A fatal error encountered while processing article "9.17 - Flexural Strength"  
Fatal error occurred while processing specification checks.  
Error - Error performing LFR specification checking!

Error - Analysis failed!

FROM: George Colgrove DATE: 4/18/2011 12:43:46 PM Eastern Daylight Time

FROM Herman (Mon 4/18/2011 12:38 PM):

George,

BRASS is used in the bridge attached to this incident. Testing should be performed using the BRASS engine to confirm the fix in the NSG analysis. This incident has nothing to do with AASHTO LRFR Engine analysis for individual girder or NSG analysis using the AASHTO LFD Engine. Please change this incident back to resolved and submit a new incident in Beta Testing.

Herman

FROM: Bin Zhang DATE: 4/18/2011 9:22:36 AM Eastern Daylight Time  
Verified using BRASS in VO63 beta1

FROM: Todd Thompson DATE: 5/11/2011 2:18:07 PM Eastern Daylight Time  
Builds the FE model and does the NSG analysis without crashing or producing error messages.  
Tested in Beta 2.

FROM: Herman Lee DATE: 11/10/2010 8:46:34 AM Eastern Standard Time  
 Submitted on behalf of Tim Armbrecht, IL DOT:

Received E-mail:

=====

Tim,

This was kicked back by design for a change in the long. Bars from #6 to #7. In Version 6.1 the LRFR RF was .99. Rhett looked through my file yesterday and tried to run it in 6.2 with some minor changes.

4/19/2016 3:08:05 PM

HRS AASHTO

1773

Complete Issue Information

Now the LRFR RF is like 0.6 and keeps stating the longitudinal reinforcing is controlling. I can change the longitudinal reinforcing with little or no effect on the rating. Just doing a LRFD spec check it says stress in the concrete is controlling with a low rating factor. When Mike tried to convert it to LARS the longitudinal reinforcing did not transfer over. Can you have the VIRTIS people look at this file? I have been reviewing it for hours and cannot find anything, but still not ruling out user error. LFD rating factors look fine.

=====

FROM: Herman Lee DATE: 11/10/2010 1:11:47 PM Eastern Standard Time  
 Longitudinal reinforcement rating is a new feature in the BRASS LRFR engine in Virtis 6.2. If you would like to compare the rating with 6.1, please select the "Ignore long. reinf. in rating" control option in the Member Alternative window. If you would like to check the longitudinal reinforcement rating, please refer to the spec check for 5.8.3.5 at the controlling location in the BRASS output file or the Intermediate output file.

HRS AASHTO

1774

Complete Issue Information

For a RC slab section, the BRASS LFD Engine takes into account of the reinforcement steels in the compression block but it's not considering the section as doubly reinforced section when computing the moment strength.

Reference: "Reinforced Concrete: A Fundamental Approach" By Edward G. Nawy

FROM: Brian Goodrich DATE: 11/17/2010 11:14:05 AM Mountain Standard Time  
The BRASS engine does consider compression reinforcement in calculating the moment capacity. Turning on the intermediate output for the point of interest in question should show this. For example, the following section of the BRASS intermediate output shows the R5 layer (compression steel) contributing to the moment capacity:

PERFORMING AASHTO STANDARD SPECIFICATION CHECKS - 8.16.3 Flexure  
Point of Interest : 104.00  
Construction Stage: 1

POSITIVE Flexural Resistance:

\*\* Analyzed as a RECTANGULAR Section \*\*

| Layer | Area, in^2 | Stress, ksi | Force, kips | Lever-Arm, in | Moment i, in-k |
|-------|------------|-------------|-------------|---------------|----------------|
| CTF   | 139.249    | -0.85*f'c   | -473.446    | 1.308         | 619.410        |
| R5    | 0.660      | -9.930      | -6.554      | 0.275         | 1.804          |
| R1    | 8.000      | 60.000      | 480.000     | -27.225       | 13067.853      |
| Sum   |            |             | 0.000       |               | 13689.067      |

Flexural Resistance Summary:

beta 1 = 0.850  
c = 2.275 in                      f'c = 4.000 ksi (flange)  
a = 1.934 in (from top)  
Mn = 13689.067 in-k  
= 1140.756 ft-k

If you are not receiving output similar to this, please submit the bridge XML file in question and indicate the structure definition, member, member alt, and point of interest. Also, include a hand calculation illustrating the moment calculation and how it differs from the BRASS results.

FROM: Herman Lee DATE: 12/3/2010 9:48:45 PM Eastern Standard Time  
Information Needed E-mail sent on 12/3/10.

FROM: Sean Hart DATE: 12/9/2010 9:21:14 AM Eastern Standard Time

There is a slight difference in the rating factors for two cases:  
1. Simple Span RC Slab with bottom rebar entered (main reinforcement) and  
2. Simple Span RC Slab with both bottom & top rebar entered (top rebar is temp/shrinkage rebar).

It appears that the BRASS engine is treating the section with bottom and top reinforcement (case 2) as a singly reinforced concrete member. I think it should treat the section as either:

1. a singly reinforced member ignoring the top bars OR

Complete Issue Information

2. analyzing the section as a doubly reinforced member.

I've verified the calculations BRASS is doing and it treats the section as singly reinforced for Case 2 above (top & btm rebar input). I've attached a PDF of the rating factor difference, the calcs from the BRASS engine and the doubly reinforced equations from the BAR7 manual.

Please let me know if you have any more questions.

Complete Issue Information

FROM: George Colgrove DATE: 11/16/2010 9:19:06 AM Eastern Standard Time  
After looking into this more, we found the following:

In Version 6.0 the legal load tension steel stress was considered in the rating analysis. In Version 6.2 there is an option to turn this consideration off. When migrating the bridge from 6.0 to 6.2, the setting is not preserved. So the subsequent rating will ignore this effect.

The solution is to check the box for "Consider legal load tensile concrete stress" in the member alternative description - Control Options tab. Then run the analysis again. Both versions should provide the same results.

FROM: George Colgrove DATE: 4/29/2011 2:32:37 PM Eastern Daylight Time  
In VO63 - both files import the same way.

### Description

FROM: Tim Armbrecht DATE: 11/15/2010 12:38:18 PM Eastern Standard Time  
From my consultant (Souther):

I made some modifications and it runs in BRASS LRFR (Inv/Opr RF's = 0.955/1.104), but it will not run in Virtis LRFR. It terminates w/the following error message...

Building Spec Check Domain objects.

54" PS I-beam - Stage 1

Error populating the cross section data! Analysis aborted!

Error - Error performing LRFR specification checking!

Error - Analysis failed!

I can't find anything obviously wrong in the input. I also tried the "Ignore long. reinf. in rating" under Control Options, but it made no difference.

FROM: Herman Lee DATE: 11/16/2010 7:48:22 AM Eastern Standard Time

I'm able to reproduce the problem after I modified the tolerance to 0.01' and 0.125" to match Illinois DOT tolerance settings.

The workaround for this problem in 6.2 is to increase the precision of the entered distribution factor ranges. Please either click the Compute button to recompute the factors or modify the entered DF ranges as described below.

- LRFD Deflection DF: Change the length from 471.666 to 471.6666

- LRFD Moment DF: Change the length of the last range from 72.299377 to 72.299977

- LRFD Shear DF: Only one range (471.6666) is needed since the DFs are the same for all the ranges

### Developer Notes:

Development build asserts in CSCSuperPSGirderElement::SetLrfrProperties.

```
fr = m_pSingleMomentFactorRangeSet->MoveRange(dLocation, m_iLengthUnitId, iLeftRightFlag);
```

FROM: Tim Armbrecht DATE: 11/16/2010 3:39:25 PM Eastern Standard Time

Herman, my consultant reports that neither method of the proposed workaround works - he still gets the same termination message.

Complete Issue Information

FROM: Krisha Kennelly DATE: 11/16/2010 4:11:40 PM Eastern Standard Time  
I'm looknig into this.

FROM: Herman Lee DATE: 11/16/2010 5:35:44 PM Eastern Standard Time  
Another option is to remove all the LRFD distribution factor ranges (moment, shear and deflection) in the window so the engine will compute the factors during the analysis.

FROM: Krisha Kennelly DATE: 11/17/2010 2:37:08 PM Eastern Standard Time  
The workaround Herman suggested yesterday (removing the distribution factor ragnes from the UI) does work. I was also able to get G1 to run by changing the last moment range length from 72.299377 to 72.30.

FROM: Krisha Kennelly DATE: 11/17/2010 3:00:29 PM Eastern Standard Time  
Jim - I think we need to add user tolerances to the MoveRange() functions.

FROM: Jim Duray DATE: 3/25/2011 9:42:59 AM Eastern Daylight Time  
I regenerated the DF and was able to run G1 to completion. I agree using tolerances would be good to do. Where did the 72.299377 come from - user input or did we compute it?

FROM: Jim Duray DATE: 3/25/2011 12:11:12 PM Eastern Daylight Time  
Fixed for Alpha 6.

FROM: Tim Armbrecht DATE: 5/12/2011 4:27:43 PM Eastern Daylight Time  
From my consultant (Souther):

This file with LLDF for LRFR recomputed in v. 6.2 has the following problems after import into v. 6.3 Beta 2:

1. Won't run under AASHTO LRFR engine using the v. 6.2 generated LLDF. Termination w/message, "Error performing LRFR specification checking." (Note: It did run under the Virtis LRFR engine with the generated LLDF.)
2. Won't compute new LLDF. An error message states, "can't compute contraflexure ranges..."
3. Will do LRFR analysis when the LLDF entries are all blanked out. (Note: It also runs under v. 6.2 when LLDF are blanked.)

FROM: Srujana Thogaru DATE: 8/29/2011 1:08:50 PM Eastern Daylight Time  
Fixed for 6.3 release. Please see the attached document for results.

## Description

FROM: Tim Armbrecht DATE: 11/15/2010 3:57:41 PM Eastern Standard Time  
From my consultant (Chamberlain):

I went back and looked at the toggle "ignore longitudinal reinforcing" and it does in fact increase the rating factor so that item does not control the rating. The question we need to ask Baker is what does it specifically ignore? When this toggle is selected does it ignore both 5.8.3.5-1 and 5.8.3.5-2 in LRFD. The online help states "This input field is available only for a steel member alternative" but we really need to what to toggle impacts for PPC I beams. If the toggle does ignore both 5.8.3.5-1 and 5.8.3.5-2 in LRFD is that something IDOT wants to be ignoring? On this example, the rating factor goes from around 1.3 by ignoring the steel to about 0.6 if it is not ignored. It appears 5.8.3.5-2 may be being applied to both ends of the beams with wet concrete stresses, which the BM does not currently address. The BM just states 5.8.3.5-2 need only be checked at the abutments, but it is possible that this check may be controlling at the piers during Stage II (wet concrete stresses).

On this same file, VIRTIS standard engine is yielding very low inventory rating results, but BRASS is not. How is VIRTIS (both std engine and BRASS) handling the temporary stresses? Is VIRTIS checking the temporary stresses vs the "in areas other than the precompressed tensile zone and without bonded reinforcement" section of table 5.9.4.1.2-1. This limits the temporary stress to 0.2ksi, but IDOT uses the capacity located just below that one in the table. Should we just bump up the temporary stresses in the stress table. Is the "temporary stress check" new is 6.2. I don't recall this being a problem before.

Complete Issue Information

Copied from the Member Alternative Description: Control Options topic in Virtis/Opis Help:

Ignore long. reinf. in rating

This input field is available only for a prestressed or reinforced concrete member alternative.

On the other hand, the "Ignore long. reinforcement in negative moment capacity" option is available only for a steel member alternative.

For the Virtis LRFR Engine, the "Ignore long. reinf. in rating" option is not used by the engine.

FROM: Brian Goodrich DATE: 11/17/2010 11:41:25 AM Mountain Standard Time

For the BRASS LRFR engine, the "Ignore long. reinf. in rating" option will ignore both AASHTO LRFD 5.8.3.5-1 and 5.8.3.5-2 . AASHTO LRFD 5.8.3.5-2 is checked when the POI is within the critical shear distance at simple-support ends of the superstructure.

BRASS checks stresses on the non-composite composite section at each POI based on the stress limits assigned on the Beam Details window. These stress limits have been available in LRFR since it was implemented in Virtis.

FROM: Krisha Kennelly DATE: 11/17/2010 2:49:32 PM Eastern Standard Time

The Virtis LRFR engine uses the allowable stresses entered on the Stress Limits window.

The Virtis LRFR engine does not produce a rating factor for the temporary stress condition. The low rating factor for this bridge is attached, it is from the final loading condition using Table 5.9.4.2.2-1.

I think this issue is related to 10295. I don't see that anything changed in the source code from 6.1 to 6.2 so I don't know why this is coming up now.

### Description

FROM: Aaron Kemna DATE: 11/18/2010 4:05:02 PM Eastern Standard Time

The properties are not calculated correctly when you use the compute button on the properties tab (Prestress Beam Shapes --> I Beams - Wide Flange - Radius Fillet is checked). For analysis, this is not a problem since BRASS and Virtis calculate their own properties which are more accurate than the properties tab. It appears that Virtis calculates the same properties as the compute button would do when calculating the distribution factors. Virtis is not pulling the values from the properties tab, just using the same values as the compute button would give. This will not create huge changes in the distribution factors so I don't know if this was done for simplification or if it is an oversight. In any case, I think Virtis should be taking the fillets into account when calculating the properties in the properties tab and for distribution factor calculations.

FROM: Aaron Kemna DATE: 11/18/2010 4:05:42 PM Eastern Standard Time

I am attaching a bridge for your quick reference.

FROM: Herman Lee DATE: 11/19/2010 7:53:13 AM Eastern Standard Time

I looked at the code for the Std Live Load Distribution Factors computation. The computation uses the Ixx and St Venant Torsional Constant entered for the PS Beam Shape. To modify the computation to use the coordinate based section properties, which are used during the spec checking, will be an enhancement. I agree that consolidate existing properties computations is a crucial enhancement for the system.

FROM: Herman Lee DATE: 6/9/2011 5:15:52 PM Eastern Daylight Time

Complete Issue Information

FROM: Krisha Kennelly DATE: 11/22/2010 10:07:17 AM Eastern Standard Time  
I'm not sure exactly what beams you are comparing so I've attached screen shots for "Beam J", "Interior w/ conduits", "Typical Interior" and "Fascia" beam.

The dv is computed as a function of the strength of the section (Mn) which is varying between these beams due to the differing effective slab widths. It seems to be working properly. The Virtis LRFR engine computes the flexural resistance at the support and then computes the dv value. Shear is then checked at points dv and away from the support.

I don't think the BRASS LRFR engine does that. The user is responsible for creating a point of interest at the dv location. It will not automatically create the point at dv like the Virtis LRFR engine does.

FROM: Beckie Curtis DATE: 11/22/2010 11:14:18 AM Eastern Standard Time  
The POI that I was looking at was at 30% (the controlling point in Virtis LRFR). I was comparing the beam called Fascia and Typical Interior. At these POI (Brass and Virtis both have calculations at this point) the value dv changes for Virtis LRFR significantly for the fascia beam vs the interior beam. Looking at detailed output for Brass this doesn't happen. The rating values are drastically different for BRASS and Virtis.

FROM: Krisha Kennelly DATE: 11/22/2010 3:11:44 PM Eastern Standard Time  
attached compare fascia.png, compare typical interior.png and control options.png

FROM: Krisha Kennelly DATE: 11/22/2010 3:42:14 PM Eastern Standard Time  
Looks like a -4" has been entered for the outside haunch thickness on the Haunch Profile window for the Fascia beam. The Virtis LRFR engine averages the Y1 and Y2 to produce an embedded haunch of -2". The BRASS LRFR engine considers the haunch to be 0". This difference causes the flexural capacity and the dv values to differ between the 2 engines.

If I revise the Y2 value to 0", I get comparable ratings between BRASS LRFR and Virtis LRFR for the Fascia Beam:

Virtis controlling RF = 1.45 at midspan due to flexure.

BRASS RF = 1.51 at midspan due to flexure

Virtis LRFR in Version 6.1 did not support embedded haunches but Version 6.2 does.

According to the MBE, permit trucks require a lane load with the truck when the span length is over 200 ft. or for negative moment regions. I do not see anywhere where you can choose a truck to only be evaluated in the negative moment region, is this correct? If so it would be a useful option to add.

FROM: Herman Lee DATE: 11/21/2010 7:18:09 AM Eastern Standard Time

For the BRASS LRFR Engine, please see Incident 9721 for more information.

The Virtis LRFR Engine will take into account the lane load defined in the vehicle when the span length is over 200 ft.

FROM: Herman Lee DATE: 11/22/2010 11:29:42 AM Eastern Standard Time

What stated above for the Virtis LRFR Engine is incorrect. For the Virtis LRFR Engine, this permit truck requirement will be implemented in the coming 6.3 release.

### Description

FROM: Beckie Curtis DATE: 11/23/2010 11:10:10 AM Eastern Standard Time

I ran HL-93 loading for the fascia beam and got very different results between BRASS engine and Virtis Std. engine (0.88 inventory rating factor in BRASS and 2.22 in Virtis). The interior beam rating factors were similar. It seems as though the two engines are calculating the live load distribution factors differently for the fascia beams.

FROM: Krisha Kennelly DATE: 11/23/2010 1:52:01 PM Eastern Standard Time

BRASS is computing the distribution factor using the Rigid Deck Override method specified in AASHTO LRFD Art. 4.6.2.2.2d.

The Virtis LRFR engine (and the UI) are not considering this article for this superstructure type. As per AASHTO LRFD Table 4.6.2.2.1-1, a prestressed concrete box beam is Superstructure Type 'b'. As per the highlighted commentary to 4.6.2.2.2d, the rigid deck method is to be applied to superstructure types

FROM: Todd Thompson DATE: 11/23/2010 1:37:59 PM Eastern Standard Time

#### 6.2 Production Release

I have a 3 Span (160:200:160) rolled girder bridge and when I do either a Virtis LRFR rating or run the Shear Stud Wizard I get an error message (although both operations appear to run to completion and correctly).

I'll attach my screenshot of the error and my bridge.xml file.

Appears to be a tolerance issue ? But I have the tolerance fairly large.

FROM: Herman Lee DATE: 11/24/2010 6:42:21 AM Eastern Standard Time

I'm able to reproduce the problem.

#### Developer Notes:

Development asserts in CSCSuperSteelGirderElement::PopulateRebarOverThePier.

```
fatMoment = m_arrayFatigueLLMomentAtPiers.GetAt(iPierNumber - 1);
```

FROM: Krisha Kennelly DATE: 11/24/2010 9:33:10 AM Eastern Standard Time

These warning messages can be ignored.

The code is trying to find the slab reinforcement over the pier so that Article 6.10.10.3 can be evaluated. The user has not entered slab rebar and there is a slight glitch in the code that is causing this message to be thrown.

### Description

FROM: George Huang DATE: 11/23/2010 5:14:40 PM Eastern Standard Time  
The LRFR model works with LRFR BRASS Engine (but ignoring and modifying some structure information). How the model doesn't run with Virtis LRFR Engine. The error message is "specification checking errors". The bridge file "LRFR\_09\_18.xml" is attached. This is our first time use LRFR Engine for PS concrete. Please let me if you have any suggestion for the modeling. Thanks.

FROM: Krisha Kennelly DATE: 11/24/2010 9:59:10 AM Eastern Standard Time  
This bridge is using a "Wide Top Flange" PS I beam. The Virtis LRFR engine validates some of the beam dimensions to ensure that the user has in fact entered data to describe a Wide Top Flange I beam. The data entered for this bridge has "0" entered for one of the top flange haunches. This results in the shape actually being a "Narrow Top Flange" I beam. If you enter the beam as a Narrow Top Flange and use this beam shape in the Beam Details window, the Virtis LRFR engine will run to completion.

I've attached some screen shots showing these windows.

### Description

FROM: Jeff Ruby DATE: 11/24/2010 9:51:57 AM Eastern Standard Time

When you run a opis/virtis standard engine run for LRFD on a Reinf. Conc. Slab bridge without shear reinforcing defined, the spec check article for 5.8.3.5 uses the fy for the reinforcing steel for the "Left" term when it should be using the fy for the longitudinal reinforcing which is defined.

Bridge is attached. I used POI 29.16667 on Member Alt. "Interior 1' Strip" on Member '2 1/2" clear to Top Steel'. The screen shot shows the "left" term is zero, when there is clearly As at this location. fy should be 60 not 0.

FROM: Mark Mlynarski DATE: 11/24/2010 10:58:13 AM Eastern Standard Time

I've llooked into this article and found that the fy being used is for the shear reinforcement (which in this case is zero).

The code will be changed to use the fy for the longitudinal reinforcement.

FROM: Mark Mlynarski DATE: 3/30/2011 2:38:44 PM Eastern Daylight Time

I've llooked into this article and found that the fy being used is for the shear reinforcement (which in this case is zero).

The code will be changed to use the fy for the longitudinal reinforcement.

FROM: Mark Mlynarski DATE: 3/30/2011 10:04:16 AM Eastern Daylight Time

Several modules were changed to correct the issue for RC. This issue did not show up before or P/S concrete since we don't define Longit. steel for P/S.

The As used needs to come from the tension region only and since different rebars can have different fy values, the calculation for As\*fy needs to be done at a point that we know of the mild steel longit reinf in the tension section of the girder. The calculation of As\*fy was already being performed in the intermediate results, but not stored. Changes were made to the following classes to store and use the As\*fy results.

ALRFD\_Results.cs

ALRFD\_5E\_05\_07\_03\_02.cs

ALRFD\_5E\_05\_07\_03\_02\_PS.cs

ALRFD\_5E\_05\_08\_03\_05.cs

ALRFD\_4E\_05\_07\_03\_02.cs

ALRFD\_4E\_05\_07\_03\_02\_PS.cs

ALRFD\_4E\_05\_08\_03\_05.cs

The final results for the attached example (comparable to 6.2\_release\_ScreenShot\_002.jpg) are in an attaced file (VI-10307-ScreenShot-Revised.jpg).

FROM: David Koenig DATE: 11/30/2010 4:02:29 PM Eastern Standard Time

We have had similar issues with saving updated bridge files at MoDOT. We submitted Incident 9860, which has not been addressed at this point. You may want to read this incident to see what we have been able to track down to see if you were doing similar things to the bridges that you were updating. Also, are you using an Oracle setup and are your servers AIX. They seem to think that the AIX servers may have something to do with it.

FROM: Amjad Waheed DATE: 12/6/2010 10:46:16 AM Eastern Standard Time

Our database servers run on IBM AIX 5.3 (UNIX).

FROM: Mehrdad Ordoobadi DATE: 2/1/2011 9:00:58 AM Eastern Standard Time

Amjad,

As you know the MoDOT had reported problems when saving bridges similar to what you reported in VI 10310. They have recently upgraded their ODBC drivers (" ODBC oracle software to the latest version (1020)") and realized that the save issue have been resolved. However, after the upgrade they have noticed sporadic crashes while opening bridges in the Virtis/Opis application.

Please note that although Oracle is a supported database for the Virtis/Opis application, no testing has been performed using an Oracle database that is hosted on a UNIX machine. The Virtis/Opis software tests (Alpha, Beta, and Acceptance) are performed on Windows environments, that is both the Virtis/Opis application and the database servers are on Windows machines.

In order for us to be able to help you with this issue we were wondering if you could try to upgrade the ODBC driver to the latest version on only ONE test machine to see if this upgrade helps with the save issue and also to see if this upgrade causes other issues like the crashes that MoDOT is experiencing.

Regards,  
Mehrdad Ordoobadi

### Description

FROM: Navnit Nakrani DATE: 11/30/2010 5:38:54 PM Eastern Standard Time

Hi,

This is Balaji and I'm working on the load rating of Reinforced Concrete Tee Beams, based on ASD & LFD method. The rating summary shows that the controlling rating is shear at  $0.10 \times \text{Length of the span}$ . The main longitudinal bars of the Tee beams are inclined at about 3' on either ends.

I have defined the longitudinal bars as such in Virtis 6.2. The shear was calculated without considering the inclined longitudinal bars.

Is it any way that we could make Virtis to consider the inclined longitudinal bars for shear calculation?

Also I was wondering how Virtis does the shear calculation. It calculates concrete shear based on the equation

$$V_c = 0.95 \cdot (f'_c)^{0.5} = 0.95 \cdot (2000)^{0.5} = 42.5 \text{ psi (Matches with Virtis output)}$$

But for stirrup rebar calculation it combines dead load with the truck.

For First Interior Beam B1 at Location 0.0

The dead load shear = 20.4 Kips

Live Load shear for HS 20 Vehicle = 26.3 kips (after including Live load distribution factor & Impact)

Is that for design shear (V) does it combining both the dead load and live load shear?

Design Shear (V) = 20.4 + 26.3 = 46.7 Kips (combining dead load + live load shear)

$$\text{Design shear stress } v = V / (b \cdot d) \\ = (46.7 \cdot 1000) / (15'' \cdot 30'')$$

$$v = 103.77 \text{ psi}$$

$$\text{Stirrup rebar VS} = \frac{(v - V_c) \cdot b \cdot \text{spacing}}{\text{Area of stirrups}}$$

$$\text{Area of stirrups (Av)} = 0.44 \text{ in}^2$$

Description

FROM: George Colgrove DATE: 12/1/2010 1:31:24 PM Eastern Standard Time

If someone wanted to model a bridge with a steel plate deck over tightly spaced girders (see attached bridge - without a number) they can still rate the bridge with standard live loads.

However, rating with a NSG truck you get the following: The NSG truck is included in the Documents tab.

Unable to generate model.  
01:30:54 PM - Line 1823 in source file .\AbxVirtisDistFactEngine.cpp.

Unable to generate girder system finite element model.

Complete Issue Information

-----

So I recreated the bridge model, but instead of a steel plate bridge, I put in a concrete deck. (see Sand\_Creek\_2) Everything else was the same. The bridge ran through a rating without a problem.

The last error on the list above was "Deck material must be defined for analysis to run!". I think the way a steel plate deck is defined (i.e. Generic) is not being registered correctly.

FROM: Herman Lee DATE: 12/1/2010 2:04:28 PM Eastern Standard Time  
 This is an enhancement request for supporting modeling of generic deck in NSG Analysis.

Description

FROM: Richard Withers DATE: 12/2/2010 11:00:25 AM Eastern Standard Time

I am having 2 issues when attempting to perform a LFD load rating of a floorbeam in a girder/floorbeam system. I am using the HS 20-44 live load.

1. BRASS is calculating an incorrect live load reaction for the HS 20-44 live load. Hand calculations and the old BARS program show that the unfactored live load moment with a 1.3 impact factor should be about 370 kip-ft. BRASS is returning it as 231 kip-ft. This is with a wheel factor of 1.0.

2. No matter what wheel factor is input in the Floorbeam Member Alternative window, BRASS uses a wheel factor of 1.0.

This is the first girder/floorbeam system I have modeled in VIRTIS and I may be doing something wrong. I have looked over the input, and it appears correct to me. I have attached and .xml export of the bridge. The floorbeam in question is under Superstructure Definition 121'-9" Span #8, Floorbeam Member Floorbeam2, Floorbeam Member Alternative Floorbeam 2.

Thanks,  
Richard Withers

FROM: Brian Goodrich DATE: 12/7/2010 12:32:58 PM Mountain Standard Time

I turned on the floorbeam intermediate output control for the BRASS LFD engine in the Analysis Settings window. This produces a list of truck positions on the floorbeam. Only one truck is positioned on the floorbeam. The travelway width is 23.833 feet, however, the traffic lane width assigned to the trucks is 11.917 feet. When two of the trucks are positioned on the floorbeam, the width is  $11.917 * 2 = 23.834$  feet, which is 0.001 feet wider than the travelway width. This is why only one truck was positioned on the floorbeam. The export must be revised to correct this issue.

FROM: Richard Withers DATE: 12/10/2010 10:52:50 AM Eastern Standard Time

I modified the travelway width so that the floorbeam now has two trucks on it. That has fixed issue number 1. What about the wheel factor issue?

Thanks,  
Richard Withers

Description

FROM: George Colgrove DATE: 12/6/2010 11:07:02 AM Eastern Standard Time

The enclosed bridge provides ratings from Virtis. BRASS however, provides nothing but zeros. The rating is failing under shear at the start end of the girder. Below is the dialog Farid Tadros and I had in trying to figure out what was going on. I feel the bridge model meets AASHTO. Not sure why it is not giving rating factors in BRASS.

V V [ START MESSAGES] V V-----

From: Tadros, Farid  
Sent: Monday, November 22, 2010 3:27 PM

We are in New York City DOT-Bridges got Evaluation Version (S.O. No.: 120203) of the Virtis software. When we tried to rate a bridge we got an error message as below:

“Unable to convert steel beam to BRASS cross sections!  
Error generating BRASS cross section commands!  
  Unable to get cross section dimensions!  
  Invalid or unsupported cross section!  
Error filling BRASS cross section!  
Error retrieving data for generated cross section at 1996.66 in  
Unable to DoSteelFlangePlateRangeSetPtr->MoveDistance in FillCrossSectionData!  
Error getting flange plate from steel flange plate ranges to left of 1996.655034321 in!  
Current tolerance for in is 0.000010000”

Attached XML file, please advice.

V V [ NEXT MESSAGE] V V-----

Complete Issue Information

From: Bridgeware, [mailto:Bridgeware@mbakercorp.com]  
Sent: Monday, November 22, 2010 4:45 PM

Please change your tolerance for small measurements from 0.00001 to 0.001. That problem will go away. The issue is that you have a very complex framing and the tolerance with locating the points is very low.

Go to the Configuration Browser and select the System Defaults at the bottom of the tree. Then Open the Tolerance tab. For 'in' please enter 0.001000.

After that you are still getting an error:

Error generating LRFD schedule commands!  
Unable to create BRASS transverse stiffener group!  
Error generating STIF-TRAN-SCHEDULE or STIF-TRAN-GROUP commands!  
Unable to retrieve transverse stiffener geometry!  
Error generating STIF-TRAN-SCHEDULE or STIF-TRAN-GROUP commands!  
The transverse stiffener width must be specified (Name: FASCIA GIRDER CONNECTION PLATE)!  
Error generating STIF-TRAN-SCHEDULE or STIF-TRAN-GROUP commands!  
Error generating LRFD control commands!  
All support skews are not equal. Therefore, the skew angle must be overridden on the Structure Definition engine properties.  
The distribution factor schedule may also be overridden.  
Error generating DIST-CONTROL-LL command!

The issue is with the transverse stiffeners. Please look at your definition for the group.

From: Tadros, Farid

Sent: Monday, November 29, 2010 11:38 AM

I am getting the B.M. and Shear values but I am still getting the load rating zero ton. So far, we are happy with the program and even we think to buy Opis also but we need to compare the result with what we have already to prepare report and make everybody feel more comfortable. I have very limited time for this evaluation version till 12-12 unless you can extend that for me. Please try to help me to find why this error happened and I am still getting zero rating.

