load on the panel points.  
For details on load management, please refer to "Method of Solution" section 1.2.2 using Virtis Help.

Live load of 24 kips you can verify in Live Load Analysis Summary Report.  
Following is some portion for it.

===== Axial for member 15 - L1U1=====

Vehicle Loading Summary for user-defined truck:

|         | Variable |         |           |          |   |
|---------|----------|---------|-----------|----------|---|
|         | Truck    | Axle    | Travel    | Position |   |
| Action  | Position | Spacing | Direction | Id       |   |
| (kip)   | (ft)     | (ft)    |           |          |   |
| Maximum | 24.000   | 20.333  | 14.000    | L to R   | 2 |
| Minimum | 0.000    | 0.000   | 0.000     | L to R   | 0 |

Loading influence line with Lane HS 15-44  
Vehicle Loading Summary for Lane Load:  
Maximum action = 22.54 kip  
Minimum action = 0.00 kip

=====

You may want to further refer to LLAnalysis\_Detail report.

As you can see when vehicle (Position of first axle) is at 20.33 ft , it can produce 24 kips tensile force in U1L1.

FROM:gbhanushali DATE:1/24/2007 10:27:42 AM  
We acknowledged a bug in live load analysis and we are working on it.  
Bug is related to the case when some panel points have floor beams and some panel points don't.  
VI 7788 is marked as bug and is currently being worked on.

FROM: Herman Lee DATE: 4/12/2010 3:20:19 PM Eastern Daylight Time  
Confirmed the nodal loads due to floorbeams in 6.2 Alpha Build 3.

=====

Computing nodal loads due to floorbeams...  
// Floorbeam1 -> 0.839 kip @ 0.000 ft  
// Applied to L0 - Node Number 1  
// Floorbeam2 -> 0.839 kip @ 12.667 ft  
// Applied to L2 - Node Number 3  
// Floorbeam3 -> 0.839 kip @ 25.667 ft  
// Applied to L4 - Node Number 5  
// Floorbeam4 -> 0.839 kip @ 38.333 ft  
// Applied to L6 - Node Number 7  
// Generating load case - Superstructure Floorbeam DC...  
// Superstructure Floorbeam DC@ L0 : Fx = 0.000 kip , Fy = -0.839 kip, NodeNum 1  
// Superstructure Floorbeam DC@ L2 : Fx = 0.000 kip , Fy = -0.839 kip, NodeNum 3  
// Superstructure Floorbeam DC@ L4 : Fx = 0.000 kip , Fy = -0.839 kip, NodeNum 5

### Description

FROM:hlee DATE:1/25/2007 9:59:07 AM

When "Advanced Method" is used to input std live load distribution factors, Virtis Std Engine should use the single lane or multi-lane distribution factor ranges based on the number of lanes loaded from the superstructure definition.

FROM:xli DATE:2/2/2007 3:22:10 PM

Only multi-lane factors are used. I used the attached bridge to test, superstruct def "3 Span GirderLine\_SingleLane", member alt "Composite Plate Girder".

The superstructdef is set to single lane in super def window.  
The input in GUI is

| One Lane DF |        |         | Multi Lane DF |        |         |
|-------------|--------|---------|---------------|--------|---------|
| SHEAR       | MOMENT | DEFLECT | SHEAR         | MOMENT | DEFLECT |
| 0.800       | 0.800  | 0.800   | 1.000         | 1.000  | 1.000   |

The Virtis StdEngine output is

4/19/2016 3:05:33 PM

HRS AASHTO

938

Complete Issue Information

DISTRIBUTION FACTORS  
SHEAR MOMENT DEFLECT  
1.000 1.000 1.000

FROM:hlee DATE:2/5/2007 9:09:13 AM

Advanced is selected for the distribution input method. This implies distribution factor ranges are to be used. The distribution factors you listed above on the output are not ranges. Those numbers you listed will not be used since D.F. Ranges is "Y" in Control and Criteria. See the analysis log file, input data file, or Virtis Std Engine User Manual for more information.

FROM:xli DATE:2/5/2007 1:25:12 PM

LIVE LOAD DISTRIBUTION FACTOR RANGES is checked, correct factors are used.

Description

FROM:dhorton DATE:Thursday, January 25, 2007 3:37:43 PM

The attached file took an extremely long time to run (3 minutes per beam - 6 minutes total) on Virtis 5.2. I know we are far past this, but it is still our production version. I tried to import to 5.5, but this one was too far back. We have several files that are exactly the same type structures and have very similar

4/19/2016 3:05:33 PM

HRS AASHTO

939

input, but run in seconds. We would just like to know if there is something obvious that causes this to drag.

The beam overhangs at the Abutments look large, but this structure has Integral Abutments and thus the values shown. As stated above, previous similar files have executed fine.

No need to spend a great deal of time, but we are interested i what might be the cause.

FROM:jduray DATE:1/29/2007 11:55:24 AM

FROM:bgoodrich DATE:Monday, January 29, 2007 12:03:15 PM  
The performance issue was corrected in the BRASS-GIRDER 5.9.3, which was released with Virtis 5.5.

XML file attached.

FROM:kkennelly DATE:2/7/2007 11:16:13 AM  
The difference in rating factors is not related to any problem with your data. In version 5.4 and previous versions, the BRASS program required the area of reinforcement to be constant over a cross section range. When Virtis exported the cross sections to the BRASS input file it computed the rebar dev lengths and made conservative estimates of the developed rebar so that the rebar exported in a cross section range would have the same area steel at the start and end of the range.

In version 5.5, BRASS allows the area of rebar to vary over the length of the cross section range so Virtis does not have to conservatively export the smaller area when the range is within the development length of the rebar. That is why your rating factors increased.

Refer to Example 3 in the Virtis help topic "Schedule Based Reinforcement Cross Section Export Examples" for more description. The BRASS formerly followed the procedure listed there for the VirtisStdEngine (area of steel had to be the same at start and end of a range).

Description

FROM:bmccaffrey DATE:Wednesday, February 07, 2007 9:58:46 AM

I'm having a problem with the P/S strand library in v/5.5. See attached screen capture of window. This was an upgraded 5.4 Oracle database. The designations are different from my MSDE migrated database. Also, the modulus of elasticity (E) has changed for stress relieved strands from 28,500 ksi to 29,000 ksi which in turn is reflected in the losses, capacity, rating factors, etc.

FROM:mordoobadi DATE:2/9/2007 4:35:12 PM

Prepared and sent Brian SQL Scripts that renews all material and factor librray items in the database.

### Description

FROM:bmccaffrey DATE:Monday, February 12, 2007 2:21:31 PM

We are having problems on a number of girder-floorsystem structures where they cannot run to completion from the Bridge Explorer. There are no errors. Each component of the bridge can be successfully analyzed from within the Bridge Workspace. Attached is a typical bridge that will run for hours. I'm using both H20 and HS20.

FROM:hlee DATE:2/16/2007 8:20:00 AM

Test that I have done so far:

- Run from Bridge Explorer using both H20 and HS20, FB1 analysis still running after 1 day.
- Run from Bridge Workspace using both H20 and HS20, FB1 analysis still running after 2 days.

We need a better way to reproduce and debug this kind of performance/reliability problem.

Description

FROM:hlee DATE:2/14/2007 11:27:54 AM  
E-mail from Paul Jensen:

I have been wasting my time trying to figure out why this one bridge has two answers. I migrated the bridge from 54 to 55 using the database utility and I am getting an inventory rating of 1.03. when I import an xml file from 54 to 55, I am getting a inventory rating factor of 1.35. there are differences with the brass export files (attached) and the minor differences with the xml files (attached).

This may be a continuation of VI7834.

- vo54\_g1.xml => xml export from vo54
- vo55\_g1.xml => migrated database from vo54 (same bridge)
- vo55q1.dat => brass input file from vo55 database migrated bridge
- vo54q1.dat => brass input file from vo55 xml migrated bridge

I use asa 902 for all of these bridges.

Reply e-mail:

=====  
Paul,

The length of the haunch profile range for the bridge in vo54\_g1.xml is 0m. This value is 44.3m for the bridge in vo55\_g1.xml. Seems like this is the cause of different rating factor.

I'm not able to reproduce what you described. Both xml files and rating results between the migrated and imported bridge are the same. My testing steps are listed below. Could you check to see what might be different between my testing procedure and yours?

1. Import vo54\_g1.xml to a Sybase 54 database
2. Migrate the 54 database to 55
3. Import vo54\_g1.xml to the 55 database
4. Export the bridge in [1] as MigratedWithDB.xml (Attached)

Complete Issue Information

FROM:bmccaffrey DATE:Thursday, February 15, 2007 1:55:22 PM

and never ends. The BRASS output file for the floorbeam analysis ends after the section property tables.

The floorbeam error file contains the following text:

Fatal Error Encountered - Unexpected Termination  
Data File: n't\_end)\Floorbeam2\FB2-6\BRASS\_LFD\FB2-6.DAT

The .xml file and analysis results are attached.

FROM:kkennelly DATE:2/16/2007 1:16:08 PM

I think the problem is due to the width of your structure typical section and the BRASS increment values set on the Floorbeam Member Definition: Engine tab. Your travelway width for this structure is slightly under 75' and the settings on the Floorbeam Member Definition: Engine tab are causing a lot of vehicle transverse locations to be considered. Refer to the BRASS engine help on that tab for what these settings do.

The settings on the Floorbeam Member Definition: Engine tab are as follows for your bridge:  
Wheel advancement denominator: 100 Lane advancement increment: 1 ft

These values are causing a lot of transverse vehicle locations to be considered. I changed these settings to wheel adv. denom = 50 and lane advancement increment to 6 ft and the FB2 analyzed very quickly. You will need to adjust these values to provide a run time and accuracy that are suitable for you. (25 and 3' also ran fairly quickly for me but I did get very different RF's between these 2 runs. )

FROM:kkennelly DATE:2/16/2007 1:24:15 PM

This is a duplicate of 4728 which is a suspended enhancement to BRASS. Maybe Brian G. can verify or offer suggestions for these settings.

FROM:kkennelly DATE:2/16/2007 1:43:53 PM

FROM:hlee DATE:2/16/2007 2:27:32 PM  
7835 is a duplicate of this incident.

FROM:bmccaffrey DATE:Friday, February 16, 2007 3:35:04 PM

It's much faster with the larger increments but I'm a little concerned with accuracy. Fix gladly accepted though.

FROM:bmccaffrey DATE:Thursday, February 22, 2007 9:30:47 AM

Any word from Wyoming on a better solution? One member shouldn't take 3 days to analyze with today's technology no matter what the settings are.

FROM:bgoodrich DATE:Tuesday, February 27, 2007 8:23:36 PM

I would keep the wheel advancement denominator at 100 because this controls how fine or coarse of an influence line there is. Setting the lane advancement increment to say 3 ft seems to work well and the actual floorbeam analysis takes less than a minute for Floorbeam1 and Floorbeam3.

Description

FROM:kkennelly DATE:2/26/2007 2:36:06 PM  
Submitted for Ron Love via email:

We have run into a situation with bridges having steel beams supporting a timber deck. The attached xml file contains a sample of this type of bridge.

Here is the segment of code where we check for the deck type. Virtis shows the deck type as 'Timber', however the API returns a value of 36201 for deck type of this structure. The documentation indicates that this value corresponds to a concrete deck.

```
IDeTypePtr ptr = m_DoGSStructDefPtr->GetDeckType();  
long typId = ptr->GetCurrentTypeId();  
if (typId == TYP_DECK_CONCRETE)
```

This is not an urgent issue for us at this time, but wanted to bring it to your attention so we can know whether we are doing something wrong or if there is a flaw in the API.

Also regarding my new email address, as of Feb. 1 CWB ceased to exist and we are all now part of Bentley Systems.

Thanks,

Ron

FROM:kkennelly DATE:5/2/2007 11:21:50 AM

FROM:kkennelly DATE:5/2/2007 11:33:18 AM

There may be some existing bridges out there that have incorrect data for the GirderSystemStructDefPtr->GetDeckType() due to a bug that existed when we introduced timber decks in version 5.0. We found this problem but did not have a foolproof way to determine when we should change the value stored in the Deck Type attribute.

For a girder system structure def, the best way to determine the type of deck is to check the deck panel type in the DeckPanelRangeSet (this is what the GUI is doing):

```
IDoDeckPanelRangeSetPtr DoDeckPanelRangeSetPtr;
```

```
DoDeckPanelRangeSetPtr = DoGirderSystemStructDefPtr->GetDeckPanelRangeSet()  
if(DoDeckPanelRangeSetPtr->MoveFirst())  
{  
    long IDeckPanelType = DoDeckPanelRangeSetPtr->GetDeckPanelTypeId(); // returns types from  
    category DECKPANEL  
}
```

FROM:kkennelly DATE:5/2/2007 11:43:37 AM

We will include a description of this in the API docs.

### Description

FROM:ttompson DATE:Wednesday, February 28, 2007 8:33:44 AM  
When SDDOT first started using Virtis-Opis, we ran a script to enable our ASA db to do check-in and check-out. I've made a copy of our DB, removed all the structures from it and want some of our designers to use as a scratch DB. But I don't need (or want) them to have to necessarily check-out and check-in the structures they are working on. Can you provide me the table and column I need to change from Y to N to turn off the check-out, check-in?  
Thanks,

### Description

FROM:hlee DATE:2/28/2007 1:18:22 PM

Paul Jensen reported that he gets very bad performance when analyzing timber bridges in his database.

4/19/2016 3:05:36 PM

HRS AASHTO

955

Complete Issue Information

To reproduce: The timber bridges are in the "Complete Bridges" folder in his database. Sort by BID and select the first 40 bridges and rate.

FROM:hlee DATE:2/28/2007 1:57:26 PM

Attached a performance analysis report for batch bridge rating. We indentified that updating the tree in the Analysis Progress window causes the system to perform badly. The performance can be improved with more efficient searching algorithm.

FROM:hlee DATE:3/1/2007 3:44:29 PM

Modified the tree item search algorithm to start at the second level. An updated performance analysis report is attached. Batch bridge rating performance increased 6 times.  
Resolved for the 5.6 release.

Description

FROM:rcurtis DATE:Wednesday, February 28, 2007 4:13:27 PM

We are creating a new, production database. I deleted all of the bridges (training bridges) from the bridge explorer. I also deleted all bridges from the "deleted bridges" folder.

Every structure that I try to import gives the error that the bridge ID is not unique. There are no bridges in the bridge explorer, so I'm not sure how the id is not unique.

Also, how do you import a structure that might have the same BID as a structure in the database that you are attempting to transfer it to?

Description

FROM:kkennelly DATE:3/5/2007 8:09:42 AM  
Submitted for Steven Maberry, New Mexico via email:

Find attached:

- 1) XML Export file for Bridge 9396
- 2) Text output that is an extract from the BRASS output file after rating Bridge 9396 (Sample.OUT)

## Complete Issue Information

We are using Virtis Opis version 5.5

The difficulty we have with the rating output is that BRASS claims a pretension strand Development Length of 2.083 feet (see page 12 of the BRASS output files-the germane detail of which is provided in the Sample.OUT attached).

According to the LFD code (Equation 9-42 in Section 9.28-"Embedment of Prestressed Strand"):

$$\text{Development Length} = 1.6(f_{su}^* - \frac{2}{3} \times f_{se})D$$

Where  $f_{su}^*$  is average stress in prestressing steel at ultimate load  
 $f_{se}$  is effective steel prestress after losses  
 $D$  is the nominal diameter in inches.

The expression in the parenthesis is considered (according to the code) to be without units and  $f_{su}/f_{se}$  are in kips per square inch.

Then:

$$\text{Development Length} = 1.6(270 - \frac{2}{3} \times 157.7) 0.5 \text{ inches} = 131.9 \text{ in} = 10.99 \text{ feet}$$

The apparently erroneous value of 2.083 feet in BRASS results in a significantly greater rating that is not supported by investigating the bridge's capacity by other means (ConSPAN).

We have identified that the value 2.083 feet is equal to the TRANSFER LENGTH (50 diameters ...  $50 \times 0.5 = 25$  inches = 2.083 feet-as per LFD Code Section 9.20.2.4).

### QUESTION:

Is this a BRASS logic error? Have we overlooked or misunderstood something?

Steven Maberry, P.E., Ph.D.  
NMDOT State Bridge Rating Engineer

FROM:bgoodrich DATE:Monday, March 05, 2007 6:07:02 PM  
BRASS LFD only provides input for either the transfer length or the development length. Currently, only the transfer length is exported. Also, BRASS LFD does not calculate the development length. I will forward this issue to WYDOT.

FROM:bgoodrich DATE:Wednesday, June 06, 2007 8:43:55 AM  
WYDOT assigned this issue to BRASS Problem Log 749.

FROM: Brian Goodrich DATE: 1/8/2010 1:46:29 PM Mountain Standard Time  
WYDOT has chosen to not make this change in the BRASS-GIRDER(STD) engine because the capability to input both the transfer and development length is present in the merged BRASS-GIRDER engine, which is being released as a beta version in early 2010. Once the export to this new engine is developed, this capability will be available to the Virtis users.

### Description

FROM:ttompson DATE:Thursday, March 29, 2007 3:17:25 PM

I have a new PS Girder Bridge in which I observed low ratings, by Shear. I reviewed my data and I thought it looked correct. But when I review the BRASS data set, I'm noticing that the start distance from beam end does not look correct.

For Str 10309368, PS Girder System, Member G2, Int Girder Member Alternative

I've attached a spreadsheet with what the Shear spacing is for the structure

I've attached the Virtis 5.5 xml file

I've attached the BRASS input/output files.

One caught my attention was an error message that the shear reinforcement was different at one end of the range versus the other end.

For example:

I calculated from plans that one range of shear reinforcement would start at 20.50 ft from end of beam, 6 spaces at 15 inches with a range length of 7.50 ft and ending at 28.00 ft. The BRASS data set shows it starting at 20.25 ft from beam end, with 15 inch spaces, range length of 7.5 ft. Somehow the range start distances are shifted 3 inches.

Maybe I'm missing something obvious?

FROM:bgoodrich DATE:Wednesday, June 06, 2007 9:20:40 AM

For the member alternative engine properties for the BRASS LFD engine, the P/S modeling method is set to "Centerline of simple-span bearing". Therefore, the BRASS model will be slightly different than the Virtis model. Virtis allows the stirrups to be defined in the entire P/S beam; however, BRASS only allows the stirrups between the simple-span bearings (in this case) to be defined. The 3" "shift" that is present in the BRASS commands are due to the 3" overhang at the left end of span 1. The export puts a stirrup at the support and then finds the first interior stirrup (right of left support) to determine the first

4/19/2016 3:05:38 PM

HRS AASHTO

964

Complete Issue Information

spacing. The other interior stirrups are really just adjusted to reference the left support, so the stirrups are not shifted within the beam.

The shear ratings around the 109.11 POI (~48.5 ft from left support) appear to be critical. Is the stirrup spacing the cause of the shear rating difference or is there something else occurring. Was a different shear method/equation used in the design? Virtis only allows the Vci/Vcw method right now.

### Description

FROM:tthompson DATE:Friday, April 06, 2007 9:32:48 AM

I had made many successful runs on this system, and suddenly I started getting an error message that there was an error generating LFD/ASD load commands. It appears to happen during the virtual loading.

Superstructure Definitions - Span 5 and Span 8  
Floorbeams FB 0 and FB 1

I've attached the error message (as a WORD doc), along with the brass files generated and the bridge XML file.

(I have not completed the Truss portion, so that part does not work yet). But I've made numerous runs of the stringers, floorbeams.

Complete Issue Information

FROM:ttompson DATE:Friday, April 06, 2007 9:39:36 AM

I can't seem to upload any files today - keep getting an error message. Will try later.

Persits.Upload.1 error '800a0005'

The system cannot find the path specified.

/AASHTOVIWeb/Manager/iwupldpr.asp, line 37

FROM:ttompson DATE:Friday, April 06, 2007 9:42:43 AM

FROM:hlee DATE:4/6/2007 2:07:37 PM

The up-to-date flag of the dead load reactions (DoFlrbmStringerDLReaction Line 985) shouldn't return false since virtual stringer analysis had been completed before the floorbeam analysis. Incident 6543 described the same problem.

FROM:ttompson DATE:Tuesday, April 10, 2007 1:36:48 PM

I can "override" the values and get the analysis to work. It's a tedious workaround. Just not sure why I was able to make many valid runs and then it quit working correctly. It did seem to break after I changed the DL Distribution method for Stage 2 loads from Uniformly to All Girders to By Tributary Area. Not sure if this helps track down why it broke or not.

FROM:ttompson DATE:Tuesday, April 10, 2007 2:33:39 PM

I exported the bridge from 5.5 and imported it into 5.6 Beta 2. Appears to run just fine. But as soon as I reviewed the Stringer Unit Reactions, did a select all, then apply. It then generates the error message when ever I run a floorbeam associated with that stringer unit. I think this narrows down where the problem generates. - see attached word document.

FROM:ttompson DATE:Thursday, May 10, 2007 3:19:22 PM

Merdad's workaround did keep me going -

Unfortunately I wasn't able to find a work-around that works through Virtis/Opis application. However, I have a remedy that involves changing the values of some fields in the database.

Here are the instructions on how to correct your data.

- (1) Find the BID of the bridge that you want to correct.
- (2) If your bridge is open in BWS then close it.
- (3) You should run the following SQL scripts to correct the data in your database for your bridge. Note that you must replace the BID in the scripts with the correct BID number for your bridge.

FOR SYBASE ASA:

-- Set the UP\_TO\_DATE flag

```
UPDATE abw_flrbm_stringer_dl_reaction SET up_to_date_ind = 'T' WHERE bridge_id = BID;
```

-- This makes the results timestamp to some time in the future

```
UPDATE abw_stringer_dl_react_detail SET results_timestamp = '2007-04-13 12:00:00.000'  
WHERE bridge_id = BID;
```

FOR ORACLE DATABASE:

4/19/2016 3:05:39 PM

HRS AASHTO

968

## Complete Issue Information

```
-- Set the UP_TO_DATE flag
UPDATE abw_flrbm_stringer_dl_reaction SET up_to_date_ind = 'T' WHERE bridge_id = BID;

-- This makes the results timestamp to some time in the future
UPDATE abw_stringer_dl_react_detail SET results_timestamp = TO_DATE('2007 04 13 12:00:00',
'YYYY MM DD HH24:MI:SS') WHERE bridge_id = BID;
```

FOR SQL SERVER/MSDE:

```
-- Set the UP_TO_DATE flag
UPDATE abw_flrbm_stringer_dl_reaction SET up_to_date_ind = 'T' WHERE bridge_id = BID;

-- This makes the results timestamp to some time in the future
UPDATE abw_stringer_dl_react_detail SET results_timestamp = 'Apr 13 2007 12:00:00' WHERE
bridge_id = BID;
```

Please let us know what you find out after applying the above scripts.

Regards,  
Mehrddad Ordoobadi

Mehrddad

FROM:hlee DATE:9/20/2007 3:20:12 PM

The check for up-to-date stringer DL reaction is broken in 5.5. The checkbox will never get checked in the GUI.

### Description:

1. Floorbeam Stringer Reactions window's AttachData calls UpdateFloorSystemGeometry().
2. UpdateFloorSystemGeometry() updates the span length table (abw\_super\_struct\_mbr\_span) by deleting and re-adding the data. This cause modification status of DoSuperStructMbrSpanSet set to modified.
3. After AttachData is called, the window will call GetUpToDateInd() to see whether the stringer DL reactions are up-to-date.
4. GetUpToDateInd() calls UpdateUpToDateFlag() to determine whether floorbeam member stringer DL reactions are up-to-date.
5. Sine modification flag is set to modified by the UpdateFloorSystemGeometry() before the window is open. The up-to-date checkboxes in the windows will never get checked.

### Option 1:

Do UpdateFloorSystemGeometry() after GetUpToDateInd().

### Option 2:

Remove modification checking for DeSuperStructMbrSpan in DoModificationStatusFunctions2.

| 7962.15373 | Duplicate     | Design method shows LFD in Analysis results window when using BRASS ASD |

### Description

FROM:rlenox DATE:Tuesday, May 22, 2007 11:54:28 AM

I am having trouble getting the LL shear forces to compute correctly. The LL shear forces and reactions seem to be calculated (based on hand check) using the Distribution Factors input for Moment and not shear when using the BRASS ASD Engine. The bridge is a steel stringer bridge with a corrugated steel planking deck with beams spaced at slightly more than 2 feet on center.

FROM:hlee DATE:5/22/2007 2:44:52 PM

BRASS LFD/ASD Engine only uses the moment live load distribution factor in the Live Load Distribution window. Engine Help has information on what is used and not used by a specific engine.

FROM:kkennelly DATE:6/19/2007 9:36:17 AM

I reviewed G2 and the controlling rating is at 6.727 m in span 1. I don't see anything in a cursory review of the output to suspect that BRASS or Virtis is wrong. I suggest the user create a point of interest at the controlling location and review the detailed BRASS output at that point to determine why the rating is so low.

### Description

FROM:jtrizeenberg DATE:Thursday, June 21, 2007 3:36:46 PM

I have a girder that is returning a very low rating. In reality, this girder has a rolled shape hinged with a plate girder. Here I have approximated the rolled shape as a plate girder and analyzed it. However, the larger and deeper plate girder shows a very low rating. I'm wondering if this is because it is hinged with a smaller beam.

Is there any better way to have Virtis analyze a rolled beam hinged with a plate girder?  
(this is for the interior girder only)

Thanks,  
Jeff

FROM:hlee DATE:6/22/2007 9:11:37 AM

There is no direct way to input rolled beam hinged with a plate girder. An alternative is the way you used, model the rolled shape as a plate girder.

I reviewed the interior girder input and BRASS output. There are several items you may want to check:

1. The locations of the points of contraflexure specified in the Member Alternative BRASS LFD engine properties.
2. There is no composite action between the deck and the girder.

### Description

FROM:rfulton DATE:Monday, June 25, 2007 11:35:30 AM

We were analyzing a bridge using non-std gage for a permit. The bridge is a 70' simple prestressed multi girder span. The load to not pass and when we started digging found out that the controllin distribution factors were coming from negative moment. This was supposed to have been fixed during the beta tag meeting prior to the 5.5 release. Attached are the truck and bridge models and copy of output.

Being we are messing with the Rating Results report in Beta 3 – I would sure like to see the Impact and Lane columns populated with actual data.

As Requested isn't very useful, especially if someone besides the report creator is reading it.

I would like to see the Impact column populated with – with or without impact or % impact and the Lane column with single or Multi-Lane. Now this would truly make this report meaningful and useful.

| 7998.15337 | Resolved      | NSG - Bridges will not run |

### Description

FROM:hlee DATE:7/2/2007 9:45:25 AM  
See attached file.

To reproduce:

1. Open BID 10 Bridge Workspace.
2. Open "G2 | Interior Member" Member Alternative Description window.
3. Change ASD Analysis Module from "BRASS ASD" to "Virtis ASD".
4. Select Rating Method ASD and Type 3 vehicle in Analysis Settings window.
5. Analyze "G2 | Interior Member".

FROM:mordoobadi DATE:9/12/2007 10:17:43 AM

The PS rating module only reports LFD ratings and no ASD results are available. It is different from the Steel and RC beams.

Based on a discussion with Herman, since the PS module does not support ASD it should warn the user that it will perform an LFD rating instead. It should also pass the corrected rating method 21702 (instead of 21701) for PS bridges.

FROM:hlee DATE:9/12/2007 3:59:00 PM

A message box will pop up and ask user whether to perform an LFD analysis.  
Resolved for 5.6 Release.

Complete Issue Information

I think I've found a solution to this. In AddMbrNodesInSpan() multiply percentages by 100 when comparing percentages to determine if G2 has nodes at the same percentages as G1. Waiting to discuss this with Jim when he returns from vacation and do some testing to be sure this won't break anything before I mark this as resolved.

FROM:tarmbrecht DATE:Wednesday, July 18, 2007 12:42:04 PM

Krishna, can you tell me if this is related to the incident I reported (7990)? Thanks, Tim

FROM:kkennelly DATE:8/7/2007 12:54:45 PM

Yes Tim this incident is related to your 7990.

Solution stated on 7/17 didn't work. Had to use tolerances when building the model. Also now issue message and stop analysis if all members don't have the same number of nodes when the deck shells are generated.

Fixed for 5.6 Beta 4.

FROM:tthompson DATE:Tuesday, October 02, 2007 1:52:24 PM

Not Sure -

Str 29299040

IN 5.5 Release runs HS20 Analysis OK

IN 5.6 Beta 5 Release - HS20 Analysis fails to run.

Error Message -

Error generating LFD/ASD schedule commands!

Error getting start distance and range for bracing schedule!

Error generating BRACING-SCHEDULE command!

Unable to determine span where range ends!

Error determining start distance and range!

Splayed girders and/or tapered overhangs are not allowed!

Error generating deck commands!

It did appear to do the NSG analysis, but the BRASS analysis failed.

So, not sure if this could be closed since the NSG runs, but now I have a bridge that ran in 5.5 but won't run in 5.6.

For Str No 29300040

This does run NSG now in 5.6 Beta 5.

FROM:hlee DATE:10/3/2007 11:59:53 AM

Str 29299040:

For the "3 Span, 5 Girder System" definition, the left overhang at the start of the bridge is 3.33 ft and the left overhang at the end of the bridge is 3.333 ft. That's why BRASS export is complaining "tapered overhangs are not allowed".

Todd, Are the tolerances set in your 5.5 database the same as those in your 5.6 Beta 5 database?

### Description

FROM:bmccaffrey DATE:Tuesday, July 10, 2007 2:21:34 PM

Complete Issue Information

It appears that BRASS is calculating the incorrect moment capacity for the attached bridge - see SD5, G5.

This is a non-composite steel riveted girder.

BRASS:  $I_x=110464 \text{ in}^4$   
Std Engine:  $I_x= 110426 \text{ in}^4$

BRASS:  $M_{dl}=2375.8 \text{ ft-k}$   $M_{ll}=1868.9 \text{ ft-k}$   
Std. Engine:  $M_{dl}=2331.1 \text{ ft-k}$   $M_{ll}=1876.8$

Moments and  $I_x$ 's match exactly.

but

BRASS:  $M_u(\text{top})=5178 \text{ ft-k}$   $M_u(\text{bottom})=10356.0 \text{ ft-k}$   
Std. Engine:  $M_u(\text{top})=\text{not reported}$   $M_u(\text{bottom})=10352 \text{ ft-k}$

Looks like BRASS is using  $M_u(\text{top})$  for the controlling rating but reports that bottom flange flexure controls.

$M_u(\text{top})$  should equal  $M_u(\text{bottom})$  for this beam so I think BRASS is incorrect.

FROM:hlee DATE:8/2/2007 10:49:21 AM

Virtis Std LFD Engine also considers the section at 73.25 ft (105 POI) as braced non-compact. In BRASS, the  $F_{cr}$  used in 10-99 is 22.5 ksi calculated using flange thickness (t) equals to 0.5625 in. In Std Engine, the flange thickness (includes the two cover plates) is 1.3125 in.  $F_{cr}$  in Std Engine is maxed out to 45 ksi ( $F_y$ ). As a result, the  $M_u(\text{top})$  is 5178 kft in BRASS and 10352 kft in Std Engine. I think the issue is the same as Incident 5218 and also the resubmitted Incident 8058.

FROM:hlee DATE:8/2/2007 12:38:45 PM

Description

FROM:hlee DATE:7/13/2007 2:29:31 PM  
 Submitted on behalf of Chris Dombrowski, Williams & Works:

Why do the "detailed rating results" on the report output (see .pdf page 10) show shear as the controlling limit state when the "load factor rating summary" and "strengths and ratings in Virtis LFD Output" show moment is the controlling limit state (see .pdf page 2 and the Virtis LFD Output Line #927)? i.e. Why does .pdf page 10 not match the Virtis LFD Output Line #927? Both files were run using the Virtis Engine. Shouldn't they have the same results?

FROM:hlee DATE:7/26/2007 8:48:26 AM  
 When populating analysis results, the engine shouldn't compare special codes (e.g. 999.99) to determine critical rating factors.  
 Resolved for both 5.6 and 6.0.

Description

FROM:hlee DATE:7/17/2007 6:02:45 AM

Submitted on behalf of Chris Dombrowski, Williams & Works:

I have another question regarding the Brass vs. Virtis output for this structure. When I run the Brass Engine I get an inventory shear rating of 0.88 at point 209 (54.92 ft) of span 2 (See Line #8751 of Brass Output). However, when I run the Virtis Engine I get an inventory shear rating of 1.56 at the same point (See Line #917 of Virtis Output). Which one, if any, is correct? Why is there such a large difference between these two - is there an error in one of the analysis engines?

FROM:jduray DATE:Thursday, July 19, 2007 3:23:25 PM

FROM:hlee DATE:9/4/2007 11:34:52 AM

The differences in engine capabilities between Virtis Std LFD Engine and Wyoming BRASS-GIRDER are the cause of the difference in rating factor.

1. In shear strength  $V_{ci}$  computation (AASHTO 9.20.2.2), Virtis Std LFD Engine sets no limit on  $M_{cr}/M_{max}$ . BRASS-GIRDER defaults to limit  $M_{cr}/M_{max}$  to 1.0. After the  $M_{cr}/M_{max}$  is set to no limit in the member alternative engine properties, the rating factor increase from 0.88 to 1.02.
2. Virtis Std LFD Engine calculated stresses and strengths of prestressed concrete section using the transformed section properties. BRASS-Girder uses the gross section properties.

Submitted on behalf of Brian McCaffrey via email:

1- It looks like when you have a rolled section with deterioratrion, the net area is not calculated using the beam area from the section library. It looks like it's turned into an equivalent plate girder before the deterioration is deducted - can you confirm this? It's not corrcet if it is.

FROM:kkennelly DATE:7/17/2007 10:34:08 AM  
(I'm not sure but the xml file attached to VI8010 may have this problem.)

FROM:gbhanushali DATE:7/30/2007 11:46:18 AM  
This has been fixed for 5.6 beta build 6 ~ Aug/07

FROM:gbhanushali DATE:7/30/2007 11:47:31 AM  
Yes it was being calculated using built up tool - for channel , angle and I.  
changes now reflect only for Area and not for Izz, lyy etc... which will be in future along with other enhancements - ( By Phone : JAD , Brian discussion )

Description

FROM:kkennelly DATE:7/19/2007 12:17:17 PM  
Submitted on behalf of Vinacs, CALTRANS via email:

Krisha

We have performed an analysis on a two span continuous T-beam bridge, the negative demand for one of the bridge seems to be inaccurate.

I attach the one that we think the results was wrong.

(See attached file: 38C0226.xml)

In this model, negative live load moment demand away from the support (0th to 0.7th pt of span 1 and 0.3rd to 1.0th pt of span 2) is reported as ZERO.

4/19/2016 3:05:44 PM

HRS AASHTO

993

Complete Issue Information

We have done another bridge that is similar configuration, but span length was exactly 16.00 (instead of 16.594 ft). For this bridge, results seems to be perfectly correct.

See the comparison of the results in the attachment (See attached file: 38C0226 bridge results.doc)

Vinacs M Vinayagamoorthy  
916-227-8657

FROM:kkennelly DATE:7/19/2007 12:21:15 PM  
Email sent to Vinacs:

I took a look at your bridge and I can't find any reason why the negative moments are zero at the ends of the span. I've entered your problem as incident 8019 on the Technical Support website and assigned it to Brian Goodrich so he can investigate the BRASS LFD results.

FROM:bgoodrich DATE:Monday, July 23, 2007 9:58:41 AM  
I reviewed your structure (Incident 8019) and finally noticed the support conditions. The left, middle, and right supports are pinned, fixed, and roller, respectively. Is this correct? Or should the middle support be a roller also?

FROM:bgoodrich DATE:Monday, July 23, 2007 9:59:16 AM  
E-mail from Vinacs (7/23/2007):

Good catch! Sorry to send this bridge to Krisha and You to check this. We should have caught this error.

This bridge was a framed structure, as a result, initially rater checked it as a framed structure. Apparently he never entered the framed connection details. When we were reviewing the bridge for error, the checker was checking whether the 'non' framed case gives him different value (without realizing the framed detail is NOT complete)

Thanks for catching the error.

### Description

FROM:ttompson DATE:Tuesday, July 24, 2007 11:05:10 AM

We're working on coding up a Girder, Stringer, Floorbeam system. The 2 Main Girders each have a couple of hinges in them. But we just noticed that there is no Hinge option for main girder members when you have a floor system. Is this intentional? Is this a bug? Or do we need to add an enhancement to add hinges to steel girder members?

FROM:hlee DATE:7/24/2007 1:20:36 PM

Duplicate of Incident 4840. Also in Incident 7050.

## Description

FROM:tthompson DATE:Tuesday, July 24, 2007 11:15:59 AM

I believe due to VI 8028, we end up with 80+ Floorbeam conc. loads on the main girders, so we exceed the 70 limit of BRASS.

4/19/2016 3:05:45 PM

Complete Issue Information

Will this problem go away when we add the 2 hinges to the main girders? If not, how do we get the main girders to analyze when we have too many floorbeams.

FROM:ttthompson DATE:Tuesday, July 24, 2007 11:18:47 AM

FROM:bgoodrich DATE:Tuesday, July 31, 2007 7:30:58 PM

I don't think the presence of hinges will affect the number of concentrated loads. Could the large number of floorbeams be modeled as a single uniform load along the girder? If not, I'll forward this request to WYDOT.

FROM:bgoodrich DATE:Thursday, August 02, 2007 6:28:41 PM

E-mail from Todd Thompson:

That is our work around. We have still yet to been able to model a complete bridge with a floor system in Virtis. I thought we were close finally.

We've had to break apart our continuous stringers, we have to limit our floor beams. So we are back to what we did in BARS, create a equivalent uniform load on the main girders. So much for modeling the bridge as it stands.

I wasn't sure how BRASS handled the hinges, break it into individual structures (hopeful but doubtful) or still leave it as one long structure with the BRASS limitations of max # loads.

Thanks for checking into it.

Todd S. Thompson, PE

FROM:bgoodrich DATE:Thursday, August 02, 2007 6:31:57 PM

I forwarded this request to WYDOT to see if anything can be done on the engine side. Should the export process combine the floorbeam dead loads and apply an equivalent uniform load to the main girder when the number of floorbeams exceeds the number of concentrated loads allowed by BRASS?

FROM:bgoodrich DATE:Friday, August 03, 2007 10:33:59 AM

E-mail from Todd Thompson:

That would be quite an enhancement to the export process.

We would be agreeable to that approach.

Todd

FROM:bgoodrich DATE:Friday, August 03, 2007 10:34:28 AM

When the number of concentrated loads is greater than the BRASS maximum, I think we could create an equivalent uniform load to be applied to the entire girder. I think we just have to check the concentrated loads array. The export work appears to be limited to the CLoadsUtility::Prepare function under the "Average Stringer Unit Dead Load" heading in the cpp file. Does this sound feasible? I estimate this would only take a few hours to implement.

FROM:bgoodrich DATE:Friday, August 31, 2007 10:59:39 AM

4/19/2016 3:05:45 PM

HRS AASHTO

997

Complete Issue Information

I revised the CLoadsUtility::Prepare function to create an equivalent uniform load along the girder in place numerous concentrated loads. This change needs tested when Todd submits his bridge file.

Description

FROM:tthompson DATE:Tuesday, July 24, 2007 11:19:04 AM

We have a 9 span Girder, Stringer, Floorbeam bridge we've been attempting to analyze. The stringers are continuous the entire length of the bridge, except at the 2 main girder hinge locations.

Due to the limitations of BRASS, we created 9 stringer units (1 per each span). But we still end up with problems with the Floorbeams at the Bents/Piers not running correctly. This floor beam is the end of two adjacent stringer units.

We get an error message that we have 17 (or 18) spans and BRASS is limited to 13 spans. Our longest stringer unit is 10 spans, the rest are 8 or 9 span stringer units. It appears to be limiting the number of spans by summing the two adjacent stringer units. (ie. 8 span stringer unit on left, 9 span stringer unit on right - sum of both stringer units = 17) This doesn't seem correct.

FROM:kkennelly DATE:7/30/2007 8:33:47 AM

Can you attach an xml file of the bridge?

FROM:kkennelly DATE:9/25/2007 3:59:35 PM

### Complete Issue Information

Can you double check that you attached the correct bridge? I don't see any 9 span structure definition in the bridge that is attached to this incident.

Can you also identify the floorbeam that gives you this error message?

I tried running 10 span 1654'6", 2 girder system (WB) and I didn't get the error message that you got.

| 8040.17029 | Resolved      | Error exporting Virtis Std data |

Description

FROM:jtriezenberg DATE:Wednesday, July 25, 2007 3:11:36 PM  
 When I try to define the beam details for the girder called 1966 fascia beam, Virtis unexpectedly shuts down. This is a flared bridge. I don't know if that is the cause of the problem.

FROM:jihnmat DATE:7/26/2007 10:03:20 AM  
 I also noticed that some of the Member Support windows could not be opened. ComputeNumSpans is returning 2 for 1966 Fascia Beam (should be 1). Jeff told me that the number of spans or girders has not been changed.

FROM:jihnmat DATE:7/26/2007 10:08:49 AM  
 All of the members after 1966 Fascia Beam (inclusive) are showing two spans, with second span having length zero.

FROM:jihnmat DATE:7/26/2007 10:26:19 AM  
 This looks like 7891. The same fix seems to work, which is:  
 1) Open "Framing Plan Detail."  
 2) Change Skew degrees from 28.25 to 0 for both supports.  
 3) Click "Apply"  
 4) Change the Skew degrees BACK to 28.25 for both supports.  
 5) Click "Apply" or "OK"

HRS AASHTO

1002

Complete Issue Information

FRFROM:bmccaffrey DATE:Monday, July 12, 2004 3:09:41 PM

Please look at the intermediate output for section 3 of the main girder (girder 1) that is attached along with the .bbd file. The section is at mid-span and does not control. It is a built up member comprised of angles and plates with a 12"x1" top cover plate. A discrepancy was found in the calculation of equation 10-100 (b/t ratio). It appears that the top flange thickness is being ignored in the equation - only the angle thickness is used.

I believe 't' should be:

top angle thickness + top cover plate thickness  
= 1.0781" + 1.0" = 2.0781"

Thanks, Brian McCaffrey, NYSDOT

FROM:bmccaffrey DATE:Monday, July 12, 2004 3:21:20 PM

The correct bbd file is 1042080. You can delete 1020280.

FROM:bmccaffrey DATE:Tuesday, July 13, 2004 8:25:56 AM

FROM:bgoodrich DATE:Monday, August 2, 2004  
WYDOT assigned this issue to BRASS Problem Log 520.

FROM:bgoodrich DATE:Monday, August 16, 2004 11:40:49 AM  
E-mail from WYDOT:

Brian:

Keith and I discussed this issue and reviewed the AASHTO Specifications. No where in the spec does it clearly define which is the "flange" in a built up section with angles and cover plates. It has been WYDOT policy to use the cover plate as the flange dimensions since the spec states specifically that the thickness must be equal to or greater than the angle thickness. In this type of built up section, we consider the angles as acting as fillets as shown on page 9.25 of the user manual. If the user disagrees with our interpretation of the code, he can simply code an equivalent I-beam section and use whatever flange dimensions he desires.

This closes out Problem Log 520.

Micheal J. Watters, P.E.  
Bridge Engineering Systems Manager

FROM:bgoodrich DATE:Monday, August 16, 2004 11:50:29 AM  
I modified the export (BrassStdAnalysisCmd.cpp) to transfer the cover plate dimensions to the flange dimensions, which corresponds to the instructions in the BRASS-GIRDER command manual.

Description

FROM:bgoodrich DATE:Tuesday, August 07, 2007 9:55:23 AM  
Entered for Yihong Gao:

Hi Brian,

The question that I have is if I can change 12 foot lane width to 11 foot lane width. Current bridge has a 44' wide travel width for each direction and I need to put 4 lane loading each direction on the bridge. The current Virtis file for this existing bridge is line girder but I should be able to change to girder system if needed.

FROM:bgoodrich DATE:Tuesday, August 07, 2007 9:57:09 AM

A user called me with the following question regarding how many lanes fit in a 44' travelway. She would like it to be four (44/11). However, I don't think the MCEB article on lane width (6.7.2.2) is considered when the travelway is 24' or greater. Is this correct? Is there anyway for an 11' lane to be used instead of 12'?

FROM:bgoodrich DATE:Tuesday, August 07, 2007 9:57:37 AM

E-mail from Krisha:

Hi Brian,

The user's email indicates the bridge is a girder line model so the beam will be loaded as per the user's input distribution factors. I don't think the lane width is used at all in a girder line model.

You are correct that the MCEB article doesn't apply when the travelway is 24' or greater. For a girder system model the user can compute the distribution factors for 11' lanes and input them instead of having Virtis compute them. I don't think the lane width is used anywhere else a standard rating or design.

Krisha

FROM:bgoodrich DATE:Tuesday, August 07, 2007 9:57:55 AM

Based on this discussion, the user must input the distribution factors regardless of the structure being input as a girder line or a girder system. There is no way to input an 11' lane even for a girder system structure definition.

FROM:bgoodrich DATE:Tuesday, August 07, 2007 10:20:12 AM

E-mail to user:

I discussed this issue with Krisha Kennelly at Michael Baker. Virtis only uses the MCEB article on lane width (6.7.2.2) when the travelway less than 24'. If you would like the distribution factors calculated based on 11' lanes, you must perform these calculations and then input the distribution factors into Virtis manually. This applies to both a girder line or girder system structure definition.

FROM:bgoodrich DATE:Wednesday, August 15, 2007 12:01:45 PM

Should an input be added where the user can specify the traffic lane width on a superstructure basis?

Description

FROM:kkennelly DATE:8/14/2007 8:21:34 AM  
Submitted on behalf of Vinacs, Caltrans via email:

I am attaching a Floor System model for your review. We are not familiar with entering data for this type of bridge structures. We thought we did pretty good, but find weird results.

Notable Weird Results are:

1. Floor beam 1 rating controlled by Fatigue and rating number is ZERO.
2. Negative moment demand from live load is reported on one side of floor beam only (There are three girders and the floor beam is spanning between the three.)

(Embedded image moved to file: pic00008.jpg)

3. Results are not symmetric

Where did we go wrong?

(See attached file: 08C00097.xml)

FROM:kkennelly DATE:8/14/2007 8:25:01 AM  
reponse sent via email:

I reviewed your Virtis input and I don't see any problems with your input. I've entered this as incident 8072 on the Technical Support website.

FROM:bgoodrich DATE:Wednesday, August 15, 2007 1:50:06 PM

It looks like issue 1 regarding fatigue is a bug. For some reason, the fatigue stress at the 109 POI is calculated as Infinity. I turned on the intermediate output for the 109 POI, and found the section modulus is zero for one case. I'll forward this issue to WYDOT immediately.

Issues 2 and 3 are related and result from the floorbeam spans being considered simple spans, not continuous. A hinge is inserted close to the interior support (at 9.1833' in your structure). The small amount of negative moment seen on the right half of the floorbeam is expected given how the floorbeam is modeled. Any loads applied to the left of the hinge cause a small amount of negative moment to the node points right of the hinge. This issue was reported in Incident 6416.

FROM:bgoodrich DATE:Friday, August 31, 2007 4:11:25 PM

WYDOT assigned this issue to BRASS Problem Log 775. This issue was addressed in the BRASS-GIRDER engine for BRASS-GIRDER(STD) 6.0.0. Fixed for Virtis version 5.6.

### Description

FROM:jtriezenberg DATE:Wednesday, August 22, 2007 1:10:17 PM

I created a superstructure definition with the wizard. Virtis is telling me that the concrete specified in the stress limits does not match the concrete in the beams. This is not true. Please see the attached file.

Thanks,  
Jeff

FROM:jtriezenberg DATE:Monday, August 27, 2007 9:37:52 AM

I have re-done the superstructure definition without using the wizard and the same problem comes up.

FROM:jtriezenberg DATE:Thursday, August 30, 2007 12:35:04 PM

Is it possible at all to have a multiple span prestressed girder bridge with more than one strength of prestressed concrete?

-Jeff Triezenberg

FROM:hlee DATE:8/31/2007 11:42:19 AM

There was a defect when validating the concrete used in the stress limit ranges.

4/19/2016 3:05:47 PM

HRS AASHTO

1008

Complete Issue Information

Resolved for 5.6 Release.

You can enter a multiple span prestressed girder bridge with more than one strength of prestressed concrete into Virtis, but both the BRASS and Virtis LFD Engine don't support this configuration. Both engines will use the prestressed concrete in the first span.

To reproduce:

1. Open TrainingBridge1 Bridge Workspace.
2. Open Analysis Settings window.
3. Change Analysis Type from Standard to Advanced.
4. Select "Inventory" in Vehicle Summary tree.

4/19/2016 3:05:47 PM

HRS AASHTO

1009

Complete Issue Information

- 5. Select Type 3 vehicle in Vehicle Selection tree.
- 6. Click >> button to add to Inventory.
- 7. Select "Operating" in Vehicle Summary tree.
- 8. Select Typs 3-3 vehicle in Vehicle Selection tree.
- 9. Click >> button doesn't add to Operating.

FROM:mordoobadi DATE:8/24/2007 3:36:51 PM

I think this was a requirement that an NSG analysis is only for one NSG truck/Adjacent truck combination.

FROM:jduray DATE:9/10/2007 8:55:46 AM

Correct.

FROM:hlee DATE:9/17/2007 8:45:50 AM

The Analysis Settings window needs to provide better feedbacks. I think this information needs to be in the Help.

Option 1: When "Inventory" is selected, add to Inventory will also add to Operating.

Option 2: If Type 3 already added to Inventory, disable the >> button when other vehicles are selected.

Option 3: Message box.

 Entered on behalf of Binh Ha (MassHighway):

=====

Hi,

I am very positive about my opinion. If you look at the Rating Results Report output, the circled numbers are for one truck load (these numbers are matched to my model analyzed with one truck load using GTSTRUDL). Therefore if we input LLDistribution = 1.235294 (wheels) (instead of using 0.61765 truck) the live load effect will be doubled on each truss (using new-n19047-truss.xml; East Truss). Let me inform your finding. Thanks,

Binh Ha, P.E.

### Description

FROM:kkennelly DATE:9/11/2007 12:34:49 PM  
Submitted on behalf of Vinacs from Caltrans:

We have been modelling a bridge that has 29 simple spans.

One of our rating engineer modelled a few spans. These girders are composite with deck. The girders has transverse and longitudinal stiffeners. When he rated the girder with and without longitudinal stiffeners, he had different rating numbers (that is expected). However, what is not expected was that the rating of the girder that has the longitudinal stiffener is less than that of the girder without longitudinal stiffeners.

In my opinion, the girder with transverse and longitudinal stiffeners should be able reach it's Full Composite Capacity, but the program limited its capacity to moment at first yield.

Could you please review the bridge and let me know, what could be done to obtain proper rating?

Structure Definition : Span 27L MDL(1/1) 09/07

Member : G2

Member Alternative: Girder E (Span27L) (This one has long and transverse stiffeners)

Member Alternative: Copy of Girder E (Span27L) (This one has transverse stiffeners only)

(See attached file: 24 0069LCaltrans.xml)

FROM: bgoodrich DATE: September 12, 2007  
I reviewed the BRASS results and also Article 10.50.1.1 and 10.50.1.1.2. The last paragraph of Article 10.50.1.1.2 indicates that steel sections with longitudinal stiffeners are limited to the noncompact bending strength of Article 10.50.1.2, i.e.,  $F_y$  or  $F_y \cdot R_b$ . Therefore, it appears that adding a longitudinal stiffener can actually reduce the bending strength as far as the specification is concerned. Please let me know if you agree with this assessment.

E-mail from Vinacs:

Lian

Yes, Specs reads the way Brian stated here. Should a modification to the spec considered? How does the LRFD spec reads on this regard?

Vinacs M Vinayagamoorthy  
916-227-8657

#####

Hi Vinasc,

1. Yes, AASHTO Standard Specifications or Caltrans BDS 10.50.1.1.2 states that "For composite sections in positive-moment regions, .... or with longitudinal web stiffeners, ..., the design bending strength shall be determined as specified in Article 10.50.1.2 (Non-Compact Sections)".
2. AASHTO-LRFD (3rd Edition) Page 6-98, Article 6.10.6.2.2 or 4th Edition, Page 6-115, Article 6.10.6.2.2 - Composite Section in Positive Flexure - It seems that as long as web meet Eq. (6.10.6.2.2-1) and other requirements are met, the section qualifies as Composite Compact Section. AASHTO Commentary does address sections with longitudinal stiffeners for deep beams. It is stated that "composite sections in positive flexure in which the web does not satisfy Article 6.10.2.1.1 - ( $D/t_w \leq 150$ ) are categorized as noncompact sections."
3. My personal opinion is that, for the purpose of evaluation, as long as  $D_{cp}$  meets AASHTO Standard Eq. (10-129) or AASHTO - 6.10.6.2.2-1 and all other requirements are met, composite sections in positive-moment regions can be considered as Composite Compact Sections.

Thanks

#####

Brian

Thanks for getting back to us soon.

I discussed this finding with Technical specialist. (see his comments below). Yes, He agreed with your point that BRASS is estimating the capacity per AASHTO Spec. However, the capacity calculation within the LRFD spec does not require us to automatically default to Non Compact Section whenever longitudinal stiffener present in a composite girder.

LRFD requires that whenever the D/tw exceeds 150 the capacity of a composite section with longitudinal stiffener be evaluated using Non-Compact Sections.

Since LRFD code is based on the latest research work, it is my opinion, the method recommended in the LRFD spec is reasonable and AASHTO Standard Specification needs revision. Unfortunately, AASHTO Standard Specification will no longer be updated and therefore, we need to an option (within Virtis/BRASS) for rating engineers to over-write the specification. With the option, rating engineers should be able use the composite section capacity (provided the D/tw <150).

This option button should be available within the longitudinal stiffener ranges are defined.

In the mean time, Brian can you suggest/think of a trick to obtain a rating using composite section capacity? We are thinking of analyzing twice (with and without) longitudinal stiffener. Without long stiffener to provide rating for moment and with stiffener to provide rating for shear (if that controls)

FROM:bgoodrich DATE:Saturday, September 15, 2007 12:53:40 AM  
Thank you for your detailed comments. I have forwarded this issue to WYDOT.

Making two runs, as you indicated, appears to be the only workaround.

FROM:bgoodrich DATE:Friday, December 28, 2007 3:22:00 PM  
E-mail from WYDOT:

I agree that we should not put in a switch to override the spec. If we start with one, we could get every state/consultant asking for a switch to correspond to their office practices.

Keith

>>> Micheal Watters 9/25/2007 1:10 PM >>>  
Brian,

The BRASS code conforms to the AASHTO Standard Specifications. I don't think we should put in a switch to override the specs. The Standard Specs are not going to change and putting in a switch only benefits a few users.

Would there be a way for the user to run this in LRFD by using LFD load factors?

FROM: Brian Goodrich DATE: 7/16/2008 1:22:39 PM Eastern Daylight Time  
An alternative has been discussed for BRASS to allow input of user-defined capacities for flexure, shear, etc. This would address several issues where the user does not agree with the specification or the BRASS engine assumptions.

Description

FROM:kkennelly DATE:9/12/2007 12:25:57 PM  
Submitted on behalf of Vinacs from Caltrans via email:

I am reporting a strange behavior of BRASS program.

We are rating a 90 ft simple span bridge, where we usually rate the bridge using 10 different trucks.

4/19/2016 3:05:49 PM

HRS AASHTO

1020

Complete Issue Information

The reactions at left and right end of the girder for 9 of the specified trucks were reported as same. However, for one particular truck (that has 11 axles), reactions at both ends were not reported the same.

Details review of the results showed, BRASS estimated an impact factor value of 30% for left end and 23.26% for right end. The correct value is 23.26%. I could not understand the logic behind this. Again, as I said it occurs only for the 11 axle trucks that we specified. I repeated this with different 11 axle trucks and I got unsymmetrical results

Here the trucks I used:

```
# 910 TRUCK-IMP

FROM: bgoodrich DATE: Saturday, September 15, 2007 1:48:07 AM  
I suspect there is a problem with determining impact when both the lead and rear axle are not located on the bridge. The first truck is 93.5 feet long while the span length is only 90 feet. The second truck is longer than the first. I will forward this issue to WYDOT for assignment to a BRASS problem log.

FROM: bgoodrich DATE: Thursday, September 20, 2007 12:05:04 PM  
E-mail from Vinacs:

Thanks for checking this out for us.

One observation that doesn't make sense is that the impact factor in the one end is estimated as 30%, but the impact at the other end is estimated as 23.26%.

Typically, I presume that BRASS runs all the trucks forward and backwards in order to obtain the results. If this is true, the program should have listed the same impact at both ends.

Vinacs M Vinayagamoorthy  
916-227-8657

FROM: bgoodrich DATE: Wednesday, October 03, 2007 11:39:11 AM  
WYDOT assigned this to BRASS Problem Log 782.

FROM: bgoodrich DATE: Friday, December 14, 2007 1:39:29 PM  
I investigated the impact calculations and found the number of axles was not the issue but rather the total length of the truck. The span length was 90 ft and the truck length was 92.25 ft. BRASS did not correctly handle the case when the rear and/or lead axles were off the bridge for the shear impact or for the end reaction impact. This issue was corrected in the BRASS-GIRDER(STD) 6.0.1 engine, which should be released with the next version of Virtis.

### Description

FROM:tarmbrecht DATE:Wednesday, September 12, 2007 2:52:23 PM

Please verify that after entering the correct information in the Floorbeam Location Wizard the locations of the floorbeams are found to be incorrect. In the referenced example there should be a floorbeam at each diaphragm location along the main girder between 0.5834' from each end bearing.

FROM:jduray DATE:9/13/2007 11:20:17 AM  
Is this new to 5.6?

FROM:hlee DATE:9/19/2007 9:11:14 AM  
Fixed a defect in determining the previous row end distance in the wizard. The test case for the above described floorbeam locations is attached.  
Resolved for 5.6 Release.

## Description

FROM:tarmbrecht DATE:Wednesday, September 12, 2007 2:55:34 PM

It appears that in the schematic view of the main Girder Member of a Girder-Floorbeam-Stringer system bridge, the diaphragms for the stringers are indicated. Since these diaphragms only affect the stringers and not the main girders, we don't feel that they should be shown in the Girder Member schematic. It lends to confusion in the diagram.

### Description

FROM:bgoodrich DATE:Monday, September 17, 2007 10:46:38 AM  
E-mail from Michelle Salas via Mike Watters:

From: Micheal Watters [mailto:Micheal.Watters@dot.state.wy.us]  
Sent: Thursday, September 13, 2007 3:46 PM  
To: Goodrich@BridgeTech-Laramie.com  
Subject: Fwd: BRASS Question

Brian,

This e-mail is from a Virtis user. She should go through Baker first to have an incident number assigned. Since it is basically a question of the terminology used in the GIRDER(STD) engine, I thought you might have a quick answer. If not, I will have her send it off to Baker.

Micheal J. Watters, P.E.  
Principal Bridge Engineer  
Special Assignments Squad

>>> "Michelle Salas, PE" <msalas@qpec.org> 9/13/2007 2:05 PM >>>  
Mike,

Here is the BRASS output file that we discussed. The question that I have is in regards to the Distributed Dead Load Summary Table on page 9 of the output. What does it mean when it refers to Span No. "All". I can account for the loads in the last two rows of the table. Load Group 1 is for the haunch (0.0635 klf) and Load Group 2 is for the stay in place forms (0.0820 klf). I can not trace where the loads in the first two rows come from; Load Group 1 (0.7125 klf) and Load Group 2 (0.3205 klf). The diaphragms are

4/19/2016 3:05:50 PM

HRS AASHTO

1028

Complete Issue Information

supposed to be concentrated loads (0.925 k per diaphragm location), but it says that a concentrated dead load summary is not available.

The load rating is controlled by shear so I need to know how the program is calculating shear. If you can shed any light on this problem, I would appreciate it. If the answer does not come easily to you, let me know and I can then refer my question to the Virtis technical support.

Thank you,

Michelle Salas, P.E.

FROM:bgoodrich DATE:Monday, September 17, 2007 10:47:29 AM

The most recent version lists the following note under the Distributed Dead Load Summary:

"Note: A span number denoted as "All" indicates all TOP spans."

In the Distributed Dead Load Summary, the first line is for the slab load calculated by the dead load distribution module and shown earlier in the GIRDER LOADS SUMMARY REPORT. The second line is the combination of the wearing surface load and the barrier loads.

BRASS-GIRDER(STD) does not provide a concentrated load summary (even when concentrated loads were entered), which is why the note was provided.

To obtain details on the shear rating, the user must create a point of interest at the point in question, select the Engine tab, open the engine properties window, and turn on the intermediate output. Then, rerun the analysis for the member alternative. The BRASS output file will then contain details on the shear capacity.

### Description

FROM:tleatherwood DATE:Tuesday, September 25, 2007 3:10:00 PM

We recently encountered a problem in building the Virtis model for a new bridge.

When we build a model, we like to check it against its expected design loading. If we develop a rating factor of about 1.0 under the design loading and assumed design conditions, then it is some indication that we have a good model.

In building this model, the following conditions applied:

- 1) The bridge is a metric design. It was designed using the load factor method in 1999. It is basically a HS-20 (MS18 actually) design. We converted the metric units to English units when building our model.
- 2) The bridge was designed for a future wearing surface load of 1580 N/M. This works out to be about 2 ¾ inches of asphalt.
- 3) The bridge carries four (4) lanes of traffic and the designer undoubtedly reduced the live load distribution factor by 25% (as per AASHTO 3.12.1) as a result. The standard multi-lane distribution factors, computed by Virtis, do not take this reduction into account. They compute a multi-lane DF of 2.318. As an alternate value, we computed the DF using simple beam reaction and then multiplied it by 0.75. This gives a DF of 1.985 (interior girder – multi-lane) which is what we used in the analysis.

## Complete Issue Information

Once the model was created, we ran it with the HS-20 vehicle using both the Virtis Std. and BRASS engines. Both engines report that the interior girders control the ratings for the bridge.

The Virtis Std. engine gave us good results. It gave us an Inventory rating factor of 1.006 at the 2.5 point (middle of span #2). Given that span #2 is by far the longest span, this is exactly the result we expected. It seems to indicate that we have a good model.

However, the BRASS engine gives us a RF of only 0.857 and IS TELLING US THAT THE RATINGS ARE CONTROLLED AT THE 2.3 POINT!

Frankly, this is impossible. The beam cross section at the 2.3 point is IDENTICAL to the section at the 2.5 point. The steel yield strength is also IDENTICAL. The composite action with the concrete slab is IDENTICAL. The cross-bracing spacing is IDENTICAL.

It therefore follows that the capacity of the beam at the 2.3 point is IDENTICAL to the capacity at the 2.5 point. However, the dead and live loads at the 2.5 point are much greater than those at the 2.3 point. Therefore, this BRASS result is WRONG!

There are two (2) possible reasons as to why BRASS is giving us this bogus rating:

- A) We have made a subtle error in our Virtis model. This error affects the BRASS engine but does not affect the Virtis Std. engine.
- B) The BRASS engine has a bug in it.

We have looked through the BRASS output file so as to try to determine why it is giving us this bogus rating. Frankly, we do not have any real BRASS experts in our office. About the only guess we could come up with is that BRASS might be using the wrong capacity. Since the 2.3 point is near where the stresses in the beam reverse, BRASS seems to be calculating a capacity for both positive and negative bending. The capacity in negative bending is much lower, of course, since the slab does not contribute.

Note that the controlling load seems to be positive. If BRASS is combining the lower, negative capacity with the larger, positive moments, it might cause this result.

However, that is just a guess and might well be wrong.

Therefore, I have decided to submit this problem as an incident and ask your help in resolving it. I am sending you the XML file for the bridge model along with a PDF file that contains excerpts from the bridge plans.

If we have made an error in the bridge model that is causing BRASS to give us bogus results, we would greatly appreciate you pointing out where we went wrong.

On the other hand, if it is a bug in the BRASS engine, we would like you to report it to the BRASS folks so that it can be corrected.

Thanks,

Terry D. Leatherwood, P.E.

I reviewed the plans and the bridge file. The low BRASS rating can be corrected by adjusting the dead load contraflexure locations in the member alternative engine properties. BRASS LFD requires that the user specify which bending sense to check for regions along the bridge. Both bending senses are NOT checked - only one. For Virtis users, these contraflexure locations must be set as a percentage of the span length. By default, these are set to 30 and 70 depending on the location of the span. You can run the structure once and look at the dead load actions for a uniform load on all spans to determine the percentages to input. I entered the following approximate contraflexure locations:

Span 1: 66  
Span 2: 21 and 79  
Span 3: 34

This changed the BRASS rating to 1.04.

FROM:bgoodrich DATE:Thursday, October 04, 2007 7:39:34 AM  
E-mail from Terry Leatherwood (10/3/2007):

Hi Brian,

Thanks very much for the information. I thought that it must have been some kind of problem related to the contraflexure locations. Unfortunately, we don't have a whole lot of experience with the BRASS engine and did not realize that it may need to be "tweaked" when dealing with a bridge with an unusual span ratio.

Your prompt response to this incident is much appreciated.

Entered for Yihong Gao:

I have a question on sidewalk:

I enter sidewalk dimensions in Structure Typical Section Window, does Virtis compute sidewalk deadload automatically from structure typical section window? How does it distribute deadload of sidewalk or rails? Does Virtis evenly distribute them over all beams? Thanks

Yihong

E-mail reply to Yihong Gao:

=====  
I have attached the BRASS LFD engine related Dead Load topic in Virtis/Opis Help. For other analysis engines, please refer to the Dead Loads Help topic for that particular engine. When you enter sidewalk load, the load is assigned to the selected load case. The load is applied to the stage selected for that load case. The load distribution for each stage is defined in the Superstructure Loads window DL Distribution tab. Each engine also has assumptions on load distributions. These assumptions are listed in the Analysis Progress window.

FROM:kkennelly DATE:9/26/2007 8:09:52 AM  
Entered on behalf of Ziad Hanna, via email:

Dear Sir,

I'm doing independent check for prestress I girder bridge, this bridge is rated less than one in shear using Virtis. Performing the independent check using other tools and some hand calculation, I noticed that the capacity is higher than what is calculated from Virtis, leading to higher rating factor. I'm attaching my hand calculation with the Virtis (xml file). I want to know the reason behind this, I really appreciate your help.

Thanks.

We tried to verify the BRASS results with the Virtis engine. This gave some unexpected results.

The rating for the fascia girder is -99. I'm not sure why this is happening.

The interior girder is rated quite low and is controlled by the positive moment capacity at 1.5% of the span. This location is the centerline of bearing for the prestressed beam. I believe this is happening

Complete Issue Information

This issue was assigned to BRASS Problem Log 844.

FROM: Brian Goodrich DATE: 1/21/2010 4:32:09 PM Mountain Standard Time  
Upon further investigation of the difference into the Vci term, we have found the following differences between the hand calculations and BRASS:

1. The section properties are slightly different.
2. BRASS considers the harped strands.
3. The unfactored live load moment used in the BRASS shear calculations is that for positive flexure.
4. The unfactored negative live load moment in BRASS does not match the live load moment from the hand calculations.
5. The shear concurrent with maximum moment is different. In BRASS, it is in the opposite direction of the dead load. In the hand calculations, it is in the same direction.
6. BRASS limits the ratio of  $M_{cr}/M_{max}$  to 1.0 when  $M_{max} < M_{cr}$ .

FROM: Brian Goodrich DATE: 1/28/2010 2:50:20 PM Mountain Standard Time  
I forwarded these latest comments to the user.

FROM: Brian Goodrich DATE: 5/18/2011 8:17:09 AM Mountain Daylight Time  
This issue was assigned to BRASS Incident 49.

FROM: Brian Goodrich DATE: 9/26/2012 12:10:04 PM Mountain Daylight Time  
Further investigation revealed the following:

1. BRASS considers the sign of the dead load shear when combining it with the shear concurrent live load. This leads to a much lower "V<sub>i</sub>" value.
2. BRASS was being run with a control option that limited the ratio  $M_{cr}/M_{max}$  to 1.0. See the shear options on the BRASS LFD engine properties for the Member Alternative in question. I changed this option to match the user's calculations.
3. BRASS determines if the positive or negative live load moment is used by checking if the moment concurrent with shear plus the dead load moment is greater than 1 or not.
4. BRASS calculates the shear depth to the centroid of the prestressing force at the point of interest. This leads to a slightly lower "d" value.

A PDF file illustrating how the BRASS values are obtained and the data and output files were attached (BrassShearCalcs.pdf and Incident8167\_Mich.zip).

Following is abstract from bridgeware emails from : Ai Fen Jimenezwu" <AJimenezwu@bryant-engrs.com>

I have these other questions:

-----

1. How do you input diaphragms for the Floorbeams? (It's a Truss-Floorbeam System w/o stringers)
2. Can you model the Floorbeams with a cantilever going beyond the centerline of the truss? (The floorbeams are cantilevers and support the sidewalks outside of the truss)

-----

Email reply:

--

VirtisTruss command language.pdf (help) page 22 shows the list of supported cross sections . Section 1 and Section 2 partial cross sections are not currently supported. Using non-detailed cross section can be an option for unsupported cross sections.

Method of Solution. pdf on page 3 and page 4 describes how deck load and floor beam loads are applied to the truss.  
Deck load and side walk load UDLs are converted by virtis to panel point load and applied on truss. Similarly floorbeam self wt converted to point load and applied on the truss.  
So floorbeam modeled as cantilevers beyond truss center line should be ok.

Complete Issue Information

Received Bridgeware e-mail:

=====

I would like to know how Virtis calculate the section properties of the composite sections for positive and negative moment area.  
 Positive moment area, do composite sections include steel beam+deck rebar+deck conc?  
 Negative moment area, do composite sections include steel beam+deck rebar only?  
 Is there difference between stiffness calculations and stress calculations?

=====

Received Bridgeware e-mail:

=====

I am using BRASS LFD for rating. It is a steel girder with concrete deck continuous 4-span bridge.  
 Thanks

=====

FROM:hlee DATE:10/9/2007 3:18:34 PM

Received Bridgeware e-mail:

=====

Once you are done investigation, please reply it by email because I don't have username and password set up for support center yet.

=====

FROM:bgoodrich DATE:Thursday, October 11, 2007 9:28:42 AM

For positive moment area, BRASS LFD includes the steel beam and deck concrete.  
 For negative moment area, BRASS LFD includes the steel beam and deck reinforcement.  
 There is not a difference between the section properties used for stiffness and those used for the stress calculations.

### Description

FROM:bmccaffrey DATE:Wednesday, October 10, 2007 3:24:12 PM

The attached bridge has the beam spacing set along the support. If you try to calculate the eff. flange width automatically, then the 'End flange width' is set to zero. You cannot override that field if the beam spacing is set along the suport.

See the first superstructure definition. This only happens on member alt G3.

This has worked in previous versions and does not work in either 5.5 or 5.6 B6.

FROM:hlee DATE:10/16/2007 8:50:30 AM

Fixed a bug in locating the span number when given a distance along the structure.  
Resolved for 5.6 Release.

Complete Issue Information

FROM:hlee DATE:10/15/2007 3:56:37 PM  
Received via e-mail (Elizabeth.Befikadu@state.ma.us):

=====

I was working on one hybrid plate girder and I have a couple of questions.

- 1) Does Virtis consider the hybrid factor
- 2) If I have a 46 ksi steel what will be the allowable bending stress at positive region. I was looking at the brass output and I have two different type of bending stress which stated one based on input spacing and the other based on maximum spacing I don't know why it depends on the transverse stiffener for positive moment region at midspan.

I have attached the bbd file please look at the North side girder system and go to copy of g2

Thanks for you help

Elizabeth Befikadu  
MHD Bridge section

=====

Please e-mail the reply to Elizabeth.

FROM:hlee DATE:10/16/2007 7:15:37 AM  
Received via e-mail (Elizabeth.Befikadu@state.ma.us):

=====

I checked that Virtis consider hybrid factor that part is solved the only part remaining is what is the allowable bending stress calculated based on the spacing of stiffener spacing. Where is it used for ? I found out that is not for flexural rating.

Please use this bbd file I found an error in the previous one

=====

FROM:bgoodrich DATE:Monday, October 22, 2007 2:48:11 PM  
I looked into the allowable bending stress that BRASS is calculating. As far as I can tell, BRASS limits the bending stress based on Article 10.34.4.4 (Equation 10-30). This appears to be a flexure-shear interaction issue.

FROM:bgoodrich DATE:Monday, October 22, 2007 2:49:00 PM  
E-mail from Elizabeth (10/19/2007):

Bin told me he has contacted you about the hybrid factor before he said Virtis doesn't consider hybrid factor. Can you clarify this for me I have a number of hybrid bridges .

FROM:bgoodrich DATE:Monday, October 22, 2007 2:49:58 PM

4/19/2016 3:05:54 PM

HRS AASHTO

1054

### Complete Issue Information

BRASS is calculating the hybrid factor based on AASHTO Article 10.40.2.1. This is apparent in the allowable stresses, which are  $0.543 * F_y * R$ .

Description

FROM:gbarnhill DATE:Thursday, October 25, 2007 1:14:58 PM  
I have modeled a 3 span continuous deck truss. Verify does not give any errors and the schematic shows the geometry I intended.  
The stringers are continuous over FB 1 thru FB 29. In order to get Virtis to run, I created 3 stringer units.  
Unit1 from FB 1 to FB 9, Unit2 from FB 9 to FB 21 and Unit3 from FB 21 to FB 29.  
When I try to analyze the Truss, it stops with the following final few lines--  
Performing Live Load Analysis...  
Generating nodes...  
Generating truss elements...  
Generating panelpoint liveload cases...  
// LL@ U1 : Fx = 0.000 kip , Fy = -1.000 kip, NodeNum 3  
// LL@ U2 : Fx = 0.000 kip , Fy = -1.000 kip, NodeNum 4  
// LL@ U3 : Fx = 0.000 kip , Fy = -1.000 kip, NodeNum 7  
.....  
// LL@ U4' : Fx = 0.000 kip , Fy = -1.000 kip, NodeNum 52  
// LL@ U3' : Fx = 0.000 kip , Fy = -1.000 kip, NodeNum 54  
// LL@ U2' : Fx = 0.000 kip , Fy = -1.000 kip, NodeNum 56  
// LL@ U1' : Fx = 0.000 kip , Fy = -1.000 kip, NodeNum 58  
Initiating finite element analysis...  
FEA - Building model...  
FEA - Creating nodes...  
FEA - Creating elements...  
FEA - Creating constraints...  
FEA - Adding load cases...  
Verifying finite element model...  
Performing linear solution...  
Successful finite element analysis.  
???Error - Live load analysis failed...

Analysis failed!

Thanks for you help.

gale.barnhill@earthtech.com

FROM:hlee DATE:11/14/2007 2:36:13 PM  
Tested the truss in 5.6, the analysis completed. Some members (eg. L5U5) have very small live load forces, the resulting rating factors are huge.  
I updated the Rating Results report to output 99.00 when the calculated rating factor is greater than 99. Please note that although the Symmetry command is used, the support conditions will not be symmetrical. The entered support is L0 Roller and L9 Roller. The generated symmetrical supports will be pinned by default (L9' Pinned and L0' Pinned).

Resolved for 6.0 Release.

```

FROM:hlee DATE:11/6/2007 1:37:49 PM  
 I verified the exported data.  
 Attached 5.6 Virtis Std Engine files.

Complete Issue Information

FROM:hlathia DATE:Tuesday, November 06, 2007 4:02:03 PM

Virtis Std Engine 5.6 does not handle non-composite girder with varying distribution factors properly as input. It will require code changes to handle this situation properly. The work around is to specify that there is a deck, but it does not have any reinforcement. F'c of concrete deck needs to be specified. Steel Member properties specified as non-composite are correct. Attached are the revised input and output files with above input modifications.

FROM:hlathia DATE:Thursday, November 08, 2007 4:02:39 PM

The problem has been corrected. The correction will be available in Virtis 6.0. Meanwhile, use the work around specified above. The output file with this correction is attached.

### Description

FROM:gbarnhill DATE:Sunday, November 11, 2007 3:40:18 PM

The attached model was created in Virtis 5.5.

There are two superstructures. Both 3 span 95'-0", 133'-10", 95'-0" with two hinges in Span 2.

In SuperDef 1338333 the middle span is modeled 133.8333 ft.

In SuperDef 1338400 the middle span is modeled 133.8400 ft.

As far as I can tell, except for the appropriate structure length adjustments, the two SuperDef's are the same.

Analyze Member G2. 1338333 gives critical HS20 Inv rating at 110. 1338400 gives critical HS20 Inv rating at 203.

In the BRASS output file. in 1338333 at 202 and 203 BRASS shows N/A for rating results.

In 1338400, BRASS shows N/A at 202, and rating results at 203.

If I adjust the lengths in 1338333 to match 1838400, then the BRASS output shows N/A at 202 and results at 203 ( the same results as 1338400).

Thanks,

Gale

FROM:gbarnhill DATE:Sunday, November 11, 2007 4:20:00 PM

Use the file commented "newest model" in the Documents list. I'm not sure the other one is correct.

FROM:gbarnhill DATE:Monday, November 12, 2007 10:21:16 AM

Brian G.

Hint- put a POI at 3/10 Span 2 for both the 1338333 and 1338400 G2 member. Notice the difference in the BRASS intermediate output.

Gale

FROM:bgoodrich DATE:Thursday, November 15, 2007 11:41:12 AM

I was able to duplicate Gale's issue. I found one difference in the input. The Camber Strip dead load case was applied to Stage 2 in one of the structures. However, this was not the source of the problem. I believe the problem is with how BRASS is interpreting the schedule of STEEL-GIRDER-CONTROL commands. The Section Type for the range left of the 203 POI is 5, and for the range right of the POI, it is 41. I believe that BRASS is choosing 5 for one of the bridges and 41 for the other. BRASS does

4/19/2016 3:05:56 PM

HRS AASHTO

1063

Complete Issue Information

not know which side to look at when a POI is at the junction of two ranges. BRASS just finds the first range in which the POI is located. For transverse stiffeners, BRASS does look at the ranges left and right and uses the one with the larger spacing. Maybe this could be done for the Section Type as well. I have forwarded this issue to WYDOT.

FROM:gbarnhill DATE:Thursday, November 15, 2007 4:04:22 PM  
Brian G, Per our phone conversation, I changed the BRASS LFD Engine Properties Counterflexure locations to Span 1-75%, Span 2-14.5% and 85.5% (the hinge locations), Span 3-25%. Span 1 & 3 based on moment results graph for deck deadload.  
The structure 1338400 now rates the same as 1338333 with critical ratings at the Pier. The BRASS output shows normal rating results at all 10th points.

FROM:bgoodrich DATE:Monday, November 19, 2007 12:10:07 PM  
Gale suggested a warning be added to the BRASS export to inform users that the contraflexure locations should be set to coincide with hinge locations. This remains to be done.

FROM:bgoodrich DATE:Monday, December 10, 2007 5:18:18 PM  
BrassStdSpans.cpp has been revised to issue the following error message:

Hinges were detected in Span 2.  
Contraflexure locations should be set to coincide with hinge locations.  
See the Member Alternative engine properties for the BRASS LFD/ASD Analysis Module.

## Description

FROM:garnhill DATE:Thursday, November 15, 2007 9:38:55 AM

This is an updated model of the truss from Incident 8238.

I've analyzed the truss named No Symmetry with Virtis 5.6.

The results are still not symmetrical. The problem seems to be with dead load cases Appurtance and Deck.

The Nodal Loads look symmetrical, but the Support Reactions and Element Actions are not.

Other load cases seem symmetrical.

FROM:garnhill DATE:Wednesday, December 26, 2007 2:19:09 PM

The Nodal Loads for Appurtance and Deck are not correctly placed.

There is no load placed on the last upper node (60).

4/19/2016 3:05:57 PM

HRS AASHTO

1066

Complete Issue Information

The load that should be there is on node 59 and the load on 59 should be doubled.

The Lane Live Loads are not symmetrical for all members.  
They are off significantly (50% in one case).

FROM:hlee DATE:1/30/2008 3:49:21 PM  
There are two issues in 8276.

- 1. The nodal loads for appurtenance and deck are not correctly placed.

Fixed a bug in determining the tributary length when typical section loads are not starting from the leftmost node. Resolved.

- 2. The lane live loads are not symmetrical for all members.

When determining the contribution of the concentrated load in the max positive action in CLmInfluenceLineLoader::LoadLane(), it should look for the peak with the largest value instead of the first peak. Not fixed yet. LoadLaneDf() also need to be fixed.

FROM:hlee DATE:2/6/2008 1:26:00 PM  
#2 is resolved in 5.6 SP1.

FROM:jduray DATE:2/20/2008 8:51:14 AM  
While fixing #2 we noticed that for the concentrated loads for lane loading we are using the maximum of the shear and moment concentrated loads for all members. I think standard practice is to use the conc. load for moment for the chords and the conc. load for shear for the verticals and diagonals. We also found that the 2nd conc. load for continuous spans is not being handled properly. I think standard practice is to use the 2nd conc. load for tension in the top chord and compression in the bottom chord (at least that is what PennDOT's BAR7 program does). These changes are being made to the live loading.

FROM:xli DATE:4/7/2008 10:32:27 AM  
Analyzed the symmetrical truss with 6.0 Beta 3, support reactions and element actions are symmetrical with dead load and live load. HS 20-44 is used as live load.

Dead Load: Load Case: Appurtenance DC

| 8343.16726 | Assigned      | Questions about BRASS LFD Shear results |

### Description

FROM:gbarnhill DATE:Tuesday, November 20, 2007 9:14:34 AM

I installed Virtis5.6 and migrated a Virtis5.5 database.

I compared rating results of both versions. All bridges compared exact except for one PS 3 span continuous.

The Critical RF increased from 0.855 to 0.887. See attached files from V5.5 and V5.6 - Member G3.

It appears the shear capacity for Truck1(HS20 truck) increased at POI 307.

I also noticed that on the Special-Truck command, parameter 6 is input as 1 on V5.6 and not input on V5.5.

Thanks,

Gale

402-745-0375

FROM:bgoodrich DATE:Thursday, December 13, 2007 3:35:28 PM

Changes were made to the BRASS LFD engine regarding the concurrent actions. BRASS finds the truck position causing a maximum action and then determines the concurrent actions based on this position. However, if the truck position one foot to the left or right of this position produces a higher magnitude concurrent action, the higher concurrent action value is stored. The shear concurrent with maximum moment increased, which caused the Vi term in the P/S shear capacity equation to increase leading to a higher shear capacity, which finally resulted in a higher rating factor at the 307 POI.

Description

FROM:kkennelly DATE:12/10/2007 11:06:28 AM  
 Submitted on behalf of Elizabeth Befikadu, Mass Hwy via email:

I am doing a prestress beam continuous for live load. I see point of interests which are not user defined or 10Th points does Virtis generate point of interest by itself other than 10th points.

The point of interest is just for curiosity for example 7.33' span 2 what is that point. The other important issue I have is on the calculation of shear capacity. When Virtis pick shear values concurrent with maximum moment sometimes it is the negative shear sometimes it is the positive shear can you explain to me specially at the supports this bridge is 6 span made continuous for SDL and Live load . The bridge is a brand new bridge and it is failing for shear for HS20 loading at 10th points of span 6 and it was designed for HS20.

FROM:bgoodrich DATE:Thursday, December 11, 2007 10:22:00 AM  
 I spoke with Elizabeth regarding the concurrent shear. I explained that as BRASS is determining the

4/19/2016 3:05:57 PM

HRS AASHTO

1070

Complete Issue Information

maximum or minimum moment, it looks at the concurrent shear for the corresponding truck position as well as the truck positions one foot to the left and one foot to the right. The shear with the largest magnitude is saved as the concurrent shear.