From: Tadros, Farid  
Sent: Wednesday, December 01, 2010 2:35 PM

Please just let me know if you will replay to me or not, so I can stop trying or wait for your replay.

V V [ NEXT MESSAGE ] V V-----

From: Bridgeware, [mailto:Bridgeware@mbakercorp.com]  
Sent: Friday, December 03, 2010 2:38 PM

First, the live load distribution factor for shear is zero. I changed that to the same value calculated for moment.

Second, the top and bottom flange steel plates for the two ends are very thin. They need to be thickened to provide adequate results. (i.e. ratings over 0.00). A zero rating means that the rating was below zero

Third - for ASD I am getting these errors:

\*\*\*\* WARNING COMPRESSIVE FLANGE WIDTH OVER THICKNESS RATIO = 22.400  
MAXIMUM ALLOWABLE = 21.023

POINTNUMBER = 108  
\*\*\*\* WARNING COMPRESSIVE FLANGE WIDTH OVER THICKNESS RATIO = 22.400  
MAXIMUM ALLOWABLE = 21.700

POINTNUMBER = 108  
\*\*\*\* WARNING COMPRESSIVE FLANGE WIDTH OVER THICKNESS RATIO = 22.400  
MAXIMUM ALLOWABLE = 19.354

POINTNUMBER = 108  
\*\*\*\* WARNING COMPRESSIVE FLANGE WIDTH OVER THICKNESS RATIO = 22.400  
MAXIMUM ALLOWABLE = 19.909

POINTNUMBER = 108  
\*\*\*\* WARNING COMPRESSIVE FLANGE WIDTH OVER THICKNESS RATIO = 22.400  
MAXIMUM ALLOWABLE = 21.475

So I set the compression flange to a thickness of 1.5 in

Fourth - You also have overlapping issues with the placement of your stiffeners.

Fifth - The spacing of transverse stiffeners at each end did not meet AASHTO at the end of the beams.

\*\*\* WARNING \*\*\*  
TRANSVERSE STIFFENER SPACING AT ANALYSIS POINT 100 FOR TRUCK # 1 DOES NOT

TRANSVERSE STIFFENER SPACING AT ANALYSIS POINT 100 FOR TRUCK # 2 DOES NOT SATISFY CURRENT

AASHTO CRITERIA. ENGINEER SHOULD REVIEW.

\*\*\* WARNING \*\*\*

TRANSVERSE STIFFENER SPACING AT ANALYSIS POINT 100 FOR TRUCK # 3 DOES NOT SATISFY CURRENT

AASHTO CRITERIA. ENGINEER SHOULD REVIEW.

The depth of the girder is 23 inches. AASHTO STD 10.34.4.3 states that the first stiffener spacing needs to be 1.5D from the end - or at least 34.5 inches. This is true for both ends.

Lastly - There are problems with the stiffener locations. I fixed one beam and I finally got ratings.

You need to comb through the model and ensure the data entered is correct.

From: Tadros, Farid [mailto:ftadros@dot.nyc.gov]

Sent: Monday, December 06, 2010 10:17 AM

Thank you very much for your great help, actually I fixed most of the stuff you mentioned but I am still getting no rating. Would you please send me the revised XML file which u did it for one girder and got rating. Also last question, is there is any way to extend the time for this evaluation version.

V V [ NEXT MESSAGE] V V-----

I am a bit embarrassed. I had been running a Virtis Rating to get a good beam definition. I finally got ratings of nearly 1 or above 1 by changing plate thicknesses and adjusting the stiffeners and the other stuff listed below. (See girder 2) I forgot to change the engine back to BRASS. In BRASS, I am still getting zero ratings because of the end shear. I do not know why. The model meets AASHTO. I will post this as a bug. The model is included for your continued investigation.

- George

FROM: Herman Lee DATE: 12/6/2010 1:30:40 PM Eastern Standard Time

I'm able to reproduce the error message reported by Farid on 11/22 with the "PLATE GIRDER G1" member alternative.

Please modify or double check the following inputs:

1. In the Girder Profile's Top Flange and Bottom Flange, change the Length of the last range from 89.068959' to 89.068960'.
2. In the Deck Profile's Deck Concrete, change the Length of the last range from 21.463996' to 21.463997'.
3. In the Member Alternative's BRASS ASD Engine Properties, change the contraflexure point in Span 1 from 70% to ~46% and in Span 2 from 30% to ~25%.
4. The width of the fascia and interior transverse stiffeners are 0.00".
5. The Pedestrian load in G1 is 745 lb/ft.
6. The locations of the top flange and bottom flange thickness change.

## Complete Issue Information

### Description

FROM: Doug Horton DATE: 12/7/2010 10:16:19 AM Eastern Standard Time

The attached file (same one we are getting zeros for BRASS LRFR) crashes when members G1 or G4 are rated using LFR. After searching Elsinore, there was some verbiage regarding this issue and it implied that the problem would not be corrected until version 6.3. It has been run in 6.1 and 6.2 with the same crash result after the file export completed information message.

Is there a work-around or will we just have to await version 6.3?

FROM: Herman Lee DATE: 12/7/2010 11:00:02 AM Eastern Standard Time

Plank beam (box beam with no void) entered in Virtis is not supported by the Virtis Std Engine.

A workaround is to enter a void with a very small diameter or model the solid box beam as I beam.

### Description

FROM: George Colgrove DATE: 12/8/2010 1:29:27 PM Eastern Standard Time

The files enclosed are from the user. The supplied truck is a model of two trucks (90% of HL93) back to back with variable spacing.

1. Import the bridge file (aa.xml) and import the truck (H93neg.xml).
2. Open the Word Document and set up the Analysis Settings to agree with the screen shots.
3. Run the bridge rating. Check the output with what was depicted in the word document. Especially take note of the moment graph of the Lane-Type Legal Load (should be asymmetrical).
4. Then change the truck HL-93 - Negative Moments so the spacing range goes from (50ft to 100ft) to (2ft to 200ft).
5. Run the bridge.

You will find that the moment graphs become symmetric - unlike the original moment graph, (depicted in the word document) which was asymmetric. Should the original graph for the Lane-Type Legal Load been symmetric?

4/19/2016 3:08:11 PM

HRS AASHTO

1813

Complete Issue Information

FROM: Brian Goodrich DATE: 12/13/2010 9:24:50 AM Mountain Standard Time  
The BRASS engine only supports a variable rear axle spacing. The "HL-93 - Negative Moments" model will only use the mininum spacing for the other axle spacings. Regardless of this, adding the "HL-93 - Negative Moments" is causing different negative moment results at the interior piers: -439.0 ft-kips vs. -471.8 ft-kips. I confirmed this by running the scenarios George described. Running the Lane-Type Legal Load by itself gives the same results as when the "HL-93 - Negative Moments" vehicle was added. I forwarded this issue to WYDOT.

FROM: Brian Goodrich DATE: 5/18/2011 8:10:09 AM Mountain Daylight Time  
This issue was assigned to BRASS Incident 34.

FROM: Brian Goodrich DATE: 5/18/2011 8:13:30 AM Mountain Daylight Time  
The source of the asymmetry problem was identified to be the truck train storage arrays. The truck train array subscripts were revised to include the live load number, which keeps the actions and reactions separate when there is more than one truck train live load. Fixed for BRASS-GIRDER(LRFD) Version 2.1.0. Fixed for Virtis 6.3.

I noticed today that when I print a timber deck rating - there is no headers or footers identifying the structure number, dates, times, etc.

I attached an example.

FROM: Joseph Ihnat DATE: 12/10/2010 3:05:46 PM Eastern Standard Time  
Missing from a truss analysis too.

FROM: Joseph Ihnat DATE: 12/13/2010 2:52:10 PM Eastern Standard Time  
Fixed for version 6.3

FROM: Srujana Thogaru DATE: 3/31/2011 3:15:08 PM Eastern Daylight Time  
Verified and found to be fixed for 6.3

FROM: Todd Thompson DATE: 4/14/2011 2:35:55 PM Eastern Daylight Time  
Checked Truss Results and Headers/Footers are there in 6.3 Beta 1.

FROM: Todd Thompson DATE: 5/11/2011 11:58:47 AM Eastern Daylight Time  
Still good in 6.3 Beta 2 - can close this

Description

FROM: Tim Armbrecht DATE: 12/10/2010 4:53:48 PM Eastern Standard Time  
 From my consultant (Souther):

In doing an LFD analysis for a 3-span continuous welded plate girder (file attached), BRASS is returning an incorrect cross-section at the first tenth point of Span 3. The flanges transition from 16" x 1.625" to 16" x 0.75" at 8.25' from Support #3, which is at .101331 of Span 3. In the BRASS output the section at .1 of Span 3 (0.10833' left of the transition point) is said to have 16" x 0.75" flanges, but should have 16" x 1.625" flanges. In the case of this structure the rating critical point is at this location for BRASS.

The Virtis LFD analysis appears to yield correct results.

FROM: Brian Goodrich DATE: 12/13/2010 8:23:56 AM Mountain Standard Time  
 The flange transition is too close to the existing tenth point to be added as a separate node point. The BRASS limit between node points is 0.12', but  $8.25' - 8.14167' = 0.10833'$ . This is a known issue with BRASS.

### Description

FROM: Aaron Kemna DATE: 12/15/2010 12:24:17 PM Eastern Standard Time

I have an adjacent P/S Box Beam or P/S Voided Slab Beam bridge. The bridge was brought in 6.1 with "use current AASHTO" selected for the LFD shear method. We are currently using 6.2. I switched the method to "AASHTO 1979" and ran the bridge. I found out that the current AASHTO method was still being used. I clicked "ignore shear" and this option ran properly. I know that I was getting the 1979 AASHTO to work for other P/S I bridges. I found something odd with the BRASS Engine Help which stated

#### Shear Computation Method

BRASS LFD only supports the 'Ignore" and 'Use current AASHTO' options.

Only this was under the ASD heading which I did not think applied to P/S structures? Regardless, is there some reason why these girders are not analyzed with the 1979 AASHTO method? I attached a

Complete Issue Information

file.

FROM: Brian Goodrich DATE: 12/17/2010 8:26:34 AM Mountain Standard Time  
BRASS only exercises the 1979 Interim shear method for simple-span prestress structures made continuous for live load with mild reinforcement over the interior supports. This is the only reason I could find that would cause the results you're seeing. Are you running a seeing this only for a simple span?

FROM: Aaron Kemna DATE: 12/17/2010 3:47:00 PM Eastern Standard Time  
Now that you mention it, the bridges I was looking at are simple spans. I tested this on a P/S I simple span and got the same problem. I assume this is an oversight. The 1979 AASHTO Interim applies to both simple spans and continuous spans.

FROM: Aaron Kemna DATE: 12/17/2010 4:02:27 PM Eastern Standard Time  
Was it the intention of BRASS to only apply 1979 AASHTO to continuous spans? If so, why?

These error messages can be ignored.

From Incident 10305

=====  
The code is trying to find the slab reinforcement over the pier so that Article 6.10.10.3 can be evaluated. The user has not entered slab rebar and there is a slight glitch in the code that is causing this message to be thrown.  
=====

FROM: Todd Thompson DATE: 12/16/2010 2:23:57 PM Eastern Standard Time  
Ok - I thought it sounded familiar. Sorry.

FROM: Todd Thompson DATE: 1/5/2011 9:27:10 AM Eastern Standard Time  
I've added resteel in the deck but I still fail to get Virtis LRFR or OPIS LRFD to run. BRASS LRFR runs ok.  
There must be an additional item causing issues that I can't seem to track down..  
I added the xml for the bridg with resteel - sd\_48243210\_reva.xml

FROM: Herman Lee DATE: 1/5/2011 12:35:14 PM Eastern Standard Time  
I'm able to rate both G1 and G2 with the LRFR Design Load Rating template. Attached is the rating results.  
Todd, if you are able to reproduce the problem, this may become a tolerance setting issue.

FROM: Todd Thompson DATE: 1/6/2011 10:50:35 AM Eastern Standard Time  
Definitely appeared to be a tolerance issue.

Real difficulty is when one tries to enter the real dimensions for a bridge and then each bridge needs the tolerances tweaked to make them run but then you can't run a batch of structures that all work for a given tolerance. Guess I need to learn to tweak the input as I enter it so I can have the tolerances work for all the bridges.

Description

FROM: Tim Armbrecht DATE: 12/17/2010 9:08:32 AM Eastern Standard Time  
 From my consultant (Souther):

I had thought that Virtis was supposed to automatically create and analyze Points of Interest when, under Control Options, "Generate at section change points" was selected. In the attached export file, POICreateProb-1010160.xml, a 3-span continuous RC-slab, this does not seem to be happening. When there are no user specified POI's (see Member Alternative, "12" Int. Slab Strip (TEST)") the rating is controlled by flexure at .5 of Span 3 (Inv/Op RF's = 0.804/1.342). When the user specifies POI's at each location where the reinforcement changes (see Member Alternative, "12" Int. Slab Strip") the rating is controlled by flexure at .44 of Span 3 (Inv/Op RF's = 0.655/1.094), which is actually not one of the user specified POI's.

This behavior seems to be inconsistent with the way Virtis should be operating.

Complete Issue Information

FROM: Brian Goodrich DATE: 12/17/2010 8:52:54 AM Mountain Standard Time

I found an error in the BRASS export that is incorrectly changing the POI control option to only consider tenth points. I am working to address the error now.

FROM: Brian Goodrich DATE: 12/17/2010 11:06:41 AM Mountain Standard Time

The export now correctly checks for the POI at section change points, which affect the setting of the POI control option. Fixed for version 6.3.

### Description

FROM: Paul Jensen DATE: 12/20/2010 4:56:06 PM Eastern Standard Time  
this might be similar to the issue in VI 10286. The issue that we found is the distribution factors are not correct during computation. the factors are correct in the export. the perplexing item was the first exterior computed correct but the other was incorrect. all of the bridges analysed are symmetrict. attcheded file is not, but the first section alternative is.

FROM: Paul Jensen DATE: 12/20/2010 4:57:16 PM Eastern Standard Time  
the first output file is from g1 and the second is from g11-

FROM: Brian Goodrich DATE: 1/10/2011 11:47:20 AM Mountain Standard Time  
The source of this problem was addressed in VI 10286.

### Description

FROM: Tim Armbrecht DATE: 12/22/2010 9:20:42 AM Eastern Standard Time  
From my consultant (Souther):

I have attached the rating sheet showing the Virtis LRFR rating factors for this bridge. The Inventory factor is 0.955 based on flexure for the Truck Pair & Lane. I have been unable to get BRASS LRFR to run for this model. It gives me an error message stating, "Error getting LRFR system and condition factors! Error determining type of LRFR system factor!" I have been unable to find any reason that this error message should be generated. It is possible that if we can get this fixed the BRASS LRFR rating factor might be higher. The export file (PSIB\_BRASS\_LRFR\_Error(006-0171).xml) is attached.

FROM: Herman Lee DATE: 12/22/2010 9:42:24 AM Eastern Standard Time  
I'm not able to reproduce the error message using the BRASS LRFR engine. Attached is the HL93 ratings for the three members. Please give us more details on reproducing the problem. Thanks.

Description

FROM: Richard Withers DATE: 12/22/2010 12:20:08 PM Eastern Standard Time  
 I have a 6 span continuous steel girder bridge that is fully composite. When I tried to run a LRFR analysis using the AASHTO engine, the analysis appears to run correctly and I get the confirmation in the analysis progress window that tells me the analysis is complete. However, when I go to get the results in the tabular report window, all the ratings are zero and the controlling location is 0% of the 1st span in flexure. When I open the VIRTIS LRFR Spec Check Results in the output, there are values in all of the tables. So it appears it ran the analysis and got results in the spec checker, but the results are not showing up in the tabular report window. The BRASS engine returns what appear to be reasonable results that show up correctly in the tabular report window.

## Complete Issue Information

There is one other issue that I have run into. Using the AASHTO engine, I can only analyze one member at a time. The system runs out of memory when attempt to analyze both member 1 and 2 in the same analysis event. I have to run one member, close VIRTIS, reopen it and then run the second member. Watching the memory usage while the analysis is running, it appears the system stops VIRTIS when it hits 1 GB of memory usage. Is there any way to increase this? The BRASS engine doesn't have any problem analyzing both members in the same analysis.

I have attached an .xml output of the bridge.

Thanks,  
Richard Withers

FROM: Wayne Skow DATE: 1/3/2011 2:56:56 PM Eastern Standard Time

The trouble is a result of no value specified for the "sustained modular ratio factor." The value needs to be defaulted in the controller.

FROM: Wayne Skow DATE: 1/4/2011 1:22:35 PM Eastern Standard Time

Default values have been added in v6.3 (2.0 for concrete on concrete and 3.0 for concrete on steel) when no sustained modular ratio factor is present along with an additional warning message. v6.2 already alerts the user to the fact that the sustained modular ratio factor has not been entered:

...

Info - Generating Stage 1 Model Span superstructure finite element model...

Warning - Sustained modular ratio factor is not entered on the Structural Typical Section window Deck (Cont'd) tab!

Sustained modular ratio factor of 3.0 will be used!

Info - Finished generating Stage 1 Model Span superstructure finite element model...

Info - Generating Stage 2 Model Span superstructure finite element model...

Warning - Sustained modular ratio factor is not entered on the Structural Typical Section window Deck (Cont'd) tab!

Sustained modular ratio factor of 3.0 will be used!

Info - Finished generating Stage 2 Model Span superstructure finite element model...

Info - Generating Stage 3 Model Span superstructure finite element model...

Warning - Sustained modular ratio factor is not entered on the Structural Typical Section window Deck (Cont'd) tab!

Sustained modular ratio factor of 3.0 will be used!

Info - Finished generating Stage 3 Model Span superstructure finite element model...

Info - Generating load cases for all models...

...

The factor is entered on the "Deck (Cont'd)" tab on the "SUPERSTRUCTURE DEFINITIONS-><superstructure name>->Structure Typical Section" dialog.

FROM: Richard Withers DATE: 1/4/2011 3:40:34 PM Eastern Standard Time

Ok, adding the sustained modular ratio factor solves the tabular report output issue. However, I still can't analyze both girders in the same analysis. Searching through the incidents on this website, incident #9970 says that there is a 2GB limit for a process on a 32-bit Windows OS. I am getting the error at 1GB of memory usage. I am running Windows XP 32-bit. How can I get Windows to allow VIRTIS to use the full 2 GB of memory?

### Description

FROM: Todd Thompson DATE: 12/28/2010 9:47:54 AM Eastern Standard Time

I thought all Steel would be ready for LRFR in 6.2, but I noticed that one can not compute LRFD/LRFR live load distribution factors for Stringer, Floor Beam, Girder Systems. And LRFR is not even an analysis option for these structure types.

I guess this needs to be added as an enhancement.

FROM: Herman Lee DATE: 3/27/2015 2:51:33 PM Eastern Daylight Time

This enhancement has been implemented in the 6.7 release.

### Description

FROM: Aaron Kemna DATE: 1/5/2011 9:41:04 AM Eastern Standard Time

I told George that I would try to keep a log of when Virtis crashes. I figured it would be easier to keep track of here.

1. I tried opening a bridge in Virtis and got the error. See the attachments. After starting Virtis again I had no problems opening the bridge.

FROM: Herman Lee DATE: 1/5/2011 12:35:19 PM Eastern Standard Time

An application typically crashes when it trys to perform an operation that violates the operating system constraints. If you recall the operations you performed within Virtis before opening that bridge, this may help us reproduce the crash and locate the source of the problem.

FROM: Aaron Kemna DATE: 1/19/2011 4:37:10 PM Eastern Standard Time

On three seperate occasions I just opened up Virtis for the first time that day and got the error with the first bridge I tried to open. Since then, Virtis was reinstalled and I have not replicated that scenario. I still get some crashes, though, but I have been testing Virtis with the LARS engine so it's hard to know

4/19/2016 3:08:15 PM

HRS AASHTO

1832

Complete Issue Information

what's causing the issues. I can make Virtis crash in some cases which is a direct result of running the LARS engine. I will try to report any further occurrences on my machine which does not have the LARS engine.

FROM: Aaron Kemna DATE: 1/31/2011 3:53:08 PM Eastern Standard Time  
See incident 9860. The crashes may be related to our recent upgrade of the ODBC drivers. The crashes are numerous and it is too difficult to keep track of my steps so to speak. Opening bridges seem to be the trigger in most cases.

FROM: Aaron Kemna DATE: 3/1/2011 10:03:29 AM Eastern Standard Time  
OK, I have some more information on this issue. We recently ran a test where we moved the Oracle Client from our network to the local drive. I did not get any system crashes like before. This may lead one to believe that we have issues with our network, but we did not get these crashes with the older version of Oracle. Our IS people think it's some sort of timing issue with the server, but that should not be the case because we have a large bandwidth. This computer speak is a little over my head so I hope this makes sense.

FROM: Herman Lee DATE: 5/7/2011 9:02:40 AM Eastern Daylight Time  
Thank you for the information. I'll keep this incident opened for another month or two. Please track the crashes here if it happens again. Thanks.

FROM: Herman Lee DATE: 7/5/2011 10:21:03 AM Eastern Daylight Time  
I changed the Status to Closed.  
Please let us know if you want to reopen this incident.

### Description

FROM: Todd Thompson DATE: 1/6/2011 1:54:40 PM Eastern Standard Time

I have a 4 Span Steel Girder Bridge with the following span lengths:

63'-10 13/16"

92'-1 7/17"

116' - 1 1/16"

91' - 9 3/16"

When I convert these to decimals, the values exceed what I can enter into Virtis, so I put in only what Virtis will allow... And then I attempt to tweak the rest of the girder details, etc within these tweaked span lengths, but no avail - the analysis always fails due to tolerance issues. I'm using the Sample DB values for Tolerances.

I've attached the plans for this 4 span girder unit. (The lengths are odd due to rebuilding a new superstructure on existing substructure - part of a Major 10 Span Reservoir crossing, where we salvaged the existing Main Span Truss Members).

For Example - G2 - I just plain attempted to force the girder to work by assuming only 1 section throughout the entire girder length.

For Example - G3 - I attempted to tweak every single dimension to fit within the accuracy of Virtis and the tolerances, but again I can't get it to work.

FROM: Todd Thompson DATE: 1/6/2011 1:59:13 PM Eastern Standard Time

I tend to get tolerance issues at each and every support -

Looking for advice on how to enter my bridge, as close to the real dimensions as possible. I know that I could just drastically change the span lengths, but I prefer coding the bridges as close to plans as possible.

Having issues mostly with Virtis LRFR/OPIS LRFD but also with BRASS.

FROM: David Koenig DATE: 1/7/2011 3:37:03 PM Eastern Standard Time  
Todd, I would suggest that you set your Virits tollerances to .01 feet and .1 inches. This is basically 1/8th of an inch. We had tolerance issues several years back. We adopted the practice of setting our tolerances to this level and then requiring entry to four decimal places. With this practice, we rarely have any issue that is related to tolerances.

FROM: Todd Thompson DATE: 1/10/2011 2:01:01 PM Eastern Standard Time  
I even set it at 1 ft and had tolerance error issues. I finally redid span lengths to nearest foot and modified the real dimensions of everything.

FROM: Wayne Skow DATE: 1/17/2011 7:07:24 AM Eastern Standard Time  
The LRFR problem noted by Herman when analyzing G1 is caused by the use of an incorrect tollerance value while preparing the data for the 2nd point @ 214.0651 (note, the model is generating 2

### Description

FROM: Todd Thompson DATE: 1/10/2011 2:16:17 PM Eastern Standard Time

I have a Truss that for the last two years we have been rehabbing and I'm trying to get this load rated.

It's a Truss, with Stringers on Floorbeams (2 or 3 span cont stringers on Floorbeams). Some of the floorbeams had the concrete deck extended down to the floorbeams to make those composite.

I can't figure out if there is a way make the floorbeams composite so the bridge will rate out ok. This was a consultant design in which we made some of the existing floorbeams composite so we didn't have to replace all of the floorbeams of the truss.

FROM: Herman Lee DATE: 1/10/2011 4:20:32 PM Eastern Standard Time

If you enter data in the Deck Profile window (Deck Concrete and Shear Connectors), the export will consider a composite slab for the floorbeam. Please note that the Deck Profile and Haunch Profile windows will only be available for a floorbeam definition when the stringers are framed into the floorbeams.

FROM: Todd Thompson DATE: 2/10/2011 3:43:42 PM Eastern Standard Time

Ok - I did not have the stringers framed into floorbeams since they physically sit on top of the floorbeams and don't frame in. But when I framed them in - then I could enter the deck area and I think it's working now. It just was not intuitive when the language said framed in.

1839

Complete Issue Information

section, which slightly affects the shear capacity due to the change in the shear depth. What ratings are you getting with and without the box checked? I even turned off shear and the critical ratings were at the 306 point for both cases.

FROM: Brian Goodrich DATE: 1/13/2011 7:27:08 AM Mountain Standard Time  
E-mail from Elizabeth Befikadu:

Brian,

I have attached the rating summary sheet for member G2 and the XML file. In this case moment governs not shear. I run it for HL93 truck.

Thanks for your help

Elizabeth Befikadu

FROM: Brian Goodrich DATE: 1/26/2011 8:56:35 AM Mountain Standard Time

When the "Ignore positive moment at supports in ratings" box is unchecked, the reinforcement on the Continuity Diaphragm tab is exported to BRASS. For this particular structure, some of the reinforcement is located in the top of the beam. Therefore, when the negative moment resistance is determined, it has a higher value than the case when the "Ignore positive moment at supports in ratings" box is checked and no additional reinforcement is present. Note that the controlling ratings are for negative bending.

 Submitted on behalf of Jesus Barreda (BarredaJ@bceo.org), Butler County Engineer's Office.

=====  
 Attached there are a couple of files. I have attached the XML file, the BARS file, and the ratings. There are a couple of discrepancies like the strand pattern for example. The question was very general because this is not the only file that I have had problems with, so I thought maybe you would have a general answer, like if it is not recommended to imported specific types of bridges.

Let me know if you need more information.  
 =====

FROM: Xinmei Li DATE: 7/11/2011 10:33:55 AM Eastern Daylight Time  
 While importing the attached BARS file, there are two warning messages about the strand pattern. First, BARS strands were defined by areas, it was converted to # of strands during import. Second, the strand pattern is adjusted for harping.

For the second warning message, when importing BARS file, the Virtis import utility looks for harped strands by matching the CG of the strands defined in card 15. In the attached BARS file, section 01 and section 02 has strands at 5.2" and 5.156". Since they're not exactly match Virtis import can't recognize them as same strands.

Workaround is to change the first card15 for section 02 to the following so that the harp can be properly imported.

```
15093670S01 02          6000360 40 300 80 900 8026001M7.515 5.20
```

After the above change, strand pattern is correctly imported. The rating results screen shot is attached.

FROM: Xinmei Li DATE: 7/11/2011 1:47:44 PM Eastern Daylight Time  
 While investigating the strand pattern import I found out that the deck effective width was not correctly imported due to some other code change. Now it's resolved for 6.4.  
 The workaround for this issue is to go to the VirtisOpis Deck profile window, Deck concrete tab, enter end effective flange width manually after bridge is imported.

FROM: Matt Kolis DATE: 8/30/2012 2:33:34 PM Eastern Daylight Time  
 Virtis does not populate the end effective flange width fields. See attached image.

Description

FROM: Tim Armbrecht DATE: 1/19/2011 12:46:07 PM Eastern Standard Time  
From my consultant (Souther):

1. Rating factors vary widely between Virtis & BRASS engines for this simple-span steel girder. Inv/Opr Rating Factors: BRASS - 1.022/1.706 (Truck, Flexural - Steel Strength), Virtis – 1.377/2.294 (Lane, Critical - Overload Provisions). This is for Beam #3. (By-the-way, is there any way the word "Critical" could be left out of the Limit State for the Virtis engine analyses? It is included in every limit state name.

4/19/2016 3:08:16 PM

HRS AASHTO

1842

Complete Issue Information

e.g., The Limit State for this Member Alternative should only state, "Overload Provisions" w/o the word "Critical".)

2. The entry of 30% bottom flange deterioration 1 foot in length from support of a 45.58' simple-span rolled steel girder affects load rating at midspan but should not. This seems to only happen with BRASS.

Compare Beam #5 (deterioration) with Beam #3 (no deterioration). The controlling Inv/Op RF's for both are at .5 of the span but for #5 the RF's are 1.009/1.685 while for #3 they are 1.022/1.706. Since the deterioration is not at .5 of the span and the dead and live loads are the same for both beams the rating at the midspan should be the same, unaffected by deterioration at the beam end.

FROM: Herman Lee DATE: 1/19/2011 1:30:38 PM Eastern Standard Time  
For #1, please refer to the naming convention in the Rating Summary of the Virtis Std Engine output file. Since Virtis Std Engine also reports positive/negative moment ratings, the word "Critical" is used for identification in the Rating Summary.

FROM: Brian Goodrich DATE: 1/25/2011 1:49:57 AM Mountain Standard Time  
Regarding issue #1, BRASS does not allow girders with yield strengths below 33 ksi to be analyzed as compact sections. This may be why the BRASS rating is lower. You will need to compare the output between the two engines to determine the source of the difference.

Regarding issue #2, when deterioration is specified, the steel beam is exported as an equivalent plate girder. For an LFD analysis of a plate girder, BRASS recalculates section properties based on the dimensions, which are slightly lower than the properties for a rolled beam. This is the source of the slight difference in the ratings.

FROM: Herman Lee DATE: 3/26/2011 2:40:09 PM Eastern Daylight Time  
Tim, please see whetheryour consultant is satisfy with the above comments/clarifications. Thanks.

FROM: Tim Armbrecht DATE: 4/6/2011 2:58:17 PM Eastern Daylight Time  
Herman,

Here is the response. I think we're OK to close off this incident, but please take note of his comments on "critical" as well of his response to #2. I believe these are recommendations we should consider adopting at some point in development.

#1 –

Regarding...

... the explanation for the difference between BRASS & Virtis LFD, the analysis looks to be correct. I changed the steel to M183 and the ratings were very close to each other.

... the issue of including the word "CRITICAL": Since in the Load Factor Rating Summary report (see example below) the "Controls" column is by definition the critical limit state and that is the only Limit State listed, the word "CRITICAL" need not be attached to the listed limit state. It is redundant (CRITICAL could be substituted for "Controls" in the column heading) and takes up valuable space, requiring the table to be unnecessarily wider (same effect occurs when outputting fields as all caps).

Load Factor Rating Summary

| Rating    | Capacity        | Location        |                |      |  |  |
|-----------|-----------------|-----------------|----------------|------|--|--|
| Live Load | Factor Controls | (Ton) Span (ft) | Percent Impact | Lane |  |  |

 Operating 2.294 CRITICAL-OVERLOAD PROVISIONS 82.60 1 22.79 50.0  
 As Requested As Requested

#2 – It seems that only the regions where deterioration is defined should be converted to near equivalent plate girders and the remainder analyzed as the rolled section that it is. Somewhat related, I think we submitted a request for an enhancement that would allow both a plate girder and a rolled section to be defined within the same beam line. (This is sometimes detailed in bridges with hinges or with a haunched beam near interior supports.)

### Description

FROM: Jim Duray DATE: 1/21/2011 9:53:33 AM Eastern Standard Time

It was found while investigating deck-through trusses for AL DOT that the symmetry command always generates pinned supports. It would be useful to change this behavior by removing the generation of support conditions from the symmetry routine. The user should be able to define all of the support conditions and the symmetry command should not generate support conditions.

Description

FROM: Beckie Curtis DATE: 1/24/2011 3:49:49 PM Eastern Standard Time

We are having a strange error in our office. We have one laptop that is consistently getting the following error:

Error loading Virtis Std ASD/LFD DLL!  
(Error Code = 8) Not enough storage is available to process this command.

After opening Virtis, we can run any file(s) without problem. After importing (both single and batch) a file, we start getting the above error and cannot run any additional files. After closing Virtis and opening again we can then run the file we just imported. This happens every time we import a file using version 6.2, Virtis Std LFD engine. Only the one computer is having this problem.

The system info for this computer is:

```

Complete Issue Information

FROM: Tim Armbrecht DATE: 1/25/2011 10:06:29 AM Eastern Standard Time  
From my consultant (Souther):

The attached export (FlbmRunFails\_(0810040)-v6.2.xml) contains a Floor Line Superstructure with a floorbeam that generates the following error:

Error generating LFD/ASD schedule commands!  
01:01:08 PM - Line 203 in source file .\BrassStdSchedules.cpp.

Unable to determine transverse stiffener groups at start and end of range!  
Possible cause: One or more stiffeners exist at the same location.  
01:01:08 PM - Line 1292 in source file .\EngineExport.cpp.

Error generating STIF-TRAN-SCHEDULE or STIF-TRAN-GROUP commands!  
01:01:08 PM - Line 609 in source file .\BrassStifTranScheduleGroupCmd.cpp.

No reason for the error has been discovered. Since I did have results recorded for the floorbeam when it was originally created in March 2010 under Virtis v. 6.1, the problem may be related to program modifications for v. 6.2.

Tim Souther, PE  
%IDOT Bridge Ratings Unit  
(217) 785-2935  
timothy.souther@illinois.gov

FROM: Brian Goodrich DATE: 1/25/2011 3:49:47 PM Mountain Standard Time  
The BRASS export is trying to create a transverse stiffener schedule for spans 1 and 3. As part of another incident, the BRASS export was revised to create schedules for spans that don't have stiffeners. For these, the bearing stiffeners were used to populate the stiffener group. However, floorbeams do not have an input for bearing stiffeners. There is basically no way to populate the stiffener group when the span contains no stiffeners. The workaround is to add a stiffener range for spans 1 and 3.

FROM: Brian Goodrich DATE: 1/26/2011 10:43:51 AM Mountain Standard Time  
E-mail from Herman:

I reviewed the incident and concluded with the following two enhancement requests.

1. Enhance BRASS LFD Engine for handling the case that not all the spans have transverse stiffeners.  
And/or
2. Enhance Virtis for allowing input of bearing stiffeners for FS floor line and floor system superstructure definitions.

Herman

FROM: Brian Goodrich DATE: 1/26/2011 10:44:25 AM Mountain Standard Time  
BRASS LFD will run even if the stiffener schedules are missing for a span. We need to either 1) provide input for bearing stiffeners for a floorbeam and then require this input or 2) we revise the export to not generate transverse stiffener schedules for spans without transverse stiffeners. We had been

4/19/2016 3:08:18 PM

HRS AASHTO

1853

Complete Issue Information

doing option 2 for girders until users requested that we use the bearing stiffeners.

FROM: Brian Goodrich DATE: 1/26/2011 1:22:26 PM Mountain Standard Time  
E-mail from Herman:

Seems like we need special treatment for floorbeam. Anyway, it's up to WYDOT to decide whether to enhance BRASS export based on option 2 for floorbeam. Please log option 1 in the incident for Virtis enhancement.

FROM: Herman Lee DATE: 7/12/2012 3:02:16 PM Eastern Daylight Time  
Option 1: provide input for bearing stiffeners for a floorbeam  
Changed Category from Enhance BRASS to Enhancement.

Description

FROM: Todd Thompson DATE: 1/25/2011 11:06:52 AM Eastern Standard Time  
I have a 336 Ft 18 Panel Truss, which I've attempted to code up as Symmetrical (EVEN).

I have 4 or 5 members that are (or I'm trying to consider) as Counters. Which would be Tension members only.

4/19/2016 3:08:18 PM

HRS AASHTO

1854

## Complete Issue Information

But when I do the analysis - what I've come across is that the symmetrical members are controlling in Compression.

And when I've reviewed the Truss schematic - the symmetrical members are NOT showing as being counters and I'm guessing the FE engine is not getting the information that they are Tension only members.

Looks like the work-around is to code all 18 panels and not just the first 9 and use the symmetry command when there are counters involved.

It is for Spans 8 & 9 Truss Spans --- the Chamberlain Truss member.

FROM: Todd Thompson DATE: 1/25/2011 11:25:51 AM Eastern Standard Time  
The attached Chamberlain truss fails to run when I code up all the counters.  
but when I had only coded some of the members - the FE does run - just doesn't do it symmetrically

FROM: Todd Thompson DATE: 1/25/2011 11:41:56 AM Eastern Standard Time  
I attached the FdAnalysisLog.txt file that was from the FE analysis failed to run.

FROM: Todd Thompson DATE: 1/25/2011 11:50:28 AM Eastern Standard Time  
maybe there are two different problems.  
(1) Counters don't appear to be reflected on the other half of truss when symmetry is used  
(2) When I attempt to mark as counters all the members that are Tension only - the FE analysis fails to run.

In the described Truss the following members are Tension Only.

L4-M5 (and it's symmetrical member)  
M5-U6 (and it's symmetrical member)  
L6-M7 (and it's symmetrical member)  
L8-M9 (and it's symmetrical member)  
L9-M9

FROM: Todd Thompson DATE: 1/25/2011 11:53:29 AM Eastern Standard Time  
I attached a line drawing of truss and the truss loads/stresses that were generated by one of our consultants who used SAP2000 to generate those loadings.

FROM: Todd Thompson DATE: 1/25/2011 2:29:49 PM Eastern Standard Time  
I coded the truss in it's entirety - without symmetry command.

I added L4-M5 and L4'-M5' as counters - runs ok  
I then added L6-M7 and L6'-M7' as counters - runs ok  
I then added L8-M9 and L8'-M9' as coutners - FE analysis fails  
I then removed L8-M9 and L8'-M9' as coutners and added M5-U6 and M5'-U6' as counters - runs ok

So it appears that adding the L8-M9 and L8'-M9' as counters causes the FE analysis to fail.

FROM: Bin Zhang DATE: 1/28/2011 4:35:28 PM Eastern Standard Time  
I just fixed the Truss Command, so it is able to generate the symmetrical counters now. You will have this feature in the upcoming virtis6.3.

I also have a couple questions for you:

4/19/2016 3:08:18 PM

HRS AASHTO

1855

## Complete Issue Information

1. Are the members that are marked as counters are actually counters? In my opinion, the member "M5-U6" and "L8-M9" may not be counters since they have double angle sections. Inappropriate assignments of counters may cause structure stability problem and then analysis abortion.
2. Regarding the "service load stress table for truss members" you sent as in the VI document, is the result for design truck, design lane or both? Is the distribution factor included in the result?  
Thanks!  
BTW, can you double check the member section property of the M3-L4? It's not consistent with the member section as marked in the "Elevation of Truss" figure.

Thank you!

FROM: Todd Thompson DATE: 2/1/2011 11:33:42 AM Eastern Standard Time

(1) Good question. The original analysis shows some of those members as Tension Members. The Consultant that analyzed this also considered some of those members as "inactive" in using SAP 2000. In fact in reviewing their work, they did a run with all members active and then some with these "counters" as inactive and somehow combined this to produce their rating values. If I make a run with all members active - some of these 'counters' fail in compression since they have little or no capacity in compression as the original analysis/design considered them to only carry tension. So I tried to take which members should be tension only and made them counters. This caused the FE analysis to fail. So a couple of members (L8-M9) are artificially high for compression so the analysis does not fail those members since I can't make them as tension only. I attached the original 1924 Truss plan with loadings from that design. (in 2009-2011, we replaced the floor systems for these trusses)

(2) Service Loads are truck and lane, which ever controlled. They are all single lane LL DF's, as there are side by side trusses, each carrying one traffic direction. Consultant considered the nearest wheel to be only 1 ft from the curb line. in computing the LL DF.

I believe the M3-L4 properties are correct - I attached calcs for this.

FROM: Todd Thompson DATE: 2/1/2011 11:39:07 AM Eastern Standard Time  
The 336Ft Truss = Spans 8 & 9 Truss Spans (Use)

I attached the latest and greatest coding up for this bridge and more specifically the 336 Ft Truss

FROM: Bin Zhang DATE: 2/8/2011 2:02:41 PM Eastern Standard Time

I am able to run the newly attached "sd\_08068084\_Truss\_newest.xml" successfully using virtis62 (Figure Summary)! I rated the "Span 8&9 Truss Spans (Use) – TRUSSES - Chamberlain" using HS20 rating vehicle. There are 4 counters in this analysis: L4-M5, L6-M7, L6'-M7', L4'-M5'. The non-linear solver worked fine for this truss. The virtis62 gave similar rating results to the results you attached in the table, mostly the relative difference is within 10%.

BTW, the newly attached XML corrected the section property assignment for member M3-L4. It was assigned as Section35 in the old XML file other than Section 33 (figure M3-L4).

The upcoming virtis63 is able to generate the symmetrical counters, and it will be released around this summer. Please feel free to let me know if you still have questions about this. Thanks!

Description

FROM: George Colgrove DATE: 1/27/2011 10:34:14 AM Eastern Standard Time

When running the enclosed bridge under a LFR rating batch, the bridge wont run and gives the error:

```

=====
Unable to create analysis module!
No rows returned from database when expecting one row.
=====

```

What is happening is that the bridge is a timber bridge and thus uses the Madero engine (ASD).

The error message gives the idea that the data entry was incorrect. I think the message should read something like