FROM: bgoodrich DATE: Thursday, December 13, 2007 12:28:04 PM

Here is what I found when I reviewed BRASS-LFD regarding the P/S shear capacity. For a composite structure, BRASS takes the shear concurrent with the maximum POSITIVE moment. There are no comments to explain why this is done. For a non-composite structure, the positive/negative sense is set based on the sum of the dead load moment and the moment concurrent with maximum shear.

I have forwarded the incident and these questions to Mike Watters at WYDOT.

FROM: Brian Goodrich DATE: 7/16/2008 1:56:01 PM Eastern Daylight Time

WYDOT has instructed BridgeTech to address P/S shear issues during the process of merging the LRFD and LFD BRASS-GIRDER engines. Therefore, no plans are in place to update the current BRASS-GIRDER(STD) engine with respect to P/S shear.

### Description

FROM:hlee DATE:12/12/2007 8:03:19 AM  
Submitted on behalf of Ai Fen Jimenezwu, Bryant Associates.

Bridgeware received e-mail:

Virtis 5.5.0 seems to support a Truss-Floorbeam System (No Stringers). For the bridge I am working on, I can run the truss analysis without any problem, but when I try to run the Floorbeams, I keep on getting these error messages:

Error generating LFD/ASD load commands!  
Error occurred for BRASS live load: H\_20-44\_\_\_~1  
Error generating FLOORBEAM-MPT command!  
Error computing virtual stringer live load reactions!  
Invalid or unsupported structure definition!  
Unable to retrieve the distribution factor!  
Error occurred for BRASS live load: H\_20-44\_\_\_~1  
Error generating FLOORBEAM-TRUCK command!  
Error computing virtual stringer live load reactions!  
Invalid or unsupported structure definition!  
Unable to retrieve the distribution factor!

I just want to know if 5.5.0 can support this kind of system (I know it can analyze the truss, but does it support the floorbeams as well?). If it

4/19/2016 3:05:58 PM

### Description

FROM:hlee DATE:12/12/2007 8:33:38 AM

Submitted on behalf of Christopher Dombrowski, Williams & Works.

Bridgeware received e-mail:

Can you please tell me where I can select the BRASS LFD "Intermediate Output" Feature to give detailed output similar to that shown in the attached .pdf file from the BRASS LFD Help Menu?

Under the Engine Properties Tab I selected option 1 - Print Floorbeam Intermediate Output, but the output does not look like what is shown in the attached .pdf file.

How I do I get this type of output?

FROM:bgoodrich DATE:Thursday, December 13, 2007 12:00:19 PM

The intermediate output you are looking for can be turned on using the point-of-interest engine properties located on the Engine tab of the Point of Interest window. Select the BRASS LFD engine and click the Properties button to open the BRASS-Standard Point of Interest Properties window. Then, check the "Detailed output report" box on the BRASS-Standard Point of Interest Properties. You must do this for every point for which you wish to receive intermediate output. Let me know if this addresses your question.

FROM:hlee DATE:12/13/2007 12:48:26 PM

E-mailed response to Christopher Dombrowski (dombrowski@williams-works.com).

### Description

FROM:bgoodrich DATE:Friday, December 14, 2007 10:59:28 AM  
E-mail from Wes Kellogg (12/12/07):

Herman -

We here at ODOT now have Virtis 5.6 and I have a question about the LRFR ratings that I am getting. I am getting H ratings that are higher than my HS ratings. Is it possible that there is a bug in the software that is allowing this to occur? Also, I get an error message when I try to load rate a PC beam without entering the age of the beam at deck placement and the design life of the beam. In the help section of Virtis it states that this information is used in calculateing prestess losses for Opis, and doesn't mention that it has any bearing on a Virtis load rating. I've varied the ages for these fields and does not seem to have any effect on the ratings, yet the the engine has to have this information for the engine to perform the analysis.

Any information you could provide would be greatly appreciated.

- Wes Kellogg

FROM:bgoodrich DATE:Friday, December 14, 2007 11:02:06 AM

I know of no problems with the H vs. HS ratings. Please export your bridge and send it to me so I can investigate this further.

The BRASS engine requires the age of the beam at deck placement and the design life when "refined" AASHTO losses are requested. However, the only AASHTO loss method available in the Virtis Prestress Properties window is the "approximate" method. Virtis doesn't have an option for the "refined" AASHTO method. The export process will need to be changed accordingly. These times were never used, which is why your results didn't differ when the times were changed.

The help topic should be updated to reflect the need to enter these times for an LRFD/LRFR analysis rather than saying Opis.

FROM:bgoodrich DATE:Wednesday, March 19, 2008 12:05:12 PM

I re-requested information from the user.

FROM:bgoodrich DATE:Thursday, March 20, 2008 10:50:41 AM

E-mail from Wes Kellogg:

Brian -

Attached is the exported XML file for a bridge standard that I checked using LRFR vs LFR. The difference between the LRFR and LFR ratings is understandable, but the fact that the HS rating is less than the H rating is a bit confusing to us. Any information you could lend would be greatly appreciated.

Thanks for your help.

- Wes Kellogg  
Acting Field Service Engineer

FROM:bgoodrich DATE:Thursday, March 20, 2008 1:15:18 PM

I imported the bridge into Virtis and analyzed the interior girder with BRASS LFD to obtain ratings. For your structure, BRASS lists the critical inventory rating location at mid-span and indicates that concrete tension is controlling. The live load moments at this location are higher for the HS truck loading than the H truck loading. The same lane load is used for both HS and H. For this length of bridge (98.5 ft), the HS truck loading governs over its lane loading, but the H lane loading governs over its truck loading. I also confirmed this with Appendix A of the Standard Spec. The HS loading with the higher live load moment should give the lower rating. The rating results I received for the interior girder are:

| Live Load Span-(%) | Live Load Type | Inventory Rating | Factor     | Inventory Location |
|--------------------|----------------|------------------|------------|--------------------|
| H 20-44            | Design Truck   | 1.870            | 1 – (50.0) | Concrete Tension   |
| H 20-44            | Design Lane    | 1.426            | 1 – (50.0) | Concrete Tension   |

4/19/2016 3:05:59 PM

HRS AASHTO

1078

Complete Issue Information

|          |              |       |            |                  |
|----------|--------------|-------|------------|------------------|
| HS 20-44 | Design Truck | 1.161 | 1 – (50.0) | Concrete Tension |
| HS 20-44 | Design Lane  | 1.426 | 1 – (50.0) | Concrete Tension |

Are these the same results you are receiving from BRASS? I just want to make sure I'm using the same live loads and settings that you are. Are there any special live load settings that you are using on the Analysis Settings window?

Please send any screen shots of the settings and/or results that might help with this issue. Also send any spreadsheets or hand calculations that show what you calculate the rating to be.

FROM:bgoodrich DATE:Thursday, March 20, 2008 4:32:53 PM  
E-mail from Wes Kellogg:

Brian -

I am getting the exact same numbers you got with BRASS LFR using Virtis set to LFR.

We are confident in the LFR analysis. I guess I should have been more clear in my question to you. Our concern is with the LRFR analysis. In the LRFR analysis, we are getting an H rating factor that is far greater than the HS rating factor. (Roughly 33% higher)

This is very concerning to us since we are on the verge of switching to LRFR across the board and implementing an automated routing/rating system for overloads using Virtis/Opis as the analysis platform. We feel that there shouldn't be that much difference between the LFR and LRFR ratings and this difference in ratings will greatly affect the outcome of this endeavor. Are we the only state that has this issue with the LRFR engine, or are we making a mistake in imputing our LRFR distribution factors, or some other factor? Any info you could provide would be greatly appreciated.

Thanks for your help.

- Wes Kellogg  
Acting Field Service Engineer

FROM:bgoodrich DATE:Thursday, March 20, 2008 4:33:53 PM  
Thanks for clarifying your concern. I see the issue now.

I ran the bridge with version 5.6, and I get the same LRFR results as you. However, there is an error with that version that results in scaled down live load actions. In short, the LRFR live load actions are not correct in version 5.6, which ultimately affects the ratings. I ran the bridge with version 5.6.1 and received the following ratings:

4/19/2016 3:05:59 PM

HRS AASHTO

1079

Complete Issue Information

The ratings are now much closer. Note that the LRFR load module combines the actions from the axle loading with those of the lane loading. Combining that increase with a higher impact on the truck loading and effectively a higher distribution factor, it stands to reason that the rating would be lower than that for LFR.

Herman – Please comment on the timeline for the release of the service pack that corrects this issue.

Description

FROM:gbarnhill DATE:Monday, December 17, 2007 5:06:24 PM

In the attached model, I copied the Superstructure Def "Three Span.....".

In the Superstructure Def "Three Span .... GAB" Member G2, I copied the first Member Alt in the list to make the other two member alts shown.

I delete the first member alt in the list and then SAVE.

I get the error, "Unable to save Bridge Data".

FROM:mordoobadi DATE:12/27/2007 10:57:57 AM

The problem appears to be related to the existing points of interest. After removing the points of interest from all member alternatives I was able to delete the member alternative.

This is not a resolution to the problem, it is just a work around. We have to further investigate this to find out what is happening.

FROM:mordoobadi DATE:1/23/2008 9:19:48 AM

| 8385.16684 | Assigned      | Rating factor "NaN" for a truss member |

## Description

FROM:pwhite DATE:Tuesday, December 18, 2007 8:25:42 AM

It appears that Virtis 5.6 is using the net area for all truss member capacity checks. For example, when checking for yielding of a tension member it appears to be using  $A_{net} \times F_y$ , rather than  $A_{gross} \times F_y$ . It also appears to not use  $F_u$  at all in the fracture check of the tension members. Since the Virtis truss engine doesn't show the rating calculations, I can't be entirely certain of this, but I can match the Virtis capacity by using  $A_{net}$  and  $F_y$  together.

FROM:hlee DATE:12/18/2007 9:47:04 AM

Virtis uses the net area when calculating the tension capacity. The Virtis Truss Method of Solution Manual Section 1.4 describes how Virtis computes the tension and compression capacities. The link to the manual is on the F1 Help of the Truss window.

FROM:pwhite DATE:Wednesday, December 19, 2007 8:54:33 AM

Yes, I agree that Virtis is calculating the axial tension incorrectly. The possible failures for tensile capacity are  $A_{net} \times F_u$  or  $A_{gross} \times F_y$ , not  $A_{net} \times F_y$ . In addition, it appears that the compression capacity is also being based on  $A_{net}$ , contrary to the manual. Is it possible to have these issues corrected in the next release?

FROM: Girish Bhanushali DATE: 9/11/2009 4:51:41 PM Eastern Daylight Time

Hi Pete,

Virtis Truss follows LFD methodology. Expectations reflected in your comments are based on LRFR

4/19/2016 3:06:00 PM

HRS AASHTO

1082

Complete Issue Information

Spec.

It is not known at this time when Virtis truss would implement LRFR Spec.

Virtis Truss does not use Anet in computing compression capacity. For Compression capacity, it uses Agross. Please refer to "Section Property Report" generated after Virtis Analysis for more information.

You can also verify this in latest version of Virtis if It is still an outstanding issue for you.

Thanks.

Girish J. Bhanushali

### Description

FROM:hlee DATE:1/4/2008 8:37:26 AM

Submitted on behalf of Ziad Hanna (zhanna@benesch.com), Alfred Benesh and Company:

when trying to modify the enginer properties in BRASS to remove the limit of 1 of (Mcr/Mmax), in the output page one I found the highlighted statment printed below in red and the results ignore the shear.

(Shear will be ignored as requested by either the ANALYSIS or the STIRRUP-SCHEDULE command).

FROM:hlee DATE:1/4/2008 8:52:37 AM

In BRASS ANALYSIS command, "Ignore Prestress Shear" should be coded as 2 instead of 1 (prestress shear rating is to be ignored).

Complete Issue Information

Related to the fix for Incident 7593.

FROM:bgoodrich DATE:Wednesday, March 05, 2008 11:48:22 AM

It looks like the fix for Incident 7593 affected the values that were ultimately stored in the engine properties for the Vci Method indicator. Previously, the values were stored as 0, 1, or 2 and accounted for the user ignoring shear from the member alt window. Now that this has been changed, the Vci Method indicator is only a 0 or 1. The export must be changed accordingly.

FROM:bgoodrich DATE:Wednesday, March 05, 2008 12:11:45 PM

I revised the CBrassStdAnalysisCmd::Prepare function in the BRASS export to handle a Vci Method indicator of 0 or 1 from the engine properties. The ANALYSIS command is now generated as expected. Fixed for version 6.0.

FROM:bgoodrich DATE:Wednesday, March 10, 2008

The change I made assumes the engine properties will return only a 0 or 1 for the Vci Method Indicator. Now that I look at the domain, it can still store a 2 and return that value from one of its member functions.

It would be cleaner if the domain converted the 2 to a 1 for internal purposes rather than keep around a value that is no longer applicable.

There are also no comments in the code to explain why a 2 is handled differently.

At the end of the CDoBrassStdMbrAltParser::ParseData function, I suggest adding the following code:

```
// A Vci Moment Indicator of 2 was changed to 1.  
if (m_iVciMomentInd == 2)  
    m_iVciMomentInd = 1;
```

Then, the other Abobrass functions could be revised to eliminate the m\_iVciMomentInd value of 2.

FROM:bgoodrich DATE:Wednesday, March 19, 2008 11:33:26 AM

E-mail from Herman Lee (3/18/2008):

We decided to include 8403 in 5.6.1. I agree with what you suggested for m\_iVciMomentInd. It is cleaner and also avoid future confusion and mistake. Please make the changes and send us the files to merge to SourceSafe.

FROM:bgoodrich DATE:Wednesday, March 19, 2008 11:33:57 AM

I actually ended up revising the ParseVersion\_5\_03\_01\_01 and ParseVersion\_5\_04\_00\_01 functions in CDoBrassStdMbrAltParser in the Abobrass project as described above. I removed references to iVciMomentInd = 2.

Hi Randall,

Could you check and send us the virtual memory settings in your machine? Steps to check the virtual memory settings are listed below. Attached is a screen capture of the Virtual Memory dialog.

1. Select Control Panel in the Start Menu.
2. Select System in the Control Panel to display the System Properties dialog.
3. Select the Advanced tab in the System Properties dialog.
4. Click on the Performance Settings button in the System Properties dialog to display the Performance Options dialog.
5. Select the Advanced tab in the Performance Options dialog.
6. Click on the Change button to display the Virtual Memory dialog.
7. Please do a screen capture of the Virtual Memory dialog and send it to us.

Thanks,  
Herman  
=====

E-mail sent (6/18/08):  
=====

Please try to change the initial paging file size from 2046 to 4092 MB. You may need to restart you machine after the change. See whether this will resolve the error loading BRASS DLL problem you reported in Incident 8404.

Complete Issue Information

Thanks,  
Herman

=====

FROM:hlee DATE:6/19/2008 8:10:20 AM  
E-mail received (6/18/08):

=====

Herman,  
Changing the paging file settings did help until I opened another program that was a memory hog. The error started up again after the other program got its share of memory. I guess the solution is to close most of the programs that are running while running V/O.

Thanks,

Randall  
By-the-way this is only half of the bridge.

=====

Reply e-mail (6/19/08):

=====

Randall,

I guess what you suggested is a solution for now. Hopefully, the BRASS combined (LFD/LRFD) engine has better memory management.

For the Beta 4 installation problem, the error code indicates you got a bad disk. We are going to send you another one today. Sorry for the inconvenience.

Herman

Description

FROM:hlee DATE:1/14/2008 9:41:48 AM  
 Submitted for Steven Maberry, New Mexico DOT via bridgeware e-mail:

REFERENCE INCIDENT ID 7880

We believe that BRASS ratings for PS Concrete beams may be erroneous in some circumstances. We no longer think it is a development length vs transfer length problem. Instead, we believe that BRASS has failed to incorporate March 2005 Errata for 9.28.1. When we analyze some bridges with Virtis/BRASS and with other means (e.g., ConSPAN), we find the results agree ONLY when we alter the "other means" by changing the 1.6 factor added in the March 2005 Errata back to 1.0.

ORIGINAL

Complete Issue Information

--AASHTO. Standard Specifications for Highway Bridges. 17th Edition. (Washington DC: AASHTO 2002)

Errata correction March 2005:

--AASHTO. "Standard Specifications for Design of Highway Bridges—17th Edition ERRATA." (Washington DC: AASHTO March 2005) p 249.

Also available at <http://downloads.transportation.org/Errata-HB-17-E4.pdf>

FROM:smaberry DATE:Monday, January 14, 2008 10:31:11 AM

I observe that the pasted images of the original AASHTO 17th edition text and that of the Errata did not make it through the Bridgeware email system. The original Equation 9-42 in paragraph 9.28 was written as:

"Three- or seven wire pretensioning strand shall be bonded beyond the critical section for a development length in inches not less than  $(f^*su - 2/3 \times fse) D \dots$ "

The errata corrects that to: "... 1.6 x  $(f^*su - 2/3 \times fse) D \dots$ "

FROM:bgoodrich DATE:Thursday, February 07, 2008 5:09:45 PM

Neither the BRASS engine or export utilize the development length equation in question. The BRASS engine is set up to accept either the transfer or development length (not both) on the STRAND-ST2 command. The export generates the STRAND-ST2 command using only the transfer length.

FROM:hlee DATE:2/14/2008 12:40:03 PM

As commented in Incident 7880 by Brian Goodrich, BRASS LFD does not calculate the development length. This issue had been forwarded to WYDOT (BRASS Problem Log 749). Status changed to Duplicate since it is related to Incident 7880.

### Description

FROM:mcruz DATE:Thursday, January 24, 2008 8:55:23 AM

It appears that Virtis does not apply the reduction in load intensity (AASHTO 3.12) when calculating the distribution factor for an interior spread box beam (AASHTO 3.28.1) as noted in AASHTO by \*\*. Why? Also, it appears that it uses the simple span (of length S) when analyzing an interior beam with  $S < 6.57$ , does AASHTO recommend this?

FROM:kkennelly DATE:1/30/2008 3:53:52 PM

1. It appears to be a bug that the reduction in load intensity from Article 3.12 is not being applied to

4/19/2016 3:06:02 PM

interior spread box beams.

2. Can you export and attach your bridge to this incident so I can check the spacing being used when  $S < 6.57$ ?

FROM:hlee DATE:3/18/2008 3:12:47 PM

May be related to Incident 8506. Please use the bridge attached in 8506 to test the fix.

FROM:macruz DATE:Wednesday, June 11, 2008 1:27:46 PM

I have attached the file you requested, but please note that I ended up inputting my own distributioun factors.

FROM:macruz DATE:Wednesday, June 11, 2008 1:33:23 PM

FROM: Herman Lee DATE: 3/4/2010 8:23:11 AM Eastern Standard Time

Included reduction in load intensity (AASHTO 3.12) when calculating the distribution factors for spread box beam (AASHTO 3.28.1 and 3.28.2). Resolved for 6.2 Release.

When  $S < 6.57$ , AASHTO 3.28.1 is no longer applicable. Virtis will issue a warning message and compute based on simple beam distribution. Virtis could provide an option to ask whether the user wants to compute based on simple beam distribution when 3.28.1 is not applicable.

The bridge attached in 8506 is an adjacent box beam. The distribution factor computations are based on AASHTO 3.23.4.3. For the "2 - 1st N Int" member (number of lanes is 5), the multi-lane distribution factor is 0.5315 (3/5.6443, with  $C = K = 0.8645$ ). Reduction in load intensity (AASHTO 3.12) is not included in the computation since it is not explicitly specified like the note \* in AASHTO 3.28.

FROM: Herman Lee DATE: 5/5/2010 3:06:23 PM Eastern Daylight Time

Verified in 6.2 Alpha 4.

### Description

FROM:pcampisi DATE:Wednesday, January 30, 2008 5:20:30 PM

When the attached bridge is load rated LRFR, the inventory and operating rating factors are substantially higher than the LRFD design ratio. The live load moment calculated in the LRFR run is lower than the LRFD critical moment, as the LRFR run is using a scale factor of 0.833 with a single lane live load distribution factor. It is using the Fatigue Limit state to calculate the moment for inventory and operating ratings(i.e. 0.833 scale factor and single lane loaded per LRFD 3.6.1.1.2). The analysis settings are not set to the single lane loaded option.

Moments as follows:

LRFR - Truck Train: AASHTO LRFD Live Load - US (TKT) = -1108.5 m-KN

LRFD - Truck Train: AASHTO LRFD Live Load - SI (TKT) = -1956.4 m-KN

Are some of my settings wrong?

FROM:pcampisi DATE:Wednesday, January 30, 2008 5:22:01 PM

The Superstructure Definition used is "11 girders Lightweight Concrete (LOAD RATING)", rating the interior girder.

Complete Issue Information

FROM:pcampisi DATE:Tuesday, February 05, 2008 3:13:54 PM

FROM:bgoodrich DATE:Thursday, February 07, 2008 5:02:41 PM

It appears that the scale factor of 0.833 is being applied to all the HL-93 loads and not just the fatigue truck. Additionally, the one-lane loaded distribution factors are being applied as well. For LRFD, the fatigue truck was specified as a separate vehicle and assigned to the Fatigue Loads event category. The export made certain assumptions based on this; however, for LRFR, these assumptions cause the behavior we are now seeing with the scale factor and the lanes loaded. I revised the export to correct this issue.

FROM:pcampisi DATE:Friday, February 08, 2008 9:06:19 AM

How do I fix this on my end?

FROM:bgoodrich DATE:Tuesday, February 12, 2008 11:25:45 AM

There is no workaround that I can see. A new export module must be distributed to correct this issue.

This has been addressed in the 6.0.0 source code.

FROM:hlee DATE:2/25/2008 2:14:53 PM

Tested in 5.6 Service Pack 1 Debug Build. Compared BRASS files before and after the fix.

FROM:hlee DATE:3/21/2008 8:54:10 AM

Use the bridge attached in Incident 8380 for testing.

FROM:xli DATE:4/7/2008 3:14:14 PM

Retested the attached bridge with 6.0 Beta 3. Live load actions of LRFD analysis and LRFR rating are exactly the same.

### Description

FROM:kkennelly DATE:2/4/2008 8:09:58 AM  
Submitted on behalf of Linda Hager via email:

I spoke with you the beginning of this week concerning a discrepancy I have found with the calculated section properties of the built-up beams and Virtis output section properties. I reviewed the input and compared the output results for the section properties to my hand calculated section properties and the properties do not match..

In addition to the above, when I run Virtis, the rating output for all the beams of this structure show that shear controls at the beam ends. This result does not make sense to us. Attached is a copy of our section property hand calculation and the Vertis xml file for your review. The attached section property calculations are labeled for each beam.

Please contact me if you need additional information or have any questions. My contact information is noted below.

Thank you for your assistance,.

User's hand calcs for I, A and y of steel builtup section don't match those in the BRASS LFD output.  
May be related to cover plates being merged.

FROM:kkennelly DATE:2/4/2008 3:57:09 PM  
Email sent to lchager@transystems.com:

Hi Linda,

Someone is going to look into your problem with the section properties.

As for the shear controlling your bridge, I noticed that your input does not contain any bearing stiffeners or transverse stiffeners. The BRASS output file lists warnings that the transverse stiffener spacing does not meet current spec requirements. I think the lack of stiffeners is why the shear is controlling.

FROM:kkennelly DATE:2/5/2008 8:05:40 AM  
email received from Linda:  
Hi Krishna,

Thank you for your prompt response. In reference to my question concerning the shear controlling, one of the members in the input is titled G-4 with stiffeners, which I set up with the bearing and intermediate stiffeners. Flexure did control for my LFD run with the stiffeners, but the ratings from this run were extremely high and did not make sense to me. I created the Member G-4 with stiffeners by copying my original G-4 input and adding the intermediate and bearing stiffeners. I would appreciate it if you can also look at this member run.

Thank you again,

Linda

FROM:kkennelly DATE:2/5/2008 8:39:51 AM

and live load forces and the section properties computed by BRASS. Create a point of interest in Virtis at the controlling rating location and then review the rating computations in the BRASS output text file. If you find a problem with any of the computations or forces we can look into that. Otherwise you have to review your input to determine if it is correct, we can't really help you with that.

Regards,  
Krisha Kennelly, PE

FROM:bgoodrich DATE:Thursday, February 07, 2008 2:15:56 PM

I investigated the issue you reported regarding differences in section properties between your hand calculations and those reported by BRASS. I found the source of the difference to be in the process that exports the built-up sections to BRASS. For your structure, the top cover plate and horizontal legs of the top angles are merged due to limitations with BRASS. This results in equivalent top angles that have an increased horizontal thickness. BRASS only supports one thickness for both legs of an angle. The thickness of the horizontal legs was sent to BRASS, which led to a higher area.

Now that I know what is going on, I plan on revising the export process to adjust the vertical leg length passed to BRASS to account for the thicker angle thickness. I don't have any suggestions for a work-around.

FROM:bgoodrich DATE:Friday, February 08, 2008 11:35:32 AM  
E-mail from Linda:

Hi Brian,

Thank you for looking into the section property issue with BRASS. For this particular project, we are running the program using the line girder method. Is there a way I can input the beam section properties into Virtis/BRASS so the program can then use this information to compute the member composite properties? I noticed there is a properties screen under the I-shape option in the beginning of the program under beam shapes.

Also, will the program export process be available as a patch for the current version we are running (version 5.6)?

Regards,

Linda Hager  
TranSystems

FROM:bgoodrich DATE:Friday, February 08, 2008 11:36:24 AM

The BRASS engines compute the section properties based on the input dimensions regardless of whether or not the section properties are specified directly. I don't know of any way to bypass this problem.

Krisha Kennelly will need to comment on the availability of a patch to version 5.6.

Description

FROM:hlee DATE:2/18/2008 11:34:57 AM  
Submitted for Steven Maberry, New Mexico DOT via bridgeware e-mail:

From: Lowe, Eric R., NMDOT  
Sent: Tuesday, February 12, 2008 3:05 PM  
To: Maberry, Steven R., NMDOT  
Subject: Virtis, Ductility Limits

Ductility limits

AASHTO Standard 9.18

When selecting the equation to calculate the flexural capacity of a prestressed beam, section 9.18 is considered. Section 9.18 states that the reinforcement index shall not exceed  $0.36 * \text{Beta } 1$ . It is my understanding that Beta 1 is based on the compressive strength of the concrete deck. It appears that Brass calculates Beta 1 for the prestressed beam concrete. With a concrete strength at or greater than 8000psi the Beta 1 factor is reduced to 0.65 from 0.85 resulting in a smaller acceptable reinforcement index. Ordinarily this is not a problem. However, when rating beams with small depth dimensions, the calculated reinforcement index is larger than usual. When limited to  $0.36 * \text{Beta } 1$  brass may select and use a flexural capacity equation that is insufficient.

Thanks,

Eric Lowe, P.E.

## Complete Issue Information

I've been assigned the ductility issue you submitted for Eric Lowe (Incident 8468). Please export Eric's bridge to the XML format and send it to me, so I can attach it to the incident and use it for duplicating the issue.

FROM:bgoodrich DATE:Wednesday, February 20, 2008 12:28:40 PM

I reviewed the BRASS engine and found that the compressive strength of the prestressed concrete girder is used to calculate beta1 for a composite section that is considered "flanged".

FROM:bgoodrich DATE:Wednesday, February 20, 2008 4:26:56 PM

E-mail from Steven Maberry:

Brian,

Find ROWE\_ERL.xml attached. This is a bridge that exhibits the described logic behavior. (VirtisOpis 5.6.0; BRASS Girder Version 6.0.0)

The BRASS output file reports:

0.36 beta1 = 0.2340

Which reveals that BRASS is using  $\beta_1 = 0.2340/0.36 = 0.65$

HOWEVER the compression flange for the composite beam is deck concrete with compressive strength = 4 ksi (NMDOT Class AA). This concrete's  $\beta_1 = 0.85$

Running the same girder-deck composite beam in ConSPAN results in the beam passing this reinforcement check. BRASS reports:

So, over reinforced, PMU = 0.00 kip-ft AASHTO 9-22

We believe BRASS is using the wrong beta1 (the one associated with the prestress concrete instead of the deck concrete, which is the compression flange) and, therefore, reporting an erroneous over-reinforced failure mode. The actual error occurs in equation 9-20 ... not equation 9-22. With  $\beta_1 = 0.85$ , the reinforcement index passes equation 9-20 so that 9-22 does not apply.

Such an issue is rare because standard AASHTO beams are much taller than the special rectangular beams in ROWE\_ERL. In standard AASHTO beams  $A_s/bd_t$  will be MUCH smaller because  $d_t$  is so large. This probably explains why the error has not previously shown up.

Thanks,

Steven M and Eric L

I was able to duplicate the issue using the ROWE\_ERL.xml file. See the "G2" member under the "Span 2" structure definition. I generated the BRASS data file and have forwarded it and the issue discussion to WYDOT.

Complete Issue Information

WYDOT assigned this issue to BRASS Problem Log 808.

FROM:bgoodrich DATE:Friday, March 07, 2008 12:16:32 PM

I am investigating the ductility issue again. I found that BRASS is using the beam f'c in the ductility calculations because the girders are input as non-composite. Unless there are shear reinforcement ranges that tie the beam and slab together, the structure will be considered non-composite. Please let me know if this addresses your concern.

FROM:bgoodrich DATE:Friday, March 07, 2008 12:17:22 PM

E-mail from Steven Maberry:

Brian,

Thanks very much. This was Eric's bridge—he actually works for a separate design unit. I had not noted that composite bridge structure was not communicated to Virtis. Once Eric installed horizontal shear transfer reinforcement, BRASS responded correctly.

Thank you very much. We are very grateful for your help in resolving this issue.

Steven M

FROM:bgoodrich DATE:Friday, March 07, 2008 12:19:42 PM

User made the bridge composite and results are as expected. Closed.

Issue ID: 8469  
Subject: Validate travelway at the same elevation is not necessary for Truss line superstructure.

Subject: RE: Truss Load Rating using Virtis

Could you export and e-mail the truss line superstructure to us for investigation?

Thanks,  
Herman

>>> O'Donnell, Shasta <sodonnell@volkert.com> 2/14/08 11:49 AM >>>

I have entered the input in as a truss line superstructure and am still getting an error concerning the lower panel points. It states that panel point L1 is not on the truss deck, please correct panel point L1 coordinates. I don't understand why it didn't complain about L0.

Subject: RE: Truss Load Rating using Virtis

Lower panel points with different elevations can be entered into Virtis. I think the problem you are having is the Virtis computed dead loads for truss system superstructure. You may want to enter the truss as a truss line superstructure and enter the floor system dead load as panel point loads in the PanelPointLoad command for those lower panel points that support the deck.

Herman

>>> O'Donnell, Shasta <sodonnell@volkert.com> 2/6/08 11:57 AM >>>  
It is similar but it is still a through truss. I assume that the lower panel points have to be at the same elevation. Will different elevations for the lower panel points be supported by virtis in the future? thanks

FROM:hlee DATE:2/18/2008 1:42:03 PM  
 For truss line superstructure, the user is responsible for computing and entering the dead loads as panel point loads. So validating travelway at the same elevation is not necessary for truss line superstructure.  
 Resolved for 6.0 Release.

Description

FROM:sboukamp DATE:Friday, February 22, 2008 11:31:57 PM

While testing the Virtis Std. Engine 6.0 I noticed in the Analysis Settings window the following:  
 Opening the Analysis Setting windows from a bridge alternative; Rating Method: Member Alt.;  
 Analysis Type: Standard; on right side: having either Inventory or Operating in the LFD/ASD tree  
 selected  
 and on the left side a vehicle which has the LFD/ASD Rating option as property NOT checked (e.g.  
 HL-93(US), HL-93(SI) or Lane-Type Legal Load vehicle); trying to add this vehicle  
 produces a message but still adds the selected vehicle to the selected right tree branch.  
 Error message: "This vehicle cannot be added as an LFD/ASD rating vehicle."

This happens also with a non-LRFR vehicle when trying to add it to either Inventory or Operating  
 branch of the LRFR tree.

FROM:mordoobadi DATE:3/3/2008 12:14:35 PM  
 Fixed for 6.0 Beta 3.

Description

FROM:jfrick DATE:Monday, February 25, 2008 10:18:57 AM

Virtis calculates web shear capacity as unstiffened at the pier of two span continuous girder structure - appears to ignore diaphragm connection plates/intermediate stiffeners or bearing stiffener at pier when calculating shear capacity. Current rating governed by web shear capacity. Previous run in 2005 rated out with moment governing at pier. Hand-calculation using AASHTO 17th Edition LFD, yields adequate results similar to 2005 results. Bridge originally designed using Merlin-Dash software.

FROM:hlee DATE:2/25/2008 1:44:06 PM

Please export the bridge to the XML format and attach it to the incident for duplicating the issue.

Complete Issue Information

See attached .xml file.

FROM:hlee DATE:2/28/2008 9:33:54 AM

I rated G-1, G-2 and G-4 with both Virtis LFD and BRASS LFD engines. For G-1 and G-4, both engines reported the critical location is at the pier with shear strength controls. For G-2, Virtis LFD engine reported shear strength controls but the critical location is not at the pier. Which member do you have problem with the web shear capacity? From the 2008 Notes in the description of the bridge, loads were added and analysis engine was switched to Virtis LFD. Please provide hand calculation for the shear strength capacity check.

FROM:jfrick DATE:Friday, February 29, 2008 10:05:14 AM

We ran using both the Virtis and BRASS engines with simialr results although Virtis LFD were slightly higher. Girders 1, 3, 4 and 6 do not rate out with either engine. Attached is our shear calc at the pier

FROM:hlee DATE:2/29/2008 10:37:15 AM

Brian, please investigate the reported issue in the BRASS run.

FROM:bgoodrich DATE:Tuesday, March 04, 2008 11:24:52 AM

I investigated G1 using the BRASS LFD engine. I confirmed it is calculating the shear capacity based on an unstiffened web. BRASS checks the stiffener spacing left and right of the support and chooses the larger spacing, which is 240 inches. BRASS calculates a maximum spacing limit (Article 10.48.8.3) of  $3D = 204"$ . Because the actual spacing exceeds this maximum, BRASS considers the web to be unstiffened. This simply explains what the engine is actually doing. It should also be noted that the stiffeners are not actually required because  $D/tw$  is 136, which is less than the 150 limit; however, they are still provided.

The hand calculations did not consider the spacing limit of  $3D$ , which leads to a higher shear capacity than BRASS is calculating. If you do not agree with the method by which BRASS is performing this calculation, I will submit this issue to the Wyoming DOT for review and possible assignment to a BRASS problem log. Please provide any justification or considerations for performing these calculations differently.

FROM:bgoodrich DATE:Wednesday, March 05, 2008 12:20:25 PM

E-mail from James Frick (3/4/2008):

Brian:

I reviewed your comments and I am in complete agreement with you and Virtis' calculation. When the ratings came up low and knowing that the previous rating summary I was provided with showed higher ratings and that flexure governed, I wanted find out why before notifying the owner. I began manually calculating the web capacity and didn't go all the way through AASHTO 10.48.8 - I stopped once I calculated the web capacity and thus did not check paragraph 10.48.8.3. Thank you for identifying this for me.

Description

FROM:gbarnhill DATE:Monday, February 25, 2008 11:00:24 AM

The attached structure is a 3 girder system. 10 ft girder spacing and 22'-6" Travelway.

With PREFERENCES/BRIDGE WORKSPACE Live Load Dist Factors set for Standard Spec, Virtis COMPUTES LL DF for G1 (Exterior member) as 1.25. This is based on wheels placed within 2'-0" of the curb.

With PREFERENCES/BRIDGE WORKSPACE Live Load Dist Factors set for MCE, Virtis COMPUTES LL DF for G1 (Exterior member) as 1.125. This is based on wheels centered within a 11'-3" Lane.

MCE 6.7.2.2 says to center wheels in lanes for Roadway 18 to 20 ft.

4/19/2016 3:06:05 PM

HRS AASHTO

1113

## Complete Issue Information

Standard Spec 3.6.3 and 3.6.4 imply wheels at maximum locations for Roadway 20 to 24 ft.

It seems that the Virtis COMPUTE should be the same for Stand Spec and MCEB for roadways 20 to 24 ft.

FROM:hlee DATE:2/26/2008 9:59:35 AM

This is related to Incident 7007. For roadway width 18 to 24 ft and MCEB selected, Virtis computes distribution factors based on 2 lanes and wheels centered within the lane. Gale, please let us know your comment.

FROM:gbarnhill DATE:Tuesday, February 26, 2008 11:17:00 AM

I agree with all the conclusions in Incident 7007 and the number of lanes used with MCEB selected. I'm questioning if the wheels should be centered in the lane for roadway widths of 20 to 24 ft.

FROM:hlee DATE:2/27/2008 8:26:48 AM

Since the number of lanes criteria in MCEB is extended from 20 to 24 ft, the wheels centering criteria is also extended when MCEB is selected as the spec to use.

FROM:hlee DATE:4/3/2008 11:28:20 AM

Since there is no more comments on the investigation, the status is changed to Resolved.

FROM:dteal DATE:Thursday, April 10, 2008 12:13:03 PM

email from David Koenig

I have been so busy on other things that I have not had time to keep up with the incidents on the website. I am in full agreement with you on this one. The wheel line should be placed to cause maximum loadings for roadways from 20 to 24 feet. Basically, they should be placing the wheel line 2 feet from the curb so as to produce the maximum loading on the exterior girder. At MoDOT, our standard practice is to always place the wheel lines 2 feet from the curb and then place additional trucks according to AASHTO. Some engineers get caught up on trying to place the vehicle within the lane to calculate DF's. That approach doesn't pass the common sense test for me. I guess that some people think that the magic white line painted on the roadway is going to keep the truck from getting closer to the curb.

FROM:hlee DATE:4/10/2008 2:45:27 PM

I agree that the wheels should be placed to obtain the maximum effect for roadways from 20 to 24 feet. At the same time, in what purpose does the selection of spec serves in the calculation of DFs. If the goal is to obtain maximum effect, the selection of Standard Spec or MCEB Spec is not needed after all.

FROM:gbarnhill DATE:Friday, April 11, 2008 11:06:02 AM

I'm not sure what the discussion was when we implemented the Preference for Stand Spec or MCEB, but I think it may have been related to Design vs Rating. I assume the Preference is available for Opis modeling, so at design time the effects would need to be placed according to the Standard Spec. At Rating time, the effects need to be placed according to MCEB.

FROM: Herman Lee DATE: 10/2/2008 1:35:05 PM Eastern Daylight Time

Modified the computation to place the wheel line 2 ft from the curb when MCEB is selected and roadways from 20' to 24'.  
Resolved for 6.0.1 and 6.1.

Description

FROM:gdoerr DATE:Thursday, February 28, 2008 2:07:05 PM

I am trying to rate a continuous truss that gives me the following error. Floorbeam Members

Fb1 (Floor System Floorbeam Member)

Existing member alternative: south end floorbeam

Current member alternative: south end floorbeam

south end floorbeam (Floorbeam Member Alternative)

Warning: LFD single lane moment distribution factor not

defined.

Warning: LFD single lane shear distribution factor not defined.

Warning: LFD single lane shear at support distribution factor

not defined.

Warning: LFD single lane deflection distribution factor not

defined.

Warning: LFD multi-lane moment distribution factor not

defined.

Warning: LFD multi-lane shear distribution factor not defined.

Warning: LFD multi-lane shear at support distribution factor

not defined.

Warning: LFD multi-lane deflection distribution factor not

defined.

Warning: Shear connector ranges are not defined.

Warning: Composite deck values have been defined but shear

connectors have not. Check for correct composite action.

Warning: LRFD live load distribution factors not defined.

ERROR: Haunch ranges are not continuous over the length of

the member alternative.

ERROR: Haunch range not defined for entire length of

member alternative.

Where do I input the DF for the floorbeams? I have not been able to find it. This may be the only thing that keeps the file from running but this is as far as I can get. The above errors show up in the validation and save operations.

The following error shows up while trying to run the analysis:

4/19/2016 3:06:06 PM

HRS AASHTO

Complete Issue Information

Unable to convert steel beam to BRASS cross sections!  
Error generating BRASS cross section commands!  
Unable to get cross section dimensions!  
Error generating BRASS cross section commands!  
Unable to compute modular ratio for slab rebar!  
The concrete modulus of elasticity must be greater than zero!

Any hints as to were to solve these items?

Gary

FROM:hlee DATE:2/29/2008 8:51:14 AM  
Distribution factor input is not required for floorbeams. The validation shouldn't report those distribution factor warning messages.

Based on the error messages during analysis, check the accuracy of the length input in the Floorbeam Profile window. If this still doesn't resolve the problem, please attach your bridge so we can take a look here.

FROM:gdoerr DATE:Monday, March 03, 2008 11:30:01 AM  
The floorbeam lengths seem correct to me. I attached the file for your review. thanks gary

FROM:hlee DATE:3/4/2008 10:05:26 AM  
Brian, please assign to Krishna to fix the distribution factor warning messages after you are done.

There are a couple of issues in Fb1 (End floorbeam) after I modified the start distance and length of the deck reinforcement to match the deck concrete. I tried the bridge in both 5.5 and 5.6.

1. The analysis locations defined in the Floorbeam Member Alternative window.

I have gotten the same error A GIRDER CROSS SECTIONAL AREA LESS THAN 0.01 EXISTS in a different (3 span) girder floor beam bridge. Is it something that I am inputting incorrectly? Gary

FROM:bgoodrich DATE:Tuesday, March 11, 2008 9:12:19 AM

I changed the haunch profile to match the deck and reinforcement profiles. There should be about a 1 foot section at the start and end of the floorbeam that consists of only the rolled beam. However, when the export calls for the cross section at the left end of the member (0.0 ft), a section with a haunch is returned. The cross sections are generated using the domain functions: ResetChangePointGeneration and GenerateCrossSectionInfo. Do you have any idea why a haunch is being found at the start of the floorbeam? Could there be a problem with the haunch range set MoveDistance function? I don't have the domain code. Please let me know what you find.

FROM:bgoodrich DATE:Tuesday, March 11, 2008 9:16:31 AM

E-mail from Krisha:

I've fixed a bug in abognrl that was causing this problem. I've attached the abognrl.dll for Debug Version 6.0.

As a workaround, entering a "fake"(all dimensions equal zero) haunch over the first 1.04' of the fb will solve the problem of the haunch being returned at the start of the fb. But then I think the export will require a "fake" deck over this portion of the fb as well. When I try this workaround of entering both a fake haunch and fake deck I get an export error about the concrete modulus of elasticity not being defined. I'm not sure where that is coming from. Can you look into that and see if this workaround can work for the user?

4/19/2016 3:06:06 PM

HRS AASHTO

1118

## Complete Issue Information

FROM:bgoodrich DATE:Tuesday, March 11, 2008 9:17:45 AM

Regarding the workaround, I entered fake slab and haunch for the first part of the floorbeam and was able to analyze the alt for "Fb1". Before adding the fake slab, I received the error about the concrete modulus of elasticity.

I also confirmed the new abognrl DLL fixed the problem.

FROM:bgoodrich DATE:Tuesday, March 11, 2008 9:18:13 AM

I still need to update the export to include the floorbeam member alt analysis locations.

FROM:gdoerr DATE:Wednesday, April 02, 2008 2:25:11 PM

Any help here? I'm supposed to have this rating done this month.

FROM:bgoodrich DATE:Monday, April 07, 2008 1:42:08 PM

Please try this workaround:

1. Expand the tree so the items under "End floorbeam" are shown.
2. Add a dummy range to the Haunch Profile window that starts at 0.0 ft with a range of 1.04167 ft. All the haunch dimensions in this row must be entered as zero.
3. Add a dummy range to the Deck Concrete tab on the Deck Profile window that starts at 0.0 ft with a range of 1.04167 ft. Enter the same data as the existing row, except for the Structural Thickness, which should be entered as 0.0 in.
4. Revise the entry on the Reinforcement tab of the Deck Profile window so the reinforcement range matches the range of the slab, i.e., starting at 1.04167 ft with a range of 33 ft.
5. Expand the tree to view Floor System Geometry > FLOORBEAM MEMBERS > Fb1 > FLOORBEAM MEMBER ALTERNATIVES > "south end floorbeam".
6. Delete the entries on the Analysis Locations tab of the Floorbeam Member Alternative window for "south end floorbeam". These could also be moved to the Points of Interest for the "End floorbeam".

FROM:hlee DATE:4/9/2008 3:32:21 PM

I tried to rate "Truss 1" in the attached bridge in 6.0 development. Following are the error messages:

```
Computing nodal loads due to floorbeams...
???Error - Unable to compute dead load of floorbeam!
???Error - Unable to compute floorbeam loads ...
???Error - Unable to compute floorsystem loads...
```

6.0 Development asserted at Line 1751 in DoSteelBeamDef. Looks like there is a bug when haunch data doesn't start from the start of the member.

```
if( !IsEqualTo( m_BmDefHaunchDataArray[i].dConcreteDensity,
               m_BmDefHaunchDataArray[i+1].dConcreteDensity) )
{
    ASSERT(FALSE);
    return FALSE;
}
```

Brian, please assign to Krishna after you are done with your export changes. There is no workaround for this problem in 5.5.

HRS AASHTO

1119

Complete Issue Information

FROM:hlee DATE:4/10/2008 2:01:05 PM

I tried to rate the truss (with Brian Goodrich's workaround) in 5.6. After I added a dummy end range (1.04163 ft) to the Haunch Profile window and the Deck Concrete tab on the Deck Profile window, "Truss 1" rating completed without any error messages. Although the analysis was completed, the element actions and support reactions listed in the Dead Load Analysis Report are either missing or with a value "NaN". I suspect there is a defect in building the truss FE model.

Krishna, please assign to Girish after you are done.

FROM: Krishna Kennelly DATE: 6/23/2008 11:40:18 AM Eastern Daylight Time

Assigned to Herman to fix building the FE model.

FROM: Herman Lee DATE: 8/28/2008 9:50:07 AM Eastern Daylight Time

Two issues need to be investigated and fixed:

1. I tried to rate "Truss 1" in the attached bridge (85-126.562\_Long\_X\_Bridge.xml) in 6.0 Release. Following are the error messages. This issue was reported above on 4/9/2008. It is a bug when haunch data doesn't start from the start of the member.

Computing nodal loads due to floorbeams...  
???Error - Unable to compute dead load of floorbeam!  
???Error - Unable to compute floorbeam loads ...  
???Error - Unable to compute floorsystem loads...

2. After I added a dummy range at the start and end of the floorbeam haunch profile and deck profile to bypass the first issue, I tried to rate "Truss 1" in the attached bridge (8480-v60.xml) in 6.0 Release and all influence line ordinates are -1.#IND. I copied "Truss 1" to "Truss 2" and removed all the joints that connect to only two members in the upper chord. Live load analysis was successfully completed but the impact factor computation failed due to the limitation listed in Incident 8067. Also attached the 6.1 Development version (8480-v61.xml) of the modified bridge.

Description

FROM:gbarnhill DATE:Tuesday, March 04, 2008 10:26:25 AM

In the attached model, Member G3 is intended to be analyzed for PS shear.

We have not checked the IGNORE SHEAR item in the member alt, but the ANALYSIS command in BRASS, parameter 7 is set to 1 = ignore PS shear.

When we built this model, we created member G2 as the moment analysis member and checked IGNORE SHEAR. Then we copied G2 member alt to G3 and unchecked the IGNORE SHEAR.

FROM:hlee DATE:3/4/2008 11:32:52 AM

Brian, please see whether this is related to Incident 8403.

FROM:gbarnhill DATE:Tuesday, March 04, 2008 3:22:58 PM

For my model, Engine Prop for G3 were set to NO LIMIT for Vci. Changing the Engine Prop to 1.0 gives a shear analysis. I did not create the model, so I'm not sure why the Engine Prop was different for this member. We usually don't change the default setting of 1.0.

FROM:bgoodrich DATE:Wednesday, March 05, 2008 12:08:55 PM

This issue is a duplicate of 8403.

### Description

FROM:jonyisko DATE:Wednesday, March 05, 2008 7:23:56 PM

I am rating a single span steel thru-truss with a roadway width of 18'-2". Although the multiple lane live load distribution factor controls, VIRTIS automatically uses the single lane live load case as the controlling case for the truss. I presume this is because the roadway width is less than 20', and based on AASHTO standard specs Section 3.6, it seems that roadway widths less than 20' should be loaded with only a single lane (although AASHTO does not address this case specifically). However, I came across the following excerpt in AASHTO Manual for Condition Evaluation of Bridges, Section 6.7.2.2, which states that:

"Roadway widths from 18-20 should have two design lanes, each equal to one-half the roadway width. Live loadings should be centered in these lanes."

Based on this, I need to use the multiple lane case as the controlling case. Now, it is not a problem to work around this in the VIRTIS truss input window. I can simply enter in the multi-lane distribution factors for both the "OneLane" and "MultiLane" sub-commands under the "LLDistribution" command, thereby ensuring VIRTIS uses the correct factors. However, I was wondering if it is possible to override VIRTIS and tell it which live load distribution factors (one lane or multi-lane) to use, as opposed to the software automatically selecting the controlling case. I know that for a Girder Line Superstructure, the

4/19/2016 3:06:07 PM

## Description

FROM:dhorton DATE:Thursday, March 20, 2008 2:54:16 PM

When exporting and importing a structure from Virtis 5.2, the export and import seem to work fine. When I try to save the file however, I receive the attached error message and the file does not save. We have not experienced this problem previously and would like to know what might be the cause. The file runs fine in both databases, but will not save to the import database. The exported file is also attached.

FROM:mordoobadi DATE:3/21/2008 11:23:18 AM

The error indicates that there is a data integrity issue in the BBD file. The original bridge may have been imported from BARS or BRASS and it refers to an import event ID that existed on the original database but does not exist on the current database. This has caused the save operation to fail.

Is the correction to the file something that can be done locally or does it require special tools?

FROM:mordoobadi DATE:3/31/2008 10:06:31 AM  
Yes, you can do same thing that I did. This is what I did to produce the new BBD file:

- (1) Imported the BBD file into a different database DB2 (not the original database DB1)
- (2) Exported the bridge from DB2
- (3) This new BBD file should save successfully on the original database DB1.

=====

That was my guess. A couple of follow up questions then to clarify.  
 If that box is NOT checked, will Virtis check a truck for the .2klf lane load and two truck loading?

If that box IS checked, will Virtis also check the single truck case?  
 If that box IS checked, does Virtis automatically add the lane load?

We have a very complicated legal/permit truck system, and switching to LRFR is not making anything less complicated. I am trying to set up our various loading scenarios.

Is there a truck limit in BRASS LRFR?

Finally, I used the HL-93 (US) loading and ran a structure. I was looking at the output, and the "scale factors" for the Truck, Tandem, Truck Train, Lane, and Fatigue Truck were listed as 0.8333 while the AASHTO legal loads were listed as 1.0. I didn't manually input any scale factors, could you explain what is meant by this?

Thanks,

## Complete Issue Information

The check box "Legal Pair" is used to specify the model on page B.6-3 (c) Lane-Type Legal Load Model in the AASHTO LRFR Manual.

Herman Lee

>>> "Rebecca (Beckie) Curtis" <CurtisRe@michigan.gov> 3/24/08 9:32 AM >>>  
Hello,

I am wondering what the check box "Legal Pair" does under the Advanced tab of the Analysis Settings window.

I've looked around briefly in the help, but the description didn't really clarify.

Thanks,

FROM:hlee DATE:4/3/2008 12:09:12 PM  
E-mail reply by Brian Goodrich:

Here are answers to the questions.

If that box is NOT checked, will Virtis check a truck for the .2klf lane load and two truck loading?

No. BRASS will check the loading from LRFR Figure B.6-6 only if the Legal Pair box is checked.

If that box IS checked, will Virtis also check the single truck case?

Yes. BRASS will also check the loading from LRFR Figure B.6-5 if the Legal Pair box is checked.

If that box IS checked, does Virtis automatically add the lane load?

If there is a lane load specified on the Lane tab, BRASS will also consider this loading and combine it with the corresponding axle loads.

Is there a truck limit in BRASS LRFR?

BRASS LRFR has the same 20-truck limit as BRASS LRFD. A single Virtis vehicle definition may consist of a design truck, tandem, lane, train, legal pair, or fatigue truck, which BRASS will consider as individual trucks.

Regards,  
Brian

More questions from Beckie Curtis:

I have a few follow up questions.

4/19/2016 3:06:08 PM

HRS AASHTO

1127

Complete Issue Information

From the table in the LRFR output:

| Limit State  | DC   |      | DW   |      | LL     | LL    | LL     |
|--------------|------|------|------|------|--------|-------|--------|
|              | MAX  | MIN  | MAX  | MIN  | Design | Legal | Permit |
| STRENGTH I   | 1.25 | 0.90 | 1.50 | 0.65 | 1.75   | 1.80  | 0.00   |
| STRENGTH II  | 1.25 | 0.90 | 1.50 | 0.65 | 1.35   | 0.00  | 0.00   |
| STRENGTH III | 1.25 | 0.90 | 1.50 | 0.65 | 0.00   | 0.00  | 0.00   |
| STRENGTH IV  | 1.50 | 1.50 | 1.50 | 0.65 | 0.00   | 0.00  | 0.00   |
| SERVICE I    | 1.00 | 1.00 | 1.00 | 1.00 | 1.00   | 0.00  | 1.00   |
| SERVICE II   | 1.00 | 1.00 | 1.00 | 1.00 | 1.30   | 1.30  | 1.00   |
| SERVICE III  | 1.00 | 1.00 | 1.00 | 1.00 | 0.80   | 1.00  | 0.00   |
| SERVICE II-O | 1.00 | 1.00 | 1.00 | 1.00 | 1.00   | 0.00  | 0.00   |
| FATIGUE      | 1.00 | 1.00 | 1.00 | 1.00 | 0.75   | 0.00  | 0.00   |

1. In this table, the Permit LL factor for Strength II is listed as 0. Is this really how Brass is checking Strength II for Permit Vehicles, or is it just listed as 0 because the LL factor varies?
2. Service I and II are entered as 1 in the table, but listed as optional for Permits in the LRFR Guide Manual. Is there a way to make the service check for Permit Vehicles Optional?
3. When you adjust the live load factor for the permit vehicle, does this only affect strength I?
4. We are going to be modifying our live load factors for all of our legal loads for Strength I. I know that you can adjust the live load factor for the Permit vehicle (assuming that it only changes Strength I). Is there a way to change the live load factors for Legal Vehicles? This is allowed if WIM data available for the site. I thought about using a scale factor or putting the truck in as a Permit Vehicle, but it seems that would invalidate the Service Checks as the load factors are different.

Thanks in advance for your help.

 Here are answers to your latest questions. I am using Virtis/Opis 5.6.

1. My table shows a 1.35 permit live load factor for Strength II. This factor would only be zero if this is what was entered in Virtis. Please send your bridge, so we can take a look at why your factors are different. If you have not added the LRFR factors to the bridge, we need a copy of your LRFR factors from the library.
2. On the Load Factors tab of the Factors – LRFR window, you can uncheck the boxes in the desired Vehicle Consider columns. BRASS still performs the calculations for each of these, but it does not

4/19/2016 3:06:08 PM

HRS AASHTO

1128

## Complete Issue Information

consider them in the search for the critical rating factor for each vehicle.

3. The factors table allows you to input a fixed permit live load factor for Strength I, Service II, and Fatigue for steel. The Strength II permit live load factor is based on the type of permit, ADTT, and/or weight. The first vehicle encountered is used to determine which weight to use. Note that there is an incident to change this behavior, so each permit vehicle could have its own live load factor for Strength II.

4. You're correct that you cannot use the scale factor or your Service checks will be invalid. How are your new legal live load factors organized? This would help us understand what you're looking for. The only way I see to change the Strength I live load factor for legal vehicles is to change the factors on the Legal Loads tab of the Factors – LRFR window. You can only adjust the factors assigned to the fixed ADTT ranges.

FROM: bgoodrich DATE: Monday, April 21, 2008 8:51:51 AM  
E-mail from Beckie (4/11/08):

1. Here is the bridge, and also the truck #18 that was used in that table. While this is a "legal" load for Michigan, it is heavy enough to be treated as a permit vehicle according to LRFR.

2. Hmm... all of these boxes are unchecked in my model, which must be the default because I didn't edit it. If we don't check anything, then what is the default that happens? Should I be opening this box for every model?

3. I will try and explain what we are doing for our legal loads. Since our legal loads are so much heavier than what AASHTO used in development of the code, we did WIM studies and have calibrated all of our vehicles (legal and routine permit) so that each has a separate live load factor. This live load factor is NOT a straight line interpolation, although it is calculated from a pretty straightforward equation of  $1.8 * (\text{Actual Truck Weight} + \text{Truck from ADTT}) / 240 * 72 / (\text{Actual Truck Weight})$  with a maximum value of 1.8 and a minimum value of 1.1. The "Truck from ADTT" value is from our Weight In Motion Data and is specific to a certain ADTT. These load factors would only be applied to the strength limit states and are not meant for the service.

Also, the trucks less than 100kips will be treated as "legal" loads according to AASHTO, and those greater than 100kips will be treated as routine permit (even if they might be called "legal" per MI legislature). This really only affects the service check as we are modifying all strength factors as described above.

My initial thought was to enter everything as a routine permit, and modify the LL factor, but then I realized that the service II check for steel bridges would be done incorrectly for trucks less than 100-kips since they should be done at the 1.3 level per table 6-1. I also wasn't sure if the Load Factor we could input on the truck analysis window was for just strength II, or if it would change the Service I or II checks also.

Ideally, we will be able to set up analysis templates for all of our trucks without having to manipulate the factors tabs between runs because that obviously creates a large possibility of user error and makes quality control difficult.

Finally, I'm still a little unclear of what steps we need to take to follow 6.4.4.2.1 and 6.4.5.4.1. For negative moments and reactions at interior supports of continuous spans, we need to apply a lane load

4/19/2016 3:06:08 PM

HRS AASHTO

1129

## Complete Issue Information

with two trucks. But I don't want the lane load/extra truck to be applied for positive moments and reactions at exterior supports. Is Virtis able to make this distinction?

Thanks for the help,  
Beck

FROM:bgoodrich DATE:Monday, April 21, 2008 8:56:04 AM  
E-mail from Beckie (4/11/08):

I may have a bit of insight into the permit truck load factor. The truck I was trying to run is a 154kip vehicle. When I ran a truck less than 150 ft, BRASS correctly computed the live load factor for Strength II. When I ran the 154kip vehicle alone, it uses 0 as the live load factor. If I run the 117kip vehicle and the 154kip vehicle at the same time, BRASS uses the LL factor for the 117kip vehicle for BOTH vehicles.

A little bit more information regarding the permit issue that will hopefully be of help to you. If I select the "LRFR Factor Override" check box from the Factors tab of the member alternative, then the load factors are calculated according to the factors table in the bridge, with the exception of trucks greater than 150kips. If this is not selected, than service ii is 0 for all permit trucks.

FROM:bgoodrich DATE:Monday, April 21, 2008 8:57:28 AM  
E-mail to Beckie (4/11/08):

We'll take a look at your questions in detail and get back to you. I did open your bridge but didn't see any LRFR factors in the bridge or any references to any Agency factors from the library. Is the where the boxes are from item 2? Or are you referring to the Vehicle Properties opened from the Analysis Settings window?

FROM:bgoodrich DATE:Monday, April 21, 2008 8:58:05 AM  
E-mail from Beckie (4/11/08):

Sorry for the confusion, I meant that there wasn't a factor set created.

FROM:bgoodrich DATE:Monday, April 21, 2008 8:58:38 AM  
E-mail to Beckie (4/14/08):

The Vehicle Consider boxes are initially unchecked when a new Factors – LRFR set is added. To load the defaults, you could use the Copy from Library... button and then change the fields as necessary. Or you might want to set up your own LRFR factors in the Agency folder of the library.

## Complete Issue Information

I don't see how you are going to enter your legal load factors that vary by truck weight and the ADTT truck weight. Virtis was designed to use the values from Table 6-5 for the Strength I legal load factors. Virtis does not allow the live load factor to be specified for a particular vehicle and limit state. Based on Table 6-5, there would be a constant legal load factor based on the bridge's ADTT. However, your legal load factors can vary by each vehicle on each bridge.

The same issue will occur with the permit load factors and Table 6-6 will apply. The only difference here is the presence of the permit load factor override on the Vehicle Properties window. The help does not state if this permit load factor override applies to all limit states or to only the Strength II limit state. It seems like this should only override the Strength II limit state. Herman – Please comment on this? Should there be one of these for the legal loads to override the Table 6-5 value for the Strength I limit state?

For LRFR, add the "Lane-Type Legal Load" vehicle to the Legal Load Rating category. Then, click the Advanced... button to open the Vehicle Properties window where you can check the Legal Pair checkbox. The legal vehicles will be exported to BRASS, and BRASS will determine whether or not a vehicle should be used based on the span length and number of spans. BRASS will also take care of figuring out when only the negative moments and interior reactions apply.

FROM:bgoodrich DATE:Monday, April 21, 2008 8:59:14 AM  
E-mail from Beckie (4/18/08):

Have you been able to look into the issue of running multiple permit vehicles at one time? No matter what I enter as the over-ride permit factor, all of the trucks in the analysis appear to use the live load factor from the first truck. If I run the trucks one at a time this doesn't seem to happen, but with 48 legal/overload vehicles running each truck individually is time-prohibitive.

FROM:bgoodrich DATE:Monday, April 21, 2008 8:59:52 AM

The short answer to your question is we know about this issue and running each truck separately is the workaround. BRASS only supports a single permit live load factor for each limit state, which is why the factor for the first truck is used. I will be revising the BRASS engine to support separate permit live load factors for each vehicle for each limit state over the next few weeks. I would like to have this ready for the 6.0 release of Virtis.

FROM:bgoodrich DATE:Monday, April 21, 2008 9:00:14 AM  
E-mail from Beckie (4/18/08):

One additional question: when the lane and truck load are run for legal loads, are the two events super-imposed, or is the lane load "gapped out" at the location of the truck?

FROM:bgoodrich DATE:Monday, April 21, 2008 9:00:37 AM

The truck and lane loads are analyzed separately and then the results are superimposed. The lane

Description

FROM:pcampisi DATE:Wednesday, April 02, 2008 1:39:28 PM

Subject: Truss Deterioration Modeling

The deterioration modeling for Channel Box Sections appears to be giving incorrect results. When I code channel deterioration for Left Truss - Member L4L5, the "Truss Member Section Property Summary" shows the Gross Area Compression, Gross Area Tension and Net Area Tension equal to zero. The section loss was also incorrectly applied to all other members with the same section name (i.e. "section2").

The same error occurs with plate deterioration for channel sections.

Is there a problem with the way I coded the deterioration? The truss validates.

Refer to the attached file "Truss Deterioration". The "Left Truss" is coded for channel deterioration.

Note: I checked the "AngleBox" deterioration in the "Right Truss" and did not find any problems. I did not check the "Built-Up" sections.

Thanks

Received e-mail from Vinacs Vinayagamoorthy:

Complete Issue Information

We are working on a steel built up section. Though we entered the intermediate stiffeners, BRASS export program did not export the stiffeners when creating the input file for analysis. As a result, we are getting ZERO rating factor.

Please check the data entry first and give us your finding (to insure our data entry is correct or not)

(See attached file: 57C0023.xml)

FROM:bgoodrich DATE:Monday, April 07, 2008 12:38:53 PM

For each member alternative, you need to visit the BRASS LFD engine properties and turn on an option to generate schedule information at points of interest.

Open the Member Alternative Description window, navigate the Engine tab, select the BRASS LFD engine, and click the Properties button. On the BRASS-Standard Member Alternative/Beam Definition Properties window, change the POI Control drop-down box to either Option 3 or 5. The various schedule input will then be generated and applied to the points of interest.

### Description

FROM:pcampisi DATE:Friday, April 25, 2008 2:44:43 PM

For the attached bridge, it appears Virtis is ignoring the presence of the diaphragm at support 2 of G6 and incorrectly calculating Lb, the unbraced length of the compression flange. This causes Virtis to miscalculate Mr and therefore Mu.

I have attached the bridge for reference. The output indicates no cross frame at the point of analysis (support 2) even though there is a diaphragm entered at the support. The rating shows Lb = 35.554 ft., when it should show Lb = 18.75 ft.

Thanks

Paul Campisi

### Description

FROM:gbarnhill DATE:Wednesday, May 14, 2008 8:11:59 AM

In the attached bridge, I created two superstructure definitions.

One with 7 ft spacing, the other with 14 ft spacing. 8 Girder system.

Using the Member Alt-Live Load-Compute from Typical Section, I get unexpected results for Member G4 and G5 for the Shear at Supports LLDF (lever rule).

For the 7 ft spacing, it appears Virtis is applying 90% to the result for G4 and G5. I think the result should be the same as for G3 and G6.

For the 14 ft spacing, I can't hand verify the result for G4 and the result for G5 is the same as G2 and G7. I think both G4 and G5 should be the same as G3 and G6.

FROM: Krisha Kennelly DATE: 7/17/2008 1:29:45 PM Eastern Daylight Time

Fixed for version 6.0.

Two issues were identified:

1. The incorrect multiple presence factor was sometimes being used (that caused problem experienced in 7' spacing structure).
2. When computing the DF due to multi-lanes of trucks the program did not always first consider the trucks closest to the girder. (that caused problem in 14' structure)

=====

According to Manual for condition evaluation of bridges part 7.4.2. referring Type 3 and Type 3S2 for spans over 200 feet in length the selected legal load should be spaced with 30 feet clear distance between vehicles to simulate a train of vehicles in one lane and a single vehicle load should be in adjacent lanes.

Question

- 1) In Virtis there is no way to input the adjacent vehicle.
- 2) In virtis even when a Type 3 and Type 3S2 vehicle are created as a serious of concentrated load to represent the lane loading. Virtis includes axle loads at all locations even if they didn't contribute to the maximum force effect for a particular member. ( The vehicles were created as both the Temporary vehicle and also as Agency vehicles.)
- 3) In the LRFR guide for condition and Evaluation of bridges in Appendix B.6.2 there is a lane loading shown on the diagram for Type 3 and Type 3S2 loading. Can this be adopted for standard and Truss engines for the enhancement ?

| 8679.16390 | Assigned      | RC Slab reinforcing area |

Description

FROM:tarmbrecht DATE:Wednesday, May 14, 2008 2:44:53 PM

Not sure if this is new or old, but was discovered during the beta testing. Multi-lane "Shear at Supports" wheel distribution factor for exterior beam is less than for single-lane, which I don't believe is correct. In the example, LLDExtBmDistError(0160046-600B3).xml, which has a 22' roadway supported by 4 beams spaced 8'-3½", the Shear at Supports factor calculated by Virtis is .525 for multi-lane and .585 for single lane.

FROM: Krisha Kennelly DATE: 7/3/2008 12:00:52 PM Eastern Daylight Time  
If the LL DF preference is set to MCEB 6.7.2.2 on the Preference: Bridge Workspace tab, Virtis computes the multi lane = 0.525 and the single lane =0.585

If the preference is set to 3.6.3, Virtis computes both DF's as 0.585

FROM: Krisha Kennelly DATE: 7/3/2008 1:33:55 PM Eastern Daylight Time  
This is related to 8475.

IF MCEB is selected, we are centering the vehicle in the lanes for roadway widths 18' to 24'. Since the roadway width is 22' we should follow the Std Spec even though they have picked MCEB.

FROM: Herman Lee DATE: 10/2/2008 2:02:19 PM Eastern Daylight Time  
Duplicate of Incident 8475.  
Incident 8475 has been resolved for 6.0.1 and 6.1.  
Tested attached bridge that both single and multi-lane Shear at Supports DFs are computed as 0.585.

### Description

FROM:pwhite DATE:Thursday, May 22, 2008 4:09:53 PM

We are rating a three span symmetric rc slab structure and are getting a low rating at 30% of span 3. However, the rating at 70% of span 1 is much higher than 30% of span 3. The BRASS output shows 0.79sq.in. of top steel at 70% of span 1, but only 0.42sq.in. of top steel at 30% of span 3. I have double checked that the reinforcing has been input properly in Virtis. In order to attempt to debug the problem, I have selected the bars as "fully developed" or doubled the bar quantity. Selecting fully developed does not change the rating and doubling the quantity does not double the area at 30% of span 3. It appears that there is a bug at this one location. I have attached the xml file for your reference.

Thanks for your help.

This is an enhancement request. No big urgency. Would it be easy to use similar code for girder deck profiles to create the same button that computes the deck profile from cross section in the deck profile dialogs for both the stringers and floor beams. Also, once defined for one, could this data be automatically entered into the other with respect to that member. So in the case the data was entered for Floor Beams, the appropriate data would also be entered into the deck profile dialog for stringers.

Description

FROM: William Metcalf DATE: 7/9/2008 11:33:43 AM Eastern Daylight Time

The following file contains 2 steel roll beams spans. The first span is rated using the following setting:

Points of Interest Control: 0 - No point of interest data will be generated

It results in a rating of 47.24 tons (inv) and 78.9 tons (opp).

The second member is exactly the same (copied and paste) as the first except i removed the POI and the setting were:

Points of Interest Control: 1 - Generate points of interest at all tenth points along TOP spans

4/19/2016 3:06:12 PM

HRS AASHTO

1149

Complete Issue Information

now the rating is 3.3 tons (inv) and 5.5 tons (opp).

obviously some thing is wrong. Any help you can give me would be much appreciated. The Bridge file is attached.

FROM: Herman Lee DATE: 7/11/2008 9:54:45 AM Eastern Daylight Time  
Could you attach the bridge for this issue? Thanks.

FROM: Brian Goodrich DATE: 7/11/2008 12:01:08 PM Eastern Daylight Time  
BRASS analyzes/rates only the points of interest that are specified by the user. This may be done explicitly using the Points of Interest window and/or with the engine's Points of Interest Control box.

For Points of Interest Control option 0, BRASS only rates those points of interest that have been manually specified in the Points of Interest window. In addition, only the override information on the Points of Interest window will be used in the analysis, i.e., any stiffener, bracing, etc. data input on the various schedule windows will NOT be used. For Points of Interest Control option 1, BRASS generates points of interest at 10th points and populates the stiffener, bracing, etc. data from the various schedules.

Points of Interest Control option 0 is provided for users that only want to check a handful of points and do not want to input schedules of information. This was the only method available to users prior to about 10 years ago.

I prefer to input the schedules of bracing, stiffeners, etc. and use Points of Interest Control option 3. That way if points of interest are manually input on the Points of Interest window, I don't have to change the Points of Interest Control option.

The file is not yet attached, so I cannot comment yet on the structures in question.

FROM: William Metcalf DATE: 7/14/2008 11:17:01 AM Eastern Daylight Time  
file attached

FROM: Brian Goodrich DATE: 8/15/2008 1:49:17 PM Mountain Daylight Time  
When using Points of Interest Control option 0, the bracing should be entered for each point of interest. If this is not set, BRASS assumes the unbraced length is zero and does not check Equation 10-96. When one of the other control options is used, BRASS generates the bracing schedule. If no bracing ranges are input in Virtis, one bracing range is exported (start of span to end of span). This is why you are seeing a difference in the ratings - Example 1 used an unbraced length of 0 ft and Example 2 used an unbraced length of 27.67 ft.

FROM: Beckie Curtis DATE: 7/11/2008 9:57:54 AM Eastern Daylight Time  
In attached file, I am getting an error when running the bridge with Virtis engine.  
There are no strands in bottom row. The strands in the second row have some debonding. The error is:

4/19/2016 3:06:13 PM

HRS AASHTO

1152

Complete Issue Information

Internal Errors (1) - Invalid index

Structural Analysis Errors (2410) - Input or computational error encountered.

Input Errors (1715) - Number of debonded strands per row is greater than the number of strands in the row.

When I modify the girder and remove the bottom row of strands from the Beam description, the beam analyzes. Please see Span 1, First Interior Beam, and then the two member alternatives.

FROM: Herman Lee DATE: 7/11/2008 2:30:10 PM Eastern Daylight Time  
Attached 5.6 Virtis Std Engine input and output files.

FROM: Has Mukh Lathia DATE: 7/11/2008 7:30:26 PM Eastern Daylight Time  
Virtis Std Engine assumes that the bottom most row is numbered as row 1. By inputting the first row (row number 1) at 4 inch from the bottom and the second row at 6 inch from the bottom should correct this problems. Debonded strands must also be identified with these rows. Revised input and output files are attached. Additional input edit checks and expanding the current error message may help.

FROM: Herman Lee DATE: 7/14/2008 10:59:16 AM Eastern Daylight Time  
Renumbered the bottom most row of all strands to row 1.  
Resolved in 6.0 Release.

 Submitted on behalf of Morteza Najafabadi, AI Engineers. Please use the bridge attached in Incident 8791.

=====  
 Herman,  
 Thanks for the information. I did both of those things and was able to get the floor beams analyzed, but still the live load moment on the floor beam is zero. Somehow the floor beam does not get the live load. Any ideas? Thanks.

-----Original Message-----  
 From: Herman Lee [mailto:HLee@mbakercorp.com]  
 Sent: Friday, July 11, 2008 9:26 AM  
 To: Morteza Najafabadi  
 Subject: RE: Virtis

Morteza,  
 You have intermediate supports defined at the start and end of the floorbeam. If you remove these two intermediate supports and enter the slab information in the cross section, the floorbeam will run. Note that Virtis computes the dead load of the floor system and applies it to the truss panel points as point loads.

Herman  
 >>> "Morteza Najafabadi" <mnajafabadi@aiengineers.com> 7/10/08 3:21 PM >>>  
 I used 0.1 ft and 0.1 in. But I can't get the floor beams to run. It gives me an error message. Thanks.

Morteza,

What tolerances do you use to get it to run?

Herman

>>> "Morteza Najafabadi" <mnajafabadi@aiengineers.com> 7/10/08 2:26 PM >>>

Herman,

I am having difficulty analyzing the floor beams for a truss, which we discussed over the phone. My floor beams are built-up members, and they don't seem to get any live load. I was wondering if you could figure out what the problem is. I have attached the file. Thanks,

Morteza Najafabadi, P.E.

=====

FROM: Brian Goodrich DATE: 7/11/2008 4:57:49 PM Eastern Daylight Time  
I was able to get live load actions if I used one 24.5' travelway instead of two 12.25' travelways. This is on the Lane Position tab of the Structure Typical Section window. I am submitting this issue to WYDOT because live load actions should be found even when there are multiple travelways.

FROM: Brian Goodrich DATE: 7/11/2008 5:02:52 PM Eastern Daylight Time  
My earlier comments are only intended as a workaround until the source of the problem in the engine can be identified and corrected.

FROM: Brian Goodrich DATE: 11/4/2008 9:44:25 AM Mountain Standard Time  
This issue was assigned to BRASS Problem Log 833.

FROM: Brian Goodrich DATE: 11/10/2008 2:27:34 PM Mountain Standard Time  
The BRASS engine has been corrected. Fixed for version 6.1.

### Description

FROM: Krishna Kennelly DATE: 7/21/2008 12:53:47 PM Eastern Daylight Time

An error in the distribution of appurtenance loads on the deck cantilever when load distribution by simple beam method is chosen was found during beta testing of the new Opus LRFD engine. (Refer to incident 8608)

This change affects Std analysis runs using the Virtis Std Engine and Virtis Truss Engine.

For appurtenance (and sidewalk and FWS) loads on the deck cantilever, the program was previously applying the appurtenance load to the exterior beam using the tributary area method. The simple beam method should have been used, this approach results in a larger load applied to the exterior girder by considering the cantilever effect. Note that the load to the next interior beam is not reduced by this cantilever effect.

Attached xml file tests new code.

In Version 5.6 the following Appurtenance Loads were computed:

G1 & G4: parapet 0.505 k/ft

Sidewalk  $6"/12*2*0.150$  kcf = 0.150 k/ft

FWS  $2.78"/12*108pcf * (2.5' + 6.5')$  = 0.225 k/ft

Complete Issue Information

In Version 6.0 the following Appurtenance Loads are computed:  
G1 & G4: parapet 0.505 k/ft \* (17.25' - 7.88"/12)/13' = 0.645 k/ft

Sidewalk 6"/12\*2'\*0.150 kcf \*16.25'/13' = 0.1875 k/ft

FWS (2.78"/12\*108pcf \* 15.5' \* 15.5'/2) /13' = 0.231 k/ft

FROM: Xinmei Li DATE: 7/24/2008 2:46:17 PM Eastern Daylight Time  
Verified fix for 6.0 release.

FROM: Herman Lee DATE: 7/25/2008 8:45:33 AM Eastern Daylight Time  
This will be included in the patch/release after 6.0 release.

FROM: Xinmei Li DATE: 5/28/2009 11:12:31 AM Eastern Daylight Time  
Tested with 6.1 Beta1, DL2 = 0.876 k/ft, it should be 0.645 k/ft+0.1875 k/ft+0.231 k/ft = 1.0635 k/ft.

Complete Issue Information

The attached file was working in April. Now the Virtis Application crashes and kicks you out of the program when the bridge is run. No changes were made to the file, yet the bridge now crashed the program.

FROM: Herman Lee DATE: 7/30/2008 1:37:34 PM Eastern Daylight Time  
I'm able to reproduce the crash in 5.6 Release and 6.0 Release. Virtis crashes after rating of "Unit2 Stringer1" stringer member.

Developer Notes:

6.1 Development asserts inside CUiAnalysisProgressDlg::PopulateDeadLoadReactionObjects (line 14795). Virtis is not able to locate the second floorbeam and crashes while cleaning up memory.

FROM: Paul Campisi DATE: 10/24/2008 12:16:32 PM Eastern Daylight Time  
I ran each element separately from within Virtis and found that the stringers in Panel 2 were crashing the program. I tried replacing them, but that didn't help. I then removed them from the analysis since all the panels are identical and so far there is no section loss. This allows me to run the analysis from outside for now.

FROM: Mehrdad Ordoobadi DATE: 9/15/2009 1:15:00 PM Eastern Daylight Time  
This is related to VI 9185, 9312, and 8176.  
The crash was fixed in 6.1 Acceptance build.

FROM: Jim Duray DATE: 5/6/2010 2:08:54 PM Eastern Daylight Time  
No crash.  
Verified - 6.2 alpha 4.

### Description

FROM: Ed Baumann DATE: 7/30/2008 1:08:11 PM Eastern Daylight Time

I'm rating a truss line superstructure in virtis 5.6. I had the model running without deterioration. Then i tried to add deterioration to one diagonal member (U1L0) consisting of two inward channels. following are the command lines i used.

### MemberOfInterest

U1L0

Deterioration

Channels

Right TopFlange 9.6 99.9 L0 3.0 1.0

The section properties in the output show gross and net areas equal to zero with I, C, R and Fy called NaN.

The Rating Summary shows 1.#R for Capacity and Rating Factors.

These resulted are mirred in member U11L12 which is symetrical with the same section.

I've attached the xml file. The superstructure definition in question is "interior truss" in the file.

FROM: Herman Lee DATE: 8/13/2008 12:20:17 PM Eastern Daylight Time

May, please see whether this is a duplicate of Incident 8533.

FROM: Xinmei Li DATE: 8/13/2008 4:21:31 PM Eastern Daylight Time

I think this is a duplicate of Incident 8533.

Description

FROM: Michael Ziegler DATE: 8/6/2008 10:10:15 AM Eastern Daylight Time  
 The migration wizard list the ability to upgrade databases from 4.0.0 through 5.6 to 6.0.0. However db prior to 5.1 need to run the ScanAngleConversion\_510.exe utility prior to migration. This utility is not included in 6.0.0 or 5.6, 5.5 or 5.4. and the utility if downloaded will not run without the dll's from 5.1. This utility needs to be updated to run under 6.0.0 and be included in future release.

FROM: Mehrdad Ordoobadi DATE: 4/6/2010 10:40:34 AM Eastern Daylight Time  
 In order to address this issue in 6.2, it was decided that the migration wizard only supports the migration of versions 5.3 and later. No domain dependent migration step exists after 5.3.

FROM: Herman Lee DATE: 5/9/2010 10:24:07 AM Eastern Daylight Time  
 Verified in 6.2 Beta 1.

### Description

FROM: Paul Jensen DATE: 8/6/2008 3:52:59 PM Eastern Daylight Time  
several factors are not used in computations of the rating. see attached document for discussion

FROM: Herman Lee DATE: 8/13/2008 12:09:13 PM Eastern Daylight Time  
Brian, please make sure the exported adjustment factors are correct and those that are not used are listed in the Engine Help.

FROM: Brian Goodrich DATE: 8/15/2008 12:31:19 PM Mountain Daylight Time  
The export is generating the commands correctly, so the bug may be within Madero.

FROM: Brian Goodrich DATE: 8/17/2009 9:36:58 AM Mountain Daylight Time  
The repetitive use factor is not being read in correctly by Madero. The default value is not being overridden by the input value. I corrected the subroutine in the Madero engine that reads in commands. This engine will need to be implemented in version 6.2.

The main output file lists only the commonly used adjustment factors. To view all the factors that are used to adjust a particular stress, turn on the "Timber Adjustment Factor Calculations" option in the Analysis Settings engine properites for the Madero engine.

FROM: Herman Lee DATE: 5/7/2010 9:56:35 AM Eastern Daylight Time  
Tested TimberTrainingBridge1 with overridden repetitive use factor.  
Verified in 6.2 Beta 1.

### Description

FROM: Herman Lee DATE: 8/8/2008 3:09:36 PM Eastern Daylight Time  
Attached bridge xml file and error message.

Floorbeam rating workaround:

1. Rate the whole bridge (All floorbeams will have this problem).
2. For each Stringer Unit Layout, open Computed Stringer Reactions window and Accept All New Reactions.
3. For each Floorbeam Stringer Reactions window, select Override Computed and copy the Computed Reaction to User Defined Reaction.

Description

FROM: Dean Teal DATE: 8/8/2008 4:11:02 PM Eastern Daylight Time  
After an LFD rating or LRFD analysis I can select the Report Tool and get a LRFD or LFD Analysis Output. But I can't get a LRFR Analysis Output (I wanted to see the Overall Summary Report) like I have for LFD.

Is this an oversight?  
How can we find LRFR rating reports besides the View Analysis Report?  
Is the only way to mine out the data by going to the .out file in the directory?

Description

FROM: Herman Lee DATE: 8/11/2008 7:56:03 AM Eastern Daylight Time  
Submitted on behalf of Jeffrey Sam (Jeffrey.Sam@dmjmharris.com). The second question is a previously reported defect (Incident 8450: LRFR - Problem with Live Load Distribution Factor). Incident 8450 had been fixed in Virtis 6.0 Release.

=====

Hello,

I have several questions regarding the modeling of a reinforced concrete deck slab bridge by LRFR analysis. These questions are not addressed in the attached example from the Tech Support website.

1) The analysis is not checking multi loaded lanes. I have entered single and multi-lane LL distribution factors (the multi-lane equivalent strip width would control the analysis). I set the single lane to 0.001 in an attempt to force the multi-lane scenario to govern; however VIRTIS is still only giving me the single lane rating. In the 'Superstructure Definition' I have the Live Load Lanes - Multi-Lane checked. How do I get VIRTIS to analyze the multi-lane case?

2) I am doing a check of the VIRTIS calculation for the single lane loaded analysis and I am calculating a lower rating factor than VIRTIS produces. The resistance factor, systems factor, condition factor, moment capacity, DL factors, DL moments & LL factor are all the same however the LL moments differ. The LL moment that I am using in my hand calc is exactly 1.2 times greater than the LL moment produced by VIRTIS. I believe that VIRTIS is applying the multiple presence factor ( $m=1.20$ ) to the live load moment twice thus yielding the lower LL and higher rating factor. Article 4.6.2.3 of the AASHTO LRFD specs states that the single lane loaded equivalent strip width equation already includes the 1.20 multiple presence factor. Am I correct and is the VIRTIS calculation incorrect?

Any assistance is greatly appreciated.

Thanks.