```

Unable to create analysis module!
LFD/LFR analysis selected. Engine requires ASD/ASR analysis.

```

Then the bridge should be skipped and the batch processing should continue.

This bridge does run from the BE under a ASD batch run.

Description

FROM: Tim Armbrecht DATE: 1/31/2011 2:07:43 PM Eastern Standard Time  
 From my consultant (Shoup):

Attached is the Virtis model and the table of results (the ratings were done with FB77) for this floorbeam issue.

The issue that Tim Souther had, I also noticed. The check point issue that I have were that if the check points match a 10th point then the analysis would fail. I also notice that some check points were causing higher ratings then if the check points were not used (It looked like it was not checking the normal 10th points). I am assuming that this has been corrected with the POI issue that Tim Souther submitted.

4/19/2016 3:08:19 PM

HRS AASHTO

1859

## Complete Issue Information

I did some investigations about the ratings of the floorbeams and the differences between LFD and ASD (and spreadsheet calculations for ASD). The attached spreadsheet has the results of the ratings with different losses (of the floorbeams) and has a ratio for ASD to LFD for the Virtis ratings and ASD rating ratio for Virtis to independent spreadsheet results. I believe it is a capacity issue, but was not able to find the capacity calculations within VIRTIS to see where the issue is. On an independent check of the capacity I matched up with the no reduction case but when I started adding in the reductions the capacity from VIRTIS dropped more quickly than what I was calculating.

There also appears to be an issue with the deteriorations when you get to the 98% to 99% loss range (horizontal flange of the angle only). I did not look into this one because I was not sure if it may be related to the differences of the LFD and ASD with the deteriorations.

I also considered that this may be an issue with the members being built up and how VIRTIS exports it to the rating engines. The BRASS files only show top flange, web and bottom flange and not the actual built up section.

using unlimited crossing, mixed with traffic and override factor checked) run for the exterior girders. However, for the interior girders we get an error message when trying to run the LRFR overload trucks – please see the attached screenshot.

FROM: Creightyn McMunn DATE: 2/16/2011 4:35:32 PM Eastern Standard Time  
Is there any update on this issue?

FROM: Xinmei Li DATE: 2/16/2011 4:48:09 PM Eastern Standard Time  
I used the attached bridge to do LRFR spec check with permit load, I'm able to reproduce the error you reported.

FROM: Wayne Skow DATE: 2/17/2011 9:04:50 AM Eastern Standard Time  
Article ALRFR\_1E\_06\_05\_04\_02\_02\_02 is crashing at line 452 when it goes to fetch the positive and negative cracked section properties of a PS cross-section. The table containing the properties (ALRFD\_Results.RCCrackedSectionPropertyTable) is populated by RCCrossSectionProperties and (it appears to me that it) may contain a varying number of records. ALRFR\_1E\_06\_05\_04\_02\_02\_02 is expecting two records (keys 0 and 1). In this particular instance, however, there appears to be only one record in the table.

FROM: Xinmei Li DATE: 2/18/2011 1:56:59 PM Eastern Standard Time  
Currently there is no workaround.

FROM: Krisha Kennelly DATE: 2/21/2011 10:39:58 AM Eastern Standard Time  
The program is unable to find the neutral axis location for the cracked section for the interior girders. The program performs an iterative procedure to find the cracked neutral axis and for some reason it cannot converge on a solution for the interior beams.

The workaround is to change the Y1 value on the Haunch Profile window from 2.0" to 2.01". This slight change allows the iteration to converge on a solution for the cracked neutral axis location.

We will continue investigating to fix the problem in the code.

FROM: Herman Lee DATE: 8/23/2012 9:46:37 AM Eastern Daylight Time  
The error message is not reproducible in version 6.4 Beta 4. I am able to complete the LRFR analysis for both the exterior and interior girders in the attached bridge.

I am using Windows 7 if that makes any difference?

I entered the Timber tutorial from the available PDF

When I do a validation it gives the following message - everything works fine, but I get this message

Srujana - please investigate. The validation when you save occurs in  
gui/abgbrdg/UiValidateComponentView. You can put breaks in there to find when the error is thrown.

FROM: Srujana Thogaru DATE: 3/21/2012 10:54:33 AM Eastern Daylight Time  
Error due to improper initialization of variables in abobrdg -> DoGirderMbrAlt.cpp validation function.

Fixed for 6.4 Release.

### Description

FROM: Paul Campisi DATE: 2/9/2011 4:08:01 PM Eastern Standard Time

The attached Bridge, which ran in Version 6.1, now crashes in Version 6.2. It appears to be a problem with the diaphragms, as when I remove them the bridge runs. See "Span 1 NB" - G12 as an example. The error is listed below.

Error generating LFD/ASD schedule commands!

Error getting start distance and range for bracing schedule!

Error generating BRACING-SCHEDULE command!

Unable to determine span where range begins!

Error determining start distance and range!

FROM: Brian Goodrich DATE: 4/13/2011 1:03:22 PM Mountain Daylight Time

I confirmed this error with the BRASS export.

Description

FROM: George Huang DATE: 2/11/2011 12:36:52 PM Eastern Standard Time  
 This is the first bridge we are trying to rate with Virtis and to compare the results from other software. However when we try to "View analysis output" for the Tuss model, we can only open the "Live Load Analysis Summary" and "Log File", and can not open any other files. It is important for us to view the other information to verify the results. Could you help us to access other output files? The bridge file (Test20C0018HG.xml) is attached. Thanks.

FROM: Herman Lee DATE: 2/11/2011 1:03:02 PM Eastern Standard Time  
 George, please try the following to see whether it fixes the problem.

- Internet Explorer needs to be the associated application for opening XML files on your computer.
- 1) Right-click on any XML file in Windows Explorer.
  - 2) Select Open With - Choose Program
  - 3) Select IE in the list, also check "Always use the selected program...", click OK.

Description

FROM: Paul Campisi DATE: 2/14/2011 3:33:52 PM Eastern Standard Time  
 For the attached model using the "148 foot span Warren Truss with Steel Grid Deck" Superstructure Definition, floorbeams 1 thru 4 will not analyzed. It appears to be a problem with the DC2 stringer reactions not updating. When I added a 4 inch wearing surface as a DC2 load, the floorbeams will no longer analyze. But the remaining floorbeams analyze. They should all run, as there is only one floorbeam definition for the bridge.

Additionally, the only way to get the new stringer reactions on the floorbeams that do run is to analyze the entire bridge from the Superstructure Definition workspace. If you change the wearing surface thickness, unless you run the bridge from the Superstructure Definition, the reactions do not update. Even if you have the "Automatically save the new computed stringer reactions" toggle activated under the preferences. If you run an individual floorbeam, the reactions do not update with a wearing surface change.

These problems appear to be tied to the addition of a wearing surface load.

Complete Issue Information

Paul Campisi  
NYSDOT

FROM: Paul Campisi DATE: 2/15/2011 10:00:16 AM Eastern Standard Time  
I have done some additional testing and found the following:

When the deck thickness is revised. The stringer reactions are not being updated when an individual floorbeam is analyzed. The rating does not change.

When a DC1 floorbeam member load is added. The stringer reactions are being updated when an individual floorbeam is analyzed and the rating changes.

When the bridge is run from the Bridge Explorer the stringer reactions are being updated and the rating revised.

### Description

FROM: Daniel Jones DATE: 2/14/2011 4:57:53 PM Eastern Standard Time

I found that Member U3L4 & its mirror (U3'L4') for any simple span truss does not calculate the Rating Factor correctly. I modeled a truss very similar to the TrussTrainingExample provided with the software. Both the training example and my model showed that the Factor ( $A1 = 1.30$ ) was not included in the calculation for the rating factor shown on the Rating Results Report.

Thanks,  
Daniel Jones

FROM: Bin Zhang DATE: 2/15/2011 9:31:46 AM Eastern Standard Time

For the member U3L4, the dead load will increase the member capacity. With this in mind, the dead load should be factored by 1.0 ( $A1=1.0$ ) other than 1.3

You can refer to VI#10070 for more information.

Thanks!

FROM: Krisha Kennelly DATE: 2/15/2011 8:59:51 AM Eastern Standard Time  
Submitted by George Huang via email on 2/2/11:

Hi Krisha,

Attached are the Virist models for two 3-span pc/ps bridges. There are shear capacity problems at 0.9 of span 1 (and 2) and 0.1 point of span 2 (and 3). Although these are 3-span bridges, there are couple different models we used to test to see if we can ignoring the rating at 0.1 and 0.9 point in original 3-span bridges, and use the 0.1 and .9 ratings from one or span models. Thanks for the help.

Phone call from George referenced shear article that contains  $V_i \cdot M_{cr} / M_{max}$ . For these points the  $M_{max}$  is small and that leads to a small  $V_i$ .

Description

FROM: Tim Armbrecht DATE: 2/16/2011 10:41:43 AM Eastern Standard Time

From my consultant (Souther):

RE: VirtisLRFR\_Run\_Failure(0820324).xml

Member 4 - 1st N Int-x in the reference Virtis 6.2 model will not run under the AASHTO LRFR engine although it does run successfully under BRASS LRFR. The run terminates with the following...

- Location - 741.4888 (ft)

Failed to perform element specification checks.

Object reference not set to an instance of an object.

### Description

FROM: Herman Lee DATE: 2/16/2011 3:36:32 PM Eastern Standard Time  
Submitted on behalf of George Huang, Caltrans.

FROM: Bin Zhang DATE: 2/21/2011 9:24:14 AM Eastern Standard Time  
Virtis program used the secant equation to calculate the rating factor for tensile members with eccentricity. This is incorrect, the secant equation should be applied to compressive members only.

FROM: Bin Zhang DATE: 1/6/2012 2:14:46 PM Eastern Standard Time  
Fixed for VO64. The new program will use interaction rating for the tensile truss members with eccentricity.  
Member L1L2 in the attached document is a tensile member with eccentricity, it could be used for the testing purpose.

## Complete Issue Information

FROM: George Huang DATE: 6/8/2012 6:50:38 PM Eastern Daylight Time

I tried to use  $e=0.1$  for LOL1 element. The operating rating (HS20 truck) changes from 7.0 (for  $e=0$ ) to 5.2 ( $e=0.1$ ). I tried to use tension capacity of 630 kips and  $M_y=2902$  kips-in, but could not figure out why the reduction is so big. Which interaction equation and which bending capacity are used in Virtis? I attached the file I used (BR10-113GH.xml).

FROM: George Huang DATE: 6/8/2012 6:54:48 PM Eastern Daylight Time

I use Span 4 (Warren pony truss) - truss 1 in the analysis.

FROM: Bin Zhang DATE: 6/15/2012 1:15:36 PM Eastern Daylight Time

Please refer to Page 16 in the attached "Virtis Truss Method of Solution.PDF" for the interaction equation.

For the bending capacity, Virtis uses the following equation : " $M_u = M_p = F_y * S_{xx}$ ". For member LOL1,  $F_y = 4752$  kip / ft<sup>2</sup>, and  $S_{xx} = 0.0509$  ft<sup>3</sup>. So the  $M_u = M_p = 241.87$  kip-ft.

Below I listed the procedures that how does Virtis calculate the Opr rating factor of member LOL1 for the HS20 vehicle.

$A_s = 0.13$ ;  $P_{cr} = 515.98$ ;  $P_e = 4269.72$ ;  $P_y = 535.76$ ;  $P_1 = 143.66$ ;  $P_2 = 69.50$ ;  $M_2 = 0.58$ ;  
using 10-155

RF1 (rating factor) = 5.21;

using 10-156

RF2 (rating factor) = 5.50;

RF = smaller value between RF1 and RF2, so RF = 5.21 here. Please let me know if this does not answer your question.

FROM: George Huang DATE: 6/19/2012 5:14:51 PM Eastern Daylight Time

Bin, the interaction equations listed at page 16 of "Virtis Truss Method of Solution" are for compression only. The interaction equations with tensile axial force are not listed in the AASHTO Standard Specification, but in section 1.8 of "Guide Specifications for Strength Design of Truss Bridges, 1985. Let me know if you need this guide spec.

FROM: Bin Zhang DATE: 6/21/2012 10:49:58 AM Eastern Daylight Time

Proposed by Herman:

We proposed the following actions for Incident 10459. Please let us know your comments.

1. For tension member with eccentricity, analysis will issue warning message and use the concentric axial rating equation (not considering eccentricity).
2. Notify Paul Campisi of this modification to the analysis and see whether he agrees to the change.
3. Enter an enhancement request for using the interaction equations for tension member in the Guide Specs for Truss (Section 1.8) when eccentricity is entered for the member.

FROM: George Huang DATE: 6/26/2012 10:54:48 AM Eastern Daylight Time

It's fine with me.

FROM: Bin Zhang DATE: 7/3/2012 9:14:36 AM Eastern Daylight Time

It's been decided that:

1. For tension member with eccentricity, analysis will issue warning message and use the concentric axial rating equation (not considering eccentricity). Do this for 6.4 Beta 3.
2. Enter an enhancement request (could be a control option) for using the interaction equations for

Description

FROM: Paul Campisi DATE: 2/25/2011 5:04:19 PM Eastern Standard Time  
The attached truss was built using Metric Units. Truss members were created using the "AngleBox", "ChannelBox" and "Builtup" member commands. Even though the truss verified, the analysis terminated with the following error:

Error performing finite element analysis...

4/19/2016 3:08:22 PM

HRS AASHTO

1878

Complete Issue Information

Error performing finite element analysis!

\*\*\*FEA ERROR - Modulus of elasticity for beam element 1 is 0..

When I re-created the members using the "NonDetailed" member command, the program ran and provided results.

The problem appears to be when the members include plates. I tested a ChannelBox without plates and it ran successfully.

See the attached model for the various test cases.

Paul Campisi  
NYSDOT  
Office of Structures

FROM: Xinmei Li DATE: 4/27/2011 1:47:38 PM Eastern Daylight Time  
The plate thickness was not parsed correctly. This is resolved for 6.4 release.

FROM: Xinmei Li DATE: 4/27/2011 3:54:04 PM Eastern Daylight Time

FROM: Paul Campisi DATE: 9/7/2012 1:41:08 PM Eastern Daylight Time  
I checked this truss and it does not run. The following error is reported for the truss 1.

???Error - Area for member LOU1 is less than or equal to zero!  
???Error - Unable to assign material properties for member LOU1.  
???Error - Member and material properties are required user input.

When you look at the sketches the plates are displayed as paper thin. Truss 2 runs as before.

Note: I had to remove the "Connection Welded 0.0" command from members "V1" and D1 as shown below for the truss to run. Otherwise the truss did not validate. This is a valid command which should not have to be removed.

Builtup = V1  
TopFlangePlate

Description

FROM: Jesus Barreda DATE: 2/28/2011 11:43:12 AM Eastern Standard Time

I am working on a reinforced concrete box beams bridge, Virtis only gives the option for I and T Beams. Since the beam does not have a void, can I treat it as a "square I" beam? (the distribution factors should be changed for adequate factors since Virtis will provide distribution factors for an I beam)

Thanks

FROM: Herman Lee DATE: 2/28/2011 12:53:46 PM Eastern Standard Time

For rating purpose, this workaround might be ok.

Description

FROM: Herman Lee DATE: 2/28/2011 3:42:46 PM Eastern Standard Time  
Submitted on behalf of Moussa Issa, HBM Engineering Group.

Received e-mail:

=====  
Hello Jim,

I am currently running the rating for a Truss Floorbeam Stringer system with deteriorations on the stringers, floorbeams and the truss. In the floorbeams and stringers definition Control Options I selected "Generate POI at Section Change Points" and "...at user defined points". I ran the rating in Brass LFD with the engine property "Print actions at all node points" This should have given me the correct ratings for all of the members with deteriorations. I noticed however that some ratings were too high. I investigated it further and noticed in the Brass output files that the rating was only being calculated at 1/10th points. To correct this error I placed Analysis Location points at the beginning and end of each deterioration on all floorbeams and stringers. The floorbeam ratings gave expected results but the stringers ratings were higher. Looking into the output files again, the rating was being calculated only at tenth points before my specified analysis location, and all points after this location were ignored. (For example, 'Unit3 Stringer1 Det' only outputs rating at 100.0 and 100.19 (0.667') from the left end of the stringer and no other locations). I also noticed that sometimes it works and other times it does not. See some examples below. Is this a bug in the program or is there something that I am doing wrong? Please let me know ASAP.

The stringer in U3S1error.pdf has a POI at 0.667', this has the error.  
The stringer in U3S1working.pdf has a POI at 0.667' and 6', this does not have an error.  
The stringer in U13S4error.pdf has a POI at 14' and 14.667' and this has the error.

Complete Issue Information

I attached the model so that you can try and reproduce my problem. Just a note, we are using a modified version of Virtis that overwrites the straight line truss verification (fix in v6.3). If you have any questions please call me or Justin Brown  
 Have a nice day.

=====  
Hi Dean,

Finally we tested the new function of "Eccentric Axial Rating" for truss member in Virtis. We analyzed a simple span truss using Virtis (see attached file "Bridge.30C0016.xml") and compared the results with our previous rating results. I discussed some of our findings with Herman Lee, and Herman created VI 10459 to correct one mistake where the secant formula was used for both compression and tension members, and should be for compression only. However the bigger issue here is that the rating equation used in Virtis based on AASHTO MBE is too conservative and even wrong in my judgment.

The controlling rating member is top cord U2U3 for this truss bridge. I attached the file "Truss\_Capacity.xlsx" to show the capacities from different equations for top cord U2U3.

Virtis calculates the capacity due to eccentricity by dividing  $0.85AP_{cr}$  with the  $\Delta_A$  from MBE Appendix 16A (eq. 16A-1, page 6-75). The operating capacity from Virtis is 182.6 Kips (Cell F23), the inventory rating is -0.029 (Cell 21) and operating rating is 0.48 (Cell 22). The different signs between inventory and operating ratings are due to different capacities using different  $P_u$  in  $\Delta_A$ .

The capacity equations used by Caltrans are based on P-M interaction (eq. 10-155) from AASHTO Standard specification, which are the same equations recommended in the "AASHTO Guide Specifications for Strength Method of Truss Bridges (Load Factor Design) 1985". Based on this equation, the capacity is 218.99 Kips (Cell J18), which is about 20% larger the operating capacity from Virtis. The inventory and operating ratings are 0.258(Cell 21) and 0.438(Cell 22).

The page 1 of file "ELoad.pdf" shows some background of Virtis and MBE equations. Eq. 1 is the basic equation from the basic beam theory. Eqs 2 and 3 are the equations used in Virtis. The rating equation used in Virtis is too conservative due to the following facts:

- 1)  $\sigma_{max}$  in Eq 1 is the maximum allowable stress not only due to the axial force, but also due to the bending moment. The stress,  $0.85 F_{cr}$ , is usually for axial load only. However Virtis is conservatively using this stress for the combined stress.
- 2) The capacity  $P$  in Eq 1 depends on the applied axial force  $P$ . The capacity calculation has to be based on the iterations of  $P$ . However the MBE equation used in Virtis, use the fixed and different combined factored dead load and live load for inventory and operating ratings to calculate different  $\Delta_A$  (Eq 3) and to get different capacities (Eq. 2). Due to the larger for  $F_u$ , the calculated capacity is smaller for Inventory rating than that for operating rating. That's why the rating factor for member U2U3 of the testing bridge is negative for inventory rating, while the rating factor for operating rating is positive. These capacities,  $P$ , will be too small for weak member since the  $P_u$  is much larger than  $P$ , and could be too large for some very strong member if  $P_u$  is much smaller than  $P$ . This is a wrong approach.
- 3) The secant equation (Eq 3) is based on the idealized pinned end conditions with no modification for  $L$ . However the member length " $L$ " in most equations in the Specifications can be modified as  $KL$  to consider the actual boundary condition, such as  $K=0.875$  is used for pinned ends in the calculation of

Fcr.

The eccentric axial rating method used in Virtis is too conservative. With this approach, States may not be able to use Virtis to get reasonable ratings for truss members with eccentric axial loads. My recommendation is to use the beam-column equations 10-155 from AASHTO LFD Standard Specification. On page 2 of the file "ELoad.pdf", I showed an example for possible revised delta equation to replace the current equation. This equation is based on the assumption  $\mu = M_y$ , and iteration has to be used to calculate the correct Delta. If different  $\mu$  is used, the formula will be different.

Let me know if you need more information. Thanks.

Description

FROM: Bin Zhang DATE: 3/8/2011 12:48:04 PM Eastern Standard Time

For the bending moment rating in a stringer, BRASS does not rate the negative bending moment. For example, if I rated the middle point of a continuous stringer, BRASS did not calculate the rating factor at all. Then I picked another POI, BRASS could calculate the rating factor. But it only calculated the positive moment rating factor.

I used the BID 13 bridge for the test. The member I rated is "Unit1 Stringer1"->Alt1.

FROM: Herman Lee DATE: 3/9/2011 8:03:54 AM Eastern Standard Time

FROM: Brian Goodrich DATE: 5/23/2011 8:41:14 AM Mountain Daylight Time

BRASS LFD performs the flexure checks based on the STEEL-GIRDER-CONTROL command when points of interest are generated. This BRASS section type is determined based on the points of dead load contraflexure (see the stringer definition engine properties) and set for the various ranges along the beam. The "Member Alternative/Beam Definition Properties: Analysis" engine properties help topic describes this. BRASS only performs one flexure calculation per point of interest, i.e., it does not check both positive and negative flexure.

The new merged BRASS will perform checks for both positive and negative flexure.

FROM: Bin Zhang DATE: 6/15/2011 11:06:26 AM Eastern Daylight Time

Received Bridgeware e-mail:

=====  
Hi

Attached is a bridge where Virtis Crashes after exporting the data to the Virtis analysis engine.

The girder that crashes is

G4 of "Span 1-3 (MDL 3 of 4)"

Could you please check and let us know what is wrong with the input that causes the crash?  
(See attached file: 35 0121eh.xml)

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer  
=====

The crash is caused by the live load distribution factor ranges. A workaround is to use the computed span lengths in the G4 Member window. The length of the DF range from support 1 will become 45.906542 ft and the length of the DF range from support 2 will become 99.796831 ft.

When no traffic data entered for LRFR ratings the default load factor used is the least conservative (1.40). I would think that when no informations is entered we would want to default to the MOST conservative load factor (1.80).

### Description

FROM: Mehrdad Ordoobadi DATE: 4/4/2011 8:08:47 AM Eastern Daylight Time

While investigating incident 9831 noticed that the end shears for a multi-span PS girder are inconsistent for DL1. This happens for bridge PCITrainingBridge5 member alternative ...StructureDefinition1/G2/MemberAlternative1(995). The shear diagram, Vrtis Std Input and output files are attached.

FROM: Hasmukh Lathia DATE: 4/19/2011 12:45:06 PM Eastern Daylight Time

It appears that DL1 shear at end of last span in a PS girder was reported correctly before implementation of BAR7 Revision149 that was added to Virtis Std Engine. DL1 shears in a continuous span PS girder are calculated based on a simple span configuration and are stored for analysis points corresponding to continuous span. BAR7 Revision149 changes to Virtis Std Engine were extensive. It will require further investigation to find a fix for this discrepancy.

FROM: Hasmukh Lathia DATE: 4/22/2011 8:14:30 AM Eastern Daylight Time

After investigating this issue further it was found that the end shears are calculated correctly and used appropriately for the calculations of shear ratings. The problem has been in reporting this value. This value is incorrectly reported only for a continuous span PS girder. A fix has been found and it will be included in Virtis/Opis Release 6.4.

this might be the issue that I reported with VI 10287. If it is, go ahead and close this one.

FROM: Herman Lee DATE: 4/4/2011 10:34:10 AM Eastern Daylight Time  
Ben, please see whether this is a duplicate of Incident 10287.

FROM: Bin Zhang DATE: 4/4/2011 11:48:19 AM Eastern Daylight Time  
I tested the NSG rating under VO63 Alpha6, I can run the rating analysis successfully without any errors. So I think this problem has been fixed.  
I attached the related figures in the document.

FROM: Herman Lee DATE: 4/4/2011 3:17:45 PM Eastern Daylight Time  
Ben, please use 6.2 to reproduce the problem and see whether there's a workaround in 6.2.

FROM: Bin Zhang DATE: 4/4/2011 3:39:51 PM Eastern Daylight Time  
This is a duplicate of the incident 10287. And the error messages are exactly the same.  
A workaround in 6.2 is to combine the three haunch profile ranges into one, with length equals to 219.6666.

Description

FROM: Bin Zhang DATE: 4/7/2011 2:31:48 PM Eastern Daylight Time

This testing was conducted using the Truss 1 in BID19 bridge model.

1. I leave the impact factor (IF) blank and run AASHTO LFR (figure 1), I got the standard IF which is 1.21 (figure 2)

2. I changed the IF to be 0.5 in vehicle properties window (figure 3), I got the IF with a value of 1.50 While the correct IF should be  $1+0.21*0.5=1.105$  other than 1.50

AASHTO used override other than multiply to get the IF, it calculated the IF by using "1+user input".

You can refer to the figures in the document for details

FROM: Bin Zhang DATE: 4/7/2011 6:08:05 PM Eastern Daylight Time

This error only happened to the Truss and Floor Truss. Impact factor works well for girder in the BID1 bridge.

FROM: Jim Duray DATE: 4/8/2011 2:44:32 PM Eastern Daylight Time

The above applies to the reaction IF only.

Resolved for 6.3 Beta 1.

### Description

FROM: Krisha Kennelly DATE: 4/12/2011 2:00:27 PM Eastern Daylight Time  
BID5 in the sample database, also attached. The wearing surface and parapet loads entered in the Member Loads window are not being applied to the girder.

If I run BRASS LFD for HS20 rating and then delete the Uniform Member Loads, re-run BRASS LFD, I get the same rating factors.

FROM: Brian Goodrich DATE: 4/13/2011 1:26:04 PM Mountain Daylight Time  
I confirmed this error and it is in the BRASS export.

Description

FROM: Mehrdad Ordoobadi DATE: 4/15/2011 12:41:01 PM Eastern Daylight Time  
 Submitted on behalf of Mr. Robert A Benshoof from Tennessee Department of Transportation  
 >>>>>>>>>>>>>>>>>>>

I am forwarding you an issue that one of our Engineers is having with Virtis. Can you look into this?  
 Thank you,

>>> Bryan Liner 4/13/2011 2:20 PM >>>  
 I am trying to rate a continuous PCBB in Vitris. The brass engine works fine and I get good ratings. The Virtis Standard engine however will not analyze the exterior beams but will analyze the interior beam.

There are no warnings or error messages when I save the bridge.

Attached is the xml file for the bridge and the error message I get when trying to use the Virtis Standard engine, Terry said this might be one to send to Micheal Baker to find out what is going on.

FROM: Herman Lee DATE: 4/15/2011 12:47:47 PM Eastern Daylight Time  
 Attached G1 and G2 Virtis Std Engine input and output files.

FROM: Hasmukh Lathia DATE: 4/16/2011 10:59:18 AM Eastern Daylight Time  
 The error message is generated whenever Virtis Std Engine cannot find a solution for the neutral axis while calculating the moment capacity of the section based on a specified stress level of prestressing steel. The error in this particular run is generated because of MFYIR and MFYOR STRESS LEVELS are specified as 0.999 and their combination with Effective Slab Width of 6.25 ft. This error can be

Complete Issue Information

neglected as the ratings based on prestressing steel tension would not govern. See the following note printed on the output.

NOTE: SINCE MFYIR STRESS LEVEL OR MFYOR STRESS LEVEL IS ENTERED AS 0.999 RATINGS BASED ON PRESTRESSING STEEL TENSION WOULD NOT GOVERN. IF RATINGS ARE TO BE CHECKED BASED ON PRESTRESSING STEEL TENSION, APPROPRIATE MFYIR AND MFYOR STRESS LEVELS SHOULD BE ENTERED.

I made some input modifications to check this. On one run I changed the input value of Effective Stalb Width to 6.50 ft for the exterior girder. On a second run I let the MFYIR and MFYOR STRESS LEVELs to default to 0.8 and 0.9 as specified in the AASHTO Maintenance Manual. In both of the runs the error messages are not generated. The input and output files for these additional runs are attached.

ASS does not calculate the moment capacity of the prestressed beam at specified level of prestressing steel tension.

The error reported by Virtis Std Engine for this particular run can be ignored.

FROM: Has Mukh Lathia DATE: 4/19/2011 1:03:04 PM Eastern Daylight Time  
This is similar to incident 9985 reported earlier. While investigating incident 9985, there were some refinements added to the logic for the interation of finding a solution for neutral axis for the calculation of moment capacity at xFy. When a test version with these revisions was run for the exterior girder, Virtis Std Engine was able to find the solution for neutral axis and moment capacity at xFy. Also, all existing input files ran successfully. This fix will be included in Virtis Release 6.4 as it is too late to be included with Release 6.3.

Description

FROM: Wayne Skow DATE: 4/19/2011 8:29:33 AM Eastern Daylight Time  
When BID3 (TrainingBridge3), girder G1, is rated with LFR in BRASS, it gives a low shear rating value near the first support. The location is at the 10% point near the 1st support which is 168 inches in. There are transverse stiffeners on the girder the first is which is at 65 inches. The second stiffener is at 207 inches. Therefore, the rating point is in the 2nd shear panel.

BRASS is treating the point as the first shear panel and limiting the allowable shear to  $C^*V_p$  (eq 10-119) in article 10.48.8.3. A higher value is allowed in the second panel.

The bridge is attached.

FROM: Brian Goodrich DATE: 4/25/2011 10:59:29 AM Mountain Daylight Time  
I confirmed the error resides in the BRASS engine. I will forward this issue to WYDOT.

Description

FROM: Herman Lee DATE: 4/20/2011 11:36:16 AM Eastern Daylight Time  
 Submitted on behalf of Sally Doles (sdoles@lonco.com), Lonco, Inc.

Received Bridgeware e-mail:

=====

We are working on a U Beam rating and are running into a problem with the effective flange width value. We are rating this bridge as LRFR but when an effective flange width, based on AASHTO 4.6.2.6.1, of 216" is entered into the deck profile, Virtis comes up with the following error:

A fatal error encountered while processing article "5.7.3.2 - Flexural Resistance (Prestressed Concrete)"

Fatal error occurred while computing Prestress Losses  
 Error performing prestress loss LRFR specification checking!

If a value of 110.25" is used for the effective flange width based on LFD, (but still using LRFR rating) then Virtis runs without any error and provides a rating.

We are not exactly sure why this certain error occurs when the effective flange width is changed. I have attached the file for this bridge, currently the values in the file are at 110.25" for the effective flange width. Please let us know why Virtis is not accepting the LRFR value for effective flange width and/or why it is producing this error.

Description

FROM: George Huang DATE: 4/21/2011 12:14:15 PM Eastern Daylight Time

In the load factor rating analysis of permit vehicle in California, the HS20 live load has to be placed in the adjacent lane for widely spaced girder, floor beam and truss bridge. The available capacity for permit vehicle is determined by subtracting the structure capacity with dead load and HS20 demands. Ratings of five permit vehicles are required for every bridge. Currently Virtis doesn't have such live load placement function. By talking to other States, I learned that Ohio State requires legal trucks placed next to permit vehicle in urban area for permit rating, and New York State requires HS20 loads placed next to the permit vehicle. Also in LRFR ratings, a train of legal vehicles and other vehicles are required to be placed side by side over 200 ft as stated in VI 9965. I think probably many States have the need to place different vehicles side by side in rating analysis. Please add this function in AASHTO LFD engine as well as LRFD engine.

FROM: Krisha Kennelly DATE: 10/19/2011 10:50:54 AM Eastern Daylight Time

Note that Vi 9965 is for Load Factor or Allowable Stress Rating, it is not for LRFR as stated above. (MBE 6B.7.2)

FROM: Herman Lee DATE: 10/20/2011 3:52:11 PM Eastern Daylight Time

Related to Incident 9593.

### Description

FROM: George Huang DATE: 4/21/2011 12:27:30 PM Eastern Daylight Time  
In California, many old steel bridges were strengthened with adding post-tension cables to the steel girders. In order to correctly rate the bridge, the equations for combined axial load and bending in 10.54.2 of Standard Specification may have to be used. However the current AASHTO LFR engine doesn't have this function. Please add this function in Virtis.

Description

FROM: Herman Lee DATE: 4/22/2011 5:32:49 PM Eastern Daylight Time  
Submitted on behalf of Mike Pichura (MPichura@mbakercorp.com), Michael Baker Jr., Inc.

The width of the G1 PS 3-void box beam is 48" and the total width of the voids is 34". The bv listed in 5.8.3.3 and the beam capacity outputs are 36". 6.1 and 6.3 Beta 1 have the same problem. Looks like there's a defect in retrieving the correct void diameters.

FROM: Mark Mlynarski DATE: 4/26/2011 11:00:17 AM Eastern Daylight Time  
For 3 circular void P/S cross sections, it does not appear that the value for D1 is being set properly. D2

Complete Issue Information

is being set, but the value for D1 is not being set (or is set to 0.0). I verified this by stopping in the debugger in PSBeamBoxCircVoidCrossSectionProperties . The SetValue routine appears to be passing a value for D1=0.0 and D2=12 (Should be D1=12, D2=10).

This ultimately leads to an incorrect calculation of bv from the method 'ComputeMinWebThk' in PSBeamBoxCircVoidCrossSectionProperties.

(see attached).

The setting of the properties for this time of beam (particularly D1 and D2 should be investigated. Mark

FROM: Krisha Kennelly DATE: 5/30/2011 8:34:58 AM Eastern Daylight Time  
 Fixed for 6.3 beta 3. Tester verify by running AASHTO LRFD engine and checking bv in art. 5.8.3.3. test for attached 3 void beam and a 2 void beam.

will also be provided as a patch to version 6.2

FROM: Bin Zhang DATE: 6/6/2011 5:18:09 PM Eastern Daylight Time  
 Tested it in VO62 and VO 63, the bv value is 14in(48-34=14 in) , verified!

RE: Files - NSG Run Failure (3-sp. WPG)-62.xml; NSG Run Failure (3-sp. WPG)-63B1.xml; NSG Test Truck.xml.

The referenced Virtis model fails to run & error messages are produced when attempting to analyze it for a Non-standard gauge truck load. The run information and error messages are displayed below. Also, after the first attempt, if any changes are made to the NSG truck load, a subsequent attempt to run it crashes Virtis.

The same thing happens when attempting to run under v. 6.2, including the crash after modifying the NSG truck load.

Complete Issue Information

Tim Souther, PE  
%IDOT Bridge Ratings Unit

=====

NSG analysis requires user to specify the path for which the vehicle travels on the superstructure (Superstructure window Vehicle Path tab). That's why Virtis complained "No paths defined!" in the error message dialog. We will investigate the crash after modifying the NSG truck load.

FROM: Herman Lee DATE: 6/6/2011 10:51:17 AM Eastern Daylight Time  
The crash is not reproducible all the time with the same steps.

FROM: Herman Lee DATE: 6/10/2011 1:48:42 PM Eastern Daylight Time  
This issue is present in previous releases. Changed Folder to /Support Center/Virtis.

FROM: Tim Ambrecht DATE: 6/13/2011 10:45:13 AM Eastern Daylight Time  
Herman, this seems to work now, though Tim Souther notes that it took nearly 30 minutes to run. I'm OK with closing this issue.

## Complete Issue Information

### Description

FROM: Michael Cruz DATE: 5/5/2011 10:27:29 AM Eastern Daylight Time

In November, 2010 we successfully rated (without any problems) a simple span, prestressed concrete stringer/girder bridge. We recently received MassDOT comments that our "H/2" POI values provided in our report and Virtis output do not match those shown when our Virtis file is re-run. I re-ran our file and found that this was now true, and not only do our "H/2" values show a ZERO rating with the MassDOT ASD vehicles, but that our governing value ratings show ZERO as well. All other POI's ("Harp Point" and ".45L") return the values we provided back in November, 2010. MassDOT Standard LFD truck analysis returns the same ratings as before for all POI including "H/2" and the governing values, so the problem is limited to the MassDOT ASD trucks for our "H/2" POI. I have gone through the file to find that any POI up to about 30+ ft into the beam will return ratings of ZERO. I have also determined that despite having our shear reinforcement input the exact same way as we did before, any runs performed now do not include "#428 Stirrup-Group" or "#497 Stirrup-Schedule" in the ASD Output. I believe the lack of shear reinforcing in the output is the reason we get ZERO ratings up until a certain distance into the beam; however, we have this information input now just as we did before when it did run just fine. To note, another similar bridge was analyzed around December, a simple span prestressed I-beam, and when I revisited that file, the same problem was found, despite previously submitting working rating reports. Any chance you have encountered this problem before? Thank you

FROM: Brian Goodrich DATE: 5/6/2011 10:44:24 AM Mountain Daylight Time

Please attach the MassDOT ASD vehicles XML file using the export utility in the Library Explorer.

FROM: Brian Goodrich DATE: 5/9/2011 10:12:22 AM Mountain Daylight Time

E-mail from Michael Cruz:

Please note that the MassDOT ASD vehicles is just a grouping of the AASHTO Standard H20, HS20, Type 3 and Type 3S2 trucks. We have attached an xml file containing these vehicles.

Michael A. Cruz

Senior Structural Engineer

FROM: Brian Goodrich DATE: 5/9/2011 10:42:48 AM Mountain Daylight Time

For the 6.1 release, the Control Options tab was added to the Member Alternative Description window. This tab contains the point of interest control (generation) options for the various analysis methods. These POI control options had been part of the BRASS engine properties in earlier versions but were removed from the engine properties for the 6.1 release. The export now picks up the POI control option from Virtis rather than the engine properties now. However, the prestressed concrete POI control options for ASD in Virtis are not exposed to the user. The reason for this is the rating specification only specifies an LFD rating for prestressed concrete. BRASS does not perform an ASD rating either. If a BRASS ASD analysis is selected, the BRASS export will generate the data file and run it with LFD anyway.

I recommend addressing this issue by obtaining the POI control options for LFD when ASD is selected only for prestressed concrete. The workaround is to rate the prestressed concrete bridges with LFD.

FROM: Brian Goodrich DATE: 5/18/2011 8:05:12 AM Mountain Daylight Time

This issue has been assigned to BRASS Incident 87.

Description

FROM: Herman Lee DATE: 5/9/2011 9:33:57 AM Eastern Daylight Time  
 Submitted on behalf of David Wolfe (DWolfe@moffatnichol.com), Moffatt & Nichol.

Received Bridgeware e-mail:

=====

Bridgeware – The calculation of Effective Deck Width at an exterior girder for the AASHTO Std. seems to have changed from VIRTIS 6.1 to 6.2. For the first default bridge "TrainingBridge1", if the Compute from Typical Section button is hit in 6.1 the Std. width for 9.5" deck structural thickness, the effective width is 108" (4'-3" overhang + 9.5"x6). In VIRTIS 6.2 the same button calculation is 107.75".

4/19/2016 3:08:29 PM

HRS AASHTO

1912

Complete Issue Information

Why would this change? The deviation in the 6.2 value is small, but will this be true in all cases?

It is noted that LRFD the 6.1 button gives 113.5" (108" +22"flange/4) and the 6.2 button gives the full tributary width of 129".

=====

The LRFD effective flange width used to be dependent on the slab thickness but with the 2008 interims of the AASHTO LRFD spec, the effective flange width is now just 1/2 the girder spacing. We moved to the 2008 interims for the 6.2 release.

For the Std effective flange width, looks like the computation also deducted half the web thickness.

May, please confirm your fix for Incident 9575.

FROM: Xinmei Li DATE: 6/27/2011 11:21:56 AM Eastern Daylight Time  
 The Std. width is a bug due to fix for 9575. It is resolved for 6.4.  
 The Lrfd width change is due to a code change made by Krishna on 4/3/2010 for the 2008 Interims AASHTO LRFD 4.6.2.6.1.

FROM: Matt Kolis DATE: 8/29/2012 3:37:00 PM Eastern Daylight Time  
 In VO 64, Beta 4, verified Effective Flange Width = 108".

Description

FROM: Wayne Skow DATE: 5/17/2011 10:26:36 AM Eastern Daylight Time  
BRASS and AASHTO are producing different controlling rating factors for the attached bridge (structure def 1, G1) for the Lane/operating load case. It appears that BRASS is ignoring the shear RF at 102 of 1.3657 which is lower than it's reported controlling RF of 1.995 at 205.

Also, BRASS is reporting that interaction is not considered because the girder is hybrid at 102. This does not appear to be the case, however. Both flanges and the web are 36ksi at the 20% point of span 1.

### Description

FROM: Aaron Kemna DATE: 5/17/2011 3:30:29 PM Eastern Daylight Time

I think the user needs to be able to manually override the system factor value, instead of just selecting cases from a pull-down. For instance, the user may consider three girder bridges to be non-redundant and wants to use a system factor less than 1.0. In order to do that, the user must select an option from the pull-down that will give them the correct value. The rating may be correct, but this can cause confusion an unnecessary additional work by users.

FROM: Xinmei Li DATE: 3/30/2012 2:21:42 PM Eastern Daylight Time

Resolved for next 6.4 Alpha build.

FROM: Matt Kolis DATE: 5/2/2012 11:17:27 AM Eastern Daylight Time

When using the Report Tool to create the BWS Report, consider adding a line to say "TRUE or FALSE" (in addition to a value) as to whether or not the System factor override box has been checked. See attached.

FROM: Srujana Thogaru DATE: 5/21/2012 5:50:39 PM Eastern Daylight Time

Report tool updated for 6.4 Beta 1

FROM: Aaron Kemna DATE: 6/28/2012 4:47:54 PM Eastern Daylight Time

Override is working properly for analysis (Virtis 6.4 Beta 2). I have a suggestion. When override button

Complete Issue Information

is not checked, can the value be shown greyed out equivalent to the selection. This would make it clear to the engineer what value the pull-down selection will implement. Plus, I can enter an override, uncheck the box, select a different choice and the old override value remains. I think this might mislead users. If you implement my suggestion, the value shown would always be used in the analysis.

Submitted on behalf of Mike Pichura, Michael Baker Jr., Inc.

Below is the e-mail without embedded graphics. Attached PDF file is the e-mail with embedded graphics.

=====

Herman,

Attached is the bridge that has the memory issue when doing the spec checks.

Just to remind you:

4/19/2016 3:08:30 PM

HRS AASHTO

1916

Complete Issue Information

- G1-G3 run without issue.
- G4-G5 produce the following error.

The only difference between the girders is the stiffener spacing. I deleted the stiffeners and tried running the G4 as you suggested. I also tried copying G3 to G4. G4 still produced the same error message.

Would you be able to find the cause or send an incident report?

Thanks for your help.

=====

Qiang, please investigate why the copied G3 member alternative in the G4 member produces the same error message. Thanks.

FROM: Qiang Gao DATE: 5/23/2011 2:13:19 PM Eastern Daylight Time  
I cannot reproduce the problem by running the LRFR analysis on virtis 6.2, virtis 6.3 beta 2.1 and my current development version. There is no any error message for both G3 and G4 members.

Mike, what size is your physical memory?

To determine whether it is due to "insufficient memory", please do the following test on your machine:

1. close other programs;
2. start Virtis; if it is running, restart it;
3. run analysis on G4; see whether it can run further than before;
4. if it remains the same as before; copy the G3 alternative to G4, and then save the bridge model.
5. resart (close it and start it again) virtis;
6. run analysis on the copied G3;

Thanks!

FROM: Bin Zhang DATE: 5/31/2011 1:15:35 PM Eastern Daylight Time  
I tested this bridge using LRFR template in beta 3, no error message has been detected. I attached the analysis progress in the document.  
Testing environment: WinXP OS with 2G RAM.

Description

FROM: Gary Doerr DATE: 5/25/2011 9:25:03 AM Eastern Daylight Time  
 When trying to load rate this bridge the exterior beam distribution factor (LFD) comes up as 0. Other than entering the number by hand, why is this doing this? I've attached the file for your use. Gary

FROM: Herman Lee DATE: 5/25/2011 12:41:36 PM Eastern Daylight Time  
 Using 2' distance from edge of lane to wheel, the first wheel from the left edge of the lane is located to the right of G2. That's why the computed simple beam factors for G1 are zeros.

Description

FROM: Herman Lee DATE: 5/31/2011 5:28:32 PM Eastern Daylight Time  
 Submitted on behalf of George Huang, Caltrans.

Part of the received e-mail on 5/31:

=====  
 For members with eccentricity, if Sx and Sy are not given, ratings for these members are zero listed in "Rating Results Report" (see the attached Rating Results Report.XML). However if you use "view analysis report", these zero ratings are simply ignored. My suggestion is giving user an ERROR MESSAGE, if Sx and Sy are missing for member with eccentricity.  
 =====

FROM: Bin Zhang DATE: 7/7/2011 10:49:21 AM Eastern Daylight Time  
 Agreed! A error message should pop out if section modulus sx or sy is missing for for member with eccentricity.

FROM: Bin Zhang DATE: 7/21/2011 1:46:34 PM Eastern Daylight Time  
 Fixed for VO6.4, an error message will pop out saying "Section Modulus (Sxx, Syy) must be defined with non zero values for truss members with eccentricity!"

FROM: Xinmei Li DATE: 9/8/2011 3:18:24 PM Eastern Daylight Time  
 I ran the attached bridge Truss1 with 6.3.1, not able to see any messages pop out other than the tolerance error.

FROM: Xinmei Li DATE: 9/9/2011 3:36:08 PM Eastern Daylight Time  
 The tolerance errors are caused by the 0 length haunch ranges in the stringers.  
 Retested the attached bridge Truss1, section3 and section4, removed Sx and Sy, the above error message pops up while doing AASHTO LFD rating..  
 Verified fixed for 6.3 service pack 1.

FROM: George Huang DATE: 9/15/2011 2:28:38 PM Eastern Daylight Time  
 The error message provided if Sx and Sy are missing for member with eccentricity. The case is closed.

 Submitted on behalf of George Huang, Caltrans.

Part of the received e-mail on 5/31:

=====  
 The calculation for live load distribution factors of stringers may not be right. As shown in the file "290049test.docx", the LLDF for exterior stringers should be smaller than those for interior stringers. However the calculation from Virtis shows the opposite results.

Complete Issue Information

=====

FROM: Xinmei Li DATE: 6/9/2011 10:35:56 AM Eastern Daylight Time  
 For Interior stringer LLDF is calculated according to AASHTO Standard Specifications Article 3.23.2.2, table 3.23.1. Since there is one design traffic lane and  $S < 10'$ , LLDF is  $S/7.0 = 2.67/7 = 0.38$   
 Exterior stringer LLDF is calculated according to article 3.23.2.3.1.5, deck is supported by 9 stringers, more than 4,  $S/5.5 = 2.67/5 = 0.48545$ .

FROM: George Huang DATE: 6/10/2011 5:13:56 PM Eastern Daylight Time  
 I accept the explanation based on AASHTO Standard Specification, although the calculated LLDFs are unreasonable, especially for rating analysis.

Description

FROM: Amanda Jackson DATE: 6/3/2011 10:04:00 AM Eastern Daylight Time  
 Whenever I use the Advanced Distribution Factor Method on slab bridges, I get the following error message from the Virtis Std Engine:

Internal Errors (1) - Invalid index  
 08:01:16 AM - Line 2473 in source file .\DoMemberResults.cpp.

Structural Analysis Errors (2410) - Input or computational error encountered.  
 08:01:16 AM - Line 2473 in source file .\DoMemberResults.cpp.

I've been entering slabs with multiple span lengths that aren't equal as tee beams to get around this, but I should be able to enter a slab using the Advanced Distribution Factor Method.

FROM: Herman Lee DATE: 6/3/2011 2:14:07 PM Eastern Daylight Time  
 Since Multi-Lane is selected for Live Load Lanes in the Superstructure Definition window, multi-lane advanced distribution factors are used. If you change Live Load Lanes to Single Lane, Virtis Std Engine will run to completion.

 Subject: Virtis 6.3 Beta 2.1 - Truss Builtup Top/Bottom Flange Not Optional

RE: CounterInCompression(0310001)6.2.xml in O:\Ratings\Unprotected\Virtis Documentation\Virtis 6.3 Beta Review\Beta 2 Exports.

This is a problem that has existed since the Virtis Truss module has been available. Many times in practice, Builtup type cross-sections do not have top or bottom flanges. This seems to be recognized in the Virtis Truss Command Language Manual\* as illustrated here...

\*The Virtis Truss Command Language Manual from v.6.2 is used here since it apparently was not included with v.6.3 Beta 2.1.

Complete Issue Information

However, when coding such cross-sections, if a top and bottom flange plate is not specified verification errors are produced and the truss analysis cannot be performed. In the Virtis Truss Command Language Manual descriptions for Builtup Section/TopFlangePlate & BottomFlangePlate, it is stated in point 4, "This sub-command is optional only if web plate and top angles exist." The issue may be tested by modifying any Builtup Section entry in the referenced Virtis model.

The program should be modified so that angles only (w/web plate or lacing) can be entered without having to do a Top/BottomFlangePlate entry.

Note: The current workaround is to enter very small values for plate width & thickness.

The referenced export file is from v. 6.2 but the issue is present in 6.3 Beta 2.1.

Tim Souther, PE  
%IDOT Bridge Ratings Unit

=====

FROM: Xinmei Li DATE: 6/16/2011 11:24:11 AM Eastern Daylight Time  
TopFlangePlate and BottomFlangePlate commands are optional only if web plate and top/bottom angles exist. This line can be found in Virtis Truss Command Language Manual pag26 and page27 (see attached screen shots).  
In attached bridge, the builtup section doesn't have web plate defined, so the TopFlangePlate and BottomFlangePlate commands are not optional. If you add webplate command and remove Lacing web, you can remove TopFlangePlate and BottomFlangePlate commands without getting any verification errors.

### Description

FROM: Aaron Kemna DATE: 6/7/2011 9:45:46 AM Eastern Daylight Time

Scale factor is not being applied to the ratings. Factor appears to be applied correctly to the analysis charts and live load actions. Log file echoes the factor as well. AASHTO LFD. I did not check LRFR.

FROM: Jim Duray DATE: 6/7/2011 10:57:18 AM Eastern Daylight Time

I ran PCITB1 with and wo a scale factor. The ratings differed as expected. What do you mean when you say "Scale factor is not being applied to the ratings"? The factor is applied to the LL. That carries through to the ratings.

FROM: Aaron Kemna DATE: 6/7/2011 11:54:40 AM Eastern Daylight Time

After further investigation, the rating factors are Ok, but the tonnage calculated is incorrect. For some of my trucks the scale factor is ignored. For others, the calculation is incorrect. I am looking at the rating results summary. I found the same issue in the speck check, too.

FROM: Aaron Kemna DATE: 6/14/2011 10:10:24 AM Eastern Daylight Time

I found the same or similar issues with the Virtis LFD engine. I did not check AASHTO LRFR. The tonnage calculated should be the RF multiplied by the tonnage of the truck. What may be happening is that AASHTO is increasing the tonnage of the truck by the scale factor and then multiplying it by the rating factor. That's not the correct use of the scale factor and does not match Brass. The scale factor should allow you to get rating levels that are something different than Inventory or Operating. This needs to be fixed in order for MoDOT to use the AASHTO engines.

FROM: Jim Duray DATE: 6/14/2011 1:12:28 PM Eastern Daylight Time

Please refer to the Help for the Analysis Settings window. The scale factor is used to modify the weight of the axle loads and lane load. The example given in the Help is an HS-20 vehicle can be scaled by 25% to make it an HS-25 vehicle. The resulting RF multiplied by the scaled weight of the vehicle is the rating in tons.

Using Virtis LFR - I copied the HS-20 vehicle and changed the loads (axle and lane) in the vehicle definition by multiplying by 2.0 and ran it - run 1. I then ran the HS-20 vehicle scaled by a factor of 2.0 (on the Analysis Settings window) - run 2. The rating factors and rating tonnage match as they should since it the the same vehicle.

We did the same using BRASS. According to BRASS run 1 has twice the rating tonnage as run 1. The same vehicle cannot have different rating tonnage. Scaling the vehicle doesn't change the capacity of the bridge.

For what trucks is the scale factor ignored?

Complete Issue Information

FROM: Jim Duray DATE: 6/14/2011 2:30:44 PM Eastern Daylight Time

FROM: Aaron Kemna DATE: 6/14/2011 4:22:05 PM Eastern Daylight Time  
Sorry, we have been using the BRASS scale factor for years to modify the operating rating to give us a posting tonnage. Since the report says Inventory or Operating, it makes sense that the tonnage would not change due to the scale factor. Personally, I think this makes the scale factor rather useless. I would think the HS25 case would be the only reason for this, and it's easier and less confusing to create an HS25 truck. We have a couple of trucks where we set the posting value to 86% of the Operating value. The scale factor is set to  $1/0.86 = 1.1628$ . BRASS, then gives us the correct rating factor and posting tonnage. I cannot think of a workaround that we can use for the AASHTO engines.

FROM: Tim Armbrecht DATE: 6/15/2011 9:39:56 AM Eastern Daylight Time  
I've had a chance to review this incident, and if the purpose of the scaling factor is as Jim describes, then it sounds like it is working properly. The tonnage for a HS-20 truck or HS-25 truck shouldn't change, because the capacity remains the same in both cases. I can see where the scaling factor (as Jim describes) would be useful to HS-25 states because a HS-20 (or HS-25) truck is hard to model, with its variable axle spacing, lane load and otherwise tricky application to the structure.

That being said, I think MoDOT's need is very important and shared by the load rating community. I can think of at least two other states (I believe NYSDOT is one of them) that use a posting level somewhere between Inventory and Operating, and IDOT is considering going that way in certain situations. I suspect that other states are thinking similarly. Therefore, I would ask Jim to change this to an enhancement, and develop the enhancement after July 1 for consideration by the TF ASAP, perhaps the meeting after the UG meeting. IDOT will take the lead in funding it.

My guess is that BRASS was thinking differently than how Jim describes, and I would suggest asking Brian G. for clarification?

Tim

FROM: Aaron Kemna DATE: 6/17/2011 9:12:31 AM Eastern Daylight Time  
Agree with Tim.

FROM: George Colgrove DATE: 6/28/2011 7:08:29 AM Eastern Daylight Time  
As per Tim Armbrecht and Aaron Kemna, this has been recategorized as an enhancement. I have set the status as suspended.

Complete Issue Information

FROM: Krisha Kennelly DATE: 6/8/2011 1:22:41 PM Eastern Daylight Time  
Submitted on behalf of Bryan Silvis via email:

C6A.4.2.3 of the MBE states that the condition factor may be increased by 0.05 if section properties are obtained by actual field measurement of losses rather than by an estimated percentage of losses, but cannot exceed 1. The values in Table 6A.4.2.3-1 are hard-coded in Virtis based on the condition factor. Adding override ability or a check box would allow states the ability to apply the commentary. Due to the position in the load rating equation, the increase in rating would be greater than 5 percent.

FROM: Xinmei Li DATE: 3/30/2012 2:23:56 PM Eastern Daylight Time  
Resolved for next 6.4 Alpha build.

FROM: Matt Kolis DATE: 5/2/2012 11:14:32 AM Eastern Daylight Time  
When using the Report Tool to create the BWS Report, consider adding a line to say "TRUE or FALSE" as to whether or not the Field measured section properties box is checked. See attached.

Also, the drop-down box for Floorbeam and Stringer Member Definition: Factor Tabs are out of order. The order appears as: Fair, Good / Satisfactory, Poor. The order should be in descending order to match Steel, P/S, and RC alternatives: Good / Satisfactory, Fair, Poor.

FROM: Herman Lee DATE: 5/2/2012 1:16:24 PM Eastern Daylight Time  
May, please assign to Srujana for the Report Tool after you are done.

FROM: Xinmei Li DATE: 5/7/2012 10:41:37 AM Eastern Daylight Time  
The drop-down box for Floorbeam and Stringer Member Definition is resolved. Please test truss floor beam factor tab, too.

### Description

FROM: Tim Armbrecht DATE: 6/10/2011 10:38:55 AM Eastern Daylight Time

Please refer to incident 10860 for the XML file. For this structure, it appears that the counter controls in axial compression, which is a theoretical impossibility. Counters should not be in compression.

FROM: Tim Armbrecht DATE: 6/10/2011 10:56:11 AM Eastern Daylight Time

More info from Tim S.:

The operating rating for the subject truss is controlled by member L3U4, a counter, with the limit state being Axial Compression. By definition, a counter should never be in compression.

The referenced export file is from v. 6.2 but the issue is still present in 6.3 Beta 2.1.

I (Armbrecht) went ahead and attached the file he was using. Tim S. suspects that this issue was present in 6.2, so I went ahead and changed to support center.

FROM: Jim Duray DATE: 6/10/2011 11:24:37 AM Eastern Daylight Time

I don't see any counters in compression. See attached file - vi 10963 span 1 n truss .pdf.

None of the counters are in compression for DL + LL. Counters may not be in compression for DL or DL + LL. However, the LL effect may be compression as long as the sum of DL + LL does not result in tension.

FROM: Jim Duray DATE: 6/10/2011 4:09:08 PM Eastern Daylight Time

The LL causes compression in the counter but it is less than the tension in the counter due to DL. In other words the LL is reducing the tension in the counter caused by just the DL. So the rating is using the compression capacity in the rating equation. It therefore is reported as AXIAL-COMPRESSION.

$RF = (\text{Cap (compression)} - 1.0 * DL) / (\text{Imp} * DF * 2.171 * LL)$

$RF = (-39.71 - (1.0 * 30.02)) / (1.2615 * 0.7559 * 2.171 * -18.23) = 1.848$

FROM: Tim Armbrecht DATE: 6/13/2011 3:33:37 PM Eastern Daylight Time

Jim, I think we may be getting to the crux of the matter. We do not believe the counter member can have compressive capacity (-39.71) because it is a counter that is not designed to carry compression. We think that the capacity should be zero, not -39.71. The other issue is the fact that we do not believe

4/19/2016 3:08:32 PM

HRS AASHTO

1930

## Complete Issue Information

a counter should control (unless it is severely deteriorated), and it certainly should not control in compression, as the results are telling Tim S. for member U3L4 for the Operating Limit State ("Axial-compression").

I realize this isn't going to be resolved this week, so I'm OK with moving this to support and discussing further with the TF and TAG. Please include in future TF meeting agenda. Thanks.

FROM: George Colgrove DATE: 6/14/2011 7:09:53 AM Eastern Daylight Time

I tend to agree with Tim, but how do we rate this member? Looking at Jim's equation, if we have zero for capacity, the resulting rating will be even lower than 1.848. Then what do we call the controlling actions? If the member is in tension and the live load reduces that tension as Jim suggests, then the resulting reporting should still be AXIAL-TENSION – compression ratings in a counter should never be calculated as suggested by Tim. If the compressive force or "relief" zero's out the tension by either matching or exceeding the DL tension, then the rating should not be calculated for the member (i.e. a rating of 99) Otherwise, if there is a calculated net tension, then a tension rating should be calculated.

FROM: Tim Armbrecht DATE: 6/14/2011 9:11:33 AM Eastern Daylight Time

It shouldn't rate in compression - somehow this member needs to disappear in compression. I think it needs a little more thought which is why I think it needs to be researched more. Here are some more thoughts from Tim S. and I have also attached the file he references:

I've attached a copy of some of the AASHTO BARS output for the subject truss. (This output is for ASR but the principle is of course the same as for LFR.)

Of note, in AASHTO BARS compressive live load force is always taken as zero for the main diagonal since, in a countered panel, as the compressive force increases it would cause the rating factor to rise until it equals the dead load tension. At that point the diagonal, is considered ineffective (buckled) and the counter diagonal, by definition, takes the load in tension. Therefore, since only live load tension can cause a reduction in the rating factor for these diagonals, it is unnecessary and misleading to consider compressive capacity.

The fact that the Virtis Truss analysis results in different members controlling the inventory and operating ratings is further indication of a likely problem. In the AASHTO BARS analysis the member U1L1 controls the operating rating as it does for both the AASHTO BARS and Virtis Truss inventory ratings. This is the expected outcome. Though possible, it's not usual for a truss inventory and operating ratings to be controlled by different members.

Tim Souther, PE  
%IDOT Bridge Ratings Unit

FROM: Jim Duray DATE: 6/14/2011 2:33:01 PM Eastern Daylight Time

I suggest we do not rate the counter for LL compression. Based on the attached file it seems that is what BARS does. For the structural analysis the member is essentially removed from the model for the determination of axial force when the DL + LL results in compression.

FROM: Herman Lee DATE: 8/8/2011 8:51:14 AM Eastern Daylight Time

Related to Incident 11040. Use the bridge attached in 11040 for testing.

FROM: Jim Duray DATE: 8/9/2011 3:15:59 PM Eastern Daylight Time

Revised to not compute a compression capacity for counters and to not compute a rating factor for

4/19/2016 3:08:32 PM

HRS AASHTO

1931

The truss schematic only shows the left side of the truss until you go and open the truss input file. Once you hit OK or APPLY the entire schematic can be viewed. I have attached a model as an example.

Complete Issue Information

Thanks,  
Daniel

FROM: Jim Duray DATE: 6/10/2011 12:54:02 PM Eastern Daylight Time  
I changed this to a Support Center issue since I believe it has been this way for several releases. Actually, this is the intended behavior so I also changing the Category to Supoprt and the Status to Closed. The left half of the truss is defined in the command language so the schematic only draws that half until the truss is Verified. When the truss is verified (or analyzed) the symmetric half is generated. After that, the schematic draws the entire truss. If it is desired that the symmetric half be generated when drawing the schematic the category forthis incident should be change to Enhancement.

Description

FROM: Herman Lee DATE: 6/13/2011 3:38:45 PM Eastern Daylight Time  
Submitted on behalf of Tim Armbrecht, IL DOT. (Ref Incident 10820)

The impact factor calculated from the code can be scaled, but can't not be set to a specific percentage (10% of reduced speed restrictions). Many states have a "crawl" speed reduction (I = 0% - 10%) that they will want to apply. This option needs to be available for overweight permit analysis.

The impact specified in the Advanced Vehicle Properties window is a factor by which the standard impact factor is to be multiplied to obtain both live load and impact. The only way for using a specific impact (percentage) in the analysis is to select the constant impact override in the Member Alternative Impact window. This requires user to modify the bridge, which is a burden for overweight permit analysis.

FROM: Jim Duray DATE: 5/31/2012 9:15:42 AM Eastern Daylight Time  
This can be accomplished using General Preferences in 6.4. Changing status to Resolved.

### Description

FROM: Krisha Kennelly DATE: 6/15/2011 10:28:12 AM Eastern Daylight Time  
originally from beta testing of 6.3:

For the LFD analysis, "d" is said to be 15.48", while for the ASD analysis it is 21.30", which I believe to be the correct value.

email history shown below:

From: Kennelly, Krisha [mailto:KKENNELLY@mbakercorp.com]

## Complete Issue Information

email received from Brian Goodrich as to how BRASS LFD computes the d value:

RE: How does BRASS LFD compute the d value for t-beams with rebar near the top?  
Brian Goodrich [Goodrich@BridgeTech-Laramie.com]  
Wed 6/15/2011 10:28 AM

Krishna,

The BRASS export determines if a rebar row falls in the top or bottom half of the beam and then assigns a row number accordingly, bottom rebar is assigned to rows 1-3 and top rebar is assigned to rows 4-5. The shear depth is taken as the distance from the compression face to the centroid of the rebar on the tension side of the beam. The rebar near the compression block is ignored because it is on the compression side of the beam.

Brian

FROM: Tim Armbrecht DATE: 6/27/2011 12:02:29 PM Eastern Daylight Time  
Some more information concerning the "d" calculation from my consultant (Souther). This is going to be a major problem for us in shear until we get this resolved.

-----  
It turns out that the way the AASHTO engine computes "d" for concrete member shear analysis is more of a problem than I originally realized.

In evaluating the resolution of VI 10773 & 10952, the issue of the way that "d" is computed arose as a major issue in the rating of the model RC Tee-beam bridge being used for the evaluation. With the issues of analysis near the end support resolved, the controlling inventory rating factor for this HS20 bridge becomes 0.525 at .8 of Span 1, with the limit-state being shear occurring with a concurrent positive moment. Because this is a high negative moment region, the negative moment reinforcement has more than twice the area of positive moment reinforcement. And, because of the way "d" is calculated by the Virtis AASHTO engine, its location is only about 40% of that calculated for negative moment. This has a major effect on both  $V_c$  and  $V_s$ , greatly reducing both of them.

It must be emphasized that the current method of computing "d" is completely wrong, resulting in totally unreliable shear ratings. Until this is resolved, we will have to completely disregard shear in evaluating reinforced concrete and possibly even prestressed concrete.

Tim Souther, PE  
%IDOT Bridge Ratings Unit

timothy.souther@illinois.gov

FROM: Jim Duray DATE: 6/27/2011 12:35:28 PM Eastern Daylight Time  
I checked the code and found that in 6.2 we used the CG of the area of the reinforcement in tension. Several months ago we changed it to use the CG of the bar forces (tension only). The last iteration in the RC T-Beam Dist .000 R Bm Cap Ver.txt file shows the detailed calculations for the determination of the NA for flexure and the corresponding bar strain, stress and forces. The CG of the bar forces is 15.48 (which agrees with D in article 8.16.6.2.1 for location 0.0 as the depth) for MA 3 - Center-x. I believe the calculations are correct based on article 8.16.6.2.1 of the 17th edition of the standard spec.

Complete Issue Information

FROM: Todd Thompson DATE: 6/16/2011 10:42:19 AM Eastern Daylight Time

Beta 3 - Update 2

Checked results and final RF's agree pretty good

The symmetrical problem appears to be fixed, which helps produce the compareable results.

-- I still think the Stringer Composite Loads should be listed as a NonComposite Load - similar to the way the BRASS does it in 6.2. I think it will cause too much confusion having it listed as a composite load. Am glad the spec checker is considering it NonComposite. Just need to list it as a Non-Composite load under the DL Actions summary report.

And yes - Brass doesn't have symmetrical results with their impact values.

I am RESUBMITTING only to get the Stringer Composite Loads to be listed as Noncomposite Loads - similar to how Virtis 6.2 handles it with BRASS LF engine.

FROM: Herman Lee DATE: 6/16/2011 12:16:29 PM Eastern Daylight Time

For the exterior floorbeam FB 0 member alternative (FBA floorbeam definition), the Load Sequence selected in the BRASS LFD engine properties in FBA is "Computed based on loadings and composite regions.". Based on this selection, the BRASS LFD engine applies Stage 1 Stringer DL Reactions to floorbeam Stage 1 and Stage 2 Stringer DL Reactions to floorbeam Stage 2 when FB 0 is analyzed.

For the first interior floorbeam FB 1 member alternative (FBB FBC floorbeam definition), the Load Sequence selected in the BRASS LFD engine properties in FBB FBC is "1 stage - Non-composite steel girder bridge with one construction stage.". Based on this selection, the BRASS LFD engine applies both Stage 1 and Stage 2 Stringer DL Reactions to floorbeam Stage 1 when FB 1 is analyzed.

Stage 2 represents the application of sustained loads. The sections properties used in the Stage 2 FE model can be composite, non-composite or composite for some ranges and non-composite for other ranges. Since the Stage 2 Stringer DL Reactions is coming from the parapet loads on top of the composite stringer, I think it's appropriate for the AASHTO LFD engine to apply to floorbeam Stage 2. This application also matches the default Load Sequence "Computed based on loadings and composite regions." in the BRASS LFD engine properties.

Todd, please let us know your comments. Thanks.

FROM: Todd Thompson DATE: 6/16/2011 1:31:55 PM Eastern Daylight Time

(A) - The Interior FB is also Noncomposite and it should not have been marked depended upon loadings and composite regions (even though there are no composite regions and should behave non-composite).

(B) - I believe the spec checker is using the stringer loads (from composite action) correctly as non-composite for the floorbeams. This is most important item, I believe.

(C) - If my Floorbeam is Non-Composite, I don't think there should be any Composite Loads listed.

(C2) - If a floorbeam is composite, then I think everything is working like it should.

I guess if the consensus is that even if Floorbeam is NonComposite, that stringer composite loads should be listed under composite loads - then I guess I'll go along with that. But I personally think since the floorbeam is non-composite (in this case) - then only Non-Composite DL's should be listed.

=====

Complete Issue Information

The way that AASHTO LFR/ASR engine applies loads to stages is the same as the AASHTO LRFD/LRFR engine in previous release.

FROM: Todd Thompson DATE: 6/20/2011 10:36:18 AM Eastern Daylight Time  
I'm not sure how it can be the same as AASHTO LRFD/LRFR engine - since we can't do Stringer, Floorbeams with LRFD or LRFR. Or am I missing something?