=====

FROM: Brian Goodrich DATE: 11/20/2008 9:28:20 AM Mountain Standard Time  
Question 1 is also attributed to Incident 8450. Using the Live Load Lanes buttons is the correct method for controlling which distribution factors get used. Both questions have already been addressed in version 6.0.

Subject: Incident 8829: Request for more information on writing  
resultsback to the Bridgeware database

Hi Ron,

Krisha submitted Incident 8829 on your behalf to Virtis/Opis Support  
Center.

Please provide us specific request information. Is there any particular  
results object you would like to have more information? Or, your  
request is for the next version of the API documentation?

Thanks,  
Herman Lee

=====

FROM: Herman Lee DATE: 9/30/2008 3:05:19 PM Eastern Daylight Time  
E-mail received from Ron Love and reply e-mail:

=====  
Hi Ron,

The option to include or exclude wearing surface is located in the Analysis tab of the Superstructure  
Definition window. The GetConsiderWearingSurfaceForRatingInd() is available for all the system  
superstructure definitions (IDoGirderSystemStructDef, IDoGfsFloorSystemStructDef,  
IDoGfFloorSystemStructDef, IDoFsFloorSystemStructDef, IDoTfsFloorSystemStructDef and  
IDoTffFloorSystemStructDef).

Attached is the list of results objects that the Virtis Std Engine and BRASS Engine used. The steps to  
create and populate those objects are described on page 81 of the API Guide. Basically, first check  
whether it is requested by the user, then call GetNew... to create one and AddRow to populate the

1168

Complete Issue Information

object.

Please let us know if you need more information.

Herman

>>> <Ron.Love@bentley.com> 9/29/08 10:59 AM >>>  
Hi Herman,

Sorry for taking so long to get back to you on this. Regarding the results object the main thing we are interested in is what I have indicated in the attachment.

Also, I recall seeing some other options on the Virtis interface, which I cannot seem to locate on the 6.0 developer version, that allow the user to indicate that the wearing surface is to be included/excluded from the analysis. This was a radio button as I recall.

Generally we need to have access to any GUI items that have engine implications. These would be items other than the engine properties, which are documented in the material you have already prepared.

Thanks and once again sorry for the delay. I appreciate you and Krishna helping us out with this.

Ron

### Description

FROM: Brian Goodrich DATE: 8/15/2008 11:34:52 AM Mountain Daylight Time  
Herman,

I have a problem I hope you can help me solve regarding prestress strand calculation and losses. I am trying to get Virtis to calculate a final prestressing force of 674 KIP. I have input a AASHTO Type III beam with the prescribed prestressing arrangement. I have assigned losses in the "Prestress Properties" folder, however when I calculate stresses due to prestress, I am not matching Virtis. How do I input the data in the "Prestress Properties" folder to account for a lower initial prestress force?

I have attached the virtis file and stress calculation (page 4) of the calculations.

Thanks

PK

Complete Issue Information

FROM: Brian Goodrich DATE: 8/15/2008 11:41:14 AM Mountain Daylight Time  
The final prestressing force of 674 kips can be obtained by making a couple changes to the input on the Prestress Properties window.

First, change the "Jacking stress ratio" to 0.7. Second, enter 45 ksi in the "Composite loss" field. Keep the "Final loss" at 45 ksi also.

FROM: Brian Goodrich DATE: 8/18/2008 10:42:02 AM Mountain Daylight Time  
E-mail from user:

Thanks Brian

I was trying to use the P/S transfer stress ratio. Plus, I am just learning this software. I appreciate the help.

I will plug it in over the weekend to see how it works.

Thanks

Description

FROM: Beckie Curtis DATE: 8/25/2008 9:00:57 AM Eastern Daylight Time  
 In attached file, see fascia girder. This is a built-up section analyzed by LFR with no cover plates, only angles.  
 Brass gives HS-20 Inv Rating of 0, Virtis gives 0.64.

Compression flange in brass moment capacity is calculated by 10-99, I can't tell if Virtis checks this or not, but the full fy instead of fcr is used. Screen shots of output attached.

Beckie Curtis - MDOT

## Complete Issue Information

FROM: Hasmukh Lathia DATE: 8/26/2008 12:07:20 PM Eastern Daylight Time  
AASHTO Eqn 10-99 is  $b'/t \leq 2200/\sqrt{F_y}$  whereas BRASS seems to be using the equation for  $F_{cr}$  given in Maintenance Manual C.2.1.3. which is the same as Eqn 10-99 assuming  $b'=b/2$  and  $F_y$  replaced by  $F_{cr}$ . Anyway, BAR7 does not reduce the capacity using  $F_{cr}$ , but flags the rating factor as 888.88. That seems to be the reason for differences in ratings reported by BRASS and Virtis Std Engine. I will also question the 56.5 inch wearing surface.

Also, see the following correspondence with BRASS contractor.

From: "Brian L. Goodrich" <Goodrich@BridgeTech-Laramie.com>  
To: "Hasmukh Lathia" <HLathia@mbakercorp.com>  
CC: "Herman Lee" <HLee@mbakercorp.com>, "Jim Duray" <JDURAY@mbakercorp.c...>  
Date: 8/25/2008 6:32 PM  
Subject: RE: Virtis Incident 8859

The "F critical..." line that BRASS reports is used in Eq. 10 99. Please clarify your comment regarding  $b' = b/2$ . BRASS does not reduce the capacity when Eq. 10 100 and/or Art. 10.48.2.1(b) are not satisfied. If Eq. 10 101 is not satisfied, the capacity from 10 99 is calculated but subject to the limiting capacity from Art. 10.48.4.1.

Also, is there really a 56.5 inch wearing surface on this bridge?

Brian Goodrich  
BridgeTech, Inc.

Subject: Virtis Incident 8859

Brian:

You might have received an earlier email from Herman regarding BRASS checking "F critical for compression flange( $[4400 t/b]^2 \leq F_y$ )" for Incident 8859. Is this the same check for AASHTO 10.48.2.1 Eqn (10 99) where BRASS may assume  $b' = b/2$ ?

Virtis Std Engine (derived from PennDOT BAR7) checks provisions of AASHTO 10.48.2.1, but does not reduce the strength if any of the provisions is violated. It gives a rating factor or 888.88 indicating that there may be a potential fatigue problem.

How does BRASS use the provisions of AASHTO 10.48.2.1 if Eqns (10 99), (10 100) and (10 101) are not satisfied?

Thanks,

Virtis Std Engine is using the AASHTO Standard Specifications 15th Edition - 1996 whereas BRASS is using the AASHTO Standard Specifications 17th Edition - 2002. There is an incident 6961 pending the Task Force approval to bring Virtis Std Engine to the AASHTO Standard Specifications 17th Edition 2002.

Complete Issue Information

Virtis Std Engine uses the Shear At Supports distribution factor for reactions.

FROM: Hasmukh Lathia DATE: 8/27/2008 2:10:40 PM Eastern Daylight Time

Virtis Std Engine actually uses both shear and moment distribution factors for calculating reactions at end supports. For the axle load placed at the end support, it uses the shear distribution factor, and for the axle loads that are not placed at the support, it uses the moment distribution factor. For a reaction at an interior support, it uses the moment distribution factor for all axle loads. Live load shears at all supports are calculated using the both distribution factors same as the reactions at end supports.

FROM: Hasmukh Lathia DATE: 9/11/2008 9:12:00 PM Eastern Daylight Time

Per email from Beckie:

>>> "Rebecca (Beckie) Curtis" <CurtisRe@michigan.gov> 9/11/08 10:31 AM >>>

According to the post,

"Virtis Std Engine actually uses both shear and moment distribution factors for calculating reactions at end supports. For the axle load placed at the end support, it uses the shear distribution factor, and for the axle loads that are not placed at the support, it uses the moment distribution factor. For a reaction at an interior support, it uses the moment distribution factor for all axle loads. Live load shears at all supports are calculated using the both distribution factors same as the reactions at end supports."

If live load shears at all supports are calculated using both distribution factors, would this also apply to checking  $h/2$  shear in a prestressed beam?

Thanks,  
Beckie

Hasmukh Lathia's Response:

In calculating live load shears at  $h/2$  in a prestressed beam, only the moment distribution factor will be used since the axle load will most likely be placed at a distance  $h/2$  from the support. To find the maximum live load shear at  $h/2$ , if any of the axle loads is placed at a support, then the shear effect of that load will be multiplied by the shear distribution factor, but the effects of other loads falling within the span will be multiplied by the moment distribution factor. In calculating the live load shear at  $h/2$ , most likely the distribution factor for shear will not be used due to the nature of the shear influence line at  $h/2$  as the influence line ordinate at the support near  $h/2$  will have a zero value. The above provisions are automatically applied by the routines in Virtis Std Engine while analyzing the shear influence lines.

Description

FROM: William Metcalf DATE: 9/17/2008 2:55:47 PM Eastern Daylight Time

Hello,

I posted incident #8788 b/c any time if i run NSG and it does not run due to input mistake or some thing of that nature then if you fix the issue and try to run NSG again virtis crashes. That incident was declaired resolved b/c the problem was fixed in 6.0; however we are now running virtis 6.0 and the problem is NOT fixed it still is happening the same as it was in the previous release.

FROM: Herman Lee DATE: 9/19/2008 1:20:09 PM Eastern Daylight Time

Do you recall the issue you fixed before you run NSG the second time? Is the issue the same as those listed (set the truck off the bridge and no existing member alternative selected) in Incident 8788?

In Incident 8788, we fixed a memory cleanup problem when the first NSG failed. Since this a memory related problem, we need to know exactly what failed in the first run in order to reproduce the problem. Thanks.

FROM: William Metcalf DATE: 9/19/2008 2:08:09 PM Eastern Daylight Time

It has happened several time, but the only ones I can remember at this time was we changed the wheel

4/19/2016 3:06:19 PM

HRS AASHTO

1185

Complete Issue Information

spacing for several of the axels and we changed some details of the bridge but I can not remember what.

FROM: William Metcalf DATE: 9/23/2008 5:31:07 PM Eastern Daylight Time  
Also I think you might not have to change anything to make it happen, I will try to test it if it happens again. It is my suspicion that it has something to do with the clean up of the crash, but I do not know this and I'm no computer or software expert.

FROM: Herman Lee DATE: 6/16/2010 11:35:35 AM Eastern Daylight Time  
I tried but unable to reproduce the crash in the second NSG analysis after the first NSG analysis failed using 6.2 Beta 2.

I changed the Status to Not Reproducible for now. We should reopen this incident when we know what failed in the first analysis causes the crash in the second analysis.

1186

## Complete Issue Information

normally. Not sure if this maybe a memmory leak causing this.

FROM: Herman Lee DATE: 9/19/2008 2:04:44 PM Eastern Daylight Time

How many bridges (member alternatives) are you trying to analyze in one session? How much RAM is available in your computer?

Some users also have the same experience. The computer ran out of memory. This is not a memory leak problem. If you are running Windows XP, try to increase the size of the virtual memory in your computer. Attached is the virtual memory settings in my computer.

Error loading BRASS DLL!

(Error Code = 8) Not enough storage is available to process this command.

FROM: William Metcalf DATE: 9/23/2008 5:27:50 PM Eastern Daylight Time

could be close to 100 up to 200 member alternatives. It also will happen if I try to run a bridge will several spans in NSG (this is more understandable). I Have 3 GB of ram

FROM: David Koenig DATE: 9/25/2008 8:53:25 AM Eastern Daylight Time

We have seen similar issues at MoDOT. They were turned in as Incident 7455. At that time, it was attributed to problems that Windows 2000 has with the way it does Virtual Memory. If you are running Windows 2000, then there is apparently nothing that can be done about it. If you are running something besides Windows 2000, then I think that this needs to be investigated more by the developer to make sure that the program is freeing things up as it goes along. Someone with 3GB of ram should not be having this type of problem. When we had this problem on our machines, we bumped up the ram and also greatly increased the Virtual Memory and still had the problem.

FROM: William Metcalf DATE: 9/26/2008 12:24:12 PM Eastern Daylight Time

I strongly agree with Mr. Koenig. I am running Windows XP. Also this machine is less than a year old; it has a core 2 duo 2.66 GHZ processer and 3 GB of ram. There is absolutely no way that the memory on this machine is the issue (my initial virtual memory was set to ~2040 and maximum was ~4092, and I Tried it with your settings ~4090 for both, and with ~6000 for both). The performance of the best retail desk top you can buy right now is not too far ahead of this one. It is clearly an issue with how the program is handling memory or something to do with how the program is interacting with the operating system. Considering that lots of other programs run in windows with out this type of problem (programs that are much more computationally intensive I might add) it's hard not to come to the conclusion that the problem is with Virtis. I request that the status of this incident be changed from resolved.

FROM: Herman Lee DATE: 9/26/2008 1:56:55 PM Eastern Daylight Time

I changed the Subject to better describe the issue.

FROM: Herman Lee DATE: 9/26/2008 2:10:31 PM Eastern Daylight Time

Also in Incident 8890.

FROM: Herman Lee DATE: 10/29/2008 3:33:55 PM Eastern Daylight Time

We're not able to reproduce the "Not enough storage..." problem with the bridge attached in Incident 8890. The NSG analysis completed without any error message.

We suspect the problem may be related to virtual memory fragmentation. Could you follow the steps below to find out the virtual memory fragmentation information in your machine? Thanks.

4/19/2016 3:06:19 PM

HRS AASHTO

1187

Complete Issue Information

1. Check to see whether you can reproduce the problem.
2. Run Windows Disk Defragmenter (Start Menu > All Programs > Accessories > System Tools > Disk Defragmenter).
3. Select the boot drive (usually C:) and select Analyze button to start the analysis.
4. After the analysis is completed, select the View Report button.
5. Scroll down the Volumn information in the Analysis Report until you see Pagefile fragmentation (See attached Defrag.png file).
6. Tell us the reported pagefile size and the number of fragments.

FROM: Herman Lee DATE: 10/31/2008 8:45:36 AM Eastern Daylight Time  
Reply e-mail to William Metcalf:

=====  
Could you first try to see whether you are able to reproduce the "Not enough storage..." problem?

If you are able to reproduce the problem, perform the following steps to see whether the problem is still there.

1. Use Windows Disk Defragmenter to defragment the C drive.
2. Download Microsoft PageDefrag (<http://technet.microsoft.com/en-us/sysinternals/bb897426.aspx>) to defragment the virtual memory.
3. Try to reproduce the problem again.

Thanks,  
Herman

>>> <WilliamMetcalf@dotd.la.gov> 10/30/08 10:03 AM >>>  
Question, do you want me to work in Virtis Till I get the error and then check the page file fragmentation or just check the page file fragmentation right now? As of right now this is the info:

Volume WINXP (C:)  
Volume size = 50.01 GB  
Cluster size = 4 KB  
Used space = 22.09 GB  
Free space = 27.93 GB  
Percent free space = 55 %

Volume fragmentation  
Total fragmentation = 26 %  
File fragmentation = 53 %  
Free space fragmentation = 0 %%

File fragmentation  
Total files = 74,565  
Average file size = 423 KB  
Total fragmented files = 7,008  
Total excess fragments = 58,962  
Average fragments per file = 1.79

4/19/2016 3:06:19 PM

HRS AASHTO

=====

FROM: William Metcalf DATE: 11/12/2008 2:41:46 PM Eastern Standard Time  
I used Virtis until the error was repeated then I checked the pagefile fragmentation and it was the same as before:

Size: 5.86 mb  
Fragments: 2

I downloaded the software from the Microsoft site and ran it (requiring reboot) the message it gave was 'page file is as contiguous as possible'. I checked the pagefile defragmentation and it was still:

Size: 5.86 mb  
Fragments: 2

Then I started using Virtis again and got the same error I have been getting. I then checked the pagefile defragmentation and it was still:

Size: 5.86 mb  
Fragments: 2

So I don't think this is the issue.

## Description

FROM: William Metcalf DATE: 9/17/2008 3:05:12 PM Eastern Daylight Time

We are having trouble with a few bridges that do not show up in the bridge explorer window even after you hit all, but if you search for them using the bridge id field it finds them. I believe this started happening before we upgraded to 6.0 and continues. Any ideas on what might cause this?

Information Needed E-mail sent on 12/1/09.

FROM: William Metcalf DATE: 12/11/2009 5:04:41 PM Eastern Standard Time  
No they do not, however the issue seems to be intermittent. For a while I thought I might be going crazy, but recently another engineer in our office has had the same issue. If you hit the binoculars icon and search by bridge ID it finds it even though it was not displayed in the bridge explore. But, as I said the issue is intermittent so it only pops up some times.

To: WilliamMetcalf@dotd.la.gov  
Subject: Virtis/Opis issue VI 8878 - Cannot find bridges in bridge explorer window

William,

If we could get a copy of your database we could investigate this further. Could you please ask your database administrator to send us a copy of the database? He can place the compressed database export file on Baker's ftp website at <ftp://ftp.mbakercorp.com/Incoming/LADOT/>. ...

Thanks,

Description

FROM: David Koenig DATE: 9/19/2008 9:19:54 AM Eastern Daylight Time  
We have discovered that when you enter steel shapes in your agency library, Virtis is not calculating RT, Sxx, RXX, or Syy. On the input screen, there is no way to enter these values, so Virtis should be calculating these behind the scenes. If you enter a new shape from scratch, it leaves these fields blank. In another scenario, we copied one from the standard library and made changes for the shape. When you copy from the standard library, it brings these values over from the copied shape. However, it does not update them as you update other values for the modified shape.

## Complete Issue Information

1. If you are not going to be able to enter these values from the input window, then Virtis should be calculating them behind the scenes for all agency entered shapes.
2. If you copy a standard shape and modify it for your agency library, then Virtis should be recalculating these values and updating them behind the scenes.
3. Also, we were suprised to find out that all of the library data is stored in Metric. This is something that users should be made aware of so that when they export a shape and are looking at the values they know that the need to convert back to English for comparison.

This bug is a very serious problem that needs to be addressed quickly. Also, states need to be made aware of this problem ASAP.

FROM: Jim Duray DATE: 10/26/2009 8:08:55 AM Eastern Daylight Time

From Herman:

"Sxx, Syy, Rt and Rxx are in the database and domain but not exposed in the GUI. When copying a rolled shape or other library item, we should only copy properties that are exposed in the GUI. Properties that are not exposed should set to NULL in the copy since user cannot change these properties."

From Brian Goodrich:

"The BRASS-LRFD engine calculates all the properties internally. The BRASS-LFD engine calculates all the properties internally except for A, I, and Z."

From Hasmukh (StdEngine):

"Std Engine is calculating some of these properties from the dimensions and other properties input by the user (passed on by GUI for Virtis)."

FROM: Jim Duray DATE: 10/26/2009 8:14:19 AM Eastern Daylight Time

Revise the copy function to not copy the values that cannot be entered using the UI.

Disable the Domain function for retrieving the values that cannot be entered using the UI (unless Bentley is using them).

Check with Bentley to make sure they are not using values that cannot be entered using the UI (I doubt they are using them).

FROM: Jim Duray DATE: 11/23/2009 1:44:12 PM Eastern Standard Time

Bentley's addition of LARS to the available engines (not yet released) is currently using Ryy, Syy, Rxx, Sxx that are not available through the UI.

We discussed this issue at the Nov Task Force meeting. Concensus by the Task Force was to remove the data items from the database for which there is no access through the UI. None of the engines (BRASS, Madero, StdEngine and the new AASHTO LRFD/LRFR) currently available in Virtis and Opis use any of the properties that will vbe removed. The 6.2 release will include a script that deletes the orphaned data from the database. The Domain API functions will be removed for those data items.

FROM: Jim Duray DATE: 12/17/2009 1:54:36 PM Eastern Standard Time

I notified Ron Love (see attached email pdf). Bentley will modify their code to calculate the values we are removing from the db.

FROM: Mehrdad Ordoobadi DATE: 1/13/2010 2:07:06 PM Eastern Standard Time  
Unused columns in library and bridge steel shapes removed.  
The Db, De, Dm, Domain classes updated. Necessary changes to the GUI completed.  
Library import was broken that is now corrected.  
Report tool causes an error when a steel channel is in the BWS. Srujana, please fix the report tool error.

FROM: Herman Lee DATE: 4/8/2010 8:08:05 AM Eastern Daylight Time  
Removed Steel Channel Nominal Depth attribute from all abr files. Resolved in 6.2 Release.

FROM: Mehrdad Ordoobadi DATE: 4/8/2010 9:40:41 AM Eastern Daylight Time  
The old rolled shapes.XML file was updated on January 13, 2010.

FROM: Herman Lee DATE: 5/9/2010 10:24:52 AM Eastern Daylight Time  
Verified in 6.2 Beta 1.

FROM: Aaron Kemna DATE: 6/11/2010 2:11:26 PM Eastern Daylight Time  
We can't really test this at MoDOT, but we are happy with the solution to the problem. Accepted for 6.2 Beta.

Description

FROM: Paul Jensen DATE: 9/19/2008 12:36:29 PM Eastern Daylight Time  
 we are working with LRFR to update our ratings in pontis. when we were working in the test builds, this worked once then I never tested again (why should I since we were working on fixes). in the production release, the LRFR will not work when updating pontis data. the screen is not the same as the test release, The new one had rating factors and tons. the error message we are getting is:

Error generating LRFD load commands!

No. of vehicles = 23 (Maximum = 20)

The number of vehicles exceeds the maximum allowed by BRASS!

This includes pedestrian loads also.

Error in the BRASS LRFD Analysis Module!

Error generating LOAD-LIVE-DEFINITION, LOAD-LIVE-COMBO, and/or LOAD-LIVE-DEFLECTION command!

the program should not have processed over 20 vehicles. we have in our list only 5.

hs20-44

hs20 (si)

type 3

type 3s3

type 3-3

all trucks are from the default library. all trucks have LRFR checked in the ratings list. we have created a rating template with the same trucks and use only inventory and operating, the system returned LRFR ratings...

what give when upn is running????

FROM: Herman Lee DATE: 9/24/2008 3:02:51 PM Eastern Daylight Time

I tested Update Pontis Ratings in a Virtis 6.0 and Pontis 4.4.3 integrated database. Following is the Update Pontis Ratings error message when LRFR is selected as the Default rating method in the Member Alternative Description window.

=====  
Error generating LRFD load commands!

03:18:00 PM - Line 200 in source file .\BrassLrfdLoadControl.cpp.

No LRFR or Design vehicles are selected!

Complete Issue Information

03:18:00 PM - Line 1284 in source file .\EngineExport.cpp.

Error generating LOAD-LIVE-DEFINITION, LOAD-LIVE-COMBO, and/or LOAD-LIVE-DEFLECTION command!

03:18:00 PM - Line 1444 in source file .\BrassLrfdLoadControl.cpp.

=====

FROM: Brian Goodrich DATE: 9/25/2008 5:59:22 AM Mountain Daylight Time  
Herman asked me to comment on how a Virtis vehicle is broken up into live loads for BRASS. A Virtis vehicle can consist of: 1) multiple axles, 2) tandem, and 3) lane. Each of these different live loads are generated as a separate live load for BRASS and then combined per the spec after the analysis. Only loads that are entered are generated. Additionally, for LRFD and LRFR, a fatigue truck and truck train is generated for design vehicles, as well as a tandem train if desired by the user. For legal vehicles, there is also type of truck train called a legal pair. I don't see how these five Virtis vehicles resulted in 23 live loads to BRASS. It might help to attach the BRASS data file.

FROM: Herman Lee DATE: 10/3/2008 1:44:43 PM Eastern Daylight Time  
Modified Update Pontis Ratings to also consider Pontis rating vehicles as LRFR Inventory and Operating vehicles.  
Resolved in 6.0.1 and 6.1.

Description

FROM: Danny Wampler DATE: 9/23/2008 2:36:33 PM Eastern Daylight Time  
Submitted By: Danny Wampler 09/23/2008 When running several ratings, 35 or more, we get an error message that says "Error loading BRASS DLL! (Error code = 8) not enough storage is available to process this command." Sometimes we can run 60 or more at a time, but other times, we cannot run 2 without getting kicked out. We added memory to our computers for a total of 3 gb, but that didn't help.

FROM: Herman Lee DATE: 9/23/2008 2:44:02 PM Eastern Daylight Time  
The memory allocated in a run is related to the number of member alternatives and also related to the complexity of each member alternative. For example, a member alternative with more cross section changes will require more memory than a member alternative will less cross section changes.

Some users also have the same experience. If you are running Windows XP, try to increase the size of the virtual memory in your computer. Attached is the virtual memory settings in my computer.

### Description

FROM: Herman Lee DATE: 9/24/2008 9:24:37 AM Eastern Daylight Time

Submitted by David Wolfe, Moffatt & Nichol (DWolfe@moffattnichol.com) via Bridgewater e-mail:

=====  
Bridgewater – Please find attached a dummy file test of a bridge (steel beam with timber deck) with top flange thickness deterioration.

Beam rating is by LFD. Deck rating is not run.

The file has 4 superstructures. Beam #2 in each case has top flange deterioration that causes the flange to be noncompact. Each superstructure is a copy of the previous with minor modifications:

- (1) Top flange lateral support full length of beams
- (2) Addition of a midspan diaphragm to (1)
- (3) Removal of the full length top flange lateral support from (2)
- (4) Removal of the midspan diaphragm from (3)

The curious feature is that the rating of beam #2 for the full length top flange lateral support ((1) & (2)) invokes top flange local buckling while (3) with only a midspan diaphragm does not. This causes (3) to have the highest rating factor.

How can (3) rate higher than (1)?

FROM: Brian Goodrich DATE: 9/24/2008 9:28:53 AM Mountain Daylight Time  
If Eq. 10-101 is not satisfied, as in case (3), the moment capacity should be the lesser of Eq. 10-99 and 10-103a. It appears that BRASS is only considering Eq. 10-103a in this case. I will submit this issue to WYDOT for assignment to a BRASS problem log.

FROM: Brian Goodrich DATE: 11/4/2008 9:38:51 AM Mountain Standard Time  
This issue was assigned to BRASS Problem Log 842.

FROM: Brian Goodrich DATE: 11/4/2008 9:42:38 AM Mountain Standard Time  
This issue was addressed in the BRASS engine.

Description

FROM: William Metcalf DATE: 9/26/2008 12:38:08 PM Eastern Daylight Time

This structure has an 11 span continuous plate girder span, and I am trying to run NSG on it. I understand that 11 spans is a lot for NSG to chew on; However the FEA both 2D and 3D part of the analysis run fine, it takes a little while (20 to 30 minutes), but it runs fine. But when it passes the info back to Virtis to do the final part of the analysis I get the 'Not enough storage....yadayadayada' error. The issue here is not my computer for 2 reasons:

1. It is a core 2 duo with 2.66 GHZ and 3 GB of ram and my virtual memory initial and maximum are both set to 4092. There is no reason this computer should not be able to run this.
2. The computer runs the FEA part fine without ever crashing; this should be computationally intensive part. If it runs the FEA there is no reason is should not run the Virtis part.

File is attached.

FROM: Herman Lee DATE: 9/26/2008 1:59:38 PM Eastern Daylight Time

The status of Incident 8877 has been changed back to Assigned.  
Since the issue described here is the same as Incident 8877, I changed the Status to Duplicate.

FROM: Herman Lee DATE: 10/29/2008 3:34:22 PM Eastern Daylight Time

I'm not able to reproduce the "Not enough storage..." problem. The NSG analysis completed without any error message but all influence line ordinates are reported as -1.#IND. Attached the G1 member influence line file.

Changed the Status back to Assigned. May be related to Incident 8480.

FROM: Jim Duray DATE: 4/26/2010 8:11:53 AM Eastern Daylight Time

I believe the generated FE model for 2D analysis is incorrect due to the hinges. The member releases appear to be incorrect.

FROM: Jim Duray DATE: 4/26/2010 4:22:17 PM Eastern Daylight Time

Beginning around line 4610 in AbxVirtisDistFactModelGen::GenerateBeamElements it looks like the code is adding a rotation release for the end of the member to the left of a hinge and the start of the member to the right of hinge.

Fixed for Alpha 4.

Description

FROM: Beckie Curtis DATE: 9/26/2008 3:28:31 PM Eastern Daylight Time

MDOT policy treats continuous for live load prestressed beams as simple for positive dead and live load moments.

Is there a simple way to analyze positive dead and live load moments as simple beams, while checking shear and negative moments as continuous beams?

Current procedure is to do a simple and continuous model for each structure and run both. We can check "ignore shear" in a simple span, is there a way to ignore positive moment for continuous span?

FROM: Brian Goodrich DATE: 9/29/2008 8:47:09 AM Mountain Daylight Time

I cannot think of any way to ignore just positive moments.

FROM: Herman Lee DATE: 9/30/2008 1:29:02 PM Eastern Daylight Time

Beckie, would you like to change this to an enhancement request?

Description

FROM: David Koenig DATE: 9/30/2008 4:37:55 PM Eastern Daylight Time

We have a Truss bridge that ran okay in Version 5.6. When trying to run it in Version 6.0, it gives errors. It basically is now requiring detailed section properties on a nondetailed section that is a tension member. Is this something that changed for Version 6.0? The XML file of the bridge from Version 5.6 is attached. Also, Word documents with the output from a verification of the bridge in each version is attached along with a document of the input file for the truss.

FROM: Herman Lee DATE: 10/1/2008 2:09:01 PM Eastern Daylight Time

Yes, additional properties are required for nondetailed section in Version 6.0. Please refer to Incident 8329 for more information. In summary, Virtis is not able to determine whether a member is in tension or compression during truss validation and a nondetailed section can be assigned to multiple members, the additional properties are required.

### Description

FROM: Beckie Curtis DATE: 10/6/2008 10:35:37 AM Eastern Daylight Time

Two items in attached bridge.

1. I set width loss to 100% and thickness loss to 100% for bottom cover plate of fascia beam. The rating is the same as the other fascia with no deterioration. When the cover plate is deleted instead of entered as deterioration, then the rating changes.

2. When detailed report is generated, the name of the truck is incorrect. The report shows three HS-20 vehicles and then only two MI legal vehicles instead of the two HS-20 vehicles and three MI legal vehicles that I actually ran.

FROM: Herman Lee DATE: 10/16/2008 1:19:48 PM Eastern Daylight Time

1. The defect is not engine dependent. I suspect the defect is in cutting the deteriorated cross sections in the domain.

2. I'm able to reproduce using 5 library vehicles.

Krishna, please assign to Mehrdad after you are done with the first item.

Complete Issue Information

FROM: Jim Duray DATE: 1/14/2009 1:13:45 PM Eastern Standard Time  
I changed the category to Bug - Domain 1 because it is affecting the rating and the problem is in the domain.

FROM: Krisha Kennelly DATE: 5/19/2009 12:22:29 PM Eastern Daylight Time  
1. Fixed for 6.1 Beta 1. Cover plate with 100% thick & width loss results in section properties in region of cover plate to be very close to rolled shape without cover plate. The properties are slightly off because a section with loss is converted to a plate in the Virtis LFD input instead of a W shape so the fillets are missing.

FROM: Herman Lee DATE: 8/17/2009 2:15:29 PM Eastern Daylight Time  
Changed Subject from "Bottom Flange Deterioration and Detailed Report Generation" to "Detailed Report Generation" since the deterioration issue (#1) has been fixed for 6.1.

FROM: Mehrdad Ordoobadi DATE: 9/24/2009 11:51:27 AM Eastern Daylight Time  
May, please investigate this issue. I am not familiar with the report.

FROM: Xinmei Li DATE: 10/20/2009 10:09:07 AM Eastern Daylight Time  
There are 3 tables for HS20 detailed rating results because 2 tables are for lane load and one table for axle load. I added the vehicle type table to each table so that user can tell from the report.  
Mehrdad, please investigate why we have two sets of lane load rating results.

FROM: Mehrdad Ordoobadi DATE: 2/11/2010 10:14:27 AM Eastern Standard Time  
Fixed the problem with having two sets of rating results for the lane loading.

FROM: Mehrdad Ordoobadi DATE: 2/11/2010 10:20:43 AM Eastern Standard Time  
Pinned in 6.1 SP1.

FROM: Jim Duray DATE: 5/6/2010 6:15:01 PM Eastern Daylight Time  
Verified #2 resolved for 6.2 a4. I assume #1 was resolved for 6.1 based on "FROM: Krisha Kennelly DATE: 5/19/2009 12:22:29 PM Eastern Daylight Time" above.

FROM: Beckie Curtis DATE: 5/12/2010 3:40:14 PM Eastern Daylight Time

Open Analysis Settings window. Pick the LRFR Legal Load Rating Template. use the Temporary Vehicles button and create a new vehicle. Add this vehicle to the Legal Load Rating category in the Vehicle Tree. Open the Advanced window, close the Advanced window. hit Ok on Analysis Settings window. Get error message "Advanced Vehicle Properties: Frequency and/or Loading Condition are not set".

Go back to Advanced window, can't change Frequency or Loading Condition (which is correct since I added this as a legal load not a permit load).

But now I can't close the Analysis Settings window because I keep getting the error message.

Should not have to set Frequency or Loading Condition for this vehicle since it is not a permit vehicle.

### Description

FROM: Paul Jensen DATE: 10/24/2008 1:35:44 PM Eastern Daylight Time  
when adding information on the framing plan screen and switch from english to metric, the program throws an exception and exits (gpf error). Not to gracefull. I can not give you an export because the program exits violently. this only happens (so far) on the floor systems and on all three types.

FROM: Paul Jensen DATE: 10/24/2008 2:54:26 PM Eastern Daylight Time  
more stuff---

when editing floorbeam locations, the screen resets skew to 0. this is for the floorbeam only the stringers are shown as described in the framing screen.

screen shot shows an issue with the deck apparent width (the driving lanes) and the actual size. the large skew of this bridge is causing computation issues. as shown the floorbeam are not long enough to cover the stringer descriptions.....

I have include the xml file of the bridge please use the structure def of "adjusted stringer and floorbeam rating"

not all of the information has been entered into the system. The issues is the skew, and floorbeam

computations.

FROM: Joseph Ihnat DATE: 10/28/2008 12:50:01 PM Eastern Daylight Time  
Crash fixed for 6.1.0 and 6.0.1  
Krisha, please investigate Paul's second issue.

FROM: Krisha Kennelly DATE: 10/29/2008 2:45:35 PM Eastern Daylight Time  
#1. when editing floorbeam locations, the screen resets skew to 0

This is due to a bug in the domain. I'm testing a fix. A workaround is if you change the span length on the Structure Def window (thereby changing the location of a floorbeam mbr for this structure type) then go to the Framing Plan window and re-enter the skew angles, hit OK. This will force the skew angle to be reset for you after you've moved the floorbeams. The fix I made will update the skew angle when you close the Structure Def window.

#2. screen shot shows an issue with the deck apparent width (the driving lanes) and the actual size.

There is a bug in the framing plan schematic when it places the floorbeam mbr for this structure type. The framing plan schematic is drawing the floorbeam mbr at its correct length but just not placing it correctly as measured from the left edge of deck.

Paul - please note that the framing plan schematic will draw the fb member at the total length entered on the Floorbeam Definition window. For your skewed floorbeams the length entered on the Floorbeam Definition window should be the skewed length of the floorbeam. The length entered in the attached xml file is not the skewed length of the floorbeam.

FROM: Krisha Kennelly DATE: 11/17/2008 10:11:23 AM Eastern Standard Time  
#1 is fixed (code is in abognrl)

Assigned to Joe for #2 and the following:

#3. Open the Floorbeam Mbr Locations window, open the Structure Def window and change one of the span lengths, hit Apply. The Floorbeam Mbr Locations window should get a message to update with the new fb location.

### Description

FROM: Beckie Curtis DATE: 10/24/2008 4:52:05 PM Eastern Daylight Time

I am checking beam P of the continuous model of attached bridge.

1. I am trying to compare the Brass and Std engine results for shear. The Brass engine is much lower than Std engine. The programs are reporting the POI's differently. Is there an easy way to get a point to be generated at the same location in the two different engines?

4/19/2016 3:06:24 PM

HRS AASHTO

1213

Complete Issue Information

2. I think I was able to find a similar point, 200.99 in Brass and 7.42 of Span 2 in Virtis. At this location Vi is 0.3 kips according to Brass and -20.7 kips according to Virtis. I can't seem to locate why there is a difference between the two, but it is causing a large difference in the rating.

FROM: Herman Lee DATE: 10/28/2008 7:46:33 AM Eastern Daylight Time

1. For PS continuous span structure, there's no easy way to get a point to be generated at the same location in the two different engines. Related to Incident 8684.

2. Please export and attach the vehicle you used so we can reproduce the above mentioned Vi for both engines.

FROM: Beckie Curtis DATE: 11/18/2008 10:19:51 AM Eastern Standard Time

Truck is now attached.

FROM: Xinmei Li DATE: 2/18/2010 2:05:19 PM Eastern Standard Time

2. I tried the attached bridge with VirtisOpis 6.1.0 release, rated beam P of continuous superstructure definition with the attached vehicle, I was not able to reproduce the shear difference stated above. Here is the detail results I get

Virtis std engine results:

Location: Span2 @ 7.42' DL1 Shear = 44.81kips DL2 Shear = 1.03kiips LL Shear Positive = 70.35kips LL Shear Neg = -10.15kips

BRASS engine results

Location: Span2 @ 7.58' DL1 Shear = 43.04kips DL2 Shear = 0.98kiips LL Shear Positive = 68.32kips LL Shear Neg = -10.24kips

The difference between two engines is less than 3%.

### Description

FROM: Yihong Gao DATE: 10/28/2008 1:33:19 PM Eastern Daylight Time  
From output, at stage 1 (non-composite) the area and I do not match up with beam only section. The top cover plate thickness and width don't match with inputs. at stage 2, the top cover plates are missing. The file is attached for your information. Thanks

FROM: Herman Lee DATE: 10/29/2008 9:53:05 AM Eastern Daylight Time  
Please attach the bridge xml file for investigation.

FROM: Herman Lee DATE: 11/3/2008 3:18:28 PM Eastern Standard Time  
Attached bridge xml and output files.

FROM: Brian Goodrich DATE: 11/4/2008 8:40:11 AM Mountain Standard Time  
I imported the XML file in version 5.6 and received the following error message when trying to run member G1:

Error converting Virtis/Opis steel cross sections or schedules to 'general' cross sections!

I tried importing the XML file into version 6.0, but it failed to import. Any ideas?

I suspect the top cover plate is being merged with the horizontal leg of the top angles in positive moment regions. The positive moment regions are controlled by the Contraflexure Locations input for the engine properites for the member alternative.

## Complete Issue Information

### Description

FROM: Xinmei Li DATE: 11/12/2008 10:45:43 AM Eastern Standard Time  
Submitted on behalf of David Lawson. The following is support history. All files are attached.

>>> Hasmukh Lathia 11/12/2008 10:09 AM >>>  
May:

I have looked at the output you sent and some earlier runs I had on this bridge. I have looked into the VSE code. It appears that VSE is using the gross section properties for the calculation of prestress losses. For all other calculations (stresses, ratings etc.) it is using the transformed section properties. This seems to be a bug in VSE. I have verified the above using a hidden input code in VSE where the user can specify which section properties to use.

Currently VSE calculates and reports both the gross and transformed section properties, but uses the transformed section properties except for the above apparent bug. This can be used to report as an incident to fix this bug in future. Let me know if you have any further questions.

Thanks,  
Hasmukh

>>> Xinmei Li 11/12/2008 8:52 AM >>>  
Input and output files are attached, also attached the comparison spreadsheet I did, and the virtis bridge file.

>>> Hasmukh Lathia 11/11/2008 5:29 PM >>>  
May:

Can you email me the input and output files for the VSE run in question?

Thanks,  
Hasmukh

>>> Xinmei Li 11/11/2008 3:19 PM >>>  
hasmuk,

Can you answer Dave's question? Does Virtis Std Engine use Transformed beam properties to calculate prestress loss?

Thanks.

May

>>> David Lawson 11/11/2008 10:38 AM >>>

When you say Virtis uses Transformed beam properties, you mean that the PS steel has been transformed, right?

The Virtis output BEAM PROPERTIES listed are the gross properties & the composite properties and do not reflect that the prestressing steel has been transformed.

So, does Virtis use transformed section properties (meaning that the PS steel has been transformed into equivalent concrete)?

## Complete Issue Information

>>> Xinmei Li 11/11/2008 7:28 AM >>>

Yes, the file from AZ DOT was using AASHTO method.

In Virtis, when you choose the AASHTO method, you can't choose whether or not prestressing steel has been transformed. But you can choose Brass Engine or Virtis Std Engine to do the rating. Brass Engine does not use Transformed beam properties, Virtis Std Engine uses Transformed beam properties.

The following is quoted from Virtis Std Engine output. The major difference between Virtis Std Engine and AZ DOT files is elastic shortening. I compared the detail breakdown of prestress loss in the attached spread sheet.

### Computing Prestress Losses:

#### BEAM PROPERTIES

CABLES = 66. SAREA = 0.153 ECC = 29.6837  
ESBEAM = 4888. ESPS = 28500.  
ULT.STRENGTH P/S = 270.000 INITIAL LOSS = 0.690 STRAND TYPE = L  
YBOT = 36.3806 YCOMP = 50.8885 CECC = 44.1915  
AIBEAM = 733320.29 AICOMP = 1356002.16 AREA = 1085.00 Pi = 2044.84

#### MAX MOMENTS

Mgir = 2172.26 Mint dia = 0.00  
Mslab = 1681.75 Mext dia = 127.10  
MDL2 = 413.23

#### STRESSES AT C.G. P/S STRANDS

fcir = 2.9391 fcds = 1.0402

#### P/S LOSSES BY AASHTO ARTICLE 9.16.2 IN SPAN: 1

SHRINKAGE = 6500.000 ELASTIC SHORTENING = 18588.692  
CREEP OF CONC. = 27988.072 RELAXATION OF STR. = 1416.727  
TOTAL LOSS = 54.493 PERCENT OF P/S FORCE = 26.910

>>> David Lawson 11/10/2008 1:56 PM >>>

When you choose the AASHTO method, does it give you options based on whether or not prestressing steel has been transformed?

With the AASHTO method, does Virtis provide detailed break-down of the losses?

I am assuming the file from AZ DOT was using AASHTO method, correct?

>>> Xinmei Li 11/10/2008 11:41 AM >>>

If you go to Prestress Properties window, General P/S Data tab, there is a drop down list of loss method. We were using the first one AASHTO method. If you know the loss, you can choose the second one, Lump-sum method and enter the prestress loss in the next tab, Lump-Sum Data tab. We also have PCI method.

>>> David Lawson 11/10/2008 1:21 PM >>>

Thanks for info.

What are the three ways to have Virtis determine losses?

It sounds like one way is to enter the losses directly using the info shown on plans.

What are the other 2 ways?

## Complete Issue Information

>>> Xinmei Li 11/10/2008 11:10 AM >>>

Dave,

According to the hand calcs you sent me, I made some changes in Virtis input.

1, Stress limit range: Span length is 124', beam projections on both sides are 9", stress limit range should be 125.5' instead of 126'

2, Concrete strength, in the load rating file you sent me, first line, f'c = 6500psi, however the Virtis was using 5700psi concrete, so I changed the material to 6500psi, also changed stress limits and factors accordingly.

After all above changes, I did analysis again and compared the Interior girder bottom concrete tensile stress in the attached spreadsheet. Vitis Std engine gives rating factors slightly larger than 1. Brass Engine gives very low rating factors because it calculates DL1 stress by using gross beam properties instead of transformed beam properties.

I agree with you that the main difference is the prestress loss.

There are three ways to define loss in Virtis, if you know the loss you can choose "Lump Sum" as loss method in Prestress Properties/General P/S Data and enter the values in the Lump-Sum Data tab.

Let me know if you have any questions.

May

>>> David Lawson 11/7/2008 5:25 PM >>>

May, overall girder calcs attached. Interior governed over Exterior. Design per Conspan using transformed section properties and losses.

I am thinking main difference is that long term losses are less (and final PS force remaining is higher) when transforming prestressing steel (since Conspan determines no Elastic shortening losses).

How does Virtis handle elastic shortening losses when you transform prestressing steel?

>>> David Lawson 11/7/2008 2:24 PM >>>

May,

Rating attached.

The stresses I entered are directly from Conspan results.

Do not pay too much attention to the operating rating....AZ DOT has us do shear design using 1979 interim AASHTO specs (which is why the shear portion will look goofy).

Looking at spreadsheet you just sent, DL stresses at midspan bottom compares good with both Virtis and Brass.

L+I stress midspan bottom, I am showing 753 psi (from Conspan) compared to 622 psi from Virtis and compared to 746 psi from Brass.

Big difference is PS stress midspan bottom, I am using Conspan result of 3528 psi compared to 3198 from Virtis and compared to 3120 from Brass.

This difference in prestress (or the long term losses) is probably causing big difference in ratings.

Design used transformed prestressing steel which meant the long-terms losses predicted by Conspan to be less (since no Elastic shortening loss).

Is Brass a/o Virtis able to transform PS steel and figure losses based off transformed section properties?

Dave.

## Complete Issue Information

>>> Xinmei Li 11/7/2008 12:09 PM >>>

Dave,

If you can send me a scan of your hand calcs it will be very helpful for me to compare the loads, section properties and rating.

Thanks.

May

>>> David Lawson 11/7/2008 2:01 PM >>>

Attached is pdf showing girder that AZ DOT should have used for rating for Ramp W-N.

The Design is per 17th Ed AASHTO using HS-25 vehicle.

Rating I performed (hand calcs) is per Manual for Condition Evaluation of Bridges, thru 2003 interims, using HS-20 vehicle.

ADOT's main adjustment of 17th Ed specs is to limit final tension to 3 SQRT instead of 6 SQRT.

I did girder design using Conspan, and for inventory rating, came up with 1.44 controlled by final tension being limited to 3 SQRT.

The file I recieved from Amin Islam is also attached, this is the one he is saying is giving him rating less then 1.0.

This is a bit of a curious issue because Az DOT with their thinking that bridge has rating less then 1.0 is now of the opinion that they would like me to add a girder line in order to increase the rating.

I do not think adding girder line is needed, so I need your help finding out why Virtis is telling Az DOT rating is less then 1.0 so I can show him that adding a girder line is not necessary.

Please let me know what else I can do to assist you with this issue and I appreciate the help.

Do not hesitate to call me with questions....direct 602-798-7543 or mbl 602-999-6629.

Thanks, Dave.

>>> Herman Lee 11/7/2008 7:48 AM >>>

May,

Amin Islam (AZ DOT) requested a rating comparison between Virtis Std Engine and BRASS Engine last week. The structure is 2926 (Ramp SE), which is similar to the structure 2926 (Ramp W-N) they sent to Dave. For Ramp SE, the inventory rating factor reported by the BRASS engine is half of the rating reported by the Std Engine. The main difference is the concrete allowable tension. This may be the reason why the rating is less than 1.0 in the Ramp W-N structure. Please extract this value in the BRASS output file so Dave can compare with the design.

Thanks,

Herman

>>> Jim Duray 11/7/08 7:51 AM >>>

Jim,

Can you help Dave?

-Ed

>>> David Lawson 11/6/2008 1:26 PM >>>

Ed,

Hope you can help me out with something.

Ariz DOT is doing a bridge rating using Virtis on a new bridge we are designing for them.

DOT is telling me that rating they are getting is coming out to be less then 1.0.

I am having hard time believing that rating is less then 1.0.

The design is per 17th edition using HS-25 truck.

We do not have Virtis in Phx office.

Can you try to use attached xml file I got from Ariz DOT to put their input and output into format I can understand and review?

Any help you can provide would be great.

Thanks and hope things are going well.

Dave.

FROM: Hasmukh Lathia DATE: 11/17/2008 2:40:45 PM Eastern Standard Time

The jacking force ratio entered as 0.7 and the relative humidity input of 40% seems to cause major differences in PS losses reported by BRASS and VSE. Relative humidity of 70% is hard coded in VSE. Gross sections properties used by VSE in calculating PS losses also cause some differences, but not as much. VSE is corrected for using the transformed section properties for the calculation of PS losses. In future, an option to choose sections properties and an input parameter for relative humidity in VSE may be provided if the TF approves and provides funds for these enhancements.

FROM: Tim Armbrecht DATE: 11/13/2008 2:04:21 PM Eastern Standard Time  
After running a NSG analysis on multiple bridges from bridge explorer, I call up the ratings results and get the bridge ratings results window. Is there a way print the results that are in this window? If not, why not?

FROM: Herman Lee DATE: 11/13/2008 2:19:04 PM Eastern Standard Time  
The Print feature is not available for the results in the Bridge Rating Results window.

Duplicate of Incident 3395.

FROM: Tim Armbrecht DATE: 11/13/2008 4:56:39 PM Eastern Standard Time  
Herman,

It is impractical to a practicing permit analysis enginer to not be able to do this. Especially if we expect Virtis to be the national leader in non-stnadard gague analysis. Is there a reason that this feature is not available? How much effort would it take to add this feature?

Note that a copy-and-paste-to-Excel solution is not practical either since we can't copy the field headers with the data.

FROM: Herman Lee DATE: 11/14/2008 7:26:29 AM Eastern Standard Time  
I agree a Print or Report feature is needed for Bridge Explorer Rating Results. I don't know why it's not available. Incident 3395 was submitted back in 2001. I guess this feature was overlooked since the beginning. I would like this feature to be implemented in the Report Tool. Option should be available to report rating results for a specific level of detail (bridge, structure or member) with drill down capability. For example, when user selects the bridge level with drill down, structure and member results should also be reported.

### Description

FROM: Paul Jensen DATE: 11/14/2008 10:58:34 AM Eastern Standard Time

The HS 20-44 truck should be removed from the vehicle options in LRFR analysis. It is not being calculated correctly. When LRFR uses the HS 20-44 truck, it puts the lane load on, then adds the truck AND the concentrated load both on top of each other, resulting in a very low rating. Either the HS 20-44 option should be removed, or the concentrated load removed from the HS 20-44 truck in LRFR analysis (which would make it almost identical to the HL-93).

I'm attaching a file where the live loads are being mis-calculated for HS-20 truck in an LRFR rating.

FROM: Krishna Kennelly DATE: 11/17/2008 9:00:04 AM Eastern Standard Time

We don't restrict the selection of vehicles in the Analysis Settings based on name since users can name their vehicles as they want. Assigned to Jim to not use concentrated load in LRFR influence line loading.

FROM: Jim Duray DATE: 1/13/2009 2:25:04 PM Eastern Standard Time

We do not use concentrated load with the lane load for LRFD/LRFR. I think this is a BRASS issue.

FROM: Brian Goodrich DATE: 1/14/2009 2:58:32 PM Mountain Standard Time

The BRASS export examines the presence of axles, lane load, and concentrated loads and generates the corresponding commands. The BRASS LRFD/LRFR engine considers the lane load and

4/19/2016 3:06:28 PM

HRS AASHTO

1230

Complete Issue Information

concentrated (live) loads if they are part of the vehicle definition in Virtis/Opis. The export cannot use vehicle names to flag certain live load combination behavior for the reason Krishna makes. While the concentrated loads are not called for in LRFD/LRFR, what happens if the user wants to combine these with a lane load? Can another vehicle be added to the library, i.e., one that only has the axles and lane load defined? Or do we need to add a flag to indicate if the concentrated loads are to be used for ASD/LFD/LRFD or ASR/LFR/LRFR?

FROM: Krishna Kennelly DATE: 5/19/2009 12:16:52 PM Eastern Daylight Time

FROM: Jim Duray DATE: 10/22/2009 8:51:25 AM Eastern Daylight Time

I think we need to come up with a consistent (across engines) way to address this. I believe a vehicle defined by AASHTO is what it is, HS-20 is made up of axles, lane and concentrated load. I don't think we should have an HS-20 vehicle definition for LFD (with concentrated lane load) and another one for LRFD (without concentrated lane load). I believe it should be the responsibility of the spec implementation to determine how that definition is to be applied. For LFD/LFR the axles should be handled as a vehicle and the concentrated plus uniform lane load should be another (I think that is what StdEngine and BRASS LFD do). For LRFD/LRFR the spec describes adding the uniform lane load (without the concentrated load) to the axle load. That is what we do in the AASHTO LRFD/LRFR engine. I think BRASS LRFD/LRFR should be corrected or the BRASS LRFD/LRFR export should be modified to not pass the concentrated lane load to the BRASS engine regardless of the name of the vehicle.

FROM: Brian Goodrich DATE: 11/2/2009 1:37:36 PM Mountain Standard Time

I can revise the export so the concentrated loads are not exported for LRFD/LRFR.

FROM: Brian Goodrich DATE: 1/22/2010 9:37:53 AM Mountain Standard Time

The BRASS LRFD/LRFR export has been changed to NOT export the concentrated loads for lane. I added a boolean that controls if these loads are exported, which is currently set to false. If there is ever an option added to control if these are exported, we can easily turn these loads back on.

FROM: Herman Lee DATE: 5/7/2010 10:06:44 AM Eastern Daylight Time

Verified in 6.2 Beta 1.

FROM: Jim Duray DATE: 7/20/2010 9:05:03 AM Eastern Daylight Time

How the AASHTO LRFR engine handles the HS20 vehicle or any vehicle with axle and lane loads depends on if the Notional checkbox is checked. If it is then the lane (without concentrated loads) is added to the axle (like the HL-93 vehicle). A truck pair is not evaluated. If it is not checked, then the truck and lane are evaluated separately and the lane includes the concentrated loads.

=====

Dear Mr.Lee,

I'm herewith attaching the exported xml file for the Reinforced Concrete Tee beam bridge.

Thanks,

Balaji.

FROM: Brian Goodrich DATE: 11/19/2008 5:04:09 PM Mountain Standard Time  
The LRFR spec indicates that concrete shear is only required to be checked for the permit rating procedure (LRFR 6.5.9). Therefore, BRASS defaults to ignoring shear for the design and legal rating procedure. Although not available to the Virtis user right now, BRASS does allow the user to consider shear if desired.

The only way to address this issue is to enhance the engine properties to allow the user to control which spec checks are considered for a particular rating procedure and limit state.

FROM: Brian Goodrich DATE: 11/20/2008 10:47:39 AM Mountain Standard Time  
E-mail from Herman Lee:

Brian,

This probably will be an agency spec exception. I think we should mark the incident as Enhancement and Suspended since we are doing what the spec specified.

Herman

Description

FROM: Dale Klossner DATE: 11/20/2008 10:39:04 AM Eastern Standard Time  
 I'm having a problem accessing the downloads section on the Virtis Opis Technical Support web site. When I select the Downloads section I don't see the logon screen, instead I receive a not authorized message (see attached screen capture). I'm using IE7 browser.

FROM: Herman Lee DATE: 11/20/2008 11:45:00 AM Eastern Standard Time  
 I'm not able to open the attached error.jpg file. Please use Add File instead of Link File to attach a file.

When you click on the Downloads link, a Connect dialog box should pop up for the User name and Password (see attached). Is the dialog box hidden behind the Internet Explorer or you don't see the box at all?

FROM: Herman Lee DATE: 11/20/2008 2:28:27 PM Eastern Standard Time  
 E-mail from Dale Klossner:

=====  
 I've attached the file.  
 The logon dialog box is not displayed, nor behind the screen.  
  
 The Firefox 3.0 browser seems to work correctly, but not IE7.  
 =====

Response e-mail:

=====  
 Hi Dale,  
  
 Some agencies also reported the same problem you are having with IE7. Those agencies are able to see the Connect dialog box after their IT department adjusted the security settings. Please consult with your IT department to see whether they can loosen up the settings for this web site.

Thanks,  
 Herman Lee

Complete Issue Information

=====  
IE7 works fine from my home. So there seems to be a problem when the computer connects through our cooperate Proxy server. I'd appreciate any information you could provide on what other agencies have done to fix the problem. I don't think our firewall/proxy administrator will loosen up the setting without a clear identification of the problem and solution.

Thanks,  
=====

Response e-mail:

=====  
Dale,

We don't know what other agencies have done to fix the problem. There are different ways to block the connect box, from Windows Local Security Policy to Agency Security Software.

The settings below may also be the causes:  
1. Logon User Authentication (see attached)  
2. Pop-up Blocker

Herman  
=====

FROM: Herman Lee DATE: 11/24/2008 11:07:18 AM Eastern Standard Time  
E-mail from Dale Klossner:

=====  
Herman,  
The problem is not isolated to IE7, IE6 has the same problem. The IE client settings don't seem to be the problem. I've tried the ones you mentioned and others. The issues seems to be with either our Mn/DOT's proxy server or the web server hosting your web page.

No need to pursue any further on my behalf. I can get by using Firefox, or get the files when I'm outside our network.

Thanks,  
=====

Description

FROM: Tim Armbrecht DATE: 12/1/2008 12:26:30 PM Eastern Standard Time  
When attempting to analyze the truss (export attached) an error is generated as follows...

“ Computing nodal loads due to floorbeams...  
???Error - Unable to compute dead load of floorbeam!  
???Error - Unable to compute floorbeam loads ...  
???Error - Unable to compute floorsystem loads...

Analysis failed!”

We have investigated this and have not been able to discover the reason for the error. The analysis of stringers and floorbeams produces reasonable results.

## Complete Issue Information

FROM: Herman Lee DATE: 12/1/2008 3:08:41 PM Eastern Standard Time

Duplicate of Incident 8480. Please see the first issue in the description on 8/28/2008 in 8480.

A workaround is to add a dummy range at the start and end of the floorbeam haunch profile and deck profile.

I also noticed that the N Truss is entered as a simple span structure but the superstructure definition is a 3-span structure.

FROM: Tim Armbrecht DATE: 12/2/2008 2:00:57 PM Eastern Standard Time

So when can we expect a fix, as mentioned in 8480? We'll try the workaround, but ultimately we're going to want a patch. This is a truss that needs to be rated now, and I have a few others like it waiting in line.

FROM: Herman Lee DATE: 12/3/2008 12:11:32 PM Eastern Standard Time

I'll discuss with the assigned person in 8480.

FROM: Krisha Kennelly DATE: 12/9/2008 10:20:10 AM Eastern Standard Time

This problem has been fixed for version 6.1.

FROM: Herman Lee DATE: 2/17/2009 9:56:46 AM Eastern Standard Time

A replacement DLL (abostld.dll) for 6.0.0 has been sent to Tim.

FROM: Tim Armbrecht DATE: 2/27/2009 9:23:05 AM Eastern Standard Time

The former error when doing the truss analysis for SN 060-0036 (VI #8931) no longer occurs and the analysis is reported as running successfully.

However...

- The dead loads and ratings are reported in the truss Rating Results Report as "-1.#J" and "1.#R" respectively. (I think this may have also happened in the analysis of the Murray Baker Bridge, SN 090-0001.)

- The following warning is generated, "Warning - Using specified unbraced length (Z-Z) 34.000000 ft for member " U1L1 " with physical length of 19.166700 ft...". Actually the physical length is 34.0 ft and the unbraced length override was specified as 34.0 ft (Z-Z) and 19.1667 ft (Y-Y).

- Using the Unit 1 stringers as an example, when I modify the counterweight distributed dead load for the 30WF124 stringer, the computed stringer reactions either don't change, or if they do, can't be successfully accepted. (I think this might have been reported a couple of years ago.)

XML attached

FROM: Herman Lee DATE: 3/1/2009 1:58:47 PM Eastern Standard Time

Before we sent out the replacement DLL, we verified the error in 8931 was fixed and also verified reasonable rating results were reported in the truss model attached in 8931. Please see below for our investigation of the additional problems.

- I compared the truss model attached in the incident with the model in the new XML file. Looks like the addition of the L8 pinned support indirectly triggered those nonsense dead load actions and rating

4/19/2016 3:06:30 PM

HRS AASHTO

1240

Complete Issue Information

results (-1.#J). I noticed that with the removal of the L12L13 and U13U14, the center section in the middle span between L13 and L13' will behave like a swing. U13L13 and U13'L13' will constraint the center section vertically but there is no constraint in the horizontal direction for the center section. This results in an ill-behaved stiffness matrix. A remedy is to put a horizontal constraint in L16 in the Support command (L16 UserDefined True False False).

- I confirmed that the unbraced length warning messages are caused by a defect in 6.0. This defect will not affect the capacity computation in 6.0 and the defect has been fixed for the 6.1 Release.

- For the stringer reaction issue, I increased the counterweight from 1.635 to 2 k/ft in the 30WF124 stringer. The reported nodal loads due to stringer unit 1 during the analysis and the resulted actions did reflect the increase in counterweight. We need more detailed description of the problem or the steps to reproduce the problem.

FROM: Tim Armbrecht DATE: 3/5/2009 12:46:56 PM Eastern Standard Time  
Looks like the horizontal bracing remedy worked.

Also, we are not able to duplicate the stringer reaction issue at this time. If we can in the future, I'll send as a separate incident. Thanks for your help.

FROM: Xinmei Li DATE: 5/28/2009 3:58:40 PM Eastern Daylight Time  
Verified fixed for 6.1 Beta1. The reported errors are gone now.

FROM: Tim Armbrecht DATE: 7/24/2009 2:52:09 PM Eastern Daylight Time  
It appears that the truss rates properly in Virtis 6.1 Beta 2 but there are no rating factors generated for the stringers or floorbeams. When run under 6.0 there are rating factors generated for the stringers & floorbeams.

FROM: Herman Lee DATE: 7/26/2009 11:32:01 AM Eastern Daylight Time  
I tried both XML files attached in this incident. I got rating factors for "Unit2 S3" stringer and "Flbm-L2-x" floorbeam. Please attach the XML file to reproduce the problem.

FROM: Tim Armbrecht DATE: 7/31/2009 12:15:43 PM Eastern Daylight Time  
I have attached the file. Not sure if we're looking in the same location, but note that we were looking for the rating factors in the grid (clicking on the grid icon) and not in the output file. As I mentioned before, we see them in 6.0, but not in 6.1.

FROM: Herman Lee DATE: 8/7/2009 10:11:12 AM Eastern Daylight Time  
The Points of Interest control option in the 6.1 Beta 2 XML file was not set correctly. This was caused by a bug in migrating 6.0 XML file into 6.1 Beta 2 database. This bug had been fixed for 6.1 Beta 3. Please try to import the 6.0 XML file into 6.1 Beta 3 database instead of using the 6.1 Beta 2 XML file since the control options for this bridge are not set correctly in the Beta 2 database.

FROM: Tim Armbrecht DATE: 8/14/2009 4:17:33 PM Eastern Daylight Time  
Appears to be working correctly. Accepted.

Description

FROM: Bob Prince DATE: 12/8/2008 3:25:38 PM Eastern Standard Time  
A VDOT modification to the AASHTO code indicates the distribution of moments from superimposed loads shall be made using the gross section properties of the slab and girder along the entire length of the girder. In other words the gross section properties should be considered when calculating stiffness and the composite section properties should be used to calculate stresses. Can this be accomplished using Virtis? If so, how? Thanks.

Complete Issue Information

FROM: Brian Goodrich DATE: 12/9/2008 7:56:15 AM Mountain Standard Time  
With regard to the BRASS ASD/LFD engine, the answer is no. This BRASS engine only allows input of the slab or rebar at any given cross section range. The export process obtains the points of contraflexure and uses those to determine if the slab or rebar is exported for a particular range. Note that a new BRASS engine is under development and will not have this limitation.

FROM: Herman Lee DATE: 12/9/2008 10:07:23 AM Eastern Standard Time  
The answer is also no for the Virtis Std ASD/LFD Engine.

Description

FROM: Krisha Kennelly DATE: 12/15/2008 3:01:49 PM Eastern Standard Time  
email from Vinacs at CalTrans, 12/11/2008:

Attached is a file that we were working on.

It appears that the BRASS export program incorrectly exports the section when bent up are involved

We have a two span continuous bridge and have bent up bars. The bent up bar details in span 1 and span 2 are similar.

We tried to rate the bridge at every 10th point (excluding over the bent). In addition, we want to rate at the face of support.

The rebars considered at edge of support (for the negative moment) by the BRASS export is the one is in question.

Our review (after considering the bar development calc provided by the BRASS) indicates that the blue, brown & pink bars were developed at Left face of the support. However, BRASS considered only the blue and pink for the analysis.

I think the program should have generated section at the face of the support (or where the brown bent up falls in as top reinforcement)

(See attached file: 38C0274.xml)

Vinacs M Vinayagamoorthy  
916-227-8657

Please review the structure definition "MVV Span 1-2 (MDL 1) (10/08)" only. I changed a few things in this model to illustrate the problem (as a result rating results would be really low and makes no sense)

Complete Issue Information

Sent: Monday, December 15, 2008 1:05 PM

Hi Brian,

Vinacs from Caltrans is having the attached error.

To make it easy to focus on the problem I made the following changes to MVV Span 102 (MDL 1) (10/08), G1 on my pc (not his attached file):

1. on the Girder Profile: Reinforcement tab delete all rebars except for G1-T3-S1-3/4" sq, Fy = 33, 15ft
2. Delete all points of interest except for 10.4583

Then run HS20 rating.

My first thought was that to the very left of 10.4853 there is no rebar because the sloped portion is just ending and that would be correct. So I revised the POI to 10.5 to force it to be in the straight portion of the bar. when I do that the cross section to the left & right of 10.5' does contain rebar in the input file but the detailed calcs for that point don't have any rebar in the section.

I've entered this as incident 8940.

Thanks,  
Krisha

#####

From: Brian L. Goodrich [mailto:Goodrich@BridgeTech-Laramie.com]  
Sent: Tuesday, December 16, 2008 1:50 PM

I made the changes you suggested to simplify the problem. The same results are produced with a POI at 10.4853' or 10.5' or 10.56875'. The second and third POI are just to the right of the cross section change at 10.4853'. However, they are within 0.12' of the existing node, so these points do not get added to the model. BRASS locks onto the nearest node point, i.e., 10.4853'.

For any point of interest, BRASS gets the properties from the adjacent element with the smallest moment of inertia. If they are the same, it uses the side with the smallest rebar area. For the POI in question, there is no rebar on one side, so that is the cross section that BRASS picks.

Am I correct that the domain functions that generate the cross sections from the rebar schedules assume no contribution from the rebar in bent region of the bar, i.e., the rebar is assumed to have zero area in these regions? Could we assume the rebar extends half way into the bent region from each side? Comments?

#####

From: Krisha Kennelly [mailto:KKENNELLY@mbakercorp.com]  
Sent: Wednesday, December 17, 2008 12:13 PM

Hi Brian,

Complete Issue Information

I think it is too unconservative to assume the bar extends so far into the bent region. We would like to come up with a way the domain can return the data and the export makes the assumptions it needs (eg, since BRASS can't check just the side of the POI the user specified maybe if it knows the bar is bending there it can use the area on both sides of the bent point and then create an extra range in between the bend points of the bar.)

Are you available for a conference call this afternoon to discuss this with Jim and me?

Thanks,  
Krisha

Submitted on behalf of Russell Howells, Michael Baker Jr., Inc.

Received e-mail:

=====

I am working on a truss in Virtis. I have attempted to define the deterioration that is present on the end post member. The member type is ChannelBox and I have identified the deterioration as shown in the manual. However, it appears that specific line of code is not correct due to the error message received from the verification. Please review and let me know what we need to do. Thank you for your help,

IR092007-d-o Span 2  
Truss RT

Line 78

=====

Reply e-mail:

=====

Looks like it doesn't like to have only TopFlangePlate deterioration for LOU1. A workaround is to enter a fake Channels deterioration after the TopFlangePlate.

Example:

```

Channels
Left BottomFlange 0 0 L0 0.00 0.00

```

The duplicate U3L4 and Deterioration lines also need to be removed.

I'll enter an incident in Virtis Support Center for this on Thursday. Please check the computed LOU1 section properties to make sure the workaround is OK. Thanks.

=====

FROM: Xinmei Li DATE: 5/28/2009 4:31:34 PM Eastern Daylight Time

FROM: Girish Bhanushali DATE: 10/6/2009 10:51:12 AM Eastern Daylight Time  
Issues have been fixed.

Complete Issue Information

Following should be Noted or documentation should be updated to help user understand this:

Input had following issue apart from the actual code related bug.  
In the input MOI for U3L4 was entered twice. (though with different component ).

```
//////// Incorrect //////////
U3L4
Deterioration
TopFlangePlate
1   9   0   L4   0.00  3.00
U3L4
Deterioration
Channels
...
////////
```

Intended way to define deterioration for a MOI is to group all the components deterioration under the corresponding MOI.

Example:  
//////// Correct //////////
U3L4
Deterioration
TopFlangePlate
1 9 0 L4 0.00 3.00
Channels
...
////////

FROM: Herman Lee DATE: 10/12/2009 3:02:24 PM Eastern Daylight Time  
Girish, if the channel deterioration is ignored in above incorrect MOI input, the truss command validation should check for the duplication or the command parser should be updated to accept the duplication.

FROM: Herman Lee DATE: 3/12/2010 9:09:06 AM Eastern Standard Time  
Girish updated the command parser to check for the duplication.  
Resolved for 6.2 Release.

FROM: Jim Duray DATE: 4/29/2010 2:08:35 PM Eastern Daylight Time  
Verified - 6.2 alpha 4.  
I verified the parser detects the duplicate line. I changed the command as suggested above and the truss rating runs to completion.

### Description

FROM: Joseph Ihnat DATE: 12/16/2008 1:16:13 PM Eastern Standard Time  
For the attached bridge superstructure member "Span 1N a" as far as I can tell the two exterior girders, girder 1 and girder 7 should be identical with the exception of a minor difference in length (on the order of 1"). The two girders rate very differently. I check the loads graph and the dead loads are almost identical but for some reason the live load moment at mid span on girder 1 is 30% higher than girder 7. The span has splayed (flared) girders and is therefore rated using the Virtis Std. engine. Any Ideas on why is happening?

FROM: Herman Lee DATE: 12/23/2008 4:48:33 PM Eastern Standard Time  
I'm not able to locate the higher live load moment at mid-span in Girder 1 (see attached screen capture). The difference in live load moment is very small.

I compared Girder 1 and Girder 7. Girder 7 is composite with deck but not Girder 1 and there are some differences in the size of shear reinforcements also.

FROM: Brian Goodrich DATE: 12/18/2008 2:19:55 PM Mountain Standard Time  
As we discussed on the phone, the workaround for the stringer reactions to the floorbeams is to override the computed values. These values can be obtained from the "Computed Stringer Reactions" window for each stringer unit layout.

I confirmed where the tolerance problem was coming from. You were right that it was due to the entries for the section loss on the floorbeam member alternatives. Open "Floorbeam 2 Alt" and go to both the "Web Loss" and "Bottom Flange Loss" tabs. Change the Start Distance and Length to 33.16666 and 0.66667, respectively. The previous values of 33.17 and 0.67 add up to 33.84' (406.08"). Note this is the value from the error message. Change these loss distances for all the floorbeams that would not rate.

These two changes should allow you to fully rate the "TRUSS (ST)" structure definition.

FROM: Brian Goodrich DATE: 12/18/2008 2:21:01 PM Mountain Standard Time  
The issue of automatically transferring the stringer reactions to the floorbeams remains to be addressed.

FROM: Herman Lee DATE: 12/19/2008 6:38:31 AM Eastern Standard Time  
I'm not able to reproduce both error messages in the attached S03004Verror.doc file. All floor beam ratings in "TRUSS (ST)" are completed successfully (see attached FloorbeamRatings.png).