FROM: Herman Lee DATE: 6/20/2011 7:06:56 PM Eastern Daylight Time  
Sorry, I should be more specific. The handling of stage 2 loads for non-composite girder is the same as what implemented in the AASHTO LRFD/LRFR engine in previous release.

FROM: Herman Lee DATE: 6/22/2011 12:10:54 AM Eastern Daylight Time  
Dean Teal's e-mail on 6/21:

=====  
=  
Todd,

This was discussed in great detail.

The TF consensus is to leave things as is for 6.3 due to the depth of testing that would be required. This will be addressed in 6.4 .

Dean  
=====

FROM: Herman Lee DATE: 7/2/2012 10:16:38 AM Eastern Daylight Time  
For noncomposite member, Stage 2 loads will be applied to the Stage 1 FE model. Implemented for 6.4 Beta 3.

FROM: Herman Lee DATE: 7/24/2012 10:36:41 AM Eastern Daylight Time  
For non-composite floorbeam that has previously accepted stage 2 stringer reactions, we need to cleanup those stage 2 reactions so they will not be double counted.

In order to deliver Beta 3 today and prepare for the user group meeting, we commented out the implementation in Beta 3.

FROM: Herman Lee DATE: 8/19/2012 12:36:24 AM Eastern Daylight Time  
Implemented code to cleanup previously accepted reactions. Resolved for 6.4 Acceptance Build.

FROM: Bin Zhang DATE: 8/21/2012 2:12:33 PM Eastern Daylight Time  
I verified the Implemented code to cleanup previously accepted reactions.

### Description

FROM: Amanda Jackson DATE: 6/17/2011 5:57:34 PM Eastern Daylight Time

I've been working on a 3 span continuous reinforced concrete slab structure, and am getting a pretty decent difference in rating factors between the Virtis Std Engine and Brass. Using 2 other continuous beam programs, I am getting about the same Live Load moments for the HS 20-44 truck as I am getting with the Brass engine. The Virtis engine moments are quite a bit higher. Dead loads are pretty close for all of the programs and engines. The bridge is attached.

FROM: Bin Zhang DATE: 6/21/2011 9:21:13 AM Eastern Daylight Time

The different RF is due to the capacity. Virtis computed lower capacity than the BRASS and AASHTO, so it generated lower RF. BRASS and AASHTO computed comparable RF, so it's very likely that

4/19/2016 3:08:34 PM

Complete Issue Information

VIRTIS computed incorrect capacity.

Table 1 RF comparison between VIRTIS, BRASS and AASHTO

|                            | VO62 Virtis | VO62 BRASS | VO63 (beta4) AASHTO |
|----------------------------|-------------|------------|---------------------|
| LL Moment (Kip-ft) -Axle   | -21.6       | -21.51     | -21.26              |
| DL Moment (Kip-ft)         | -16.74      | -16.43     | -16.36              |
| Factored Capacity (Kip-ft) | -63.8       | -70.22     | -70.18              |
| Inv RF - Axle              | 0.897       | 1.046      | 1.06                |
| Opr RF - Axle              | 1.497       | 1.747      | 1.77                |

FROM: Amanda Jackson DATE: 7/1/2011 11:44:15 AM Eastern Daylight Time  
 Look at the 1 ft slab strip with cap (E) (C) Member alternative. I've attached a plotted comparison of the moments from Virtis, Brass, and the AASHTO engine in 6.3. The Virtis negative moments are quite a bit higher over the piers - not sure why.

I agree that the problem is probably more of a capacity calculation issue than a moment issue.

When I rate this member alternative with the AASHTO engine, I still get a difference in rating factors, but it's not quite as high:

|     | 6.2 Virtis | 6.2 Brass | 6.3 AASHTO |
|-----|------------|-----------|------------|
| RFi | 0.876      | 1.290     | 1.113      |
| RFo | 1.461      | 2.154     | 1.858      |

This might be because the locations of the controlling rating are slightly different (7.2 ft for Brass and 5.5 ft for AASHTO). The location of the Virtis controlling rating is way off from the other two (22.75 ft).

FROM: Herman Lee DATE: 9/7/2011 1:17:34 PM Eastern Daylight Time  
 Virtis/Opis Task Force and User Group decided not to deliver or maintain Virtis Std Engine in future releases.  
 Status changed from Assigned to Suspended.

### Description

FROM: Aaron Kemna DATE: 6/20/2011 4:35:44 PM Eastern Daylight Time

I have a structure where the rating results summary detailed table is giving the same ratings for "with impact" as that shown for "without impact". The values appear to be the "with impact" ratings. This bridge has 4 girderline structures. "Structure Definition 4" is the only structure experiencing this problem. Note that G1 has the impact override set to 0.0. The other girders will have the problem.

FROM: Brian Goodrich DATE: 6/21/2011 1:58:50 PM Mountain Daylight Time

Shear is controlling the rating for the structure. BRASS stores the live load actions with and without impact. The function that ratios the two actions is saying the live load shear associated with the rating is zero. Therefore, the impact is determined to be 1.0, which results in the same ratings with and without impact. I logged this issue as BRASS Incident 113.

FROM: Aaron Kemna DATE: 7/2/2012 2:54:04 PM Eastern Daylight Time

Verified Brass is doing this correctly now. 6.1.3

FROM: Herman Lee DATE: 4/12/2013 11:54:06 AM Eastern Daylight Time

Updated Status to Resolved per BridgeTech request.

HRS AASHTO

1946

Complete Issue Information

Could you please take a look at the recently forwarded .xml file (see previous email, filename W107.87\_S\_App-Spans2-5.xml) and let me know if you can see anything in the input file (or more likely control options?) that would be affecting the rating results in this way? When Appendix A6 is not used, the results are reasonably close. However, when Appendix A6 is selected, the controlling rating results are significantly different, and in the case of Virtis, shear controls and not flexure. Note that I am not making any changes to the rating file between runs, yet obtain these different results.

=====

In the VO62 Virtis LRFR spec check, Article 6.10.8.1.1 failed , while "6.10\_General\_Flexural\_Results" used A6 1.4 as governing article .  
It's a VO62 Virtis LRFR bug.

FROM: Wayne Skow DATE: 6/23/2011 2:27:01 PM Eastern Daylight Time  
This is caused by the controller not returning the proper signal when 6.10\_General\_Flexural\_Results's "IsMissing" function is examining whether A6.1.1 has run or not. The controller either needs to implement a reliable set of rules for testing the status of articles, or the set of articles for this situation needs to be reordered.

FROM: Krisha Kennelly DATE: 6/27/2011 2:33:39 PM Eastern Daylight Time  
as noted in my email, 6.10 General Flexural results should check if the result of the App A6 articles is null. If it is, data is missing.

even with this change the controlling moment capacity does not seem to be picked up by the flexure rating article.

FROM: Wayne Skow DATE: 6/28/2011 7:08:23 AM Eastern Daylight Time  
Fixed a problem in GenFlexResults to properly detect when the A6 articles have completed.

Fixed a problem with bad moment units in A6.1.1 (all versions except 4E2008) where the values were calc'd as K-in but saved as K-ft without being converted.

Fixed a problem in MBE 6A.4.3.1 steel flexure moments (1E and 2E) where RF was being miscalculated under certain conditions.

### Description

FROM: George Huang DATE: 6/29/2011 1:30:01 PM Eastern Daylight Time

This is a truss bridge with travel width of 19'-8". Currently it is a two-lane bridge. In the truss analysis, both one-lane and two-lane live load conditions are analyzed. However in the "rating results summary" only the results of one-lane condition are listed, which are not in control. The files for bridge model, 29\_0049TEST.xml, and results, 29\_0049TEST.docx, are attached.

FROM: Herman Lee DATE: 6/29/2011 2:10:48 PM Eastern Daylight Time

The "As Requested" loading type is one-lane condition (based on the travelway width) and with impact. That's why the "As Requested" Rating Results Summary lists the results for one-lane condition with impact. If you select "Detailed" in the Rating Results Summary, it will display all the one/multi lane and with/without impact combinations. Please let me know if this doesn't answer your question.

### Description

FROM: Geoffrey Trees DATE: 7/7/2011 1:17:11 PM Eastern Daylight Time

When I run the truss floorbeam in this example modeled as beam elements, it crashes. Herman thinks the problem may have to do with the function not handling the cantilever properly while being modeled as beam elements. See the attached bridge...

To Reproduce:

-Set the truss floorbeam to beam elements:

SuperStructDef -> GF -> Member Def -> Floorbeam Def -> FBTruss -> Truss Member Properties

-Run Floorbeam1 -> Alt -> Fb1

FROM: Herman Lee DATE: 8/30/2011 10:35:28 AM Eastern Daylight Time

"Model truss member as beam element" checkbox should be hidden when the superstructure definition doesn't have stringers.

Resolved for 6.4 Release.

FROM: Xinmei Li DATE: 8/29/2012 9:29:36 PM Eastern Daylight Time

Verified the fix in 6.4 Beta4.

Description

FROM: George Colgrove DATE: 7/8/2011 9:46:09 AM Eastern Daylight Time

The enclosed bridge [corrdeck] has a corrugated deck. As such the distribution factors are based on lever rule.

The resulting LLDF in the dialog table are accurate. The result in the "view calculations" report are accurate. However the values used to calculate the LLDF are wrong.

### Description

FROM: Tim Armbrecht DATE: 7/14/2011 12:04:20 PM Eastern Daylight Time  
From my consultant (Souther):

RE: file name - FlaredBeams(0500246).xml

LFD analysis of the flared beam (5A - 1st W Int-x) in the subject bridge model using the AASHTO Engine (6.3 Beta 5) generates significantly lower controlling rating factors at the second support than using the Virtis Standard Engine. The moments from Stage 2 DL and LL are close to each other. However the unfactored Stage 1 DL moments are significantly different with -2469.2 ft-kip for the AASHTO Engine and -1599.68 ft-kip for the Virtis Standard Engine. This extreme difference in Stage 1 DL accounts for the extreme difference in rating factors.

FROM: Herman Lee DATE: 8/30/2011 10:13:50 AM Eastern Daylight Time  
Fixed a defect in determining the deck load for flared beam.

Description

FROM: Aaron Kemna DATE: 7/14/2011 4:18:43 PM Eastern Daylight Time  
 This is really an add on to Incident 10713. I found a case where the My is being calculated using the web capacity when it should be the flange capacity for a hybrid girder. This is a section in negative flexure with composite reinforcement. I don't think there is a case where the lower web strength should be used over the higher flange strength for hybrid girders. I'm attaching the bridge and an image of the spec check article. You only need to rate Structure Definition 3 - G2. Analysis point is at Bent 2.

AASHTO uses 87640 when it should be 119308 (tension flange).

FROM: Wayne Skow DATE: 7/28/2011 7:17:18 AM Eastern Daylight Time

4/19/2016 3:08:35 PM

HRS AASHTO

1955

Complete Issue Information

I agree. The effects due to lower web Fy are taken into account in other ways. For LFD, section 10.53 specifies what to do for a hybrid situation including the use of a hybrid reduction factor. I need to review LRFD to see if the same problem exists. LRFD also uses a hybrid reduction factor so My should not be controlled by web edge stress.

FROM: Wayne Skow DATE: 9/22/2011 1:26:12 PM Eastern Daylight Time  
Fixed in 6.4. Web stress will no longer determine moment at first yield.

Tester: use a built-up girder with a web yield stress much lower than either flange. For LRFD, LFRF and LFR, the moment capacity at first yield (ALFD\_17E\_My\_all\_sections for LFR, App D6.2 for for LRFD and LRFR).

FROM: Tim Armbrecht DATE: 7/19/2011 9:21:35 AM Eastern Daylight Time  
From my consultant (Souther):

RE: file NoCustLFs(0982015)-63.xml (attached)

In the referenced Virtis 6.3 model, custom Load Factors (IL Culvert) are specified under Factors/LFD but are not utilized in the analyses of the Member Alternatives. In similar model in Virtis 6.2, using BRASS, the IL Culvert load factors are used in the analyses. The IL Culvert specifies that the DL factor (A1) is 1.5, which is shown for the BRASS output but, as shown below, 1.3 was used in Virtis 6.3 AASHTO Engine.

Virtis 6.3 Spec Check...

| Rating Level | Vehicle | LL (kip-ft) | Load Factors |      | Phi (kip-ft) | Mn (Ton) | RF | Capacity |
|--------------|---------|-------------|--------------|------|--------------|----------|----|----------|
|              |         |             | A1           | A2   |              |          |    |          |
| Inv          | 1       | 1.20        | 1.30         | 2.17 | 0.90         | -42.72   | NA | NA       |

Virtis 6.2 BRASS output...

Truck 1 Load Level 2 Rating Factor(Pos mom) = 23.10 = ( 38.35 - 1.00 \* 1.50 \* -6.41) / (1.00 \* 1.30 \* 1.60)

FROM: Krisha Kennelly DATE: 7/19/2011 4:00:32 PM Eastern Daylight Time

See the attached '11032 explanation.png'. The System Default Spec and Factors are set for the member alt. If you want the member alt to use the factors from the IL Culvert factors, change the the Selection type to 'override', pick the spec and pick the IL Culvert factor. See attached '11032 rating factors.png' for the A1 = 1.50 being used by the AASHTO LFD engine after this change.

 Subject: Unsymmetrical Virtis Loads Due to Suspended Span\_Shade-Lohmann Bridge

Complete Issue Information

Hello Tim,

We are completing the rating for the Shade-Lohmann bridge (090-0108 and 109) and have discovered a possible Virtis issue. The suspended span has been set up according to the "Virtis Truss Method of Solution" pdf. We eliminated the superficial elements U15U16 and L14L15 and then placed an x-axis fixity at L15 (for your convenience the pdf page is attached). The issue is that the live load maximum member forces in the truss do not have symmetry near the point of fixity and the piers. See the attached examples. We are raising this issue because we feel that it could be in the Virtis program or if it is not a problem something should be done to address this method of solution.

Thanks,

Moussa A. Issa, Ph.D., P.E., S.E.  
Chief Structural Engineer  
HBMENGINEERING GROUP, LLC

### Description

FROM: Amanda Jackson DATE: 7/21/2011 11:57:49 AM Eastern Daylight Time

Requesting an enhancement to the corrugated deck module to calculate deck bending moments over the net span (edge of flange to edge of flange). The AASHTO engine currently calculates the moments from center of girder to center of girder, which results in much higher moments. I have rated a bridge with a net span of 57 inches, and am getting an inventory rating factor of 0.699. The allowable net span recommended by the manufacturer is 57 inches (for the HS 20-44 vehicle). The rating is extremely conservative, and allows the deck to control the rating when it shouldn't. This makes it difficult to use the corrugated deck module on any bridge. The enhancement would fix this problem.

FROM: Herman Lee DATE: 7/7/2013 12:56:01 PM Eastern Daylight Time

Net span model (edge of flange to edge of flange) for corrugated deck is supported in the 6.5 release.

 When LFR is performed on a prestress girder, there are 5 critical values checked by the articles:

- concrete compressive stress
- concrete tensile stress
- flexure

4/19/2016 3:08:37 PM

HRS AASHTO

1963

Complete Issue Information

shear  
prestressing steel tension

Currently, only the first four of those are considered by SCSuperStructure.cpp in PopulateAllStdCriticalResults() when determining the critical RF location. Prestressing steel tension (from articles ALFR\_1E\_6B\_06\_03\_03\_PS\_Stl\_Tensile\_Stress and ALFR\_2E\_6B\_05\_03\_03\_PS\_Steel\_Tensile\_Stress) needs to be added.

FROM: Wayne Skow DATE: 7/28/2011 7:16:13 AM Eastern Daylight Time  
coding changes were made in VO 6.4. More testing is needed.

FROM: Wayne Skow DATE: 9/8/2011 8:12:16 AM Eastern Daylight Time  
coding changes were added to VO63sp1 and tested.

FROM: Xinmei Li DATE: 9/9/2011 10:46:24 AM Eastern Daylight Time  
Attached bridge is a modification of PCITrainingBridge1. It causes PS steel tension to control. It is used to verify the code change above.

Verified fixed for 6.3 service pack 1. Now PS tensile stress controls LFD rating factors.

## Complete Issue Information

| Name | Current State | Summary |
|------|---------------|---------|
|------|---------------|---------|

### Description

FROM: Paul Campisi DATE: 7/26/2011 1:50:05 PM Eastern Daylight Time

I am having problems saving LRFR results in Virtis. When in the Bridge Explorer, if I toggle on the "Save Analysis Results" under the "Analysis Settings" workspace, the program analyzes the first beam in the first bridge and then locks up. It appears Virtis can't save the LRFR results and then locks up after the first analysis is performed. See the attached screenshot of the "Save Analysis Results" toggle button.

I can analyze a bridge (or set of bridges) without the "Save Analysis Results" button toggled on. But when the results are displayed and I hit the "Save All" button, the computer locks up. See attached screenshot of the "Save All" button.

It appears Virtis is unable to save the LRFR results. I have no problems saving LFD results for the same bridges.

I need to be able to save both LFD and LRFR results to the department's ORACLE database. Is there a required setting I am missing to save LRFR results?

Thanks

Paul Campisi  
New York State DOT  
Office of Structures

FROM: Todd Thompson DATE: 7/28/2011 4:16:44 PM Eastern Daylight Time

I checked both LF and LRFR and appears to work fine with 6.3

FROM: Mehrdad Ordoobadi DATE: 8/17/2011 8:46:44 AM Eastern Daylight Time

Please provide the export of the bridges that cause this issue.

Also, what do you mean by locking up? Is Virtis unresponsive for a long time and does not come back at all? Is it giving you any errors?

FROM: Mehrdad Ordoobadi DATE: 8/17/2011 2:13:41 PM Eastern Daylight Time

BRASS produces so much data for LRFD and LRFR analyses. Saving BRASS analysis results takes a lot of time and database space. I Imported your bridge into a SQL Server database that is on my machine and performed an LRFR analysis for the bridge from the Bridge Explorer. The analysis took a few minutes and Bridge Rating Results window appeared. I clicked Save All. It took 3 and half minutes for the save to complete for the one bridge. I monitored the size of the database and noticed that it grew from 33 MBs to 186 MB.

Then I did another LRFR analysis with the "Save Analysis Results" check box checked. It took a while and the database size grew from 186 MB to 339 MB.

Considering the volume of the information that is being saved to the database and the fact the all these information are going through the network this behavior is normal. That's the reason, we often discourage the Virtis/Opis users to save BRASS LRFD and LRFR results to the database.

Description

FROM: Amanda Jackson DATE: 7/26/2011 4:20:17 PM Eastern Daylight Time  
Member U5L4 in the 180 ft Through Truss is controlling the rating in axial compression. U5L4 is a counter. I don't have this issue with the HS 20-44 truck or the AASHTO legal trucks, but the truck I am rating (attached) is causing the problem. This is a V/O 6.2 file. I checked it with the latest beta version of 6.3 with the same results (we don't have the production version of 6.3 up and running yet).

FROM: Herman Lee DATE: 7/27/2011 7:50:16 AM Eastern Daylight Time  
Related to Incident 10963.

FROM: Amanda Jackson DATE: 8/4/2011 9:50:51 AM Eastern Daylight Time  
In the first xml file I attached, I had a few members defined as counters that shouldn't have been. I fixed the file, and have attached the correct one. Now I am getting axial compression in a counter controlling for the Type 3 truck for inventory and operating, and axial compression in a counter controlling the operating rating for all of the trucks (Type 3, 3S2, 3-3, and HS 20-44).

FROM: Jim Duray DATE: 8/17/2011 8:38:52 AM Eastern Daylight Time  
I believe we have fixed this issue and I would like to use your bridge to test.

Using L32.xml and a test build of Virtis member U8L8 controls (see attached file L32 Rating Results Report.pdf) for a Type 3 vehicle for both inventory and operating ratings. We will likely be issuing a service pack that includes resolution of this incident in September-October. Would you be able to do some testing to verify this incident is resolved?

FROM: Bin Zhang DATE: 8/19/2011 9:44:48 AM Eastern Daylight Time  
verified in vo63 with today's dll updates, now the program does not compute a compression capacity for counters and does not compute a rating factor for counters subjected to LL compression < DL tension.

### Description

FROM: George Huang DATE: 7/28/2011 3:09:35 PM Eastern Daylight Time

We are rating a 2-span pc/ps i-girder bridges and found following possible errors:

- 1) There are negative DL moment for non-compite stage, which should be zero;
- 2) The ratings at the edge of the girder (2.7% of span 2) are much smaller than those at the center of Bent 2 (100% of Span 1). This seems not reasonable. The negative moment demand usually reaches the peak value at the center of the bent. The negative moment capacity is contributed by the continuous mild steel in the deck, which should be the same at 2.7% or 0.0% points. Therefore the rating at center of pier 2 should be smaller.

Both bridge model (56-0643GH.xml) and results (56-0643Results.docx) files are attached.

FROM: George Huang DATE: 7/28/2011 4:30:29 PM Eastern Daylight Time

Another problem is that the "detailed" "Rating Results Summary" is not shown, see attached file, 56-0643detail.docx.

FROM: Herman Lee DATE: 7/31/2011 12:19:33 PM Eastern Daylight Time

The 2-span PS structure has frame connection specified in the interior support. The interior support constraints are incorrect in the stage 1 FE model.

In 6.3, only the "Detailed by Scaling" or "Detailed by Vehicles" selection will generate the detailed with/without impact and single/multi lane rating results.

FROM: Herman Lee DATE: 8/16/2011 1:54:52 PM Eastern Daylight Time

George would like to include the fix for this in the 6.3 Service Pack.

FROM: Herman Lee DATE: 8/24/2011 2:29:59 PM Eastern Daylight Time

Fixed for 6.3 Service Pack.

Description

FROM: George Huang DATE: 8/2/2011 12:41:35 AM Eastern Daylight Time  
 The virtis LFD analysis engines (BRASS, Virtis and AASHTO) utilize the shear reinforcement spacing specified at the point of interest when establishing the shear capacity. This approach could result in lower capacity. We are requesting an enhancement to provide an "Advanced" option by which user could specify how the shear capacity contribution from shear reinforcement is calculated. When this

4/19/2016 3:08:38 PM

HRS AASHTO

1972

Complete Issue Information

advanced option is selected, software will first "count" the number legs crosses the 45degree diagonal shear failure line (instead of establishing the number by using d/s) and obtain the capacity. The Advance option should give the users to choose the vertical centroid location of the 45degree shear failure plane in section (ex. mid depth or top of the section). The shear plane should be drawn from the point of interest toward the closest support. The shear failure planes are shown in the attached file.

### Description

FROM: Aaron Kemna DATE: 8/3/2011 2:09:43 PM Eastern Daylight Time

This was suggested by one of our raters.

I would like to see an enhancement of the Rating Results from the Bridge Explorer. Currently when you run ratings for a bridges in the Bridge Explorer it generates the "Rating Results" Dialog Box with the controlling ratings for the bridge. It is desirable that the controlling structure and member be added to "Bridge Rating Results" and the "Structure Rating Results". Also I'd like to see the material type, girder type, control point and impact factor for each rating on those two dialog boxes and the "Member Rating Results" dialog box. This way the user does not need to open the file just to see what's controlling the rating.

Maybe some user control would be nice to determine what columns show up in these tables. Such as, removing LRFR columns for LFR ratings.

Description

FROM: George Huang DATE: 8/9/2011 11:29:42 AM Eastern Daylight Time  
 This is a two span PS I-girder bridge. In the details from output screen, there are 3 sets identical results listed. If the intension is to list the results from three different stages, then different stage should be listed and the results from different should not be idetical. The bridge file, 56-643.xml, and the screen shots, 56-643output.docx, are atached.

FROM: Srujana Thogaru DATE: 8/11/2011 10:26:59 AM Eastern Daylight Time  
 Error cannot be reproduced in 6.4 debug. Need to test with 6.3 SP for confirmation.

FROM: Srujana Thogaru DATE: 8/24/2011 10:57:48 AM Eastern Daylight Time  
 Error cannot be reproduced in 6.3 service pack.

FROM: Xinmei Li DATE: 9/8/2011 11:30:07 PM Eastern Daylight Time  
 Verified error not reproducible in 6.3sp1.

FROM: Herman Lee DATE: 9/15/2011 1:10:54 PM Eastern Daylight Time  
 Each run should create the SpecCheckDetails.LST file instead of trying to append to the existing file.

E-mail from George Huang:

=====

Herman,

One more thing, there are only one sets of files in C:\..., but Virtis Windows shows so many sets.

Fw: VI 11503

Herman:

I may found the cause of the problem: after every analysis (run), there will be a set of files, "Dist xx.xxx L(R) Bm Cap Sum", in "Details". If you run same girder three times with same or different settings, you will have three sets files with same titles.

I think we may either just same the last set results (this may be enough), or save every sets (it may not be necessary) with different labels.

Let me how do you want me comment on this VI. Thanks.

Herman,

Both Srujana Thogaru and Xinmei Li could not reproduce the problem in 6.3sp1. However I still have the same problem. If you are able to connect to my computer, I can show you the details. Any suggestion? Thanks.

### Description

FROM: Daniel Jones DATE: 8/10/2011 2:44:50 PM Eastern Daylight Time  
This was sent to me from Robert Fulton of David Evans and Associates.

Attached are 2 models (One in version 6.2 for Brass Engine results and one in version 6.3 for the AASHTO Engine results) and a summary spreadsheet. In short the LFD ratings for the AASHTO engine for composite steel are too low.

Please advise.

Thanks,  
Daniel Jones

FROM: Qiang Gao DATE: 8/15/2011 9:27:45 AM Eastern Daylight Time  
I can reproduce the problem by comparing the results between 6.3 AASHTO engine and 6.2 Brass engine. In the results from 6.3 AASHTO, it is controlled by "Design Flexure-Steel" at location 27.42, while it is controlled by "SERVICEABILITY-STEEL" at location 12.2 in 6.2 Brass engine results. Firstly, I found 6.3 AASHTO model has different railing and curb models (Std Conc Curb 24" wide walkway + Approach) with 6.2 Brass model (Rail/Curb Combined). I changed 6.3 AASHTO model to use "Rail/Curb Combined", while the results still remain the same. I compared all the dead loads and live loads which are all comparable.

Wayne,  
Herman told me you are more knowledgeable on this. Could you have a look? Thanks!

FROM: Wayne Skow DATE: 8/31/2011 2:11:42 PM Eastern Daylight Time  
The problem is the cover plate. In v63, if a rolled section has a cover plate on either flange, it is not allowed to be compact. Therefore, the allowable bending moment is decreased. If the cover plate is removed, the section is treated as compact. We are contemplating a change in v64 that will allow

4/19/2016 3:08:40 PM

HRS AASHTO

1982

Complete Issue Information

compactness if there's a cover plate on the tension flange only.

FROM: Daniel Jones DATE: 9/15/2011 4:54:47 PM Eastern Daylight Time  
Robert Fulton believes this is not a matter of the member being a compact section. Instead the AASHTO Engine calculates incorrect rating factors for the Load Factor method. Based on output reports, it appears that the AASHTO engine is using  $\phi = 1.3$  from the strength capacity equations in the service check equations and not using the  $.95F_y$  allowable. AASHTO is using  $RF = (F_y - 1.3(DL) - 1.3(SDL)) / (1.3 * 5/3 * (LL + I))$  when it should be  $RF = (.95F_y - (DL) - (SDL)) / (5/3 * (LL + I))$ .

Please advise.  
Thanks,  
Daniel

FROM: Wayne Skow DATE: 9/16/2011 6:54:49 AM Eastern Daylight Time  
A decision was made to include the change I mention above in v6.3 service pack 1. With that change (compact members are allowed cover plates on the tension flange), Aashto's RF's match BRASS as indicated in Robert's spreadsheet. The controlling RF's are now service loads at 22%. In v6.3, the controlling loads were strength @ 50%.

Based on Robert's statement "Based on output reports, ...", I also checked the output of both v6.3 and v6.3sp1. There are two separate routines and reports that handle strength and service ratings. Each appear to be using the proper factors which are indicated on the output. Please have Robert review that as I cannot reproduce it. If he still finds the wrong factors reported on the output, please have him send a screen shot.

I attached screen shots from v6.3 and v6.3sp1.

### Description

FROM: Krisha Kennelly DATE: 8/18/2011 1:25:49 PM Eastern Daylight Time  
Run attached girderline with AASHTO LFD engine. 10.48.4.1 Cb crashes because the brace pt moment table is null. But since at 0' the section is an unbraced cantilever, this article shouldn't try to retrieve the moments from brace pt moment table (it won't exist because the section is unbraced). Cb = 1 for unbraced cantilevers so don't try to access the brace pt moment table if stillXSecProp.UnbracedCantilever is true.

This bridge should be put in the regression testing suite.

Description

FROM: Creightyn McMunn DATE: 8/19/2011 12:29:30 PM Eastern Daylight Time  
When analyzing "Span 2, Typical Interior Beam" on the attached file, we are getting significantly lower results with the AASHTO engine as compared to the Virtis engine.

FROM: Wayne Skow DATE: 9/13/2011 8:59:18 AM Eastern Daylight Time  
The problem is the bottom cover plate. In 6.3, any steel girder with a cover plate is not allowed to be compact which lowers the girder's allowable capacity. This is appropriate for flanges with cover plates in compression, but compact sections with cover plates on the tension flange only should remain compact. This problem has been fixed in 6.3 service pack 1 (see attached comparison document).

Subject: RE: Fatigue Rating

Andrea,

The screen shot indicates that "Fatigue check not required as per Art. 7.2.3" for the \*\* note in the table. Please let me know if you disagree with this check.

Herman Lee

Subject: Fatigue Rating

Hi,

I am trying to determine the Fatigue Rating for a Category E' detail. I have a simple span so the bottom flange is always in tension. I specified a fatigue detail in the user defined Point of Interest and when running the AASHTO LRFD Fatigue Truck I do not get any rating. I have attached a screen shot of the output at my POI. I am using the AASHTO LRFR 2011 factors, with the MBE 2nd LRFD 5th 2010i as the specifications.

Is there something I have to check in order for it to calculate the fatigue ratings?

Thanks.  
Andrea

The bridge model is attached in the documents.

Complete Issue Information

FROM: Wayne Skow DATE: 8/31/2011 1:26:26 PM Eastern Daylight Time  
This problem was actually fixed for issue 10463. However, it was only fixed in the MBE first edition version of 7.2. The fix wasn't copied to the MBE second edition version. That is now complete.

If you run the first edition, you will get a result.

FROM: Bin Zhang DATE: 8/31/2011 2:30:53 PM Eastern Daylight Time  
The workaround works!

FROM: Herman Lee DATE: 8/31/2011 2:48:36 PM Eastern Daylight Time  
Resolved by Wayne for the 6.4 Release.

FROM: Srujana Thogaru DATE: 8/29/2012 9:38:03 AM Eastern Daylight Time  
Fix verified with 6.4 Beta 4

We can apply the system factor to each member Alt (I different system factor can be applied to each)  
We need to be able to apply a system factor to ranges on the member - like we can for deterioration over a range. It's basically the same thing.

We uncovered this need during the NHI LRFR course.

### Complete Issue Information

The MBE allows the use of stripped lanes for permitting, this will allow more capacity. We need to add this feature (option) and take advantage of the MBE provisions.

### Description

FROM: Tim Armbrecht DATE: 8/29/2011 10:45:57 AM Eastern Daylight Time  
From my staff (Litchfield). When he runs the attached truck for the attached structure model, the rating factors do not seem to correspond with the reported capacity and the actual truck weight. For instance, the truck weight is approx 117 tons, but in the attached report, the Operating rating factor is shown as 7.0 and the available capacity is shown as 112 tons, so the rating factor should be less than 1. Applies to Inventory as well.

4/19/2016 3:08:42 PM

HRS AASHTO

1994

Complete Issue Information

FROM: Wayne Skow DATE: 8/31/2011 1:24:58 PM Eastern Daylight Time

There appears to be a problem with the custom vehicle routines. The truck referenced above has 19 axles with weights totaling 349.51 kips. The minimum distance between the first and last axle is around 276 ft (on a 526 ft, 4 span girder). The vehicle weight being reported is 31.8 kips (58.48/3.678 or  $97.67/6.143 = 15.9$  ton) which just happens to be the combined weight of the first 2 axles.

FROM: Jim Duray DATE: 8/31/2011 4:51:16 PM Eastern Daylight Time

Only the minimum axle spacing is input. Both the minimum and maximum spacing for each axle must be input. With the current vehicle definition the software assumes a variable axle spacing for all but the first axle. The influence line loader was written to handle only one variable axle spacing for a vehicle so only the first two axles are used, the others are ignored. We are adding an error message to the AASHTO engine to inform the user of this condition.

FROM: Tim Armbrecht DATE: 9/1/2011 10:09:14 AM Eastern Daylight Time

Why not set it up so that if the max field is empty, it matches what's in the min field? Why should both be filled when there is no variable spacing? Especially for permits, when there is usually no variable spacing.

FROM: Jim Duray DATE: 9/1/2011 1:51:07 PM Eastern Daylight Time

We are going to make that change too. Until this change is released in 6.4 the user will have to define the vehicle with both a min and max.

FROM: Tim Armbrecht DATE: 9/1/2011 2:01:39 PM Eastern Daylight Time

Jim, great, thanks.

FROM: Herman Lee DATE: 9/1/2011 4:01:55 PM Eastern Daylight Time

Modified the live loader to:

- Set max spacing = min spacing when max spacing is not entered
- Set min spacing = max spacing when min spacing is not entered

Fixed for 6.4 Release.

FROM: Herman Lee DATE: 10/16/2011 7:09:04 PM Eastern Daylight Time

Also fixed for 6.3 Service Pack.

FROM: Todd Thompson DATE: 10/20/2011 9:41:40 AM Eastern Daylight Time

Tested this with 6.3 SP 1 - Beta 2 ---- appears to be corrected now. (Todd - SDDOT)

FROM: Bin Zhang DATE: 10/24/2011 2:30:34 PM Eastern Daylight Time

Verified this fix with 6.3 SP 1 - Beta 2.

FROM: Tim Armbrecht DATE: 11/4/2011 2:46:02 PM Eastern Daylight Time

Agree that this appears to have been fixed - tested in SP1 beta 3.

FROM: Srujana Thogaru DATE: 8/29/2012 2:17:14 PM Eastern Daylight Time

Verified with 6.4 Beta 4

Description

FROM: Richard Withers DATE: 8/31/2011 3:20:26 PM Eastern Daylight Time  
I am using the VIRTIS standard engine. When load rating a bridge, in the analysis settings window I selected the Advanced button on the right side of the window. The Vehicle Properties window pops up. When I leave the Impact field blank, the load rating runs and I get a load rating factors I will call "A". When I change the Impact to 0.0, I get load rating factors "B". If I then go back and change the impact to 0.5, I get load rating factors "A" again. It doesn't matter what I put in the Impact field, as long as it is not zero, I get load rating factors "A". In other words, it seems the VIRTIS engine only uses 1 impact modification factor, which is zero.

I have run this on multiple types of bridges with standard and non-standard gage trucks. BRASS appears to handle the impact modification factor correctly.

Thank you,  
Richard Withers

FROM: Herman Lee DATE: 8/31/2011 4:03:49 PM Eastern Daylight Time  
Yes, it's a limitation in the Virtis Std Engine. Virtis Std Engine (Virtis LFD/ASD) doesn't support impact override other than 0.0.

The analysis progress log will have the following message to warn the user.

=====  
Warning - Non-zero impact factor override is not supported!  
=====

Please note that the AASHTO Engine in 6.3 does support non-zero impact override.

Description

FROM: Tim Armbrecht DATE: 9/1/2011 10:14:38 AM Eastern Daylight Time  