After I imported the attached bridge, I'm not able to save the bridge to the database. Below are the error messages:

```

Submitted on behalf of Russell Howells, Michael Baker Jr., Inc.

Received and Reply E-mail:

=====

Looks like the distances to stringer group definition workpoint in the Floor System Geometry window don't match up exactly with the floorbeam locations in the Floorbeam Member Locations window.

After I used the Floorbeam Location Wizard to recompute the locations and copied the locations to the Floor System Geometry window, I'm able to rate all stringer units. Attached is the modified bridge. Since using the wizard deleted all floorbeam member alternatives, please reenter the floorbeam member alternatives.

Herman

>>> Russell Howells 12/19/08 11:15 AM >>>  
Herman,

Try running the entire bridge. The program is still shutting down on me.

Russ

>>> Herman Lee 12/18/2008 11:57 AM >>>  
Virtis didn't close out when I rated the "Left Truss". It complains the following at the end of the rating. Since you don't have a deck defined, the message is ok.

"Cannot compute deck dead load if concrete material is undefined!"

Please try to rate it again to see whether the close out can be reproduced.

Herman

>>> Russell Howells 12/16/08 4:13 PM >>>  
Herman and Krisha,

The attached file has been very problematic. When attempting to analyze the truss, the program closes out. Please see if you can determine the source for the error. Thank you for your help,

Russ

### Description

FROM: Paul Jensen DATE: 12/23/2008 3:30:36 PM Eastern Standard Time  
we were adding timber bridge decks to our system and found an issue, where is the loading specified by articals 3.7.6a and 3.7.7a? When the timber addition was made to the Virtis, on the timber deck page (see attached screen shot).

for the short term, which table updates this for export so that I can resolve the problem.....

FROM: Herman Lee DATE: 12/24/2008 9:54:37 AM Eastern Standard Time  
For girder line superstructure definition, two more fields (Overhang and Girder spacing) are available for Deck Rating Parameters (see attached GirderLineDeckWindow.png file). These two fields are at that location since the beginning (version 5.0). If this is not the information you are looking for, please provide more detail on the problem.

FROM: Herman Lee DATE: 2/4/2010 1:55:42 PM Eastern Standard Time  
E-mail from Brian Goodrich:

I don't think the Virtis GUI has ever supported this load reduction. Madero does, but the export is hard-coded right now for this to be ignored. This option applies to both H and HS type trucks. This option appears to do either the full or reduced loads but not the critical of the two.

Description

FROM: Jim Onysko DATE: 1/23/2009 9:30:37 AM Eastern Standard Time  
I am doing an LRFR rating on a multi-span continuous steel structure and I had a few questions.

1.) When I print the rating summary for several beams, the controlling limit state for the HL-93 at the operating level is Strength II. Why is the design level rating for the HL-93 being carried out for the Strength II limit state when LRFR manual states that Strength II only applies to permit vehicles? Is this

## Complete Issue Information

because the operating live load factor is 1.35, which is the same as the Strength II live load factor for design in LRFD?

2.) The rating summary shows only the controlling rating factor, controlling limit state, and controlling span location. How do I obtain the controlling rating factor for a specific limit state? For example, flexure controls for most of my beams. However, for reporting purposes, I need to show the controlling flexural rating and controlling shear rating for each beam. Is there any way to do this without searching through the many pages of BRASS output? If not, then it seems there should be a way to do so. After the analysis is run, rating data is obtained for each limit state at each point. If the program has all the analysis results in the database after running the analysis, couldn't there be a way to just easily access the info for a specific limit state or point of interest?

FROM: Brian Goodrich DATE: 1/26/2009 1:48:36 PM Mountain Standard Time

1. The Strength II limit state is used as the Design Load Operating rating because the live load factor is also 1.35.

2. The rating summary currently shows only the controlling rating factor for each live load combination. Searching through the output file is necessary to determine critical rating factors for non-controlling limit states.

The user is requesting an output filter, i.e., functionality to get to rating factors other than the critical. This is similar to 4699 and 6716.

### Description

FROM: Krishna Kennelly DATE: 1/27/2009 9:51:56 PM Eastern Standard Time  
Submitted on behalf of Vinacs via email 1/23/09:

We are starting to use the Virtis-BRASS to rate PS-I girder bridges that are made continuous for live load. In many cases, we are experiencing the difficulty in completing the rating because, the shear at the edge of support control the overall rating.

The stem of PS-I girders are much thicker (typically 19") compare to the stem in the mid region (Typically they are 7"). BRASS uses the bw as 7" in establishing the shear capacity. If we use bw of 19" at the end, the shear capacity would be much higher. How could we enter the thicker web at the end of PS girders?

How do other states rate the bridge especially closer to support location?

email response sent via Herman Lee on 1/24/09:

Virtis doesn't support varying cross sections along a PS girder span. We don't think there's any workaround.

The Virtis Std Engine considers AASHTO Std 9.20.1.4 for PS girder but this may not be enough to reveal the true controlling location.

FROM: Herman Lee DATE: 6/30/2012 9:45:51 AM Eastern Daylight Time  
Implemented for 6.4 release.

FROM: George Huang DATE: 8/10/2012 4:16:18 PM Eastern Daylight Time  
verified by Vinacs in V6.4 beta build 3.

Submitted on behalf of Vinacs Vinayagamoorthy, Caltrans.

=====

Hi Vinacs,

I'm able to reproduce the crash. The Virtis Std Engine output file has some information/hint on why the analysis failed and crashed the program. Unlike the BRASS Engine, Virtis Std Engine uses the data in the Stress Limit window. The Final allowable tension entered is 10 ksi but the allowable input format for this field in the Virtis Std Engine is X.XXXX. That's the reason why the program crash. Virtis needs to prevent the crash and reports the problem back to the user.

Herman Lee

>>> Murugesu Vinayagamoorthy <murugesu\_vinayagamoorthy@dot.ca.gov> 2/4/09 4:01 PM >>>

When I used the "user defined" LFD Factors and use the Virtis-LFD program to analyze the prestressed girder bridges made continuous, the Virtis program crashes.

Complete Issue Information

On the other hand, if I had used the BRASS-LFD, the Virtis will NOT crash.

Review the Span 1-2 (1993) MDL 2 of 2; G1

### Description

FROM: Brian Goodrich DATE: 2/6/2009 10:57:03 AM Mountain Standard Time  
Submitted on behalf of Elizabeth Befikadu, AI Engineers, Inc.

Live load actions from Madero are too high. For a 12' stringer, the moment is 96 ft-kips.

FROM: Brian Goodrich DATE: 2/6/2009 11:00:03 AM Mountain Standard Time  
The live load actions shown in the Analysis Results window are based on the axle weights and not adjusted for live load distribution (wheel fractions). This differs from the BRASS engines. This fact is documented in the (Madero) Engine Related Help topic for the Analysis Results window.

Herman, I have attached my hand calcs for the first interior girders on the east and west bound spans. It appears that shear at supports for these girders are the only ones that are in question. I have discovered my error on the others. Please let me know if you can help

Thanks,  
Andy

=====

Complete Issue Information

FROM: Xinmei Li DATE: 10/13/2009 9:20:49 AM Eastern Daylight Time

In your hand calculations,

Middle 2 girders are 1.2 and 1.67, match Virtis calculation;

1st interior, the left wheel of second truck cannot be placed 4' from right wheel of first truck, it should be 6' from first truck so that both trucks are in within a 12' lane. Virtis places two trucks at 2.667' and 8.667' (first truck), 14.667' and 20.667' (second truck), measured from the centerline of G13 (exterior girder).

1270

Complete Issue Information

Issue : For span 1 and span 5 at midspan topflange flexure governs. This is a simply supported beam I don't know how Top flange flexure governs at midspan.

Please let me know what you think.

FROM: Brian Goodrich DATE: 2/10/2009 11:07:06 AM Mountain Standard Time  
This issue applies to BRASS ASD. The structure in question is a non-composite simple span, so the flange stresses due to a positive moment are the same magnitude, with the top being in compression and the bottom being in tension.

It appears that she would like the tensile stress to control the rating for positive flexure when the magnitudes are the same. I suspect that BRASS is simply searching for the minimum rating by starting at the top of the section and ending at the bottom. We could check for a simple span and reverse the search process to start at the bottom of the section.

I forwarded this issue to WYDOT for consideration.

FROM: Brian Goodrich DATE: 3/10/2009 11:49:28 AM Mountain Daylight Time  
E-mail from Mike Watters (WYDOT):

Brian,

If we did as you suggest, some user may come later and want a different order. I presume the output file shows the ratings for tensile stress, and that it is only the summary sheet she wants changed. Also, I noted that this was an ASD rating, which we are not making any changes to. I recommend leaving the program as is.

### Description

FROM: Herman Lee DATE: 2/12/2009 10:23:22 AM Eastern Standard Time  
Submitted on behalf of Elizabeth Befikadu, AI Engineers, Inc.

See the Floorbeam in the attached Floorbeam-Stringer Floorline Superstructure Definition.

FROM: Brian Goodrich DATE: 2/17/2009 8:32:43 AM Mountain Standard Time  
The BRASS export is set up to export the deck load to a floorbeam only when the stringers frame into the floorbeam. The floorbeam stringer floor system superstructure definition has a checkbox for specifying if the stringers frame into the floorbeam, but the floorbeam string floorline superstructure definition does not. The export is using this flag to determine if the deck load is applied directly to the floorbeam.

FROM: Brian Goodrich DATE: 2/18/2009 10:16:33 AM Mountain Standard Time  
E-mail from Herman Lee 2/17/2009 1:17 PM

#### Option 1:

Since GFS Floor Line has the "Stringers frame into floorbeam" checkbox, the checkbox should also be available in FS Floor Line.

#### Option 2:

Since members are not related to each other in line superstructure, if a deck is entered for the floorbeam member alternative of a floor line or truss line superstructure definition, we should apply the deck load to the floorbeam.

4/19/2016 3:06:43 PM

## Complete Issue Information

Krishna, what's your opinion on this?

Herman

FROM: Brian Goodrich DATE: 2/18/2009 10:19:15 AM Mountain Standard Time  
E-mail from Krishna Kennelly Tuesday, February 17, 2009 11:33 AM

I suggest Option 2.

In system superstructures we use the 'stringers frame into fb' checkbox to decide if we should show the floorbeam deck profile window in the tree. For that case it is ok to use the checkbox to know if the floorbeam has a deck DL because that checkbox allows/restricts the deck profile window from showing up.

For lines, we should use the deck DL if it is entered for the floorbeam in its Deck Profile window without regard to that checkbox.

I think it is a mistake to have the checkbox on the GFS Floor Line window. That checkbox doesn't affect the tree like it does for a system and I don't think it should.

FROM: Brian Goodrich DATE: 2/18/2009 10:19:54 AM Mountain Standard Time  
The export was using the IDoFsFloorLineStructDef ::  
GetStringerFrameInFloorbeamInd function to get the flag for if stringers framed into the floorbeam. Since this item is not being populated by the GUI, should this function be removed from the domain?

I'll work on implementing Option 2 for the floorbeam stringer floor line.

FROM: Brian Goodrich DATE: 2/18/2009 10:20:07 AM Mountain Standard Time  
E-mail from Herman Lee 2/17/2009 12:22 PM

Brian,

Please assign the incident back to me after you are done. We still need to decide what to do with the checkbox, which is available in the GUI, in GFS Floor Line. Does the export consider the "Stringers frame into floorbeam" checkbox in GFS Floor Line?

Thanks,  
Herman

FROM: Brian Goodrich DATE: 2/18/2009 10:21:11 AM Mountain Standard Time  
Yes, the export does consider the "Stringers frame into floorbeam" checkbox in a GFS Floor Line. The TFS Floor Line has this checkbox too and the export uses it accordingly. Let me know what you decide to do for the GFS and TFS floor lines.

I changed the export for the FS Floor Line only at this point. See the

4/19/2016 3:06:43 PM

HRS AASHTO

1273

Complete Issue Information

CEngineExport::IsDeckApplicableToFloorbeam() function.

FROM: Brian Goodrich DATE: 3/12/2009 8:44:27 AM Mountain Daylight Time  
Let me know if I need to revise the export for the GFS and TFS floor lines.

FROM: Herman Lee DATE: 3/17/2010 10:29:45 AM Eastern Daylight Time  
The BRASS export considers the "Stringers frame into floorbeam" checkbox in GFS Floor Line and TFS Floor Line. Removing the checkbox from the user interface, domain and export will change existing ratings for the case that the checkbox is not checked and there is a deck entered for the floorbeam. This checkbox provides an additional control for applying deck load to floorbeam. I think we should leave the checkbox in GFS Floor Line and TFS Floor Line.

FROM: Herman Lee DATE: 5/9/2010 10:36:58 AM Eastern Daylight Time  
Tested the XML file in this incident.  
Verified in 6.2 Beta 1.

### Description

FROM: Todd Thompson DATE: 2/19/2009 3:04:58 PM Eastern Standard Time  
I have a bridge that works for normal load rating/analysis but the NSG analysis fails for some reason that I have not been able to track down.  
I've attached the xml of the structure.  
I'll attempt to also zip and include the output and attach that.

FROM: Herman Lee DATE: 2/20/2009 9:18:24 AM Eastern Standard Time  
I'm able to reproduce the problem. I tested the following 2 configurations.

1. Use original configuration and modify support skews to 0.0.  
NSG analysis runs to completion.
2. Use original configuration and unlink G3, G4 and G5. Copy G1 member alternative to G5 and G2 member alternative to G3 and G4.  
NSG analysis runs to completion.

I suspect there is a tolerance problem in locating analysis points along linked member for skewed bridge.

FROM: Krisha Kennelly DATE: 5/19/2009 2:12:29 PM Eastern Daylight Time  
Problem is occurring in CABxVirtisDistFactEngine::Compute2DActions().

line 4308 is trying to find pLinkPoiInfo->m\_dDistance at 128.9999999473 inside the pmapPoiInfo. But pmapPoiInfo has a poi at 129.0000000526. KEY\_FACTOR is 100000L so 12899999 is never matched to 12900000.

FROM: Jim Duray DATE: 4/26/2010 7:05:36 PM Eastern Daylight Time  
There is another search loop for when the key is not found. However, the tolerance for the comparison was the default system tolerance (0.000001 ft). I changed the comparison to use a tolerance of 0.01 ft.

Fixed for Alpha 4.

FROM: Jim Duray DATE: 4/29/2010 2:44:48 PM Eastern Daylight Time  
Verified - 6.2 Alpha 4.

FROM: Todd Thompson DATE: 5/11/2010 11:44:30 AM Eastern Daylight Time  
6.2 Beta 1  
Appears to be fixed - tested the attached structure and worked ok.

FROM: Todd Thompson DATE: 7/15/2010 3:30:08 PM Eastern Daylight Time

### Description

FROM: Beckie Curtis DATE: 2/27/2009 1:17:52 PM Eastern Standard Time

In attached structure, span 1 is non-composite and span 2 is composite. Rating results between Brass and STD engine are greatly different. Closer investigation finds that STD engine is not treating span 2 as composite. Attached is the xml file, and screenshots of Brass and Virtis output.

FROM: Herman Lee DATE: 3/1/2009 3:45:22 PM Eastern Standard Time

I checked the Virtis Std Engine output. Span 2 is composite from 9 ft to the end.

I compared the rating results between the Virtis Std engine and the BRASS engine (see attached Ratings.png). The results are comparable.

### Description

FROM: Beckie Curtis DATE: 3/3/2009 1:01:53 PM Eastern Standard Time

Virtis and Brass engines produce different results for section properties, and consequently different rating results. The flange changes and the Virtis engine does not seem to be including this.

FROM: Herman Lee DATE: 3/3/2009 2:10:35 PM Eastern Standard Time

I checked the Virtis Std Engine output. Changes in top and bottom flanges thicknesses are included.

I compared the rating results between the Virtis Std engine and the BRASS engine (see attached Ratings.png). The results are comparable.

Please note that the BRASS LFD export requires you to specify the points of contraflexure in a continuous steel beam in order for the export to determine what section properties (composite or non-composite) should be used. The points of contraflexure are defined on the Engine tab of the Member Alternative Description window. Since there are hinges in Span 2, the contraflexure locations should be set to coincide with the hinge locations.

FROM: Beckie Curtis DATE: 3/3/2009 3:22:42 PM Eastern Standard Time

The structure is noncomposite and so the points of contraflexure weren't edited.

Attached is an image of my output, showing very different Virtis ratings.

Complete Issue Information

FROM: Beckie Curtis DATE: 3/3/2009 3:54:27 PM Eastern Standard Time  
Also attached are the Brass and Virtis output. No changes were made in the file between runs other than selecting the different engine.

FROM: Herman Lee DATE: 3/5/2009 2:43:29 PM Eastern Standard Time  
Based on the output files, I entered the "Michigan 2 Unit Truck 18-DL" vehicle and rated the girder with both engines. The rating results are comparable.

The BRASS output file from my run is similar with the one you attached. But the Virtis Std output file (see attached "HL Virtis Main\_Girder.OUT") from my run is very different from the one you attached.

Could you try to rate the girder with both engines in a different machine in your Agency to see whether you get the same results?

FROM: Herman Lee DATE: 10/27/2009 2:33:16 PM Eastern Daylight Time  
I discussed this incident with Beckie during the International Bridge Conference back in June. The database contains this bridge was overwritten by a new installation. This incident is marked as Not Reproducible until more information is available.

Submitted on behalf of Sarah Saeed, Saeed Associates. (sarah\_saeed82@yahoo.com)

Received Bridgeware e-mail:

=====  
Hello. I had a question about using VIRTIS. I am running a steel girder bridge in VIRTIS. I ran it using LFD and it worked. However, when I switch to LRFR method, it does not run. Besides traffic information which I have entered, is there additional input needed to run using LRFR that is not needed in LFD method? I have attached my file in xml and bbd format. Can you please look at my file and tell me what is missing and what the problem is? Thank you very much.

FROM: Herman Lee DATE: 3/5/2009 1:57:48 PM Eastern Standard Time  
Looks like part of the type 3 inverted rebar is sticking out of the bottom of the cross section. I think we should issue validation error, either in the GUI or while cutting cross sections.

FROM: Brian Goodrich DATE: 3/5/2009 1:59:03 PM Mountain Standard Time  
The negative distances go away if the inverted rebar distances are increased by the height of the Type 3 bar. I think the user should simply correct the rebar distances.

This information has been forwarded to the user.

FROM: Krisha Kennelly DATE: 2/2/2010 9:05:09 AM Eastern Standard Time  
Message is now issued while cutting cross section if the bar is above or below the beam. Fixed for 6.2

Description

FROM: Herman Lee DATE: 3/5/2009 1:22:37 PM Eastern Standard Time  
Submitted on behalf of Patricia Botas, Botas Engineering (general@botasengineering.com):

Part of the e-mail from Brian Goodrich:

=====  
I talked with Patricia Botas. We discussed the following issues:

1. She wants to ignore the steel serviceability checks from AASHTO STD 10.57.1 and 10.57.2. This rating for operating can be ignored using a checkbox in the point of interest engine properties, but I don't see any way through Virtis to ignore this for the inventory rating. For a stand-alone BRASS user, the LOAD-LEVEL-2 command could be coded with a low gamma factor, which would effectively reduce the flange stresses so the serviceability

4/19/2016 3:06:45 PM

HRS AASHTO

1283

Complete Issue Information

ratings are not critical.

=====

FROM: Brian Goodrich DATE: 3/5/2009 1:31:55 PM Mountain Standard Time  
E-mail from Patricia Botas:

Please, forward this servicibility issue...as I mentioned, it is not very efficient for us to analyze all these bridges using LFD and having to hand pick the controlling load rating factors....many times there are many girders being analyzed and the spans are continuous.....this makes the task long and labor intensive.

FROM: Brian Goodrich DATE: 3/5/2009 2:47:09 PM Mountain Standard Time  
E-mail from Patricia Botas:  
Hi Brian:

We tried to follow your suggestion but it is not working for Operating either.

See results below.

Patricia Botas, P.E.

FROM: Brian Goodrich DATE: 3/5/2009 2:47:45 PM Mountain Standard Time  
The option for ignoring operating serviceability will only work if you do not generate points of interest. The BRASS LFD "Engine Related Help" for the Point of Interest window reads:

"BRASS LFD will not use the override data entered in the Point of Interest windows if the POI Control on the Member Alternative Description: Engine (BRASS LFD) window is selected as a "generate" option (Options 1, 3, or 5). Selecting a generate option on that window means that the points of interest will be generated from the schedule data that you have entered in other windows. You must select the "No point of interest data will be generated" option on that window in order for BRASS LFD to use the data entered on the Point of Interest windows. If you select "No point of interest data will be generated" as the POI Control, you must enter all of the information on the Point of Interest windows. The export will not generate any data from other windows for items left blank on the Point of Interest windows."

If points of interest are not generated from the various schedules, they have to be manually input in Virtis. This means you have to figure out the following for each point you enter: the stiffener size and spacing, lateral bracing, unbraced lengths, etc. This may be more work than you want to do, especially because the inventory serviceability rating cannot be shut off.

FROM: Brian Goodrich DATE: 3/23/2009 12:38:22 PM Mountain Daylight Time  
E-mail from 3/5/2009:

Mike,

I am forwarding Virtis Incident 8985 to you for consideration. We could add a parameter for turning off the serviceability ratings for inventory too. We may want to consider doing this for the entire structure at once rather than at each POI like is currently done for the operating rating. We may also want to

4/19/2016 3:06:45 PM

HRS AASHTO

1284

Complete Issue Information

consider handling the bearing stiffener rating at the same time, which has been requested in the past. I estimate 12 hours to address this. This will also require changes to the BRASS engine properties in Virtis and the BRASS export, which are not included in the estimate.

Brian Goodrich  
BridgeTech, Inc.

FROM: Brian Goodrich DATE: 3/23/2009 12:42:46 PM Mountain Daylight Time  
E-mail from Mike Watters (3/16/2009):

Brian,

As I read this, it appears BRASS users have a means to do this (not very elegant, but they do have a way). I suppose Virtis could be changed by adding a means to turn off the serviceability. This check box would then enter a low gamma factor in the LOAD-LEVEL-2 command.

I have not heard of any BRASS users requesting a checkbox. I interpret this as a Virtis issue.

Micheal J. Watters, P.E.

Description

FROM: Herman Lee DATE: 3/5/2009 1:43:23 PM Eastern Standard Time  
 Submitted on behalf of Patricia Botas, Botas Engineering (general@botasengineering.com):

Part of the e-mail from Brian Goodrich:

=====

I talked with Patricia Botas. We discussed the following issues:

3. She also requested that the Alternate Military Loading be made available for ASD/LFD ratings. This loading is discussed in AASHTO 3.7.4. The workaround is to copy the Standard library vehicle and make the change, but this would not be necessary if the ASD/LFD rating box was checked in the existing standard vehicle.

=====

I think we should check the ASD/LFD rating box for the Alternate Military Loading Standard Vehicle. We should only do this in 6.1 installed database, not in migrated database.

FROM: Jim Duray DATE: 4/21/2009 4:13:34 PM Eastern Daylight Time  
 I agree.

FROM: Krisha Kennelly DATE: 5/19/2009 12:21:17 PM Eastern Daylight Time  
 It's ok if this doesn't make it into Beta 1.

### Description

FROM: George Huang DATE: 3/11/2009 2:35:54 PM Eastern Daylight Time

We have many concrete bridges with hinges at span locations. Currently VIRTIS can not analysis this type bridges. W would like to have this function developed in the new version.

FROM: Krisha Kennelly DATE: 2/2/2010 2:07:45 PM Eastern Standard Time

This enhancement has been approved for inclusion in Version 6.2. (was approved at the Nov 2009 TF meeting)

Domain has been updated to allow Reinforced and Prestressed concrete beams to have hinges.

Joe - please implement hinges in the UI for these beam types.

Herman - please implement hinges in the engine exports for these beam types

Srujana - please implement hinges in the report tool for these beam types

Mehrdad - please implement hinges in the database migration scripts for these beam types (if necessary)

FROM: Joseph Ihnat DATE: 2/3/2010 9:15:41 AM Eastern Standard Time

UI is done.

Currently there is only cross section based reinforcement input for concrete I girder. It is very time consuming to input all reinforcement information. In California, there are many RC box girder bridge. If there is schedule based input, we can use I-girder to rate the box girder bridge with some modifications. This will greatly improve our productivity.

Subject: Re: Virtis Error Message - number of steel member propertieslines exceeds the maximum (150) allowed

Hi Chris,

G2 has more than 150 Steel Member Properties lines. The format of the Steel Member Properties exported to the Virtis Std Engine is described on page 5-12 in the Virtis Std User Manual. Each unique cross section in G2 is entered on one line.

Herman Lee

>>> "Dombrowski, Chris" <Dombrowski@williams-works.com> 03/10/09 12:03 PM >>>

I am receiving the following error message when I try to run a girder using the Virtis Analysis Engine:

"Error - The number of steel member properties lines exceeds the maximum (150) allowed! Error - Unable to generate Steel Member Properties!"

I have run other bridges with more than 150 lines of code under the "Steel Member Properties" heading in the text file without any errors. Can you please tell me what this error message is referring to?

I have attached the text file and the .xml file for the bridge. The bridge is incomplete, but I was trying to run it to see if it would run before I finished entering all of the input.

Thank you,

CHRISTOPHER DOMBROWSKI, PE  
Project Engineer

FROM: Hasmukh Lathia DATE: 3/23/2009 10:52:40 AM Eastern Daylight Time  
When user inputs more than 150 section property ranges, the program checks and issues an input error message. When less than 150 section property ranges are entered, other array subscripts are exceeding which generates a Fortran dump error. This girder has too many section property ranges. This problem did not occur before PennDOT made BAR7 revision 159 where rating are calculated at both sides of an analysis point where section properties change. The problem has been resolved by increasing the array sizes, but the ratings are still negative. A run from the revised code is attached. Please check the other input to ensure proper rating calculations.

Description

FROM: Dean Teal DATE: 3/13/2009 10:32:29 AM Eastern Daylight Time  
Maybe I'm doing something fundamentally wrong?

- I ran a NSG
- Selected the Report Tool from the tool bar, selected report type – LFD Analysis Output, then Generate
- The report came up blank in an explorer window
- I went back to each individual member alternative and selected the view analysis report from the tool bar to see the rating results summary – the report was there for each member individually
- So I went back and ran a SDS gage rating for a member and used the report tool, the report was generated

So is there a reason I can't generate a report with the report tool for NSG?  
Or am I soing something wrong?

Structure I used is attached

FROM: Herman Lee DATE: 3/13/2009 11:11:05 AM Eastern Daylight Time  
LFD Analysis Output is only available for the member alternative.  
Please see attached png file for the Advanced Rating Results Report, which is available for the Superstructure.

Description

FROM: Todd Thompson DATE: 3/13/2009 1:20:49 PM Eastern Daylight Time  
 AASHTO Manual for Condition Evaluation of Bridges Section 7.4.2 states that for spans over 200 ft in length the selected legal load should be spaced with 30 ft clear distance between vehicles to simulate a train of vehicles in one lane and a single vehicle load should be applied in the adjacent lane(s).

And the New AASHTO The Manual for Bridge Evaluation in section 6B.9.2 - states essentially the same.

I can't seem to find how or if Virtis handles these rules within the product. So I guess I'm looking for an answer if the live load model follows this AASHTO rule or not.  
 Thanks

FROM: Todd Thompson DATE: 3/13/2009 1:30:47 PM Eastern Daylight Time  
 And while I'm asking - I'll ask about LRFR rating also - AASHTO The manual for Bridge Evaluation Section 6A.4.4.2 - has a similar greater than 200 ft span length requirement by using the AASHTO

4/19/2016 3:06:47 PM

HRS AASHTO

1296

Complete Issue Information

Type 3-3 multiplied by 0.75 and combined with a lane load of 0.2 klf.

FROM: Brian Goodrich DATE: 3/13/2009 2:02:30 PM Mountain Daylight Time  
The BRASS-LFD engine does not consider the legal train loading of MCEB 7.4.2. This load model has never been coded in that engine. You could create an agency vehicle that models the axles from both trucks, but you would have to do something about the vehicle in the adjacent lane.

The BRASS-LRFD/LRFR engine does support the legal train live load model from the new MBE. The "Lane-Type Legal Load" vehicle must be specified and the "Legal Pair" box must be checked on the Advanced tab.

FROM: Brian Goodrich DATE: 1/28/2010 1:31:57 PM Mountain Standard Time  
I commented on the functionality in BRASS. What about the Virtis engines?

FROM: Jim Duray DATE: 1/28/2010 5:42:56 PM Eastern Standard Time  
The Virtis UI does not permit the user to enter an adjacent vehicle so 7.4.2 is not considered. Virtis does evaluate 6A.4.4.2.

FROM: Herman Lee DATE: 7/14/2010 10:39:57 AM Eastern Daylight Time  
Changed Status to Maintenance.

Complete Issue Information

=====

Herman,

The tolerance settings corrected that error. But now I'm getting a "Not enough storage" error. I've tried restarting the PC and increasing the increment in the vehicle path from 2' up to 16', both didn't help. I'm running the analysis using the virtis std. engine and on a newer PC with 4Gb of ram.

Thanks,

=====

Looks like the NSG analysis completed ok but the Virtis Std Engine (Virtis LFD) has problem loading up when trying to use the NSG distribution factors to perform the rating.

FROM: Herman Lee DATE: 12/12/2010 1:11:24 PM Eastern Standard Time  
 The analysis has exceeded the 2 GB limit for each process on 32-bit Windows OS.

Description

FROM: Tim Ambrecht DATE: 3/19/2009 2:32:16 PM Eastern Daylight Time  
 Could you please help me track down the capacity equations being used by BRASS, BRASS-LRFD and VSE? For the attached structure, we get a LRFR rating factor of 1.125 (with 4" FWS). However, for LFR, we get 0.808 and 0.768 for BRASS and VSE respectively. I have to admit that I'm surprised with the difference, especially since I was under the impression that the capacity calculations are pretty similar between LRFD and the Std. Specs. I can see the capacity numbers, but I can't tell how they were determined. Since the structure is OK under the new code, but not the old, this is causing some consternation in our Design section. Is this bug, or if it's legitimate, what is the reason? Thanks, Tim

FROM: Herman Lee DATE: 3/21/2009 2:17:14 PM Eastern Daylight Time  
 I'm able to reproduce similar LRFR rating factor using the "2 - 1st E Int-x" member and HS 20 vehicle but not able to reproduce similar LFR rating factors listed above. Please give us more details on reproducing above factors with the attached bridge.

FROM: Brian Goodrich DATE: 3/23/2009 12:45:40 PM Mountain Daylight Time  
 The steel capacities should be fairly close between the specs, unless the engines are not treating the sections the same regarding compactness.

Also include the vehicles you are rating for each method.

FROM: Tim Ambrecht DATE: 4/2/2009 3:11:22 PM Eastern Daylight Time  
 OK, we investigated further on our end. It now looks like the only difference in ratings is between the line-girder & girder system is the BRASS LFD rating. It appears that the system comes out significantly higher than the line girder. However, the VSE LFD rating is about the same for both. I attached a new xml that includes both alternatives (line and system).

Brian, at this point, we are just using the standard HS 20 vehicles.

## Complete Issue Information

I believe the difference in the BRASS LFD ratings is due to a difference in the member alternative engine properties. The "Compactness at the pier" is set to non-compact for one and compact for the other. I get very close ratings between the system and line once I make these consistent.

FROM: Tim Armbrecht DATE: 7/7/2009 10:59:10 AM Eastern Daylight Time

This resolves our issue with BRASS. However, the VSE numbers are still very low. Is it because VSE does not consider compactness?

FROM: Brian Goodrich DATE: 7/9/2009 9:31:40 AM Mountain Daylight Time

The BRASS issue is resolved. Assigned to Baker to comment on the VSE.

FROM: Jim Duray DATE: 1/13/2010 10:57:27 AM Eastern Standard Time

Herman - I think this should be assigned to Hasmukh to determine why VSE RF are low. If you agree please do so.

FROM: Herman Lee DATE: 1/13/2010 4:03:29 PM Eastern Standard Time

When any section does not qualify as compact in Virtis Std Engine, the summary will reflect the lowest non-compact rating factor. Virtis Std Engine does list both compact and non-compact rating factors in the output file when a section is qualifies as compact (see attached png file). The listed compact rating factors are very close to those reported by the BRASS Engine.

FROM: Tim Armbrecht DATE: 1/26/2010 1:07:50 PM Eastern Standard Time

But doesn't it qualify as compact? Isn't that why VSE shows those (compact) numbers and why LRFR has higher load ratings? If it's compact, shouldn't Virtis list those numbers in the summary instead of the non-compact numbers?

FROM: Herman Lee DATE: 1/26/2010 3:31:42 PM Eastern Standard Time

Tim, only some sections are qualify as compact. In the BAR7 program that Virtis Std Engine based on, when any section does not qualify as compact along the span, the critical will reflect the lowest non-compact rating factor of all sections. This is a conservative approach in the BAR7 Program. Do you want to change this to an enhancement request for the Virtis Std Engine?

The attached Ratings Comparison file listed ratings from different engines in different settings. The operating rating is 1.227 shear for LRFR, 1.354 flexural for BRASS LFD (Compactness at pier not selected in engine properties) and 1.993 serviceability for BRASS LFD (Compactness at pier selected). The limit states are different between LRFR and LFR. Please let us know if you would like us to investigate further.

FROM: Tim Armbrecht DATE: 3/19/2010 4:21:34 PM Eastern Daylight Time

Herman, were we ignoring shear before? Why did those shear ratings for LRFR all of a sudden pop up and cause the difference in limit states?

FROM: Herman Lee DATE: 3/21/2010 12:18:44 PM Eastern Daylight Time

No, the option to ignore shear is not available for steel girder.

Brian, do you have any comments on the difference in limit states between LRFR and LFR?

## Complete Issue Information

I am forwarding your problem to BridgeTech, they maintain the BRASS programs for Wyoming DOT.

I see in the FB8'\_alt.out file a Multiple Presence Truck exists on page 1 of the output but this truck does not show up in the FB8'\_Section\_Losses.out even though the LL input appears the same between these 2 files. That is why the alt with section losses has the higher rating factor.

Regards,  
Krisha Kennelly, PE  
Michael Baker, Jr. Inc

>>> "Carroll, Julia" <Julia.Carroll@aecom.com> 3/18/2009 3:41 PM >>>

Those are not the results I get. I was running HS-20 (no lane). I get the same governing location, but an inventory LFD rating of 1.499 for the member without losses. Attached are the BRASS output files for each member.

To: Carroll, Julia

Subject: RE: Issue: Floorbeam with section losses rates higher thanonewithout

Hi Julia,

I ran both of these fb mbr alts for an HS20 truck using the BRASS LFD engine and I get the following results:

FB8' Section Losses controlling Inv Rating = 1.391 (for lane) at 18.9' which is 9.15' into Span 2

FB8' controlling Inv Rating = 1.388 (for lane) at 18.9' which is 9.15' into Span 2

I don't see any large difference in the rating factors and I don't see any difference in the live load between these runs.

There is a slight difference in the section properties between these 2 runs due to BRASS using the rolled shape section properties for the FB8' alternative and BRASS computing the section properties for the FB8' Section with losses. The BRASS input for the FB8' Section with losses alternative consists of plate descriptions for the beam because a portion of the beam has losses.

The BRASS calculated plate section properties at 18.9' (which has no deterioration) end up very slightly larger than the rolled shape section properties so the alt with section loss has a slightly higher rating factor.

4/19/2016 3:06:48 PM

HRS AASHTO

>>> "Carroll, Julia" <Julia.Carroll@aecom.com> 3/18/2009 9:43 AM >>>  
Hello,

I have two identical Floorbeam Member Alternatives in a truss-floorbeam-stringer model. One has losses on the top and bottom flanges, the other has gross dimensions. When I remove the losses, the floorbeams rate exactly the same, but when I re-enter the losses and run either ASD or LFD, the floorbeam with losses rates higher than the original. Looking through the BRASS output files, I have noticed that the dead loads are identical (except the self-load in the section exhibiting losses, which is correct as is), but the live load being applied to these floorbeams is significantly different (lower live load on the beam with losses). As best I can tell, the virtual stringer analyses are completely identical. Can you provide any insight? Is this a bug? What can I do?

Thank you,

FROM: Brian Goodrich DATE: 3/19/2009 2:19:23 PM Mountain Daylight Time  
I have confirmed that the source of the floorbeam issue is in the BRASS engine. Therefore, I requested a work order from the Wyoming DOT. Once I receive authorization from them, I will address the issue.

FROM: Brian Goodrich DATE: 3/19/2009 2:20:01 PM Mountain Daylight Time  
I ran this in 6.0 release and got the same output as Julia. I just had to create a copy of the HS-20 vehicle and remove the lane load.

The multiple presence truck does not show up in the details summary for the floorbeam with losses. Both the data files generated by the export have the multiple presence truck. Because the losses are considered, the cross section and span commands are different between the two data files. There has to be some kind of problem processing the combination of commands in the file with losses.

FROM: Brian Goodrich DATE: 4/6/2009 12:34:24 PM Mountain Daylight Time  
WYDOT assigned this issue to BRASS Problem Log 882.

FROM: Brian Goodrich DATE: 4/27/2009 2:29:40 PM Mountain Daylight Time  
This issue was corrected in BRASS-GIRDER(LRFD) 2.0.2. Fixed for Virtis 6.2.

FROM: Brian Goodrich DATE: 3/20/2009 10:24:06 AM Mountain Daylight Time  
Submitted by Rachel Mertz:

>>> "Rachel Mertz" <RLMertz@modjeski.com> 3/17/09 2:32 PM >>>  
I am unable to verify the live load results calculated by Virtis.

I am performing a girder line analysis for a two-span continuous girder. Both spans are 25' for a total bridge length of 50'. The controlling live load distribution factor is 0.562. I verified the results for the lane load. My hand calculations compared to Virtis' results are as follows. I am only providing the results for the tandem truck - this truck controlled per Virtis (the HL93 controlled per my hand calculations). Also, I did not calculate results for the rear axle variable spacing. My HL93 results used axle spacings of 14' - however, this difference does not explain the major difference in our results. A note within the output states that the Virtis live load results include impact and the distribution factor; therefore, my results also include these multipliers. (Impact = 1.33.)

618-659-9029 (fax)

FROM: Brian Goodrich DATE: 3/20/2009 10:26:07 AM Mountain Daylight Time  
Hi Rachel,

I've been assigned to investigate your live load issue with Virtis/BRASS.

I input the structure you described into Virtis, but I'm unable to duplicate the moments. The moments that I am getting from BRASS are as follows:

Design Tandem (Max +M) = 160.2 ft-k  
Design Tandem (Max -M) = -87.3 ft-k

Design Truck (Max +M) = 127.5 ft-k  
Design Truck (Max -M) = -116.9 ft-k

The above moments have not been combined with the lane load, but have been factored by 1.33 for impact and a distribution factor of 0.562.

## Complete Issue Information

Using the model that you currently have (with pin and roller supports), the virtis output shows that the section is not compact and meets the requirements for noncompact web sections. However, I am calculating that the section is compact. Do you have any insight?

Rachel L. Mertz, P.E., S.E.  
Modjeski and Masters, Inc.  
#4 Sunset Hills Professional Center  
Edwardsville, IL 62025

FROM: Brian Goodrich DATE: 3/23/2009 12:23:10 PM Mountain Daylight Time  
There is an engine properties setting that must be changed to allow BRASS to consider the section as compact. Open the BRASS-LRFR engine properties for your member alternative (Interior Stringer). On the Miscellaneous tab, check the "Use Appendix A6..." box. When this box is checked, BRASS determines if the section is compact or not based on the specification. Otherwise, BRASS bypasses Appendix A6 and just moves on to AASHTO 6.10.8. Please let me know if this addresses your issue.

FROM: Brian Goodrich DATE: 4/1/2009 9:49:31 AM Mountain Daylight Time  
E-mail from Rachel Mertz:

>>> "Rachel Mertz" <RLMertz@modjeski.com> 3/26/09 1:47 PM >>>  
If I am rating a structure for more than one permit vehicle, does virtis calculate an individual load factor for each permit loading based on the vehicle's axle weight on the bridge? In the output summary, only one load factor is listed.

Also, for a continuous structure, the number of axles on the structure producing the maximum positive and negative moments would be different. Is a different load factor calculated for different points of interest based on the varying number of axles on the structure required to produce the maximum moment at each point of interest?

Rachel L. Mertz, P.E., S.E.  
Modjeski and Masters, Inc.

FROM: Brian Goodrich DATE: 4/1/2009 9:59:45 AM Mountain Daylight Time  
The BRASS engine used by Virtis 6.0 has a limitation of one permit live load factor for the entire bridge. The live load factor for the first permit vehicle encountered by the BRASS export will be used. I have been working this week to enhance BRASS so a live load factor for each permit vehicle is allowed. Virtis does calculate this live load factor for each vehicle. Look for this change in Virtis 6.1.

The weight is determined by placing the vehicle on the bridge to result in the maximum weight of axles on the bridge. This calculation is performed in the export process to determine the live load factor.

Complete Issue Information

FROM: Brian Goodrich DATE: 4/1/2009 9:59:56 AM Mountain Daylight Time  
E-mails from Rachel Mertz:  
Sent: Monday, March 30, 2009 10:37 AM

I had assumed this might be the case and reanalyzed the structure by running one permit vehicle per analysis. However, my results showed that a new load factor was not calculated for each vehicle. I wonder whether virtis is only using the ADTT to calculate the load factor. Anyway, it does not appear that the axle loads on the bridge are factored into the equation.

Rachel L. Mertz, P.E., S.E.  
Modjeski and Masters, Inc.

I attached my simple 25' span model, the vehicles, and also a pdf of the vehicles with my load factor calculation summary for LASDV 1 and LASDV 2. For either run, virtis is using a load factor of 1.36. I am calculating a load factor of 1.4002 for LASDV 1 and 1.4524 for LASDV 2.

Rachel L. Mertz, P.E., S.E.  
Modjeski and Masters, Inc.

FROM: Brian Goodrich DATE: 4/1/2009 10:01:20 AM Mountain Daylight Time  
I reviewed your simple-span bridge, vehicles, and live load factors. Based on your live load factor calculations, the permit vehicle must be using an "Unlimited Crossings" frequency from the table. The default frequency for a permit vehicle in the Vehicle Properties window (use Advanced button on Analysis Settings window) is "Single Trip." I changed this setting and the calculated live load factors matched yours.

Also, the weight of the LASDV2 vehicle on the bridge is 67 kips using the middle 4 axles.

 Submitted on behalf of Rob Benshoof, TN DOT.

Tolerance for ft = 0.01  
 Tolerance for in = 0.1

Error message:

```
=====
Unable to generate model.
02:15:23 PM - Line 1810 in source file .\AbxVirtisDistFactEngine.cpp.
```

```
Unknown error while generating finite element model!
02:15:23 PM - Line 739 in source file .\AbxVirtisDistFactModelGen.cpp.
=====
```

I'm able to complete the NSG analysis if the tolerances are back to the defaults.

FROM: Krisha Kennelly DATE: 3/27/2009 10:20:59 AM Eastern Daylight Time  
 The span length for span 4 is entered as 74.88' on the Structure Definition window. Span 1 is 74.875' so I suspect the intent was for Span 4 to also be 74.875'.

The length of the deck is entered as 301.25' which is total bridge length using 74.875' for Span 4.

If I change the length of Span 4 to 74.875' the NSG will run with the above tolerances. This change will let you analyze your bridge, I will continue investigating to fix the problem.

FROM: Herman Lee DATE: 5/27/2010 1:13:04 PM Eastern Daylight Time  
We fixed a NSG model generation bug in 6.2. I tested the bridge with the NSG vehicle attached in this incident. I'm able to complete the NSG analysis.

Description

FROM: Herman Lee DATE: 4/5/2009 11:07:43 AM Eastern Daylight Time  
Submitted on behalf of Chris Dombrowski, Williams & Works.

This incident is for the G3 array size error. Incident 9028 is for the member alternative copy issue.

Received Bridgewater e-mail:

=====  
Please see the attached .xml file. I previously sent a version of this file which had an array size error

Complete Issue Information

(See Virtis Incident 8992). As a workaround to this error, I have separated the file into 3 separate superstructures to reduce the array size and get the girders to run.

For the superstructure definition "WB Spans 9-15 (Continuous Pin and Hanger)", I was able to enter girder G2 and get it to run. However, when I copied the information to girder G3 and adjusted the properties for the different span lengths, I received an array size error when I tried to run G3. The only differences between G2 and G3 are the span lengths and plate girder flange thicknesses for Spans 1 and 5. Spans 2, 3, 4, 6, and 7 are exactly the same. Can you tell me why I am getting an array size error on one girder and not the other?

Also, when I copied the data from G2 to G3 Virtis recalculates all of the start distances. For example, the transverse stiffener spacings for Spans 2, 3, 4, 6, and 7 are exactly the same for Girders G2 and G3. However, when I copy the member alternative Virtis changes all of the start distances for the transverse stiffeners in these spans. Therefore, I had to retype all of the stiffener spacings for G3. Virtis also changes the distances for the hinge locations and deck reinforcement. Can you tell me how to copy the member alternative without having Virtis change the start distances for these spans?

Thank you,

CHRISTOPHER DOMBROWSKI, PE  
Project Engineer

=====

FROM: Has Mukh Lathia DATE: 4/6/2009 2:00:40 PM Eastern Daylight Time  
There appear to be duplicate Steel Member Properties ranges at the ends of spans 1, 2, 3 and 4. After removing these duplicate input lines, G3 runs fine. Please check Virtis input for this girder. The revised input file and corresponding Virtis Std Engine output files are attached.

FROM: Herman Lee DATE: 4/6/2009 4:38:17 PM Eastern Daylight Time  
Virtis computed span lengths for G3 are shown in the G3 Member window. To eliminate those duplicate lines, please enter more precise ranges so the top and bottom flange ranges end at each support. For example, the computed length for span 1 is 115.928866 ft but the entered first top flange length is 115.927 ft. This results in 2 cross sections.

Description

FROM: Herman Lee DATE: 4/16/2009 3:46:17 PM Eastern Daylight Time  
Submitted on behalf of Joshua Colella, Michael Baker Engineering, Inc.

Received via e-mail (jcolella@mbakercorp.com):

=====

In regards to this structure. We are also noticing that we are obtaining different coincident force

4/19/2016 3:06:50 PM

HRS AASHTO

1315

Complete Issue Information

reactions for symmetric nodes. The truss is symmetrical about L4U4 and, for example, are obtaining different values for the vertical member at L1 and L7 (which, due to symmetry, are the same node).

L1U1 @ L1 with 39.54 kips and concurrent forces of 32.42 kips at the lower chords  
L&UL @ L7 with 39.54 kips and concurrent forces of 44.42 kips at the lower chords

I would expect these concurrent forces to be the same. Given the symmetry of the structure, is there any reason that these differences are occurring?

=====

FROM: Jim Duray DATE: 5/15/2009 3:47:30 PM Eastern Daylight Time  
I ran this truss on an alpha build of 6.1 and could not reproduce the unsymmetrical results described above. I believe the work done of the influence line loading for other incidents included fixing this problem as well.

FROM: Herman Lee DATE: 2/2/2010 7:57:46 AM Eastern Standard Time  
E-mail from Joshua Colella:

=====

Another update; it appears that we are still encountering the analysis engine's inaccuracy described in AASHTOware technical support incident 9038 (un-equal coincident forces at symmetrical truss nodes).

We have the model up and running using the workaround. I also re-analyzed another truss model for a bridge we submitted to our client prior to the release of Virtis 6.1 and again, encountered the above inaccuracy issue.

=====

Attached the 6.1 bridge file (BIN 04F 2-2-10.xml) and a screen capture (L1 vs L7 2-2-10.png) to illustrate the issue.

FROM: Jim Duray DATE: 4/27/2010 8:07:09 AM Eastern Daylight Time  
I believe the unsymmetric results are for the hanger members only (L1U1, L3U3, L5U5, L7U7). there are two truck positions that cause the maximum effect (for each hanger). The Influence lines for the concurrent actions are being loaded with the vehicle moving Left to Right, but Right to Left may cause larger forces in the concurrent members.

Modify the infl loader to store both and apply to the concurrent members and select the max/min.

FROM: Jim Duray DATE: 4/28/2010 2:09:17 PM Eastern Daylight Time  
Herman - I added to the infl line loader class the tracking of multiple vehicle positions that result in the same max/min action. Please make the changes to the concurrent forces for truss.

FROM: Herman Lee DATE: 7/2/2012 11:00:56 AM Eastern Daylight Time  
The reported concurrent forces are based on the first truck position that causes the critical force in the primary member. I added a note in the report for the 6.4 Release.  
The concurrent forces report needs to be enhanced when more than one truck positions cause the critical force in the primary member.

### Description

FROM: David Koenig DATE: 4/23/2009 4:59:18 PM Eastern Daylight Time

We are having problems with Virtis not wanting to run a floorsystem unless the bridge is checked out. It does this from the Bridge Explorer and within the actual bridge. It generates the error messages shown below when you try to rate it. We have also noticed that when you have the bridge checked out, it shows the floorbeam definitions, stringer definitions, stringer member alternatives, and floorbeam member alternatives as being locked. These two issues may or may not be related. The BMD file is attached.

### Description

FROM: Paul Campisi DATE: 4/29/2009 9:52:35 AM Eastern Daylight Time

I have several Truss-Floorbeam-Stringer models with large skews where stringer dead loads are not passed to the truss finite element engine analysis. This includes the stringer's self-weight and any associated concrete haunch and member loads.

This problem occurs when the end floorbeam skew is large, making the fascia stringer on one side too short for Virtis to analyze and compute dead load reactions. When this error occurs, the entire structure's stringer dead loads(including haunches and member loads) are not accounted for.

Although the log file contains an error message attesting to this, the truss analysis is not terminated. Therefore, in these cases Virtis generated truss member forces are incorrect.

If not all of the truss loads are accounted for in the analysis, Virtis should terminate with no results reported. Otherwise, this can be very misleading if the error is not caught in the log file.

The log file error message is listed below:

```

???Error - Couldn't compute average dead load due to stringer unit 11!
???Error - Unable to compute stringer unit loads ...
    
```

4/19/2016 3:06:52 PM

HRS AASHTO

1331

## Complete Issue Information

An example bridge model where this problem exists is attached. See "Superstructure Definition – Span 1."

FROM: Herman Lee DATE: 5/20/2009 7:37:46 AM Eastern Daylight Time  
Summary of issues for the attached bridge:

1. For the "Heavy (Left) Truss", the leftmost stringer in Unit 11 is too short (0.76 ft) for Virtis to compute the load due to Stringer Unit 11. This is most likely due to the tolerances set in the user's system. Virtis requires stricter tolerances since numerically Floorbeam 11 and Floorbeam 12 are not exactly at the same location on the left truss. I'm able to rate the left truss without any error messages with the default tolerances, which is very strict, set in the system.
2. When truss loads are not accounted for during the analysis, Virtis should terminate the analysis.
3. Although I'm able to complete the analysis in 1 without any error messages, Stringer Unit 11 load is not being applied to the left truss.
4. The computed Stringer Unit 1 and Stringer Unit 11 loads seem low. The average stringer length in Unit 11 is half of Unit 10. The computed load of Unit 10 on left truss is 72.646 kip but the computed load of Unit 11 on left truss is only 4.823 kip.

FROM: Herman Lee DATE: 5/20/2009 10:09:42 AM Eastern Daylight Time  
#2 is fixed for 6.1 Release. Virtis will terminate the truss analysis when loads are not accounted for during the analysis.  
#3 is fixed for 6.1 Release.

Krishna, please confirm the calculations in the ComputeTrussStrUnitAveDeadLoad function.

FROM: Paul Campisi DATE: 5/20/2009 3:51:12 PM Eastern Daylight Time  
Is there a way to get the short stringer to analyze so we can get results?

If not, we should have the choice to override the termination. You can work around the missing stringer loads by putting the missing loads in as Panel Point loads. This way we can still get results.

FROM: Herman Lee DATE: 3/16/2010 8:22:18 AM Eastern Daylight Time  
#4, I confirmed the computed Stringer Unit 1 load, Stringer Unit 11 load and Stringer Unit 10 load. The difference between Unit 10 and Unit 11 is the additional 1 kip/ft "Test Stringer Member Load" in Unit 10 stringers.

I cannot think of a way to rate the short stringer (0.76 ft) without a strict tolerances set in the system. The override option for not computing apply loads on the truss is an enhancement to the truss system analysis. An alternative is to model the truss as truss line superstructure definition. Please let us know if you want to change this to an enhancement request.

Resolved for 6.2 Release.

FROM: Herman Lee DATE: 5/5/2010 2:21:29 PM Eastern Daylight Time  
Verified in 6.2 Alpha 4.

## Description

FROM: Paul Campisi DATE: 4/29/2009 10:56:24 AM Eastern Daylight Time

For Truss-Floorbeam-Stringer models with cantilevered sidewalks, if you input the sidewalk in the "Structure Typical Section" workspace in its cantilever position (not on the structural deck), the sidewalk loads are not passed to the truss finite element analysis engine. Therefore, in these cases Virtis generated truss member forces are incorrect.

If all of the truss loads coded in Virtis are not accounted for in the analysis, Virtis should terminate with no results reported. Otherwise, this can be very misleading if the error is not caught in the log file.

An example bridge model where this problem exists is attached. See "Superstructure Definition – Span

4/19/2016 3:06:53 PM

HRS AASHTO

1333

Complete Issue Information

2 with sidewalk.”

FROM: Herman Lee DATE: 5/20/2009 10:16:18 AM Eastern Daylight Time  
Summary of issues:

1. The reported sidewalk load on truss in the analysis log file is incorrect. Note that each sidewalk load is distributed to each truss based on the Dead Load Distribution method selected in the Superstructure Loads window DL Distribution tab.
2. When truss loads are not accounted for during the analysis, Virtis should terminate the analysis.
3. For the "Light (Right) Truss" in "Span 2 with sidewalk" superstructure definition, the rightmost sidewalk load is not being applied to the right truss.

FROM: Herman Lee DATE: 5/20/2009 11:23:52 AM Eastern Daylight Time  
#1 is fixed for 6.1 Release.  
#2 is a duplicate of the #2 issue in Incident 9061. Fixed for 6.1 Release.

Krishna, please see whether the ComputeSidewalkLoadOnTruss function can handle the rightmost sidewalk. The rightmost sidewalk is cantilevered on the outside of the through truss but Virtis doesn't support cantilever floorbeam for through truss. Note that you have to pin down one truss support before the "Light (Right) Truss" can run in 6.1 Development.

FROM: Krishna Kennelly DATE: 6/10/2010 2:54:22 PM Eastern Daylight Time  
#3 The right sidewalk is not attached to the deck so Virtis cannot compute the load due to it.  
Message is now issued saying sidewalk not attached and analysis stops.  
Similar code changes made for girder system structures that have appurtenances or sidewalks not located on the deck. Virtis Std and Opis LRFD/Virtis LRFR will issue message and stop analysis.

Fixed for 6.2

### Description

FROM: Paul Campisi DATE: 4/29/2009 2:55:58 PM Eastern Daylight Time

When rating a truss with a severely deteriorated member where the capacity is exceeded by the LFD factored dead load ( $1.3 \times (\text{Dead Load})$ ), the computed Rating Factor is not reported correctly. It appears that Virtis is using absolute values in the Rating Factor equation and is not reporting negative Rating Factors. Therefore, the controlling member is not showing up as controlling. Although this case is rare, a message should be generated indicating the member has a negative Rating Factor.

I used the Training Truss as an example (see attached file: trainpwc.xml).

For the North Truss, Member L2L3 has a negative Rating Factor, but member L4U5 is shown in the summary as controlling in the summary.

Paul Campisi  
NYSDOT  
Office of Structures  
Load Rating Unit

FROM: Herman Lee DATE: 7/1/2009 1:56:56 PM Eastern Daylight Time  
Negative rating factor will be reported as 0.0.  
Resolved for 6.1 Release.

FROM: Herman Lee DATE: 5/5/2010 2:33:12 PM Eastern Daylight Time  
Verified in 6.2 Alpha 4.

Issue ID: 9068

Subject: Report path is not setup for multi vehicle paths NSG Analysis.

### Description

FROM: Doug Horton DATE: 5/4/2009 12:18:08 PM Eastern Daylight Time

There was an entry for this quite long ago (2852) that has been suspended. Virtis does not appear to have the capability to handle a voided RC slab. Is there a recommended workaround? Our particular structure is being widened with voided prestressed box beams and we would like to know how to input the voided RC slab.

FROM: Herman Lee DATE: 5/4/2009 2:04:57 PM Eastern Daylight Time

4/19/2016 3:06:53 PM

Description

FROM: Paul Jensen DATE: 5/15/2009 1:05:35 PM Eastern Daylight Time

we have a high number of bridges that have timber stringers and timber decks on floorbeams (trusses and girder systems). since we can rate timber decks on steel girders and timber girders, why can't we rate these combinations on trusses? these options are not available to us in the floorsystem models.

FROM: Herman Lee DATE: 5/15/2009 3:48:36 PM Eastern Daylight Time

Looks like all the components are there, but still have to connect them in the user interface and analysis export in floor and truss systems.

Description

FROM: Paul Jensen DATE: 5/20/2009 3:04:53 PM Eastern Daylight Time  
when reviewing the the concurrent forces report for a multiple truck run, the report [i think] thinks that there are several trucks on the bridge not the one truck at the single time. we are not sure what force we are getting because we see several trucks in the same report. we should have the maximum and concurrent forces for each truck individually not the summary of all of the trucks and only the truck with the maximum for that connection location.

FROM: Herman Lee DATE: 5/20/2009 3:32:22 PM Eastern Daylight Time  
In the Concurrent Forces Report, the critical live load force of each primary member is the max of all the trucks. The concurrent forces are then determined based on this critical truck position. The critical live load force can be related back to the live load force reported in the Rating Summary Report.

this is a request for enhanceing the concurent and max force report for returning the shear in the x plane and in the y plane for coputational use.

it would be better, if we could all agree on using the fhwa guidelines for computing a rating for the gussets and have it "inline" with the product.

FROM: Todd Thompson DATE: 5/22/2009 10:32:17 AM Eastern Daylight Time  
I have a load rater/designer working on analyzing one of our Stringer-Floorbeam-Girder systems and when we do an analysis - Virtis Crashes out on us.

I've attached the structure.

FROM: Todd Thompson DATE: 5/22/2009 11:07:18 AM Eastern Daylight Time  
Added the error message .txt file - not sure if it helps or not

FROM: Herman Lee DATE: 5/22/2009 12:51:24 PM Eastern Daylight Time  
Developer Notes:  
1. To run with the system default tolerances, S3(20-5) Stringer Definition span length needs to be 20.416666 ft (same as the rolled shape length in the Stringer Profile).  
2. Crash is inside the Analysis Progress dialog when it failed in locating the second floorbeam in Stringer Unit 9.

FROM: Mehrdad Ordoobadi DATE: 9/4/2009 10:25:07 AM Eastern Daylight Time  
The crash is fixed. This is related to issue 9312.

The stringers in Unit 10 are only supported on one side. This caused the crash.  
This problem is related to accuracy of stringer spans and floorbeam locations.

FROM: Mehrdad Ordoobadi DATE: 9/11/2009 1:36:03 PM Eastern Daylight Time  
Joe, please investigate the issue with stringer supports.

FROM: Joseph Ihnat DATE: 1/19/2010 7:57:38 AM Eastern Standard Time  
Fixed for version 6.2

FROM: Joseph Ihnat DATE: 4/30/2010 11:23:21 AM Eastern Daylight Time

Complete Issue Information

Appears to be fixed, although I had several tolerance issues.  
I need

FROM: Todd Thompson DATE: 5/11/2010 1:01:05 PM Eastern Daylight Time  
6.2 Beta 1

I revsed the inches tolerance from 0.00001 inches to 0.001 inches and now it works fine.  
When one is dealing with stringer lengths and fractions - the default tolerance for 0.00001 inches is just bad.

Complete Issue Information

A prestressed I beam bridge with concrete slab was analyzed. It gave good results. But when the stirrups were extended in the deck, it gave zero rating and was failing in shear. BRASS LFD engine was used in the analysis. XML file is attached.

FROM: Herman Lee DATE: 6/1/2009 1:02:11 PM Eastern Daylight Time  
We don't see the XML file attached in this incident. Please attach the bridge XML file again. Thanks.

FROM: Amjad Waheed DATE: 6/2/2009 9:25:49 AM Eastern Daylight Time  
I have tried to attach the XML file. Please let me know if you get it or not.

thanks,

FROM: Herman Lee DATE: 6/2/2009 2:58:02 PM Eastern Daylight Time  
We got your attached XML file.

FROM: Brian Goodrich DATE: 6/3/2009 8:58:38 AM Mountain Daylight Time  
When the stirrups extend into the deck, the structure is analyzed in two stages, which affects the dead load distribution. For this structure, the stage 2 dead load is uniformly distributed. The dead load was huge for all the members for the composite case. For the non-composite case, only G6 had a huge load because tributary area was used to distribute the dead loads.

The "SIDEWALK AND BARRIER" appurtenance is the source of the problem. The unit weight for this appurtenance is entered as 150 kcf instead of 0.15 kcf. Ratings are now better for the composite case than the non-composite case.

Description

FROM: Brian Goodrich DATE: 5/28/2009 10:45:25 AM Mountain Daylight Time  
Submitted for David Wolfe (DWolfe@moffatnichol.com)

Bridgeware – The attached bridge file gives an error when running BRASS LRFR on G5 due to transverse stiffener input. The first batch of stiffeners stops about an equal space shy of the next, but BRASS LRFR seems to add the additional space, which then slightly overlaps the range. Changing the spacing from 45.25" to either 45.24" or 45.26" seems to eliminate the error. BRASS LFD does not give an error. What is happening?

FROM: Brian Goodrich DATE: 5/28/2009 11:07:19 AM Mountain Daylight Time  
This issue deals with an internal spacing tolerance when exporting the transverse stiffener schedules. The export used the first spacing in a range to compare to subsequent spacings. For this girder, one spacing was 45.25" and the next was 45.238". These spacings were deemed essentially the same due to the comparison tolerance, which gives a slightly longer range than was input by the user. The next range overlaps this range slightly, which is causing the problem. The solution was to use the average spacing for a range, which for this one becomes 45.244". In addition to the transverse stiffener schedules, similar changes were made to the bracing and stirrup schedules. No changes were necessary for the shear connector schedules.

### Description

FROM: Tim Armbrecht DATE: 6/2/2009 1:16:13 PM Eastern Daylight Time  
Reported by my consultant:

When the AASHTO 1979 Interim code is checked for the Shear Computation Method I've had one problem. I've had this occur on a couple of PPC I-beam bridge, the ratings are "0" when the AASHTO 1979 Interim code is checked. When "Ignore" or "Use current AASHTO" is checked, the correct ratings are calculated. This only occurs in continuous PS beams.

FROM: Brian Goodrich DATE: 6/3/2009 11:03:00 AM Mountain Daylight Time  
The "jd" term is being calculated as zero, so the Vc and Vs components of the shear capacity are zero. The only contribution showing up now is the prestress force Vp. I'll forward this issue to WYDOT for review.

FROM: Brian Goodrich DATE: 7/9/2009 9:34:50 AM Mountain Daylight Time  
WYDOT assigned this issue to BRASS Problem Log 899.

FROM: Brian Goodrich DATE: 10/16/2009 3:23:31 PM Mountain Daylight Time  
An error in the BRASS engine was corrected. The strand centroid distance is now being calculated correctly. Fixed for BRASS-GIRDER(STD) 6.0.3.

FROM: Tim Armbrecht DATE: 6/21/2010 2:49:32 PM Eastern Daylight Time  
Looks like it's working correctly. Accepted.

### Description

FROM: Todd Thompson DATE: 6/2/2009 4:17:04 PM Eastern Daylight Time  
In testing Virtis LF engine in 6.1 Beta 1 - I also noticed that this occurs in 6.0.

But I have a RC Slab bridge that I have entered Cross Section Based and in 6.1 I have asked only for at user defined points of interest but I'm getting my rating to control at locations other than the user defined points of interest.

FROM: Todd Thompson DATE: 6/2/2009 4:18:43 PM Eastern Daylight Time  
I attached an example bridge.  
It analyzes ok with BRASS LF.  
But not with Virtis LF.

FROM: Herman Lee DATE: 6/8/2009 4:43:23 PM Eastern Daylight Time  
Virtis Std Engine doesn't have the capability to turn off generation of tenth points and section change

Description

FROM: Paul Campisi DATE: 6/5/2009 4:31:25 PM Eastern Daylight Time  
 For Builtup and Angle Box Section Members, the truss module is not calculating section properties with the section orientation (Horizontal and Vertical) as defined in the Truss Input Command Language Manual. When the angles are coded as being "Vertical", the section properties are calculated with the angles orientated "Horizontal", which is incorrect.

See the examples below, which are taken from the attached file "TRUSS CHECK":

Angle Box Member

From "North Truss"

AngleBox = Section2  
 LeftWebPlate  
 20.0 0.5  
 RightWebPlate

## Complete Issue Information

20.0 0.5

TopAngles "L 7x4x0.5" Vertical Inward

BottomAngles "L 7x4x0.5" Vertical Inward

BackToBack 20 20

Lacing Top

For the Anglebox section defined above, I have coded the "L 7x4x05" as vertical, which has the following definition in the manual: "Vertical means y-axis of this section is parallel to the y-axis of the overall member cross section." The angle is defined in the Virtis shape library with the long leg parallel to the y-axis. With this in mind, the long leg should be vertical for section2. But Virtis calculated the section properties with the long leg horizontal. See calculations below:

Virtis calculated the following section properties as shown in the MemSectionProperties.xml file for Section2:

Izz = 2425.31 in<sup>4</sup> ==> These values are not correct

Iyy = 3415.05 in<sup>4</sup> ==>

Note: The calculations show in the MemSectionProperties.xml file show the Bottom Left and Right Angle "Y" dimension from the 1-1 axis as 0.92 inches, which is incorrect.

The section properties with the long leg vertical as calculated with STAAD Pro 2007 Section Wizard are as follows:

Izz = 1979.12 in<sup>4</sup>

Iyy = 3857.52 in<sup>4</sup>

As shown above, there appears to be an orientation error with the angle legs as calculated by Virtis.

## Builtup Member

For Built up members, the same error appears to be occurring. As an example, the following section is built in the truss module:

From "North Truss"

Builtup = Section3

WebPlate 20 0.5

TopAngles "L 7x4x0.5" Vertical

BottomAngles "L 7x4x0.5" Vertical

BackToBack 20

Connection Riveted 0

Virtis calculated the following section properties as shown in the MemSectionProperties.xml file:

Izz = 2091.97 in<sup>4</sup>

Iyy = 256.72 in<sup>4</sup>

For comparison, the same section was built under the Member Definitions – Floorbeam Definitions Workspace as "Built-up Check LLV" and "Built-up Check LLH":

BRASS calculated section properties from Brass output with the long leg vertical (see Floorbeam1):

4/19/2016 3:06:58 PM

HRS AASHTO

1364

Complete Issue Information

lxx = 1670 in^4

BRASS calculated section properties from Brass output with the long leg horizontal (see Floorbeam2):  
lxx = 2096 in^4 ==> Closely matches MemSectionProperties.xml

As shown above, there appears to be an orientation error with the angle legs as calculated by Virtis.

### Description

FROM: Doug Horton DATE: 6/8/2009 12:19:17 PM Eastern Daylight Time

VDOT is currently using LRFR to rate all structures. In looking at the MBE(2008), section C6A.4.4.2.1a, last sentence of first paragraph, states "When the lane type, load model governs the load rating, the equivalent truck weight for use in calculating a safe load capacity for the bridge shall be taken as 80 kips."

It appears that Virtis (5.6 and 6.0) all appear to be using only the truck weight (30 tons) to compute the tonnage (60 tons for lane type legal load-negative). The truck weight works fine for all other loads, but, based on our understanding of the text, is incorrect for the lane legal loads.

Please let us know if we have missed something or it was a TF decision to stay with the truck weight only.

FROM: Brian Goodrich DATE: 6/9/2009 7:15:31 AM Mountain Daylight Time

I agree with Doug's comments regarding the 80 kips. Here is some background... In the BRASS stand-alone engine, users specify the lane-type loading by first entering the legal truck and lane separately, i.e., a Type3-3 truck without the 75% applied and a legal lane of 0.2 klf. Then, the user specifies the combination factors for the truck and lane, i.e., 0.75 and 1.0, respectively. BRASS sums the axle weights to obtain the total vehicle weight, which is the 80 kips in this case. This general implementation was developed when LRFR under development. When LRFR was implemented in Virtis, the lane-type load input was done differently where the axle weights were input at 75% of the actual. This is now the issue we are facing with this log. I will develop a plan to address this issue.

FROM: Brian Goodrich DATE: 1/22/2010 10:09:58 AM Mountain Standard Time

I have only come up with one option for getting the vehicle weight to come out to 80 kips, and it involves two assumptions:

1. The vehicle definition contains axle loads with a lane load.
2. The vehicle definition is assigned to the legal category.

I don't think we can make assumptions on the sum of the axle weights or the magnitude of the lane load because that would limit agencies from inputting their own lane-type legal load. Maybe they want to use their state's Type 3-3 truck instead of the AASHTO truck. Maybe they want to use something other than the 0.2 k/ft legal lane load.

If the two assumptions above are met, the axle weights would be divided by 0.75 and exported as usual. The difference is the BRASS live load combination command would need to be adjusted to export an axle combination factor of 0.75.

### Description

FROM: Doug Horton DATE: 6/8/2009 5:56:19 PM Eastern Daylight Time

In reviewing some of the ratings and factors performed by BAKER under the VDOT Pilot effort, we have experienced results that are approximately 1/2 those obtained from comparison programs (Merlin DASH and PCBars). In searching for the cause of the large discrepancy (1.33 in Virtis vs. 2.55 +/- in DASH and PCBars) it was discovered that the span properties being sent to BRASS were not 100% in agreement with what was entered into Virtis.

File G2.dat is the BRASS export file. Please note the first SPAN-D line for span 2. The location of 27.0001 is causing the section to be selected as XSECT-2, when the actual section to the left is XSECT-3. We have tried several iterations of input into the Girder Profile, but always seem to have the same issue. The input appears correct and no unexpected values are showing up in the dimensions. Please review the input file to see if there is a hidden reason for the difference in the export. Span 1 has the same dimensions near the pier and exports fine.

We have also attached a file showing the beam properties (G2Prop.txt). Please note that span 2

4/19/2016 3:06:59 PM

HRS AASHTO

1367

### Complete Issue Information

includes incorrect flange width and thickness at point 2.20. This is directly associated with the export issue in all likelihood.

Once the span value issue is resolved we will investigate the rating factor difference in more detail.

FROM: Brian Goodrich DATE: 6/9/2009 11:12:35 AM Mountain Daylight Time

There is a slight difference in the flange ranges versus the deck ranges in Virtis for span 2. The flange change points are at 10 ft, 27 ft, and 95.807291 ft, but the deck change points are at 10.000057 ft, 27.000057 ft, and 95.807292 ft. This small difference is causing a different cross section to be determined at the right end of the range than at the left. BRASS then interpolates the dimensions for points within this range. If I change the deck ranges to match those for the flanges, the correct section dimensions are used in BRASS.

Hi!

I am Naveen Bitla, working with United International Corporation, CT.

I am doing load rating for a skewed Truss span with four main Truss member. I am facing a problem in defining the first two and the last two Floor beams which do not intersect Truss1 or Truss 4. I also want

4/19/2016 3:06:59 PM

Complete Issue Information

to know how to define the three floor beams that are in between the main truss spans which we can see in the Cross section plan. I am attaching my query in detail and the drawings with this mail.

Your response would be greatly appreciated.  
Thank you.

FROM: Herman Lee DATE: 6/17/2009 8:25:02 AM Eastern Daylight Time  
The configurations of the first two and last two floor beams are not supported by Virtis. The floor beams between the main truss spans are assumed as continuous span in Virtis.

### Description

FROM: Paul Campisi DATE: 6/17/2009 1:29:37 PM Eastern Daylight Time

For the attached file "33787 - Copy\_of\_2265170.xml", the Virtis application is crashing to desktop when Superstructure Definition "Span 1 - Left Truss" is analyzed. The problem appears to be connected to angle leg deterioration coded for built-up member sections. When angle deterioration is coded to the angle legs, the program crashes. When the angle deterioration command is removed, the truss analyzes and produces results. It is noted that the "Left Truss" validates with and without the deterioration commands present.

The Superstructure Definition "Span 1 - Right Truss" has no deterioration coded and the truss analyzes and produces results.

Also of interest, in the same file the Superstructure Definition "Three Span Continuous With Deterioration - Right Truss" has angle leg deterioration coded for an anglebox section and does not crash.

Sub: Continuation of Issue ID: 9306

Complete Issue Information

Hi!

I am Naveen Bitla working with United International Corporation, CT. Thank you so much for your response earlier this morning regarding issue ID-9306. It was of great help. I was working with what you said earlier this morning. I have described my queries in detail in Query-2 file that I am attaching with this e-mail.

I want to know if my approach of considering two trusses at a time is correct.

Could you help me defining the floor beams at the ends which are skewed?

I want to know how we define the Stringer Units both at the beginning and end of the span?, because the length varies along the skew.

I would really appreciate if you could send me a skewed Truss example which is similar to this span which can help me.

I am attaching the following drawings with this mail,

- 1. Truss Span Cross section
- 2. Truss Framing Plan.
- 3. Truss Stringer Beam Lengths.

And also my Virtis file and the query letter.

Thank you so much. I greatly appreciate your help,  
Naveen Babu Bitla  
United International Corporation, CT

FROM: Herman Lee DATE: 6/18/2009 9:21:42 AM Eastern Daylight Time  
Attached is a skewed floor system example. For the floor beam does not intersect truss message, the warning message is very sensitive to the skew input. You could either change the skew to 41.186 Degrees or add another digit after 41.1861 Degrees.

### Description

FROM: Brian Goodrich DATE: 6/30/2009 4:13:02 PM Mountain Daylight Time  
Entered for Yuen Shuenn Siow:

Hi,

4/19/2016 3:07:00 PM

HRS AASHTO

1375

Complete Issue Information

I am using Virtis to rate a built-up girder with cover plate (see attachment for the cross section). I found that Virtis doesn't consider the thickness of the cover plates for the compression flange area in the Lateral torsion buckling resistance calculation. As a result, the resistance was reduced significantly. I also found that Virtis is inconsistent regarding the compression flange calculation. In the Web Load-Shedding Factor calculation, cover plates were included when compression flange area was calculated. See attached screen shot of the spec check for the comparison.

What is the reason cover plates were excluded from lateral torsion buckling resistance?

Thanks in advance for your help.

Yuen Shuenn Siow, P.E., S.E.

FROM: Brian Goodrich DATE: 6/30/2009 4:18:47 PM Mountain Daylight Time

I am responding to your comments and questions regarding the compression flange for a built-up section. It is our intent to be consistent with the compression flange dimensions throughout the BRASS analysis.

I have forwarded this issue to WYDOT (the owners of BRASS) and will be discussing it with them. Please send me a description or calculations of how you would perform these checks when cover plates are present. I am particularly interested in the width you use in the checks (16", 24", or something else). I would like to share your comments with WYDOT and address this issue for the next release.

FROM: Brian Goodrich DATE: 7/9/2009 9:28:42 AM Mountain Daylight Time  
WYDOT assigned this issue to BRASS Problem Log 902.

FROM: Brian Goodrich DATE: 5/18/2011 8:19:21 AM Mountain Daylight Time  
This issue was assigned to BRASS Incident 47.

FROM: Brian Goodrich DATE: 4/12/2013 10:37:02 AM Eastern Daylight Time  
This issue was addressed in the BRASS-GIRDER(LRFD) 2.1.3 released in June 2012.

FROM: Herman Lee DATE: 4/12/2013 11:48:05 AM Eastern Daylight Time  
Updated Status to Resolved per BridgeTech request.

Description

FROM: Herman Lee DATE: 7/1/2009 8:26:47 AM Eastern Daylight Time  
Submitted on behalf of William Kristoff (Michael Baker Engineering).

Section properties at mid-span (no loss) for Span 1 S1 and S14 should be similar. Dimensions are the same but area and moment of inertia are different. Although the area and moment of inertia are different, the LFD ratings are close between S1 and S14. The ASD ratings are very different between S1 and S14.

FROM: Brian Goodrich DATE: 7/2/2009 4:07:33 PM Mountain Daylight Time

### Complete Issue Information

S1 has no losses, so it is exported as a wide flange shape where the area and moment of inertia are transferred directly into BRASS using the section library. S14 has losses, so it is exported as a plate girder where the fillets between the flanges and web are ignored. For a plate girder, BRASS calculates the area and moment of inertia, which are smaller due to the omission of the fillets. Changing this behavior would require modification of the BRASS engines.

Complete Issue Information

I thought we had discussed this in Pittsburgh last month during the BETA Testing session. But I can't locate this in VI anywhere, so it must have gotten lost or not entered.

I wanted to run a NSG analysis and then use those DF within LRFR Rating method. But if I choose LRFR as an option - then Advanced Radio Button is greyed out and not available. I thought we had discussed that this should be available.

FROM: Jim Duray DATE: 7/2/2009 11:05:14 AM Eastern Daylight Time  
Herman - Let's discuss this.

FROM: Dean Teal DATE: 7/28/2009 2:01:52 PM Eastern Daylight Time  
Were are we on this?

FROM: Todd Thompson DATE: 7/29/2009 9:58:10 AM Eastern Daylight Time  
AASHTO MBE 6A.3.3 - Refined Analysis -- refers one to AASHTO LRFD 4.6.3 which refers you to 4.4 - which allows FE Method of analysis.

Isn't it possible to make the advanced Radio Button available for NSG analysis followed by LRFR rating using these new DF's.

FROM: Herman Lee DATE: 7/29/2009 1:46:22 PM Eastern Daylight Time  
We are in the process of implementating LRFR for Advanced analysis.

For Member Alternative Rating Method, we need to update the Vehicle Summary tree for allowing LRFR rating categories (permit, legal ...).  
For LRFR Rating Method, we need to enable the the Advanced radio button.

Then, use the advanced DFs and modify the Advanced Rating Results Summary Report for allowing LRFR rating categories.

FROM: Jim Duray DATE: 8/12/2009 4:38:11 PM Eastern Daylight Time  
Based on discussion with TF on July 29th this will be held for a future release. Changed to Suspended and Enhancement (not included in any previous work plan). When it is implemented it should also be implemented for BRASS LRFR.

FROM: Todd Thompson DATE: 8/17/2009 10:55:42 AM Eastern Daylight Time  
All future work NEEDS to include NSG (just like documentation, testing, API 3rd party documentation updating...)

FROM: Herman Lee DATE: 4/30/2013 10:49:17 AM Eastern Daylight Time  
Implemented LRFR for NSG analysis in the 6.5 release.

FROM: Krisha Kennelly DATE: 7/9/2009 3:36:26 PM Eastern Daylight Time  
Submitted on behalf of Vinacs, Caltrans:

email from vinacs, 7/7/2009

I have a bridge where steel girders are supported on Bent Cap.

I thought I did a good job. However, program runs into problem. Once it is exported to do the BRASS analysis, it keeps on going and with says 500 step Times out.

Check the "Twospan Bent Cap" structure definition

(See attached file: 50 0183.xml)

Also, I misplaced the official e-mail address that I am supposed to send this type of inquires, please let me the e-mail as well.

Thanks

response sent by KKennelly, 7/8/2009

You are getting that message because you have a very wide travelway over the floorbeam and BRASS is trying to move the lanes transversely across the travelway at 1' increments by default.

You can change the increment on the Floorbeam Definition: Engine tab. You can change the "Lane advancement increment" value to a bigger number to get BRASS to run quicker. But you'll have to use engineering judgment to determine the increment to balance the speed of the analysis with the accuracy of the loading.

The technical support email is [bridgeware@mbakercorp.com](mailto:bridgeware@mbakercorp.com)

Let me know if you need any additional information.  
Krisha

email sent by Vinacs 7/9/2009

When I tried the analysis with 4ft lane advancement and analysis is completed within a minute.

However, when I tried the analysis with 2ft, the analysis was not completed even after I let the computer run for 10 minutes. That means, the analysis went on an internal loop. In my opinion, program should terminate with an error messages. Also, if there is limitation as to how many lane advancement could be performed, that needs to be relaxed in the futuer version.

Vinacs M Vinayagamoorthy

Description

FROM: Navnit Nakrani DATE: 7/9/2009 5:14:55 PM Eastern Daylight Time  
This is Balaji, working with United International Corporation,CT.

I tried transferring Virtis License from Version 6.0 to Version 5.6 as given in the help line, but couldn't make it happen.

I'm not sure what I'm doing wrong.

Steps Followed:

4/19/2016 3:07:01 PM

HRS AASHTO

1382

Complete Issue Information

We already have Version 6.0 running fine in one of the systems(old computer), and installed Version 5.6 in the new computer and transferred License (5.6) from the new computer to a common folder (on the Server).

Then transferred License , version 6.0 from the old computer to the folder (on the server) where Version 5.6 was already transferred. That shut down the Virtis Version 6.0 in the old computer.

Then in the new computer when I opened Version 5.6 and tried transferring the license by selecting the folder, it wasn't working fine.

I checked with the system time for the new computer not to earlier than the old computer and also both the systems are logged in under the administrator privileges.

It would be great if you could help me resolving this problem.

Thanks for the help.

Sincerely,

Balaji.

FROM: Joseph Ihnat DATE: 7/13/2009 9:15:02 AM Eastern Daylight Time  
Balaji was finally able to do the license transfer using a flash drive.

### Description

FROM: George Huang DATE: 7/12/2009 12:54:08 AM Eastern Daylight Time

How does the Virtis calculates the shear capacity for T-beam? When I specified 11 points of interest and changed the shear re-bar spacing between point 1 and point 2, there was no change for the shear rating at point 1, which is at the face of bent cap. The analysis engine was LFD Brass.

FROM: Brian Goodrich DATE: 7/14/2009 9:37:31 AM Mountain Daylight Time

BRASS uses the larger stirrup spacing adjacent to a point of interest. This may be why changing the stirrup spacing on one side doesn't change the capacity. Please attach the bridge file, so I can review the input and results specific to this bridge.

FROM: George Huang DATE: 7/15/2009 12:49:23 AM Eastern Daylight Time

Hi Brian, how do I attach the bridge file to you?

FROM: Brian Goodrich DATE: 7/20/2009 9:17:56 AM Mountain Daylight Time

E-mail from George Huang:

Hi Brian,

You are right. BRASS does use the larger stirrup spacing adjacent to a point of interest. By further checking my input file, I did found some mistake I made. So the issue for the shear capacity is solved. However I do have a separate question for the same bridge file. During the saving of the shear reinforcement for G2, there was an error message

4/19/2016 3:07:02 PM

HRS AASHTO

1384

Complete Issue Information

End Distance is 153.5000000 ft.  
Beam length is 154.0000000 ft.  
Do you want to change the spacing?

If I choose "Yes", It will ignore the last rebar input and it doesn't seem right. Attached is the bridge input file. Thanks.

FROM: Brian Goodrich DATE: 7/21/2009 9:03:05 AM Mountain Daylight Time  
The message you are getting regarding the end distance is really just a warning. Virtis issues this message when a ranges ends within one foot from the end of the girder. The range starting at 46.5 ft from Support 3 with 2 spaces at 3" fills in the rest of the beam with shear reinforcement.

For the stand alone version, after IT staff installed the Virtis with SQL Server Express, the database wouldn't work under user's account. Right now in our office, IT staff had to grant the user with administrative rights first, then to install the program with user's account, and to remove user's administrative right after program been installed. Is there any easier way to install the program?

FROM: Joseph Ihnat DATE: 7/13/2009 9:16:52 AM Eastern Daylight Time

Depending on your local policies, SQL Server may require permissions of the folder where the mdf and ldf files are located.

Granting Full Control to Everyone on this folder may keep you from needing to change the user's privilege level.

The next version of Virtis will set the permission on this folder during the install.

## Tasks

| Name | Current State | Summary |
|------|---------------|---------|
|------|---------------|---------|

### Description

FROM: Beckie Curtis DATE: 7/13/2009 9:11:02 AM Eastern Daylight Time

First issue:

In the attached structure, see WB Spans 5-9 G3 (Interior Girder 10S). Virtis and Brass are calculating different shear capacities. It appears that STD engine is calculating the shear at 96.8% of Span 1 (a change in web thickness) as  $C*V_p$ .

Brass is giving NA for the rating calculations at this location.

I am not sure why Brass is giving NA, but I didn't disagree with the Virtis results since I could see Eq 10-119 applying due to the point of interest being in the first bay from the pin and hanger location.

Second issue:

Checking now WB Spans 9-15, Exterior Girder 7S, at 30-ft in Span 4, the combined Moment/Shear is controlling. Looking at STD engine detailed output,  $C*V_p$  is once again being used.

Looking at Brass for the same location,  $V_u$  is calculated according to Eq 10-114 and is significantly higher.

My questions:

1. Does Brass always ignore shear at web transitions?
2. What situation would not allow the STD engine to use Eq 10-114? It does not appear to be using it for this structure.

FROM: Hasmukh Lathia DATE: 7/14/2009 5:09:19 PM Eastern Daylight Time

Answer to Question 2:

Std Engine uses Eq 10-113 if the girder has a unstiffened web or has a stiffened web and the  $d_0/D$  ratio is greater than 3, or if it is an end panel or if the girder is hybrid. It uses Eq 10-114 if the girder has a stiffened web and the  $d_0/D$  ratio is less than or equal to 3. Looks like the girder in question is hybrid.

FROM: Brian Goodrich DATE: 7/27/2009 10:26:11 AM Mountain Daylight Time

I was able to duplicate the BRASS results (or rather lack thereof). I forwarded this issue to WYDOT.

FROM: Brian Goodrich DATE: 8/12/2009 3:53:40 PM Mountain Daylight Time

WYDOT assigned this issue to BRASS Problem Log 905.

FROM: Brian Goodrich DATE: 10/16/2009 3:18:41 PM Mountain Daylight Time

The points of dead load contraflexure were not entered correctly in Virtis. Because of this, BRASS was

4/19/2016 3:07:03 PM

HRS AASHTO

1390

Complete Issue Information

calculating a negative moment capacity, while the applied factored moments were positive. When this condition is detected, no moment or shear ratings are performed. I changed the contraflexure locations on the member alternative engine properties from 95% and 5% to 97% and 3% to better match the actual dead load action diagram. These changes resulted in acceptable ratings.

When using the superstructure definition wizard to create your PS structure  
You are allowed to name the LRFD PS Stress Limits with a name of any length (no limit)  
It is allowed  
Now when you try to save the structure you will get a system error.  
What is does when the name length is too long, it will delete your name and leave the field blank.  
With the filed name Null, the save fails

When you name the PS limits outside the wizard, you cannot enter a string that is too long.  
I think this is how the wizard should behave also.

Description

FROM: Herman Lee DATE: 7/22/2009 9:17:31 AM Eastern Daylight Time  
Submitted on behalf of Andy Benkert (abenkert@cmeengineering.com).

=====  
Great Barrington is a symmetric bridge and therefore the end floorbeams should have the same live load. However, with this bridge I continue to get slightly different live load results between floorbeams 1 and 9. I have checked the layout of the stringers and floorbeams but I can't seem to find an error. Can you offer any advice?  
=====

For Type 3 truck, wheel line reactions are the same on floorbeam 1, 2, 8 and 9.  
For HS 20 truck, wheel line reactions on floorbeam 2 and 9 is a bit higher than floorbeam 1 and 8.  
Is this related to the truck advancement in the virtual stringer analysis?

FROM: Brian Goodrich DATE: 8/12/2009 4:03:45 PM Mountain Daylight Time  
There is a slight asymmetry in the HS20 truck actions calculated by BRASS-LFD due to the nature of the moving the truck along the influence line. This causes the end reactions to be slightly different, which is the reason for the difference in loads applied to the floorbeams. This could occur for other trucks as well.

### Description

FROM: George Huang DATE: 7/28/2009 8:35:17 AM Mountain Daylight Time

(Short Version)

The eccentricity of the member has to be included in the capacity calculation. By ignoring the eccentricity, the rating factors for the bridge can be five times larger than the actual ratings as we found during our rating analysis of a 204 feet long, 21.5 feet wide, 10 panel pin connected, Through Pratt Truss bridge

4/19/2016 3:07:04 PM

HRS AASHTO

1395

Complete Issue Information

(Detailed version)

In the current Virtis truss analysis, it assumes that the axial forces in all truss members are acting at the location of the neutral axis of the member cross section. There is no eccentricity between the force and neutral axis of the cross-section. Therefore there is no place to input the eccentricity property for the truss member in Virtis. This assumption may be right for some bridges.

But for some through truss bridges, it is common that the cross-sections for the post and top cord members are not symmetric to the horizontal axis. These members are usually built up with two vertical channels and one top plate. So the neutral axis for cross-section is located above the center line of the channel. However the pine connections, which transfer the forces through different members, are located at the center of the channel. In this case the eccentricity of the member has to be included in the capacity calculation. By ignoring the eccentricity, the rating factors for the bridge can be five times larger than the actual ratings as we found during our rating analysis of a 204 feet long, 21.5 feet wide, 10 panel pin connected, Through Pratt Truss bridge.

Thank you very much.

## Description

FROM: Paul Jensen DATE: 7/28/2009 4:42:36 PM Eastern Daylight Time

attached is a bridge that we had removed one of the girders in the super def (14 girder). now the deck size is not correct in the export- we think it is taking the maximum spacing and computing the deck size, rather than using the information provided in the deck def.

me thinks we have an issue-

FROM: Brian Goodrich DATE: 7/30/2009 2:11:27 PM Mountain Daylight Time

The Madero engine does not support unequal girder spacings. This was known at the time of implementation, so the export was coded to issue the following warning to the LOG file:

WARNING (Medium):

An unequal girder spacing was detected! Madero only supports equally spaced girders. Therefore, the maximum girder spacing is exported. This may increase deck and wearing surface dead load comps. The deck width will be adjusted accordingly.

FROM: Paul Jensen DATE: 8/25/2009 11:11:29 AM Eastern Daylight Time

this issue need better resolution than a warning. this is a common issue with timber

me still thinks there is an issue--- elevate to TF action...

FROM: Brian Goodrich DATE: 7/12/2010 8:21:26 AM Mountain Daylight Time

The Madero export and engine were updated to support different spacings between the stringers. Fixed for version 6.2.

Description

FROM: Herman Lee DATE: 7/29/2009 12:55:43 PM Eastern Daylight Time  
 Submitted on behalf of John Rosatone (jrosatone@aiengineers.com), AI Engineers.

Received e-mail:

=====

The Reinforced concrete T-Beam bridge with the diagonal shear crack that I mentioned to you previously is the problem. I got the bridge to run and it gives reasonable results. The problem is that shear controls for all trucks as you might expect, but the controlling values are not being summarized so when we make a screen shot of all the controlling vehicles, it shows flexure controlling, not shear. I have attach the results for Girder G2 and also the Brass Intermediate output file results of the rating. Do you have any clue of why this is happening. Again any help is truly appreciated.

=====

Complete Issue Information

FROM: Brian Goodrich DATE: 7/29/2009 12:06:03 PM Mountain Daylight Time  
BRASS calculates shear ratings and reports these in the detailed output as you found. Because checking shear is optional for design and legal loads per the LRFR spec, BRASS (by default) ignores the shear ratings when searching for the critical ratings. This explains the results you are getting. BRASS contains options for considering shear (and other spec checks), but these have not been exposed to the Virtis user through the GUI in the version you're using. In the upcoming 6.1 release, new options have been added to consider or ignore shear.

The only workaround would be to take the BRASS data file generated by the BRASS export process, add some MAP-SPEC-CHECK commands to consider the shear check, and run the data file with the stand-alone version of BRASS from WYDOT. These results would not be imported back into Virtis though. They would be at the end of the BRASS output file.

FROM: Brian Goodrich DATE: 7/30/2009 2:09:24 PM Mountain Daylight Time  
E-mail from John Rosatone:

Brian, Herman

Thank you both for your help. You have educated me on the subject and that is very much appreciated.

Sincerely

John

### Description

FROM: William Metcalf DATE: 8/11/2009 4:57:04 PM Eastern Daylight Time

I have noticed that the forces in the PanelPointMaxForces file include impact and distribution factor. The forces in the PanelPointConcurrentForces file do not include impact or distribution factors. There may be a good reason that the forces are reported this way. However, if there is not then this should be fixed. I don't know that it matters which way it is done but unless there is a good reason to do otherwise

4/19/2016 3:07:06 PM

Description

FROM: George Huang DATE: 8/12/2009 3:50:19 PM Eastern Daylight Time  
We are using concrete T-beam to model a 10-span slab bridge and found that Virtis can only input maximum 9 spans. Is this right? Please see the attached file. Thanks.

FROM: Herman Lee DATE: 8/13/2009 8:39:46 AM Eastern Daylight Time  
I copied the superstructure definition, added another span and modified G1 for 10 spans in the attached 10-Span.xml file. I got the following limitation when I tried to rate G1. Is there any workaround for this limitation?

=====  
Error generating LFD/ASD load commands!  
Error generating load group commands!  
Load Case: DW

4/19/2016 3:07:06 PM

HRS AASHTO

1406

Complete Issue Information

The number of deck uniform loads exceeds the maximum allowed by BRASS!

No. of uniform loads = 10 (Maximum = 9)

=====

FROM: George Huang DATE: 8/17/2009 10:55:28 PM Eastern Daylight Time

I have the feeling that error is due to the span number. For this particular bridge, 9-span model is fine for our rating purpose.

I also tried to use Virtis Engine with modified support conditions (because I got error message that Virtis Engine can only deal with pin or roller supports) for G1, this time there was error message and the program (Virtis) was shut down. When I re-open the Virtis, I even could not save file because the error in G2.

FROM: George Huang DATE: 8/17/2009 11:20:36 PM Eastern Daylight Time

The error message (Virtis\_error.doc) and my revised file (10-spanGH.xml) for G1 in "Copy of Span 1-10 (MDL 1) (06/09)" are attached.

FROM: Herman Lee DATE: 8/18/2009 9:08:40 AM Eastern Daylight Time

Brian, please assign this incident back to me after you are done.

FROM: George Huang DATE: 8/20/2009 6:14:21 PM Eastern Daylight Time

The 10 span model will run with Brass Engine if assign overlay with DC load case, but won't run with DC1 or DW load cases. With Virtis Engine it won't run even with DC load case.

FROM: Herman Lee DATE: 8/21/2009 8:39:57 AM Eastern Daylight Time

For Virtis Std Engine, one internal array exceeds its limit. We will add a check for this condition in 6.2 or 6.1 patch if there's one.

FROM: Herman Lee DATE: 3/5/2010 5:13:36 PM Eastern Standard Time

May, please attach the Virtis Std Engine input file.

FROM: Herman Lee DATE: 3/7/2010 9:25:29 AM Eastern Standard Time

Attached Virtis Std Engine input file.

FROM: Hasmukh Lathia DATE: 3/8/2010 2:52:05 PM Eastern Standard Time

The problem with exceeding one internal array size is not due to the number of spans, but a combination of number of analysis points and reinforcement ranges defined for the bridge. A fix will be made in 6.2 or 6.1 patch to catch this limit, inform the user and exit the program gracefully.

FROM: Herman Lee DATE: 3/30/2010 12:53:04 PM Eastern Daylight Time

Resolved by Hasmukh Lathia on 3/30.

FROM: Herman Lee DATE: 5/9/2010 11:43:04 AM Eastern Daylight Time

Tested the 10-SpanGH.XML file in this incident.

Verified in 6.2 Beta 1.

Complete Issue Information

George Huang would like to change this incident to Virtis Std Engine enhancement request for increasing the size of the internal array.

FROM: George Huang DATE: 5/12/2010 4:29:15 PM Eastern Daylight Time  
Herman, we were told the Brass LFD were able to handle bridge with more than 10 spans. If this is true, then the problem may due to the UI export file. Could you verify this?

FROM: Herman Lee DATE: 5/13/2010 10:36:45 AM Eastern Daylight Time  
For BRASS LFD, the limitation is not the number of spans. The limitation is the number of uniform loads. Brain, has this been already requested by BRASS users?

=====  
Error generating LFD/ASD load commands!  
Error generating load group commands!  
Load Case: DW  
The number of deck uniform loads exceeds the maximum allowed by BRASS!  
No. of uniform loads = 10 (Maximum = 9)  
=====

E-mail sent to Brian Goodrich on 5/13 for clarification.

FROM: Brian Goodrich DATE: 5/13/2010 9:31:55 AM Mountain Daylight Time  
The deck load module has a limit of 9 uniform loads as indicated by the error message. I will forward this to WYDOT.

One work-around would be to reduce the number of deck uniform loads by one and input this as a member load.

Description

FROM: Brian Goodrich DATE: 8/12/2009 3:45:40 PM Mountain Daylight Time  
 Submitted on behalf of Sarah Saeed, Saeed Associates. (sarah\_saeed82@yahoo.com)

Received Bridgeware e-mail:

=====  
 Hello. I am trying to rate a 3 span continuous steel girder bridge in VIRTIS 5.6 in LRFR. I am getting a very low rating when I rate it in LRFR, but not when I use LFD. I get a normal rating in LFD. I have checked the input and can not find the problem.. Can you please take a look at the bridge, I am attaching it in xml format, and tell me where the problem is? Thank you very much.  
 =====

FROM: Brian Goodrich DATE: 8/12/2009 3:47:50 PM Mountain Daylight Time  
 For your 00992.xml file, it appears that a Service II check (Web Bend-Buckling) is controlling the rating for LRFR. I don't see anything wrong in the input. I reviewed the detailed output from BRASS, but don't see any problems here either. The output from the BRASS 210 point of interest is included below:

Complete Issue Information

AASHTO REFERENCE: 6.10.1.9 Web Bend-Buckling Resistance

6.10.1.9.2 Webs With Longitudinal Stiffeners

EQUATION NO. : 6.10.1.9.1-1

Input Parameters:

D = 105.000 in Fyw = 50.000 ksi Fyc = 50.000 ksi

tw = 0.500 in E = 29000.000 ksi Rh = 1.000

Longitudinal Stiffeners Provided: YES

More Input Parameters:

D = 105.000 in Dc = 58.002 in ds = 84.000 in

Calculations: [AASHTO LRFD 6.10.1.9.2]

Calculated Value: ds / Dc = 1.448

AASHTO Limit : 0.400

Calculations: [AASHTO LRFD 6.10.1.9.2-1]

$k_1 = 5.17 * (D / ds)^2 = 8.078$

$k_2 = 9.0 / (Dc / D)^2 = 29.494$

$k = \text{MAX}(k_1, k_2) = 29.494$

Are both edges of web are in compression?

NO => k = 29.494

Calculations: [AASHTO LRFD 6.10.1.9.1-1]

$F_{crw} = 0.9 E * k / (D / tw)^2 = 17.456 \text{ ksi}$

Complete Issue Information

$$F_{crw} \text{ Minimum}(1) = R_h * F_{yc} = 50.000 \text{ ksi}$$

$$F_{crw} \text{ Minimum}(2) = F_{yw} / 0.7 = 71.429 \text{ ksi}$$

$$F_{crw} = \text{MIN}(F_{crw}, \text{Minimum}(1), \text{Minimum}(2)) = 17.456 \text{ ksi}$$

AASHTO REFERENCE: 6.10.4.2.2 Flexure

EQUATION NO. : 6.10.4.2.2-4

Input Parameters:

$$\phi = 1.000 \quad f_c = 26.680 \text{ ksi}$$

Flexure Resistance Summary:

$$F_r = \phi F_{crw} = 17.456 \text{ ksi}$$

Result Code: FAIL

=> Note: Result Code lists PASS if the flange stress ( $f_c$ ) is less than the limiting stress ( $F_r$ ).

PERFORMING RATING FACTOR COMPUTATIONS: Stress (Web Bend-Buckling Stress (Bottom Flange))

Point of Interest : 210.00

|                     |              |                 |         |
|---------------------|--------------|-----------------|---------|
| Construction Stage: | 3            | Resistance =    | -17.456 |
| LL Combination No.: | 1            | Dead Load =     | -15.210 |
| Limit State         | : SERVICE II | Live Load =     | -11.470 |
| Units               | : ksi        | Rating Factor = | 0.196   |

Complete Issue Information

There are known differences in between LFR and LRFR, such as the load model, live load distribution factors, and impact. I suspect these might be contributing some to the lower rating with LRFR.

FROM: Herman Lee DATE: 10/30/2009 2:44:30 PM Eastern Daylight Time  
Changed Status to Resolved since Brian Goodrich didn't find anything incorrect in the input.

Stress = -1207.9 psi

Feel free to call me if you need to.

Mark G. Unterkofler, P.E.

FROM: Brian Goodrich DATE: 1/28/2010 9:07:46 AM Mountain Standard Time  
I attached a file (Incident9426-BRASS-Calcs.pdf) documenting how BRASS calculates the concrete tension rating factor of 0.49. I verified that the dead loads input into Virtis are getting into the BRASS engine. There appears to be a difference in the dead loads between the Conspan model and the Virtis model.

Description

FROM: Brian Goodrich DATE: 8/13/2009 2:40:38 PM Mountain Daylight Time  
 Submitted on behalf of Cory Chamberlain via Tim Armbrect:

=====

===

Krishna,

When you get a chance, can you please confirm what my consultant is reporting below – that BRASS does not recognize bearing stiffeners as transverse stiffeners in computing shear capacity in LRFD/LRFR?

Thanks,  
 Tim

Tim,

I have been working with Dewey and Tim on tracing some of the VIRTIS issues. One issue is VIRTIS/BRASS is not recognizing the bearing stiffeners as transverse stiffeners to increase the shear capacity. The work around is to add transverse stiffeners at the bearing stiffener locations, but this is time consuming to do. The program should recognize the bearing stiffeners as transverse stiffeners and calculate the shear capacity based on the spacing between the bearing stiffener and the next connection plate. This is for sure a problem in LRFD/LFD, but not sure it is a problem in the LFD module.

Cory

 I'm looking into the transverse stiffener issue. The export process adds a schedule for the range between the end of a span and the first transverse stiffener present. I tested this with the 6.1 beta version and the ranges are added correctly. I don't see that this area of the export has been changed

## Complete Issue Information

significantly for about three years.

One possible solution is to make sure that the engine properties are set to generate POIs at user-defined or tenth points. Otherwise, none of the schedule input will be used.

If this is already set, then I'll need the bridge XML file as well as the version of Virtis the consultant is running, so I can investigate further.

FROM: Brian Goodrich DATE: 8/13/2009 2:45:06 PM Mountain Daylight Time  
E-mail from Tim:

Brian,

Just discussed with my consultant. What you describe below is not the issue. The issue is does BRASS consider bearing stiffeners to act as transverse stiffeners for the purposes of calculating shear capacity? It doesn't appear so, and the workaround is to add a transverse stiffener at the bearing location. However, we would prefer that the program looks at the bearing stiffener and thinks "transverse stiffener" in the shear capacity calculations. In this case, I'm wondering if BRASS is calculating  $d_0$  (as in "d sub zero") to be the distance from the first transverse stiffener to the left of a pier support to the first transverse stiffener to the right of the support, and ignoring the bearing stiffener at the pier support. When I posed this possibility to the consultant, he replied:

I believe your statement to be correct, however when I traced the output in BRASS it states "no transverse stiffeners" for that section so I am not sure what is going on for sure, but when I use the workaround the shear capacity hits exactly what MDX is producing. When I just use the transverse stiffeners at the cross frames and bearing stiffeners at the pier the shear capacity significantly drops to what an unstiffened web should be. This appears to be a hiccup in the programming logic but I don't know for sure, other than the shear results are wrong without the workaround.

In this case, we believe the bearing stiffener behaves as a transverse stiffener, and  $d_0$  should be revised accordingly.

Can you confirm that this is what happens in BRASS? Thanks,

Tim

FROM: Brian Goodrich DATE: 8/13/2009 2:46:25 PM Mountain Daylight Time

We did fix an issue where there was a slight gap in the transverse stiffener schedule near the end of a span. The stiffener spacing for a POI at the adjacent support was therefore determined as non-existent. This can be seen if you look at the STIF-TRAN-SCHEDULE commands in the BRASS data file. If the start distance plus the range doesn't add up to exactly the BRASS span length, the gap exists.

If this doesn't explain the issue, please send in the bridge XML file.

=====  
=====  
Brian,

I have attached the xml file and Cory's comment. Please review and let me know what you think.  
Thanks,

Tim

=====  
=====

=====  
=====  
Tim,

I am not sure this discussion below is relevant to our problem. I believe it is a issue with bearing stiffeners not being recognized or acting as transverse stiffeners for shear capacity. Since adding a transverse stiffener at the same location as the bearing stiffener "fixes" the problem, I would speculate the problem highlighted below is not our problem.

The XML file is attached. Unit 1 has the workaround to get the correct shear capacity, which is to define a transverse stiffener at the same location as a bearing stiffener. Unit 2-4 have not been modified as such.

Thanks,  
Cory

I'm not able to duplicate this issue with the 6.2 alpha version. Please indicate the exact structure definition, member, and member alternative that is exhibiting the unexpected behavior. Also, attach the BRASS data file that is produced by the export.

FROM: Tim Armbrecht DATE: 2/22/2010 2:35:54 PM Eastern Standard Time  
Brian, we can't duplicate it any more either. It appears to have been fixed for the 6.1 release, because we have been running 6.1 since October and our last post to this incident was in August. It appears to be OK now. Please go ahead and close this incident. If it pops up again, we'll re-submit. Thanks.

Description

FROM: Herman Lee DATE: 8/14/2009 2:27:52 PM Eastern Daylight Time  
 Submitted on behalf of Jim Randall, County of Santa Clara (Jim.Randall@rda.sccgov.org).

Received e-mail:

=====  
 We are using Virtis 6.0 to establish our permit vehicles (California Permit Truck P-15) rating using a IM = 25%. We have changed the Bridge, Superstructure Definitions, and the Member Alternative windows for the LRFD Dynamic Load Allowance, All other limit states box to 25%. When we run the program with out changing the Vehicle Properties impact box the results are for IM = 33%. When we change the Vehicle Properties, Impact box to 0.7576 = 25/33 then the moment results from Virtis agree with our hand calculations. It appears that the program does not take into account the preliminary Impact/Dynamic Allowance windows discussed above? I am attaching my xml file and a memo for your comment and guidance. I called today but you were not available to discuss this issue.  
 =====

I'm able to reproduce the issue described above. Looks like Rating Procedure in the LOAD-LIVE-DYNAMIC command is always set to D (Design Loads).

FROM: Brian Goodrich DATE: 8/14/2009 2:54:09 PM Mountain Daylight Time  
 The export only generates the LOAD-LIVE-DYNAMIC command for "design" loads, but this was done long before LRFR was implemented. The workaround that Jim is using works, but this isn't a long-term solution. The 25/33 factor input on the Vehicle Properties window removes the default 33% used within BRASS. Therefore, this workaround only works for the BRASS engine.

On the various Impact/DLA windows, should the LRFD Dynamic Load Allowance be used for design, legal, and permit categories? If so, I just have to revise the export to generate commands for the legal and permit categories. This means that when vehicles are assigned to the design, legal, and permit categories, they all get the same impact unless overridden on the Vehicle Properties window. The alternative is to enhance Virtis to allow the user to input the impact differently for each category. Comments?

FROM: Brian Goodrich DATE: 8/17/2009 8:34:44 AM Mountain Daylight Time  
 E-mail from Herman:

=====  
 With what we have now, I think the Dynamic Load Allowance should be used by all the vehicles in the design, legal and permit categories.

Description

FROM: Brian Goodrich DATE: 8/21/2009 10:34:08 AM Mountain Daylight Time  
 Received Bridgeware e-mail (David Wolfe, Moffatt & Nichol <DWolfe@moffattnichol.com>):

=====

Bridgeware - It appears that running "Lane-Type Legal Load" as an LRFR Legal Load runs only the truck portion defined on the truck tab and neglects the lane load portion defined on the lane tab. When any truck is defined, the lane load information is ignored for LRFR Legal Load.

Therefore, the Lane-Type Loading for Negative Moments and Interior Reactions shown in MBE Figure

Complete Issue Information

D6A-5 cannot be analyzed using VIRTIS vehicle definitions.

I am running VIRTIS 5.6.

Take a lane type legal load as an user defined agency vehicle:

- (a) Analyze legal load with truck + 0.200 klf lane
- (b) Run same as (a) but change lane to 200 klf. I get the (a) results
- (c) Delete all portions of the truck and keep 200 klf, then I get a very low RF as one would expect.

Respectfully - DW

FROM: Brian Goodrich DATE: 8/21/2009 10:53:25 AM Mountain Daylight Time

I was able to reproduce the results you reported regarding the "Lane-Type Legal Load". This version is not exporting the legal truck with the right code for it to be combined with the legal lane. The only workaround I have found is to check the "Legal Pair" checkbox for this vehicle on the Vehicle Properties window.

This problem no longer occurs in the upcoming 6.1 release version schedule for release in October.

Please let me know if the workaround addresses your issue for the short-term.

Description

FROM: Todd Thompson DATE: 8/21/2009 4:43:15 PM Eastern Daylight Time  
Is this Spec Article (6.4.4.2.1) for Live Loads in Virtis LRFR?

States For All Span lengths

- critical loads shall come from
- AASHTO Legal Loads (3, 3-3 and 3S2)
- For Neg Moments and Reactions at Interior Supports - a lane load of 0.2 klf combined with TWO AASHTO Type 3-3 Trucks multiplied by 0.75 - headed in same direction - separated by 30 ft

In addition - for span lengths greater than 200 ft

- AASHTO Type 3-3 multiplied by 0.75 and combined with lane load of 0.2 klf

And also -

Dynamic Effects only on legal trucks and NOT the lane loads  
and if ADTT < 500 - lane load excluded and 0.75 factor revised to 1.0 - if warranted by Engineer.

FROM: Jim Duray DATE: 8/24/2009 11:18:26 AM Eastern Daylight Time  
Yes.

You can add vehicles to the "Legal Load Rating" category in the analysis settings.

If a vehicle does not have a lane load it is processed as described in bullet 1 under 6.4.4.2.1.  
If a vehicle has a lane load it is processed as described in bullets 2 and 3 under 6.4.4.2.1.

There is a vehicle in the library named "AASHTO Lane-type legal Load Model". It is a Type 3-3 truck (multiplied by 0.75) with a lane load of 0.2 k/ft.

The last sentence regarding ADTT and engineering judgement is not implemented. 0.75 is always used and so is the lane load.

FROM: Todd Thompson DATE: 9/9/2009 4:52:49 PM Eastern Daylight Time  
Please mark this as an enhancement to allow the user to follow the AASHTO code if they so choose to use that option.

Complete Issue Information

Changed to Enhancement and Suspended and moved to Support Center.

FROM: Herman Lee DATE: 5/30/2010 10:17:26 AM Eastern Daylight Time  
Changed to Maintenance (TF and TAG May 2010)

FROM: Herman Lee DATE: 6/7/2013 11:01:55 AM Eastern Daylight Time  
This enhancement is to support the following statement in 6A.4.4.2.1a.

"If the ADTT is less than 500, the lane load may be excluded and the 0.75 factor changed to 1.0 if, in the Engineer's judgement, it is warranted."

A workaround is to create a separate vehicle with the lane load excluded and the 0.75 factor changed to 1.0. I tested this workaround. The modified Figure D6A-4 model worked as expected but not the modified Figure D6A-5 model. I entered Incident 12644 for fixing the application of the modified Figure D6A-5 model.

## Complete Issue Information

FROM: Beckie Curtis DATE: 8/28/2009 10:23:33 AM Eastern Daylight Time

In analyzing the effects of the beam top flange not being attached to the deck, I tried to gap out the lateral support from 5-ft left of pier to 3.5-ft right of pier. However, at the 3.5-ft point of span 2 in the output shows an unbraced compression flange of 1053-in (the span length) rather than the 8.5-ft I attempted to input. Used Virtis engine. Can't compare to Brass since it always considers the top flange braced if a deck is added. see screenshot.

Second issue: checking deflection, and the Virtis engine is showing deflection (not uplift) at the pier for dead load. Brass engine shows 0in deflection at pier.

FROM: Xinmei Li DATE: 3/5/2010 5:14:01 PM Eastern Standard Time

1) Lateral support issue: For Virtis std engine, the top flange for the entire girder is assumed to be continuously supported. So the information you entered (3.5') was not imported to std engine, which was not considered in rating analysis.

2) Deflection issue: I'm not able to reproduce Virtis std engine deflection for dead load with my development version. See attached screen shot, "ZeroDeflection\_VirtisStdEngine".

FROM: Xinmei Li DATE: 3/7/2010 9:03:44 AM Eastern Standard Time

Virtis std engine input and output files are attached.

FROM: Xinmei Li DATE: 3/7/2010 11:01:51 AM Eastern Standard Time

2) Deflection issue: I tried this again with 6.0 release version, I was able to reproduce the non zero deflection, it seems this issue was fixed.

FROM: Xinmei Li DATE: 3/10/2010 9:40:31 AM Eastern Standard Time

1) Lateral support issue: Virtis export did not export the lateral bracing information to the engine, see the warning message in the attached log file.

Lateral Brace Points and Stiffener Spacings

Warning - Lateral support ranges in span 1 are not within a foot of the span length!

Warning - The lateral support ranges in span 1 will not be exported!

Warning - Lateral support ranges in span 2 are not within a foot of the span length!

Warning - The lateral support ranges in span 2 will not be exported!

FROM: Hasmukh Lathia DATE: 3/10/2010 5:23:56 PM Eastern Standard Time

1) Lateral Support Issue: I have modified the Virtis Std Engine input file for adding top flange brace points at 5' left of support 2 and 3.5' right of support 2. Virtis Std Engine recognizes these brace points and considers appropriate unbraced lengths for an analysis at 3.5' in span 2. The output file beginning with 9463A\_.... (no bracing at top flange) and with 9463(1)A\_... are attached for review. This appears to be a user input issue with Virtis export.

FROM: Hasmukh Lathia DATE: 3/11/2010 4:28:06 PM Eastern Standard Time

If the girder has a gap in the top flange bracing, the export should pass on input to Virtis Std Engine coded as follows:

BG in Span 1 with code C for 1 spacing of 82.75' followed by code T for 1 spacing of 5.0' and

BG in span 2 with code T for 1 spacing of 3.5' followed by code C for 1 spacing of 84.25'.

Input lines for Virtis Std Engine should look like this:

4/19/2016 3:07:08 PM

HRS AASHTO

1427

Complete Issue Information

BG 1 C 1 82.75 T 1 5.00 0 0.00 0 0.00

BG 2 T 1 3.50 C 1 84.25 0 0.00 0 0.00

I ran the girder with these changes. The ratings are much better (no negative ratings). The two outputs, one with unbraced and another with continuously braced top flange in the regions identified, are attached .

Virtis Export for Std Engine will be fixed accordingly in 6.2 Release.

FROM: Herman Lee DATE: 3/14/2010 1:57:34 PM Eastern Daylight Time  
 Updated export for gaps in lateral support ranges.  
 Resolved for 6.2 Release.

FROM: Jim Duray DATE: 5/6/2010 6:42:21 PM Eastern Daylight Time  
 Verified for 6.2 alpha 4.

Description

FROM: George Huang DATE: 8/28/2009 10:38:34 AM Eastern Daylight Time  
All Caltrans bridge models are created to run BRASS engine. Since Brass engine will be phase out in 2011, these models have to run with Virtis Engine. However Virtis engine can only handle pin and roller supports while our models have the rotational stiffness from substructures when they are applied, our bridge will not run with Virtis engine, unless changing the boundary conditions or Virtis adds the function to handle the rotational stiffness for the bounday condition. Is there any plan for this new addition in Virtis?

### Description

FROM: George Huang DATE: 8/28/2009 12:59:02 PM Eastern Daylight Time

For precast concrete beams used in multi-beam deck as defined in AASHTO STD Specification (2002), section 3.23.4, the live load distribution factor should be calculated with the equations listed in that section. These girders are also defined in AASHTO LRFD Specification Table 4.6.2.2.1-1 as Typical Cross-Section (h), (g), (i) and (j). The live load distribution factors for moment in interior beams are listed in Table 4.6.2.2.2b-1. However in Virtis, the live load distribution factors for moment are calculated based on S/5.5 for both LFR and LRFR.

Personally I feel the equations listed on both Specs are questionable, and I will use S/5.5 for our specific bridge (see the attached file). However, If Virtis has made decision to use the different equations other than those from the Specs, it may need to add a note, which may pop up after clicking the "computer from typical section" button, to explain it positions.

FROM: George Huang DATE: 5/12/2010 3:49:19 PM Eastern Daylight Time

The question has been clarified. The case is closed.

FROM: Herman Lee DATE: 5/12/2010 4:33:26 PM Eastern Daylight Time

If the Deck checkbox in the PS Tee Beam window is checked, Virtis will consider the girders to be adjacent to each other.

FROM: Gale Barnhill DATE: 9/4/2009 11:03:41 AM Eastern Daylight Time

In this model, I made a copy of the Super Def "Simple span through truss WITH BOTH COUNTERS" and made some changes to the Truss Command sets.

I tried to assign the new Super Def "Simple span through truss REMOVE COUNTERS" to the Superstructure Alternative.

When I select that name in the pulldown list, I get the error shown in the attache screen shot.

I was able to work around this error by Unchecking the Superstructure Alternative from the Alternatives Tab of the Superstructures window, deleting the Superstructure Alternative and reentering it and then assign the new Super Def.

|------|---------------|---------|

Description

FROM: Beckie Curtis DATE: 9/9/2009 7:28:46 AM Eastern Daylight Time  
Similar to 9363, I'm reposting so this additional comment doesn't get missed.

AASHTO LFD Section 10.53 defines a hybrid girder as "girders that utilize a lower strength steel in the web than in one or both of the flanges". For the bridge posted in 9363 with A242 steel, the web yield strength is higher than in the flanges. Therefore, it is technically not a hybrid girder per the AASHTO definition. This directly influences the shear capacity calculated by Virtis Std Engine.

FROM: Has Mukh Lathia DATE: 9/12/2009 7:45:33 PM Eastern Daylight Time  
Virtis Std Engine treats the girder as hybrid if all the three elements (top flange, web and bottom flange) of the girder do not have the same yield strength. The section in question may not be technically hybrid as per wording in AASHTO LFD Section 10.53, but it is not homogenous either.

Was there a specific reason to use lower strength steel in the tension flange?

FROM: Beckie Curtis DATE: 9/15/2009 8:14:09 AM Eastern Daylight Time  
The girder has plate sections whose thickness increases to the point that the yield strength per the specification needs to be reduced.

FROM: Has Mukh Lathia DATE: 9/16/2009 3:35:24 PM Eastern Daylight Time  
Virtis Std Engine has been revised to treat the girder as hybrid only if the steel used in the web has a lower strength than in one or both of the flanges as per AASHTO LFD Section 10.53. This revision will be implemented in Virtis 6.2.

FROM: Herman Lee DATE: 5/9/2010 11:47:02 AM Eastern Daylight Time  
Verified in 6.2 Beta 1.

FROM: Beckie Curtis DATE: 5/12/2010 3:44:18 PM Eastern Daylight Time  
Shear issue is resolved, but Virtis STD is still applying the hybrid factor to the moment capacity of beams with  $f_y$  of the web greater than the flange. See attached xml, g2 of superstructure test 9483.

FROM: Herman Lee DATE: 5/13/2010 1:12:37 PM Eastern Daylight Time  
There are four member alternatives defined in Test 9483 G2. Only one has Virtis LFD selected in the LFD Analysis Module. Attached Virtis Std Engine input and output files.

FROM: Has Mukh Lathia DATE: 5/13/2010 6:58:32 PM Eastern Daylight Time  
BAR7 calculates hybrid strength modification factor R regardless of whether the girder is hybrid or not. A fix has been made to set R equal to 1 if the girder is not hybrid. Two output files with OUTPUT option A are attached. Revised source code (Rategf.for) has been sent to Herman.

FROM: Herman Lee DATE: 5/14/2010 8:50:10 AM Eastern Daylight Time  
Fixed by Has Mukh Lathia for 6.2 Beta 2.

### Description

FROM: Navnit Nakrani DATE: 9/16/2009 9:10:03 AM Eastern Daylight Time

Hi,

This is Balaji working with UIC, CT. We are using VIRTIS 5.6 for Virginia Load rating. Though we specify the scale factor for HL-93 Design Vehicle as 1.0, the output file shows the scale factor as 0.833. I checked the calculations too, but it considers only 0.833 instead of 1.0.

I'm herewith attaching the .xml file for your review.

Thanks,

Balaji.

FROM: Herman Lee DATE: 9/16/2009 9:58:52 AM Eastern Daylight Time

Duplicate of Incident 8380 and 8450. This defect had been resolved for the 6.0 Release.

Description

FROM: George Huang DATE: 9/17/2009 12:47:40 PM Eastern Daylight Time

We have some problems to rate a four-span continuous timber bridge. Based the live load moment demand, it looks like the Virtis can only rate the simple span timber bridge. Please confirm. The bridge file is attached. I can send more information from e-mail if I have the e-mail address for the contact person. Thanks.

FROM: Herman Lee DATE: 9/17/2009 4:26:17 PM Eastern Daylight Time

More information from George:

=====

Hi, George,

The Virtis file of this bridge is in the network and here is the export file. (See attached file: 10C0123.xml)

The problem: This 4-span continuous log-stringer bridge span lengths are 18.6 ft, 15.5 ft, 15.0 ft, 20.4 ft. However, the Virtis Moment & Shear diagrams shows the span lengths are

- Span 1: 18.6'
- Span 2: 34.1' = 18.6' + 15.5'
- Span 3: 49.1' = 18.6' + 15.5' + 15'
- Span 4: 69.5' = 18.6' + 15.5' + 15' + 20.4'

Therefore, the live load moments shown in Virtis output are not reasonable. Please take a look the following typical printscreen.

(Embedded image moved to file: pic10367.jpg)

Richard C. Tsang, P.E.

=====

FROM: Herman Lee DATE: 9/18/2009 3:01:40 PM Eastern Daylight Time

I'm not able to reproduce the live load actions shown in the pic10367.jpg file. Attached png files are the moments and shears I got for HS20.

Please provide more detailed descriptions or step-by-step instructions for reproducing the issue. Thanks.

FROM: Herman Lee DATE: 10/1/2009 8:38:16 AM Eastern Daylight Time

Received e-mail (9/30/2009):

=====

Hi Herman,

Complete Issue Information

We tried with both Version 6.0 and 6.1 and couldn't produce the same plot you got. The difference between is only the wrong span length in the plot (there are gaps in our plots), however the values for moment and shear are the same. The ratings from Virtis and our hand calculation are listed here.

(Embedded image moved to file: pic15910.jpg)

Attached are files for our hand calculation. Please let me know if you need more information. Thanks.

George Huang, Ph.D., P.E.

=====

FROM: Brian Goodrich DATE: 1/28/2010 1:26:41 PM Mountain Standard Time  
I was able to duplicate the issue with both dead and live load actions. Some of the summaries in the Analysis Results window, i.e., the dead and live load action tables, show up correctly with the span number and distance along the span. However, the ASD Critical Loads and ASD Critical Stresses show up with the span number and the distance from the left end of the structure. I think there are two issues going on here:

1. Madero is incorrectly writing out the distance from the left end of the bridge for the ASD Critical Loads/Stresses table.
2. Virtis is doing something to the results to adjust this distance, but it is doing it for all Madero results rather than just for the ASD Critical Loads/Stresses.

I plan to correct the Madero engine to write these distances to the results object so they correctly reference the left end of the span. Then, no adjustment will be necessary within Virtis when plotting these results.

Herman - Please verify my assumption regarding Virtis doing something to the Madero results when plotting the actions.

FROM: Mehrdad Ordoobadi DATE: 1/29/2010 8:33:45 AM Eastern Standard Time  
Brian, Virtis is calculating each location based on the span number and location from the left end of the span and it is doing it the same way for Dead/Live Load Actions too. As you noted all that needs to be done from the Madero engine is to provide span numbers and locations from the left end of the span when populating the ASD Critical Stresses and ASD Critical Loads.

FROM: Brian Goodrich DATE: 3/23/2010 10:15:18 AM Mountain Daylight Time  
I revised the Madero engine to write the distances so they reference the left end of the span. I am forwarding a new DLL.

FROM: Herman Lee DATE: 5/7/2010 11:08:16 AM Eastern Daylight Time  
Tested the XML file in this incident.  
Verified in 6.2 Beta 1.

### Description

FROM: Todd Thompson DATE: 9/25/2009 1:39:03 PM Eastern Daylight Time  
Acceptance Release with 2nd set of patches.

I ran a BRASS LRFR rating from the desktop and looked at the results.  
Note that HL-93 appears to be INV = 62.13 and OP = 80.77 but when you open up all the members – one of the members is only 43.65 and 56.74. So something is broke with the results again.

So for some reason it is not pulling the controlling rating factors at the highest level.

Didn't we have issues with results with Beta 1... seems like we've fallen back to some of those problems.

I think we made a mistake in doing these patches with the Acceptance Release or they were not adequately tested prior to being shipped out.

FROM: Jim Duray DATE: 9/28/2009 8:21:53 AM Eastern Daylight Time  
We did what we felt was a reasonable amount of testing of the few incidents we fixed for each of the updates.

FROM: Herman Lee DATE: 9/28/2009 12:41:46 PM Eastern Daylight Time  
The critical rating reported by Bridge Explorer is based on the rating factor, not the load rating capacity (see attached Ratings.png). The lowest rating factor for the bridge is 1.726. Please note that the controlling live load types are different in the two superstructure definitions. The issues with results in Beta 1 were for the Virtis LRFR Engine.

Further investigation indicates inconsistency in the reported live load type and load rating capacity (see attached RatingOutputs.png).

FROM: Todd Thompson DATE: 9/28/2009 3:33:49 PM Eastern Daylight Time  
Good catch.... I am too used to looking at LF analysis results and looking at "tons" and not necessarily the Rating Factor value. And this was has Axle Load controlling on one span and Tandem controlling on another span, so the tons are not comparable. And now I see the issue you reported.

Complete Issue Information

FROM: Herman Lee DATE: 9/30/2009 4:53:28 PM Eastern Daylight Time  
The Live Load Type in the Rating Results Summary window doesn't reflect the Live Load Combination listed in the BRASS output file (see attached RatingOutputs.png). This is an existing bug in 5.6 and 6.0, not new to version 6.1. Virtis vehicles are separated into individual components (truck, tandem, lane...) in the BRASS input data file and the engine combines these components into live load combinations. To resolve this, both the export and engine need to be modified. This is risky since we are close to final acceptance build and the required modifications will affect the rating results reporting process. We are going to add help descriptions to the BRASS LRFD/LRFR Engine Related Help for 6.1 and fix this in the 6.2 Release.

FROM: Brian Goodrich DATE: 1/28/2010 3:30:49 PM Mountain Standard Time  
This appears to be related to Incident 9594.

WYDOT assigned this issue to BRASS Problem Log 934. This issue was addressed in BRASS-GIRDER(LRFD) 2.0.3. Fixed for Virtis 6.2.

FROM: Herman Lee DATE: 5/7/2010 11:12:48 AM Eastern Daylight Time  
The Live Load Type in the Rating Results Summary still shows Axle Load (TYP\_VEHICLELD\_VLDAXLE) instead of Truck + Lane (TYP\_VEHICLELD\_VLDDGNTRKDGNLN).

FROM: George Colgrove DATE: 9/27/2010 10:42:22 AM Eastern Daylight Time  
Verified fixed in VO62B7. The lowest values as published in the desktop rating (as obtained by Todd) was properly pulled from the girder ratings.

### Description

FROM: Krisha Kennelly DATE: 9/29/2009 8:44:23 AM Eastern Daylight Time  
Submitted on behalf of Tim Souther from Illinois DOT:

portion of email from Tim:

Could you ask for clarification regarding the Channels subcommand under the ChannelBox Section (6.9.3) in the Virtis Truss Input Command Language manual?

Under Channels for "<back-to-back>" it says, "Enter back of the web to back of the web dimension." If there are web plates attached to the channels, which dimension are we to enter, back-to-back of the channel webs or back-to-back of the web plates?

Baker email Response:

<back\_to\_back> under Channels subcommand corresponds to back to back of the channel webs.

Illinois request:

His answer would lead me to suggest that in the manual they change the description to, "<back\_to\_back> = Enter back of the channel web to back of the channel web dimension." This would eliminate any confusion.

FROM: Xinmei Li DATE: 10/15/2009 9:49:39 AM Eastern Daylight Time  
Updated the manual as suggested above.

Description

FROM: Adam Price DATE: 10/1/2009 3:04:47 PM Eastern Daylight Time  
 AASHTO 5.4.2.6 specifies different equations for the modulus of rupture for different areas of design. There is no way to specify different values for the modulus of rupture in Opis. I suggest that the program be enhanced with this capability.

FROM: Herman Lee DATE: 10/2/2009 10:21:17 AM Eastern Daylight Time  
 The modulus of rupture is associated with the concrete composition and f'c which are defined with the Concrete Material. Are you requesting to allow user to enter a different modulus of rupture for a specific spec article? Thanks.

FROM: Todd Thompson DATE: 10/2/2009 4:17:26 PM Eastern Daylight Time  
 I'm guessing he is referring to this - depending on which code check you are dealing with - there are different modulus of rupture values:

5.4.2.6 Modulus of Rupture  
 Unless determined by physical tests, the modulus of

4/19/2016 3:07:11 PM

HRS AASHTO

Complete Issue Information

rupture,  $f_r$  in ksi, for specified concrete strengths up to 15.0 ksi, may be taken as:

- For normal-weight concrete:
  - o When used to calculate the cracking moment of a member in Articles 5.7.3.4, 5.7.3.6.2, and 6.10.4.2.1.....0.24 f c
  - o When used to calculate the cracking moment of a member in Article 5.7.3.3.2 .....0.37 f c
  - o When used to calculate the cracking moment of a member in Article 5.8.3.4.3 .....0.20 f c
- For lightweight concrete:
  - o For sand-lightweight concrete .....0.20 f c
  - o For all-lightweight concrete .....0.17 f c

When physical tests are used to determine modulus of rupture, the tests shall be performed in accordance with AASHTO T 97 and shall be performed on concrete using the same proportions and materials as specified for the structure.

FROM: Herman Lee DATE: 10/5/2009 9:33:28 AM Eastern Daylight Time  
Received e-mail:

=====  
Herman,

Yes, the user needs to be allowed to enter different  $f_r$  for specific article. These different values could be automatically calculated by Opis when  $f'_c$  and the concrete composition are entered, and then manually changed if desired (just as the current single value of  $f_r$  is input).

Thanks,

Adam Price, M.S., P.E.  
Structural Specialist Supervisor 1  
Tennessee Department of Transportation

=====  
Currently, Opis computes  $f_r$  based on 5.4.2.6. This request is to enhance Opis to allow user to override the computed  $f_r$ .

FROM: Adam Price DATE: 10/6/2009 8:53:16 AM Eastern Daylight Time  
Not only does the user need to be able to override the computed  $f_r$ , but the program needs to provide input boxes for the  $f_r$  values required for the different code articles. Currently, two values for  $f_r$  are needed, one for the minimum reinforcement check and a different one for crack control. Whenever the program gains the capability to check article 5.8.3.4.3, then a third value will be needed.

Description

FROM: Adam Price DATE: 10/1/2009 3:14:16 PM Eastern Daylight Time

I have noticed a problem with the end slab depth for slab bridges. Under girder profile, when the slab depth is changed for a member with no depth variation, the end depth will not automatically change. It will change when clicked on. After closing the girder profile screen, if the screen is reopened, the old end slab depth reappears. I don't know if this is actually causing a problem in the analysis, but it is at least a worrisome cosmetic problem. Please try this error in the attached file.

FROM: Joseph Ihnat DATE: 10/14/2009 1:21:55 PM Eastern Daylight Time

Same problem existed in steel profile. Fixed both for version 6.2

Submitted on behalf of David Wolfe (DWolfe@moffatnichol.com).

Bridgeware support e-mail:

=====

Bridgeware – See attached shear force diagram for HL-93 for a simple span plate girder bridge with

Complete Issue Information

CIP deck running VIRTIS 6.0. Other vehicles give same type of diagram. Rating is for vehicles running in both directions.

Notice that the top of the envelope appears to linearly interpolate for the data point at about 2% at the left. The bottom envelope has a kink at about 98%. These should have been similar. How come these differ at the two ends?

=====

FROM: Herman Lee DATE: 10/5/2009 10:21:12 AM Eastern Daylight Time  
E-mail sent to David requesting the bridge XML file for reproducing the attached shear diagram.

FROM: Herman Lee DATE: 10/6/2009 8:25:49 AM Eastern Daylight Time  
David reply e-mail:

=====

Bridgeware – Attached is a minimum data bridge to get the resulting shear force diagram for LL. Note that removing the diaphragms from Bay 1 produces results without a kink in the shear diagram. The Live Load Dist Factors summarized in the output file appear to be the same for both cases. However, it looks like at left it uses the 0.950 and at the right it uses 0.849 for shear. At the far end of Beam 2 the diaphragm slightly closer to the end of the beam seems to cause this selection of LL DF. This can be shown by adding a POI slightly before the first POI, which gives a jump in the shear diagram (see Beam 4). The previously first POI of Beam 4 now has the lower value observed at Beam 2's far end.

Beam Distribution Factor Schedule: Shear (Beam 2)

| Span No. | Distances, in |          | mg(1-lane) | mg(M-lanes) |
|----------|---------------|----------|------------|-------------|
|          | Start         | End      |            |             |
| 1        | 0.000         | 31.196   | 0.783      | 0.950       |

|          |               |          | (LRFD)     | ( M,LRFD)   |
| 1        | 1494.014      | 1524.000 | 0.783      | 0.950       |
|          |               |          | (LRFD)     | ( M,LRFD)   |

=====

FROM: Brian Goodrich DATE: 10/14/2009 2:02:24 PM Mountain Daylight Time  
The shear discontinuity is due to the distribution factor schedule for shear. The version of BRASS you are using provides too coarse of ranges for the shear distribution factor schedule. This issue has already been addressed in a new BRASS LRFD engine (Version 2.0.2 - August 2009). However this version has not been released with Virtis. The new schedule for Beam 4 looks like:

Beam Distribution Factor Schedule: Shear

| Span No. | Distances, in |     | mg(1-lane) | mg(M-lanes) |
|----------|---------------|-----|------------|-------------|
|          | Start         | End |            |             |
| -----    |               |     |            |             |

Complete Issue Information

|   |          |          |        |           |
|---|----------|----------|--------|-----------|
| 1 | 0.000    | 76.200   | 0.783  | 0.950     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 76.200   | 228.600  | 0.767  | 0.930     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 228.600  | 381.000  | 0.750  | 0.910     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 381.000  | 533.400  | 0.733  | 0.890     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 533.400  | 685.800  | 0.717  | 0.870     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 685.800  | 762.000  | 0.700  | 0.849     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 762.000  | 838.200  | 0.700  | 0.849     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 838.200  | 990.600  | 0.717  | 0.870     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 990.600  | 1143.000 | 0.733  | 0.890     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 1143.000 | 1295.400 | 0.750  | 0.910     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 1295.400 | 1447.800 | 0.767  | 0.930     |
|   |          |          | (LRFD) | ( M,LRFD) |
| 1 | 1447.800 | 1524.000 | 0.783  | 0.950     |
|   |          |          | (LRFD) | ( M,LRFD) |

There will still be discontinuities due to the nature of the distribution factor steps in the schedule. However, the discontinuities should not be so dramatic.

FROM: Brian Goodrich DATE: 11/16/2009 11:33:38 AM Mountain Standard Time  
Fixed for Virtis/Opis 6.2.

FROM: Herman Lee DATE: 5/7/2010 1:10:54 PM Eastern Daylight Time  
Confirmed reduced discontinuity effect at the end of LL shear diagram.  
Verified in 6.2 Beta 1.

### Description

FROM: Beckie Curtis DATE: 10/5/2009 2:33:39 PM Eastern Daylight Time

We were modifying a previous model, simple span reinf conc tee beam done cross-section based. There is a small amount of steel in the deck, which the model had included. If the steel in the deck (top flange) is included the Brass rating is fine but the Virtis STD rating drops significantly. Removing the steel in the deck brings the rating more in line with Brass.

FROM: Xinmei Li DATE: 3/5/2010 10:05:48 PM Eastern Standard Time

I tried the attached bridge with my current development version, using Virtis std engine. I used Original Concrete T-beam cross section/G2/Interior beam. With reinforcement in deck (top flange) included, the rating factors are 0.571 and 0.953, after those reinforcement removed the rating factors drops to 0.413 and 0.69. Virtis std engine input and output files are attached.

FROM: Xinmei Li DATE: 3/7/2010 9:52:42 AM Eastern Standard Time

I tried the attached bridge with my current development version, using BRASS engine. I used Original Concrete T-beam cross section/G2/Interior beam. With reinforcement in deck (top flange) included, the rating factors are 1.482 and 2.469, after those reinforcement removed the rating factors drops to 1.459 and 2.431.

Comparing Virtis std engine and Brass engine, dead load and live load are very close. The significant rating factor difference was due to the shear strength at the end of the span.

Virtis std engine shear strength at the end of span is 57.6k, while Brass is 106.0k. For Virtis std engine Stirrup is not considered at the start and end of the beam.

Virtis std engine used stage 3 composite section for live load, while Brass used stage 1 non-composite for live load.

FROM: Xinmei Li DATE: 3/7/2010 11:21:59 AM Eastern Standard Time

4/19/2016 3:07:12 PM

HRS AASHTO

1451

Complete Issue Information

With 6.0 Release version, the Virtis std engine rating results are 0.571 and 0.953 with or without reinforcements in deck.

FROM: Xinmei Li DATE: 3/7/2010 8:28:45 PM Eastern Standard Time  
When I looked at the shear reinforcement input in GUI, there is no stirrups defined at the beginning and end of the beam. After adding stirrups at the beginning and end of the beam, the shear strength of Virtis std engine is 104.3k (vs BRASS 106.0k ) and rating factors are 1.27 and 2.12 (vs BRASS 1.482 and 2.46).  
The revised bridge (with strrups at both ends of the beam) is attached.

FROM: Hasumukh Lathia DATE: 3/7/2010 10:15:35 PM Eastern Standard Time  
May, The input file Interior\_beam\_w\_deckReinf.dat has no shear reinforcement at the ends of the span. The problem seems to be with absence of this shear reinforcement, not with the deck reinforcement. Deck reinforcement makes a little difference in flexural ratings. If the above is true, attach the input and output files with the shear reinforcement at the ends of the span.

FROM: Xinmei Li DATE: 3/22/2010 10:32:37 AM Eastern Daylight Time  
Brian,  
When user doesn't define shear reinforcements at the start and end of beam in GUI (attached bridge is an example), BRASS still assumes there are stirrups at both start and end when calculating shear capacity.  
Coule you please take a look? Thanks.

FROM: Brian Goodrich DATE: 4/17/2010 5:15:35 PM Mountain Daylight Time  
When points of interest are to be generated from stirrup schedule input, BRASS requires that the entire structure be filled with schedules. Any gaps in the input schedules are filled in with a stirrup spacing equal to the gap. This is what is happening at the beam ends.

Below are from Incident 9277.

FROM: Tim Armbrecht DATE: 8/12/2009 10:13:27 AM Eastern Daylight Time  
Just tried to run AASHTO LRFR in Beta 3. Used "rate" from the menu, legal load template. I no longer get error messages, however, there are no bridge rating results. The bridge rating results window pops up, but it is empty.

FROM: Jim Duray DATE: 8/13/2009 4:46:59 PM Eastern Daylight Time  
Dead and live load actions are computed. Based on the log file no spec-check domain a=objects are created so no spec checks are performed.

I tried an LRFR rating using the design template. It behaves the same way.  
I tried an LRFR rating with a type 3 vehicle assigned as a permit vehicle...same behavior.  
I tried LFRD....same behavior.  
I tried BRASS LFRD....it completes successfully.

FROM: Jim Duray DATE: 8/13/2009 5:40:22 PM Eastern Daylight Time  
Control options are not set to include any points of interest. Why are we not setting a default?

FROM: Mehrdad Ordoobadi DATE: 8/14/2009 9:45:26 AM Eastern Daylight Time  
It was decided that if none of the POI check-boxes are selected default to Tenth Points and Change Points.  
Fixed for next build (Acceptance)

FROM: Krisha Kennelly DATE: 9/1/2009 8:31:06 AM Eastern Daylight Time  
After talking with Jim we decided that if none of the POI check boxes are checked we will just issue a message in the log file and not generate the tenth points and change points.

FROM: Srujana Thogaru DATE: 9/2/2009 2:49:24 PM Eastern Daylight Time

## Complete Issue Information

FROM: Tim Armbrecht DATE: 9/9/2009 3:23:20 PM Eastern Daylight Time

This has not ben resolved. I attached a screen shot taken today running the same structure in the acceptance build.

FROM: Tim Armbrecht DATE: 9/9/2009 3:51:24 PM Eastern Daylight Time

I don't think the solution (putting a note in the log) is a good one for the users. This is too confusing for your average user. Either default to the tenth points, or pop up a dialog box and ask the user what he/she wants to do. This will look like an error every time.

FROM: Jim Duray DATE: 9/9/2009 4:55:47 PM Eastern Daylight Time

We do not have access to the UI from the spec-check module so we cannot popup a dialog during the analysis. We can popup a dialog from the control options window to warn the user when Ok or Accept is selected. The way it works in the acceptance build gives the user a way to do a superstructure analysis without the spec-checking. That is why we chose to add a message to the log file. BRASS aborts if there are no point of interest selected.

So I think the options are:

- 1) Leave the message, add a popup to the control options window and do not do a spec-check if no points of interest are selected.
- 2) Change it to default to 10th points as you suggest.

FROM: Jim Duray DATE: 9/15/2009 8:07:39 AM Eastern Daylight Time

Email to Tim:

"Tim

We can do that if you like. We have to add an flag to the analysis event that we can check during the analysis/spec-check to determine if it is a batch rating or not (not a big deal to do) and set the control options internal to the spec-checker to check the appropriate points.

However, after discussing this issue with Herman, Krisha and Mehrdad this morning, I think the control options should be considered as part of the data that defines the member (just like defining the width of a flange, etc.) and should not differ between BWS rating and bridge explorer rating. After all, the user should be defining the locations that were determined to be critical. If the user wants to experiment with overriding the schedule by defining temporary POI (or any other data) he/she should make a copy of the mbr alt (not mark as Existing and therefore not used in batch ratings) and use it for what-if analysis within the BWS. This leaves the mbr alt marked as Existing unaltered and presumably "correct" for others to analyze as necessary including from the bridge explorer for a permit analysis.

I suggest if none are enabled in the window we add the message to the window to inform the user that ALL (tenth, user and change) will be used for the analysis and spec-checking if the AASHTO LRFD/LRFR engine is used – as you requested below. Add a similar message in the AASHTO spec checker. And change the code in the spec-checker to enable all three options (internal to the spec-checker only for that run only) if none are selected regardless whether it is an analysis from the BE or BWS. No changes to BRASS or the BRASS export.

Jim"

Complete Issue Information

from Tim referring to the third paragraph on 9/15:

"Jim,

I agree with your proposal in the third paragraph, because I think that if a user has them all turned off and wants to run an analysis, especially from BE, it's probably an oversight. If you can set it to ALL for that analysis only, not change the control options and get a message up there letting the user know what's going on, I think that would be ideal. Thanks,

Tim"

Mehrdad - assign to Joe when you are finished.

FROM: Mehrdad Ordoobadi DATE: 9/15/2009 4:33:36 PM Eastern Daylight Time  
Fixed for final release.

FROM: Joseph Ihnat DATE: 9/16/2009 7:36:06 AM Eastern Daylight Time  
Fixed for final release.

FROM: Herman Lee DATE: 9/17/2009 8:14:21 AM Eastern Daylight Time  
Verified with updated Beta 4 DLLs.

FROM: Tim Ambrecht DATE: 9/29/2009 1:01:26 PM Eastern Daylight Time  
Installed the new dlls.

A couple of questions regarding this incident:

If POI are not selected and BRASS LRFR is run, should we expect no results in the ratings results window?

Suppose the user selects "rate" from the "bridge" menu and sets up his rating analysis. Should the warning pop-up message show up when the user clicks OK?

FROM: Jim Duray DATE: 9/29/2009 1:03:45 PM Eastern Daylight Time  
No rating results if no POI are selected (for BRASS). No popup warning when rating from the BE.

FROM: Tim Ambrecht DATE: 10/5/2009 11:00:34 PM Eastern Daylight Time  
Appears to be working for AASHTO engine. Accepted on condition that it will ultimately also work similarly for the BRASS engine.

FROM: Herman Lee DATE: 10/6/2009 11:44:20 AM Eastern Daylight Time  
In 6.0 BRASS LRFR Engine Properties, the available POI Controls are:

- 
- 1 - User-defined points only (no schedule data)
  - 2 - Generate at user-defined points (using schedule data)
  - 3 - Generate at tenth points plus user-defined points (using schedule data)

In 6.1 Member Alternative Control Options, the available Points of Interest options are:

4/19/2016 3:07:12 PM

HRS AASHTO

1455

Complete Issue Information

- A - Generate at tenth points
- B - Generate at section change points
- C - Generate at user-defined points

The current 6.0 to 6.1 BRASS LRFR POI Controls migration are:

---

| Engine Properties | Control Options    |
|-------------------|--------------------|
| 1                 | -> None checked    |
| 2                 | -> C checked       |
| 3                 | -> A and C checked |

When none is checked in 6.1 Member Alternative Control Options, the 6.1 BRASS LRFR Export will translate it back to 1 (User-defined points only (no schedule data)) so the user will get the same results when compared to 6.0.

I think it's ok for each analysis engine to decide how to interpret those control options. In this case, since the mapping between the UI and the BRASS LRFR Engine is not one to one, if we force to check all when none is checked, the results may be different than 6.0.

FROM: Tim Armbrecht DATE: 10/6/2009 12:58:02 PM Eastern Daylight Time  
So if none is checked in 6.1 and user defined points are not defined, there are no rating results in BRASS?

As I pointed out to Jim before, this looks like an error when no results are showing. if a user does not have pois checked and (in the BRASS case) did not created user defined pois, that is probably an oversight on the users part. In this situation, it would be better to do ALL, as we are doing with the AASHTO engine.

FROM: Herman Lee DATE: 10/6/2009 2:49:56 PM Eastern Daylight Time  
In 6.0, when "User-defined points only (no schedule data)" is selected in engine properties and no user defined points, only dead load and live load analysis results are available. There are no rating results.

In 6.1, when none is checked in Control Options Points of Interest and no user defined points, only dead load and live load analysis results are available. There are no rating results.

I created Incident 9520 to modify the BRASS export to behave the same as the AASHTO Engine.

FROM: Brian Goodrich DATE: 11/17/2009 4:18:57 PM Mountain Standard Time  
I revised the export per Herman's instructions. The BRASS export now generates points of interest (tenth, user, and change) when none of the POI control boxes are selected AND there is no POI defined in the member alternative. Fixed for version 6.2.

FROM: Herman Lee DATE: 5/7/2010 1:29:57 PM Eastern Daylight Time  
Verified in 6.2 Beta 1.

Description

FROM: Herman Lee DATE: 10/7/2009 8:47:06 AM Eastern Daylight Time  
Submitted on behalf of Sean Hart and Russ Howells (Michael Baker Jr., Inc.):

=====  
Herman,

Attached is the XML file of the floor system.

The floorbeams that are missing some of the stringer reactions are: #18, 19, 25 & 26

The floorbeams that are missing ALL of the stringer reactions are: #20-24

Thank you for your help,

Russ

=====

FROM: Herman Lee DATE: 10/7/2009 11:04:44 AM Eastern Daylight Time  
The Computed Reaction will not show up in the Floorbeam Stringer Reactions window unless the

4/19/2016 3:07:13 PM

HRS AASHTO

1457

### Complete Issue Information

reactions have been accepted in the Computed Stringer Reactions window. For each stringer on the floorbeam during a floorbeam rating, Virtis will first check whether there is a User Defined Reaction, then check whether there is an up-to-date Computed Reaction. If there are no User Defined Reaction and up-to-date Computed Reaction, Virtis will perform a dead load analysis for that stringer. The purpose to store the computed stringer reactions is to speed up the floorbeam rating.

To fill up those missing reactions, rate the stringer and accept the reactions in the Computed Stringer Reactions window. Or, don't need to do anything since the floorbeam rating will decide what to do.

Description

FROM: Beckie Curtis DATE: 10/9/2009 10:51:06 AM Eastern Daylight Time  
 Attached structure is similar to Incident 8859, however there are slight differences and also I am wondering if the first incident was ever resolved?  
 In the attached structure, the SB superstructure proposed girder A1, the unbraced length isn't met at pier 5. When I add a diaphragm within 3-ft of pier 5 to meet the unbraced length, the rating factor reduces. It doesn't seem right that adding a brace point would lower the rating factor. It seems that equation 10-100 is not analyzed in Brass of partially braced members. Since the thinking behind Fcr is a shape factor buckling requirement on the localized level, wouldn't it apply regardless of the global member bracing?  
 In follow up to the previous incident, is Fcr limit on Fy being added to the Virtis engine?

FROM: Hasmukh Lathia DATE: 3/8/2010 3:10:57 PM Eastern Standard Time  
 The issues in this incident and 8859 (see comment in 8859) will be looked at when the task force approves implementation of the 17th edition of AASHTO in Virtis Std Engine.

## Complete Issue Information

### Description

FROM: Tim Armbrecht DATE: 10/14/2009 10:58:35 AM Eastern Daylight Time  
What would cause the following:

Error loading BRASS DLL!

(Error Code = 8) Not enough storage is available to process this command.

09:52:49 AM - Line 1540 in source file .\AbxBrassEngine.cpp.

File attached.

FROM: Tim Armbrecht DATE: 10/14/2009 11:33:53 AM Eastern Daylight Time

OK, I did some further investigation. I shut down Virtis and restarted it. It then ran OK for this file and another one. Originally, I rated about 24 bridges (using BRASS) from Bridge Explorer. By the last 5 or 6, I started getting this message, and just blew by the message. After that run, I tried to rate this structure from BE and got the same message. So after quitting Virtis and restarting, it worked again. Memory leak?

FROM: Todd Thompson DATE: 10/15/2009 2:45:40 PM Eastern Daylight Time

Still or again..... this seems to keep popping up year after year after.....

FROM: Brian Goodrich DATE: 11/18/2009 9:17:06 AM Mountain Standard Time

BRASS requires about 200MB of memory to execute. We have found that if there is not enough physical memory, some of the virtual memory is used. However, once BRASS dips into the virtual memory once, it will not execute successfully again. This is when the memory error is issued.

FROM: Todd Thompson DATE: 11/18/2009 1:35:24 PM Eastern Standard Time

Running Virtis 6.1 - I ran a series of Virtis LRFR ratings and then when I attempted to run a BRASS LRFR rating, I got the memory issue.

There must be some memory leak issue somewhere. As soon as I shut down and restarted VIRTIS, then I could run the BRASS LRFR.

I will have to watch my Physical Memory usage. Typically I can have multiple apps open, including Virtis and the available Physical Memory is in the 600 to 800+ K range. I'll have to notice if this dips below 200 K when I get this problem. Must be a pretty good memory leak if I can start in the 600 to 800 K range and yet end up dipping below 200 K to prevent VIRTIS from launching BRASS anymore.

FROM: Todd Thompson DATE: 11/18/2009 2:10:31 PM Eastern Standard Time

Since this happens on a daily basis when using Virtis, I watched my Task manager and the Available Physical Memory - BRASS failed to load and task manager stated there was 352,448 K available Physical Memory.

So I guess I'm not sure why it failed to load? or why after a series of a few runs, that the Physical Memory got gobbled up.

FROM: Brian Goodrich DATE: 1/26/2010 10:03:31 AM Mountain Standard Time

I just received the following message when trying to run the Virtis LFD engine:

Error loading Virtis Std ASD/LFD DLL!

(Error Code = 8) Not enough storage is available to process this command.

4/19/2016 3:07:13 PM

HRS AASHTO

1462

Complete Issue Information

It looks like the memory issue may not be limited to BRASS.

FROM: Todd Thompson DATE: 1/27/2010 9:25:01 AM Eastern Standard Time  
TST 1-27-2010

There seems to be a memory leak somewhere with the Virtis/Opis application not allowing the different engines to load and run.

FROM: Tim Armbrecht DATE: 2/18/2010 5:18:36 PM Eastern Standard Time

Just got an email from one of my engineers trying to run NSG for about 20 structures. We even installed more physical memory. He has 3GB in his machine right now:

Even after BIP installed an extra 1GB of RAM on my computer. I'm still receiving this error, when I run a NSG analysis for a group of structures.

Error loading BRASS DLL!

(Error Code = 8) Not enough storage is available to process this command.

03:58:03 PM - Line 1540 in source file .\AbxBrassEngine.cpp.

 Issue submitted for Michelle Jose:

=====

Hi,

I have a two span curved structure (with straight beams) modeled in Virtis, and I have modeled each beam as a girder line because of the unique skew for each beam (attached is a copy of the deck plan and framing plan). The overhangs vary along the length of the structure, so I have reflected the varying non-composite dead loads as distributed loads. When I run Beam L-1 (fascia beam in Span 1), I get Inventory rating factors of 0 for all trucks at midspan for top flange flexure.. When I run Beam L-5 (fascia beam in Span 2), I similarly get low Inventory rating factors of around 0.03 at midspan. I have checked my stresses at midspan with the dead load (deck load from tributary width and overhang load at midspan) moment and section modulus and I obtain stresses well below the allowable (around 11,000psi actual vs. 17800psi allowable). I lowered my live load distribution factors to 0.01 and got valid rating OPERATING factors (99), but still received inventory rating factors of 0. I've run other points along the beam, and also get valid rating factors. I've decreased the distributed non-composite dead load over the beam, and finally received reasonable inventory rating factors. I've tried placing a diaphragm at midspan. I've also decreased my tributary widths and received reasonable Inventory rating factors. But with all loads, input, and geometry correct, with no data manipulation, I still get stresses below allowable. Can you please explain to me why I am getting INVENTORY rating factors of 0 (only for two fascia beams) when stresses do not exceed allowable?

Thank you,  
 Michelle

Complete Issue Information

=====
Hello again,

In addition to getting Inventory rating factors of 0 for two fascia beams (L-1 and L-5) at midspan regardless of decreased load input, I am getting error messages saying that three out of my eight beams (L-3, L-6, and L-7) have cross-sectional areas of less than 0.01. I have checked my girder sections and reloaded the beam sections under "Beam Shapes," and I still get the error messages.

Thank you for your time again,
Michelle

FROM: Brian Goodrich DATE: 10/15/2009 1:46:23 PM Mountain Daylight Time
It seems like the deck load is being accounted for twice in the input. The Member Loads window contains entries assigned to the "Non-Composite Dead Load" load case, which appear to be for the deck. Then, on the Deck Concrete tab of the Deck Profile window, there are tributary widths entered. These tributary widths are used to automatically calculate the deck dead load. I cleared out the tributary width fields, reran the ASD analysis, and the L-1 inventory rating is now 1.20, which seems reasonable.

Regarding the area issue, this is the same as Incident 7917. The BRASS LFD engine error requires that a section containing a rolled beam be constant over each range. This section is a rolled beam with a tapered slab. The workaround is to input this section as an equivalent plate girder or to assume some constant effective flange width.

FROM: Brian Goodrich DATE: 11/17/2009 4:16:21 PM Mountain Standard Time
E-mail from Michelle Jose:

=====
Hi Brian,

Thank you for reviewing our situation. For the fascia beams, we input a separate "Non-Composite Dead Load" load to accommodate for an overhang that varied in width along the beam to add to the tributary width of deck directly over the beam. We did an independent check and found that the overhang deck load was overstressing the beam causing a 0 rating at midspan. In regards to the rolled section with a tapered slab, we actually already received a response addressing the necessity to maintain a constant effective flange width for rolled beams. We initially assumed that since there is a "Start Effective Flange Width" and an "End Effective Flange Width," a tapered section was feasible.

Thank you for help and comments.

Michelle

Submitted on behalf of Andrew Benkert (abenkert@cmeengineering.com).

Received Bridgewater support e-mail:

=====  
Herman, I mentioned to you awhile back that we were having trouble running a short girder (4.11ft) in Virtis. The issue is with the Live Load. Virtis gives an error indicating that the wheel advancement increment is too small for the member. You recommended that we lower the wheel advancement denominator in the engine properties. We followed your reference guide but our computer continues to give us the following error when we select properties for the analysis module. Any suggestions on why this is?

Description

FROM: Gale Barnhill DATE: 10/16/2009 7:35:22 PM Eastern Daylight Time

I defined a girder system with a median appurtance.

I also defined a wearing surface.

The Structure Typical Section clearly shows two roadways on either side of the median.

When I analyze a member, the DW load effect reported is based on the WS applied between the exterior curbs without a deduction for the median.

I copied the Super Def and removed the median from the typical section and redefined the roadway.

4/19/2016 3:07:14 PM

HRS AASHTO

1467

Complete Issue Information

The DW load effect reported is the same as the member with a median.

FROM: Brian Goodrich DATE: 11/2/2009 10:48:52 AM Mountain Standard Time  
The BRASS export does not generate the median or curb commands. Therefore, BRASS cannot internally deduct the median width from the wearing surface. BRASS only supports one median, but Virtis can have multiple. So, BRASS generates these loads using other commands. This explains what is happening. Now what should we do?

A workaround would be to input a negative uniform load to remove the wearing surface in the median region. However, this is only necessary for BRASS.

A partial solution would be to export the median command if there was only one median. But then, what do we do if there are more?

## Description

FROM: Herman Lee DATE: 10/20/2009 10:10:43 AM Eastern Daylight Time

The NSG analysis results are the same as the standard analysis results for timber bridge. If Madero doesn't support NSG analysis, the rating process needs to check for the type of analysis instead of performing the standard analysis. This may produce unconservative results.

To reproduce, use the timber bridge in the sample database.

FROM: Jim Duray DATE: 4/27/2010 8:07:50 AM Eastern Daylight Time

The Madero input file after a NSG analysis is the same as the input file for a standard analysis using the same vehicle. I attached the bridge xml file I used. so the Madero export doesn't seem to be using the NSG distribution factor.

FROM: Herman Lee DATE: 5/24/2012 7:03:07 AM Eastern Daylight Time

The Madero engine doesn't support NSG analysis, I updated the Madero export to check for NSG analysis, display an error message and exit the analysis.  
Resolved for 6.4 Release.

FROM: Matt Kolis DATE: 8/30/2012 9:21:04 AM Eastern Daylight Time

Verified in VO64, Beta 4, an error is generated when using the Madero engine with NSG analysis.

Complete Issue Information

Engine.

Please see whether you are able to reproduce the Virtis Std Engine non-composite deck results in your screen shot with the bridge attached in this incident.

FROM: Herman Lee DATE: 4/6/2010 10:10:33 AM Eastern Daylight Time  
Information Needed E-mail sent on 4/6/10.

FROM: Beckie Curtis DATE: 4/7/2010 11:41:39 AM Eastern Daylight Time  
This may be an engine related assumption issue, but it seemed odd to me. I didn't analyze as completely non-composite, I just made the deck non-composite in the negative moment region (25.75-ft on either side of the pier). Below are my results for negative moment over pier of the interior beam using HS-20 lane.

fully composite  
806 - Virtis  
642 - Brass

fully noncomposite  
827 - Virtis  
819 - Brass

partially composite  
655 - Virtis  
644 - Brass

It may be just that the Virtis STD engine uses the composite section properties when calculating the load even though it is in the negative moment region, while Brass does not. Even if this is not a "bug", I would like the implications of this to be considered for development of the AASHTO LFR engine.

FROM: Herman Lee DATE: 4/7/2010 12:43:41 PM Eastern Daylight Time  
From the Engine capabilities comparison table in 6.0 Release Notes:  
For the member stiffness used in structural analysis, Virtis Std Engine uses positive flexure properties (beam + slab) over entire beam length and BRASS uses positive flexure properties (beam + slab) in positive moment regions and negative flexure properties (beam + rebar) in negative moment regions.

### Description

FROM: David Koenig DATE: 10/23/2009 11:28:26 AM Eastern Daylight Time  
We have rated a steel structure and are getting zero ratings on the exterior girders for Structure Definition 3. The problem stems from the check that BRASS LRFR does for AASHTO 6.10.7.3 at the 210 point. This is a ductility check to ensure that the flange yields before the slab crushes. The problem is that it is checking this at a negative moment location. There is some positive live load moment on the envelope, but the dead load moment is significantly higher than the live loads. We don't believe that it should even be checking this requirement at this point. The Virtis file and some PDF files with the output are attached.

FROM: Brian Goodrich DATE: 3/24/2010 4:16:31 PM Mountain Daylight Time  
See Structure\_Definition\_3\G1\Plate\_Girder.

I forwarded this issue to WYDOT for assignment to a BRASS Problem Log.

FROM: David Koenig DATE: 12/2/2010 9:46:47 AM Eastern Standard Time  
What is the status on this incident? It was submitted over a year ago and nothing appears to have been done with it at this point. Was a BRASS problem log ever assigned?

FROM: Brian Goodrich DATE: 5/18/2011 8:22:18 AM Mountain Daylight Time  
This issue was assigned to BRASS Incident 49.

FROM: Brian Goodrich DATE: 10/30/2012 12:08:27 PM Mountain Daylight Time  
This issue no longer occurs as of BRASS-GIRDER(LRFD) Version 2.1.0. It was addressed as part of BRASS Incident 43.

### Description

FROM: William Metcalf DATE: 11/5/2009 3:18:33 PM Eastern Standard Time

In Virtis we have items in our attribute lists. County names, District names, etc. which are specific to our state. We have set up Virtis to be used by some of our designers on their computers with a 'stand alone' SQL express or whatever it is called database. We would like to have our state specific items in the attribute list. Is it possible to import these or to otherwise accomplish this? If so how is it done?

FROM: Mehrdad Ordoobadi DATE: 4/6/2010 9:38:32 AM Eastern Daylight Time

Currently there is no automated way for transferring this information. You may want to ask your database administrator to prepare SQL scripts that can be created based on the data in the PARAMTRS table and can be used to populate the stand alone databases.

### Description

FROM: Paul Campisi DATE: 11/6/2009 4:38:08 PM Eastern Standard Time  
Angle box deterioration commands for two successive Members of Interest will not validate unless you code the first Member of Interest with at least one line of angle deterioration. Refer to the attached .xml file for an example where the left truss validates and the right does not. The only difference is the angle deterioration coding added to the command language for the first Member of Interest - Left Truss.

4/19/2016 3:07:16 PM

FROM: Krishna Kennelly DATE: 11/7/2009 9:39:05 PM Eastern Standard Time  
Submitted on behalf of Tim Ambrecht, Illinois DOT via email:

From: Shoup, Scott M  
Sent: Wednesday, November 04, 2009 3:49 PM  
To: Souther, Timothy E  
Subject: New Virtis Release

Tim,

Did we get the Virtis Release Notes for the new Virtis 6.1.0 update? I am rating the gusset plates for 090-0030 and noticed that there is a significant drop in the truss rating from my original truss run. I am wondering what they changed that caused this.

Thanks.

Scott

FROM: Herman Lee DATE: 11/9/2009 12:17:07 PM Eastern Standard Time  
For the truss in Span 10 superstructure definition, dead load and live load actions in 6.1 are the same

4/19/2016 3:07:16 PM

HRS AASHTO

1478

Complete Issue Information

as 6.0. The section properties and compression capacity of the critical member (L21U21) are different. It's related to the fix for Incident 9292 (Virtis Calculating Incorrect Angle Box and Built-up Member Section Properties).

May, please confirm the reported (see attached) section properties and compression capacity for L21U21.

FROM: Xinmei Li DATE: 11/17/2009 10:00:03 AM Eastern Standard Time  
Herman is right. The difference was due to the fix for incident 9292. Version 6.1 gives correct rating results.

L21U21 section property is defined as follows:

Builtup = VSec2 //V19, V21, V23  
TopFlangePlate  
1.00 0.0625  
BottomFlangePlate  
1.00 0.0625  
TopAngles L6x4x7/16 Vertical  
BottomAngles L6x4x7/16 Vertical  
BackToBack 19.25  
Connection Riveted 0.00  
Lacing Web

The TopAngles and BottomAngles are Vertical, which means the local y axis of angle is parallel to the y axis of the overall section. This was not correctly coded in the calculation in 6.0, but fixed in 6.1.

FROM: Xinmei Li DATE: 11/17/2009 10:53:23 AM Eastern Standard Time

FROM: Tim Armbrecht DATE: 11/18/2009 8:49:59 AM Eastern Standard Time  
This solves the issue for us, but please note the following from my consultant:

-----  
First of all the rating of this structure is now the same. It looks like they adjusted the orientation of the angles with Virtis Version 6.1. Therefore, I needed to adjust my model from "Vertical" to "Horizontal" for the angle call outs on the vertical Builtup Members (This is the info that would have been nice to get from Baker). When I did this, I got the same answer as Version 6.0.

We will need to keep this in mind when opening previous Virtis truss structures. It may be necessary to adjust the "Builtup Members" sections.

-----  
Because this fix is significant and may cause some confusion with the results of previously modeled trusses, I suggest sending out an advisory to the users as an e-notification. I also recommend updating the documentation, and perhaps attaching it to the notification to explain the changes.  
Thanks, Tim

FROM: Herman Lee DATE: 11/25/2009 8:17:53 AM Eastern Standard Time  
We are preparing a Technical Note to be sent out by eNotification.

Description

FROM: Paul Campisi DATE: 11/9/2009 1:42:54 PM Eastern Standard Time  
Virtis is miscalculating built-up member section properties when the member is reduced for horizontal leg section loss. When the built-up member is transformed into an equivalent plate girder by the BRASS engine, the percent loss of section coded for the horizontal angle legs is applied to the entire plate girder flange thickness. This reduces the total area of the angle (vertical and horizontal legs) by the percentage section loss coded for the horizontal legs. This results in substantially lower section properties. There should not be "horizontal" and "vertical" leg section loss coding in Virtis if it is taken into account.

The attached file is an example of a built-up member (Floorbeam 2) having 60% horizontal leg section loss and the section properties coming out substantially lower. Looks like the reason for this error is Virtis/BRASS is reducing (due to the section loss) the transformed flange thickness to compute the b/t

4/19/2016 3:07:16 PM

HRS AASHTO

1480

Complete Issue Information

ratio per AASHTO 10.48.2.1 for the reduced section. The b'/t might be correct but the flange area is wrong.

Per BRASS Output file:

F critical for compression flange ( $[4400 t/b]**2 \leq F_y$ ) = 19054.8 psi  
Yield moment top, bottom  
AMUT= 113.6 AMUB= 260.9 ft-kips

Floorbeam 2 Section Properties by BRASS

Ixx (no deterioration) = 1199 in<sup>4</sup> =====ok  
Ixx (calculated by Virtis w/60% loss to horizontal legs) = 847 in<sup>4</sup> ===incorrect  
Ixx (correct w/60% loss to horizontal legs) = 988 in<sup>4</sup>

Note: I did not check the vertical leg, but this should also be investigated.

Paul Campisi  
NYSDOT  
Load Rating Engineer

FROM: Brian Goodrich DATE: 11/12/2009 7:50:52 AM Mountain Standard Time  
Requested file from Paul.

FROM: Brian Goodrich DATE: 11/20/2009 11:02:54 AM Mountain Standard Time  
Virtis supports different leg thicknesses for angles, so the error is not on the Virtis side. It's the BRASS engine that does not support different leg thicknesses. I will forward this issue to WYDOT to see if there is something that can be done there.

FROM: Brian Goodrich DATE: 1/28/2010 12:01:25 PM Mountain Standard Time  
I discussed this issue with WYDOT at our quarterly meeting. We discussed the option of revising BRASS to allow different leg thicknesses, but this option was not approved. WYDOT's suggestion was to model this member as an equivalent plate girder with the section loss accounted for in the flange dimensions.

It might be possible to revise the export to generate an equivalent plate girder for a built-up member with deterioration.

Subject: RE: System Error while saving the .xml file

Dear Mr.Ordoobadi,

Please disregard the previous email sent on Nov. 12 , 2009 at 4:01 Pm.

I gave the truck percentage as 100 in the " Bridge description data" . Thats why it was giving the error message. Now its working fine.

Sorry for the inconvenience.

Sincerely,

Balaji.

From: bmahalingam@uiceng.com  
Sent: Thu, November 12, 2009, 4:01 PM  
Subject: RE: System Error while saving the .xml file

Dear Mr.Ordoobadi,

Thanks for the reply. I could save the file now, but after I try to input the Traffic data in the 'Bridge Description', and try to save it gives the system error like

" Unable to Save Bridge Data  
Saving new and modified objects failed while processing CDmBridge (Saveorder Object:53)  
.....  
-----"

similar to the system error received by Ms.Kimberly Coleman, for the Prestress strands, which I saw in the issue browser. Actually this happened before you fixed this problem for this .xml file.

Could you please help me in this regard.

Thanks,

Balaji.

### Description

FROM: Gale Barnhill DATE: 11/13/2009 2:48:06 PM Eastern Standard Time

We modeled an continuous RC Tee member with a single parabolic segment in Span 1 and 3 and two adjoining segments in Span 2.

For the shear check member, we changed the BRASS LFD properties to 5-only user defined POI and input the POI we wanted checked. ("d" from CL support and all 10th points in between).

In the BRASS output for the shear member, we see this warning multiple times.

**\*\* WARNING:** Two adjacent web segments on Span No. 1 have geometry that indicate that they are part of

    a continuous parabolic or elliptical profile. However, because the adjacent web depths are not equal, the RIGHT-MOST segment will not be considered as part of the continuous profile.

For the moment members, the BRASS LFD properties are set at 3-10th points plus user defined. We did not define any extra POI for the moment members. There are no warning messages in the BRASS output of the moment members.

Complete Issue Information

The warnings do not appear to change the results.

FROM: Brian Goodrich DATE: 11/18/2009 11:01:07 AM Mountain Standard Time  
In span 1, there is a web segment that has a depth that is slightly different at the end than at the start of the next segment.

SPAN-WEB-GENERAL 1, 24.8161, 3, 30.2813, 26.5975  
SPAN-WEB-GENERAL 1, 26.6093, 3, 32.2813, 28.2717

The error message is repeated several times due because of a loop that searches through an array. I will check with WYDOT to see if I can add something so the message only gets reported once.

Due to the reinforcement that is input, multiple cross sections are determined along the span. There must be a short range that was merged with another when Virtis generates cross sections and ranges for BRASS to export.

E-mail from Gale:

=====

Brian,  
I'm not sure how to add new comments in Elsinore.

For the bridge in this Issue, there is a bar cut-off within a few 100ths of a foot from POI 107 and 303. I changed the web variation to linear segments to eliminate the parabolic error message. In checking that model, I discovered that 107 and 303 were not getting near symmetrical results and found that due to the section change proximity issue that you explained to me in Denver, BRASS was analyzing using the cutoff bar at POI 107 and not using it at POI 303. I moved the bar cutoff 3 inches so both 107 and 303 now do not use the bar and am getting nearly symmetrical output.

I've attached my revised model with the linear segments and revised bar. See the notes on the Super Def window, Description Box.

Gale

=====

Attached 10030 revised by GAB.xml.

FROM: Brian Goodrich DATE: 1/28/2010 10:04:55 AM Mountain Standard Time  
WYDOT did not authorize any changes to limit the number of warning messages. This issue does not occur in the merged BRASS engine, which will eventually replace the BRASS LFD engine.

FROM: Brian Goodrich DATE: 3/24/2010 4:07:38 PM Mountain Daylight Time  
This issue appears to be resolved by changing the input.

Description

FROM: Todd Thompson DATE: 11/17/2009 4:59:50 PM Eastern Standard Time  
I've been having issues in getting inconsistent live load factors for legal load ratings using Virtis LRFR ratings.

Example:  
ADTT = 40

## Complete Issue Information

therefore Table 6.5 reflects factor of 1.4

BRASS LRFR has 1.4 factor used  
VIRTIS LRFR has a 1.64 factor used.

On some bridges it seems to be ok. On other bridges, not ok. Have not been able to track it down. But in comparing about 6 or 7 bridges - some agree between BRASS and VIRTIS for legal trucks within 0.2% and yet others are 20% difference - all due to incorrect LL factors being used.

Not sure if I'm missing something?

I'll attach one that has incorrect values.

FROM: Todd Thompson DATE: 11/18/2009 9:32:19 AM Eastern Standard Time  
11-18-2009

In following up with the attached structure.

If ADTT = 5000, Virtis has correct LL factor of 1.8

If ADTT = 1000, Virtis has correct LL factor of 1.65

if ADTT = 100, Virtis has correct LL factor of 1.4

but when ADTT is below 100, it incorrectly computes LL factors greater than 1.4, when they should be 1.4

FROM: Todd Thompson DATE: 11/24/2009 3:04:46 PM Eastern Standard Time

In checking Permit loads with various ADTT values - those appear to be correct.

This appears to only happen with ADTT less than 100 and when dealing with LRFR Legal load checks.

## Warranty Bug

FROM: Todd Thompson DATE: 1/11/2010 2:58:05 PM Eastern Standard Time

Not sure if this should also be considered a critical bug since you get incorrect rating results?

FROM: Herman Lee DATE: 1/12/2010 12:42:35 PM Eastern Standard Time

Our current process is to include all the bugs that will or have the potential to create unconservative results since we don't want to create a big list and nobody wants to read it. This is not a strict rule, in my opinion any bug that will affect a lot of users should also be included in the critical bugs list.

Todd, what's your comments or opinion on this?

FROM: Todd Thompson DATE: 3/1/2010 2:01:59 PM Eastern Standard Time

This bug does product "conservative" results unless one is possibly need to post a bridge because of the results being wrong. The economic and political impact can be quite large when one has to post a bridge.

So while this might not be critical, it does have the impact to affect users. Not sure if there is a large number of users.

Hopefully we can just fix this in 6.2 and move on.

FROM: Jim Duray DATE: 3/4/2010 2:13:45 PM Eastern Standard Time

Problem for ADTT < 100 for legal loads.

Fixed for 6.2

### Description

FROM: Beckie Curtis DATE: 11/18/2009 11:52:39 AM Eastern Standard Time

We haven't done many NSG's yet, so hopefully this will end up being education. In the attached file, we are trying to analyze for the distribution factor at pier 5. The model kept crashing Virtis when analyzed as NSG, and so we created a dummy model that was just spans 5 and 6. This model also crashes when doing a NSG analysis. I have attempted to decrease the settings, change which truck was being analyzed, etc but Virtis crashes each time.

FROM: Herman Lee DATE: 3/5/2010 7:50:50 AM Eastern Standard Time

Virtis Std Engine crashes while generating the output file. The input data file is attached in this incident.

Hasmukh, the distribution factors in the input data file are coming from the Non-Standard Gage analysis. This girder doesn't have live load on it, that's why the numbers are small.

FROM: Hasmukh Lathia DATE: 3/5/2010 6:34:45 PM Eastern Standard Time

Virtis Std Engine crashes because the format width to print the Shear Strength is not big enough. For some reason the Shear Strength values for certain sections in span 2 are infinite (9999999.99). Either the format statement needs to be changed or the Shear Strength needs to be set to 99999.9 to avoid this problem. Why the Shear Strength is infinite for certain sections needs to be investigated further.

FROM: Hasmukh Lathia DATE: 3/9/2010 1:39:30 PM Eastern Standard Time

Upon further investigation, it was found that the shear strength at certain sections in span 2 are set to infinite because the live load shear at these sections are negligible. Since the live load distribution factor is entered as a very small value (0.001), live load shears at these sections are negligible, hence the shear rating factor is infinite and thus the live load strength is also set to 99999999.9. Since BAR7 was not intended to do just the dead load analysis (no live load on the structure) some of these issues are coming up. The above mentioned fix should eliminate the output conversion error.

FROM: Herman Lee DATE: 3/30/2010 12:50:58 PM Eastern Daylight Time

Resolved by Hasmukh Lathia on 3/30.

FROM: Herman Lee DATE: 5/9/2010 11:56:31 AM Eastern Daylight Time

Tested "SB Dummy Span" superstructure. Virtis Std Engine crashes while generating the output file in 6.2 Beta 1.

Hasmukh, please run the attached input file (Exterior\_Girder...) in your standalone version. If it doesn't crash, send us the updated files for this fix so we can compare to see whether SourceSafe has the updated files. Thanks.

FROM: Herman Lee DATE: 3/16/2010 2:37:37 PM Eastern Daylight Time  
Duplicate of Incident 8877.

FROM: David Koenig DATE: 3/17/2010 9:03:54 AM Eastern Daylight Time  
This is also the same issue as Incidents 9648 and 9529. We had this issues several years ago and it was attributed to Windows 2000. The bottom line is that this memory issue has been around off and on for a long time and is happening in all versions of Windows. We can't run a large group of bridges without getting the error. Once you get the error, you have to reboot your machine to clear everything out. That is not a very efficient way to operate. We need to do a detailed examination on how the program is operating so that we can determine what is causing this issue and get it fixed once and for all. From our viewpoint, it has never been addressed going all the way back to the incidents we submitted in 2006.

### Description

FROM: Steve Mample DATE: 11/18/2009 1:39:45 PM Eastern Standard Time

I have a prestressed girder bridge that I am analyzing using the BRASS-LRFR engine. I used the "Compute from Typical Section" button in the Live Load Distribution window to have Virtis calculate the values for me. I reviewed the Calculations and found that Table 4.6.2.2.3c (Correction Factors for Load Distribution Factors for Support Shear of the Obtuse Corner) is being used but Table 4.6.2.2.2e (Reduction of Load Distribution Factors for Moment in Longitudinal Beams on Skewed Supports) is not. Is this correct?

Mary Walker

Idaho Transportation Department

FROM: Krisha Kennelly DATE: 4/9/2010 9:06:52 PM Eastern Daylight Time

There is a bug that prevents the 4.6.2.2.2e (reduction for moments on skewed supports) from being applied to interior beams.

This bug has been fixed for Version 6.2.

There is no workaround for Version 6.1 or prior. 4.6.2.2.2e does reduce the moment distribution factor so Opis results should be conservative.

FROM: Krisha Kennelly DATE: 5/7/2010 10:27:01 PM Eastern Daylight Time

Verified fix in 6.2 beta 1. 4.6.2.2.2e is now applied to the interior beams.

### Description

FROM: Herman Lee DATE: 11/18/2009 1:29:01 PM Eastern Standard Time  
Submitted on behalf of Dennis Morgan, Michael Baker Jr., Inc.

To reproduce, rate G7 in the SPAN 1, 2, 3 Superstructure Definition with the HS20 vehicle. Operating rating is higher when the "Consider wearing surface for rating" checkbox is checked.

FROM: Brian Goodrich DATE: 11/19/2009 9:05:33 AM Mountain Standard Time  
I investigated the difference in the ratings between the two runs: without and with the wearing surface. I tracked the problem to the input of the BRASS LFD engine "Points of Contraflexure" (see the Engine tab on the Member Alternative Description window). These percentages need to correspond to the dead load actions reported by BRASS. I changed Span 1 to 66%, Span 2 to 24% and 76%, and Span

4/19/2016 3:07:19 PM

HRS AASHTO

### Description

FROM: Beckie Curtis DATE: 11/20/2009 10:41:39 AM Eastern Standard Time

In the control options tab at the member alt level, the shear for LRFR is set to ignore shear as the default, and so we need to go into every member alternative to change this. Is there a location to change the default?

FROM: Herman Lee DATE: 11/20/2009 12:24:26 PM Eastern Standard Time

When creating a new RC and PS member alternatives, the default for "Shear Computation Method" is General Procedure and both "Ignore design & legal load shear" and "Ignore permit load shear" are selected by default. These defaults cannot be overwritten in 6.1.

For XML and database migrated bridges, the "Shear Computation Method" is set to General Procedure if shear is not to be ignored in previous version. Both "Ignore design & legal load shear" and "Ignore permit load shear" are selected by default. These migration defaults also cannot be overwritten.

FROM: Beckie Curtis DATE: 11/24/2009 11:30:33 AM Eastern Standard Time

I don't believe this is resolved, and I don't believe it is correctly identified as education.

It seems that a bridge modeled in 6.0 would have checked shear. Now that bridge has ignore shear checked in 6.1. This changes the analysis in the new version. At least this is the case for my database.

FROM: Herman Lee DATE: 11/24/2009 11:44:03 AM Eastern Standard Time

Changed Status back to Assigned and Category to Bug.

FROM: Herman Lee DATE: 11/25/2009 8:14:09 AM Eastern Standard Time

Looks like currently the "Ignore design & legal load shear" and "Ignore permit load shear" will always be checked in the migrated bridges.

For XML and database migrated bridges, if the "LRFR Ignore Shear" is NOT checked in 6.0, I think both the "Ignore design & legal load shear" and "Ignore permit load shear" SHOULD NOT be checked

4/19/2016 3:07:19 PM

HRS AASHTO

1497

## Complete Issue Information

in 6.1.

FROM: Herman Lee DATE: 12/3/2009 1:05:25 PM Eastern Standard Time

Description of the issue

=====

When migrating a 6.0 database to 6.1 or importing a 6.0 bridge XML file into 6.1, "Ignore design & legal load shear" and "Ignore permit load shear" will always be selected in the Member Alternative Description window's Control Options tab. Note that these two options are for LRFR only and only available for PS and RC member alternatives.

When "LRFR Ignore Shear" is NOT selected in 6.0, the LRFR control option "Shear Computation Method" is correctly set to "General Procedure" in 6.1 but both Ignore shear options are selected. As a result, based on what selected in the user interface, the migrated/imported 6.1 bridge will ignore shear but the 6.0 bridge will consider shear.

Investigation

=====

Since the bridges have already migrated to 6.1 and control options may have been modified by the user, a suitable/conservative solution is the following.

If the LRFR control option "Shear Computation Method" is "General Procedure" or "Simplified Procedure", set "Ignore design & legal load shear" and "Ignore permit load shear" to uncheck if and only if both of them are currently checked.

In the past several days, we worked on a utility for the above solution and also corrected the version conversion DLL in 6.1.

During developing the test cases for this utility, we found out that although "LRFR Ignore Shear" is NOT selected in the 6.0 user interface, the BRASS LRFR Engine in 6.0 will ignore shear ratings by default when searching for the critical ratings (see details in Incident 9410). Attached is the rating results comparison for a member alternative between 6.0 and 6.1. In conclusion, even though the ignore shear options are different between 6.0 and 6.1, the rating results are the same since both will ignore shear.

Resolution options

=====

1. Prepare Technical Note and provide the utility and the corrected version conversion DLL for those users that concern more about matching ignore shear options between 6.0 and 6.1 than matching rating results. Note that the utility only provides a conservative solution.
2. Prepare Technical Note to describe the issue and what needs to be reviewed.
3. Do nothing.

For models that were created prior to 6.1 (this may be prior to 6.0 actually, but they are the existing models in our now 6.1 database), the LRFR impact is set to 0. Is there an easy way to change this without manually changing each member alternative?

FROM: Herman Lee DATE: 11/20/2009 1:24:06 PM Eastern Standard Time

Please see Incident 9287 and 9519 for more information related to this issue. The script (one for each type of database) attached in 9287 allows you to change the LRFD Dynamic Allowances for all the member alternatives and member definitions in your database to the AASHTO default values. Let us know if you need instruction in applying the script and please backup your database before applying the script.

### Description

FROM: Tim Armbrecht DATE: 11/25/2009 10:37:56 AM Eastern Standard Time  
From my consultant:

RE: Girder Profile, Web tab.

The Virtis Help doesn't adequately describe what should be entered for the web depth of a RC Tee-beam (Begin Depth & End Depth). There are two possibilities for the dimension:

1. Bottom of stem to bottom of deck slab.
2. Bottom of stem to top of deck slab.

From the Help, under Girder Profile: Web, all it says is, for Begin Depth, "Enter the depth of the web at the beginning of the range." For End Depth it's, "Enter the depth of the web at the end of the range." The only way I've been able to resolve this was by going to the BRASS output and seeing, under Beam Properties, that the listed web depth is the Web depth entered in Virtis less the slab thickness. This should not be necessary.

Bottom line: The Virtis Help needs to be revised so that it specifies exactly that what is meant by Begin Depth and End Depth, is "Bottom of stem to top of deck slab."

Description

FROM: Gale Barnhill DATE: 11/25/2009 1:01:32 PM Eastern Standard Time  
For this PS Type IV Girder bridge, I can not verify the Exterior Member Eff Flange Width (STD) computed by Virtis.

Type IV web = 8 in = Eff Web  
Girder Spacing = 11 ft = 132 in  
Span Length = 64 ft = 768 in  
Structural Slab = 7.25 in  
Deck Cantilever (CL Girder to back of slab) = 42 in

I assume per AASHTO 8.10.1,

4/19/2016 3:07:20 PM

HRS AASHTO

1502

Complete Issue Information

Max Eff Slab = Span Length / 4 = 192 in

Or

Girder Space / 2 + Deck Cantilever = 132 / 2 + 42 = 108 in

Or

6 times Structural Slab + Eff Web / 2 + Deck Cantilever = 6 \* 7.25 + 8 / 2 + 42 = 89.5 in

In the Deck Profile, Virtis COMPUTE gets 93.5 in which appears to be using the total Eff Web width in the last calculation.

What am I missing ??

I've attached the Virtis 6.0 model.

Thanks,  
Gale Barnhill

### Description

FROM: Tim Armbrecht DATE: 12/1/2009 1:18:50 PM Eastern Standard Time  
From one of my staff. Please review and determine the reason for the differences. Thanks.

Tim, as discussed here is the xml file and the member summary rating page for the subject structure. As discussed, VIRTIS is showing rating factors of 0.607 (HS 12.1) for inventory and 1.013 (HS 20.3), serviceability controlling. While LARS is showing rating factors of 0.85 (HS 17.1) for inventory and 1.42 (HS 28.4) for operating, flexure (moment) controlling. The serviceability rating factors from LARS are 1.17 (HS 23.4) for inventory and 1.95 (HS 39.1) for operating. The controlling member is the 1931 steel beams in span 8. The 1931 steel beams in spans 4-7 have slightly higher (0.618) rating factors for serviceability. BARS gives rating factors of 1.1424 and 1.904 for serviceability for inventory and operating for the same beam.

Complete Issue Information

Member Alt: B28x91-Comp.

This is a simple-span structure definition, but there is one contraflexure location set to 79.90%. Generally, no contraflexure locations should be input for a simple span. If I clear this value in the BRASS LFD engine properties for the member alternative, the inventory rating is 1.183 and the operating rating is 1.975.

If this does not address the issue, please submit detailed calculations of how the other engines arrived at their ratings.

FROM: Tim Armbrecht DATE: 1/26/2010 2:32:49 PM Eastern Standard Time  
Brian, we concur. We were able to match your ratings after taking out the contraflexure location. We consider the issue closed. Thanks.

FROM: Brian Goodrich DATE: 1/26/2010 1:32:19 PM Mountain Standard Time  
Closed.

Complete Issue Information

The attached bridge will not rate in Virtis STD. Brass LFR, LRFR and Opis LRFR work.

FROM: Beckie Curtis DATE: 12/2/2009 1:16:45 PM Eastern Standard Time  
Correction - Virtis LRFR does not work.

FROM: Herman Lee DATE: 12/2/2009 3:07:51 PM Eastern Standard Time  
For the Virtis Std Engine, there's a defect in converting the beam model based shear reinforcements to span model based.  
This is fixed for the 6.2 Release.

For the Virtis LRFR Engine, analysis log has the following error message.  
A fatal error encountered while processing article "5.7.3.2 - Flexural Resistance (Prestressed Concrete)"

FROM: Herman Lee DATE: 3/15/2010 4:14:18 PM Eastern Daylight Time  
This is a duplicate of Incident 9629. A workaround for now is to enter the shear key dimensions for the box beam.

Description

FROM: William Metcalf DATE: 12/2/2009 10:44:32 AM Eastern Standard Time

We are getting an error running NSG on two separate bridges, both of which have skewed bents. This could be similar to Issues #8980 and #9000, but not sure. We have tried lowering tolerances to 0.1 for in/ft to no avail. Does a change in skew angle from bent to bent cause this, and how can this be averted?

As a side note, Virtis crashes anytime the analysis fails to run. I've seen this problem posted before but never a resolution to it. But the main concern is getting it to run correctly in the first place.

The spans of concern in the attached files are

@ 018321 - Span 3&4

@ 040198 - 26.25 m Type IV

4/19/2016 3:07:21 PM

HRS AASHTO

1507

Complete Issue Information

(copy and pasted error from 018321 file)

Unable to generate model.  
09:14:26 AM - Line 1817 in source file .\AbxVirtisDistFactEngine.cpp.

Unable to generate girder system finite element model.  
09:14:26 AM - Line 575 in source file .\AbxVirtisDistFactModelGen.cpp.

All members do not have the same number of nodes! Model cannot be generated!  
09:14:26 AM - Line 1621 in source file .\AbxVirtisDistFactModelGen.cpp.

FROM: Krisha Kennelly DATE: 12/15/2009 3:39:33 PM Eastern Standard Time  
There is a problem with tolerances in these bridges.

A workaround for 040198 - 26.25 m Type IV is as follows:  
For G2, change the deck profile length and haunch profile length from 23.438846 to 23.438845  
For G3, change the deck profile length and haunch profile length from 23.593523 to 23.593522

The NSG analysis will then run.

I am unable to find a workaround for 018321.

Notes to programmer:  
Code to fix the tolerance problem was added to AbxVirtisDistFactModelGen.cpp.

FROM: Krisha Kennelly DATE: 12/16/2009 12:57:20 PM Eastern Standard Time  
Error handling also added.

Fixed for 6.2.

### Description

FROM: Beckie Curtis DATE: 12/2/2009 11:30:41 AM Eastern Standard Time

In the attached structure, I first entered a stiffener at 42in from support 2. I then changed and entered the stiffener at 447in from support 1, which is the same location as the first try. The results changed significantly.

FROM: Brian Goodrich DATE: 1/22/2010 12:56:08 PM Mountain Standard Time

I ran both cases and found that there is no STIF-TRAN-SCHEDULE command exported for span 1 when the stiffener is input from support 2. The workaround is to input a stiffener range for span 1, with a spacing of 405".

The BRASS engine requires that the schedule be input for the entire length of the structure. The export must be revised to look for gaps in the schedules input by the user.

FROM: Brian Goodrich DATE: 1/26/2010 9:09:08 AM Mountain Standard Time

I revised the export to use the bearing stiffeners as transverse stiffeners when there are no intermediate transverse stiffeners within a span. The ratings are now the same for the structure in question regardless of how the stiffeners are referenced. Fixed for version 6.2.

FROM: Herman Lee DATE: 5/9/2010 12:40:36 PM Eastern Daylight Time

Verified in 6.2 Beta 1.

FROM: Beckie Curtis DATE: 5/12/2010 4:24:19 PM Eastern Daylight Time

See Test 9582, g2. When stiffeners are modeled in each span, ratings are fine. When you enter the stiff as -12 inches from support 2, the stiffener is shown in the model as being in the right spot, but Brass results drop.

FROM: Brian Goodrich DATE: 6/1/2010 12:52:18 PM Mountain Daylight Time

I ran the G2 member from Test 9582. A different transverse stiffener schedule is exported for the "Copy of plate girder odd stiffeners" alternative. For one of the input schedules, the spacing itself is entered as a negative value, which is not supported by the BRASS export. If the start distance is input as a negative value, the correct schedules are exported. The workaround would be to not input negative spacings.

Herman - Are negative spacings a valid entry?

FROM: Herman Lee DATE: 6/2/2010 6:18:39 AM Eastern Daylight Time

4/19/2016 3:07:21 PM

HRS AASHTO

1509

Complete Issue Information

FROM: Joseph Ihnat DATE: 6/2/2010 8:21:51 AM Eastern Daylight Time  
A negative spacing value is a valid entry .

FROM: Brian Goodrich DATE: 6/2/2010 10:22:23 AM Mountain Daylight Time  
The BRASS export will need to be revised to consider the negative spacings for the transverse stiffener schedules. Stirrups and bracing must be changed as well.

Description

FROM: Beckie Curtis DATE: 12/2/2009 11:44:50 AM Eastern Standard Time  
At a location of a change in stiffener spacing, the larger spacing is used for the analysis, which I agree with for intermediate spacings since the shear shouldn't change significantly on either side of the point of interest. However, at the support of continuous beams, the shear can be very different on each side of the support and therefore the requirement for stiffeners would be different.  
I verified the program uses the larger spacing at the support for the Virtis STD engine, not sure about Brass LFR engine (see previous issue) and I did not check LRFR.

4/19/2016 3:07:21 PM

HRS AASHTO

1510

Complete Issue Information

I recommend the program use the shear and the stiffener spacing on the side of the support that is being checked rather than the shear from one side and the stiffener spacing from the other side.

FROM: Beckie Curtis DATE: 12/2/2009 11:45:31 AM Eastern Standard Time  
Issue referred to above is 9582

FROM: Herman Lee DATE: 12/2/2009 1:16:58 PM Eastern Standard Time  
I interpret this as an enhancement request.

FROM: Tim Armbrecht DATE: 12/2/2009 4:21:02 PM Eastern Standard Time  
While I haven't seen the numbers for myself, it sounds like a bug the way Beckie describes it. If the shear is different on each side of the support, the capacity for each side needs to be calculated. If the stiffener spacing is different on each side of the support, it stands that if the capacity depends on the spacing, then the capacity is also different on each side. You can't compare the capacity based on the stiffener spacing on one side of the support with the shear on the other side.

FROM: Herman Lee DATE: 12/2/2009 5:06:48 PM Eastern Standard Time  
I would consider this as an enhancement since BAR7 is implemented as-is. I don't think BAR7 will consider stiffener spacings when determining the shear capacity. We are checking on how BAR7 handles the situation described above.

FROM: Tim Armbrecht DATE: 12/3/2009 10:15:32 AM Eastern Standard Time  
Herman, good point about BAR7. Thanks.

FROM: Beckie Curtis DATE: 12/3/2009 3:21:23 PM Eastern Standard Time  
Does anyone know what Virtis LRFR will do?

FROM: Herman Lee DATE: 12/3/2009 3:26:48 PM Eastern Standard Time  
We are currently working on the Virtis LRFR Engine steel module for the 6.2 Release. We will pay attention to what described above during the development.

FROM: Hasmukh Lathia DATE: 12/3/2009 4:15:29 PM Eastern Standard Time  
I agree with Beckie about using the stiffener spacing at the side of support where the shear capacity is calculated. This is a shortcoming of BAR7 which was implemented in Virtis Std Engine as received from PennDOT for steel girders. This needs to be corrected, but it would be an enhancement for Virtis Std Engine.

Description

FROM: Beckie Curtis DATE: 12/3/2009 1:42:27 PM Eastern Standard Time  
 When running member 4 (only member entered) the program crashes with Virtis STD engine. Brass will run.

FROM: Beckie Curtis DATE: 12/3/2009 3:20:26 PM Eastern Standard Time  
 Looking further into Brass results - There are bent bars used as reinforcement. I had originally checked them as inverted, but looking into Brass output this was putting the bars 30in or so outside of the beam. So, I unchecked the inverted box, but now the bars are 30-in too far the other way. I analyzed the beam with them as straight and they plopped in the right spot, at least at midspan. This may be why it was not working in Virtis STD. I also had issues with LRFR - Brass and Virtis.

FROM: Herman Lee DATE: 12/4/2009 10:26:08 AM Eastern Standard Time  
 For the Virtis Std Engine, we added a check for c.g. lies outside the section so it will not crash. This is fixed for the 6.2 Release.

For BRASS LRFR and Virtis LRFR, please specify the issues you have and attached the straight bar model if it's still available.

FROM: Herman Lee DATE: 1/5/2010 10:02:44 AM Eastern Standard Time  
 Information Needed E-mail sent on 1/5/09.

FROM: Herman Lee DATE: 1/9/2010 6:43:34 PM Eastern Standard Time  
 Beckie Curtis e-mail to Bridgeware on 1/8/2010:

=====

Complete Issue Information

I uploaded the file. I also uploaded the plans.

If you could let me know how the bar should be entered to model it bending I would appreciate it. Or I will just tell my folks to always put them in straight.

Thanks.

Beckie Curtis

### Description

FROM: Tim Armbrecht DATE: 12/9/2009 12:01:34 PM Eastern Standard Time

The values for Shear and Moment are based on the greater of S/5.5 and the lever-rule computed value. This might be acceptable for a new design, where one would want to ensure that the outside beam is designed for at least the LLDF of the interior beams. However, when dealing with the analysis of an already existing in-service outside beam, it is the most common practice to use the lever-rule to determine the LLDF. Would like to see an enhancement that would provide the user with the ability to set this computation to always use the lever-rule.

FROM: George Huang DATE: 6/29/2012 6:31:27 PM Eastern Daylight Time

One case for steel girder spacing @8.25' is checked. The results seems fine, however there may be some errors in the LLDF calculation files. Two files with comments in red are attached.

Another question I have is for the AASHTO Std Specs. Section 3.23.2.3.1.4 is conflict to Section 3.23.2.3.1.5. For this case, LLDF for exterior girder is s/6.06 is less than that of the interior girder S/5.5.

Complete Issue Information

FROM: George Huang DATE: 7/2/2012 11:58:51 AM Eastern Daylight Time  
One case for concrete T-beam has been checked. The LLDFD for exterior is always usinf lever rule, 3.23..2.3.1.4 never used. The bridge model 24\_0261RR in VI11164 is used.

FROM: George Huang DATE: 7/2/2012 12:19:57 PM Eastern Daylight Time  
For PC/PS girders, the LLDFD for exterior is always usinf lever rule, 3.23..2.3.1.4 is not used. Bridge model 56-0643GH.xlm is attached.

FROM: George Huang DATE: 7/2/2012 1:56:32 PM Eastern Daylight Time  
For steel girder with  $s \leq 6'$ , the results are verified.

FROM: Xinmei Li DATE: 7/2/2012 2:19:10 PM Eastern Daylight Time  
1, In attached word files, the check for  $s \leq 10.0$  and  $s \leq 16.0$  always display the same for concrete deck, S should be 7 in interior girder calculatong details. They are both release bugs, not related to the lever rule enhancement. This is reported in a seperate incident 11686.  
2, Section 3.23.2.3.1.4 has never been considered by the software since only rating is considered for LFD, not new design. Article 3.23.2.3.1.4 is geared to a new design.  
3, This enhancement is for all beam types. 3.28.2 for PS beams is ignored if this enhancement is being used.  
Please see attached email between Tim and Krisha regarding this enhancement.

FROM: Phil Litchfield DATE: 7/24/2012 7:11:18 PM Eastern Daylight Time  
From consultant (Souther):

The enhance appears to work as intended but only for exterior steel beams and stringers on the left edge of a superstructure or floor system. Even though the option is selected, the LLDF for the right-side exterior beam is computed in the default method.

FROM: Xinmei Li DATE: 8/9/2012 3:54:36 PM Eastern Daylight Time  
Resolved for next build.

FROM: Phil Litchfield DATE: 6/4/2013 10:39:15 AM Eastern Daylight Time  
Fixed in 6.4.1

### Description

FROM: Gale Barnhill DATE: 12/11/2009 10:41:02 AM Eastern Standard Time

I migrated a 6.0 DB to 6.1.

For a PS Voided Box Beam superstructure, the results are not the same.

It appears that 6.1 does not include the Wearing Surface dead load.

I have attached the 6.0 and 6.1 models and a portion of the BRASS output files showing the difference in BRASS input commands.

FROM: Herman Lee DATE: 12/11/2009 1:27:41 PM Eastern Standard Time

Gale, this is related to the fix for Incident 8504. Please see 8504 for information on the fix.

Description

FROM: Joanne Walsh DATE: 12/11/2009 6:46:27 PM Eastern Standard Time  
 Bridge description: multispan girder-floorbeam-stringer viaduct (upperdeck and lowerdeck) with steel bents. The Virtis model will analyze each span as a simple spans. Floorbeams are modeled in place of the bents just in Virtis just to complete the model (bent analysis performed by another program). I have attached the framing plans, bridge cross section and the errors I have encountered.

Issue: When I try to analyze the floorbeams in my Girder-Floorbeam-Stringer model, Virtis gets "stuck" in an endless loop. The error seems to occur during the "Generating Influence Functions" part of the program and the error is in the form of a loop at the "Time Check of 500 Positions" (see attached .doc).

4/19/2016 3:07:23 PM

HRS AASHTO

1518

Complete Issue Information

I can analyze the stringers, and am able to obtain the rating values for them. Please review the models "Span 39" and "Span 41" (see attached .xml). Another engineer is working independently on this project and she developed the same error.

Please feel free to contact me at bdartista@hntb.com. Any insight you can provide on this matter is greatly appreciated. Thank you for your time and effort.

FROM: Herman Lee DATE: 12/14/2009 9:09:30 AM Eastern Standard Time  
Decrease the wheel advancement denominator and increase the lane advancement increment will speed up the floor beam rating (see attached EngineProperties.png) but the analysis will be less refined.

Description

FROM: Brian Goodrich DATE: 12/16/2009 11:05:49 AM Mountain Standard Time  
Submitted for Tyler Haney:

-----  
Herman,

First of all, I just want to say that I understand if this is too much for you to run through...

I have a bridge that was rated with Brass 1.6.5 and received a Inventory Rating of 1.05 (HL-93 TANDEM @ Const. Stg 3 - LRFD 6.10.4.2.2 Flexural Stress) and an Operating Rating of 1.37 (HL-93 TANDEM @ Const. Stg 3 - LRFD 6.10.4.2.2 Flexural Stress). I noticed that the initial bridge appears to not have been design for the utility loading. I've modeled that same bridge in Virtis (file attached) and can't seem to get an Inventory rating of higher than 0.913 for G1 girder (no utility loading to match the initial brass 1.6.5 rating – utility loading is 7 girder spacings away)

Do you have any idea why this may be? The bridge is on a funky orientation (as shown in the pdf) so it runs diagonally through an intersection. I have run both 4 lanes across the bridge and hard wired VIRTIS to only use two lanes, but no difference in rating was seen. Just as an FYI - the exterior girders on this bridge are actually interior girders as well so distribution factors should all be the same (the interior section of the bridge was modeled during design and I have followed this same practice for the rating.)

4/19/2016 3:07:23 PM

HRS AASHTO

1521

Complete Issue Information

To me, all the input looks relatively similar (close enough that I didn't think it would decrease the rating – one difference is the design included a future wearing surface when I am not including this. So my wearing surface is 280 plf where the initial design was including 514 plf... you'd think this would cause a higher rating.) The difference I found in the output was interesting. The numbers generated for the Moments under Flexural stress were quite different (shown below)... I'm not sure why these numbers are so different when all the inputs seemed very similar if not the same... am I missing something? I just don't know how to explain the lower rating at the moment and have scoured through all this, but haven't really come across anything clear.

Hi Tyler,

Looks like the live load combination used in the two BRASS versions are different. I forwarded your support request to BridgeTech, they maintain the BRASS programs for Wyoming DOT.

Herman  
-----

E-mail from Tyler Haney:

-----  
After looking through it some more, we've noticed that, for the output shown below, not only are the live loads different as you have mentioned, but the method used to compute the resistance is different. The old brass uses 6.10.7.1.2-2 assuming a compact section where the virtis' brass is using 6.10.7.2.2-2 assuming a noncompact section. The beam used is a W18x76 and with the composite action is appears to still be a compact section so we don't know why it is using the noncompact section formula which may account for part of the change in rating... Do you know what in Virtis might be triggering the computation using the noncompact section formula or if this is part of Brass 2.0?

Thanks!,

Tyler Haney, P.E.

E-mail from Tyler Haney:

-----  
Brian,

Let me know if you need the original 1.6.5 file or if you have any questions. I still can't figure out why a bridge we rated previously that was fine is now computing with a 0.9 inventory rating...

Tyler Haney, P.E.

FROM: Brian Goodrich DATE: 12/16/2009 11:11:59 AM Mountain Standard Time  
I reviewed the output file and agree with Herman that the live loads are different. I also found differences in the dynamic load allowance, live load distribution factors, and a specification control option.

1. The 1.6.5 file uses a % of Dynamic Load Allowance of 0%, while the 2.0.0 file uses 100%.
2. The 1.6.5 file uses the tandem truck by itself along with beam distribution factors of 1.0. The 1.6.5 file was coded to have BRASS calculate the live load distribution factors, but then some DIST-BEAM-SCHEDULE commands were added, which override the automatic calculations. These commands default the live load distribution factors to 1.0. This could be an input error. The 2.0.0 file has a tandem plus lane load with beam distribution factors calculated by BRASS.
3. The STEEL-SPECIFICATION command was not input in the 1.6.5 file. Therefore, the second parameter (Allow Plastic Analysis) was automatically defaulted to YES. In the 2.0.0 file, this command was generated with parameter 2 being NO. This is why the 2.0.0 flexural resistances are in terms of stress, while the 1.6.5 flexural resistances are in terms of moment. The resistances should match up once this inconsistency is addressed.

Please let me know if this helps address your questions.

### Description

West Plate Girder:

I got the following validation errors, so I changed the flange ranges in Girder profile to eliminate these errors.

West Plate Girder (Member Alternative)

ERROR: Web and top flange total lengths are not equal.

ERROR: Web and bottom flange lengths are not equal.

ERROR: Beam shape not defined over entire length of member

alternative.

Then I did BRASS analysis with west plate girder, got zero rating factors. In BRASS output files I found the following warning messages.

4/19/2016 3:07:24 PM

HRS AASHTO

1527

Complete Issue Information

\*\*\* WARNING \*\*\*

TRANSVERSE STIFFENER SPACING AT ANALYSIS POINT 100 FOR TRUCK # 1 DOES NOT SATISFY CURRENT

AASHTO CRITERIA. ENGINEER SHOULD REVIEW.

\*\*\*WARNING STIFFENER SPACNG IS NOT ADEQUATE. REVIEW PRECEDING OUTPUT FOR LOCATION AND MORE DETAIL.

So I added transverse and longitudinal stiffeners. I got valid rating factors with the revised west plate girder. FROM: Joanne Walsh DATE: 12/17/2009 5:29:38 PM Eastern Standard Time  
Bridge description: multispan girder-floorbeam-stringer viaduct (upperdeck and lowerdeck) with steel bents. The Virtis model will analyze each span as a simple spans.

Issue: When I try to analyze the east girder in Span 41 of my Girder-Floorbeam-Stringer model, I receive the following error:

Error generating LFD/ASD load commands!

Error generating load group commands!

Unable to compute average dead load of stringer unit!

Error in the loads utility!

The west girder of Span 41 does not error but produces rating values of zero. The stringers and floorbeams in this span do not error when analyzed and produce reasonable rating values. I was looking at a similar bridge and I noticed that my stringer units seem to be labeled on top of one another in my framing plan. This might be an indicator of the error. I have attached the .xml file of my model.

Any insight you can provide on this matter is greatly appreciated. Thank you for your time and effort.

FROM: Herman Lee DATE: 12/18/2009 12:01:45 PM Eastern Standard Time

When I try to rate the "East Plate Girder" and "West Plate Girder" in the "Span 41" Superstructure Definition, Virtis complains the effective slab width (Std) is missing. Please attach the bridge XML file for reproducing the above error message.

FROM: Joanne Walsh DATE: 12/18/2009 2:01:29 PM Eastern Standard Time

I have attached the .xml file. This should be the version that reproduces the error. If the effective slab error pops up again, just delete the line in the deck profile. Thanks again for the help.

FROM: Joanne Walsh DATE: 1/6/2010 12:06:51 PM Eastern Standard Time

Any update? Thank you.

FROM: Xinmei Li DATE: 1/12/2010 9:44:42 AM Eastern Standard Time

The zero rating factors in west girder of span 41 was due to lack of stiffener definitions. There is no stiffeners defined for west plate girder. After adding valid transverse and longitudinal stiffeners, the analysis produces rating factors.

BRASS output file gives warning messages as follows:

\*\*\* WARNING \*\*\*

TRANSVERSE STIFFENER SPACING AT ANALYSIS POINT 100 FOR TRUCK # 1 DOES NOT SATISFY CURRENT

AASHTO CRITERIA. ENGINEER SHOULD REVIEW.

4/19/2016 3:07:24 PM

HRS AASHTO

1528

Complete Issue Information

\*\*\*WARNING STIFFENER SPACNG IS NOT ADEQUATE. REVIEW PRECEDING OUTPUT FOR LOCATION AND MORE DETAIL.

\*\*\* SHEAR RATING IS BASED ON THE EXISTENCE OF TRANSVERSE STIFFENERS AND LONGITUDINAL STIFFENERS WITH THE MINIMUM PROPERTIES (I&A) SHOWN. IF THE ACTUAL STIFFENERS WILL NOT MEET THIS CRITERIA, RATING FOR VERTICAL SHEAR WILL BE IN ERROR. ENGINEER SHOULD REVIEW. AASHTO EQN 10-32a MAY PRODUCE A NEGATIVE VALUE FOR MINIMUM AREA.

FROM: Joanne Walsh DATE: 1/12/2010 10:37:48 AM Eastern Standard Time  
What about for the east girder? The following error is what I receive for the east girder:

Error generating LFD/ASD load commands!  
Error generating load group commands!  
Unable to compute average dead load of stringer unit!  
Error in the loads utility!

I will add stiffeners to both girders and run the analysis again. Thank you again for the help.

FROM: Joanne Walsh DATE: 1/12/2010 3:13:55 PM Eastern Standard Time  
Issue: When I try to analyze the east girder in Span 41 of my Girder-Floorbeam-Stringer model, I receive the following error:

Error generating LFD/ASD load commands!  
Error generating load group commands!  
Unable to compute average dead load of stringer unit!  
Error in the loads utility!

The west girder of Span 41 does not error. I added stiffeners to both girders and I still get the same error on the east girder. I have attached an updated .xml file of my model.

Any insight you can provide on this matter is greatly appreciated. Thank you for your time and effort.

FROM: Xinmei Li DATE: 1/13/2010 10:34:03 AM Eastern Standard Time

For the error message you got while analyzing East girder was due to stringer definitions. If you validate "Span 41" you will get errors as follows,

Unit1 Stringer3 (Floor System Stringer Member)  
Existing member alternative: Stringer 3 Alt  
Current member alternative: Stringer 3 Alt  
Stringer 3 Alt (Stringer Member Alternative)  
ERROR: The stringer definition length of 26.6667 ft assigned

to this stringer

member alternative does not match the stringer member

length of 26.7580 ft.

4/19/2016 3:07:24 PM

 Submitted on behalf of Brent H. Schiller [BSchiller@Forsgren.com].

Received Bridgware e-mail:

=====  
 We are experiencing a strange issue that we ran across accidentally. We have a basic concrete deck on steel girder type bridge and are rating it using the BRASS LFD engine. We are running H20 and HS20 trucks for the ratings. When we run the HS20 by itself on girder G2 on the superstructure labeled "continuous 3-span CSC girder bridge", it gives a different operating rating for the axle load than if we run the H20 + the HS20 in the same run. The controlling location also seems to change. This doesn't make sense to us since we should get duplicate results for the HS20 regardless of whether we run if by itself or with another vehicle. Is this a known program bug? I've attached the xml file of the virtis model. Thank you!  
 =====

I'm able to reproduce the issue. See attached "HS20 Axle Operating.png" file.

FROM: Brian Goodrich DATE: 12/21/2009 12:17:56 PM Mountain Standard Time  
 This issue no longer occurs when using BRASS LFD 6.0.2. This version has not been released with Virtis yet.

FROM: Herman Lee DATE: 5/9/2010 12:47:18 PM Eastern Daylight Time  
 Tested the XML file in this incident.  
 Verified in 6.2 Beta 1.

Description

FROM: Herman Lee DATE: 12/18/2009 2:19:22 PM Eastern Standard Time  
Submitted on behalf of Adil Bukhari [Adil.Bukhari@stantec.com].

Received Bridgware e-mail:

=====  
I did create the channel beam that I described before and it worked fine with the BRASS Engine, when analyzing the beam. But when I use the Virtis Engine (NJDOT wants us to use Virtis Engine) the program freezes and closes after an error message. Is this a typical problem with program and what I should do to solve this issue?  
=====

Virtis Std Engine export should check for 0" inputs in the box beam.

FROM: Herman Lee DATE: 12/21/2009 3:13:24 PM Eastern Standard Time  
Received Bridgware e-mail:

=====  
I have modeled the channel beam as a double tee beam for the Virtis Std Engine as you suggested and it gives me the same problem as the model before. It freezes and then shuts down the program. Please see attached for the XML File.  
=====

FROM: Herman Lee DATE: 3/15/2010 10:17:38 AM Eastern Daylight Time  
Box beam without bottom slab (thickness equals to 0) is not supported by the Virtis Std Engine. I added checks in Virtis Std Engine export for top and bottom slab thicknesses. Fixed for 6.2 Release.

FROM: Hasmukh Lathia DATE: 3/15/2010 7:20:10 PM Eastern Daylight Time  
Modeling a channel section as a tee beam with W1 equal to W3 and specifying T1 = 0.001 would overcome the overflow error in Virtis Std Engine. The user need to verify if the section properties reported and used by Virtis Std Engine and the rating results are acceptable. May be the export program be modified to handle channel beam modeled as an I beam. The output file with above modifications is attached for user's review.

FROM: Herman Lee DATE: 3/16/2010 10:44:41 AM Eastern Daylight Time  
Updated Virtis Std Engine export to handle tee beam as I beam with bottom flange thickness equals to 0.01 in.  
Resolved for 6.2 Release.

FROM: Herman Lee DATE: 5/9/2010 12:51:51 PM Eastern Daylight Time  
Verified in 6.2 Alpha Build.

Description

FROM: David Koenig DATE: 12/22/2009 11:45:13 AM Eastern Standard Time  
 The following incident came from a consultant. We cannot verify due to time constraints and difficulties we have with running the Virtis Engine with Windows 2000.

Adjacent P/S Box Beam bridge with no slab:  
 Virtis LFD uses transformed properties for stage 1 loads, but uses gross section properties for stage 2 DL and Live Loads when calculating stresses. This does not seem correct.

## Complete Issue Information

In addition to the above incident, the consultant mentioned that Virtis includes elastic shortening losses while using transformed properties to calculate stresses. From what I understand, this loss is inherently included when you transform properties and thus should not be added. Similarly, elastic gains should not be included when you transform properties.

If you would like more information on the above topics, or need some clarification, I recommend contacting one of our rating engineers, Aaron Kemna, at (573-522-8075).

FROM: Herman Lee DATE: 12/23/2009 1:41:43 PM Eastern Standard Time  
Please export the bridge to a XML file and attach to this incident for our investigation.

FROM: David Koenig DATE: 12/23/2009 2:34:15 PM Eastern Standard Time  
We will try to get the file from the consultant as soon as possible. Until then, the XML file attached to Incident 9603 should replicate the issue.

FROM: Herman Lee DATE: 12/23/2009 4:40:55 PM Eastern Standard Time  
We will use the bridge attached to Incident 9603 for our investigation.

FROM: Hasmukh Lathia DATE: 12/28/2009 3:06:10 PM Eastern Standard Time  
Virtis Std Engine is incorrectly calculating transformed composite section properties (used for calculating DL2 and LL stresses) when the section is specified as non-composite. It is setting these properties equal to equal to basic beam gross section properties. This error has been traced to the Beam Section Properties Program that came with BAR7 from PennDOT. A fix has been found. PennDOT has been notified. The current work around is to run a non-composite PS beam as a composite section with a negligible slab thickness. Virtis Std Engine needs to be fixed for this error.

I am not clear about the issue with including elastic shortening losses using the transformed sections properties Can you provide a reference (AASHTO article or else) where it states this loss should not be included when using transformed section properties?

FROM: David Koenig DATE: 12/29/2009 9:37:18 AM Eastern Standard Time  
This was sent to us by the consultant.

As requested, please find attached some backup calculation and references for Incident 9602. Attached is the Virtis file which was analyzed, a pdf of the output from this Virtis file and hand calculations verifying the computed stresses, a pdf from NCHRP Report 496 regarding Elastic Shortening Losses, and two pdf's of the prestressed losses computed in Conspan (One using transformed section properties, and one using gross section properties). You will note that the losses from the Conspan file using gross section properties computes losses within 0.16% of that calculated by Virtis.

Comments by Aaron Kemna as it relates to transformed properties & prestress losses, AASHTO C5.9.5.2.3a is clear on the issue for LRFD. The same concept should apply for LFD, but this code is no longer updated. Dr. Maher K. Tadros, professor at the University of Nebraska would be the best contact if clarification is needed.

FROM: Hasmukh Lathia DATE: 1/4/2010 12:37:06 PM Eastern Standard Time  
Setting and using the transformed section properties for the calculations of DL2 and LL stresses will be considered as a bug fix for the Virtis Std Engine. We are awaiting a concurrence from PennDOT on this fix.

## Complete Issue Information

### Description

FROM: David Koenig DATE: 12/22/2009 11:58:16 AM Eastern Standard Time  
Incident 8504 discusses how the DL2 loads are being distributed according to the DL1 distribution defined in Virtis for non-composite P/S girders. It is our understanding that the incident will be fixed in 6.2. I was looking at an Adjacent P/S Slab Beam bridge that does not have a deck. Virtis 6.1 (BRASS Engine) is calculating and reporting three non-composite loads; superimposed dead load, DL2 - Railing, DL2 - FWS. The superimposed dead load is the combination of the Railing + FWS weight distributed according to the Stage 1 setting. The DL2 - Railing & DL2 - FWS loads are distributed according to the Stage 2 setting. BRASS is applying all of these loads on the structure, thus doubling the DL2 loads, essentially. This may apply to more structures or engines than mentioned here.

FROM: Herman Lee DATE: 12/22/2009 2:55:08 PM Eastern Standard Time  
Incident 8504 has been fixed in 6.1 Release.

FROM: Brian Goodrich DATE: 12/23/2009 9:01:51 AM Mountain Standard Time  
Requested bridge file.

FROM: David Koenig DATE: 12/23/2009 11:27:21 AM Eastern Standard Time  
It just occurred to me that this file was exported from Version 6.0 and imported into 6.1. Maybe this is a migration issue.

FROM: David Koenig DATE: 12/23/2009 1:53:35 PM Eastern Standard Time  
In talking with Tim Armbrrecht a couple of days ago, he indicated the Incident 8504 was not in Version 6.1, but would be in Version 6.2

FROM: David Koenig DATE: 12/23/2009 2:20:07 PM Eastern Standard Time  
Clarification. The bridge file attached was exported from 6.0. The problems occur after importing to 6.1. We are still in the process of upgrading our production database to 6.1. That's why we had to do this exporting importing workaround.

FROM: Brian Goodrich DATE: 12/23/2009 1:12:44 PM Mountain Standard Time  
I was able to duplicate the results reported by David. The export is accounting for some of the dead loads twice. I will investigate the source code.

FROM: Brian Goodrich DATE: 1/8/2010 8:55:01 AM Mountain Standard Time  
I corrected the BRASS export to only generate the member load commands when a non-composite P/S member has deck loads distributed uniformly in stage 2. Fixed for version 6.2.

FROM: Herman Lee DATE: 5/5/2010 4:41:53 PM Eastern Daylight Time  
Verified in 6.2 Alpha 4.

FROM: David Koenig DATE: 5/11/2010 3:56:29 PM Eastern Daylight Time  
Verified in 6.2 Beta

Description

FROM: Tim Armbrecht DATE: 12/22/2009 12:12:25 PM Eastern Standard Time  
 For this GFS, Virtis is rating the girder HS 11.4 inventory and HS 19.1 Operating, which is much lower than the results from LARS (which grabbed its info from Virtis using the Connector program) Also attached a copy of the LARS Results Summary.

FROM: Brian Goodrich DATE: 12/23/2009 9:04:58 AM Mountain Standard Time  
 I tried all the girders in the bridge, but none of them result in an HS 11.4 inventory rating. Please note exactly which girder is giving the difference.

Sometimes the differences can be attributed to the engine properties, particularly for steel. BRASS LFD requires the user to specify the contraflexure locations and the pier compactness in these engine properties.

FROM: Brian Goodrich DATE: 12/23/2009 1:52:12 PM Mountain Standard Time  
 Requested more information to narrow down the differences.

FROM: Herman Lee DATE: 1/5/2010 10:09:06 AM Eastern Standard Time

Complete Issue Information

Information Needed E-mail sent on 1/5/09.

FROM: Tim Ambrecht DATE: 1/6/2010 12:15:32 PM Eastern Standard Time  
I'm a little short on manpower right now. I'll try to verify why we came up with a HS 11.4 and Brian did not.

FROM: Brian Goodrich DATE: 1/20/2010 10:37:55 AM Mountain Standard Time  
I'm able to duplicate the rating now. We do need information on how LARS arrived at the higher rating factor. BRASS LFD requires the user to specify the contraflexure locations and the pier compactness in these engine properties. I'm not sure if this is part of the issue or not. Also, Baker provided a flowchart for comparing results. The BRASS intermediate results for the critical POI should be turned on to compare to the LARS results at the same point. This should help isolate the issue.

FROM: Tim Ambrecht DATE: 2/22/2010 4:50:23 PM Eastern Standard Time  
I have attached some LARS reports for your use. The detailed member report (FlexuralMemberReport) should give you the info you need to compare results. If you need any additional information, please let me know. Thanks.

FROM: Brian Goodrich DATE: 4/17/2010 7:04:24 PM Mountain Daylight Time  
Ran BRASS-LFD for Member Alt: 0020003\Spans\_1-3\_(GFS)\1\_-\_E\_Girder\120\_\_WPG\BRASS\_LFD.

From the BRASS output file:

LOAD NO. 1: Truck: AASHTO H 20-S 16 Loading, 1944 Ed  
TOTAL VEHICLE WT. : 36.00 (tons)  
CONTROLLING POINT : 103.00  
Limit State : STEEL GIRDER (FLEXURAL - STEEL STRENGTH )  
RATING FACTOR (pos): 0.48  
LOAD RATING : 17.39 (tons)

Strength Rating Factor - Flexure (Positive Action) - BOTTOM OF SECTION  
Dead Load Moment = 2075.93 (ft-kips)  
Live Load Moment = 2366.67 (ft-kips)  
Nominal Capacity = 5180.75 (ft-kips)

$$\text{R.F.} = \frac{[(\Phi(\text{flexure}) * Mn) - (\text{Gamma} * \text{Beta}(\text{DL}) * \text{DLM})]}{(\text{Gamma} * \text{Beta}(\text{LL}) * \text{LLM})}$$

\*\*R.F. = 0.4831

The dead and live load moments show above are unfactored.

There is a difference in the capacity from how I'm reading the LARS reports. At the 1.3, LARS is showing 5789.5 ft-kips. Please confirm and expand on how this value was determined.

FROM: Herman Lee DATE: 5/6/2010 4:46:16 PM Eastern Daylight Time  
Information Needed E-mail sent on 5/6/10.

## Complete Issue Information

I forwarded this to Bentley to look at. When I get a response, I'll post it here.

FROM: Tim Ambrecht DATE: 7/12/2010 3:44:31 PM Eastern Daylight Time  
From Bentley:

Hi Tim,

Regarding the rating difference between BRASS and LARS for bridge 0020003, member "Spans1\_3\_(GFS)\1\_-\_E\_Girder\120\_WPG" (Girder G2 in LARS) we have found the following:

The LARS Connector is not extracting all of the superimposed dead load for Virtis GFS superstructures correctly which is affecting the member in question. Work is underway to remedy this problem.

To properly model this member in LARS for comparison with BRASS, we applied the dead load to the girder extracted from Virtis exactly as specified in the BRASS output that you sent us. Using the LARS rating of this model to compare to the BRASS results we found the following:

Dead load and live load moments at the checkpoint in question (i.e. cp 1.3) were within a reasonable tolerance.

LARS makes two assumptions when processing longitudinal stiffeners:

- 1) the stiffener is in effect the entire length of the member
- 2) the location of the stiffener (i.e. the  $d_s$  term used in section 10.48.4.1) is automatically computed by LARS as  $D/5$ .

When we extract members from Virtis longitudinal stiffeners are detected and their presence is made known to LARS, but the above actual  $d_s$  valued is needed to correctly compute the moment capacity. The value of  $d_s$  is not passed through DataConnector.

When computing  $\mu_u$  according to eq. 10-103a ( $\mu_u = \mu_r * R_b$ ), a discrepancy was discovered in the calculation of  $R_b$ . LARS computes a value  $R_b$  equal to 1.0 while Virtis computed a value of  $R_b = .737$ . If you multiply the LARS  $\mu_u$  by 0.737, the resulting lower rating is consistent with the BRASS rating. The reason for this discrepancy is the difference in the  $d_s$  value. LARS uses a value  $120/5=24$  and passes the criteria of  $D/t_w \leq 5460 (k/f_b)$ , resulting in  $R_b=1.0$ . Virtis uses a value 120 and fails the criteria resulting in  $R_b=.737$ . This is the difference between the LARS moment capacity of 7527 and BRASS moment capacity of 5549. If you multiple the LARS moment capacity of 7527 \* .737, the result is 5547 – close to the BRASS value of 5549. Therefore, when the same value is input, both LARS and BRASS are performing in the same manner.

A possible workaround would be to add the maximum  $d_s$  value in a stiffener ranges when DataConnector gets the stiffener data. Would this solution be acceptable to you?

Please let us know if you have any questions. Ron and I are would be happy to get on a call to discuss this with you further.

Thanks,

Rita

So, related to the above explanation from Rita, how does Virtis/Lars get the ds value she mentions? is it entered by the user, or is it calculated by either/both of the programs?

FROM: Tim Armbrecht DATE: 7/12/2010 3:46:15 PM Eastern Daylight Time  
Sorry, I meant "Virtis/BRASS", not "Virtis/Lars"

FROM: Herman Lee DATE: 7/13/2010 8:21:38 AM Eastern Daylight Time  
ds should be based on the vertical distance entered for the longitudinal stiffener range in the user interface. Brian, please confirm the exported BRASS STIF-LONG-GROUP command. Thanks.

FROM: Brian Goodrich DATE: 9/2/2010 10:23:08 AM Mountain Daylight Time  
If the user inputs a fixed longitudinal stiffener distance, BRASS exports that distance as parameter 4 on the STIF-LONG-GROUP command. If the user inputs a percent of web, BRASS is supposed to export the web depth times that percent, but that wasn't happening correctly until v6.2 beta6 (see VI 10134). BRASS does not automatically calculate this distance if left blank. The GUI input shows the distance input as 24" from the bottom flange. The BRASS resulting BRASS output shows ds = 24". I would like to see the BRASS output showing the ds = 120".

We currently use the BRASS engine for various reasons, but an important one to us is that you can get a detailed tabular report for all trucks (with impact, without impact, single lane and multilane). Can we get this same report or something similar for the Virtis Engine. We would prefer not to use the Virtis Engine with its current limitations.

Hi Jim,

I'm not sure what's the logic and necessity to limit the concentrated load to 99.999. I hope this limit to be modified. Thanks.

George

RE: Possible Error within Virtis  
LFD

Hi Vinacs,

Virtis Std Engine requires those DC2 concentrated loads to satisfy the XX.XXX input format (see Page 5-6 in the Virtis Std Engine User Manual).  
The Py loads entered for the "Copy of Interior Steel Girder (1966) 11/09" exceed this input format.

Subject: Possible Error within Virtis LFD

Hi

We have placed additional concentrated loads (Load Case 2) using member load GUI.

When we tried to analyze the bridge using VirtisLFD engine the following error popped up. (BRASS LFD continued to analyze the bridge)

Could you please let us know what causes for the VirtisLFD program to terminate the analysis.

Attached structure won't run in Virtis STD engine.

#### Gives error:

Cannot compute appurtenance dead load by continuous beam analysis!

FROM: Krishna Kennelly DATE: 1/4/2010 11:19:28 AM Eastern Standard Time

The dead load distribution by continuous beam analysis is not available for the Virtis STD engine as descibed in the Engine Related help for the Virtis Std Engine.

The system error message is misleading, there was no error computing the load. That method of computing the load just isn't available for this engine.

For 6.2 warning message will be issued that this method of computing the load isn't available instead of issuing the system error message.

Description

FROM: Xinmei Li DATE: 1/5/2010 9:59:07 AM Eastern Standard Time  
This is submitted by Vinacs M Vinayagamoorthy from CA DOT.

I did some hand calculations as below, result matches BRASS output.

$$F_y = 50 \text{ ksi} = 50000 \text{ psi}$$

$$t_w = 0.375''$$

$$D = 106''$$

$$d_0 = 18''$$

$$d_0/D = 48/106 = 0.453 < 3$$

$$V_p = 0.58 (106)(0.375)(50) = 1152.75 \text{ kips} \quad (10-115)$$

$$k = 5 + (5/(0.453^2)) = 29.38$$

$$D/t_w = 106/0.375 = 282.67$$

$$7500 \cdot \sqrt{k}/\sqrt{F_y} = 7500 \cdot \sqrt{29.38}/\sqrt{50000} = 181.80$$

Since  $D/t_w > 7500 \cdot \sqrt{k}/\sqrt{F_y}$ ,

4/19/2016 3:07:27 PM

HRS AASHTO

1548

Complete Issue Information

$$C = 4.5 \times 10^7 \text{ k} / ((D/tw)^2 \cdot Fy) = 4.5 \times 10^7 \cdot 29.38 / ((282.67^2) \cdot 50000) = 0.331 \quad (10-117)$$

Since  $d0/D < 3$ , use (10-114) to calculate shear capacity

$$Vu = Vp \cdot (C + (0.87 \cdot (1 - C)) / (\sqrt{1 + (d0/D)^2})) = 1152.75 \cdot (0.331 + (0.87 \cdot (1 - 0.331)) / (\sqrt{1 + 0.453^2})) = 992.5 \text{ kips} \quad (10-114)$$

In Virtis LFD output shear capacity was calculated with Equation 10-113 or 10-119,  $Vu = C \cdot Vp = 0.331 \cdot 1152.75 = 381.56 \text{ kips}$ .

Standard spec 10.48.8.1 says for beams and girders with unstiffened webs, the shear capacity should be calculated with Eq. 113. This member has both transverse and longitudinal stiffeners.

Standard spec 10.48.8.3 says the first stiffener space at the simple support end of a transversely or longitudinally stiffened girder, use Eq. 119. The analyzed location is not at the first stiffener space.

Since  $(d0/D)$  is less than 3, I think 10-114 should be used to calculate shear capacity at this location.

Cc: George Huang; Anthony Gugino  
Subject: Shear Capacity Estimate by Virtis-LFD and BRASS-LFD software

Hi

I noticed the shear capacity estimate by the Virtis-LFD and BRASS-LFD drastically different for the attached bridge at 28.5ft away from support.

Consider the 'Left Interior Girder Model' for the comparison.

Check the location at 28.5ft away from support. You may have to create the analysis point to get the BRASS-LFD results.

Here is the summary of the results from BRASS-LFD, Virtis-LFD and Hand Calc (At the location of 28.5 ft)

(Embedded image moved to file: pic02929.jpg)

If you notice the results, Capacity estimated by the Virtis-LFD is 381.5 compare to 992.75 kips estimated by the BRASS and HandCalc.

It appears that the Virtis-LFD did not use the Equation 10-114, instead it used the 10-113 and or 10-119.

Could you please review and let us know which analysis engine is wrong.

(See attached file: 39\_0164L.xml)

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer  
916-227-8657

FROM: Herman Lee DATE: 1/5/2010 12:29:17 PM Eastern Standard Time  
Virtis Std Engine uses Eq 10-113 if the girder has an unstiffened web or has a stiffened web and the  $d_0/D$  ratio is greater than 3, or if it is an end panel or if the girder is hybrid. It uses Eq 10-114 if the girder has a stiffened web and the  $d_0/D$  ratio is less than or equal to 3.

Please let us know if you want to change this to an enhancement request.

FROM: vinacs vinayagamoorthy DATE: 4/27/2010 3:47:56 PM Eastern Daylight Time  
Virtis LFD did not use Eq10-114 though the  $d_0/D \leq 3$  with stiffeneed web (if it did, the capacity should have been around 992 kips. I think it is a bug NOT an enhancement

FROM: Herman Lee DATE: 4/27/2010 5:37:51 PM Eastern Daylight Time  
Vinacs, if I remember right, Virtis LFD uses Eq 10-113 because it's a hybrid girder.

FROM: George Colgrove DATE: 5/11/2010 1:09:41 PM Eastern Daylight Time  
Please look at George Huang's comments

FROM: George Huang DATE: 5/12/2010 5:02:30 PM Eastern Daylight Time  
This is not a hybrid girder. If there is no plan to update the Virtis Std LFD engine, this mistake, which is a bug, should be informed to all users. Although this bug yields LOWER ratings, it may cause some unnecessary very very long detour. This is un-wanted so called conservative.

FROM: Herman Lee DATE: 5/13/2010 11:27:52 AM Eastern Daylight Time  
Please see attached for the top flange input in the Girder Profile window of the bridge attached in this incident. The top flange has both the 42 and 46 ksi materials entered. Let us know if you would like to change this to an enhancement request for the Virtis Std Engine.

### Description

FROM: Gale Barnhill DATE: 1/5/2010 10:25:06 AM Eastern Standard Time

This is a follow-up to Incident 9591.

In my report for 9591, I had the results reversed, 6.0 did not create a WS load evenly distributed to all members, 6.1 does.

However, I now see an additional load created in both 6.0 and 6.1 that appears to be the WS applied as a tributary load.

If I remove the WS input from the Typical Section, then both loads go away.

I've attached the 6.1 model and a portion of the BRASS output with notes.

FROM: Herman Lee DATE: 1/5/2010 12:38:39 PM Eastern Standard Time

I think this is a duplicate of Incident 9603.

FROM: Brian Goodrich DATE: 1/8/2010 9:14:03 AM Mountain Standard Time

This is a duplicate of 9603.

### Description

FROM: Beckie Curtis DATE: 1/5/2010 2:47:58 PM Eastern Standard Time

We were looking at some construction loads (don't worry, we aren't actually approving axle loads quite that big yet) and the Virtis STD engine is giving really inaccurate values when the axle loads are greater than 99.99 kips. We were looking at a steel beam superstructure. Brass engine worked fine.

FROM: Herman Lee DATE: 1/5/2010 4:10:40 PM Eastern Standard Time

Virtis Std Engine doesn't support axle load greater than 99.99 kips since the input format for Axle Load is XX.XX. The fix for Incident 8965 (Virtis Std Engine needs to check valid input format.) will stop the rating process in 6.2 Release.

Please let us know if you want to change this to an enhancement request.

FROM: Beckie Curtis DATE: 1/5/2010 5:15:31 PM Eastern Standard Time

Just giving an error rather than an incorrect result is enough. Thanks.

A web depth on span 2 could not be determined due to an invalid range. (iseg\_store = 0)

----- End of Contents of BRASS Error File -----

FROM: Brian Goodrich DATE: 1/8/2010 1:40:39 PM Mountain Standard Time  
 I believe there is an input problem on the Deck Concrete tab in the Deck Profile window. The second entry has a length of 14.496' and the third entry has a start distance of 129.996' with a length of 109.004'. Changing these to 14.5', 130.0', and 109.0', respectively, allows the structure to be run.

### Description

FROM: Todd Thompson DATE: 1/8/2010 11:30:32 AM Eastern Standard Time

I was working with a 3 span cont RC Slab bridge.

I used the compute from typical section (used 42.6667 ft and 2 lanes along with 12 in wide slab) and did ok.

It pasted into Virtis the LL DF's for LRFR. But when I reviewed the calcs - vs what was in Virtis - I noticed that for Span 3 - it placed the Span 2 value for Moment and for Shear.

When I review the calc's and and summary - they are correct for Span 3. Just the data isn't getting to Virtis from the LRFR LL DF Calculation correctly.

I've attahed screen shot after running LRFR LL DF calculation, I've attached the calcs and I've attached an xml of the bridge.

Virtis 6.1 - SQL Server DB

FROM: Todd Thompson DATE: 3/2/2010 10:27:38 AM Eastern Standard Time  
I've added another bridge in which the last span doesn't get captured from the LLDF calculation and saved into Virtis correctly.

This Bug causes me to have to review every single one and verify that the correct DF's are placed into Virtis and when they don't I have to manually correct the application.

Hopefully this bug will be fixed and in the 6.2 Release.

I added structure 58033060

FROM: Todd Thompson DATE: 3/2/2010 10:44:49 AM Eastern Standard Time  
Added another structure, including all the screenshots.. 58043060

FROM: Krisha Kennelly DATE: 3/3/2010 10:46:57 PM Eastern Standard Time  
Fixed for 6.2 release.

bug only appears to be a problem with rc slab line member alts.

FROM: Krisha Kennelly DATE: 5/7/2010 10:29:31 PM Eastern Daylight Time  
verified in 6.2 beta 1 build. Ran Distribution factor wizard for all 3 attached bridges. last span now shows the correct DF in the UI.

FROM: Todd Thompson DATE: 5/11/2010 1:39:04 PM Eastern Daylight Time  
6.2 Beta 1  
I checked 36480091 and appears to be fixed.  
I'll continue to monitor this to make sure.

## Description

FROM: Beckie Curtis DATE: 1/8/2010 4:34:43 PM Eastern Standard Time

In G7 of span 1 or 4 (JN 90115) Virtis gives 1.002 for rating of HS-20 at 60% and Brass gives 1.297. This is a prestressed beam, fairly short span with only four prestressing strands.

FROM: Herman Lee DATE: 1/9/2010 10:00:24 PM Eastern Standard Time

Virtis Std Engine uses flexural strength reduction factor k (AASHTO Manual 6.6.3.3) when  $\Phi * M_n$  is less than 1.2 times cracking moment  $M_{cr}$ . BRASS Engine doesn't use flexural strength reduction factor.

If you would like us to investigate further, please narrow down the difference to the point that the rating diverge so we can provide more specific help.

FROM: Beckie Curtis DATE: 1/11/2010 9:34:33 AM Eastern Standard Time

But we are at or over the  $\Phi * M_n = 1.33 * \mu$ , so k should be near or at 1.0, and the capacity should not be reduced. This is in MBE 6B.6.3.3 and AASHTO LFD 9.18.2.2

FROM: Hasumkh Lathia DATE: 1/12/2010 4:57:50 PM Eastern Standard Time

Virtis Std Engine does not check for provision of AASHTO LFD 9.18.2.2. It was set to conform to AASHTO 1996 LFD Specs. 1996 LFD specs did not have a waiver of Article 9.18.2.1.

Can you provide some backup calculations to your statement "But we are at or over the  $\Phi * M_n = 1.33 * \mu$ , so k should be near or at 1.0, and the capacity should not be reduced."?

FROM: Beckie Curtis DATE: 1/12/2010 5:40:00 PM Eastern Standard Time

Using HS-20 truck at 40%:

$$\mu = 1.3 * (164.61 + 16.5) + 2.17 * (274.37) = 830.82 \text{ k*ft}$$

$\Phi * M_n = 1022.45 \text{ k*ft}$  per detailed rating output

$$k = \Phi * M_n / (1.33 * \mu) = 1022.45 / (1.33 * 830.82) = 0.93, \text{ which I believe is higher than}$$

So the revised nominal moment capacity is 950k\*ft, giving you a rating factor of 1.2 (instead of the 1.32 that you would have had if you chose to ignore k).

Even if this isn't added to Virtis Std Engine, I feel it should be an option (off or on) for the Opis LFR.

FROM: Beckie Curtis DATE: 1/12/2010 5:42:29 PM Eastern Standard Time

Revising:

4/19/2016 3:07:28 PM

HRS AASHTO

1557

Complete Issue Information

So the revised nominal moment capacity is 950k\*ft, giving you a rating factor of 1.2 (instead of the 1.32 that you would have had if you chose to ignore k and more than the 1.014 that Virtis STD is giving).

Even if this isn't added to Virtis Std Engine, I feel it should be an option (off or on) for the Opis LFR. It makes a bigger difference for my legal/overloads at operating level.

FROM: Hasmukh Lathia DATE: 1/13/2010 2:28:52 PM Eastern Standard Time

I agree that there should be a user option to use or not to use the reduction factor k per MEB 6.6.3.3, but I am not sure if you can check the provision of AASHTO LFD 9.18.2.2 by taking a ratio of  $\phi * M_n / (1.33 * \mu)$ . In a rating analysis,  $\mu$  is a function of the live load being rated where the rated load is equal to the rating factor times the rating vehicle. In any case, either adding an option for k or checking AASHTO LFD 9.18.2.2 will be an enhancement to Virtis Std Engine. The provision of LFD 9.18.2.2 is more of a design specification rather than a rating specification.

FROM: Herman Lee DATE: 1/14/2010 7:58:43 AM Eastern Standard Time

Hasmukh checked with PennDOT. PennDOT PS3 does not check for the provision of 9.18.2.2. Category changed to Enhancement.

Description

FROM: William Metcalf DATE: 1/11/2010 12:21:46 PM Eastern Standard Time

I have a question regarding the LRFD exterior girder live distribution factor calculation from typical section. The attached bridge does NOT have any diaphragm or cross frame. The software still used the special analysis to calculate the distribution factor and which does control the result. I think the DF should be calculation per lever rule only.

Please review the calculation.

Thanks,  
Dana

FROM: Krisha Kennelly DATE: 2/5/2010 6:52:30 PM Eastern Standard Time

There is no bridge attached to this incident but I do see in the code where the check for diaphragms was not made.

Code has been revised to only process the rigid deck distribution in Art. 4.6.2.2.2d if diaphragms exist. Code was tested on BID10. Fixed for Version 6.2

Description

FROM: Herman Lee DATE: 1/16/2010 8:10:31 AM Eastern Standard Time  
Reported by Rob Benshoof, TN DOT.

I got the following error message when I tried to generate the influence line output with a Type 3 vehicle.

Input Errors (1095) - For influence line output (IOUT = 9) only one live load may be entered.

FROM: Has Mukh Lathia DATE: 1/16/2010 9:15:05 AM Eastern Standard Time  
This appears to be a bug in Virtis Std Engine. It checks for a combination of the OUTPUT code and the LIVE LOAD code before reading the NO OF SP LL in the Control and Criteria line. Currently there is no workaround for this problem. This needs to be fixed in the next release of Virtis.

FROM: Herman Lee DATE: 3/30/2010 4:11:07 PM Eastern Daylight Time  
Resolved by Has Mukh Lathia on 3/30 for 6.2 Release.

Description

FROM: Paul Campisi DATE: 1/20/2010 12:05:09 PM Eastern Standard Time

The attached girder floorbeam bridge has four main load carrying longitudinal girders. When I run any of the floorbeams I get the following error message.

----- Contents of BRASS Error File -----

File: C:\Program Files\AASHTOWARE\VirtisOpis60\3348270\Span\_4\Floorbeam5\FB5  
 \BRASS\_LFD\FB5.ERR  
 Fatal Error Encountered - Unexpected Termination  
 Data File: 48270\Span\_4\Floorbeam5\FB5\BRASS\_LFD\FB5.DAT