 From my consultant (Souther):

There is a bug in Virtis Truss where, under Deterioration, HorizontalLeg section loss that is entered is not included in the analysis of the truss member. In the attached Virtis model under Truss "Span 3 N Truss", consider the identical Builtup type truss Members L0L1 and L1L2. Both L0L1 and L1L2 have identical VerticalLeg section loss entered but L0L1 has HorizontalLeg section loss entered as well. But, upon examining the MemSectionProperties.XML file, one finds that the Gross and Net Areas reported for them, which are supposed to reflect both the VerticalLeg and HorizontalLeg Deterioration entered, are the same. Since there is HorizontalLeg section loss entered for L1L2 in addition to the VerticalLeg section loss that is entered for both L0L1 and L1L2 the Gross and Net Areas for L0L1 should be less than for L1L2. This bug is also reflected in the ratings, which are the same for both members but should be less for L0L1.

Description

FROM: Tim Armbrecht DATE: 9/1/2011 2:05:13 PM Eastern Daylight Time  
From my consultant (Souther):

There is a bug in Virtis LFD in which analysis of a 45.5' long beam in a simple-span multi-beam WF Virtis model, made up of a 2.25' length of W27x102 spliced to the remaining 43.25' of B28x97, results in apparently erroneous results as compared to another beam identical except for being B28x97 for full length. In the attached model, the former is Member "3 - 2nd N Int-x" and the latter is Member "4 - 2nd

4/19/2016 3:08:43 PM

HRS AASHTO

2000

Complete Issue Information

S Int-y". The Virtis v. 6.3 AASHTO Engine LFD analysis results are as follows:

Member Name: 3 - 2nd N Int-x

Member Alternative Name: B28x97/W27x102-Comp

| Live Load |           | Rating |        | Controls        | Capacity |           | Location<br>Percent |
|-----------|-----------|--------|--------|-----------------|----------|-----------|---------------------|
|           |           | Factor |        |                 | (Ton)    | Span (ft) |                     |
| HS 20-44  | Inventory | 1.223  | Design | Flexure - Steel | 44.04    | 1 13.65   | 30.0                |
|           | Operating | 2.043  | Design | Flexure - Steel | 73.55    | 1 13.65   | 30.0                |

Member Name: 3 - 2nd S Int-y

Member Alternative Name: B28x97/W27x102-Comp

| Live Load |           | Rating |  | Controls        | Capacity |           | Location<br>Percent |
|-----------|-----------|--------|--|-----------------|----------|-----------|---------------------|
|           |           | Factor |  |                 | (Ton)    | Span (ft) |                     |
| HS 20-44  | Inventory | 1.380  |  | Service - Steel | 49.67    | 1 22.75   | 50.0                |
|           | Operating | 2.304  |  | Service - Steel | 82.94    | 1 22.75   | 50.0                |

Since the spliced 2.25' end should have only a possibly very minor effect in the loads and structural characteristics in the overall beam, there should be very little difference in the ratings between the two members. Both beams should be controlled by Service or Flexure at the mid-point of the span. This is the case for AASHTO ASD and for both BRASS LFD and ASD. Since this is not the case for the AASHTO LFD analysis, there is apparently a bug in the AASHTO LFD analysis engine.

In addition, the Virtis 6.3 AASHTO LFD results showing Service to be the limit-state at the span mid-point for Member 4 - 2nd S Int-y is also questionable. Note that for the Virtis 6.2 BRASS LFD analysis the limit-state is not Serviceability but Flexural - Steel Strength and is 25% lower than the Service rating factors calculated by the AASHTO LFD engine. This also suggests a possible bug. One should also take note that rating factors for BRASS and AASHTO ASD analyses are comparable.

The Virtis v. 6.2 BRASS Engine LFD analysis results for the mixed-beam member are as follows:

Member Name: 3 - 2nd N Int-x

Member Alternative Name: B28x97/W27x102-Comp

Load Factor Rating Summary

| Live Load |           | Rating |          | Controls       | Capacity |           | Location<br>Percent |
|-----------|-----------|--------|----------|----------------|----------|-----------|---------------------|
|           |           | Factor |          |                | (Ton)    | Span (ft) |                     |
| HS 20-44  | Inventory | 1.039  | Flexural | Steel Strength | 37.39    | 1 22.75   | 50.0                |
|           | Operating | 1.735  | Flexural | Steel Strength | 62.45    | 1 22.75   | 50.0                |

Also, while the apparent bugs reported here are for simple-span composite WF beams, they may also affect other bridge member types, such as plate girders, continuous and non-composite.

FROM: Wayne Skow DATE: 9/9/2011 10:39:36 AM Eastern Daylight Time

Aashto LFR appears to be working correctly.

Member "B28x97-Comp (Spliced End)" is laterally supported by diaphragms at two locations, 15.17 ft and 30.33 ft. The 30% location falls within the 1st segment (0.0 to 15.17 ft). Since this segment is made of two steel sections of different depths, the segment is no longer prismatic disqualifying it as a compact section (10.50.1.1.2 fails). This reduces the allowable causing the 30% POI to control with a

## Complete Issue Information

lower RF. Compare the 30% location with the 70% location.

If you add another diaphragm at 3 ft making the section at the 30% POI prismatic once again, you get the result you're expecting.

Do you concur?

FROM: Tim Armbrrecht DATE: 9/23/2011 4:30:50 PM Eastern Daylight Time  
My consultant's (Souther) response:

Technically, he is correct. The introduction of the slightly different 2.25' end section does make the beam within the first bracing range non-prismatic. However, I'm not sure why we are concerned with diaphragm location in a simple span since the top flange is in compression full length and is continuously supported laterally by the deck. From a practical standpoint, it is obvious that the difference between the spliced end section (W27x102) and the remainder of the beam (B28x97) is minor and would have virtually no effect on the remainder of the beam and that the beam should be considered prismatic for its full length. Virtis should be modified to consider this beam as constant depth. In the meantime, the suggested workaround will produce the proper results.

There is another issue that's somewhat unique to this beam, which answers the issue of Service controlling instead of Strength. Since the 30ksi Fy for the B28x97 section is less than 36ksi, plastic analysis does not apply (AASHTO ). When the "Allow Plastic Analysis" box is unchecked for either the B28x97 full length beams or the beams with the W27x102 spliced end, the control point is at mid-span with limit-state Strength. When the steel being used is less than 36ksi the default for this box should be unchecked in accordance with the AASHTO Standard Specifications. Perhaps we could get a procedure from Baker to apply this to our Virtis databases and a future enhancement to cause the appropriate setting based on the steel being used. I understand that some other states might want to allow plastic analysis regardless of steel type but the program should default to the Standard Specifications. This could also be an entry in our proposed global settings customization tables. When steel other than those listed in the first paragraph of 10.50.1.1, i.e., "(AASHTO M 270 Grades 36, 50, and 50W (ASTM A 709 Grades 36, 50, and 50W), and AASHTO M 270 Grade HPS70W (ASTM 709 Grade HPS70W)" plastic analysis should not be permitted. Since this is not complied with by the AASHTO Engine, it should be considered a bug in the program. That would be true even if the "Allow Plastic Analysis" box is checked. The operative word for that checkbox is "allow". It should be understood that plastic analysis is allowed when the Std. Specs. allow it. It's apparently being used to apply plastic analysis despite them.

FROM: Wayne Skow DATE: 9/28/2011 9:05:20 AM Eastern Daylight Time

The determination as to whether the section is prismatic or not and whether plastic analysis applies to a specific steel grade is based on multiple factors. Depth and Fy are only one factor in each of those cases. The exact determination in every practical situation involves more complexity than Virtis has been given. The user manages that through features and modeling. For example, 10.50.1.1's steel grade list is not exhaustive and I don't think 36 ksi is a specific limit.

At this point, I think Virtis is behaving according what is specified for 10.48.1.2 in the AASHTO LFR Engine Method of Solution (see attached)."

### Description

FROM: William Metcalf DATE: 9/1/2011 4:26:34 PM Eastern Daylight Time

Here are the printout from the spec checker for a prestressed girder. The modular ratio in both stages is the same and it is 1 unless i'm missing some thing. Also if I change the number in the "Structure Typical Section" screen from 2 to 3 or 3 to 2 w/e these numbers (and the rating) do not change at all. Also for prestress girders the sustained modular ratio field in the structure typical section defaults to 3.00 where it should default to 2.00. I have included pdfs of the spec checker out put for this. The problem is not specific to a particular bridge i have observed it for several.

FROM: William Metcalf DATE: 9/1/2011 5:10:04 PM Eastern Daylight Time

err I just realized that the 2n may not have been used in LFR, i'm not sure.

Description

FROM: Herman Lee DATE: 9/2/2011 3:59:39 PM Eastern Daylight Time  
Submitted on behalf of Sally Doles (sdoles@lonco.com), Lonco, Inc.

Received Bridgeware e-mail:

=====

I am doing a rating for a bridge using the a Floor System Superstructure with the Girder-Floorbeam-Stringer model. The structure has a corrugated deck with gravel fill. I have entered the corrugated deck in the model but when I check the Validation list, there are warnings under each member that a "concrete deck profile or reinforcing for deck" has not been entered. The program also computes the Live load distribution factors for a concrete deck, but I had entered the moment live load distribution factors that I wanted to use.

My main problem is that when I run the rating, I get an error that says "Unable to Perform Analysis" and under debug it says "Line 616 in sourcefile AbxAshtoEngineUiCtl.cpp" but no other explanation. I have gone thru my model several times and cannot figure out why it will not run. I have attached the file in xml format. Help as to why virtis is unable to perform analysis is greatly appreciated as I am completely at a loss right now.

Thank you,

Sally D. Doles, P.E.

=====

Developer Note:

For floor system structure def, CUIBWSTreeMemberAltLabelItem::InitGirderMemberAlt should check the structure def deck panel type before setting the member alt deck type.

Alpha Testing: Confirm the apply deck load in the girder rating, validation messages and girder LL distribution factors.

FROM: Herman Lee DATE: 9/6/2011 7:32:39 AM Eastern Daylight Time  
Please remove the Shear Connectors tab in the Cross Section Ranges window if the deck type is corrugated deck.

FROM: Joseph Ihnat DATE: 9/6/2011 11:25:04 AM Eastern Daylight Time  
Fixed for 6.4

FROM: Joseph Ihnat DATE: 9/6/2011 3:20:39 PM Eastern Daylight Time  
Fixed for 6.3.1. Member alternatives entered in 6.3.0 will need to be reentered in 6.3.1 6.4

FROM: Xinmei Li DATE: 9/9/2011 10:34:39 AM Eastern Daylight Time  
Verified fixed for 6.3 service pack 1.  
Shear Connectors tab is removed. Reentered a new member alt, analyzed with no error.

FROM: Xinmei Li DATE: 10/21/2011 9:49:04 AM Eastern Daylight Time  
Similar problem may happens in floorbeams and stringers, see the following email from Sally Doles. Bridge provided by Sally is attached to this incident (11091\_00116 - Beta2.xml).

To: Bridgeware,  
Subject: RE: Virtis/Opis 6.3 Service Pack 1 Beta 2

\*Incident 11091 - Unable to analyze girder member in corrugated deck floor system\*

I re-entered the bridge from this incident (i.e. - girder-floorbeam-stringer superstructure with a corrugated metal deck) since the service pack does not fix the case for bridges which were entered previously.

Virtis ran a rating for the girder but it came up as failing and the Critical Moments were significantly higher than those found if the structure was entered as a Line System. But again, for both the floorbeam and stringers, I got the same error of "unable to Perform Analysis" and "Line 616 in sourcefile AbxAashtoEngineUiCtl.cpp"

Another item for this particular bridge is that when I used the Stringer Unit Layout Wizard, under the live load distribution factors, I could not use the "Compute from typical section" button. Virtis would come up with "Error computing distribution factors. But when I went into each individual stringer case after the wizard was run, I was able to use the "Compute from typical section" button without a problem.

I have attached the file I used to test this Incident.

If there are any questions, please let me know.

Thank you,

Sally D. Doles, P.E.

## Complete Issue Information

Please see below we (AECOM) are getting 0 ton ratings using Vitis 6.3 on the floor beam ratings where it transitions from the main section of the floor beam to the cantilevered section. In Vitis 6.2 using the brass engine our model was analyzing this correctly, and then modified the model per HBM's recommendation ran it in Vitis 6.3 (AASHTO Engine) which generated 0 ton ratings at this location.

We believe this is a bug with the AASHTO engine.

If you have any questions or need additional information please let me know.

Moussa,

I made the changes using your proposed corrections in v/6.3 but I'm now getting 0T ratings on these floorbeams. Did you get meaningful results when you tried this on your model?

I attached 0900108 in v/6.3 with the floorbeam profile changes on Spans 1-4 EB. I will change the FB assignments in the rest of the superstructure defs when we resolve this, that won't take long.

Brian

Subject: Shade Lohmann FB Spec Check Issue

Hello Brian,

As you may know, we recently received a fix for the unsymmetrical loading in our main truss span through the use of Vitis 6.3 and additional fixed DLL's (to be used in Vitis 6.4). We needed to reanalysis the model because of the updated engine (AASHTO Engine instead of BRASS) and we uncovered some errors in the approach span floorbeams. The specification checks that the new engine uses does not allow for the assumptions that were made in regards to the connection of the cantilever portion of the floorbeam to the girder. Specifically, the cross section check does not allow for the top flange to have the dimensions 0.01"x0.01" (width x thickness) and it does not allow for a discontinuity in the web section (going from 60" to 48" and 48" to 60" adjacent to each other). To resolve these issues, we propose 2 fixes:

1. Make the top flange dimensions 1"x0.01" (width x thickness) and use a dummy steel of  $f_y=0.01$ ksi (resolves dimensional issue).
2. Make a transition from 60" to 48" of length 0.02" and then from 60" to 48" with the same length (resolves the discontinuity issue).

FYI: Our current tolerances are set to 0.01 ft and 0.001 in

Complete Issue Information

Please verify that these changes are satisfactory and complete them so that we can finalize the Virtis model. Attached please find the most current Virtis .xml's for the EB and the WB bridges. If you need any additional information please don't hesitate to call. We can also provide the Virtis 6.3 DLL's for you if you find that you need them. Have a nice day.

Thanks,

Moussa A. Issa, Ph.D., P.E., S.E.

FROM: Bin Zhang DATE: 9/13/2011 2:35:04 PM Eastern Daylight Time  
 If the top flange of the floorbeam has a very small dimension (1"x0.01"), it will not pass the compression flange proportionality check ( $0.1 \leq l_{yc}/l_y \leq 0.9$ ). This led to a zero negative moment capacity and then a zero rating factor.  
 The AASHTO engine does not have the function/feature to analyze the I beam without a top flange, and I could not find a workaround to trick the AASHTO engine.

### Description

FROM: Srujana Thogaru DATE: 9/8/2011 11:49:05 AM Eastern Daylight Time  
(From Bridgeware email from Scott E. Cavanaugh, HNTB Corporation NJ on Sep 06 2011)

Recent ratings performed by URS for a NJ Turnpike structure revealed a potential issue with shear ratings for members with low condition factors (fair or poor, 0.95 and 0.85 respectively). I performed additional runs using previously created xml files, and have confirmed the problem.

It appears as though Virtis v6.3 does not recognize the condition factor for shear ratings. However, moment ratings do appear to consider this condition factor when computing the member capacity. I have not checked whether this problem also is present in version 6.2.

I proved this by randomly selecting 3 previously created xml files, and first running them with a condition factor of 1.00 (run 1: good or satisfactory). I then ran the same member after adjusting the condition factor to 0.85 (run 2: poor). When the rating results were compared, the moment ratings decreased from run 1 to run 2, which is expected. However, the shear rating results did not change.

The bridges investigated were all steel structures.

FROM: Srujana Thogaru DATE: 9/8/2011 1:40:46 PM Eastern Daylight Time  
Fixed for 6.4 Release.

FROM: Srujana Thogaru DATE: 9/8/2011 2:34:53 PM Eastern Daylight Time  
Fixed for 6.3 Service Pack

FROM: Xinmei Li DATE: 9/9/2011 10:45:38 AM Eastern Daylight Time  
Tested with 6.3.1, used BID1, did LRFR rating. Then in member alt winow, factor tab, changed conditon factor from good to poor, then did LRFR rating again. Compared stage 3 shear resistance article detail at location 32.2', both runs are having identical shear rating results.  
I also compared LFD rating results, at the location 32.2', steel shear stress article reports the same shear rating results.

FROM: Xinmei Li DATE: 9/9/2011 11:35:20 AM Eastern Daylight Time  
Verified fixed for 6.3 service pack 1.  
Used BID1 for testing, compared LRFR rating results in article 6A.4.2.1 shear rating, shear rating results are reduced when factor is changed from good to poor.

FROM: Matt Kolis DATE: 5/3/2012 4:13:02 PM Eastern Daylight Time  
Tested the attached xml file in VO64. LRFR results were verified, however, LFD results were still the same when looking at stage 3, steel shear stress article reports @ location 32.2'.

FROM: Srujana Thogaru DATE: 5/21/2012 12:53:54 PM Eastern Daylight Time  
Condition factor and system factor apply only to LRFR analysis.

### Description

FROM: William Metcalf DATE: 9/8/2011 12:19:59 PM Eastern Daylight Time  
this is submitted by one of our consultants:

Dana,

We believe there is possibly a glitch in VIRTIS 6.3, we've also contacted VIRTIS (Michael Baker) but they would like correspondence to go through DOTD.

It appears the Legal Lane Load Model Type II will not run properly for span lengths less than 200'.

Additional Detail I-12 @ Range Ave. and Example Bridge:  
Running a 3-span continuous unit for Range Avenue (55',87',57'), both HL-93, LADV 11, predefined

4/19/2016 3:08:44 PM

HRS AASHTO

2011

Complete Issue Information

Lane Type Legal and user-defined Lane Type Legal (MBE Figure D6A-5) doesn't run properly under the legal load case. Our user defined Lane-Type Legal in MBE Figure D6A-5 should be able to run for any continuous span arrangements since it is required for any negative moment case.

Running a fictitious 3-span continuous unit with 225' spans, HL-93, LADV 11, predefined Lane Type Legal, and our user-defined Lane Type Legal (MBE Figure D6A-5) all run properly under the legal load case.

This leads me to conclude that Virtis 6.3 is coded to only recognize truck+lane vehicle loads under legal load case for spans greater than 200'. This would be appropriate if the Lane Type Load in MBE Figure D6A-5 was not required for all cases where negative moment is presence regardless of span length.

Thanks, I'll give you a call next week to discuss.

 Submitted on behalf of Mike Patton (Mike.Patton@tshengineering.com), Tsiouvaras Simmons  
 Holderness.

Received Bridgeware e-mail:

=====

I have run into another problem, this time concerning a fatal error that was encountered during analysis: "Error performing prestress loss LRFR specification checking". I've checked my inputs and can not figure out what would be causing this error.

A screenshot of the error message as well as the xml file have been attached.

I have not run into this problem before, but have not done a U-girder yet either. Could you please let me know if this is a program flaw?

Thank you

Mike Patton  
 Design Engineer

Unable to run AASHTO LFD rating for the attached bridge in 6.3.1 Beta  
To reproduce, use LFD analysis setting "HS20 rating" template, rate "Interior Girder A2", error message screen shot is attached.

FROM: Xinmei Li DATE: 9/12/2011 11:37:19 AM Eastern Daylight Time  
This problem exists in 6.3 release version, too.

Complete Issue Information

FROM: Wayne Skow DATE: 9/13/2011 9:08:32 AM Eastern Daylight Time  
The model is set up for LRFR rating (The active "member alternative" is LRFR) but the "HS 20 Rating" template (generally used for LFR/ASR) is selected. When LRFR is setting up for analysis, it creates a list of load factors for the various limit states for the inventory and operating categories. Internally, however, it appears the inv/opr categories for LFR are not the same as the inv/opr categories for LRFR. Therefore, no load factors are assigned since there is no mapping for it. That leaves the LRFR vehicle map empty causing the analysis to terminate with the generic error message "Error performing LRFR specification checking!" A more specific error message would help the user understand the problem.

FROM: Herman Lee DATE: 9/13/2011 10:47:12 AM Eastern Daylight Time  
Added vehicle checking at the beginning of the analysis.  
Resolved for 6.4 Release.

FROM: Matt Kolis DATE: 5/3/2012 4:55:37 PM Eastern Daylight Time  
Verified in VO64 Alpha Build 3.

Description

FROM: Daniel Jones DATE: 9/15/2011 5:29:21 PM Eastern Daylight Time  
This was reported to me by Robert Fulton of David Evans and Associates.

Apparently for Built-Up Plate Griders the AASHTO Engine does not run through the 10.48.1.1 compact section criteria or does not apply 10.48.2 when the girder does not meet the compact section criteria in 10.48.1.1.

Attached is a spreadsheet for the main girder of Bin 8714 (Span 5 and Girder). I did get good agreement between the System definition and the Girder line definition. The Dead loads and Live loads were copied directly out of Virtis, and the section properties were copied from the output reports.

Thanks,  
Daniel Jones

FROM: Bin Zhang DATE: 9/16/2011 8:51:15 AM Eastern Daylight Time

It was decided that AASHTO would do the following:

- All built-up girders (with or without cover plates) will only consider 10.48.4

Please refer to 10828 for details.

### Description

FROM: Daniel Jones DATE: 9/16/2011 9:32:02 AM Eastern Daylight Time  
Submitted to me by Robert Fulton of David Evans and Associates.

Section properties of floor truss sections are being calculated incorrectly when deterioration profiles are used.

It tries to use the built-up I girder definition.

Thanks,  
Daniel Jones

FROM: Bin Zhang DATE: 9/16/2011 9:40:15 AM Eastern Daylight Time  
The problem could be reproduced using the member alt "Span 5"->"Floorbeam25"->"FT25 (As-Designed)". (Truss member U0L1)  
There are 2 issues should be fixed.

1. The bottom 3 lines should be removed in the "Member Section Property Report" for the deterioration model;

2. Section properties of floor truss sections are being calculated incorrectly when deterioration profiles are used, for example Y, Z, Iyy, Izz. The hand calculation spreadsheet was attached in the document.

FROM: Xinmei Li DATE: 1/12/2012 11:38:41 AM Eastern Standard Time  
I reran the attached bridge with 6.3 release confirmed it's a bug.

Complete Issue Information

The attached hand calculation spreadsheet is not calculating lyy self correctly. I corrected it and attached the corrected spreadsheet.

In order to investigate the deterioration calculation I imported this bridge to 6.4 dev. However I can't analyze "FT25 (As-Designed)" and got errors as shown in the attached screen shot.

FROM: Xinmei Li DATE: 1/13/2012 9:39:27 AM Eastern Standard Time  
The back to back angle section flag and IsXVertical flag was not correctly set before applying deterioration for back to back angle builtup sections.

FROM: Xinmei Li DATE: 1/18/2012 3:51:42 PM Eastern Standard Time  
Both #1 and 2 are resolved for the next release.  
Added code in ResetDeterioration function.

FROM: Matt Kolis DATE: 5/4/2012 9:17:24 AM Eastern Daylight Time  
Unable to verify in VO64 Alpha Build 4. Still obtain error when analyzing FT25 (U0L1) using LFR.  
Need more information on how to generate "Member Section Property Report".

FROM: Xinmei Li DATE: 6/5/2012 1:13:28 PM Eastern Daylight Time  
Matt, I can't reproduce any error when analyzing "FT25 (As-Designed)", please try again with the newest version. After you're done with the rating, you can access "Member Section Property Report" by clicking the eyeglasses button on tool bar or go to your local directory to open the xml file directly.

Description

FROM: Daniel Jones DATE: 9/16/2011 11:45:15 AM Eastern Daylight Time

This is a request for an enhancement to be able to have stringers staggered with the floorbeams. The Word file (Stagger stringers) shows how the outside stringers usually are the same where as the middle stringer begins and ends at different floorbeams.

I have included some drawings showing how the typical floor truss system is built in Alabama.

Thanks,  
Daniel Jones

AASHTO Standard Engine (version 6.3.0 or higher) needs capability to turn-off inventory level stress (i.e. prestressing steel tension, concrete tension or compression stresses) checks for Precast Prestressed Girder bridges.

This enhancement should help engineers compare/validate past rating results obtained using the Brass-engine.

Moved from VI110888

FROM: Tim Ambrecht DATE: 9/7/2011 9:45:33 AM Eastern Daylight Time  
Can you tell me if this is related? From my consultant (Shoup). You should have our XML file for 090-0030 and possibly 002-0005. They are very large files, so I'm trying not to resend them if possible.

I am getting an "Top angle horizontal leg thickness is less than or equal to zero!" Error in Virtis for >=75% top flange horizontal reduction. This would be on the floorbeam compression flange of SN: 090-0030. I could not figure out why this error was occurring. I looked at the lyc/ly Limit and that does not appear to be the reason (I am not getting this limit until about the 90% loss range).

I also checked this on SN 002-0005 and got a similar error.

Complete Issue Information

Could you please submit this and see what the issue is. I tried to trouble shoot it but didn't get much information when it does not run. Let me know if you need anything else on this one.

Thanks.

Scott

FROM: Xinmei Li DATE: 9/20/2011 3:43:27 PM Eastern Daylight Time

Scott,

I used the bridge (090-0030 Cedar Street - 2011-04-18.xml) attached to VI 10828 to test. I looked all TFS superstructure defs, can't find any deterioration defined, so I added the following lines to the bottom of "Truss 1 - North" in "Span 10; Single Span TFS".

MemberOfInterest

U17U18

Deterioration

Angles

TopRight HorizontalLeg 78.0 78.0 L17 0.0 21.0

The above lines are adding deteriorations to the top right angle horizontal leg. Losses are >75%, but I don't get any error message while rating the truss.

Please provide more information to help me to reproduce the error you got.

Thanks.

May

FROM: Tim Ambrecht DATE: 9/23/2011 9:41:16 AM Eastern Daylight Time

Scott's reply:

My issue is with the floorbeams and not the truss. Not sure if they would be related but would assume that they would not be. I am getting an error of "Top angle horizontal leg thickness is less than or equal to zero!" when the top horizontal flange of the floorbeam has about 75% section loss or more. I am not sure why I am getting this error or if the error is not labeled correctly. I would only think that I should get this error when I would specify 100% section loss on the horizontal flange of the angle.

FROM: Xinmei Li DATE: 1/19/2012 9:21:11 AM Eastern Standard Time

I tested again with 6.3 release using the bridge (090-0030 Cedar Street - 2011-04-18.xml) attached to VI 10828. I used Span8->FB0, I revised Top flange loss to Horizontal 75%. I was able to rate FB0 successfully without any error message.

## Description

FROM: Creightyn McMunn DATE: 9/21/2011 4:43:25 PM Eastern Daylight Time

When running either beam in the attached file, I am getting significantly higher results with the AASHTO engine as opposed to the Virtis engine. The results with the AASHTO engine also vary greatly when "Generate at section change points" is checked/not checked, even though the governing location is entered as a POI.

FROM: Wayne Skow DATE: 9/22/2011 1:42:24 PM Eastern Daylight Time

The problem was in "6B.4.1 General - Steel Combined Moment and Shear". There was a 0/0 division situation that was not handled properly causing NaN's (not-a-number) in the results and output. This was affecting the function that determines the critical RF. After fixing (v6.4), Aashto, Virtis and BRASS results are all very close and Aashto results are unaffected by the "Generate at section change points" switch.

FROM: Creightyn McMunn DATE: 10/20/2011 2:08:13 PM Eastern Daylight Time

This is not acceptable to wait until v6.4 to fix. This is a critical bug which produces unconservative results. The AASHTO engine is giving rating factors which are almost 40% higher than they should be.

Error exists in 6.3 Release.

FROM: Wayne Skow DATE: 9/23/2011 10:07:30 AM Eastern Daylight Time  
It's asserting in SCSuperSteelGirderElement at line 9737. There's something going on with this model relative to the 4th support.

FROM: Creightyn McMunn DATE: 10/20/2011 2:26:03 PM Eastern Daylight Time  
Running this file in v6.3 Service Pack 1, Beta 2 with the AASHTO engine causes Virtis to crash. I get the error "Virtis Application has encountered a problem and needs to close. We are sorry for the inconvenience."

FROM: Krisha Kennelly DATE: 11/17/2011 9:21:13 AM Eastern Standard Time  
A workaround is to enter the following data items to the exact length of the beam (302.0625') instead of the 302.06' that they are using now:

1. The second row of reinforcement in the Deck Profile: Reinforcement tab. It is entered with a length of 302.06' right now.
2. The Haunch profile should be entered with a length of 302.0625'. It is entered with a length of 302.06' right now.

#### Developer notes:

The FE model generated by the export ends at 302.06'. The spec check controller tries to find the FE element at the last support location (302.0625') but can't find it so it throws an error.

In the export when the FE model is generated, 302.06' is added as a node due to a change point for the rebar and haunch. Then when 302.0625' is added as the last tenth point, it does not get added to the FE model due to the tolerance. Any nodes in FE model within the tolerance of the last support should be removed and the last node in the FE model should be the last support.

FROM: Herman Lee DATE: 11/17/2011 11:55:31 AM Eastern Standard Time  
Modified girder, floor beam and stringer FE model generation to first add support nodes before adding other nodes (change points, brace points ...).

Resolved for the 6.4 Release.

FROM: Matt Kolis DATE: 5/4/2012 10:11:03 AM Eastern Daylight Time

### Description

FROM: Luis Vargas DATE: 9/26/2011 12:14:54 PM Eastern Daylight Time  
We have project specific conditions that require us to modify the Resistance Factors for LFR runs. We have tried to reduce the reinforced concrete resistance factors to 0.855 (from 0.9) for Reinforced

4/19/2016 3:08:48 PM

HRS AASHTO

2030

Complete Issue Information

Concrete Flexure factor and to 0.8075 (from 0.85) for Reinforced Concrete Shear factor. However, if comparing the results of the same run with modified resistance factors and without, the rating factors are identical. We then tried using resistance factors of 0.5, just to make sure that this was not a rounding problem, and still the results did not change. Therefore, it appears that modifications to LFR resistance factors are not being picked up by Virtis.

FROM: Herman Lee DATE: 9/26/2011 12:24:40 PM Eastern Daylight Time  
Please attach the bridge to this incident for investigation.

FROM: Luis Vargas DATE: 9/26/2011 2:08:04 PM Eastern Daylight Time  
The first bridge file was modeled using version 6.3, and the second one using version 6.2

FROM: Bin Zhang DATE: 9/26/2011 2:19:28 PM Eastern Daylight Time  
1. In VO63, AASHTO LFR could not pick up the LFD factor if I modify it in the "Factors-LFD" window (figure1 and 2).  
There is a workaround for this issue. You can use specs override to trigger Virtis to pick up the modified factors (figure 3).  
2. In VO62, Virtis LFR has similar issue in picking up the modified factors.  
Please read the attached word document with embeded figures for details.

FROM: Srujana Thogaru DATE: 9/29/2011 2:28:49 PM Eastern Daylight Time  
This is not an error.

If you use System default in the specs window, factors obtained by the program will be from the library.

If you want to change the factors, you should override the default factors/library factors with the factors defined in LFD factors window.

You have changed the concrete resistance factor from 0.90 to 0.85 in the LFD window but did not override the factors in the specs window.

Similar name from factors defined in LFD factors window and library factors is also a reason for confusion.

Please let us know if you have further questions.

Complete Issue Information

Hi,

I have the attached file ran using AASHTO engine and at middle of analyzing it I get the failed error message that says "Failed to perform element specification checks. Object reference not set to an instance of an object." But when I am using the virtis LFD engine it works fine. Could you please look into and tell me what's that I am doing wrong. I've checked everything and seem ok. Thanks

Dan

p.s. also I attached the failed message that I get.

=====

FROM: Wayne Skow DATE: 10/7/2011 9:21:00 AM Eastern Daylight Time  
This is the same problem as issue 11105. The problem is with unbraced cantilevers. article 10.50.2.1 relies on results from 10.48.1.1. 10.48.1.1 was changed to not allow unbraced cantilevers, however, 10.50.2.1 was not. Therefore, when 10.50.2.1 runs the proper data is not present.

This has been fixed in v6.4.

A possible work-a-round for this problem is to add a longitudinal stiffener to the unbraced cantilever segment of the girder. 10.50.2.1 is disallowed when there's a long-stif present. Generally, this should not affect a rating unless it's controlled by shear.

This is a BRASS issue. I was lead to believe that we should still be reporting these issues through this website. Let me know if this has changed. I have multiple issues to report.

I have a bridge that ran in 6.2, but gets zero ratings for 6.3 (BRASS GIRDER (LRFD) 2.1). For some reason the prestress force is not being included in the stress checks. I'll attach a screen capture and the xml file. I ran the HL93 Truck.

FROM: Herman Lee DATE: 4/12/2013 11:55:19 AM Eastern Daylight Time

Updated Status to Resolved per BridgeTech request.

### Description

FROM: Todd Thompson DATE: 10/11/2011 8:59:05 AM Eastern Daylight Time

I've been noticing cases where the tons reported when using the AASHTO LF engine is used are wrong.

I'll attach a screen shot of the summary report and my truck.

Assuming the Rating Factor is correct - the Tons should have been 177.84 based on  $RF = 1.384$  since the truck weighs 128.5 tons. But in the summary it is showing 25.61 tons.

I've noticed this with several different trucks and bridges and haven't been able to isolate anything.

FROM: Jim Duray DATE: 10/11/2011 10:22:54 AM Eastern Daylight Time

Srujana - please investigate this issue.

Description

FROM: Todd Thompson DATE: 10/13/2011 3:04:31 PM Eastern Daylight Time  
I have had these two trusses working fine and have analyzed several trucks over them.

4/19/2016 3:08:50 PM

HRS AASHTO

2037

Complete Issue Information

But for this particular truck - I get an error message -  
Unable to add axle to vehicle definition.  
02:02:19 PM - Line 5817 in source file AbxTrussLfdEngine.cpp.

And the truss fails to run.

I'll attach the truck and bridge xml files.  
Not sure if there is a length or number of axle limitation for Trusses?

The two trusses are:  
Spans 5, 6, & 7 Truss Spans (Use)  
Spans 8 & 9 Truss Spans (Use)

Version 6.3 - ASA Database - Windows 7, IE 8