```

-----
Error No.: 1103
Type   : Input Error
Location : prgen.for
      ****ERROR**** A GIRDER CROSS SECTIONAL AREA LESS THAN 0.01 EXISTS IN SPAN
1 SPAN POINT = 19
  RUN STOPPED.
  REVIEW INPUT OF CROSS SECTION DATA AND SPAN DATA.

```

----- End of Contents of BRASS Error File -----

I do not see where any of the required floorbeam parameters in Virtis are undefined.

Load Rating

FROM: Brian Goodrich DATE: 1/22/2010 11:33:21 AM Mountain Standard Time  
The 1 ft cantilevers are so small that BRASS cannot create tenth points in the model because the nodes would be too close together. Cantilevers of 1.2 ft seem to work. The workaround is either to enter a slightly longer cantilever or to eliminate the cantilever all together.

The only other option would require a change to BRASS to generate fewer nodes for a short span. I forwarded this issue to WYDOT.

FROM: Brian Goodrich DATE: 1/26/2010 12:03:13 PM Mountain Standard Time  
This is similar to Incident 7639.

FROM: Brian Goodrich DATE: 1/28/2010 10:00:57 AM Mountain Standard Time  
WYDOT assigned this issue to BRASS Problem Log 933.

FROM: Brian Goodrich DATE: 5/18/2011 8:24:52 AM Mountain Daylight Time  
For extremely short spans that cannot physically consist of ten elements due to the short element limitation, fewer elements must be created. The girder engines were revised add fewer elements for this condition. Additionally, the algorithms that generate points of interest at tenth points were modified to only generate points of interest at tenth points that coincide with the generated mesh. For example, if a span had five original elements, then points of interest would be generated at 0%, 20%, 40%, 60%, 80%, and 100%. Fixed for BRASS-GIRDER(STD) 6.0.3 and BRASS-GIRDER(LRFD) 2.0.3. Fixed for Virtis 6.2.

Description

FROM: Herman Lee DATE: 1/21/2010 1:24:46 PM Eastern Standard Time  
 Submitted on behalf of Scott Cavanaugh, HNTB (SCavanaugh@HNTB.COM).

AASHTO Engine should only use the shear information in the point of interest when Override schedule is checked.

FROM: Krisha Kennelly DATE: 1/30/2010 11:19:56 PM Eastern Standard Time  
 I need some more information to investigate this.

What engine are you running: AASHTO LRFD or AASHTO LRFR?

And which information is being used even though you have not checked Override?

Please attach an xml version of your bridge. Thanks.

4/19/2016 3:07:30 PM

HRS AASHTO

1567

Complete Issue Information

FROM: Herman Lee DATE: 1/31/2010 9:55:01 AM Eastern Standard Time

To reproduce:

1. Use Example7 G2 member
2. Change LRFR Shear Computation Method to General Procedure and uncheck both LRFR Ignore Shear options
3. Remove all existing points of interest
4. Rate G2 with the Virtis LRFR Engine
5. Spec Check at mid-span evaluates both 6.4.2.1 Concrete Flexure and Shear
6. Add a point of interest at mid-span without overriding schedule
7. Rate G2 again
8. Spec Check at mid-span only evaluates 6.4.2.1 Concrete Flexure

Looks like the spec check is reading the disabled LRFR ignore shear options in the point of interest.

FROM: Krisha Kennelly DATE: 4/7/2010 1:01:26 PM Eastern Daylight Time

A work around is to:

1. Select the Override Schedule checkbox on the Shear tab on the POI window.
2. Unselect the 2 'Ignore shear' options for LRFR.
2. Select the Override Schedule checkbox again (so that the box is not checked.)
3. Lrfr analysis will now include shear checks at the POI.

FROM: Krisha Kennelly DATE: 4/11/2010 12:54:16 PM Eastern Daylight Time

Fixed for 6.2

FROM: Srujana Thogaru DATE: 5/5/2010 4:12:18 PM Eastern Daylight Time

Verified for 6.2 Beta build 1.

### Description

FROM: Tim Armbrecht DATE: 1/28/2010 10:40:38 AM Eastern Standard Time

From my consultant:

There is an error that occurs when running the rating for this bridge. I have it narrowed down to something involved with the intermediate support of the floorbeam. All of the stringers appear to run correctly, but the error occurs when BRASS is rating the floorbeam. I haven't pin pointed the issue. When I delete the intermediate supports of the floorbeam, BRASS runs. A low rating is generated.

(xml attached)

The particular floorbeam with section loss is in "Unit I – 3-Sp Cont-x". It is Flbm25, however this error message occurs with all floorbeams with intermediate supports.

FROM: Brian Goodrich DATE: 2/4/2010 9:56:38 AM Mountain Standard Time

I have confirmed this is a bug. It appears to be with the export and engine properties.

This is the error message I get:

```
Error generating LFD/ASD schedule commands!  
The contraflexure locations cannot be equal!  
Invalid BRASS engine properties for the member alternate!  
Error generating STEEL-GIRDER-CONTROL command!
```

Is this the same error you are getting?

FROM: Brian Goodrich DATE: 3/23/2010 8:35:06 AM Mountain Daylight Time

E-mail from Bob Perkins (2/10/2010):

This is the error message I'm receiving:

```
Error generating LFD/ASD schedule commands!  
The first contraflexure location must be less than the second!  
Invalid BRASS engine properties for the member alternate!  
Error generating STEEL-GIRDER-CONTROL command!
```

Bob Perkins

FROM: Brian Goodrich DATE: 3/23/2010 8:38:22 AM Mountain Daylight Time

4/19/2016 3:07:30 PM

HRS AASHTO

1569

### Complete Issue Information

The contraflexure locations in the BRASS engine properties are based on the number of spans. When the intermediate supports are used, the spans of the contraflexure locations don't match up, which leads to the error messages we are seeing.

FROM: Brian Goodrich DATE: 4/18/2010 10:18:05 AM Mountain Daylight Time

One option is to revise the engine properties to include the intermediate supports when determining the number of spans. This still provides the user with control over the contraflexure locations exported to BRASS. We should discuss how this would affect existing structures and what we can do to correct these structures.

Subject: errors and issues with truss and floor systems

4/19/2016 3:07:31 PM

HRS AASHTO

1573

Complete Issue Information

09:29:55 AM - Line 1288 in source file .\EngineExport.cpp.

Error preparing stringer dead load reactions!

09:29:55 AM - Line 3771 in source file .\LoadsUtility.cpp.

This error message doesn't show up if I just rate the bridge – only when I use the UPR button.

- 2) Glulam is not an option in the timber deck input - only nail laminated and plank. Why wasn't the glulam option added? It can't be that hard. I had to manually calculate and enter all of the distribution factors and the timber factors.
- 3) When I add point loads to the girders in a timber deck, steel girder superstructure, I can't rate the deck because "Madero doesn't support point loads". Point loads applied directly to the girders shouldn't affect the deck, and Madero should be able to run. The point loads shouldn't even be exported to Madero.
- 4) It is very frustrating to not have a timber deck option in truss and floor system superstructures. I have to build a completely separate superstructure just to rate the deck.
- 5) The program doesn't allow me to enter section loss directly over the bearing location or to the left of the bearing. The girders on this bridge have section loss in the webs, but only over the bearing area. If I enter the start point for the section loss as a negative number, I get errors when I save the file. If I put the section loss to the right of the bearing (and Virtis requires a minimum section loss distance of half a foot), the girders control in flexure, which is not an issue since the section loss is over the bearing. It would help if there was a bearing length option, not just a point bearing, and the capability of entering section loss just over the bearing – so the girders are checked for bearing capacity with the section loss, but not for flexural capacity.

for this span the auto distribution calculation works for G1 but not for any of the other girders I have included a PDF of the error i can not figure out what it means.

thanks.

FROM: Krisha Kennelly DATE: 2/5/2010 6:29:57 PM Eastern Standard Time  
The finite element model that is generated to compute DL contraflexure points will contain nodes at diaphragm locations. For bays 2 thru 6 the diaphragms are entered incorrectly. They have a diaphragm located at 39.5' but the beam is only 38.5' long. So the FE model is not generated correctly and you get that error message.

Fix the diaphragm locations so they are at 38.5' and the live load distribution factors will be generated for you. (Note that if you Validate the Structure Definition you will get error messages that the diaphragms are not on the beams.)

Description

FROM: Beckie Curtis DATE: 2/9/2010 9:23:40 AM Eastern Standard Time

I have some questions regarding the NSG analysis.

1. At how many locations is the load distribution factor calculated?
2. When the analysis is performed on the member, what distribution factor is used, the maximum or the distribution at the point in question? Is this dependent on the analysis engine selected for that member? Is it dependent upon LRFR or LFR?
3. If multiple load distribution factors are calculated, is there an easy way for the user to view these results?

4/19/2016 3:07:32 PM

HRS AASHTO

1582

Complete Issue Information

FROM: Herman Lee DATE: 2/9/2010 9:51:49 AM Eastern Standard Time

1. Analysis point will be generated at tenth point, change point (e.g. top flange thickness change) and hinge location.
2. The maximum distribution factor is used in the member analysis. This maximum distribution factor is passed to the engine selected for that member and only LFR is supported currently.
3. The distribution factors at each analysis point are reported in the file with name like "Path 1 (Centered) - Summary". This file can be accessed from the Analysis Output window.

FROM: Beckie Curtis DATE: 2/9/2010 2:20:21 PM Eastern Standard Time

Just want to clarify - is it A, B or C?

- A - the maximum load distribution factor exported from the NSG and then used by the analysis engine to calculate load effects
- B - the load effect (using the load distribution factor) calculated in the NSG analysis and then the load effect is exported to the analysis engine
- C - none of the above

FROM: Herman Lee DATE: 2/10/2010 10:47:05 AM Eastern Standard Time  
NSG analysis implements process A

FROM: Herman Lee DATE: 2/17/2010 8:05:14 AM Eastern Standard Time  
Beckie Curtis e-mail on 2/17/10:

=====  
Herman -

Can you please change this to an enhancement request? I would like LFR to be able to do multiple distribution factors for NSG.

Thanks,  
Beckie

=====

FROM: Herman Lee DATE: 4/30/2013 10:45:05 AM Eastern Daylight Time  
Implemented multiple distribution factors for NSG in the 6.5 release.

Description

FROM: Brian Goodrich DATE: 2/9/2010 8:15:48 AM Mountain Standard Time  
 E-mail submitted by Jim Randall via Herman:

-----

Herman,

I have been converting my LRFR example ratings to LFR/LFD method rating. The steel girder example 37C0160JRR (sent to you earlier) used in the LRFR rating was converted to LFD input. The results I am getting using BrassLFD module is producing rating factors that are larger than my check calculations can justify. I have checked the input properties shown in the output file, however, the BrassLFD output is not as detailed as the BrassLRFD output files which do show the details for the capacity calculation. Construction Stage 1 and 2 (not used) beam properties seem ok, however, the Construction Stage 3 @ 105.00 (midspan) composite beam properties are larger than my hand calculations??? ... how can I get the output file to print the details of this critical calculation? In addition, the rating factors are printed in a report listing and the detail of these calculations are not shown. Can I get the same output file similar to the BrassLRFD output file? I have attached my hand rating calculation with the Virtis ratings shown. I am having a hard time accepting the Virtis rating. Jim Randall

FROM: Brian Goodrich DATE: 2/9/2010 8:17:25 AM Mountain Standard Time  
 E-mail from Herman:

Complete Issue Information

-----  
Jim,

Detail rating calculations are available in the Intermediate output. To turn on the Intermediate output for a specific location, create a point of interest at that location in the Bridge Workspace. For your case, create a point of interest at mid-span. You don't have to override any schedule. The detail rating calculations at mid-span will be generated inside the BRASS output file. Search for "Analysis point number 105.000" to quickly locate the detail calculations.

Please let me know if you need additional information.

Herman  
-----

FROM: Brian Goodrich DATE: 2/9/2010 8:18:04 AM Mountain Standard Time  
E-mail submitted by Jim Randall via Herman:

-----  
Herman,

Thanks for the advice on the output file. All of the information seems to check ok when I add the Y1 haunch value to my hand calculations. The one remaining issue is the calculation of the plastic moment  $M_p$ . Do you have a schematic of the lever arm values used by the computer to obtain the 6011.34 ft-kip value. I have not been able to determine how that value is that large? My  $M_p$  value is much lower 4815 ft-kips, possible differences using cg of plate girder to sum moments, missing addition force in the top flange??? I am attaching my latest output file with my check comments. Thanks for your help. JimR  
-----

Added PlasticMoment1.jpg, PlasticMoment2.jpg, PlasticMoment3.jpg, PlasticMoment4.jpg.

FROM: Brian Goodrich DATE: 2/9/2010 8:22:32 AM Mountain Standard Time  
I reviewed the BRASS calculations you submitted. The margin notes indicate agreement with the yield moment of 5125 ft-kips, so the plastic moment has to be more than that. The calculations in the margin notes use the lever arm from neutral axis of the bare steel section instead of the lever arm based on the plastic neutral axis.

I don't have a copy of your bridge, but I suspect there is a 1.0 inch haunch between the top of the steel section and the bottom of the slab. This offset of the slab from the beam results in a higher plastic moment than if there was no haunch.

Please let me know if this addresses your questions.

Complete Issue Information

Brian,

Thanks for your advice. I did recalculate the Mp value using LRFD Appendix D6. Attached are the hand calculations indicating a Mp value of 6352 ft-kips using Appendix D6. Is there a way of seeing what Virtis (BrassLFD) used to calculate the Mp = 6011.34 ft-kips? Hand calculation pages 3, 2-3-2010, and 2-8-2010 show the Caltrans Bridge Design Spec calculation (page3), page 2-3-2010 is the verification of BrassLFD section modulus calculation, and page 2-8-2010 is the Appendix D6 LRFD calculation. I am looking for additional advice concerning my hand calculation to obtain convergence with the BrassLFD result. Thanks again JimR

-----

Added 37C0160LFRHandCalcs.pdf.

-----

Brian,

Rechecked my Appendix D6 Mp calculation and found a error in the ds concrete slab value that resulted in a Mp hand calculation value of 6015 ft-kips as compared with the BrassLFD Mp value of 6011.34 ft-kips. I would still like to know if there is a way of seeing the componets of the Mp computer program calculation. JimR

-----

FROM: Brian Goodrich DATE: 2/9/2010 8:26:19 AM Mountain Standard Time

It looks like we're in agreement with the plastic moment. The output files with notes that you originally sent as JPG files are the only calculations that BRASS LFD produces from Virtis. There is some extended output that is used for debugging purposes, but this is not available to the user through Virtis. This extended output lists the summary of the force components and associated the lever arms used to calculate the plastic moment. If you would like this output to be made available as part of the regular output, please make that request and I will forward it to WYDOT.

FROM: Brian Goodrich DATE: 2/9/2010 11:22:29 AM Mountain Standard Time

E-mail submitted by Jim Randall:

-----

Brain,

Thanks again for your help. We are developing our expertise using the Virtis program and using the hand calculations for quality control/training to accept the computer rating and debug our in-house rating process. Since Caltrans has not accepted the LRFD rating method for older bridges designed by ASD and LFD methods they have directed us to use LFD rating for our bridge reports. I am not sure how much trouble/effort is involved in adding the additional output for the Mp calculation. Since this is a critical value in the rating process it seems that the current Virtis output is a black-box result only showing the final answer. I am reluctant to make the request with out knowing the scope of the request. We appreciate your help in debugging the hand calculations. JimR

-----

FROM: Brian Goodrich DATE: 2/9/2010 11:37:55 AM Mountain Standard Time

The BRASS LFD output lists various input parameter and the results related to equations 10-123 through 10-128, which are used to obtain the plastic moment. The only thing that appears to be missing from the output is the lever arm to each of the force components. Is this what you are looking

for? It might help if you could show some sample output that illustrates what you are looking for.

FROM: Brian Goodrich DATE: 2/22/2010 10:58:26 AM Mountain Standard Time  
E-mails submitted by Jim Randall (2/9/2010):

Brian,

The location of the PNA from the top of the slab and the lever arms (as described in Appendix D6) used to calculate the Mp by the program would have allowed me to spot check my check calculations and find the error or question my bridge input model. You can see my notations on the current output file that confirmed most of my hand calculations were in sync with the computer and the code equations referenced ... judging the results is extremely important in accepting the results with confidence. I thought there would be a graphic in the help section that described the computer calculation in detail but did not know where to look. Since I am a relatively new user of Virtis I am not familiar with all of the nuances. We are using Caltrans Bridge Design Specifications that reference AASHTO Standard Specifications 16 th Edition with interim's and did not go back to LRFD Appendix D6 until you made your suggestion. Your comments solved the problem for me, I used this appendix in doing the LRFD rating of the same bridge. I got off on the wrong track using AASHTO "The Manual for Bridge Evaluation" Illustrative Example pg A-46 as a guide ... which has the PNA at the top of the flange. Hope this explanation helps. Thanks again, JimR

FROM: Brian Goodrich DATE: 5/7/2010 8:39:20 AM Mountain Daylight Time  
The BRASS-GIRDER(STD) 6.0.4 engine was revised to output details regarding equations 10-123 through 10-128. This engine will be available in the release after Virtis 6.2.

Description

FROM: Brian Goodrich DATE: 2/9/2010 11:04:04 AM Mountain Standard Time  
 E-mail submitted by Elizabeth Befikadu via Herman:

-----  
 Herman,

How are you doing?

I am working on bridge # 045101 LRFR rating. The last superstructure which is SWsuperstructure (Mod) is a reinforced concrete T-beam structure. I look to the Brass Load Distribution file and the LL distribution factor calculated is as follows.

- 1) LL distribution factor by Lever rule method is zero.
- 2) The LL distribution factor calculated by ridged method is 0.353 although the value NL/Nb by itself is 0.5. The value should be minimum 0.5.

Is there any reason for this ? I have attached the XML file.

Thanks for your help.

Elizabeth Befikadu  
 -----

FROM: Brian Goodrich DATE: 2/9/2010 11:15:40 AM Mountain Standard Time  
 The lever rule issue appears to be a bug. I'll forward this issue to WYDOT.

Regarding the rigid method, both the deflection and rotation of the deck cross section must be considered. Because the live load is eccentric to the C.G. of the girder group as shown in the BRASS DST file, the rotation decreases the load on the left girder and increases the load to the right girder. Note that the sign of the eccentricity depends on which girder is selected as the girder of interest.

FROM: Brian Goodrich DATE: 3/23/2010 8:54:33 AM Mountain Daylight Time  
 This issue is assigned to BRASS Problem Log 938. This issue has been addressed in BRASS-GIRDER(LRFD) 2.0.3. Fixed for Version 6.2.

FROM: Herman Lee DATE: 5/9/2010 1:02:37 PM Eastern Daylight Time  
 Verified in 6.2 Beta 1.

Description

FROM: Joanne Walsh DATE: 2/9/2010 4:54:13 PM Eastern Standard Time  
Bridge description: multispan girder-floorbeam-stringer viaduct (upperdeck and lowerdeck) with steel bents. The Virtis model will analyze each span as a simple span.

Issue: The inventory rating factors for the girders in our GFS model are extremely low (0.44 to 0.60).

## Complete Issue Information

There is no major section loss to the girders and the structure was designed for HS-20 loading. The live load moments produced by Virtis were checked against Table C6B-1 of Appendix C6B of the AASHTO Manual for Bridge Evaluation (MBE). MBE Table C6B-1 provides simple span truck moments for a beam bridge based upon truck and span length. The live load moments produced by Virtis and the moments from MBE Table C6B-1 were very close which indicates that Virtis analyzed the girder under a simple span condition (this is also evident by the shear diagram in Virtis) and not by transferring the live load through the stingers then to the floorbeams and then into the girders at concentrated loads from the floorbeam. The girder has floorbeams framing into it at the 1/3 points. We believe a simple span analysis is overly conservative and the reason for the low rating factors. Can you please confirm the methodology used by Virtis in applying the loading on girders in a GFS system? Is there any way that Virtis can analyze the girder under the actual loading condition of a GFS system where the floorbeam reactions are concentrated loads on the girder? Please review the model titled "Squared Span 41" (see attached .xml).

Please feel free to contact me at [bdartista@hntb.com](mailto:bdartista@hntb.com). Any insight you can provide on this matter is greatly appreciated. Thank you for your time and effort.

FROM: Joanne Walsh DATE: 2/18/2010 10:01:00 AM Eastern Standard Time  
Any update? I am not able to continue to work on this project until this issue is resolved. Thank you.

FROM: George Colgrove DATE: 2/19/2010 2:08:36 PM Eastern Standard Time  
TO Brian Goodrich

Hi Brian,

The enclosed VI incident #9638. Joanne Walsh is asking for specifics on how the floor system is analyzed. I think she is right in her assessment. She is using BRASS in her analysis. I don't think there is a work around to do as she wants. Can you confirm this for me. If there is no work around, I will inform her that we will keep the issue open for User Group consideration as an enhancement.

George

FROM: Brian Goodrich DATE: 2/22/2010 8:57:35 AM Mountain Standard Time  
With respect to the BRASS engine, the live loads are NOT applied to the girder through the floorbeam reactions. I don't know of any workaround.

Have other possibilities for the low rating been exhausted: dead loads, unbraced lengths, contraflexure locations, etc.?

FROM: Joanne Walsh DATE: 2/22/2010 1:59:22 PM Eastern Standard Time  
Brian/George,

We pretty much have exhausted all of the other possibilities that would contribute to a low rating. From your discussion, it sounds like Virtis does not have the capability to accurately model a girder in a GFS system since the loading is not transmitted through the floorbeams into the girders. Can you please verify this? Is there another engine that has this capability? What is the timeframe on this possible enhancement commencing? I just want to know if it is worth my time to wait for the enhancement or continue the rating by other means.

Please feel free to contact me at [bdartista@hntb.com](mailto:bdartista@hntb.com). Any insight you can provide on this matter is greatly appreciated. Thank you for your time and effort.

Benny D'Artista

FROM: Joanne Walsh DATE: 3/3/2010 9:11:25 AM Eastern Standard Time  
Any update? I am not able to continue to work on this project until this issue is resolved. Thank you.

FROM: George Colgrove DATE: 4/13/2010 10:14:07 AM Eastern Daylight Time  
Benny and Joanne,

I was reviewing issue #9638 today. I believe at this point there are no work around solutions for this issue. Right now it appears you will need to wait for an enhancement to be approved by members of the User Group and/or the BRIDGEWare Task Force. You may also want to work with Brian Goodrich to get the BRASS engine enhanced for your needs.

I will change the status of the issue to an Enhancement request.

If there is anything you wish to add to the discussion, please feel free to log into IssueNet.

- George Colgrove

FROM: George Colgrove DATE: 4/13/2010 10:15:38 AM Eastern Daylight Time  
At this point we need to wait for direction from the User Group and the Task Force to include a resolution to this issue.

FROM: Brian Goodrich DATE: 4/18/2010 11:25:27 AM Mountain Daylight Time  
The BRASS engine moves live loads across the girders in a GFS system as if they were those in a girder system. Live loads are not transferred to the girder at the floorbeam locations. However, dead loads are.

Running the HS20 truck and lane, BRASS gives an inventory rating of 0.86.

Submitted on behalf of Bardia Emami, PB.

=====  
Hi,

Under our current contract, we rate number of bridges for VDOT using Virtis (V6.0). They got an error message during rating of a PS beam bridge in LFD, using Advance Analysis and Non-Standard Gage Vehicle. I attached the XML file to this email. I did some test run and bridge rates without error using Standard Type Analysis. Also Span 1 (which has same skew and same beam length) runs without error using Advance Analysis and Non-Standard Gage Vehicle. It seems this error occurs only to variable skew spans with PS beams (I didn't have this problem with variable skew steel bridges). Do you have any recommendation for us to adjust the model and make it rate the Non-Standard Gage Vehicle?

Feel free to contact me for more information.

Regards,

Bardia Emami, P.E.  
Lead Structural Engineer

PB

=====  
 Herman

The rating factor that is reported low is due to the tolerance level set in my computer.

Complete Issue Information

I have the following tolerance level setup

(Embedded image moved to file: pic13251.jpg) With this the rating results from Virtis-LFD is as follows:  
(Embedded image moved to file: pic31721.jpg)

When I change the tolerance level to the following:  
(Embedded image moved to file: pic11560.jpg) With this new setup, The rating results from Virtis-LFD  
is (Embedded image moved to file: pic21807.jpg)

The BRASS results did not get affected by the tolerance level: Here is the BRASS results with the new  
tolerance level (Embedded image moved to file: pic29623.jpg)

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer

=====

I'm not able to track down the problem in the export (Bot Plate Thick @ 32.10.png) when the ft  
tolerance is 0.05. I tried the bridge (Span 1 G1) in 6.1, it has the same problem.  
Krisha, please check the bottom flange thickness for the domain generated cross section at 32.10'.

FROM: Herman Lee DATE: 3/24/2010 9:52:57 AM Eastern Daylight Time  
When generating cross section ranges for analysis, a list of unique cross sections will be created.  
When comparing two cross sections, the dimensions should be based on inch or mm instead of ft or m.  
If comparison is done in ft with ft tolerance set to 0.04, a cross section with flange thickness 0.625 inch  
(0.05208 ft) is considered to be the same as a cross section with flange thickness 1.000 inch  
(0.08333 ft) since the difference of the two thicknesses in ft (0.03125) is less the 0.04. The comparison should  
be done in inch and compare with inch tolerance.

Fixed for 6.2 Release.

### Description

FROM: Gale Barnhill DATE: 2/16/2010 2:57:50 PM Eastern Standard Time

In the truss named .....Det South in this model for member L2L3, I believe I have the AngleBox section defined with the 6 inch angle leg vertical and 4 inch leg horizontal.

The horizontal legs of the angles are deteriorated.

In the member deterioration input, I show 24% of top left horizontal leg thickness.

The gross area of 6x4x9/16 angle is 5.31 sqin.

Virtis computes a deteriorated area of 4.50 sqin.

That appears to be  $5.31 - 0.24 \times 0.5625 \times 6$ .

I want it to be  $0.24 \times 0.5625 \times 4$ .

FROM: Gale Barnhill DATE: 2/17/2010 5:12:01 PM Eastern Standard Time

I've added another version of the same bridge dated Feb 17.

In the truss named .....Det North in this model for member L0L1, it's an AngleBox with 6x4x3/4 angles.

I entered deterioration of 50% for top angles - left horizontal leg - right vertical leg.

I entered deterioration of 25% for bottom angles - left horizontal leg - right vertical leg.

The member section property report - detailed section property calculations shows the same area for both top angles and the same area for both bottom angles. It appears to be using the 6 inch leg both times.

For the top angles, Y is the same, but AY is different.

For the bottom angles, Y is different and AY is the product of the areas times Y's.

FROM: Gale Barnhill DATE: 2/18/2010 10:08:51 AM Eastern Standard Time

Here's the third model with slight changes.

One truss has not deterioration noted.

It appears the TN13 changes are implemented to show the correct section properties for L3L4 and L4L5.

The other truss has deterioration modeled for L3L4.

Again, the deterioration is applied to the 6 inch vertical leg instead of the 4 inch horizontal leg and I also notice that the section properties are reversed for the angles.

The section property reversal is also carried over to L4L5 which does not have deterioration applied.

Subject: RE: Deterioration issue (VI9643)

George,

The angles appear to be properly placed (6 inch leg vertical) based on the fix described in the Technote.

However, when Deterioration is applied, the new section properties computed by the Truss Engine revert to the 4 inch leg vertical.

It also appears that the property comps are caught in a loop and report the same reduced area for consecutive members.

In the last model I sent on Feb 18, L3L4 Izz and Iyy for the deteriorated shapes appear to be reversed. L4L5 does not have deterioration applied, yet Izz and Iyy look reversed.

L5L6 (a similar member to L4L5) appears to have Izz and Iyy correct.

Call me if you would like to discuss.

Thanks,

Gale A. Barnhill, P.E.

FROM: Gale Barnhill DATE: 2/22/2010 12:38:59 PM Eastern Standard Time

George,

I've added another version of this problem.

In this model (VI9643...). I've coded a 6x4x1/2 anglebox to be used for most of the lower legs.

4/19/2016 3:07:34 PM

HRS AASHTO

1598

## Complete Issue Information

In the truss V19643 NO DET, there is no deterioration coded. Note that the member section property results show lzz self of 17.40 and lyy self of 6.27 for all members using a 6x4x1/2.

In the truss V19643 DET, I coded deterioration for L2L3.

Now for all members using the 6x4x1/2, lzz and lyy are reversed.

For L3L4, I coded a 6x4x9/16. lzz and lyy are reported the same as for the NO DET results.

I'll continue to check other variations.

Gale

FROM: Gale Barnhill DATE: 2/22/2010 4:23:49 PM Eastern Standard Time

I've added another newer version.

In the model V19643...Bad Areas, I coded several variations of deterioration on the 6x4x1/2 assigned to the lower chords.

I see a common error in the section properties report. The "Y" for Top Right Angle is always reported the same as the "Y" for Top Left Angle. It appears a correct value is computed and used for "AY" and "AY^2", but it is not the value reported.

When the same percent of Length and Width are deteriorated for Top Left and Bottom Left, the Area values are not the same. Top Left appears to be correct.

FROM: Xinmei Li DATE: 4/14/2010 2:19:15 PM Eastern Daylight Time

For the bug reported in Feb16 bridge (Det South, member L2L3) is resolved:

Incident summary:

There's a defect in setting "Vertical" for angles in angle box/ builtup sections with Deterioration.

Workaround:

When entering deterioration for angles in angle box/ builtup sections, enter Horizontal leg % loss as Vertical leg, vise versa.

Resolved for:

6.2 release

FROM: Xinmei Li DATE: 4/15/2010 9:12:49 AM Eastern Daylight Time

For the bug reported in Feb17 bridge (Det North, member L0L1) is resolved:

Incident summary:

There's a defect in xml report for top right angle in angle box sections.

Another defect in setting deterioration angle legs for angle box sections.

Workaround:

There is no workaround now.

Resolved for:

6.2 release

For the bug reported in Feb18 bridge (Truss with Det L3L4, member L3L4):

The bug in L3LL4 (deterioration is applied to wrong leg) is a duplicate of the one reported in Feb 16 bridge.

For the section properties reversal, please refer to TN13.

For the bug reported in Feb22 Angle Flip bridge:

### Description

FROM: David Koenig DATE: 2/17/2010 3:29:17 PM Eastern Standard Time

I have duplicated an issue one of our raters ran into. If you modify the number of spans in an existing structure definition, then try to link it with the Superstructure Alternative, you get the following message.

"Superstructure Definition length mismatch.

The number of spans in the superstructure definition assigned to this superstructure alternative does not match the number of spans in the superstructure."

Screen shows that the number of spans and length are the same. The bridge was created in 6.0 or earlier and modified in 6.1.

To duplicate:

Modify number of spans. Remove link to superstructure definition in superstructure alternative. Then, try to select the definition again.

I attached an .XML file.

FROM: George Colgrove DATE: 2/19/2010 2:26:19 PM Eastern Standard Time

David,

You may want to reattach the XML file. I tried the steps you listed and I have not been able to get the error. If you post the XML file, I'll give it another try.

George

FROM: David Koenig DATE: 2/19/2010 3:18:53 PM Eastern Standard Time

I thought I attached it. Here it is. You should not be able to link it right away.

4/19/2016 3:07:35 PM

HRS AASHTO

1601

Complete Issue Information

FROM: George Colgrove DATE: 4/13/2010 10:28:16 AM Eastern Daylight Time  
I imported the bridge then I did as you described above. I was able to get the error as you described above.

I did this with other bridges as well without the error however. So it may be something unique with your bridge model.

My suggestion is to change the number of spans then delete the errant Superstructure Alternative. Once deleted recreate it. Then it works.

FROM: George Colgrove DATE: 4/13/2010 11:50:44 AM Eastern Daylight Time  
Another observation is that when I open the data tree to the Structure alternative and go directly to the Structure Alternative and attempt to modify the Superstructure Definition Link - I get the error.

If I open the Bridge Alternative Dialog - then cancel out, then open the Superstructure dialog - then cancel out, and once again enter the Structure Alternative and once again attempt to modify the Superstructure Definition Link - I get success.

I think this is a data issue.

FROM: Joseph Ihnat DATE: 10/14/2010 3:11:46 PM Eastern Daylight Time  
You don't even need to open the Bridge Alt window, just open the Superstructure window then Cancel (at least in version 6.2 that's all you need to do).  
The error comes from the fact that the number of spans in the DoSuperSubStructInterfaceSet object (3) doesn't match the number of spans in the structure def (4). I don't know if that's even possible to accomplish in the current (6.2) version. Opening the Superstructure window must sync it back up, though I'm not sure where.  
Since we seem to have a workaround, and I'm not sure if the problem is reproducible in the current code, I'm not sure if we want to pursue this any further.  
A further fix might be something like adding a check in the import (version conversion) and the migration.

FROM: Jim Duray DATE: 10/14/2010 3:31:27 PM Eastern Daylight Time  
Mehrdad - what do you think?

FROM: Mehrdad Ordoobadi DATE: 2/1/2011 1:14:14 PM Eastern Standard Time  
Since this is reproducible only with this bridge and we are not able to reproduce it with other bridges. We should offer the workaround that is opening the super structure window and closing it then assign the structure definition to struture alt.

FROM: Mehrdad Ordoobadi DATE: 2/1/2011 3:35:18 PM Eastern Standard Time  
Code added to 6.3 to avoid this problem.

FROM: Xinmei Li DATE: 3/28/2011 2:35:37 PM Eastern Daylight Time  
Verified fixed for 6.3 Alpha6.

FROM: Aaron Kemna DATE: 4/26/2011 1:44:10 PM Eastern Daylight Time  
Seems to be fixed for my bridge. Accepted.

### Description

FROM: David Koenig DATE: 2/19/2010 2:50:25 PM Eastern Standard Time

We tried to run about 400 bridges in the Virtis Explorer with a single operating truck. Every time we tried we got the same error (image attached) after a number of bridges ran.

Windows 2007 with 4 GB of RAM. Got error on bridge 200. Tried again. Got error on bridge 165.

Windows 2000 with 2 GB of RAM. Error on bridge 85.

Windows XP with 3 GB of RAM. Error on bridge 77. Got a few more to run. Error on bridge 89.

Error is not bridge specific, and normally we can't run anymore bridges after the error pops up without exiting Virtis or maybe restarting the machine.

Received Bridgewater Support e-mail (Frank DeOrtentiis, WSP Sells  
[Frank.DeOrtentiis@wspells.com]).

Complete Issue Information

=====

Herman,

Here is the file from Virtis 6.1.

#1 – Look at Span A of the attached file. The 26.0' length FB is along the 40 degree skewed support line, but Virtis is not displaying the Typical Section graphics or framing plan correctly by using the projected length of the floorbeam, 19.92'. Additionally, and much more worrisome, I don't believe Virtis is applying the stringer dead load and live load reactions at the proper location on the floorbeam.

If you analyze the floorbeam and view the analysis chart for the stringer DL reactions from stage 1, you will see that the stringer spacing and their location on the FB is the PERPENDICULAR spacing, not the spacing along the skew, which is wrong. Virtis is analyzing the FB's as they are shown in the typical cross section, which is incorrect.

#2 - I tried to use a floor line superstructure to model this bridge, and no where in that system do I see any mention of skew. Can the floor-line floorbeam/stringer system accommodate skewed floorbeams??

Please get back to me on both issues.

Thank you,  
Frank.

=====

Reply e-mail:

=====

Frank,

I'm able to reproduce the two issues in #1 with your Floorbeam-Stringer Floor System bridge. The floorbeams in the framing plan and structural typical section schematics are not drawn correctly and the stringer DL reactions are not applied in the correct locations along the floorbeam. The stringer DL reactions should be located at 1.71', 6.23', 10.74', 15.26', 19.77' and 24.29' from the left end of the floorbeam measuring along the floorbeam. I will submit an incident on your behalf on Monday. I don't see any workaround to model this bridge using Floor System.

When modeling using Floor Line Superstructure Definition, skew is not required since there's no relationship between the stringers and floorbeams in Floor Line Superstructure Definition. Virtis will not compute the typical section loads and stringer dead loads and apply to the floorbeams for you. You need to enter those loads manually in the Floorbeam Member Loads window.

Herman

=====

Joe, please investigate the schematic problem and assign to Brian for the stringer dead load reaction problem after you are done. Thanks.

FROM: Joseph Ihnat DATE: 2/24/2010 7:54:24 AM Eastern Standard Time  
Schematics are fixed for version 6.2

Tim,

Here is a screen shot of the error message and the XML file for the subject bridge. The Virtis engine seems to crash at different times while trying to analyze this bridge. It runs fine in Brass LRFR and LFD.

=====

FROM: George Colgrove DATE: 2/22/2010 3:57:46 PM Eastern Standard Time  
This may be similar to a problem I have come acrossed a couple times before. I have tried to copy a girder line from one location to another. This is an effective means of saving time, but at times, the girder I copied never analyzes. I was able to analyze GL 1 and GL 2. GL 3 is essentially the same thing as GL 2 - so I am assuming GL 3 was a copy of GL 2. GL 3 is not analyzing. To test this, completely redefine the GL 3 Member Alternative w/o copying anything. If this works, we need to look at the copy mechanism to determine why we are having trouble.

FROM: Herman Lee DATE: 4/18/2011 1:25:59 PM Eastern Daylight Time  
I'm able to rate all the members in the attached bridge using the AASHTO LRFR Engine in 6.3 Beta 1. The attached 63Beta1Ratings.png file is the rating results for the member that Cory had problem in 6.1. I think the defect has been fixed in 6.3 Beta 1.

### Description

FROM: Beckie Curtis DATE: 2/23/2010 4:10:15 PM Eastern Standard Time  
When I add a poi at 90% of span 1 for girder 16 I get a different result than with no poi's entered. The control options have 10th points selected.

FROM: Jeff Ruby DATE: 4/13/2011 10:04:51 AM Eastern Daylight Time  
Checked that still not working, or at least something still isn't right with 6.2 Release. I attached the screen shots for the different rating output screens. It is using the BRASS engine.

FROM: Herman Lee DATE: 4/18/2011 2:22:12 PM Eastern Daylight Time  
I confirmed the Girder G16 in the attached 6.1 bridge doesn't have a LRFR analysis module selected. The issue described above is for the selected BRASS LFD Engine.

FROM: Brian Goodrich DATE: 4/25/2011 11:01:09 AM Mountain Daylight Time  
I believe this issue has already been fixed in the BRASS engine. I tried to test this with version 6.3 beta and the export hung in the call to the GirderMbrAltPtr->ResetReinfConcChangePointGeneration()

function. This is a domain function, so I'm unable to debug this problem.

FROM: Herman Lee DATE: 4/26/2011 9:13:27 AM Eastern Daylight Time  
I'm able to rate both member alternatives in Girder G16 using the BRASS LFD engine in 6.3 Beta 1. Attached zip file contains the BRASS input and output files. Brain, please try it again when we have the Beta version for 3rd-part developers ready. Thanks.

Description

FROM: Herman Lee DATE: 2/25/2010 12:06:15 PM Eastern Standard Time  
Submitted on behalf of Tim Ambrecht, IL DOT.

Below is the e-mail without embedded graphics. Please see attached PDF file for the e-mail with embedded graphics.

Attached is a xml file for 040-0016. This structure is a multi-unit structure containing a 1-Span Welded Plate Girder & several spans of PPC I-beams. I've had an issue with the "Generate at section change points" option under the Member Alternative Description (control options tab). When this option is checked, Virtis is not calculating the rating at the section change points. In the attached xml file there is a 72" WPG with three top flange sections. I obtained 3 different results when experimenting with the different analysis options.

For the trials below I'm looking at Member "3 - 2nd W Int - x" of the Superstructure Definitions "Sp. 2: 1-Span WPG"

Trial 1) No points of interest entered. These are the options checked:

The Inv/Opr rating is 2.439/4.074, with the controlling rating @ 50% of the Span.

Trial 2) A point of interest entered at the location of the section change of the flange. The same options checked as above. The following error message appears:

It appears that this error message occurs when there is a point of interest located at section change points.

Trial 3) A point of interest entered at the location of the section change of the flange. These are the options checked:

The Inv/Opr ratings are 2.162/3.611, with the controlling rating @ 24.9% of the span. This is the location of the point of interest, which is the location of the section change of the flange. Based on these trials it appears that the "Generate at section change points" option is not calculating a rating at the section change points, or it is using the larger section at this location. If the "Generate at section change points" option is working properly I should get the same results for both Trials 1 & 3.

I have had this occur on several bridges, it doesn't appear to be something with this particular structure.

=====

FROM: Tim Ambrecht DATE: 3/2/2010 3:12:22 PM Eastern Standard Time  
Another consultant of mine had a few things to add - Tim.

RE: Member Alternative, Control Options tab (LFD box) & Points of Interest; Example Virtis Model:  
POI\_Generation\_Errors-v61(0400016).xml

I have further investigated the issue that Bob Perkins presented in his email of February 25, 2010,  
Subject: Virtis Problem.

1. When a User-defined POI is specified at the same location (or w/in 0.12') as a section change (flange transition in this case) and, under Control Options, both the "Generate at section change points" and "...at user-defined points" are checked running the bridge model analysis returns an error w/the following text...

----- Contents of BRASS Error File -----

File: C:\Program  
Files\AASHTOWARE\VirtisOpis61\0400016\Span\_2\_WPG\3\_-\_2nd\_W\_Int-x\72\_\_WPG-  
Comp\_\BRASS\_LFD\72\_\_WPG-Comp\_.ERR  
Fatal Error Encountered - Unexpected Termination  
Data File: t-x\72\_\_WPG-Comp\_\BRASS\_LFD\72\_\_WPG-Comp\_.DAT

-----

Error No.: 2300  
Type : Structural Analysis Error  
Location : Data File  
The POI 0.0000 is not at a node point, adjust the POI so that it is.

-----

Error No.: 2300  
Type : Structural Analysis Error  
Location : Data File  
\*\*\*\* ERROR \*\*\*\* Points of interest must be within 0.12 feet of a node point location.  
Node point locations are 1/10 points, all range and cross section change locations, and user input POI locations.  
IMPORTANT When node points are generated, ones that are too close together (less than 0.12 feet) will be merged into one node point. The girder properties report turned on by a 1 in parameter one of the ANALYSIS command will report each generated node followed by girder properties.

----- End of Contents of BRASS Error File -----

and

Structural Analysis Errors (2300) - Analysis point and node point do not coincide  
From the line that starts with "IMPORTANT", it appears that the two definitions should be combined as one and analyzed w/o error. Even if that interpretation is wrong, it is not reasonable that a user defined POI at the same location as a system generated point should cause an analysis error.

In this example, but w/"Generate at user-defined points" unchecked, the same error occurs.

2. When "Generate at section change points" is checked and a user-defined POI is specified but not w/in 0.12' of the flange transition (and not 0.00 or at mid-span), the critical location for the load rating is at the flange transition (75.1% of span) with a truck Inventory RF of 2.154. After then unchecking "Generate at section change points" and specifying the flange transitions as User-defined

4/19/2016 3:07:37 PM

HRS AASHTO

1613

Complete Issue Information

POI's the results are the same. These results appear to be the correct ones.

3. When "Generate at section change points" is checked and no User-defined POI is specified, the critical location for the load rating is said to be at the midpoint (50%) of the span, with a lane Inventory RF of 2.439. This is in error. The correct value would be the same as in 2. Despite specifying that the system is supposed to analyze section change points it is only analyzing at the tenth points.

### Description

FROM: Herman Lee DATE: 2/25/2010 12:24:41 PM Eastern Standard Time  
Submitted on behalf of Sal Mensah, TSIUUVARAS SIMMONS HOLDERNESS  
[sal.mensah@TSHengineering.com].

When you rate a floorbeam, the stringers sit on the floorbeam will get analyzed for stringer DL reactions. The wheel fraction used in these analyses are 1.0 and rating will be performed also. If you rate those stringers, the wheel fraction used will be the one entered by the user. The BRASS input and output files are available in the Analysis Output window, it is misleading to have different rating results.

To reproduce, rate Floorbeam2 and save a copy of the Unit1 Stringer 1 BRASS files. Rate Unit1 Stringer 1 and compare the BRASS files with those saved.

FROM: Brian Goodrich DATE: 5/12/2010 9:20:01 AM Mountain Daylight Time  
I'm able to duplicate the issue reported by the user. In the export, I found the source code that sets the wheel fraction to 1.0 when the stringer is analyzed just to obtain dead load reactions to the floorbeam.

### Description

FROM: Gale Barnhill DATE: 2/26/2010 11:30:05 AM Eastern Standard Time

This is related to VI9643.

In this model (truss VI Channel Box Det), I coded deterioration to compression members that are Channel Box shapes with a top flange plate.

If I code only deterioration on the top flange (see U1U2), there are no changes in section properties.

If I code only deterioration to the left channel web (see U2U3), the section properties of the right channel are also changed. (same with only right channel web-U3U4)

If I code the top flange and a channel web (see U4U5), then the top flange properties are changed.

I can get the top flange only properties to change if I code a channel web with zero deterioration (see U5U6).

I also found out that the top flange only code MUST be at the end of the command set or I get a verification error (that's why U1U2 is last).

FROM: George Colgrove DATE: 3/3/2010 8:46:08 AM Eastern Standard Time

I just worked with U2U3. I changed the deterioration values to 0 for depth and 0 for width. This should yield the exact same results with having no deterioration entered. Area, Y, AY and AY^2 are all the same. However, the values for Izz and Iyy are all off. Somehow the engine is changing the core shape section properties regardless of the values entered.

- George

HRS AASHTO

1616

Complete Issue Information

FROM: Xinmei Li DATE: 4/21/2010 9:32:09 AM Eastern Daylight Time

Incident summary:

For problems reported in section properties (U1U2,U2U3, U3U4, U4U5, U5U6), there's a defect in deterioration area calculation in channel box sections.

For verification error, I can't reproduce.

Workaround:

There is no workaround now.

Resolved for:

6.2 release

FROM: Herman Lee DATE: 5/9/2010 1:19:26 PM Eastern Daylight Time

Verified in 6.2 Beta 1.

FROM: Gale Barnhill DATE: 7/6/2010 10:49:26 AM Eastern Daylight Time

I've imported the model into Virtis 6.2 Beta 3.

The Top Plate deterioration is now correctly applied.

Now there is no deterioration applied to the Channels for any variation of input.

FROM: Gale Barnhill DATE: 7/16/2010 12:35:52 PM Eastern Daylight Time

I've installed Beta 4 with July 16 updates.

I've attached a new model with deterioration issues.

Channel Box Top Flange Plate Deterioration coded

U2U3

Deterioration

TopFlangePlate

1 50 0 U2 0 1

Virtis Result = 50% of thickness x 100% of width = ½ total plate area -- OK

Channel Box Channel Web and TopFlange Deterioration coded

U3U4

Deterioration

Channels

Left Web 50 0 U3 0 1

Left TopFlange 50 0 U3 0 1

Virtis Result = No area reduction for either Web or Flange

Channel Box Channel Web and TopFlange Deterioration coded

U4U5

Deterioration

Channels

Left Web 50 99 U4 0 1

Left TopFlange 50 99 U4 0 1

Virtis Result = 50% of thickness x 99% of width = nearly ½ of element area

Why doesn't the same input method as for TopFlangePlate work ??

HOWEVER – Now the calculations for Top Flange Plate and the Channel not deteriorated are bogus.

4/19/2016 3:07:37 PM

HRS AASHTO

1617

Complete Issue Information

Channel Box Channel BottomFlange Deterioration coded  
U5U6

Deterioration

Channels

Left TopFlange 50 99 U5 0 1

Right BottomFlange 50 99 U5 0 1

Virtis Result = Top Flange Plate calculations are OK, Channel TopFlange calculations are OK (11.8 total area minus 1.13 = 10.67), Channel BottomFlange calculations show 2 times the area has been deducted (11.8 total area minus 1.13 x 2 = 9.54).

FROM: Srujana Thogaru DATE: 8/13/2010 9:02:34 AM Eastern Daylight Time

Error in the code fixed to report deteriorated Area for U3U4 and to report correct area for Channel Bottom Flange.

Tested for all above mentioned issues and found be yielding corrected results.

Resolved for: 6.2 Beta Build 6

FROM: Gale Barnhill DATE: 9/7/2010 3:54:11 PM Eastern Daylight Time

I've tested this in Beta 6 and still find errors in the section property calculations.

See the attached screen shot and comments.

I also attached my Beta 6 model.

It appears that the value of "AY^2" for Channel 1 is repeated for Channel 2 even though "AY" is different.

I highlighted this for U3U4, but the same is true for U4U5 and U5U6.

I also see that "Iyy Self" increased for Channel 1 of U3U4 which has the deteriorated web.

FROM: Srujana Thogaru DATE: 9/13/2010 12:43:46 PM Eastern Daylight Time

Fixed for 6.2 beta build 7

Workaround:

Code corrected to report correct AY^2 value for channel 2 and note has been added to VirtisTrussCommandLanguage.pdf (6.19.2), to explain the increase in the Iyy self for rolled sections i.e

6. Component self section properties for deteriorated rolled sections are recalculated using approximated dimensions.

This may result in slightly higher section properties than the original non-deteriorated rolled section whose properties

are based on entries on the Beam Shapes-Properties Tab.

FROM: Gale Barnhill DATE: 10/13/2010 4:40:41 PM Eastern Daylight Time

I've reviewed this issue in 6.2.0 release version and am satisfied with the resolution.

### Description

FROM: Derek McDonagh DATE: 3/1/2010 10:09:17 AM Eastern Standard Time

I have a Girder/Floorbeam/Truss bridge in which the girders and floorbeams rate ok. The truss appears to be entered correctly but produces an error message indicating that VIRTIS is unable to compute floorbeam and floorsystem loads. Haven;t seen this error message before. How do I fix this one?? I have attached a pdf of the error message as well as the xml file. Thanks for the help!!

FROM: George Colgrove DATE: 3/3/2010 9:15:20 AM Eastern Standard Time

I changed the tolerance for in to 0.000100 from 0.000010. The analysis then ran.

George

FROM: Derek McDonagh DATE: 3/4/2010 10:59:31 AM Eastern Standard Time

Hi George,

I changed the tolerance, but that didn't work. I still get the same error message. Any other ideas??

Derek

FROM: George Colgrove DATE: 7/7/2011 6:34:26 AM Eastern Daylight Time

Looking deeper in this issue, there is a few tolerance issues that is preventing the bridge to run.

4/19/2016 3:07:38 PM

HRS AASHTO

1619

Complete Issue Information

1. The three spans are entered as 10.708333, 10.333333 and 10.708000 in the stringer definition.
  2. Total length as entered is 31.749666.
  3. The length of the stringers are entered as 10.749660 - short of what was entered.
  4. The x-coord for the lower nodes in the truss definition are entered as 10.70833, 21.04166 and 31.75 - does not line up with what was entered for girder spans.
  5. The length of truss in the superstructure definition is entered as 31.7499.
6. The distance from left edge to first stringer is 0.6116 and when added to the 8 stringer spaces of 1.9199 comes up short by 0.0006 ft.
7. The diaphragm location in the Structure Framing Plan Details are truncated.
- To first diaphragm it is 10.7083 rather than 10.708333 ft.
  - First diaphragm spacing is 10.3333 rather than 10.708333 ft.
  - Second spacing is 21.0416 rather than 21.041666
- I fixed the above data to comply (1-5) with the entered lengths in the stringer definition.
  - I fixed the data in the structure typical section so that the edge distance is 0.6119 rather than 0.6116 ft.
  - I fixed the diaphragm locations.

With the fixes, the entire structure ran in BRASS (VO6.0 and VO6.2). Every element produced ratings. The ratings from AASHTO engine (VO 6.3) produced similar ratings. This was a Data entry issue.

Subject: LRFR and BRASS  
Importance: Low

Scott,  
I know you said (or someone did) that BRASS now allows 80 axles. Is this for Non-standard gage?  
Please see the error message below from 6.1.

Is there a specific setting we need to add or change?

Doug L. Horton, P.E.

Description

FROM: George Colgrove DATE: 3/3/2010 2:19:24 PM Eastern Standard Time  
 I agree. I am more concerned we don't get G1=G5 and G2=G3=G4 than I am about exactly matching BRASS.

Did the user enter DF or are they calculated by BRASS/Virtis?

From: Kennelly, Krishna

 To: Colgrove, George  
 Cc: Duray, Jim  
 Subject: RE: Virtis LRFR engine

I suggest investigating the distribution factors to see why Opis doesn't produce the same RF for G1-G5 and G2-G3-G4

From: Bridgeware,  
 Sent: Wednesday, March 03, 2010 10:13 AM  
 To: Kennelly, Krishna  
 Cc: Duray, Jim  
 Subject: FW: Virtis LRFR engine

I know it is reasonable that the two engines would not produce the exact values. These are the section property from each engine:

Virtis LRFD:  
 NA From Bot of Beam = 35.25 (in)  
 NA From Top of Slab = 17.63 (in)  
 Moment of Inertia = 369834.88 (in^4)  
 Slab Top Section Modulus = 25690.91 (in^3)  
 Beam Top Section Modulus = 37934.90 (in^3)  
 Beam Bot Section Modulus = 10491.53 (in^3)

Complete Issue Information

BRASS LRFD:

Input Parameters:

$$I = 375759.938 \text{ in}^4$$

Section Moduli Summary: (Gross Cross Section)

| Location | c, in   | n     | S, in <sup>3</sup> |
|----------|---------|-------|--------------------|
| CSLB     | 17.858  | 0.812 | -25905.631         |
| CTOP     | 9.594   | N/A   | -39164.332         |
| CBOT     | -35.406 | N/A   | 10613.021          |

These are slight differences. The rating factors are also slightly difference (see below). Do you think the differences in the property sections could explain the differences in the rating factors?

George

From: Wampler, Danny  
Sent: Wednesday, March 03, 2010 9:00 AM  
To: Bridgeware,  
Subject: Virtis LRFR engine

I seem to have run into a problem with the Virtis LRFR engine. Below you will find rating results for a symmetrical cross section structure. You will notice that the RFs for the Brass LRFR or the Brass LFR engine gives ratings as expected. G1=G5, G2=G3=G4. The same is not true when the same file is run using the Virtis LRFR engine.

|              |               |
|--------------|---------------|
| Brass Engine | Virtis Engine |
| G1=1.382     | G1=1.375      |
| G2=1.030     | G2=1.102      |
| G3=1.030     | G3=1.102      |
| G4=1.030     | G4=1.087      |
| G5=1.382     | G5=1.392      |

Nothing in the files changed except the engine.  
What would be the reason for this?

I have also attached the .xml for your use if you need it. Thanks

Danny Wampler, PE

Description

FROM: Herman Lee DATE: 3/5/2010 2:04:57 PM Eastern Standard Time  
Submitted on behalf of Scott Cavanaugh, HNTB [SCavanaugh@HNTB.COM].

Complete Issue Information

The fascia girder has longitudinal stiffener along the whole length but BRASS LRFR Engine is checking 6.10.2.1.1 Web Without Longitudinal Stiffeners.

FROM: Brian Goodrich DATE: 4/18/2010 1:01:16 PM Mountain Daylight Time  
The requirements for checking if the section is compact are listed in Article 6.10.6.2.2, which include checking Article 6.10.2.1.1 even though a longitudinal stiffener is present. I suggest that a note be added to the output that indicates that this particular instance of the check is being done to check compactness. This should clarify why this check is performed. The check for Article 6.10.2.1.2 is done elsewhere.

I forwarded this issue to WYDOT for consideration with respect to the BRASS engine.

FROM: Brian Goodrich DATE: 5/18/2011 8:34:51 AM Mountain Daylight Time  
This issue was assigned to BRASS Problem Log 956.

FROM: Brian Goodrich DATE: 5/18/2011 8:35:20 AM Mountain Daylight Time  
The BRASS engine was revised to correct this issue. Fixed for BRASS-GIRDER(LRFD) Version 2.1.0. Fixed for Virtis 6.3.

### Description

FROM: Brian Goodrich DATE: 3/24/2010 3:05:16 PM Mountain Daylight Time

Submitted for user:

We are using Virtis to rate NEBT Pre-stressed concrete beam, in the output file there are warnings as the following.

"PERFORMING BASIC MECHANICS OF MATERIALS - Cracking Moment of a Composite Section [per AASHTO LRFD Appendix 6.2]

Point of Interest : 104.00

Construction Stage: 2

\*\* WARNING: The section has already cracked due to the loads of the previous stage(s).  
Therefore, M<sub>cr</sub> was set to zero. The engineer should review carefully. "

4/19/2016 3:07:39 PM

HRS AASHTO

1629

Complete Issue Information

We went through the intermediate stress and calculations of VIRTIS run, find out the VIRTIS calculated crack beam top flange moment MAD is negative at the stage before concrete deck dead load is applied( meant section has no crack moment capacity left for other loads?). But we also found out the calculated stress of beam top flange for that stage is still under compression. We are not sure what the warning mean? And what we should look for the warning.

Thanks

Yihui Peter Wu, P.E. Ph.D.

FROM: Brian Goodrich DATE: 3/24/2010 3:41:34 PM Mountain Daylight Time  
The warning you are seeing is not typical. It means just what you wrote: "section has no crack moment capacity left for other loads."

We recently fixed an error in the BRASS engine's concrete module related to the cracking moment. I'd like to get your bridge, run it with the latest development version of BRASS, and check if the warning is still issued. Please send me your bridge XML file.

FROM: Herman Lee DATE: 3/25/2010 10:52:16 AM Eastern Daylight Time  
Request for information e-mail sent to user on 3/24/10.

FROM: Brian Goodrich DATE: 5/3/2010 10:18:52 AM Mountain Daylight Time  
I attached the XML file (Public No.065101 date 030310.xml) submitted by the user. I ran this file with the latest version of BRASS. There are no longer any crack control warnings in any of the intermediate output files. Fixed for version 6.2.

### Description

FROM: Tim Armbrecht DATE: 3/25/2010 9:39:36 AM Eastern Daylight Time  
From my consultant (Souther):

Virtis is incorrectly calculating the 1-Lane LL Distribution factor for Shear at Supports for the attached bridge model (LLDFLeverRuleWrong-v61(0810040).xml). The subject Member is "B - 1st E Rdwy", which is the outermost roadway beam. The values are shown in the screen capture...(attached)

Notice that the 1-Lane Shear at Supports is greater than the Multi-Lane value, which is, of course, impossible. Hand calculations verify that the Multi-Lane value is correct.

As a side note, for rating of in-service bridges, the Shear and Moment LL distribution factors for outer roadway beams should always be based on the lever rule. This is in contrast to design of new superstructures, where the outer beam must be designed to at least the capacity of the interior beams, using the greater of S/5.5 or lever rule. When the superstructure is already in place, however, only the lever rule applies. For outer roadway beams, the Virtis Standard Distribution factor table should display the lever rule values for Shear, Shear at Supports and Moment.

FROM: Herman Lee DATE: 3/25/2010 9:50:00 AM Eastern Daylight Time  
Providing the option to select whether to use S/5.5 or lever rule for computing outer roadway beam's shear and moment LL distribution factors is an enhancement request.

Complete Issue Information

FROM: Beckie Curtis DATE: 4/6/2010 5:54:27 PM Eastern Daylight Time

In the attached structure, not all floorbeams are running. Looking at stringer unit 8, the DL for superimposed stage 1, haunch, and superimposed stage 2 are being calculated in the individual member alt, but that information isn't showing up in the computed stringer reactions.

FROM: Herman Lee DATE: 4/7/2010 6:56:16 AM Eastern Daylight Time

There's a defect in 6.1 for updating stringer DL reactions. As a result of this defect, the floorbeams that support those stringers cannot be analyzed.

This is a duplicate of Incident 8826 (Error preparing stringer dead load reactions for floorbeam). 8826 has been fixed and will be included in 6.2 Release. Attached is the Computed Stringer Reactions in 6.2 Alpha Build. A workaround is to override with user defined reactions in the Floorbeam Stringer Reactions window.

Description

FROM: Beckie Curtis DATE: 4/12/2010 2:54:55 PM Eastern Daylight Time  
6A.4.5.4.1 requires a .2klf lane load to be applied with the permit vehicle for negative moments and reactions of interior supports for continuous spans and also for long spans between 200 and 300-ft.

If the user adds the lane load, then it is accounted for. However, it also appears to be used in determining max positive moment which is not correct.

The lane load for the permit truck needs to be added by the user and is not automatically added by the analysis. I don't think it is obvious to the user what is happening.

FROM: Brian Goodrich DATE: 4/18/2010 2:05:25 PM Mountain Daylight Time  
With respect to BRASS, the limits on the long spans are not considered for permit loads. If a permit truck and lane are input, BRASS performs the analysis for all actions. I'll forward this to WYDOT.

Description

FROM: Beckie Curtis DATE: 4/13/2010 10:56:06 AM Eastern Daylight Time  
 Is there a workaround available to be able to use state specific legal loads according to 6A.4.4.2.1a, specifically with a lane load? I have tried but it doesn't seem to let me run a truck and lane load at the same time using legal load configuration, and I can't edit the AASHTO lane load configuration.

FROM: Herman Lee DATE: 4/13/2010 11:55:21 AM Eastern Daylight Time  
 I assume the question is for the BRASS LRFR Engine. The AASHTO LRFR Engine will use the entered lane load and combine with the truck load for analysis.

FROM: Beckie Curtis DATE: 4/13/2010 5:07:30 PM Eastern Daylight Time  
 Yes, the question was for a steel bridge and so Brass was being used. I don't have any continuous prestressed so I didn't check AASHTO LRFR.

FROM: Brian Goodrich DATE: 4/18/2010 2:35:15 PM Mountain Daylight Time  
 The lane-type legal loads are ignored if the spans are less than 200 ft. Please attach a screenshot of the error you are getting.

Complete Issue Information

FROM: Herman Lee DATE: 5/6/2010 4:49:39 PM Eastern Daylight Time  
Information Needed E-mail sent on 5/6/10.

FROM: Herman Lee DATE: 5/7/2010 3:37:57 PM Eastern Daylight Time  
Beckie Curtis e-mail to Brian Goodrich on 5/7/10.

=====  
This is for a continuous span, which is less than 200-ft but is still required to have the lane load.

Description

FROM: Jim Onysko DATE: 4/16/2010 3:52:42 PM Eastern Daylight Time  
The fascial beams (G1 & G10) for the attached project are returning zero's for rating values and rating factors under LRFR. This appears to be related somehow to effective flange width. When the correct width (50") is either input or automatically computed by Virtis, the zero ratings are returned. By trial & error I have found that an effective width of 59.17" or greater will return "normal" rating results. Please

## Description

FROM: Gary Doerr DATE: 4/21/2010 10:46:39 AM Eastern Daylight Time

This three span steel plate girder bridge will not rate. I've tried various tolerance changes to no avail. I've attached the error statements and the Bridge file. Gary

FROM: Herman Lee DATE: 4/23/2010 12:52:56 PM Eastern Daylight Time

Gary, I'm able to rate both G1 and G2 using the system default tolerance settings (0.001 for ft and 0.00001 for in). Please see whether these settings are acceptable and you are able to rate the girders with these settings.

FROM: Gary Doerr DATE: 4/27/2010 8:20:19 AM Eastern Daylight Time

Thank you Herman, that worked. I was taking the tolerance the opposite way and getting the errors. Thanks again,

Gary

=====  
Hello,

4/19/2016 3:07:42 PM

HRS AASHTO

1640

Complete Issue Information

I'm trying to run a four span, 42 panel point truss on VIRTIS using the symmetry command. The data has been input for even symmetry with two roller supports (the first, second, and forth support are actually rollers and the third is pinned). When I try to verify the data I get two validation errors:

VALIDATION\_ERROR: Error generating symmetrical members...  
VALIDATION\_ERROR: Unable to generate symmetrical truss data...

However, if I change the symmetry to odd it works but the truss now differs from what I actually want to model. I've tried changing support conditions which hasn't helped and I've rechecked the coding to make sure the panel points and members are correct.

Could you please give me some guidance as to what these errors mean exactly and possible ways to alleviate the problem.

Thanks,

John W. Wertan  
=====

FROM: Herman Lee DATE: 4/26/2010 7:39:34 AM Eastern Daylight Time  
We investigated but unable to locate a solution in 6.1. The workaround in 6.1 is to model the whole truss.

FROM: Xinmei Li DATE: 11/8/2010 12:22:39 PM Eastern Standard Time  
When generating mirrored panel points M13 was missed. It was due to a code change for incident 8945.  
Resolved for the next release.

Received Bridgeware e-mail:

=====  
Herman,  
Unfortunately I have looked through the entire model again and cannot find the cause of the problem.  
The error message I am getting is:

“Missing data in article 5.9.5.1 Total loss of prestress. Fatal error while computing prestress losses.”

I have tried inputting values in the few locations with missing info, but it has had no effect on the run.

Any insight would be greatly appreciated.

Thanks  
Scott

=====  
FROM: Krisha Kennelly DATE: 4/30/2010 11:46:09 AM Eastern Daylight Time  
I'm looking into this. Doesn't appear to be a missing input problem, suspect it is a source code problem.

FROM: Krisha Kennelly DATE: 6/23/2010 11:03:39 AM Eastern Daylight Time  
Programmer note: same as 9935. Need a tolerance when comparing spec check domain locations when setting stage tables.

FROM: Krisha Kennelly DATE: 10/17/2010 8:37:48 PM Eastern Daylight Time  
Attached bridge runs to completion in 6.2 release. The fix to 9935 fixed this problem but it was incorrectly not marked as resolved for 6.2.

### Description

FROM: David Koenig DATE: 5/3/2010 11:05:45 AM Eastern Daylight Time

Our raters have ran into this issue multiple times since converting to 6.1. Most commonly it occurs when the rater deletes a structure definition and copies a new one to replace it. The rater, then, cannot save. T0672 is an example. In another instance, the rater could not save after checking ignore shear. A0181 is an example. I have attached the xmls for these files along with some screen captures. Unfortunately, the xmls will probably not help. After exporting and importing both of these bridges I no longer have the problem. Thus, we may have a database problem. We did have difficulties converting over to 6.1. I wonder if Incident 9644 is related.

FROM: Mehrdad Ordoobadi DATE: 6/22/2010 9:26:18 AM Eastern Daylight Time

I tried to duplicate these issues in the current development version 6.2 but I am not able to reproduce these save issues. If you would like us to investigate these issues further, we would need to get a copy of your database.

FROM: Herman Lee DATE: 7/7/2010 3:33:52 PM Eastern Daylight Time

Information Needed E-mail sent on 7/7/10.

FROM: David Koenig DATE: 7/7/2010 4:45:10 PM Eastern Daylight Time

A copy of the database was sent to Mehrdad on June 22. On July 1, he indicated that he was having

4/19/2016 3:07:43 PM

HRS AASHTO

1647

## Complete Issue Information

some problems importing the database. Our IS person responded to the July 1 email asking Mehrdad to call him to discuss the import issue. If you are still having problems with the database that we sent, then please call Randy Rademan at (573) 522-3435. He does the Oracle setup of our database.

FROM: Mehrdad Ordoobadi DATE: 7/13/2010 11:52:09 AM Eastern Daylight Time  
Got another Oracle database export file from Randy and was able to import. Currently investigating the save issue.

FROM: Mehrdad Ordoobadi DATE: 7/13/2010 2:38:55 PM Eastern Daylight Time  
Using a copy of your production database I have not been able to reproduce the problem. If you are able to reproduce the issue, could you please provide step by step instructions on how to re-produce the problem.

FROM: Mehrdad Ordoobadi DATE: 7/13/2010 3:57:35 PM Eastern Daylight Time

Subject: RE: AASHTO Virtis/Opis - Michael Baker Jr., Inc. - priority requires additional information.

Hello David,

I got the database from Randy. I used that database to try to reproduce the problem that you have reported in issue 9860 but I have not been able to reproduce the problem. If you are still able to reproduce the issue, could you please provide step by step instructions on how to re-produce the problem.

I have noticed a potential cause of the problem in the data in your database but unfortunately the same data did not cause save problem on our system . There are values in some fields in the database table `abw_conc_beam_def` that have many significant digits (see the screenshot attached), that the Virtis/Opis system may not be able to handle. This is consistent with your description of the problem that bridge save fails after the ignore shear is checked. But as I said before I cannot reproduce this issue on my system. This problem in data may or may not be the real cause of the problem, if we cannot reproduce the problem based on the detailed instructions that you will give us, I can provide a database script that will reduce the accuracy of (round) the double precision fields in table `abw_conc_beam_def`.

The field marked in the attached screenshot of data in Oracle database comes from the Member Alternative window (stored in KN/m): See attached.

I think the reason that we can't reproduce the problem may be that your Oracle database software is installed on an AIX server and we are trying it on Windows.

Thanks,  
Mehrdad

FROM: Aaron Kemna DATE: 7/15/2010 2:58:41 PM Eastern Daylight Time

4/19/2016 3:07:43 PM

HRS AASHTO

1648

Complete Issue Information

Yes, we are still getting the errors.

For T0672, delete structure definition 3, copy definition 1 to 3 and try to save. For A0181, just check ignore shear for any member alternative and try to save. Understand that these steps won't necessarily create the error for all structures, especially the ignore shear. One common thread seems to be that these files have multiple structure definitions.

FROM: Aaron Kemna DATE: 9/28/2010 2:15:42 PM Eastern Daylight Time

I found some additional information. For both bridges mentioned above (RC), changing one of these options in the Control Options will cause the saving error; LRFD Shear Computation Method, LRFR Shear Computation Method. Checking one of these options caused the error; Ignore design & legal load shear, Ignore permit load shear, Consider permit load tensile steel stress, LFD - Ignore shear. I then looked at two P/S girder bridges (A7623 & A7662) & got the saving error with the following options; LRFD Shear Computation Method, LRFR Shear Computation Method, Ignore design & legal load shear, Ignore permit load shear, Consider permit load tensile steel stress. I did not get the error when I checked the Consider legal load tensile steel stress which is not a RC option. Also, I did not get the error when I switched the LFD Shear Computation Method from Ignore to another option. For a steel bridge I did not find any issues with the control options. The P/S bridges are single structure definitions so the multiple definitions theory is busted other than these are the bridges where we have the copying and saving error.

FROM: Aaron Kemna DATE: 11/18/2010 3:06:28 PM Eastern Standard Time

We migrated our databases to 6.2. We are still getting the exact same saving errors. We need a solution.

FROM: Aaron Kemna DATE: 1/31/2011 3:47:34 PM Eastern Standard Time

We are no longer getting the saving error, but another problem is occurring. We recently updated our ODBC oracle software to the latest version (1020). This step was missed during previous version upgrades to Virtis. After the upgrade, the saving issue was fixed, but we are getting a large amount of Virtis crashes. I have another incident for the crashes.

FROM: Mehrdad Ordoobadi DATE: 2/16/2011 8:40:53 AM Eastern Standard Time

Issue 10343 is reported by Aaron Kemna related to the crashes after upgrading the ODBC driver.

FROM: Mehrdad Ordoobadi DATE: 2/16/2011 8:47:15 AM Eastern Standard Time

Marked resolved since the save errors do not happen any more.

### Description

FROM: Paul Campisi DATE: 5/5/2010 12:14:52 PM Eastern Daylight Time

How are the LRFR Condition and System Factors revised in Virtis? As an example, you want to change the Condition Factor for "Poor" from 0.85 to 0.95.

Paul Campisi  
New York State DOT  
Office of Structures  
Load Rating Unit

FROM: Herman Lee DATE: 5/5/2010 12:28:49 PM Eastern Daylight Time

The Condition Factor for each category (Good, Fair and Poor) cannot be changed by the user. When Poor is selected, Virtis will use 0.85 internally. System Factor is the same, the value for each category cannot be changed by the user.

Please let us know if you want to switch this to an enhancement request.

FROM: Paul Campisi DATE: 5/6/2010 5:06:50 PM Eastern Daylight Time

Yes. We would like to have the option of defining the values associated with the Condition and System Factor categories.

### Description

FROM: Brian Goodrich DATE: 5/5/2010 11:07:35 AM Mountain Daylight Time  
E-mail submitted by Jim Randall via Brian:

Attached are copies of girder and composite girder brass properties and other associated hand calculation information. I am in a checking phase of the output for the simple span prestressed girder bridge. Shear and Concrete Tension appear to be controlling the rating. Dead load and Live Load moments appear close enough. I have not looked carefully at the details of the shear rating using hand calculations.

My current question concerns the composite section properties that have yellow background highlight ... and modification of the deck width adjusted by n for computation of area, moment of inertia and distance to centroid ... how can I see the details of these modifications and the basis in specification for this adjustment? N for the prestressed steel and concrete was input but the deck concrete and rebar n was not input and I assume this value was calculated by the analysis?

Complete Issue Information

I will not be in the office tomorrow but will check at home. Thanks Jim Randall

FROM: Brian Goodrich DATE: 5/5/2010 11:10:17 AM Mountain Daylight Time  
E-mail from Herman:

Jim,

I am forwarding your question to BridgeTech, they maintain the BRASS programs for Wyoming DOT.

Herman

FROM: Brian Goodrich DATE: 5/5/2010 11:11:04 AM Mountain Daylight Time  
BRASS doesn't have any details regarding the deck width adjustment by the modular ratio. This adjustment is between the modulus of elasticity of the beam and the modulus of elasticity of the deck. These values are taken directly from the input in Virtis and passed to BRASS on the PROPERTIES-PC1 command. The slab width becomes smaller for the calculations of area and moment of inertia.

FROM: Brian Goodrich DATE: 5/5/2010 11:10:41 AM Mountain Daylight Time  
E-mail from Jim Randall:

Thanks, I was hoping for an example of the programmer's example problem that shows how they designed the fortran program. I have some old Caltrans examples for their fortran Frame program. It looks like they are adjusting the deck using n to compensate for the different strength concrete? I was using the gross section properties not a transformed cross section in the hand calculations.

FROM: Brian Goodrich DATE: 5/5/2010 11:10:41 AM Mountain Daylight Time  
You are correct that BRASS is adjusting the deck width by n to compensate for the different concrete strength. These adjustments are only done to the deck width. Also, BRASS does not transform the prestressing strand for any of the calculations.

FROM: Brian Goodrich DATE: 5/7/2010 8:37:59 AM Mountain Daylight Time  
E-mail from Jim Randall:

Thanks, Brian! It turns out that during my checking of my input and results the reduced properties and Ultimate Shear are determining the rating for this prestressed I girder bridge. Jim Randall

## Complete Issue Information

The text below states, "<panel\_point\_name> = Enter Panel point name belong to <member\_name>". First, on its face, this doesn't make sense. Shouldn't it read, "...that belongs to truss member being described by <member name>" like it is under the "Angles" Deterioration Sub Command. This also goes for BottomFlangePlate, LeftWebPlate, RightWebPlate, WebPlate, RolledBeam & Channels Sub Commands.

### Sub Command TopFlangePlate

(<plate\_index><percent\_thickness><percent\_width><panel\_point\_name> <start\_distance><length>)\*

Description <plate\_index> = Starting 1 that is closest to the section.

<percent\_thickness> = Enter deteriorated % loss of thickness.

<percent\_width>= Enter deteriorated % loss of width.

<panel\_point\_name> = Enter Panel point name belong to <member\_name>

<start\_distance> = Enter start distance of deterioration.

<length>= Enter deterioration length

Notes:

1. This sub-command is optional.

2. All data entries are on the same line below sub-command name.

Example TopFlangePlate

1 12.0 0.0 L2 0.0 8.0

2 15.0 0.0 L2 0.0 8.0

Second, in the example given below, L2 is given as the panel point for U3L3. Is this correct? If so how do I know what panel point to enter for this item?

Complete Issue Information

May, please update the Truss Command Language Manual.

FROM: Xinmei Li DATE: 11/8/2010 10:57:58 AM Eastern Standard Time  
Manual is updated for the next release.

FROM: Srujana Thogaru DATE: 4/13/2011 9:49:47 AM Eastern Daylight Time  
Has been updated for only topflangeplate please update for BottomFlangePlate, LeftWebPlate, RightWebPlate, WebPlate, RolledBeam & Channels Sub Commands.

FROM: Xinmei Li DATE: 4/13/2011 10:26:34 AM Eastern Daylight Time  
VirtisTrussCommandLanguage manual is updated for the next 6.3 Beta build.

FROM: Srujana Thogaru DATE: 4/13/2011 3:02:54 PM Eastern Daylight Time  
Verified that Manual updated for 6.3

FROM: Tim Armbrecht DATE: 5/12/2011 3:32:12 PM Eastern Daylight Time  
Item 1 – Under 6.2, the wording for Deterioration Sub Command TopFlangePlate for <panel\_point\_name> was, “Enter Panel point name belong to <member\_name>”. In 6.3 Beta 2 it is “Enter Panel point name belong to truss member being described by <member\_name>. The word “belong” should be changed to either, “belonging” or, “that belongs”.

Item 2 – <FIXED> Under 6.2, the example using Member U3L3 incorrectly specified L2 as the reference panel point. In 6.3 Beta2 is has been made correct, using panel point L3.

FROM: Xinmei Li DATE: 5/13/2011 9:13:06 PM Eastern Daylight Time  
Item 1 is resovled for next 6.3 Beta build.

FROM: Bin Zhang DATE: 5/16/2011 8:42:44 AM Eastern Daylight Time  
Page 58 needs to be updated.

FROM: Tim Armbrecht DATE: 6/13/2011 10:47:22 AM Eastern Daylight Time  
Item 1 is now fixed, but Tim Souther notes that the example for Item 2, which was previously fixed, doesn't appear to exist anymore in beta 3? He claims it should be between pages 62 & 63 but it is not. Could you please verify? Thanks.

FROM: Xinmei Li DATE: 6/13/2011 2:43:58 PM Eastern Daylight Time  
Item2, since we added new builtup section types to Version 6.3, item 2 now is on page 67.

FROM: Xinmei Li DATE: 6/13/2011 3:26:58 PM Eastern Daylight Time

FROM: Tim Armbrecht DATE: 6/14/2011 2:07:03 PM Eastern Daylight Time  
May, we're simply not seeing this is the 6.3 beta 3 version of the truss language document. It will be available in the next release?

FROM: Xinmei Li DATE: 6/15/2011 9:12:53 AM Eastern Daylight Time  
Yes, it will be available in the 6.3 release.

## Description

FROM: Brian Goodrich DATE: 5/10/2010 12:31:40 PM Mountain Daylight Time  
Submitted for Tyler Haney via BridgeWare:

I've recently run across some interesting things with Virtis when rating steel bridges. I've attached two bridges in question.

First of all, it seems Virtis isn't including the strength of the deck reinforcement in negative flexure. This

4/19/2016 3:07:45 PM

HRS AASHTO

1657

## Complete Issue Information

may have been excluded from the programs analysis due to its minimal influence upon the rating, about a .013 increase in this instance—determined by transforming deck steel into additional top flange thickness. I discovered this using bridge 18386... Since the bridge rating was failing in flexure over pier 2, I decided to see how the deck steel would influence the rating by changing the steel over the piers from #7 bars to #10 bars. The rating actually went down from 0.84 to around 0.7... I don't understand, other than increasing the dead load, why the rating would decrease. Inversely, if the bar size was decreased, say to a #3 bar, the rating slightly increased.

Second, and more importantly, I noticed when working with bridge 18260, that we received a rating of around 2.1 for inventory HS20 loading without including the longitudinal stiffeners. Once I added the longitudinal stiffeners, the rating dropped from the 2.1 to around 1.45. I don't understand why the rating would drop by strengthening a member.

The longitudinal stiffeners came up again when further checking bridge 18386. I ran an LRFR analysis so I could access the "Spec Check" (had to input shear stud tensile strength and force analysis to check only the tenth points to avoid some errors). Spec Check showed the model was not including longitudinal stiffeners in capacity analysis, even though they were included in the input.

I tried a work-around for this error by inputting a Point of Interest (POI) and using the options within the POI definition to force a longitudinal stiffener at the point controlling the rating. Once this stiffener was forced in, it appeared to only fix a portion of the checks and did not fully acknowledge the longitudinal stiffeners. It still seems to not consider the stiffener when computing It resulting in the statement below:

"AASHTO LRFD (6.10.11.1.3-1): \*\* NOTE: This article is Not Applicable because the nominal shear resistance was NOT determined using tension-field action of the web as specified in AASHTO LRFD 6.10.9.3.2."

However, according to the code, it appears that using the tension-field action is applicable for this case.

We input bridge 18386 into our MDX software and produced an inventory rating of 1.04 where the exterior girder controls in flexure over pier 2 compared to the Virtis rating of 0.847. Something isn't right and I don't know where else to look.

Have any suggestions or think I may have found some things?

Thanks for your help!,

Tyler Haney, P.E.  
Structural Engineer

FROM: Brian Goodrich DATE: 5/10/2010 4:36:46 PM Mountain Daylight Time  
I've reviewed your issues.

Issue 1: Bridge 18386: Changes in rating over pier

I wasn't able to duplicate the values you reported, but I was able to get a lower rating at the pier when increasing the bar size. I ran the HS-20 vehicle for the interior girder and got a rating of 1.06 with #7 bars and 1.02 with #10 bars. Increasing the bar size at the pier increases the moment of inertia. This

4/19/2016 3:07:45 PM

HRS AASHTO

1658

Complete Issue Information

draws more moment to the pier point of interest which affects the rating somewhat. In addition, the flexural capacity was reduced slightly for the point, due to a different bending capacity reduction factor (Rb from Eq. 10-103b). The Rb factor is dependent on a section modulus which is larger when #10 bars are used.

Issue 2: Bridge 18260: Difference in rating with and without longitudinal stiffeners

I'm able to duplicate this issue. When the longitudinal stiffener is present, BRASS does not perform a compact section analysis and the capacity is limited to the yield moment. When the longitudinal stiffener is excluded, BRASS calculates the capacity using Eq. 10-129c.

Issue 3: Bridge 18386: Longitudinal stiffeners not showing up in LRFR analysis

The longitudinal stiffener commands are generated in the BRASS data file and several of the points of interest I checked showed these stiffeners being present. Please expand your comments on this issue. Indicate the point of interest you are examining.

### Description

FROM: George Huang DATE: 5/11/2010 11:52:48 AM Eastern Daylight Time  
Under the batch run, both inventory and operating ratings are listed in the summary table for all vehicles including those only required for inventory results. You may use the 50-3050K file.

FROM: Krisha Kennelly DATE: 5/13/2010 12:30:40 PM Eastern Daylight Time  
Can reproduce with Training Bridge 1.

Rate TB1 from the Bridge Explorer. On the analysis settings window, select HS20 in the Inv and Op categories. Add some other vehicles to the Operating category only. Rate bridge. Bridge Rating Results window shows Inventory values for some vehicles that were selected to be in only the Operating category. Not sure if this is a BRASS LFD problem or a results problem in Virtis.

FROM: Herman Lee DATE: 5/20/2010 10:12:45 AM Eastern Daylight Time  
I'm able to reproduce the problem using both BRASS LFD and Virtis LFD. The problem is also reproducible in 6.0 and 6.1.  
The UiBridgeRatingResultsDlg, UiStructureRatingResultsDlg and UiMemberRatingResultsDlg should check for the vehicle category before populating the results.

Complete Issue Information

FROM: Mehrdad Ordoobadi DATE: 5/20/2010 11:17:27 AM Eastern Daylight Time  
The UiBridgeRatingResultsDlg, UiStructureRatingResultsDlg and UiMemberRatingResultsDlg report the results that is populated by the analysis engine.  
The information about vehicle category is not readily available in the UiBridgeRatingResultsDlg, UiStructureRatingResultsDlg and UiMemberRatingResultsDlg windows.  
The best way to fix this issue is to change the engine code so that the unnecessary values are not populated.

FROM: Herman Lee DATE: 5/20/2010 1:33:28 PM Eastern Daylight Time  
I agree that the best way is to change the engine code so that the unnecessary values are not populated. This can only be done if Virtis passes the vehicle category information to the the engine. Currently, BRASS LFD and Virtis LFD perform both inventory and operating ratings for each vehicle.

Issues in Incident 9954 and 9984 are duplicate of this incident. Please test the scenarios described in those two incidents after this incident is resolved.

FROM: Jim Duray DATE: 6/1/2010 11:42:13 AM Eastern Daylight Time  
I changed the Category to Maintenance. The three windows that report ratings from the BE have been this way from the beginning. The windows are correctly implemented to display the results reported by the engines and should not be filtering results. Modification of BRASS and StdEngine is an enhancement. StdEngine was implemented "as is" so whatever we have to do to change it is either Maintenance or and Enhancement. The new AASHTO LRFR engine reports ratings as requested by the user.

Description

FROM: George Huang DATE: 5/11/2010 12:53:41 PM Eastern Daylight Time  
This is still for 53-3050R. The Operating Limit State for HL 93 should be Strength I NOT Strength II. The Legal Limit State should be Service I NOT Service i and fatigue.

FROM: George Colgrove DATE: 5/12/2010 12:15:21 PM Eastern Daylight Time  
Is this based on the Table B6A-1 of the MBE? (or similar table in prior manual?) See page in Documents.

FROM: George Huang DATE: 5/12/2010 4:46:18 PM Eastern Daylight Time  
Oops. The load case for legal trucks was Right. Only the load case for HL 93 was wrong.

FROM: Krisha Kennelly DATE: 5/13/2010 12:34:32 PM Eastern Daylight Time  
I can reproduce this with Training Bridge 1. Rate G1 with the Default Design Load Rating template. See attached screenshot showing Strength II being considered for the operating rating.

FROM: Brian Goodrich DATE: 6/2/2010 2:37:22 PM Mountain Daylight Time  
BRASS LRFR has always used the Strength II limit state for the operating rating as this limit state has the same load factor. This issue has already been assigned to BRASS Problem Log 927.

FROM: Brian Goodrich DATE: 11/19/2010 8:13:08 AM Mountain Standard Time  
The BRASS limit states have been revised. The Strength II limit state no longer doubles as Strength I Operating. This issue has been fixed in BRASS-GIRDER(LRFD) 2.0.4 to be released at the beginning of 2011. Fixed for version 6.3.

Description

FROM: Beckie Curtis DATE: 5/12/2010 9:03:51 AM Eastern Daylight Time  
 I tried to make a fake bridge to model the problem outside of what I had originally submitted. I made a span length of 30.001. From 0-30ft, the steel strength is 36ksi. From 30-ft to 30.001ft, the steel strength is 0.1ksi.  
 Looking at the detailed report, the detailed rating factor doesn't change from the 0ft to 30.001ft point, even though the steel strength is very different. The tolerance for ft is set to 0.001 in my configuration.

FROM: Herman Lee DATE: 5/19/2010 1:38:31 PM Eastern Daylight Time  
 The input format for span length in Virtis Std Engine is XXX.XX. The precision of the entered span length (30.001 ft) exceeds this input format. The export has been updated to check for this precision and warn the user for this limitation in 6.2 Release.

Please let us know if you want to change this to an enhancement request.

FROM: Herman Lee DATE: 5/19/2010 3:44:49 PM Eastern Daylight Time

Complete Issue Information

E-mail from Beckie Curtis on 5/19:

=====
As long as the issue isn't propagated into the AASHTO LFR I don't need an enhancement.
=====

FROM: George Colgrove DATE: 5/21/2010 10:51:25 AM Eastern Daylight Time
I think the portion of the girder from 30' to 30.001' is not recognized by the Virtis LFD engine. I am assuming this is OK.

LRFR seems to see the full length, but internally sees it as only 30'. The system should have a point at 30' and an end point at 30.001' theoretically. It only has a point at 30.001' with results suggesting that the material properties out to the end of the girder are for the first segment of the girder. I added a 30' POI and I got the same results. The 30' POI did not show up in the spec check. Should the software look at the 30' - 30.001' segment independently?

Description

FROM: Aaron Kemna DATE: 5/13/2010 2:34:34 PM Eastern Daylight Time  
 Both girders run fine with Brass LFD. Virtis LFD Analysis fails for G2 with the following pop-up.

Internal Errors (1) - Invalid index  
 Structural Analysis Errors (2410) - Input or computational error encountered.  
 Structural Analysis Errors (2305) - N.A. solution in a loop. No solution for M@xfy.  
 Structural Analysis Errors (2305) - N.A. solution in a loop. No solution for M@xfy.  
 (etc.)

FROM: Aaron Kemna DATE: 5/13/2010 4:35:09 PM Eastern Daylight Time  
 I attached a continuous double-tee with similar problem and really low rating.

FROM: George Colgrove DATE: 5/14/2010 7:40:01 AM Eastern Daylight Time  
 I dont know what or why, but there is a data problem in the bridge file. I ran the bridge and got the same results as above. When looking at the bridge file the data appears to be entered correctly, but there is a problem with G2. I copied the definition for G1 to G2 and recalced the distribution factors and made sure the correct beam section was placed properly. I made it the current and existing and reran the bridge and it worked. Find enclosed (A0160back).

Complete Issue Information

FROM: Jim Duray DATE: 5/24/2010 2:04:35 PM Eastern Daylight Time  
Herman - I think you should look at the export for BAR7. If you don't find anything unusual with the data can you give the BAR7 input file to Hasmukh to review.

FROM: Herman Lee DATE: 5/24/2010 2:11:39 PM Eastern Daylight Time  
Attached G1 and G2 Virtis Std Engine input and output files.  
G1 and G2 are similar except the flexural reinforcements. G2 output stopped just before the Rating Summary.

FROM: Hasmukh Lathia DATE: 5/25/2010 11:10:01 PM Eastern Daylight Time  
Herman - Can you tell how the export models a double tee beam as an I beam for a Virtis Std Engine analysis? G2 Analysis stops because it is unable to find a solution for the location of N.A. for calculating the moment capacity of the section when the stress in the bottom strand reaches 0.9Fy.

FROM: Herman Lee DATE: 5/26/2010 7:42:17 AM Eastern Daylight Time  
The following export message is in the log file:  
Warning - The tee beam (with two tees) in prestressed precast concrete beam span 1 will be exported as regular I beam with 0.01 in bottom flange thickness!

Attached (G2 PS Tee Beam.png) is the double tee beam used in G2.

Changed Folder to /Support Center/Virtis since this is an existing issue in the Release.

FROM: Hasmukh Lathia DATE: 5/26/2010 4:21:58 PM Eastern Daylight Time  
Even though there is not much difference in dimensions between of two I beams, both are very shallow Tee beams for which the calculations of moment capacity at xFy were never intended in BAR7. This appears to be a problem of convergence in finding a solution for neutral axis for the calculation of moment capacity at xFy. It will require further investigation and code changes to find a fix for this issue.

FROM: Herman Lee DATE: 5/26/2010 4:44:00 PM Eastern Daylight Time  
Tee beam is not one of the supported beam type in BAR7. Virtis Std Engine export converts the double tees into an equivalent I beam with 0.01" bottom flange thickness. The Virtis Std Engine needs to be enhanced to properly handle tee beam.

FROM: Herman Lee DATE: 4/22/2011 8:27:20 AM Eastern Daylight Time  
The reported issue has been resolved by the fix for Incident 10755. The fix for 10755 (for PS box beam) added refinements to the logic for the interaction in locating the neutral axis for the calculation of moment capacity at xFy.

### Description

FROM: Herman Lee DATE: 5/13/2010 1:49:17 PM Eastern Daylight Time  
Submitted on behalf of Aaron Kemna, Missouri DOT.

To reproduce the issue:

1. Rate G2 in the attached bridge with the "W 18x119" steel shape.
2. Rate G2 again with the "W 18x119 No Properties" steel shape.
3. The beam properties listed in the BRASS output files are different (see attached Beam Propertis.png file).

Looks like BRASS export uses the dimensions and some properties in the shape to determine which rolled shape to use in the BRASS library. How does BRASS export determine which steel rolled shape to use when there's no exact match in the BRASS library? Is the name of the selected shape listed in the output file?

4/19/2016 3:07:46 PM

HRS AASHTO

1668

Complete Issue Information

FROM: Brian Goodrich DATE: 11/19/2010 8:30:40 AM Mountain Standard Time  
A temporary BRASS sections library is generated each time a bridge is run from Virtis. Only the beam shapes for the member alternative being run are exported to this library. The BRASS LFD engine obtains section dimensions and properties from this file for the current analysis. If the area or moment of inertia is missing, BRASS uses the section dimensions to calculate these values.

1669

Complete Issue Information

FROM: George Colgrove DATE: 5/14/2010 6:08:36 AM Eastern Daylight Time  
Becky, What Bridge were you working with? I want to see if things are fixed.

Using a Development Build (05/14/10 - morning) and running Training Bridge 1 - I get the following:

Virtis:

INV RF = 0.477  
OPR RF = 0.618

HS-20 Tonnage = 36T

INV T = 0.477 \* 36T = 17.17T (Reported = 17.17T)  
OPR T = 0.618 \* 36T = 22.25T (Reported = 22.25T)

BRASS:

INV RF = 0.480  
OPR RF = 0.622

HS-20 Tonnage = 36T

INV T = 0.480 \* 36T = 17.28T (Reported = 17.27T)  
OPR T = 0.622 \* 36T = 22.39T (Reported = 22.39T)

FROM: Krisha Kennelly DATE: 5/14/2010 8:42:44 PM Eastern Daylight Time  
Virtis LRFR uses the weight of the controlling vehicle (eg, tandem) like BRASS LRFR does.

This is a support incident since it also applies to how we implemented concrete in 6.1.

FROM: Jim Duray DATE: 5/24/2010 2:11:03 PM Eastern Daylight Time  
I'm changing it to "Maintenance".

FROM: Krisha Kennelly DATE: 6/3/2010 11:12:10 AM Eastern Daylight Time  
Please revise all existing LRFR articles (including concrete) to retrieve the dVehicleWeight from

```
dVehicleWeight = RatingLoadFactors[k].VehicleWeight;
```

instead of

```
dVehicleWeight = memberActions.MomentZTruckLoad.GetValue(iForceUnitId);
```

Please track your time with a comment 'Maintenance'.

FROM: Srujana Thogaru DATE: 6/4/2010 8:26:02 AM Eastern Daylight Time

Received Bridgeware e-mail:

=====
Herman,
I believe we discussed the Multiple Presence Factor issue that Ekin and I had discovered over the phone some time ago, but I thought I should send it via email for possible program revisions / updates. As far as I understand from your emails below, no program modifications or future enhancements are currently planned to address this issue. See the attached emails below.

In summary, the BRASS LRFR engine is not dividing the computed LL distribution factors by the MPF (1.2) when running a special permit vehicle. The Virtis LRFR engine appears to correctly divide the

4/19/2016 3:07:47 PM

HRS AASHTO

1671

Complete Issue Information

DF's by 1.2 for permit vehicles.

This was noticed when running a reinforced concrete slab structure. I've attached the .xml file for your reference.

Thanks  
Scott

From: Scott Cavanaugh  
Sent: Friday, April 30, 2010 10:02 AM  
To: Ekin Senturk  
Subject: RE: NJTA RC P/S Runs

Ekin,

Upon review of your plots and further investigation in Virtis, it looks like the BRASS engine does not divide by 1.2 (multiple presence factor), while the Virtis engine does divide by 1.2.

For example, I looked closely at 103.53 using both the Virtis and BRASS engines. As you pointed out, the Virtis RFs for OL1 through OL4 are higher than the corresponding LFR for the legal loads, which also does not make sense when looking at the trend for the steel structures. This is due to the Virtis engine dividing the DFs (which were manually input) by 1.2, hence reducing the amount of load supported by the member in question. The BRASS engine does not divide by 1.2. Note that the BRASS RF's for 103.53 are LESS THAN the legal load LFRs, which make sense when comparing 103.53 to all of the steel structures (which also use BRASS exclusively).

I have created a folder in the public drive at the following location and included a few files I used for comparison.

N:\Virtis Load Ratings\Report\Virtis Detailed Results - LRFR\OL1-4 DF Investigation

The OL1-OL4 log file was run using Virtis and shows explicit notes for vehicles OL1-OL4 stating:

- ...Processing vehicle OL1...
- Warning - Using single lane distribution factor for special (limited crossing) permit vehicle OL1!  
For the special (limited crossing) permit truck, the single lane distribution factors have been divided by 1.2 to remove the multiple presence factor.

No such notes are evident in the file for the legal loads, which makes sense since they are not input as permit loads.

You can also look at the other two files for DF output. The BRASS DF output can be found on page 112.

Per AASHTO LRFD 3.6.1.1.2, it states that for single lane DFs, methods used other than the lever rule and statical method, shall be divided by 1.2.

Complete Issue Information

Scott,

LRFR 6.4.5.4.2.2 specifies one lane distribution factor (without including multiple presence factor) should be used for special limited-crossing permit.

I submitted Incident 9848 (AASHTO Engine should determine single or multi lane loaded based on the superstructure definition) on your behalf for the single lane/multi lane problem we discussed over the phone.

Herman

Herman,  
Here is the file for the T-beam structure with the DF discrepancy – dealing with the 1.2 multiple presence factor as we discussed.

Let me know what you conclude.

Thanks  
Scott

=====

FROM: Brian Goodrich DATE: 6/1/2010 10:03:17 AM Mountain Daylight Time  
The BRASS export must be revised to detect the special (limited crossing) permit vehicle. Then it must set the number of lanes loaded for that vehicle definition to one and multiply the scale factor for that vehicle definition by 1/1.2. This will affect all the distribution factors though.

FROM: Brian Goodrich DATE: 6/2/2010 11:06:24 AM Mountain Daylight Time  
I revised the BRASS export to detect the special (limited crossing) permit vehicle and set the number of lanes loaded for that vehicle definition to one and multiply the scale factor for that vehicle definition by 1/1.2.

FROM: Herman Lee DATE: 7/9/2010 8:17:02 AM Eastern Daylight Time  
Resolved for 6.2 Release.

Subject: BRASS Error

Tim,

Complete Issue Information

I can't seem to find the problem in the VIRTIS file that is causing BRASS to create a fatal flaw. The input file runs in the VIRTIS 6.2 VIRTIS engine. Can you forward this for review?

=====
FROM: Herman Lee DATE: 6/1/2010 11:32:01 AM Eastern Daylight Time
Error message when performing LRFR analysis for the "1- E Fascia" member. The start distance in one of the BRACING-SCHEDULE command is negative.

=====
Error No.: 1707
Type : Input Error
Location : Data File
\*\* ERROR: Parameter 3 on the BRACING-SCHEDULE command must be greater than zero.
=====

FROM: Brian Goodrich DATE: 6/1/2010 12:44:15 PM Mountain Daylight Time
The engines do not necessarily crash. The BRASS engine issues error messages and returns the focus to the Virtis GUI. Two different errors can occur here depending on the tolerance settings.

The bracing doesn't add up to exactly the span length for Span 2. Depending on the tolerance settings, the error shows up at the end of Span 2 or the start of Span 3 in the BRACING-SCHEDULE commands. This is a BRASS export issue that must be addressed.

### Description

FROM: Beckie Curtis DATE: 6/4/2010 5:07:25 PM Eastern Daylight Time

We added a point of interest at stirrup spacing, and this led to different Brass and Virtis LRFR results. Shear controls at 10-ft with Brass, the Virtis controlling point is midspan flexure. I tried to see the Virtis shear spec check at the user defined point of interest, but it wasn't generating. I can see the Virtis shear at the 10th point, but not the 10-ft point.

FROM: Beckie Curtis DATE: 6/4/2010 5:16:43 PM Eastern Daylight Time

For a user defined point of interest, ignore shear is checked by default. To change it, you need to click override schedule, uncheck ignore shear, and then uncheck override schedule. This seems like the incorrect default - the point of interest should, by default, match the default of the beam and then be able to be changed by the user.

FROM: Herman Lee DATE: 6/5/2010 5:23:56 PM Eastern Daylight Time

This is a duplicate of Incident 9623. Virtis LRFR Engine should only use the shear information in the point of interest when Override schedule is checked. Incident 9623 has been resolved for the 6.2 Release.

I tested the attached bridge in 6.2 Beta 2 and confirmed the defect has been fixed. Below is a

4/19/2016 3:07:48 PM

HRS AASHTO

1677

Complete Issue Information

workaround copied from Incident 9623.

A work around is to:

1. Select the Override Schedule checkbox on the Shear tab on the POI window.
2. Unselect the 2 'Ignore shear' options for LRFR.
2. Select the Override Schedule checkbox again (so that the box is not checked.)
3. Lfr analysis will now include shear checks at the POI.

Description

FROM: Beckie Curtis DATE: 6/25/2010 9:46:00 AM Eastern Daylight Time

I think this is an enhancement request, although if there is a work around it would be helpful.

We have some main girder/floorbeam structures. The abutments/piers are on a skew, but the floorbeams are perpendicular to the roadway. This causes some of the floorbeams to rest on both a support and the main girder. At the pier, the floorbeam may rest on both girders and the pier. I would like to be able to model these.

FROM: Herman Lee DATE: 6/25/2010 10:18:08 AM Eastern Daylight Time

The above girder/floorbeam configuration cannot be modeled in Virtis using floor system definition. An alternative is to model the girders and floorbeams individually in a floor line definition.

FROM: Herman Lee DATE: 6/4/2012 4:07:24 PM Eastern Daylight Time

Beta TAG May 2012 discussion:

10083 and 11104 should be combined.

Description

FROM: Herman Lee DATE: 6/25/2010 2:35:16 PM Eastern Daylight Time  
 Submitted on behalf of Ekin Senturk, HNTB.

The elastic section properties reported in the output file and used in 6.4.2.1 flexural stress rating doesn't reflect the process described in the BRASS manual for riveted girder. The equivalent fillets are not included in the section properties calculations.

BRASS manual:

=====

The riveted girder is converted to an equivalent I-section with fillets as follows. The top flange width is set to twice the top horizontal leg length plus the web thickness. The top flange thickness is set to the top horizontal leg thickness. The top vertical legs are converted to equivalent top fillets with the same centroids. The bottom angles are converted similar to the top angles.

=====

FROM: Herman Lee DATE: 6/28/2010 1:46:26 PM Eastern Daylight Time  
 Submitted on behalf of Shafiul Azam (sazam@mbakercorp.com), Michael Baker Jr., Inc.

Received e-mail:

=====

Herman,

Attached is a solid box beam rating file. I am getting the following error.

I have checked the input again and it seems the input is fine. I have even tried creating the file from scratch. But, I get the same error. Can you please help me with this error?

=====

An alternative is to enter a void with a very small diameter or model the solid box beam as I beam.

FROM: Herman Lee DATE: 7/8/2010 8:49:39 AM Eastern Daylight Time  
Hasmukh, the solid box beam is exported as a plank beam. Please take a look at the attached input and output files. Thanks.

FROM: Hasumkh Lathia DATE: 7/9/2010 3:49:49 PM Eastern Daylight Time  
Inputting a value of top slab thickness (T3 dimension for a plank beam) seems to cause the error. What does the actual bridge consist of? A plank beam can be composite (with a value of T3 dimension greater than zero) or non-composite (T3=0). A bridge section showing the actual beam with dimensions will help to investigate this further. If the slab is composite with the solid beam, enter as such.

FROM: Hasumkh Lathia DATE: 7/9/2010 5:52:57 PM Eastern Daylight Time  
Looking at the debug output, it appears that the program is setting the value of T3 equal to the Slab Thickness which causes this error while calculating the moment capacity at xFy. It appears to be a bug in Virtis Std Engine which was not caught before. The slab thickness is also used in calculating the dead load acting on the beam, so entering a zero slab thickness and adjusting the DL1 input may be a workaround until a fix is made to the program.

FROM: Herman Lee DATE: 8/20/2010 10:27:34 AM Eastern Daylight Time  
Virtis user interface can only define PS I, Tee, Box (circular and rectangular void) and U shape beams. Plank beam is not supported. I have updated the export to check for plank beam and exist the analysis.

Resolved for 6.3 Release.

FROM: Xinmei Li DATE: 3/28/2011 4:50:57 PM Eastern Daylight Time  
Verified that the error message is provided when section is not supported, for 6.3 Alpha6.

FROM: Hasumkh Lathia DATE: 4/22/2011 11:42:47 AM Eastern Daylight Time  
The bug regarding setting T3 equal to Slab Thickness has been fixed. Also the fix made in Virtis Std Engine module PMCXFY for issues 9985 and 10755 will also prevent the error regarding rgw slotion for neutral axis going in a loop. This fix will be included in Virtis/Opis Release 6.4.

### Description

FROM: Jim Onysko DATE: 6/30/2010 10:25:03 AM Eastern Daylight Time

I am trying to model and analyze a simple-span reinforced concrete t-beam structure in VIRTIS, but I'm running into error messages when I try to run the analysis. It appears that the errors have to do with the export of the reinforcement schedule. I have attached the VIRTIS file, as well as a pdf of plan drawings and sketches to illustrate the geometry and rebar layout.

For the interior beams, (Beam "B" in the model), I entered in the beam geometry and reinforcement exactly as shown on the plans. I did not click "fully developed" for the reinforcement, so the program should compute and account for the development length of the bars. However, the following error pops up when I try to run the analysis:

"Error converting Virtis/Opis R/C schedules to 'general' cross sections!"

4/19/2016 3:07:50 PM

HRS AASHTO

1689

### Complete Issue Information

How do I fix this and get the analysis to run? I'm thinking the program doesn't like how I defined the bent bars, maybe? However, there's no apparent way to model the "Type H" bars on the plans other than to use VIRTIS's Type 3 bars.

### Description

FROM: Richard Withers DATE: 6/30/2010 4:16:01 PM Eastern Daylight Time  
I get the following error when attempting to analyze a prestressed girder with the Virtis LRFR engine: "Error - performing LRFR specification checking!". The analysis runs fine when using the BRASS LRFR engine. I have attached a screen shot of the error and a xml export of the bridge. What does Virtis need that BRASS doesn't?

Thanks,

Richard Withers

Complete Issue Information

Richard, the only member that has Virtis LRFR selected as the LRFR Analysis Module is the member alternative for "Member 1" in "40' span #1". I'm able to complete the analysis using the "LRFR Design Load Rating" analysis template. Please provide us more information on reproducing the error message. Thanks.

FROM: Richard Withers DATE: 7/19/2010 1:05:13 PM Eastern Daylight Time  
I have narrowed it down to a Legal Load that is causing the error. It is defined on the Tandem tab of the Agency Standard Gage Vehicles in the Library Explorer. When I define the load on the Truck tab, the analysis runs correctly. Is this correct? (The Concrete Truck, HS-LONG, AND HS-SHORT loads are defined on the truck tab and run correctly with no error.) I have also attached a screen shot of the Analysis Settings window so you can see how the truck loads are applied in my rating.

Thanks,

Richard Withers

Description

FROM: Gary Doerr DATE: 7/1/2010 10:20:02 AM Eastern Daylight Time  
our IT group is planning an upgrade to SQL Server 2008. How will that affect compatability with Virtis?

FROM: Mehrdad Ordoobadi DATE: 7/6/2010 7:44:23 AM Eastern Daylight Time  
Virtis/Opis 6.1 software does not officially support SQL Server 2008, it supports SQL Server 2005. This means that no testing has been performed on Virtis/Opis 6.1 with a SQL Server 2008 database and we will not be able to provide support if there is a compatibility issue. So we recommend that you wait until the release of the next version of Virtis/Opis software (version 6.2) to upgrade the Virtis/Opis database SQL Server software. Virtis/Opis 6.2 is scheduled to be released in August 2010.

### Description

FROM: Jesus Barreda DATE: 7/14/2010 11:18:48 AM Eastern Daylight Time

I have a pre-stressed box beam. I am trying to determine the adequacy of a superstructure for a non-standard gage vehicle. It does not allow me to finish the analysis, the display error says "deck thickness must be greater than zero for analysis to run!" javascript: \_\_doPostBack('ctl00 \$Main\$tabStrip','Workaround')

I do not have a deck since is a non-composite box beam. What should I do?

FROM: Herman Lee DATE: 7/14/2010 11:23:39 AM Eastern Daylight Time

The deck is required in the generation of the 3D FE model during the Distribution Factor Analysis. The deck is always included in the model regardless of whether the beams are composite with deck. Please check the FE model section properties and results to see whether the workaround is acceptable.

Incident 8845 (NSG will not run on Adjacent PS Box bridge with no deck.) is the enhancement request for this issue.

### Description

FROM: Krisha Kennelly DATE: 7/19/2010 9:28:06 AM Eastern Daylight Time  
Submitted as part of beta testing for Virtis 6.2:

From issue 10094:

FROM: George Huang DATE: 7/13/2010 1:26:35 PM Eastern Daylight Time  
The lane type legal load rating factors from Virtis is quit different from Brass. The definations of the weight are also different, 40 tons used for Virtis while 30 tones used for Brass, which may need to be revised.

FROM: George Huang DATE: 7/13/2010 1:28:36 PM Eastern Daylight Time  
See the attached file "CALRFD\_Brta4.doc" for the built 4 results.

4/19/2016 3:07:51 PM

HRS AASHTO

1694

Complete Issue Information

FROM: Beckie Curtis DATE: 7/14/2010 4:58:28 PM Eastern Daylight Time  
George has a point about the tonnage for Brass vs Virtis.

For the legal lane load, the truck is the 3-3, multiplied by 0.75 - in the analysis. I would imagine this should be reported in tonnage based on the 3-3 without the 0.75 reduction (similar to the tandem load in HL-93 being reported as the HS-20 truck).

The Virtis LRFR engine reports based off of the 3-3.

FROM: Krisha Kennelly DATE: 7/19/2010 9:47:14 AM Eastern Daylight Time  
Virtis LRFR is using 80 kips as the vehicle weight when computing the lane type legal load capacity as per MBE C6A.4.4.2.1a.

BRASS LRFR is using 60 kips as the vehicle weight.

FROM: Brian Goodrich DATE: 7/23/2010 8:05:15 AM Mountain Daylight Time  
With respect to BRASS, this issue is the same as Incident 9988, which was assigned to BRASS Problem Log 970. BRASS internally calculates the truck weight as the sum of the axle weights. We have to add a parameter to BRASS for passing in the truck weight input in Virtis.

FROM: Brian Goodrich DATE: 5/18/2011 8:39:20 AM Mountain Daylight Time  
In BRASS-GIRDER(LRFD), the TRUCK-SPECIAL-WEIGHT command was added for overriding vehicle weight. The export must be updated to generate this command.

FROM: Brian Goodrich DATE: 5/18/2011 8:45:10 AM Mountain Daylight Time  
This issue was assigned to BRASS Incident 98.

FROM: Brian Goodrich DATE: 6/16/2011 9:32:57 AM Mountain Daylight Time  
In the database, the "Lane-Type Legal Load" axle weights are input as 75% of the Type 3-3 axles weights, which results in a vehicle weight of 60 kips. However, this vehicle weight needs to be exported as  $60/0.75=80$  kips. The regular legal vehicles should not be adjusted. So how does one determine if a particular vehicle weight should be adjusted for the 75%?

FROM: Brian Goodrich DATE: 6/16/2011 11:13:04 AM Mountain Daylight Time  
From Krisha:

"We apply the vehicle loads like they are defined in the UI to get the force effects and then when we compute the tonnage capacity for the vehicle we check to see if the vehicle name is "Lane-Type Legal" and then we use the 80 kips for it to compute the tonnage capacity. So it is hard-coded inside the engine."

FROM: Brian Goodrich DATE: 6/16/2011 11:42:12 AM Mountain Daylight Time  
I revised the BRASS export to generate the new TRUCK-SPECIAL-WEIGHT command with the adjusted vehicle weight for the "Lane-Type Legal" loads. Fixed for Virtis/Opis 6.3.

FROM: George Huang DATE: 6/30/2011 2:33:59 PM Eastern Daylight Time  
I am unable to verify it since I don't have the latest BRASS engine.

Description

FROM: Brian Goodrich DATE: 7/23/2010 7:56:29 AM Mountain Daylight Time  
 Issue submitted for David Wolfe via Bridgeware:

Bridgeware – The BRASS LRFR engine seems to treat the end 5% of a span as an end panel regardless of the stiffener arrangement. Attached is one of the training bridges with additional girderline members made by copying the original with the only modification being POI's added at 4.999% and 5.001% of Span 1. The copy of the girderline with the POI at 4.999% of Span 1 rates very low in shear, whereas the girder line with the POI at 5.001% of Span 1 rates the same as the original girder in flexure.

Is the 5% location threshold supported by code? Or is this a programming convenience?

Complete Issue Information

I am running VIRTIS 6.1.

Respectfully - DW

FROM: Brian Goodrich DATE: 7/23/2010 8:02:38 AM Mountain Daylight Time  
The BRASS LRFD/LRFR engine treats the end 5% of a girder as an end panel. This was coded into BRASS prior to implementing transverse stiffener schedules. This limit should be replaced with logic to determine the end panel based on transverse stiffener schedule input.

WYDOT assigned this issue to Problem Log 779.

FROM: Brian Goodrich DATE: 5/18/2011 8:46:20 AM Mountain Daylight Time  
This issue was assigned to BRASS Incident 54.

Description

FROM: Daniel Jones DATE: 7/23/2010 11:05:19 AM Eastern Daylight Time  
1. Truss Member Properties: When you add a member, the default for k is the Pinned boundary

4/19/2016 3:07:52 PM

HRS AASHTO

1697

Complete Issue Information

conditions, when change to other boundary condition k does not change. Have to go to user defined then to bolted, riveted etc. before it loads the correct k value.

2. Truss Member Properties: When you duplicate a member and then change the connected joints, the Z & Y axis unbraced lengths do not change. Either have to enter manually or create using new button. Reference screen shot (TMP3). Is the unbraced length an effective length or just actual length?

Thanks,  
Daniel

FROM: Herman Lee DATE: 7/26/2010 9:31:05 AM Eastern Daylight Time

1. This is a defect in the 6.1 Release.

2. The unbraced length is an effective length which may be different than the actual length between the two panel points. The Z and Y axis unbraced lengths will only be set with the actual length the first time you select the two panel points. Changing the panel points afterward will not reset the unbraced lengths since the window doesn't know whether you have entered your own values.

I changed the Folder for the incident to /Support Center/Virtis since both are existing issues in the 6.1 Release.

FROM: Geoffrey Trees DATE: 9/21/2010 9:14:32 AM Eastern Daylight Time

1. Fixed for 6.3 Release.

FROM: Xinmei Li DATE: 3/28/2011 4:57:39 PM Eastern Daylight Time

#1 is fixed. Verified for 6.3 Alpha6.

Description

FROM: Daniel Jones DATE: 7/23/2010 5:19:17 PM Eastern Daylight Time  
 The report generated (FE Model for Stage 1) from floor trusses created unequal stringer dead load reactions (Node 8 = 13.334 kips; Nodes 4 & 6 = 13.4 kips). This is a symmetrical model with loads distributed by tributary area.

FROM: Herman Lee DATE: 7/24/2010 12:15:08 AM Eastern Daylight Time  
 Daniel, please attach the bridge to this incident for our investigation. Thanks.

FROM: Daniel Jones DATE: 7/26/2010 12:18:27 PM Eastern Daylight Time  
 I am using Floorbeam1 (FT1) for comparison.

FROM: Jim Duray DATE: 8/3/2010 1:54:31 PM Eastern Daylight Time  
 The stringer reactions are computed by BRASS. Check the BRASS output files for the appropriate stringers to verify the stringer DL reactions.

FROM: Daniel Jones DATE: 8/3/2010 5:47:15 PM Eastern Daylight Time  
 When I look at the BRASS output for Stringer 1 & 2, I come up with 13.4 kips; however, for Stringer 3 I get 13.3 kips. The difference is in the Haunch + Diaphragm Dead Load. One shows 0.3 kips and 0.2 kips.

Thanks,  
 Daniel

Complete Issue Information

FROM: Herman Lee DATE: 8/11/2010 2:16:10 PM Eastern Daylight Time  
The exported diaphragm point load in Unit2 Stringer3 is 0.125 kip. The exported diaphragm point load in Unit2 Stringer1 and Unit2 Stringer2 is 0.187 kip, which should be 0.125 kip based on the inputs in the S10 stringer group definition.

This is an existing issue in 6.1 Release. I'm changing the Folder to /Support Center/Virtis.

FROM: Brian Goodrich DATE: 8/20/2010 9:57:23 AM Mountain Daylight Time  
For Stringer 3, the FlrSystemStringerMbrPtr->GetCountGroupDefDiaphragmList() returns 6 diaphragms. However, for Stringer 1 and Stringer 2, the FlrSystemStringerMbrPtr->GetCountGroupDefDiaphragmList() returns 9 diaphragms. Half the weight of each diaphragm is applied to the stringer, which is why 0.1875 kips (0.125/2 \* 3) is calculated. Why are 9 diaphragms being returned for the first 2 stringers? The input has three diaphragms per bay and there are four bays. Could there be a problem a problem with retrieving the diaphragms?

FROM: Herman Lee DATE: 8/20/2010 1:43:08 PM Eastern Daylight Time  
There are bad diaphragm data in the S10 stringer group definition. The abw\_fsyz\_strgrp\_diaph table has 9 rows of diaphragm data for Stringer 1. When I use the Diaphragm Wizard to recreate those diaphragm inputs, the number of diaphragms is correctly set to 6. I tested the Diaphragm Wizard and Copy Bay To but unable to reproduce those bad data.

Joe, please see whether you are able to reproduce the issue. The GetCountGroupDefDiaphragmList is in BrassBracingScheduleCmd line 769.

FROM: Geoffrey Trees DATE: 9/21/2010 9:21:50 AM Eastern Daylight Time  
Daniel, I was not able to reproduce this error and I cannot find the cause. Have you been able to reproduce this error? I will need to know the steps to be able to reproduce this error if you are able to provide them.

FROM: Daniel Jones DATE: 10/18/2010 5:17:45 PM Eastern Daylight Time  
I tried reproducing the error but was unable as well. I am not sure what caused the problem.

Description

FROM: Daniel Jones DATE: 7/26/2010 2:28:43 PM Eastern Daylight Time  
The Boundary Conditions for the floor truss need to be reviewed. From a GT Strudl model it looks as if the software is setup to use a Pinned-Pinned-Pinned-Pinned boundary condition for the floor truss. I believe it should be Pinned-Roller-Roller-Roller.

Thanks,  
Daniel

FROM: Daniel Jones DATE: 7/29/2010 12:57:36 PM Eastern Daylight Time  
The model boundary conditions are wrong. Virtis has all 4 corners of the truss pinned. It should be one corner pinned (preferably a corner that has a diagonal framing into it) and the other three corners should be rollers (i.e. support in the y only). There are 3 reasons for this:  
1. The floor truss was designed this way.  
2. The current model is very unconservative for the Top and Bottom chords. The top chord will go into tension and the bottom chord will go into compression. In addition the forces in the chords will be very small as the supports are applying a force in the opposite direction of the forces actually in the chord cancelling them out.  
3. This is not realistic. For a built up section (like the example bridge used for verification) the angles that connect to the girder will deform relieving this force. For welded girders, the web deflects and relieves this force.

FROM: Herman Lee DATE: 8/12/2010 9:52:54 AM Eastern Daylight Time  
The Truss Floorbeam Mockups reviewed by the TAG specified that "All girder to truss floorbeam panel points are assumed to be pinned".

This is an existing issue in 6.1 Release. I'm changing the Folder to /Support Center/Virtis.

FROM: Herman Lee DATE: 8/20/2010 9:41:07 AM Eastern Daylight Time  
Floor truss was an enhancement in the 6.1 Release. The support conditions are hard coded as pinned based on what was specified in the Truss Floorbeam Mockups. Since floor truss has been released,

4/19/2016 3:07:53 PM

HRS AASHTO

1701

Complete Issue Information

changing the hard coded support conditions in 6.2 to what described above will affect floor trusses modeled in 6.1.

Below are the options we provided to the Task Force for consideration:

- 1. Do nothing.
- 2. Change the hard coded support conditions in 6.2 to what is described in the incident assuming this feature has not been used since 6.1 only supports rolled and built up sections for floor truss.
- 3. Change the hard coded support conditions in 6.2 to what is described in the incident and send out a technical note with 6.2 or after 6.2 is released.
- 4. 1, 2, or 3 and provide a new window for floor truss to enter support conditions in 6.3. Migration from 6.2 to 6.3 will populate all supports as pinned.

FROM: Herman Lee DATE: 8/20/2010 10:36:12 AM Eastern Daylight Time  
Task Force e-mail on 8/20:

The Task Force would like to move with #4 and #1 - do nothing for 6.2 but work on the user interface for 6.3.

FROM: Bin Zhang DATE: 1/25/2011 10:05:06 AM Eastern Standard Time

The floor truss boundary conditions were modified from "all pinned supports" to "one pinned and 3 roller supports", but are still of hard code. The virtis version 6.3 will have this modification.

FROM: Herman Lee DATE: 6/9/2011 4:51:56 PM Eastern Daylight Time  
This is in the 6.4 Work Plan.

FROM: Herman Lee DATE: 8/14/2012 5:55:04 AM Eastern Daylight Time  
Added a new window for floor truss support conditions in 6.4 release.

|                                                                   |

### Description

FROM: Daniel Jones DATE: 7/26/2010 2:32:41 PM Eastern Daylight Time  
I believe the section properties for the truss members needs to be reviewed.

Thanks,  
Daniel

FROM: Daniel Jones DATE: 7/29/2010 12:54:19 PM Eastern Daylight Time  
With the exception of Gross Area, the section property calculations are wrong. The Virtis calculation for the net area (or effective gross area) could not be duplicated, but it is obvious that the program is not using the Area of holes input in the built up section description. Also Iy is calculating the distance (in the Ad2 portion of the Iy calculation) from the bottom of the angle to the centroid of the component vs. the distance for the centroid of the built up section to the centroid of the component. Iz is using the Iy centroid instead of the Iz centroid. (Note: the nomenclature Iy is actually Ix and Iz is Iy. This is why

we are recommending a reference to the Global system coordinates). If lx & ly are wrong then the radius of gyration is wrong.

FROM: Herman Lee DATE: 8/30/2010 9:23:10 AM Eastern Daylight Time  
May, after back-to-back angle is implemented, please use the bridge in 10162 to verify the reported section properties.

FROM: Daniel Jones DATE: 9/7/2010 5:04:49 PM Eastern Daylight Time  
Here are some concerns we have.

1. Need something telling the user to fill out either Number of holes, diameter of holes or Eff area, not both.  
This should at a minimum be in the help files. A warning when you exit the tab would be better. If you have staggered holes, Virtis will not calculate the effective area properly and I am assuming this is why this is here.  
It is a good feature to allow the user to override but It is not a good idea to input both as virtis uses its calculation as a default.
2. Virtis uses the wrong axis orientation for the angles and it is messing up the section property calculations.
3. When I reverse the angles (see pdf file) Iz matches exactly to the above calculations but Iy is off slightly and needs to be checked.
4. Virtis uses gross area for tension and does not check for the area change due to holes. Supposed to deduct area of holes beyond 15% of the gross area.

Thanks,  
Daniel

FROM: Herman Lee DATE: 9/16/2010 1:24:41 PM Eastern Daylight Time  
The file attached by the user is not back-to-back angle.  
Changed Folder to /Support Center/Virtis.

FROM: Geoffrey Trees DATE: 9/16/2010 4:42:05 PM Eastern Daylight Time  
It appears that there is a bug when reading the values from the shape. The horizontal leg is using the opposite leg values to make the section calculations. Selecting the vertical leg gives the correct answer. See attached excel file.

FROM: Herman Lee DATE: 9/17/2010 8:04:39 AM Eastern Daylight Time  
#1 - When both are entered, Virtis uses the one with larger area of deduction (Number of holes x Hole size or Effective area). A warning message should be added during analysis.

#2 is fixed for the 6.3 release.

FROM: Geoffrey Trees DATE: 9/20/2010 3:30:27 PM Eastern Daylight Time  
#1 - Warning messages have been added during analysis. Fixed for the 6.3 release.

FROM: Herman Lee DATE: 9/20/2010 3:43:16 PM Eastern Daylight Time  
May, please investigate #4.

Complete Issue Information

FROM: Herman Lee DATE: 8/11/2010 3:44:22 PM Eastern Daylight Time  
Back-to-back angle is not a supported cross section for floor truss. This cross section is in version 6.3 work plan. The analysis needs to provide better feedback to the user.

This is an existing issue in 6.1 Release. I'm changing the Folder to /Support Center/Virtis.

FROM: Herman Lee DATE: 8/20/2010 10:02:25 AM Eastern Daylight Time  
The Dummy angle used at the bottom of the built up section doesn't have any dimensions and properties entered. The error message "Truss element cross section steel shape area is not entered!" does provide accurate feedback to the user.

FROM: Daniel Jones DATE: 10/29/2010 4:29:58 PM Eastern Daylight Time  
Received a new error as seen under file "10162".

FROM: Herman Lee DATE: 10/29/2010 4:34:47 PM Eastern Daylight Time  
Please attach the modified bridge xml file. Thanks.

FROM: Herman Lee DATE: 11/1/2010 9:50:14 AM Eastern Daylight Time  
May, please try to reproduce the error and identify the 155 concentrated loads (Deck + Diaphragms + Stringer+Floorbeam Loads).

FROM: Xinmei Li DATE: 11/1/2010 5:13:45 PM Eastern Daylight Time  
I'm not able to reproduce exact the same error. But I can't analyze either. It fails when computing dead load for the last floorbeam, cannot find intersection with girder.

FROM: Xinmei Li DATE: 11/3/2010 9:44:51 AM Eastern Daylight Time  
By adjusting the tolerance from 0.00001 to 0.0001, I can reproduce the error, but number of loads is 104 instead of 155.  
In this 104 concentrated loads, 51 loads are from floorbeam selfweight, the rest are girder diaphragms and stringer diaphragms deadload.

FROM: Xinmei Li DATE: 11/10/2010 2:21:09 PM Eastern Standard Time  
I'm able to reproduce 155 concentrated loads with 6.2 release version. Since the maxium number of concentrated loads BRASS can analyze is 70, this could be an enhancement.

Description

FROM: Doug Horton DATE: 8/5/2010 8:40:49 AM Eastern Daylight Time  
 One of our users was working on a small structure with heavy deterioration. The ratings were performed using LRFR and LFR. The differences in the LRFR ratings appeared acceptable, however there was a vast difference in the LFR ratings considering the deterioration (Ratings w/o deterioration were almost identical). In reviewing the two runs, the section properties and moments are very close and are obviously not an issue. The projecting compression flange fails to meet specs in BRASS. The file is attached, as is a spreadsheet showing the Operating rating factors at various levels of deterioration. The inspection report shows a 65.8% loss in top and bottom thickness. The exported file uses 40%.  
 I do not know what I am missing as I have reviewed the output several times. I feel there is a little value or values that need to be tweaked.

| 0.924 |                |                         |                          |                          |                          |

What can be said is what is causing the differences is consistent.

More over the controlling ratings were located exactly in the same place and for the most part with the same limit state.

For LDF and ASD there was a different story.

In my findings, Virtis ASD correlates with BRASS ASD and Virtis LFD fairly well in limit state as well as ratings. Virtis ASD and LFD both correlated well with each other in location as well. These values however did not correlate with LRFR.

BRASS LFD did not correlate at all with BRASS ASD or Virtis ASD or LFD - much more so with the two interior girders.

BRASS ASD, Virtis ASD and LFD did correlate fairly well with LRFR for the interior girders, whereas the exterior girder rated much higher in these three than it did with LRFR.

I would say the exterior girder differential has to do with the differences in how an exterior girder is designed between ASD/LFD and LRFD. LRFD is far more conservative on the exterior girders.

FROM: Brian Goodrich DATE: 8/18/2010 9:36:40 AM Mountain Daylight Time  
 In order for the export to determine if a P/S beam is spread or adjacent, the beam on either side of the beam in question must be assigned in the Beam Shape column on the Span Detail tab of the Beam Details form. However, for your structure, the G3 member is a P/S box while the G4 member is an R/C tee. The export is not handling the mixed beam type case. I need to discuss this with the development team and determine a solution. The only workaround at this point would be to use a girderline structure definition for each girder in your system.

Description

FROM: Doug Horton DATE: 8/10/2010 12:02:41 PM Eastern Daylight Time

This issue is related to incidents 9293 and 9907. SQL Server fails to install correctly due to MSXML 6.0 SP2 having been installed. The problem is exactly as noted in the release notes.

Unfortunately the "fix" is no longer available as Microsoft has withdrawn the clean-up utility.

I did not see a useable fix on Microsoft. Has any research been done on this problem other than the fixes performed by Joe?

FROM: Joseph Ihnat DATE: 8/10/2010 2:06:34 PM Eastern Daylight Time

Going forward this isn't an issue in version 6.2 using SQL Server 2008.

Only one user has reported this problem recently. I happened to have a copy of the CleanUp Utility so i sent it to them.

FROM: Todd Thompson DATE: 8/12/2010 12:45:31 PM Eastern Daylight Time

I had the problem installing it on another user's laptop prior to the UG meeting. So this cleanup utility may need to remain on the install DVD so users have access to it.

Subject: Virtis 6.2 Beta5 - Bar Mark Type 2 Bug

Reinforcement bars set up under Bar Mark Definitions as "Type 2" bars are generated w/incorrect total lengths. These bars are described & detailed as indicated here:

When called for use in a Member Alternative the total length is indicated as being the "B" length only (42.5' here), not including the additional lengths, as follows...

Note that "Straight Length" for the Type 2 bar G1 is displayed as 42.5'. The total straight length, including the x-coordinate of the bent portions (assuming a 45 deg. Bend\*), is actually 46.871'. For bars G2, G3 & G4, which are Type 3, the total length, including the bent and end portions, is included in the straight length. This is also borne out in the schematic view of the reinforcement.

Complete Issue Information

\*Unlike for Type 3 bars, there is no input for the bend angle. It seems like this is necessary information for Virtis to be able to use the angled portion for shear analysis.

It seems that the only way to get a Type 2 bar to display properly, both in the Girder Profile table and the schematic, is to locate the bar according to the point of the bend. This, however, is not consistent with the way Type 3 or other type bars are located, which is from the beginning of the bar. None of this is described in the Help.

A further and more critical issue that is occurring is that (again, unlike w/Type 3 bars) the angled portion of the Type 2 bars are not included in the shear resistance for the beam. This can be verified by describing the Type 2 bar as an equivalent Type 3 bar (which is also the workaround) and as a Straight or Type 1 bar and observing the results.

I have also included the v. 6.2 Beta5 export file for the subject bridge model (Bar Mark Type 2 Bug - 0640009 (6.2 Beta5).xml).

Tim Souther, PE  
%IDOT Local Bridge Unit

=====

FROM: Krisha Kennelly DATE: 8/16/2010 3:12:19 PM Eastern Daylight Time  
Please refer to the help topic for locating the reinforcement bars in the Girder Profile: Reinforcement window. I've attached that topic to this incident.

It has sketches showing how to define the location of the bars.

also, the sloped portions of bars are not included in the shear capacity. The Opis LRFD Superstructure Method of Solution manual explains this in the Assumptions and Limitations.

## Description

FROM: Paul Campisi DATE: 8/13/2010 10:00:59 AM Eastern Daylight Time

Skewed trusses with stringer-floorbeam flooring systems are causing Virtis to crash. There is no reason why this should occur since the BRASS engine can analyze skewed floor systems. This is not related to the problem the BRASS engine has analyzing the short stringer in a skewed bay (Incident 9061). The attached file ("Skewed Truss") does not have any short stringers but still crashes. When I remove the stringer framing in the end bays the truss module does not crash. I made a Superstructure Definition in the attached file that works with no end bay stringer framing. It looks like the problem is when Virtis attempts to calculate the framing loads at the end of the truss with two floorbeams framing into the bearing. We have numerous skewed trusses in NYS we need the truss module to have the ability to analyze skewed trusses.

Paul Campisi  
NYSDOT  
Load Rating Unit

FROM: Herman Lee DATE: 8/19/2010 11:19:53 AM Eastern Daylight Time

I tested both the Left Truss and Right Truss in the Skewed Truss (Not Working) superstructure definition with the default system tolerances (0.001 for ft and 0.00001 for in).

### Issues during analysis:

Left Truss -> ###Warning - Couldn't find panel point at floorbeam location 154.375000 ft.

Right Truss -> ###Warning - Couldn't find panel point at floorbeam location 0.001252 ft.

I adjusted the inputs based on the attached framing plan (Framing Plan.png). The modified skewed truss is attached (00026 - Skewed\_Truss Modified.xml).

### Issues during analysis:

Left Truss -> ???Error - Couldn't compute average dead load due to stringer unit 8!

Right Truss -> ???Error - Couldn't compute average dead load due to stringer unit 1!

When two floorbeams are at the same location on the truss, there is a defect in 6.1 in applying the stringer unit load as a point load at that location.

Fixed for 6.2 Beta 6.

Description

FROM: Krisha Kennelly DATE: 8/16/2010 1:35:44 PM Eastern Daylight Time  
 From VI10175. Found during 6.2 beta testing.

run BRASS LRFR for G2 of attached bridge (from 10175). Shear capacity at end of beam is being calculated using 58" stiffener spacing. It should be using 29".

user has entered the last stiffener as a spacing of -29" with a start distance of 68' from support 4. that results in the stiffener being located 29" from the last support.

FROM: Brian Goodrich DATE: 8/20/2010 11:36:42 AM Mountain Daylight Time  
 I determined why the last stiffener is not being considered. For negative spacings, the input geometry is converted such that the original end location becomes the start and original start location becomes the end. The export then put the first stiffener at the end of the first spacing. This was corrected by

Complete Issue Information

changing the start distance to one spacing left of the original end location. Stiffeners are now placed correctly. In addition to the transverse stiffener schedules, I revised the stirrup and bracing schedules accordingly.

FROM: Brian Goodrich DATE: 9/7/2010 3:37:44 PM Mountain Daylight Time  
Resolved. Fixed for 6.2 beta 6.

FROM: Krisha Kennelly DATE: 9/9/2010 1:25:38 PM Eastern Daylight Time  
correction to Brian's note above: corrected for beta7

Tested in beta 6 with updates. Stiffener spacing is now 29" at end of beam.

 Submitted on behalf of Matt Hamby (mhamby@sdrengineering.com), SDR Engineering Consultants.

Received Bridgeware e-mail:

```
=====
For the Little Creek: I have a slightly weird section that is basically a square girder 457mmx457mm. For
G1 (Exterior Girder) I tried modifying an AASHTO girder to this size and the analysis will not work, but if
I put in a typical AASHTO section for the girder the analysis works fine. I also tried the same thing for a
box girder (G1, box) and I get the same error message. I know from other bridges I can modify a
section in the library, but for this one it seems it will not let me.
=====
```

To reproduce, run G1 Exterior Girder with the Virtis LRFR Engine.

Developer Notes:

Below are two validations in PSBeamWideCrossSectionProperties SetDimensions. Are the validations required for ComputeCoordinates?

```
if (ComparisonFunctions.IsGreaterThanOrEqualTo(dWebThk + (2 * dTopHaunch2Width),
dTopFlgWidth, 0.00001) ||
    ComparisonFunctions.IsGreaterThanOrEqualTo(dWebThk, dBotFlgWidth, 0.00001))
{
    // web is equal to or wider than the flange
    return false;
}

if (ComparisonFunctions.IsGreaterThanOrEqualTo(dTopFlgThk + dBotFlgThk + dTopHaunchHeight +
dTopHaunch2Height + dBotHaunchHeight, dBeamHeight, 0.00001))
{
    // no web
    return false;
}
```

Description

FROM: Brian Goodrich DATE: 9/2/2010 8:42:10 AM Mountain Daylight Time  
Submitted via BridgeWare:

Hello Sir or Madam,

I have a question regarding a problem we are having after importing BRASS 5.8.9 files into Virtis 6.1. I should note first that we are using BRASS Library Utility Version 2.0.4 to convert our old BRASS 5.8.9 .LBY files to .BLS and .BLV files as used in the more current versions of BRASS. After using the Virtis 6.1 BRASS Import tool we attempt to run an analysis on the imported bridge with 4 different truck types (South Dakota Type 3, Type 3S2, Type 3-2 and HS 20-44). Once we run the analysis the output data within Virtis 6.1 reports that all operating and inventory level factors are 0.0.

I tried but could not attach the database, as it is too large.

Please note two things:

- 1) These files, which we are trying to import into Virtis 6.1, work and give accurate results when using BRASS 5.8.9 software.
- 2) We ran numerous BRASS 5.8.9 files through the BRASS Import tool in Virtis 6.0 and never had this problem.

Any help would be greatly appreciated. Please let me know if you need any further information.

Best Regards,

Daniel K. Johnson, P.E.

FROM: Brian Goodrich DATE: 9/17/2010 11:10:17 AM Mountain Daylight Time  
The plastic section moduli for the X and Y axes are switched, which is causing the zero ratings. The original .BLS file looks correct, so I suspect the BRASS import utility is switching the values. I'll need to get the BRASS import utility source code to verify this.

FROM: Xinmei Li DATE: 4/3/2012 10:11:44 AM Eastern Daylight Time  
Please send me the original .BLS so that I can do further investigation.

FROM: Herman Lee DATE: 4/12/2012 3:08:02 PM Eastern Daylight Time  
Attached BLS file from Brian Goodrich.

FROM: Herman Lee DATE: 8/23/2012 9:45:23 AM Eastern Daylight Time  
The plastic section moduli for the X and Y axes are switched in the BRASS import utility. Fixed for the 6.4 Release.

Issue ID: 10236  
Subject: Runs fine in BRASS, not in AASHTO Engine

### Description

FROM: Tim Armbrecht DATE: 9/2/2010 3:11:58 PM Eastern Daylight Time

This appears to be a 6.1 problem. My consultant (Chamberlain) was trying to model this PPC I-beam structure in Virtis. Was able to get LRFR results in BRASS, but hung up with the AASHTO Engine. File attached.

FROM: Herman Lee DATE: 9/2/2010 3:16:31 PM Eastern Daylight Time

AASHTO LRFR Engine complains the following when I tried to rate the beams in the attached bridge. After making Span 3 strand layout inputs the same as Span 1, I'm able to complete the rating.

Error - Harped strand configuration is specified but no strands are harped in Span 3!

FROM: Tim Armbrecht DATE: 9/2/2010 4:29:23 PM Eastern Daylight Time

Accepted.

FROM: Tim Armbrecht DATE: 9/15/2010 3:58:17 PM Eastern Daylight Time

Need to resubmit this - just got this from my consultant:

Tim,

I revised the file for the draped strands, however VIRTIS for LFD and LRFR is yielding a low result for a serviceability condition that BRASS is not indicating. The revised file is attached.

Cory

Complete Issue Information

FROM: George Colgrove DATE: 9/16/2010 7:57:58 AM Eastern Daylight Time  
This is still true for VO6.2 Beta 7.

- 1. This is only true for Inventory Ratings for Virtis LRFR
- 2. This is only true for the Axle Load for LFR

In Virtis, the controlling articles is with 6.4.2.1 - MCE-LRFR. The Controlling rating was 0.197 for Service III at the top of the girder

6 Load and Resistance Factor Rating  
 6.4 Load Rating Procedures  
 6.4.2 General Load-Rating Equation  
 6.4.2.1 Design Load Rating Prestress Service III Tensile Stress  
 (AASHTO Manual for Condition Evaluation and Load and Resistance Factor Rating (LRFR) of Highway Bridges, First Edition - 2003, 2005 Interims)

The location is at 0.75 ft - BRASS does not produce a POI at 0.75 - when I put a POI at 0.75 ft from support 2, it simply makes a POI at 0.00 ft at support 2. BRASS is not doing many Service III calculations other than Determination of Section Moduli. BRASS is not seeming to be calculating the effects of the negative flexure over the pier where the rating factors based on the negative moment effects in the reinforcing steel over the support.

FROM: George Colgrove DATE: 7/7/2011 10:11:09 AM Eastern Daylight Time  
Running a straight rating for both BRASS (VO6.1) and AASHTO (VO 6.3) provides very similar rating results. The rating factors for VIRTIS (VO 6.1) (pre-AASHTO engine) provided similar operating ratings, but the inventory ratings were very low. VO 6.1 and VO 6.2 produced similar results. The problem appears to be fixed under VO 6.3

 Tallahassee, FL 32308

=====

Use G2 in SPANS 11 & 12 to reproduce the crash.

FROM: Herman Lee DATE: 9/3/2010 4:19:32 PM Eastern Daylight Time  
 Matt requested to be notified if there's a workaround.

FROM: Krisha Kennelly DATE: 9/7/2010 3:20:23 PM Eastern Daylight Time  
 I'm looking into this, can't find a workaround yet.

FROM: Krisha Kennelly DATE: 9/8/2010 1:08:37 PM Eastern Daylight Time  
 email with workaround sent to Matt:

Sent: Wed 9/8/2010 1:08 PM

Hi Matt,

The crash is due to an error creating an output file when Virtis LRFR is run. Member G2 in the structure def "SPANS 11 & 12 = SPANS 13 & 14: Type BT-72 Continuous" is crashing. As a workaround, I shortened the structure def name to "SPANS 11 & 12 = SPANS 13 & 14: Type BT-72" and was then able to run Virtis LRFR to completion.

Complete Issue Information

We'll look into fixing this problem for the next release (Version 6.3).

Regards,  
Krisha Kennelly, PE  
Michael Baker Jr., Inc.

Joe - please add some code to check that the path length is not too long in line 7172 of ScSuperStructure .cpp. Other calls to File::Open() in AbaSpecCtrl may need similar length checks on the path name.

FROM: Joseph Ihnat DATE: 11/30/2010 8:00:40 AM Eastern Standard Time  
I've added code to squeeze out the underscores from our folder names, which should reduce the overall path lengths.  
Krisha, if more checking is required, assign this back to the original developer(s).

FROM: Krisha Kennelly DATE: 3/26/2011 1:18:49 PM Eastern Daylight Time  
Path lengths have been reduced in the code. G2 to now runs to completion.

Also, warning messages are issued when the path & file exceeds Microsoft allowables and the program no longer freezes.

### Description

FROM: Aaron Kemna DATE: 9/3/2010 1:32:23 PM Eastern Daylight Time

Currently Brass will automatically set the load factor ( $\gamma = 1.5$ ) for wearing surface entered in the structure typical section. The MBE allows a  $\gamma$  value of 1.25 to be used for field measured wearing surface. Thus, I believe, Brass should be using the load case assigned to the wearing surface. That way the wearing surface load case can be set to DC or DW depending on which load factor is appropriate. I understand that a member load could be added to get around the issue, but I believe that is a poor solution.

FROM: Herman Lee DATE: 9/3/2010 2:34:30 PM Eastern Daylight Time

Brian, is this an enhancement request?

FROM: Brian Goodrich DATE: 9/7/2010 4:10:56 PM Mountain Daylight Time

The BRASS export uses the factors that have been specified by the user. If none are specified, the factors default to those specified in the System Defaults window. I checked the factors library and found that 1.5 is the LRFR default for the DW load case. Please let me know if this addresses your issue.

FROM: Aaron Kemna DATE: 9/8/2010 9:10:02 AM Eastern Daylight Time

Changing the DW load factor could work for some bridges, but would not work for bridges that had a wearing surface and utilities for example. The MBE allows the 1.25 load factor for wearing surface only. The simplest solution is to define the wearing surface as a DC or DW load type depending on the user's situation (field measured or approximated, respectively). Technically the load type is DW. Again,

4/19/2016 3:07:57 PM

HRS AASHTO

1727

Complete Issue Information

a member load could be set up to use the DC load type to get what the user wants, but it seems silly when we have a tab set up for wearing surface specifically (girder system). I guess I would classify this as an enhancement request for Brass or Virtis. Another solution, would be to add a drop down in Virtis that specifies if the wearing surface is field measured or not. Then the engine could use the appropriate load factor according to the MBE, Table 6A.4.2.2-1.

FROM: Brian Goodrich DATE: 9/8/2010 10:34:50 AM Mountain Daylight Time  
Thank you for the clarification. This would be an enhancement to create another DW load factor for the utilities separate from the wearing surface. I will forward this issue to WYDOT for the BRASS side of things.

FROM: Aaron Kemna DATE: 9/17/2010 10:31:44 AM Eastern Daylight Time  
Is Virtis planning to address this issue? I understand there are workarounds, but technically the DW factor is being reduced.

FROM: Todd Thompson DATE: 9/17/2010 11:40:06 AM Eastern Daylight Time  
I've tried the workaround by creating 2 different LRFR Libraries - the only difference is the DW factor. And then I have to select which library I want to select.

This should be resolved via maintenance since this is in the current AASHTO Spec supported for Virtis and the MBE Spec.

FROM: Herman Lee DATE: 6/9/2011 5:03:50 PM Eastern Daylight Time  
This is in the 6.4 Work Plan for the AASHTO LRFR Engine.

FROM: Aaron Kemna DATE: 7/2/2012 2:51:58 PM Eastern Daylight Time  
Accepted for Virtis 6.4 Beta 2.

Description

FROM: Herman Lee DATE: 9/8/2010 10:49:11 AM Eastern Daylight Time  
 Submitted on behalf of Daniel Johnson (dkjjec@iw.net), Johnson Engineering Company.

Received Bridgeware support e-mail (RE\_ Problems with Skewed End Panel Truss System.pdf):

=====

I am having trouble performing analysis on a Truss System superstructure with skewed end panels. The two end panels are skewed -41.0 degrees. The end panels are arranged as shown in the picture below. This configuration results in two stringers which are very short where the two floorbeams intersect at the main members as shown in sketch below. The two short stringers are 0.15 feet and 0.95 feet long. When running the Stringer Unit Layout Wizard and getting to the Live Load Distribution Factors calculation portion of the Wizard I receive an error when I get to the stringer with a length of 0.95 feet which reads "End Distance is 0.0000000 ft. Stringer Definition length is 0.9453000 ft. Do you want to change the length?" with YES and NO as selectable choices. I receive a similar error when I arrive at the 0.15 feet long stringer for calculation of Live Load Distribution Factors within the Wizard module. Then when I try to move on to the next girder I am prompted that "Data in the grids has changed! Do you want to save this data before switching to another stringer?" YES/NO. It then tells me that the end distance is different than the stringer definition length and doesn't let me move on to the next stringer. The Stringer Unit Layout Wizard seems to work well for all of the other stringers in the bridge configuration.

One last point to make on this issue is that when I view the schematic drawing on the Framing Plan Detail the two short stringers mentioned above do not appear correctly. The 0.95 ft stringer looks too short and the 0.15 ft stringer looks way to long and actually appears to carryover beyond the limits of the bridge. This is shown in the drawing below.

Complete Issue Information

I did see Issue 9061 on the technical support website. In this issue it is stated that smaller girders may result in problems when running analysis with Virtis 6.0. However, we are currently running Virtis 6.1. It did mention that changes would be made in Virtis 6.1 for this issue.

=====

Reply e-mail:

=====

Daniel,

The entered end panel stringer lengths are close to those I computed in Geometry.xlsx file. For the schematic issue, I suspect there's a defect in handling the negative "Left edge of deck to first stringer" input. I have entered the schematic issue on your behalf as Incident 10243 in Virtis/Opis Support Center for further investigation.

Below are two additional input issues:

- For interior panels stringer profile, the Start Distance should be 0 and the Length should be 14.8333. (see attached Stringer Bays 2, 3, 4.png).
- For the right end panel (Unit 5), the stringer definition assignments for stringer 1 to 19 should be from Stringer a to Stringer s since it is opposite to those in Unit 1.

In 6.1, the defect described in Incident 10195 will cause an incorrect stringer unit load applied to the truss. Incident 10195 has been resolved for the coming 6.2 release in this month. A workaround in version 6.1 is to model the truss as truss line.

Herman

### Description

FROM: Todd Thompson DATE: 9/8/2010 2:26:38 PM Eastern Daylight Time

As I'm concluding my testing - I have a newer 3 span Prestressed Girder Bridge that BRASS and VIRTIS agrees very well for HL-93 and Legal trucks. But for my NYSDOT Permit Truck, I get differences of up 27%.

The P-15 permit truck agrees ok between the two products.

My Control Options say to use 1/10 points and User-Defined Control Points (of which I have not described any).

Yet BRASS LRFR gives me ratings at points other than 1/10 points and I'm sure this is the root cause of the large rating differences. (9.1% of span 2)

I've attached my permit trucks, my bridge XML and my results between BRASS and VIRTIS. I just ran out of time to dig deep enough to figure out what the difference is for this bridge. (Only bridge that is PSC that I've had a chance to test in 6.2 so far)

The Single Trip, Mixed have results around 11% difference.

Unlimited have results around 27 to 29% difference

Single Trip, Escorted have results around 23 to 27% difference.

FROM: Herman Lee DATE: 9/10/2010 11:14:12 AM Eastern Daylight Time

BRASS LRFR controlling limit state is:

SERVICE I Concrete Stress Minimum Effects DL + PS + LL Bottom of Beam

LRFD 5.9.4 Concrete Stresses (ksi) : DL + PS + LL

Virtis LRFR controlling limit state is:

STRENGTH II-Concrete Flexure

MBE 6.4.2.1 Concrete Flexure

4/19/2016 3:07:58 PM

HRS AASHTO

1731

## Complete Issue Information

Virtis LRFR evaluates LRFD 5.9.4 for design ratio only, not rating factor. MBE 6.6.4.2.2 (Service limit state for legal and permit load rating) doesn't specify to rate for the stresses in LRFD 5.9.4. That is the reason why Virtis LRFR doesn't rate for the stresses.

The controlling rating for Virtis LRFR is flexure at pier 1 for Strength II. RF is 1.737 (Single Trip, Escorted). The BRASS Output at the 200 point Strength II flexure RF is 1.752. The flexure rating factors are comparable between the two engines.

Todd, please let us know of your opinion.

FROM: Todd Thompson DATE: 9/13/2010 1:05:12 PM Eastern Daylight Time  
The 2003 AASHTO LRFR Spec (with 2005 interims) for 6.6.4.2.2 is for Steel Girder Bridges, not Prestressed Girders.

This release of Virtis doesn't include the newer MBE spec.

So between a possibly wrong Spec Reference and the reference for Steel Girder bridges for PS has me confused a bit.

Looking for some guidance here as to either correct Spec Reference or correct Spec. I will otherwise try to pursue this in more depth also.

FROM: Todd Thompson DATE: 9/13/2010 1:20:06 PM Eastern Daylight Time  
Also - what about the Control Options stating to only check at 1/10 SP Points but yet BRASS is giving me a controlling rating point at 9.1% of the Span. Appears the control option isn't controlling.

FROM: Krisha Kennelly DATE: 9/13/2010 1:32:00 PM Eastern Daylight Time  
The correct article is 6.5.4.2.2. from the MCE 2003

I haven't looked into it but is the 9.1% due to the modeling method being used for BRASS? CL of simple span bearing or CL of final supports?

FROM: Krisha Kennelly DATE: 9/13/2010 1:50:03 PM Eastern Daylight Time  
If you run with the BRASS PS modeling method set to 'Centerline of final supports' you'll get results at tenth points.

FROM: Todd Thompson DATE: 9/13/2010 2:36:38 PM Eastern Daylight Time  
Ok - that explains the 1/10 point problem.

And 6.5.4.2.2 (MCE 2003) is optional for Service I Limit State for Permit loads - so that is why Virtis does not do this check?

FROM: Krisha Kennelly DATE: 9/13/2010 3:06:43 PM Eastern Daylight Time  
Have you checked the control option to include this check? 'Consider permit load tensile steel stress'

FROM: Todd Thompson DATE: 9/14/2010 9:33:21 AM Eastern Daylight Time  
I tried checking that option and Strength II still controls with VIRTIS.  
And BRASS always considered this - regardless of whether the control option is checked or not.

I'll try to dig into it deeper but appears this control option doesn't work correctly for permit loads?

Complete Issue Information

FROM: Todd Thompson DATE: 9/15/2010 1:06:03 PM Eastern Daylight Time  
Beta 7 (and Virtis 6.1)

Control Option - Consider permit load tensile steel stress

When checked YES - BRASS has this  
MAP-SPEC-CHECK SE, 3, P, CS1, YES  
MAP-SPEC-CHECK SE, 3, P, CS2, YES  
MAP-SPEC-CHECK SE, 3, P, CS3, YES

When not checked - BRASS has this  
MAP-SPEC-CHECK SE, 3, P, CS1, NO  
MAP-SPEC-CHECK SE, 3, P, CS2, NO  
MAP-SPEC-CHECK SE, 3, P, CS3, NO

So the proper data is getting to BRASS-LRFR.

After reviewing the BRASS output - the BRASS-LRFR output is the same (minus the MAP-SPEC-CHECK as shown above). Appears the either BRASS-LRFR does not use this:  
MAP-SPEC-CHECK SE, 3, P, CS1, YES  
MAP-SPEC-CHECK SE, 3, P, CS2, YES  
MAP-SPEC-CHECK SE, 3, P, CS3, YES

Or I'm not sure.

I've attached the input and output from BRASS-LRFR  
those that precede with NOT are tied together (do not consider permit load tensile steel stress)  
and the regular ones are tied together. (consider permit load tensile steel stress)

This issue should not hold up 6.2 since it existed in 6.1

FROM: Herman Lee DATE: 9/15/2010 2:49:39 PM Eastern Daylight Time  
For Virtis LRFR, when the "Consider permit load tensile steel stress" option is checked, LRFR spec article 6.5.4.2.2.2 will be evaluated (see attached Virtis LRFR.png).

For BRASS LRFR, I'm able to reproduce what Todd described on 9/15.

Note that the controlling limit state for BRASS LRFR is:  
SERVICE I Concrete Stress Minimum Effects DL + PS + LL Bottom of Beam  
LRFD 5.9.4 Concrete Stresses (ksi) : DL + PS + LL

FROM: Brian Goodrich DATE: 11/22/2010 7:03:36 AM Mountain Standard Time  
We are investigating this issue with respect to the BRASS engine.

### Description

FROM: Ed Baumann DATE: 9/9/2010 11:05:34 AM Eastern Daylight Time

The attached bdd file is of a through truss-floorbeam-stringer system. The existing interior floorbeams should be skewed with respect to the trusses, but in the model they are square. How do we make the interior floorbeams skewed?

FROM: Herman Lee DATE: 9/9/2010 12:14:43 PM Eastern Daylight Time

Skewed interior floorbeam is not supported in truss system superstructure definition. An alternative is to model using truss line superstructure definition.

Description

FROM: Andrea Grunau DATE: 9/10/2010 10:19:24 AM Eastern Daylight Time  
When I try to analyze the structure the program crashes and exits. I went into the output file and there is an error that states "\*\*\*\*\* INPUT ERROR 1 \*\*\*\*\* STRAND TYPE MUST BE SPECIFIED AS L OR S". It seems like the input at this point is not correct as it is shifting numbers over to different columns. Am I neglecting to put in some information or putting in too much?

FROM: Herman Lee DATE: 9/10/2010 10:28:30 AM Eastern Daylight Time  
The f'c and f'ci for both PS beams should be based on ksi. After f'c and f'ci are corrected, you need to reselect the PS concrete material in the Stress Limits window so the stresses are recomputed.

Complete Issue Information

Note that analyzing this bridge in the coming 6.2 release will not cause Virtis to crash and exist. The analysis will exit with an error message for that command line.

Description

FROM: Andrea Grunau DATE: 9/13/2010 10:52:30 AM Eastern Daylight Time

I am rating a recently built 4 span Prestressed Concrete I-Beam structure. The rating is coming up less than 1.0 for inventory for a few standards vehicles. I looked into the output and saw that the program is calculating a low positive moment capacity at 1.33' from the end of the span which corresponds to the centerline of bearing. The structure is simply supported and continuous for live load. I have input the reinforcement for the continuity diaphragm and also checked the box to ignore the positive moment at the supports. It seems like that is what the rating factor is being calculated with at 1.33'.

FROM: Herman Lee DATE: 9/13/2010 12:24:55 PM Eastern Daylight Time

As mentioned in the Engine Help for the Virtis Std Engine, "Ignore positive moment at supports in ratings" are not used by the Virtis Std Engine.

Submitted on behalf of Daniel Johnson (dkjjec@iw.net), Johnson Engineering Company.

Received Bridgeware support e-mail:

=====  
Herman,

I completed the suggested task. The bridge still doesn't run a successful analysis on the truss. I have attached the updated file. Any further assistance would be appreciated. I should mention that I did still get an error when changing Stringer Unit 5 Stringer 1 to a 'Stringer a' type Virtis reports an error which states 'End Distance is 0 ft. Beam Length is 0 ft. Do you want to change the length?' with Yes/No selectable choices. This also occurs when changing Stringer Unit 5 Stringer 2 to a 'Stringer b' type, except the only difference in the pop up window is that the Beam Length is reported as 1 ft.

Thanks again,

Daniel K. Johnson, P.E.

Complete Issue Information

Virtis asserts when DoTrussRefLinePtr->FindIntersection in CDoTfsFloorSystemStructDef::ComputeTrussMbrLengthAlongUnit.

FROM: Krisha Kennelly DATE: 9/28/2010 12:37:56 PM Eastern Daylight Time  
A workaround is to change the Span Length from 59.3333' to 59.333333' on the Structure Definition window. Truss 1 will then analyze.

With the skews and the trailing digits of the data, the program is having difficulty finding the interesction of the last floorbeam and the truss.

Developer Note:  
ComputeSkewAtDistance(dDistFromLeftEnd + dUnitLength, ...) is unable to find the skew of the last floorbeam.  
Last support is at 59.3333 (based on user input), program internally computes dUnitLength as 7.416667' which results in last floorbeam being a little past the last support.

Complete Issue Information

Submitted on behalf of Jordan Pitt, LPA via email:

Herman,

Please see the attached Bridge file. We are having problems with Girders G1, G2, G7, G8, and G9 running for the 3-span superstructure with skewed supports #2 and 3. The analysis stops while performing the specification checks around point 109-ft. We have reviewed the file but can't seem to figure out why some girders are running and others are not. Could you take a look and let me know what you find?

Thanks,  
-Jordan

FROM: Krishna Kennelly DATE: 9/22/2010 10:12:18 AM Eastern Daylight Time  
reply sent via email:

Hi Jordan,

Herman asked me to look into your problem. For these girders, Virtis is not recognizing the last support due to an internal tolerance problem.

A workaround for your problem is to change the length of the Haunch Profile range to the following values:

G1 150.95942  
G2 150.5772  
G7 148.666  
G8 148.2836  
G9 147.9014

With these values and the System Default tolerances delivered with Virtis, I'm able to run these girders.

I've entered this problem as Issue #10256 on the Virtis/Opis Technical Support website. We'll look into fixing it for the next release, Version 6.3.

Regards,  
Krisha Kennelly, PE  
Michael Baker Jr., Inc.

FROM: Krishna Kennelly DATE: 10/17/2010 9:23:14 PM Eastern Daylight Time  
Fixed for version 6.3. Tested G1, 2, 7, 8 and 9 in attached bridge. all ran to completion. also tested g1 in bid10 to make sure nothing broken.

Description

FROM: Dan Heller DATE: 9/22/2010 1:45:08 PM Eastern Daylight Time

As a background, we are new to Virtis and trying to do some sample bridges to get familiar with the software.

Our sample bridge consists of 3 spans type V AASHTO girders. Spans of 55', 130', and 55'. Spans 1 & 3 have 13 girder lines while span 2 has 20 girder lines. When defining the "Girder System Superstructure Definition" how do we change the number of girders for each span?

FROM: Herman Lee DATE: 9/22/2010 4:23:55 PM Eastern Daylight Time

If you have 3 simply supported spans, you need to have 3 superstructures in Virtis. If the first and the third spans have the same configuration, you need 2 different superstructure definitions. The first and

4/19/2016 3:07:59 PM

HRS AASHTO

1741

Complete Issue Information

third superstructures use the first superstructure definition (13 girders). The second superstructure uses the second superstructure definition (20 girders).

If you have 3 simply supported spans and the deck make continuous for live load, Virtis doesn't support having different number of girders in different spans.

### Description

FROM: George Huang DATE: 9/23/2010 4:38:53 PM Eastern Daylight Time

This is a RC slab bridge with using RC T-Beam function. The modle is working with BRASS LFR Engine but fails to export to Virtis LFR engine. The bridge model file, "Caltrans\_10C0163.xml", and log file "11ft\_RC\_slab.log" are attached.

FROM: Jim Duray DATE: 9/23/2010 4:51:56 PM Eastern Daylight Time

This is a problem in StdEngine export.

May - please try to run this in 6.2 beta 7 and 6.1.

FROM: Xinmei Li DATE: 10/4/2010 10:19:30 AM Eastern Daylight Time

I am able to reproduce this export error with 6.2 beta7.

Since the bridge is 6.2, I can't test with 6.1.

George, if you have 6.1 version of this bridge please attach it so that I can test if this is an old problem.

Thanks. If you don't have it you can just assign it back to Jim.

FROM: George Huang DATE: 10/4/2010 10:51:59 AM Eastern Daylight Time

Hi Xinmei, the 6.1 version file (00879-10C0163.xml) is attached.

FROM: Xinmei Li DATE: 10/6/2010 1:40:01 PM Eastern Daylight Time

I tested with 6.1. The section properties of T beam is not exported correctly. This was a bug, fixed in 6.2.

The section properties entered in this girder is not supported by std engine. The web thickness is too big, change it from 132" to anything less than 100" the analysis will run with no problem.

Description

FROM: Richard Withers DATE: 9/27/2010 3:44:19 PM Eastern Daylight Time

When loadrating a floorbeam in a truss/floorbeam/stringer system, I received a notification telling me an error ocured while the program was generating stringer deadload reactions. Two things:

1. I am using a generic rail. After I ran the initial rating (which ran without error) and was reviewing the BRASS output, I realized that I applied the rail in load case DC1. I went to the Structure Typical Section window and changed the load case for the rail to DC2. When I tried to rerun the load rating, I received the error.

2. This is a symmetrical, square (no skew) truss with 8 floorbeams. The error only occurs with floorbeams 1 - 3. Floorbeam 8, which is identical to floorbeam 1, runs without error. Floorbeams 4 -7, which are identical to floorbeams 2 & 3 also run without error.

So why do I get an error for floorbeam 1, 2 & 3 when I change the load case of the rail to DC2?

FROM: Herman Lee DATE: 9/28/2010 8:21:43 AM Eastern Daylight Time  
Richard, the error in preparing stringer dead load reactions is a duplicate of Incident 8826. The defect has been fixed and will be included in the 6.2 release. We are going to send out 6.2 DVD today. I tested your bridge for the scenario described above and confirmed the defect is fixed.

FROM: Richard Withers DATE: 9/28/2010 9:34:45 AM Eastern Daylight Time  
That's great news. I searched for similar incidents but I didn't see 8862. I see the work around and will use that until we get 6.2 installed.

Thanks,

Richard

Description

FROM: George Huang DATE: 9/27/2010 6:29:29 PM Eastern Daylight Time

This bridge was fine with BRASS LFD engine but not working with Virtis LFD Engine. Although 0.0 Shear LLDF was used for G1, it still doesn't work after change to 0.01. You may test G2 or G3 first. It looks like looking for composite information when exporting the section information. The file 00628-08C0255 is attached.

FROM: George Huang DATE: 9/27/2010 6:31:12 PM Eastern Daylight Time

Virtis 6.2 beta 7 has similar error messages.

FROM: Herman Lee DATE: 9/28/2010 8:48:08 AM Eastern Daylight Time

For G1, the error message is "Error - The Standard live load distribution factor per wheel for shear at supports is zero!". Please enter 0.01 for Shear at Supports LLDF instead of Shear LLDF.

For G1, G2 and G3, Virtis Std Engine requires lateral brace points for the girder to be entered. The lateral brace points can be either lateral support for top flange or diaphragm for bottom flange. Please see whether it is reasonable to model these along the girder or at supports. Thanks.

FROM: Herman Lee DATE: 9/28/2010 12:04:51 PM Eastern Daylight Time

Virtis Std Engine in 6.1 release will complain duplicate range for the girders. This defect has been fixed and will be included in the 6.2 release.

### Description

FROM: Brian Goodrich DATE: 9/29/2010 9:09:16 AM Mountain Daylight Time  
Submitted via BridgeWare for David Wolfe:

Bridgeware – The following is for BRASS LRFR engine.

For a concrete member LRFR rating, the Member Alternative Control Options check boxes for (i) "Ignore design & legal load shear" and (ii) "Ignore permit load shear" seem to work as expected.

For a shear override at a Point-of-Interest (POI) there are also check boxes under LRFR for (i) "Ignore design & legal load shear" and (ii) "Ignore permit load shear", which do not work as expected. These check boxes imply that they correspond to the override being performed at the POI, however, at the POI, the second check box ("Ignore permit load shear") does not seem to do anything and the first check box for ("Ignore design & legal load shear") seems to only function as an on/off switch for the combination of check boxes selected at the Member Alternative Control Options.

Respectfully - DW

FROM: Brian Goodrich DATE: 9/29/2010 9:16:09 AM Mountain Daylight Time  
The BRASS engine does not support the "Ignore design & legal load shear", "Ignore permit load shear", or "Consider permit load tensile steel stress" at the point-of-interest level. The BRASS-specific help must be revised to reflect this limitation.

Description

FROM: Paul Campisi DATE: 10/5/2010 6:24:03 PM Eastern Daylight Time  
One of our networked users is getting the following error when trying to rate a bridge.

“Unable to generate BRASS LFD/ASD section library file!  
Error generating BRASS cross section commands!  
Unable to open the requested file.”

Not sure why one user would get this error. He has rights to create and modify bridges. This error has been intermittent for several months, and apparently resolves itself after several hours to over a day.

Thanks

Paul Campisi

Description

FROM: Amy Levan DATE: 10/6/2010 9:48:27 AM Eastern Daylight Time

I have imported .xml files from version 6.1 into version 6.2 to verify results of 6.2. I recieved the same ratings for design and legal loads, however, my permit trucks are rating 1.52 times higher in version 6.2 than in 6.1.

I compared BRASS LRFR input, and it appears the trucks are being scaled by 0.8333. If I go into Analysis Settings: Vehicles, on the Advanced Tab, the scale factor is listed as 1.0. I have to change this to 1.2 to get the BRASS LRFR input to list the scale as 1.0. Why?

This does not fully correct the problem either. After changing the scale factor to 1.2 so that the input reads 1.0, the ratings are 1.27 times higher than version 6.1 ratings.

FROM: Herman Lee DATE: 10/7/2010 8:21:07 AM Eastern Daylight Time

Please attach the bridge XML file to this incident and specify the Frequency and Loading Condition you selected in the Advanced Vehicle Properties window for the permit truck.

FROM: Herman Lee DATE: 10/7/2010 8:45:02 AM Eastern Daylight Time

E-mail from Amy Levan:

=====

Thanks for your attention, but I solved the problem yesterday. The wrong frequency had been chosen.

Amy R. Levan, P.E.

Greenman-Pedersen, Inc.

Description

FROM: Beckie Curtis DATE: 10/7/2010 10:58:11 AM Eastern Daylight Time  
 A consultant came across this error on two separate bridges (See attached screenshot) using the Virtis LFD Standard Engine. For the submitted .xml, run Spans 1 or 3 - Beam A. Beam B & Beam D both run fine and Beam A runs fine using BRASS engine.

FROM: Herman Lee DATE: 10/7/2010 11:24:20 AM Eastern Daylight Time  
 Below is copied from the analysis log file.

```
=====
Warning - The precision of the entered span length exceeds the fixed length data field allocated!
Warning - The entered span length will be adjusted!
Span Length 1: 80.37
```

Complete Issue Information

=====

The adjusted span length should be 80.38 since the entered span length is 80.375. This defect has been fixed for the 6.3 Release.

A workaround is to enter the span length as 80.375001 so it will be rounded up to 80.38.

FROM: Srujana Thogaru DATE: 3/31/2011 4:43:44 PM Eastern Daylight Time  
Verified and found to be fixed for 6.3

Description

FROM: Aaron Kemna DATE: 10/22/2010 4:35:31 PM Eastern Daylight Time  
 I could not replicate Virtis's Cb values for partially braced members using the moment envelopes. Does Virtis use corresponding loading at the brace points? For more detail, I have a bridge with flexure problems at Bent 4 of a 4-span bridge. The unbraced length to the right is 25'. The left brace point is at Bent 4. The right braced point is at midspan. The left braced point is in a non-composite region. The right braced point is in the composite region. I am assuming Virtis uses stresses to calculate Cb since the section changes? Using the Moment envelopes, I get a Cb value of around 1.9 or 1.99 (G2)

4/19/2016 3:08:02 PM

HRS AASHTO

## Complete Issue Information

depending on some load factor assumptions for the HS20 Lane Load. Virtis LFD is maxed out at 2.3. I found similar issues with other trucks, but I think I matched the HS20 Truck Load. I have attached the bridge if you need it. Note that 6.2 matches 6.1.

FROM: Xinmei Li DATE: 11/1/2010 10:21:47 AM Eastern Daylight Time  
Do you mean Virtis LFD or LRFD?

FROM: Aaron Kemna DATE: 11/2/2010 1:23:54 PM Eastern Daylight Time  
Virtis LFD. If you could tell me what Virtis is doing to get the Cb value at the 4.0 point for G2 and a HS20 Lane Load, that might clear up the issue. What's the M1, M2, f1 or f2 values for the Cb calculation?

I get from Virtis LFD.

|               |              |               |
|---------------|--------------|---------------|
| @ 4.0         | @ 4.5        |               |
| MDL1 = -250.6 | MDL1 = 172.2 |               |
| MDL2 = -91.5  | MDL2 = 87.7  |               |
| MLL = -272.8  | MLL = -75.2  |               |
| M2 = 1037     | M1 = 175     |               |
| f2 = 38.9     | f1 = 8.5     | ==> Cb = 1.99 |

The above stresses are calculated for the bottom flange from factored loads. Full load factors were used for the MDL values at 4.5 which could be unconservative.

FROM: Xinmei Li DATE: 11/3/2010 9:23:39 AM Eastern Daylight Time  
Hasmukh, can you take a look?

FROM: Herman Lee DATE: 11/4/2010 5:47:22 PM Eastern Daylight Time  
Attached Virtis Std Engine G2 input and output files.

FROM: Hasmukh Lathia DATE: 11/5/2010 4:24:23 PM Eastern Daylight Time  
Virtis Std Engine uses the equation  $C_b = 1.75 + 1.05(M1/M2) + 0.3(M1/M2)^2$  where M1 and M2 are factored moments at brace points. These factored moments M1 and M2 are derived from the maximum unfactored DL1, DL2 and LL+I moments at braced points. These moments are not simultaneously occurring moments. The unfactored DL1, DL2 and LL+I moments as well as factored M1 and M2 moments are printed in the detailed output. The program does not use any factored stresses.

For section at 0.0 in Span 4, using M1 = -355.6 and M2 = 841.8 in the above equation, I get Cb = 2.246 which is the same as 2.25 reported by Virtis Std Engine. If you provide the calculations for the Cb value of 1.99 you are getting, I can check this further.

FROM: Aaron Kemna DATE: 11/9/2010 10:01:42 AM Eastern Standard Time  
The values I used are shown above. The first three values are service loads. M1 & M2 are factored using 1.3 for dead loads and 2.17 for live loads. M1 sign was changed to accommodate the Cb calculation. I also give the factored stress values. 1.99 was obtained by replacing M1 & M2 with f1 & f2, respectively. If you use M1 & M2, Cb is 1.94. M1 is the max factored load at Bent 4. You can't use a different load because that's the load that the section will be checked against. M2 was calculated by using the largest negative live load at the midspan of span 4. This will create the smallest Cb value. Some additional modifications to the load factors could be made at this location because of the change in sign, but I wanted to keep it simple. All of these loads are pulled directly from Virtis. I can't replicate your loads. Could give me a breakdown of your M1 & M2 loads. Note that I am checking the HS20

Complete Issue Information

Lane loading only.

Plus, I could not open your .OUT file. Is there a way in Virtis to get the Cb calculations?

FROM: Hasmukh Lathia DATE: 11/9/2010 1:44:39 PM Eastern Standard Time

As I stated earlier, Virtis Std Engine uses the equation  $C_b = 1.75 + 1.05(M1/M2) + 0.3(M1/M2)^2$  limited to a value of 2.3, where M1 and M2 are the maximum (not simultaneous) moments at brace points. For Service Load method, these M1 and M2 are unfactored moments and hence the ratio of M1/M2 could be different. This may result in different values of Cb between Service Load and Strength Design methods. Virtis Std Engine uses the value of Cb calculated based on factored moments for both the Service Load and Strength Design methods (this is perhaps a shortcoming of Virtis Std Engine). You cannot use factored stresses for Cb calculations (that is not how it is specified in Table 10.32.1A)

Virtis Std Engine reports the values of M1, M2 and Cb (and some more intermediate results) when the user specifies the OUTPUT option A. If you want to see these detailed output values, double click on the G2-Plate\_Girder.OUT file attached under the Documents tab in this incident.

FROM: Aaron Kemna DATE: 11/10/2010 4:23:47 PM Eastern Standard Time

I figured out how to get the "Detailed Rating Report". I thought "detailed output" was the most detail so thanks for pointing that out. So this is where I stand. For my case the factored moment at 4.0 is -1037 k-ft (I think it is obvious that this value must be used for M2 since this creates the highest stress on the bottom flange which is unsupported). The factored moment at 4.5 using the smallest live load value is 175 k-ft. The service loads used to get these values are provided above. Thus, the Cb value should be 1.94 with M1/M2 = 0.1688. I mentioned using factored stresses earlier because another program does exactly this when there is a section change along the unbraced length. I know this is not in AASHTO, but it does make some sense. The M1 & M2 values that Virtis is using seem to be incorrect, at least for this loading case. I do agree that Virtis should use different M1 & M2 values for ASD or service checks.

FROM: Hasmukh Lathia DATE: 11/12/2010 8:10:13 AM Eastern Standard Time

Using factored stresses for a composite-noncomposite range does make sense, but it is not in the specs. I agree that for the Service Load method the program should use the unfactored moments for the M1/M2 ratio. If Virtis Std Engine needs to be changed, this should be approved by the Task Force.

FROM: Herman Lee DATE: 11/18/2010 7:19:03 AM Eastern Standard Time

Hasmukh, please confirm the M1 and M2 values used by the Virtis Std Engine.

FROM: Hasmukh Lathia DATE: 11/20/2010 7:49:18 AM Eastern Standard Time

I stand corrected. After a review of the source code, it is determined that Virtis Std Engine uses the corresponding moments at brace points for the calculation of Cb and not the maximum values as stated earlier. The factored moments M1 and M2 in the calculation of Cb are based on the following moments occurring concurrently at brace points for a live load position causing the maximum negative moment at x=0 in span 4.

BRACE POINT MOMENTS (UNFACTORED)

| DL1M1  | DL2M1 | DL1M2 | DL2M2 | PLMX1 | NLMX1  | PLMX2 | NLMX2 |
|--------|-------|-------|-------|-------|--------|-------|-------|
| -250.6 | -91.5 | 172.2 | 87.7  | 41.2  | -272.8 | 20.6  | 232.6 |

| BRACE POINTS |    | UNBRACED | BRACE POINT MOMENTS (FACTORED) |    |
|--------------|----|----------|--------------------------------|----|
| X1           | X2 | LENGTH   | M1                             | M2 |

Complete Issue Information

196.00 221.00 300.00 -355.6 841.8

FROM: Aaron Kemna DATE: 12/1/2010 11:30:01 AM Eastern Standard Time  
I can't verify the corresponding moments, but they seem reasonable.

Based off the values you give (unfactored), the appropriate M1 and M2 values should be as follows.

$$M1 = 1.3*(-250.6 - 91.5)+2.17*(-272.8) = -1037 \text{ k-ft} \rightarrow \text{Bent 4 (Analysis point)}$$

$$M2 = 1.3*(172.2 + 87.7)+2.17*(20.6) = 383 \text{ k-ft}$$

You are showing the minimum negative moment at X1 and the maximum moment at X2. I believe this is only applicable for the top flange check at X2 or midspan and thus inaccurate since the top flange is fully braced. For the bottom flange check, we would want to find the maximum negative moment which creates compression in the bottom flange and the corresponding moments at the brace points. With this in mind for the Cb calculation, M1/M2 = 0.37 & Cb = 2.18. The resulting value is not far off, but it could make a big difference for other cases. I would like to make sure that Virtis LFD is doing this properly.

FROM: Hasmukh Lathia DATE: 12/3/2010 1:36:14 AM Eastern Standard Time

As far as I can see Virtis Std Engine is calculating M1 and M2 properly. Since Brace Point moments are not reported in regular detailed output, I just turned the debug output to show these values. I have attached the detailed output for analysis point at Bent 4. I have defined the debug output for brace point moments at the top of the output. Have a look at CASE 2 - NEGATIVE LL+I MOMENT - CORRESPONDING SHEAR. See if this helps.

FROM: Aaron Kemna DATE: 12/17/2010 2:29:02 PM Eastern Standard Time

OK, here is what I am seeing. M1 was calculated from DL1M1, DL2M1 & PLMX1. M2 is calculated from DL1M2, DL2M2 & NLMX2. I would think M2 should be using PLMX2 (Moment at X2 corresponding to PLMX1). Thus, M1 = -355 & M2 = 382.6 & Cb = 2.3. The moment to be resisted with this Cb value would be -355 k-ft. I believe Case 2 is calculated correctly (I originally mixed NLMX1 & PLMX2 above. I was assuming incorrectly which values were corresponding). Is it the intent of Virtis to mix NL with PL to create the smallest Cb value? Is Virtis arbitrarily applying the lowest Cb value calculated between the Cases, independent of the loading that is being checked? Case 1 is not corresponding loads, but is using corresponding loads as an envelope (My best guess?).

FROM: Hasmukh Lathia DATE: 12/20/2010 9:00:12 AM Eastern Standard Time

I agree that for Case 1 M2 should be using PLMX2. This needs to be looked at for future correction to Virtis Std Engine. Virtis Std Engine is calculating Cb for each case and using it for calculating moment strength that is to be used to calculate the moment rating for that case.

FROM: Aaron Kemna DATE: 12/20/2010 2:03:53 PM Eastern Standard Time

If the corresponding loading issue above is fixed, I would consider this issue resolved.

FROM: Herman Lee DATE: 12/23/2010 8:51:49 AM Eastern Standard Time

We have notified PennDOT of this issue.

FROM: Herman Lee DATE: 6/9/2011 5:07:00 PM Eastern Daylight Time

## Description

FROM: Doug Horton DATE: 11/1/2010 5:16:38 PM Eastern Daylight Time

We have a file that always returns zero values when run in LRFR. The structure is continuous for live load.

The BRASS output contains rating non-zero rating values, but they are not being shown in Virtis as having been received.

We have looked at the file in depth, but were unable to find the error. The file is attached.

Any assistance in finding what we are missing would be greatly appreciated.

4/19/2016 3:08:02 PM

HRS AASHTO

1757

Complete Issue Information

FROM: Herman Lee DATE: 11/2/2010 7:36:57 AM Eastern Daylight Time

Doug, I don't see any file attached in this incident. Please attach the bridge XML file again. Thanks.

FROM: Herman Lee DATE: 11/8/2010 4:19:00 PM Eastern Standard Time

I reviewed the G2 girder. The controlling limit state is flexure at the pier locations. The bridge is a multi-span deck make continuous for live load PS structure but there's no continuity diaphragms entered at the pier. Please double check the plans to see whether there's mild steel specified at the pier locations.

FROM: Doug Horton DATE: 11/30/2010 3:53:28 PM Eastern Standard Time

An updated file which contains the steel in the continuity diaphragm is attached. I have also attached a file that shows the ratings obtained from both BRASS and VIRTIS. As noted before, the BRASS ratings ignoring the positive moments at the supports provides values while all results are zero when considering the positive moments. The Virtis 6.1 Engine provides the same ratings considering the positive moments and not considering them. LFD ratings were also run for the structure and, although low, values were generated. Exporting and running the same structure in Virtis 6.2 provided zero results with BRASS and incomplete results using Virtis. We do not see what we missed with BRASS in 6.1, but feel certain something is missing.

Thanks for your continued assistance!

FROM: Herman Lee DATE: 12/1/2010 1:27:05 PM Eastern Standard Time

I took a closer look at the Virtis model and nothing jumps out. Since the controlling limit state is flexure at the pier location, my suggestion is to double check the deck reinforcements input. If this checked out ok, could you send us the plans for confirming the model?

FROM: Doug Horton DATE: 6/1/2011 11:52:48 AM Eastern Daylight Time

Sorry for the delay in response. The pertinent plan sheet files are attached in the zip file. I tried sending it by regular email, but it is too large (3Mb). If you do not get them because of the size, please let me know.

The consultant is still having issues with getting a reasonable and acceptable rating.

FROM: Bin Zhang DATE: 6/6/2011 9:15:42 AM Eastern Daylight Time

1. The deck reinforcements don't reflect what the plan specified (sheet 27 and 32).
2. Modeling of mild reinforcement steel in prestress beam is not currently supported. This is a planned enhancement in next year 6.4 release.

### Description

FROM: Aaron Kemna DATE: 11/2/2010 1:39:25 PM Eastern Daylight Time

Due to rounding issues, the number of lanes considered for a bridge may be incorrect. I have a bridge that is entered with an out - out width of 38.6666'. The barrier curbs are 16" wide. I used the compute button to calculate the roadway width. The resulting roadway width was shown as -18.000000' and +18'. When I calculated the distribution factors, the ML Deflection DF was calculated assuming 2-lanes. There should be three lanes. When I entered the roadway width by hand, the correct value was calculated. I only checked the distribution factors so I don't know how widespread the problem is. The number of lanes should follow the tolerance limits set. My bridge is attached.

FROM: Herman Lee DATE: 12/12/2010 11:40:57 AM Eastern Standard Time

Aaron, below details our investigation of the problem you submitted. We are not able to reproduce the problem. Please attach the bridge, specify which Compute button or analysis engine you used and the tolerance settings in your database for us to investigate further. Thanks.

Modified TrainingBridge1 in the sample database for the following:

1. Parapet width = 16"
2. Skew = 0
3. Girder spacing = 12'
4. Left edge of deck to superstructure definition reference line = 19.3333'
5. Right edge of deck to superstructure definition reference line = 19.3333'
6. Left overhang = 1.3333'

Compute from Typical Section for the Standard LL Distribution Factor:

1 Lane = 0.5 wheels and Multi-Lane = 1.35 wheels  
Multi-Lane factor is based on 3 lanes.

FROM: Aaron Kemna DATE: 12/14/2010 11:49:31 AM Eastern Standard Time  
Sorry, I must have forgot to attach the file. I looked at this again and the issue is not exactly what I thought. The file I attached was created in 6.1. I decided to add the LRFR information for 6.2. When I clicked on the LRFR distribution factor compute button, the deflection distribution factor was computed based off of two lanes. By looking at the Lane Position data it appears that I have exactly a 36' roadway width (previously calculated with button). If I click the compute button here and then re-calculate the distribution factors, I get the correct values. I don't see why we would need to use this workaround to get the correct number of lanes to be analyzed for the distribution factors.

Description

FROM: Aaron Kemna DATE: 11/2/2010 2:04:58 PM Eastern Daylight Time  
These vehicles are in the MBE and can be an important part of a DOT's posting procedures for LRFR. The MBE has load factors, truck descriptions and a notional load to cover all axle configurations. These trucks would need there own classification when setting up the analysis. I would classify this as a maintenance issue.

FROM: Herman Lee DATE: 11/2/2010 3:05:43 PM Eastern Daylight Time  
Update LRFR to MBE 1st Edition 2008 is an enhancement for the 6.3 Release. The legal load rating tree in the Analysis Settings window with be separated into Routine vehicles and Specialized Hauling vehicles in 6.3.

### Description

FROM: Aaron Kemna DATE: 11/2/2010 2:29:01 PM Eastern Daylight Time

AASHTO 5.14.1.4.6 states that a different tensile limit should be used at the top of prestressed girders at interior bents for simple span girders made continuous for live load. The temporary stress limit with  $f'_{ci}$  replaced with  $f'_c$ , or  $0.24 \cdot \text{SQRT}(f'_c)$  should be used instead of the  $0.19f'_c$  used to check tensile limits near mid-span. The Service III load combination should be used to calculate the stress at these points. I would classify this issue as maintenance.

FROM: Jeff Ruby DATE: 11/8/2010 11:30:30 AM Eastern Standard Time

I was about to add an incident for this very "problem". Here is my take:

AASHTO 5.14.1.4.6 mentions the table, which the standard engine is using ( $0.0948 \cdot \text{SQRT}(F'_c)$ ).

In order to use  $0.24 \cdot \text{SQRT}(f'_c)$  mild reinforcing steel (or P\*S strands) would need to be present in the top of the P\*S beam. (This would be useful for the stress calculations at release and transportation as well.) Virtis/Opis has no way of inputting this steel at this time. So it would be hard to implement.

But, AASHTO 5.14.1.4.6 states:

Alternatively, the top of the precast girders at interior supports may be designed as reinforced concrete members at the strength limit state. In this case, the stress limits for the service limit state shall not apply to this region of the precast girder.

I vote for this option. We need a control option to Ignore Beam Stresses Near Interior Supports, if the designer so desires, when the slab is designed for the strength moment over the pier.

It may also be an enhancement to provide the ability to enter mild reinforcing in the top of the P\*S beam definition as well.

FROM: Jeff Ruby DATE: 11/8/2010 11:36:25 AM Eastern Standard Time

Additionally,

BRASS already has this option. See the attached screen shot.

FROM: Krisha Kennelly DATE: 11/16/2010 2:14:21 PM Eastern Standard Time

duplicate of 10295. please see that incident for more discussion.

Description

FROM: Tim Armbrecht DATE: 11/3/2010 9:48:45 AM Eastern Daylight Time  
From one of my consultants (Souther):

BRASS generates misleading results for the attached Virtis model (BRASS\_RC\_Prob(1010031).xml) of a 2-span continuous RC-slab. I believe this may be from internal limitations. It appears that, as modeled, the analysis only go to .415 of Span 2. Since the controlling point is at .6 of Span 2 (Inv RF = 0.965), Virtis erroneously reports .4 of Span 1 as the critical section with Inv RF = 1.032. When the POI's are limited, the analysis returns the correct RF's. When the Virtis Standard Engine is utilized, Virtis reports correct results when the same explicit POI's are specified.

Description

FROM: Todd Thompson DATE: 11/8/2010 2:52:32 PM Eastern Standard Time

For the majority of my bridges, the Data Field LRFR - System Factors is blank (or NULL). Is there a way to populate them in bulk so I don't have to open up 1200 bridges and go to each member to set these values?

FROM: Mehrdad Ordoobadi DATE: 2/2/2011 8:51:03 AM Eastern Standard Time

Todd, There is no way to do this from the user interface. If you tell me what you would like them be to defaulted to I will prepare a SQL script that your DBA could run against your database.

FROM: Mehrdad Ordoobadi DATE: 2/2/2011 9:14:24 AM Eastern Standard Time

Here are the scripts that you need to run to set the LRFR System Factor to "All Other Girder/Slab Bridges" if they are null.

```
UPDATE ABW_BEAM_DEF SET LRFR_SYSTEM_FACTOR_TYPE = 46206 WHERE LRFR_SYSTEM_FACTOR_TYPE IS NULL;
```

```
UPDATE ABW_DETAILED_TRUSS_DEF SET LRFR_SYSTEM_FACTOR_TYPE = 46206 WHERE LRFR_SYSTEM_FACTOR_TYPE IS NULL;
```

Please ask your database administrator to run these scripts to default the empty values to "All Other Girder/Slab Bridges".

FROM: Todd Thompson DATE: 5/11/2011 2:39:37 PM Eastern Daylight Time

This did work and can be closed.

- Location - 82.9000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 90.8000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 98.7000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 106.3750 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 106.6000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 114.5000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 122.4000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 122.6250 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 130.3000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 138.2000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 146.1000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 151.7656 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 153.3333 (ft)  
- Location - 154.0000 (ft)  
- Location - 154.6667 (ft)  
- Location - 156.2344 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 161.5000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 169.0000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 176.5000 (ft)

A fatal error encountered while processing article "9.17 - Flexural Strength"

Complete Issue Information

- Location - 184.0000 (ft)  
A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 184.3750 (ft)  
A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 191.5000 (ft)  
A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 191.8333 (ft)  
A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 199.0000 (ft)  
A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 199.1250 (ft)  
A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 206.5000 (ft)  
A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 214.0000 (ft)  
A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 221.5000 (ft)  
A fatal error encountered while processing article "9.17 - Flexural Strength"  
- Location - 226.7656 (ft)