FROM: Todd Thompson DATE: 10/13/2011 3:17:11 PM Eastern Daylight Time  
I suspect it may be the truck. As I tried another Truss and it doesn't work there either.

FROM: Todd Thompson DATE: 10/13/2011 3:48:33 PM Eastern Daylight Time  
I added the vehicle again to the library and should be the same but this truck works. But the original truck somehow doesn't work. Not sure why.

But Truss Model is fine.

I'll attach the new truck model.xml file I created.

FROM: Bin Zhang DATE: 10/18/2011 9:01:21 AM Eastern Daylight Time  
There is an accuracy problem for the truck definition (test\_todd-vehicle). Axle spacing at the location of no.7 and no.9 should be modified as shown in the figure 1 and 2. Please read the attached word document for the details.

FROM: Todd Thompson DATE: 10/18/2011 2:00:10 PM Eastern Daylight Time  
I guess I don't understand the problem. As long as the Min is less than the Max axle spacing and if you can enter that many digits of accuracy - why in this case do we need to only use 2 digits of accuracy?

FROM: Bin Zhang DATE: 10/18/2011 10:03:37 AM Eastern Daylight Time  
You can use more digits of accuracy as long as the Min is consistent with the Max. For example, you can use 62.667 for both Min and Max at the location of Axle 9. Please feel free to let me know if you have further questions about this.

### Description

FROM: Assistant Administrator Amjad Waheed DATE: 10/19/2011 4:00:54 PM Eastern Daylight Time  
Attached bridge worked in VO62 using BRASS LFD. In VO63, when AASHTO LFD was picked, the system could not calculate the Wearing Surface load. When Wearing Surface was removed from Typical Section, it ran but the girder rating factors were all zeros.

FROM: Herman Lee DATE: 10/21/2011 8:12:35 AM Eastern Daylight Time  
Below is the error message when I tried to rate "Girder 1" with the AASHTO Engine.  
"Export cannot compute wearing surface dead load if lane position location varies over length of structure definition!"

There are two sidewalks on the typical section. For the first sidewalk, the entered Distance At Start is 1.167 ft and Distance At End is 1.1667 ft. For the second sidewalk, the entered Distance At Start is 1.167 ft and Distance At End is 1.16667 ft. The computed lane position based on these two sidewalks varies over the length of the structure definition. Looks like the BRASS engine in 6.2 didn't detect this issue. My suggestion is to consistently use 1.1667 ft for the sidewalk Distance At Start and Distance At End inputs. After changing the two sidewalks, the lane position generated by the Compute button in the Lane Position tab will no longer varies over length of the structure definition.

HRS AASHTO

2039

Complete Issue Information

With the above changes, I'm able to complete the analysis but the ratings are zeros. There's a longitudinal stiffener specified for "Girder 1". It is located at 1.71 in from the top flange. Please double check the location of this longitudinal stiffener. If it is located at 1.71 ft (20.52 in), the HS20 Truck Operating RF is 1.673. Please resubmit this incident if the input of the longitudinal stiffener is correct.

FROM: Assistant Administrator Amjad Waheed DATE: 10/21/2011 11:17:46 AM Eastern Daylight Time  
Thanks Herman. It resolved the issue.

Description

FROM: Creightyn McMunn DATE: 10/19/2011 5:03:15 PM Eastern Daylight Time  
When running the Typical Interior Girder in the AASHTO engine (LFD) with "Allow Plastic Analysis" and "Generate at User-Defined Points" control options, I get results. If I add either "Generate at tenth points" or "Generate at section change points" I get the error "Error performing LFR specification checking! Error - Analysis failed!"

FROM: Srujana Thogaru DATE: 11/2/2011 9:25:41 AM Eastern Daylight Time  
Wayne, this error appears to be fixed in 6.4 Debug. Please confirm.

Complete Issue Information

FROM: Wayne Skow DATE: 11/2/2011 10:53:42 AM Eastern Daylight Time

This is the same problem as 11105 which has been fixed in 6.4. The hinge is causing that section of the girder to be classified as an unbraced cantilever. It should be ignoring 10.50.2.1, but isn't because of the bug. You can get around the problem by adding a longitudinal stiffener to the section that is considered an unbraced cantilever since this also disallows 10.50.2.1.

FROM: Creightyn McMunn DATE: 9/10/2012 3:21:05 PM Eastern Daylight Time  
Verified this has been fixed for V6.4 Beta 4.

### Description

FROM: Creightyn McMunn DATE: 10/19/2011 5:46:05 PM Eastern Daylight Time

After running a parabolic concrete tee beam with the AASHTO LFD Engine, I received an error message that certain bars are located above the top of the beam – see attached screenshot. This appears to be a possible bug in Virtis v6.3, because it should not be possible to define bars above the top of the beam. It appears as though somewhere in the analysis the input dimension is being flipped – i.e. instead of measuring 41in from the top of the beam down as shown on the sketches in the Virtis input help file, the analysis engine is interpreting this dimension to be 41in above the top of the beam. This bridge was previously analyzed in v6.2 with the BRASS engine and had the same error.

FROM: Herman Lee DATE: 10/21/2011 9:12:06 AM Eastern Daylight Time

Developer Note:

The A114 bar is closer to the bottom of the girder than to the top. The input of A114 is measured from the top of the girder.

FROM: Krisha Kennelly DATE: 11/16/2011 10:48:47 AM Eastern Standard Time

The A114 bar is entered incorrectly. See the attached VI 11142.pdf for the calcs showing how the A114 bar referenced 41" from the top of the girder has the bar sticking out of the bottom of the beam.

Also see attached Vi 11142 bar location.png to see that at 48.82' the bar is 0.56" below the bottom of the beam (40.43" - 41" = -0.56").

The error message being issued by Virtis is displaying the incorrect position of the bar, this error message will be fixed for 6.4.

However, the main problem with this bridge is the incorrect data entry.

FROM: Krisha Kennelly DATE: 11/17/2011 9:18:14 AM Eastern Standard Time

Error message has been corrected for version 6.4.

This is found out while investigating VI11091, bridge (11091\_00116 - Beta2.xml) is attached to VI11091  
The following is the original email from Sally.  
I ran the bridge with 6.3.1 release. The rating factors for girder is zero. I am able to reproduce the rest  
problems described in the following email.  
The error of "unable to Perform Analysis" for floorbeams and stringers are similar to incident 11091 and  
is resubmitted.

Complete Issue Information

-----Original Message-----

From: Sally Doles [mailto:sdoles@Lonco.com]  
Sent: Thursday, October 20, 2011 1:22 PM  
To: Bridgeware,  
Subject: RE: Virtis/Opis 6.3 Service Pack 1 Beta 2

\*Incident 11091 - Unable to analyze girder member in corrugated deck floor system\*

I re-entered the bridge from this incident (i.e. - girder-floorbeam-stringer superstructure with a corrugated metal deck) since the service pack does not fix the case for bridges which were entered previously.

Virtis ran a rating for the girder but it came up as failing and the Critical Moments were significantly higher than those found if the structure was entered as a Line System. But again, for both the floorbeam and stringers, I got the same error of "unable to Perform Analysis" and "Line 616 in sourcefile AbxAashtoEngineUiCtl.cpp"

Another item for this particular bridge is that when I used the Stringer Unit Layout Wizard, under the live load distribution factors, I could not use the "Compute from typical section" button. Virtis would come up with "Error computing distribution factors. But when I went into each individual stringer case after the wizard was run, I was able to use the "Compute from typical section" button without a problem.

I have attached the file I used to test this Incident.

If there are any questions, please let me know.

Thank you,

Sally D. Doles, P.E.  
LONCO, INC.  
Phone: 303-620-0098

FROM: Herman Lee DATE: 10/21/2011 12:43:37 PM Eastern Daylight Time  
May be related to 11091. After 11091 is fixed, please verify whether the above Stringer Unit Layout Wizard issue is also fixed.

FROM: Xinmei Li DATE: 10/21/2011 4:26:03 PM Eastern Daylight Time  
This incident is not related to 11091.

2045

Complete Issue Information

FROM: Xinmei Li DATE: 11/1/2011 4:26:06 PM Eastern Daylight Time  
When calculating exterior girder distribution factors deck edge location is used as lane edge location.  
Currently there is no work around for bridges with parapet.

FROM: Xinmei Li DATE: 11/2/2011 10:20:23 AM Eastern Daylight Time  
I went back to the bridge and found out that in Structure Typical Section window, Parapet tab, "Distance At End" column is left blank. I put the same values as the "Distance At Start" column. Then compute DFs again, I got 1.315 which is still slightly different than the number in your hand calculations. I did my own hand calculations based on the model you entered. I used the numbers you put in the Structure Typical Section window, got 1.315, see attached hand calculation file.

Description

FROM: Luis Vargas DATE: 10/25/2011 2:24:47 PM Eastern Daylight Time  
We are load rating a prestressed beam bridge using AASHTO LFD Analysis module. When trying to retrieve the output, we are unable to get the Section Properties or the Detailed Rating Results using the LFD analysis Output option under the Report Tool. We can obtain this information by going to "View Spec Check" tool, however, it cannot be printed from there. Is there a way to be able to obtain a complete Output report using the AASHTO LFD Analysis module? File is attached.

### Description

FROM: Shannon Murgoitio DATE: 10/26/2011 11:14:50 AM Eastern Daylight Time  
Virtis v6.3 does not display timber deck ratings. From our investigation it appears the Madero engine is rating the timber deck, it is just not being displayed in the analysis results window. Please see the attached word file for screen prints of results with more information, and the xml file.  
Thank you,  
Shanon Murgoitio

FROM: Shannon Murgoitio DATE: 10/26/2011 12:46:02 PM Eastern Daylight Time  
I am running a Windows 7, 64 bit operating system.

FROM: Herman Lee DATE: 10/26/2011 12:46:34 PM Eastern Daylight Time  
Ben, please confirm it's a defect in the system.

FROM: Bin Zhang DATE: 10/26/2011 5:31:03 PM Eastern Daylight Time  
It's a program bug, I can also reproduce it in a WinXP 32 bit OS. This bug has not been fixed in Virtis6.3.1 build 2 or Virtis64 yet. This display issue does not appear in Virtis62.

FROM: Herman Lee DATE: 11/1/2011 10:53:30 AM Eastern Daylight Time  
Developer Note:  
The vehicle id in DoDeckPanelRatingSummary AddRow is 0.

FROM: Brian Goodrich DATE: 11/9/2011 9:27:36 AM Mountain Standard Time  
I'm running 64-bit Window 7 and am able to duplicate the error with the attached bridge. The vehicle name that is added to the results object within the export is the same one that is used to retrieve the ID in the Madero engine. I also confirmed that the flag returned by the DeckPanelResultsPtr->AddVehicle function was true. Within the engine the results object function IDoDeckPanelResults\_GetVehicleId is

4/19/2016 3:08:52 PM

HRS AASHTO

2048

## Complete Issue Information

called, but it returns the vehicle ID as zero. The same code is called for a timber stringer and the `IDoMemberResults_GetVehicleId` function returns a non-zero vehicle ID.

I also ran the deck and stringer for `TimberTrainingBridge1` and the same error occurs for just the deck analysis. So, this issue is not limited to just the user's bridge.

Herman - I cannot find any problem in the Madero export or engine. Please verify the problem does not reside in the `DeckPanelResultsPtr->AddVehicle` function or in the `IDoDeckPanelResults_GetVehicleId` results object functions.

FROM: Aaron Kemna DATE: 11/18/2011 11:09:41 AM Eastern Standard Time  
I ran into the same issue. I'll attach the bridge in case it would be helpful.

FROM: Amanda Jackson DATE: 2/9/2012 9:54:57 AM Eastern Standard Time  
I also ran into the same issue on a Windows XP 32 bit OS. I have attached my file as well (`timber_deck_error.xml`).

FROM: Herman Lee DATE: 3/26/2012 2:36:13 PM Eastern Daylight Time  
Brian, please see the attached two screenshots.

1. `DeckPanelResults_AddVehicle.png` - Madero export adds vehicles to the deck panel results. The export vehicle id is ok (not zero).
2. `DeckPanelRatingSummary_AddRow.png` - Madero engine adds rating results to the deck panel rating summary. The export vehicle id is zero.

Could you put a break point in the Madero engine when calling `AddRow` to confirm the export vehicle id being added? Thanks.

FROM: Brian Goodrich DATE: 3/27/2012 1:48:28 PM Mountain Daylight Time  
The vehicle ID is zero when the `AddRow` function is called. Prior to this call, the Madero engine passes the vehicle name to the `IDoDeckPanelResults_GetVehicleId` function, but the vehicle ID that is returned here is zero. Within the Madero export, just prior to calling the Madero engine, I called the function `DeckPanelResultsPtr->GetVehicleId("Type 3_TRK")` to see what was returned. Vehicle ID 1 was returned here, which was correct. I compared the interface code for this function to others in the file and don't see anything that could be causing this. Can you see what is going on when the `DeckPanelResultsPtr->GetVehicleId` function is called by the Madero engine?

FROM: Herman Lee DATE: 5/11/2012 10:35:02 AM Eastern Daylight Time  
I put a breakpoint inside `DoDeckPanelResults::GetVehicleId`. That function never get called. I compared 6.3 `aborslt` source code with 6.2. The only difference is the module id to GUID changes.

FROM: Herman Lee DATE: 5/24/2012 8:59:25 AM Eastern Daylight Time  
Joe suggested to try the `Madero.dll` that comes with `Virtis 6.2` in `6.3`. The old `Madero.dll` works in `6.3` and the deck rating results passed back ok. If you don't see any changes between `Madero 1.2.3` and `1.2.4` that will cause this, my suggestion is to see whether rebuilding the `aborslt` Fortran interface file using the `6.3 aborslt` will fix this problem.

Brian's e-mail on 8/28/2012:

=====  
Herman,

I'm getting the same problem with the deck results as with 6.3. I've compared both engine and export source code with those from Virtis 6.2.

I added a call to GetVehicleId before and after the call to the Madero engine and those calls return a valid vehicle ID. The correct object pointer is being passed into the Madero engine and I verified that. The only thing that makes sense is there is something going on with the interface function to the results object. I uploaded this file (VirtisAboResults.f90) to the FTP site (Incoming/Virtis). Only the IDoDeckPanelResults\_GetVehicleId seems to be a problem.

Brian  
=====

FROM: Herman Lee DATE: 10/26/2012 10:27:12 AM Eastern Daylight Time  
Attached further e-mail communication for this issue (RE\_ Madero.pdf).

FROM: Amanda Jackson DATE: 12/5/2012 4:51:55 PM Eastern Standard Time  
Did this get resolved? I'm still having the issue in 6.4. Is there another way to get the results out of the program? I only see one rating factor in the Madero output files. I don't want to have to hand-rate all of our timber decks until this is fixed. Any help would be appreciated.

FROM: Amanda Jackson DATE: 12/6/2012 10:53:50 AM Eastern Standard Time  
Ok, I figured out where the different Operating and Inventory rating factors are in the Madero output - just had to look closer.

FROM: Herman Lee DATE: 4/1/2013 1:07:10 PM Eastern Daylight Time  
Brian Goodrich email on 3/12/2013:

=====  
I put together a Madero solution that reproduces the problem. I uploaded the files (MaderoTest.zip) to the FTP server (Incoming/Virtis/Madero folder).

Set a breakpoint in SetVehicleId.f90 where the IDoMemberResults\_GetVehicleId and IDoDeckPanelResults\_GetVehicleId functions are called. IDoMemberResults\_GetVehicleId returns a vehicle ID while IDoDeckPanelResults\_GetVehicleId returns zero.

Thanks,  
Brian  
=====

FROM: Mehrdad Ordoobadi DATE: 4/11/2013 11:19:28 AM Eastern Daylight Time  
I debugged the Virtis/Opis application and set a break point in the AddRow function in CDoDeckPanelRatingSummary and it receives a IVehicleId = 0 when AddRow is called.

That's causing the GetVehicleId function call to return 0.

Complete Issue Information

FROM: Brian Goodrich DATE: 4/12/2013 10:09:59 AM Eastern Daylight Time  
The test program doesn't contain the call to the IDoDeckPanelRatingSummary\_AddRow function. When that function is called, BRASS is passing the vehicle ID it retrieved from IDoDeckPanelResults\_GetVehicleId. The IDoDeckPanelResults\_GetVehicleId function is returning the vehicle ID of zero. All vehicle IDs are obtained prior to calling IDoDeckPanelRatingSummary\_AddRow, and they are all zero.

FROM: Mehrdad Ordoobadi DATE: 4/26/2013 1:40:18 PM Eastern Daylight Time  
I set a break point inside the long CDoDeckPanelResults::GetVehicleId(LPCTSTR sExportVehicleName) function. The debugger never stops at that break point.

FROM: Mehrdad Ordoobadi DATE: 4/26/2013 4:46:35 PM Eastern Daylight Time  
Found the problem inside the aborslt project. Fixed for 6.5 Beta 1.

FROM: Subhadeep Ghosh DATE: 5/9/2013 12:05:32 PM Eastern Daylight Time  
Verified for 6.5 beta 1.

### Description

FROM: Shannon Murgoitio DATE: 10/26/2011 2:55:05 PM Eastern Daylight Time  
I cannot change the Engine Help Configuration unless I am running v6.3 as an administrator.

When in a bridge workspace I go to Help==>Engine Help Configuration and try to switch engines (example: AASHTO Std. to AASHTO LRFD) and I get the following message:  
"!Failed to change engine help. Please close any open help windows and try again."  
If running v6.3 as an administrator this action can be performed and the message does not appear.

Is there something I can do that will allow the Engine Help Configuration to be changed even if you are not running v6.3 as an administrator? We can't have all our users running as admin.

Operating System: Windows 7, 64bit  
Virtis v6.3 loaded in the default location. C:\Program Files\AASHTOWARE

Thank you,  
Shanon Murgoitio

FROM: Herman Lee DATE: 10/26/2011 3:21:21 PM Eastern Daylight Time  
Ben, please confirm it's a defect in the system and assign the incident to Geoff.

FROM: Joseph Ihnat DATE: 10/26/2011 3:52:41 PM Eastern Daylight Time  
Try granting "Full Control" to "Everyone" for the C:\Program Files\AASHTOWARE\Virtis63\Help folder. Not sure why the permissions granted to the Virtis63 folder in the install don't extend to the Help folder. We'll have to investigate.

FROM: Joseph Ihnat DATE: 12/6/2011 8:19:02 AM Eastern Standard Time

Description

FROM: Bin Zhang DATE: 10/28/2011 1:35:39 PM Eastern Daylight Time

For the special (limited crossing) permit truck, the single lane distribution factors have been divided by 1.2 to remove the multiple presence factor. However, if I checked the single lane loaded box in the advanced section of the analysis, the 1.2 factor failed to be applied.

The problem could be reproduce using the BID1 TrainingBridge1, member alt of G1, LRFR permit load rating.

FROM: Herman Lee DATE: 10/31/2011 9:26:34 AM Eastern Daylight Time

Fixed for the AASHTO LRFR Engine. Resolved for the 6.4 Release.

FROM: Matt Kolis DATE: 5/18/2012 12:40:56 PM Eastern Daylight Time

See attached document from VO64 Alpha Build 5. After selecting "single lane loaded" for a Type-3 vehicle, analysis still says distribution factors have been divided by 1.2.

FROM: Herman Lee DATE: 5/18/2012 1:05:50 PM Eastern Daylight Time

Matt, based on the document. The issue described above is fixed. TrainingBridge1 is a multi-lane bridge. When you select the single lane checkbox for the special (limited crossing) permit truck, single lane DF is used and 1.2 is divided out.

Description

FROM: Luis Vargas DATE: 10/28/2011 2:46:12 PM Eastern Daylight Time

We are load rating an AASHTO girder bridge using Virtis' AASHTO LFD analysis module. The ratings that Virtis is reporting are controlled by shear, however, the output is reporting the controlling section at 0 ft from support instead of H/2. When we run the same file using Virtis LFD analysis module, the reported controlling section for shear ratings is shown correct at H/2. Is there a way to ignore the shear ratings in AASHTO LFD analysis output within H/2? File is attached.

FROM: Herman Lee DATE: 10/31/2011 8:25:29 AM Eastern Daylight Time

4/19/2016 3:08:53 PM

HRS AASHTO

2057

Complete Issue Information

AASHTO Std 9.20.1.4 specifies that sections located within h/2 from face of support are evaluated for shear acting at the h/2 location. AASHTO Engine evaluates all the points of interests within h/2 with the Vu at the h/2 location.

Please note that the Special Consultant License Option only allows us to provide limited support for installation. The primary support channel for consultant is through the sponsoring agency of your license.

FROM: Luis Vargas DATE: 10/31/2011 12:18:30 PM Eastern Daylight Time  
Based on AASHTO Std 9.20.1.4, the shear (Vu) within h/2 of the support should be taken the same as at location h/2. However, the AASHTO LFD engine gives me different results at location 0 ft (RF=1.62 ), at location 1.26 ft (RF=1.69) and at location h/2=2.58 ft (RF=1.76) . The rating factor at locations between 0 to h/2 should equal rating factor at location h/2. Please clarify.

FROM: Herman Lee DATE: 10/31/2011 12:19:23 PM Eastern Daylight Time  
The Vn at 0 ft is different than the Vn at h/2. Please resubmit if you disagree with Virtis Vn calculations.

## Complete Issue Information

From my consultant (Souther):

Analysis fails for two of the floorbeams in the attached Virtis model (FlbmAnalysisFailures(0999901)63.xml) under the "West Bascule Leaf" Superstructure Definition. In addition the analysis of Unit 2 stringers yields questionable results, with shear controlling.

When attempting to analyze Floorbeam F1 (a floorbeam truss), the following error occurs:  
Error - Unable to determine stringer dead load reactions!  
Error - Analysis failed!

When attempting to analyze Floorbeam F2 (a riveted built-up plate girder), the following error occurs immediately after the stringer reactions are computed:  
Unable to perform analysis!  
08:47:34 AM - Line 616 in source file AbxAshtoEngineUiCtl.cpp.

(For both of the preceding, it appears that there is a problem with the calculation of Stringer Unit 2 reactions. Unit 2 is comprised simple span stringers with a 3' cantilever.)

FROM: Herman Lee DATE: 11/1/2011 11:51:55 AM Eastern Daylight Time  
Developer Note:  
iSupportNum = 0 in CUiAnalysisProgressDlg::PopulateDeadLoadReactionObjects Line 15702.  
The code should skip locating the floorbeam at the free end of the cantilever.

FROM: Mehrdad Ordoobadi DATE: 5/3/2012 2:21:29 PM Eastern Daylight Time  
Fixed in Virtis/Opis 6.4 Alpha 4.

2064

Complete Issue Information

I received this issue from a consultant. They originally modeled the worst case scenario (Span 2 Girder B) as a girder line only. This barely passed for Michigan loads. They then modeled the entire flared girder structure. Span 2 Interior Girder B still governs but the rating factor is now slightly less than 1.0. They are running in AASHTO engine, LRFR.

We compared the moments between the girder line model and the girder system superstructure. All moments were comparable between the two, except "Concrete Deck Load". The concrete deck moment for the girder line is 1298.16 k-ft, which is to be expected for a 9" deck with 6.42' tributary width (the average spacing for the flared system). The concrete deck moment for the flared girder system is 1526.08 k-ft, which is significantly larger and does not seem accurate. The spacing perpendicular to the beam varies from 6.28125' to 6.5625', so even the largest spacing of 6.5625' should only produce a moment of 1326.9 k-ft. Is there something that we are missing or is this an error in the AASHTO engine?

Thank you,

CREIGHTYN E. McMUNN, PE  
LOAD RATING ENGINEER

=====

FROM: Bin Zhang DATE: 11/7/2011 3:16:24 PM Eastern Standard Time  
The deck load intensity in the Girder system superstructure is higher than the girder line results. The girder line deck load intensity exactly matched my hand calculation. The hand calculation and the deck load intensity snapshots were attached in the word document.

FROM: Herman Lee DATE: 11/11/2011 11:00:51 AM Eastern Standard Time  
Fixed a defect in CDoGirderSystemStructDef::PopulateGirderDataArray when determining girder spacings for non-parallel system.  
Resolved for 6.4 Release.

FROM: Matt Kolis DATE: 5/7/2012 4:12:15 PM Eastern Daylight Time  
When testing this issue in VO64 Alpha Build 5, I get an error when trying to do an LRFR analysis for Span 2 (Simple Span) - Interior Girder B Member Alternative. This same member runs fine in VO631.

FROM: Herman Lee DATE: 5/11/2012 10:33:04 AM Eastern Daylight Time  
Matt, please reverify this incident in Alpha 6.

FROM: Matt Kolis DATE: 5/23/2012 9:51:10 AM Eastern Daylight Time  
Verified in VO64 Beta Build 1.

FROM: Creightyn McMunn DATE: 9/10/2012 3:33:46 PM Eastern Daylight Time  
In V6.4 Beta 4, I am still getting a moment of 1496.34 k-ft for the girder system superstructure, which is

4/19/2016 3:08:54 PM

HRS AASHTO

2065

Complete Issue Information

significantly higher than it should be.

FROM: Creightyn McMunn DATE: 9/10/2012 3:48:01 PM Eastern Daylight Time  
Disregard my previous comment. I was running the wrong member. When running Span 2, Girder B, in AASHTO LRFR I get the following error: "Error - UNable to determine Haunch Load entered on the PS Haunch Profile window! Error - Unable to determine haunch load! Error - Analysis failed!" Other members run fine.

FROM: Creightyn McMunn DATE: 11/14/2012 2:45:13 PM Eastern Standard Time  
I can run Span 2, Girder B, in AASHTO LRFR without error and get a concrete deck moment of 1298.12 k-ft. The issue has been resolved in V6.4.1 Beta.

Submitted on behalf of Vinacs M Vinayagamoorthy, Caltrans.

Received e-mail:

=====

Herman

We have been rating continuous span Tee beam bridges at the "User defined" points only. These user defined points are set such that the software does not rate bridges over the support location (100 or 200) etc.

(Embedded image moved to file: pic27013.jpg)

When I analyzed this bridge using LRFR, the controlling rating factor is reported at 100 point. See below (Embedded image moved to file: pic30477.jpg)

I believe this is a bug!, Please check this for me and add to the Incident list.

Thanks

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer

=====

The image for the rating results is coming from the Virtis LRFR Engine. I'm able to reproduce the issue in both 6.2 and 6.3.

FROM: Krisha Kennelly DATE: 11/8/2011 9:55:02 AM Eastern Standard Time  
I have confirmed that this is a bug. There is no workaround.

It will be fixed in version 6.4.

FROM: Krisha Kennelly DATE: 1/3/2012 12:43:26 PM Eastern Standard Time  
Fixed for 6.4. Controlling location is no longer a support location.

4/19/2016 3:08:55 PM

HRS AASHTO

2067

Complete Issue Information

This problem only existed for RC beams rated using LRFR.

FROM: Bin Zhang DATE: 2/3/2012 1:30:41 PM Eastern Standard Time  
Verified in VO631 with the caltran dll updates.

FROM: George Huang DATE: 2/9/2012 4:43:46 PM Eastern Standard Time  
The issue is resolved with the patch for VO6.3.1.

FROM: Matt Kolis DATE: 5/8/2012 10:59:36 AM Eastern Daylight Time  
The attached xml file seems to lock up VO64 Alpha Build 5 every time I attempt to perform an LRFR analysis.

FROM: Krisha Kennelly DATE: 5/22/2012 12:08:35 PM Eastern Daylight Time  
i can't reproduce this in 6.4 beta 1. please retry and if it happens again list all steps that lead to this error.

FROM: Matt Kolis DATE: 5/23/2012 9:07:52 AM Eastern Daylight Time  
Bridge continues to lock up in VO64 Beta Build 1. Steps are shown in attached "Doc1". I did an LRFR analysis using HL-93 inventory and operating rating vehicles.

FROM: Matt Kolis DATE: 5/23/2012 10:21:54 AM Eastern Daylight Time  
Verified in VO64 Beta Build 1.

FROM: George Huang DATE: 6/26/2012 6:17:02 PM Eastern Daylight Time  
The LRFR rating factors from 6.4 beta 2 are much different than those from 6.3.1, which are more reasonable.  
The results for G2 from the attached file 24 0261R RR.xml are 0.059 for Type 3 from 6.4 but 1.05 from 6.3.1. the screen shots (VI11164\_64vs631.docx) are attached.

FROM: Krisha Kennelly DATE: 6/27/2012 8:58:13 AM Eastern Daylight Time  
Srujana - please investigate the different ratings between 6.3.1 and 6.4 beta 2.

FROM: Srujana Thogaru DATE: 6/27/2012 9:45:29 AM Eastern Daylight Time  
Reason for the differences in the rating factor is due to the change in the dv value. ComputeDV function in RCBeamCapacity.cs has been changed.

FROM: Wayne Skow DATE: 6/27/2012 4:07:29 PM Eastern Daylight Time  
Restored RCBeamCapacity.cs to it's previous version.

FROM: George Huang DATE: 7/10/2012 2:12:04 PM Eastern Daylight Time  
I'm just curious about the reason to change DV for 6.4 beta 2. We should use the right DV function.

FROM: Herman Lee DATE: 11/17/2011 12:17:28 PM Eastern Standard Time  
Received e-mail:

=====

Brian,

I need to correct my previous comments (2) "Based on the hand calculation the rating factors should be the same for travel way width between 18 and 24 feet, but the results from BRASS engine vary with the different width. The smallest rating, 0.625, occurs at the 18' width. If this rating is right, then this rating factor should be used for all cases between 18 and 24 feet." The ratings for width between 20' to 24', not 18' to 24', should be the same, since the minimum distance between the wheel and edge of lane is different for traffic lane width less than 10'.

Thanks.

Brian added this issue to the BRASS incident tracking system. (11/17/2011 e-mail)

FROM: Herman Lee DATE: 11/21/2011 8:46:44 AM Eastern Standard Time  
George, I'm not able to reproduce the "Inv RF (AASHTO)" numbers in the Word file. I suspect those numbers are the results of lane loading. For the AASHTO Engine, the first row in the Analysis Results window is for HS20 Lane Load and the second row is for HS20 Truck Load.

The 99 rating factors are caused by defects in the input of the transverse loader. The defects has been fixed.

For this bridge, the floorbeam length (25.6667 ft) does not match up with the truss spacing (26.6667 ft). The wheel positions on the floorbeam are off by 0.5 ft. I modified the code to handle this situation. All the influence lines and live load patterns are listed in the LL Detail and LL Summary files.

AASHTO Engine does support MBE 6B.6.2.2 for floorbeam transverse live load analysis.

Resolved for the 6.4 Release.

Complete Issue Information

Verified in VO64 Alpha Build 5.

FROM: George Huang DATE: 6/8/2012 3:14:48 PM Eastern Daylight Time  
 For AASHTO engine, the 99 rating factors have been corrected. The rating for travel way width from 10 to less than 18' the ratings are fine. However for travel way width from 18' to 24', the rating factors need to be checked. I am using the same Br10-113 file to analyze floorbeam2. the results for 20' to 24' the results are identical to those from Virtis6.3 shown in BR10-113.docx, which are different for different width. I think these ratings may should be the same. The Inventory ratings for 18' and 19' travelway are 0.637 and 0.653. But the rating for 20' width is 0.647, which should be larger that that for 19' width. Please take a look at my previous comment (3) in BR10-113.docx. I think beta 1 only address my comment (4).

FROM: Herman Lee DATE: 7/2/2012 3:31:12 PM Eastern Daylight Time  
 George, below are the rating results for different travelway widths. The results I have for 20' width is 0.674. Could you also take a look at Incident 7007 (Wrong LL DF for 20' to 24' roadways?) for the procedure Virtis used to determine number of lanes? We could discuss over the phone after that. Thanks.

Complete Issue Information

Ben, for the node corresponding to the truck rating controlling locaton, find the max moment in the "Span LL Summary" text file and confirm the max moment with the indicated load pattern. Thanks.

FROM: Bin Zhang DATE: 7/16/2012 5:26:11 PM Eastern Daylight Time

When calculating the transverse load patterns, Virtis uses the parameters listed below.

- 1. Lane increment = 4.0000 ft
- 2. Vehicle increment within a lane = 2.0000 ft

I did a simple test for the floorbeam 2 with a travelway width of 23 feet. The Truck Inv RF decreased from 0.785 to 0.709 after I refined the 2 parameters to the numbers below.

- 1. Lane increment = 1.0000 ft
- 2. Vehicle increment within a lane = 0.5 ft

An enhancement request is submitted into the issue net to add the 2 parameters into the GUI, so the user will be able to modify them when calculating the transverse load patterns. The issue ID is 11720.

The controlling pattern is correct based on the two hard coded increments. Also, the moment calculation is correct based on its corresponding load pattern.

Submitted on behalf of Tim Ambrecht, IL DOT:

Received e-mail:

=====

Tim,

It appears that Virtis is not calculating a difference between the Inventory and Operating capacity for shear. I am specifically looking at SN: 086-0001, Span 6, Floorbeam 0 which is a built up section with  $F_y = 30$  ksi. I am not aware of an exception in the code that would allow these capacity to be the same. I think Baker should verify that it is calculating the Inventory and Operating Shear capacity correctly.

Let me know if you need any additional information or if you know of a code reason for this issue.

Thanks.

Scott

Complete Issue Information

FROM: Wayne Skow DATE: 12/20/2011 7:08:26 AM Eastern Standard Time  
Scott is correct. The allowable shear stress for operating rating wasn't being set properly. Currently, allowable shear stress is always .33\*Fyw. Operating allows .45\*Fyw, so the current value is conservative.

Fixed in v6.4.

FROM: Matt Kolis DATE: 5/7/2012 10:11:23 AM Eastern Daylight Time  
When analyzing the bridge using LFR in VO64 Alpha Build 4, VO gives the error which can be seen in the attached word document. VO631 does not give that error.

FROM: Wayne Skow DATE: 5/9/2012 3:21:17 PM Eastern Daylight Time  
This error is an entirely different problem. The original problem involved ASR. This problem is with LFR. The reported error concerns floor beam 6 which is a built-up member. The controller (SCSuperSteelGirderElement->PopulateCompositeInfo(...)) see lines 17424 to 17455) populates composite info for this member, but it does not have an option for built-up cross-sections. It only handles rolled and plate girder cross-sections.

FROM: Matt Kolis DATE: 5/18/2012 9:08:31 AM Eastern Daylight Time  
When performing an ASR analysis on the bridge, Virtis gives a spec check error which can be seen in the attached ASD Error document.

FROM: Xinmei Li DATE: 5/23/2012 10:51:27 AM Eastern Daylight Time  
Fixed for the next build

FROM: Phil Litchfield DATE: 6/27/2012 2:42:16 PM Eastern Daylight Time  
Checked with 6.4 beta 1, and appears to be fixed.

### Description

FROM: Srujana Thogaru DATE: 11/30/2011 3:07:04 PM Eastern Standard Time

Virtis gives zero Inventory rating for LFR analysis when input was given as P and CGS instead of strands in Strand Layout window.

Reason for PS stresses in 6B.5.53.3 PS Concrete Tensile Stress are considered as zeros.

Example bridge file is attached, G1 and G2 gives zero Inventory rating factor as P and CGS are give as Input where as G9 gives good rating since input strands.

FROM: Srujana Thogaru DATE: 3/13/2012 10:42:01 AM Eastern Daylight Time

=====

Bridgeware,

While checking one of our Prestressed Concrete bridges, we noticed that the Service I specification check is reporting stress values for the Prestressed Section in the negative moment region, while it should be reporting for the Reinforced Concrete section over the pier, similar to the other two permit trucks OFRD #2 and OFRD #3. However, the rating appears to be computed correctly per the Reinforced Concrete section information and the problem seems to be only within the stresses that are being reported.

The .xml file has been attached for your use, in case you wish to check if there is an error with the engine or simply an error within our file.

Thanks,  
 -Jordan

=====

FROM: Krisha Kennelly DATE: 12/2/2011 9:11:23 AM Eastern Standard Time  
 The correct stress ratio was computed and printed out but incorrect summary data was sometimes printed out in the article table.

Code has been fixed for 6.4. Text file showing corrected article output is attached.

## Complete Issue Information

Please attach your file. Also indicate which engine you are using - BRASS or AASHTO.

Since you are getting zero rating factors for both rating methods there is likely something incorrect with your model. Please review the FAQ help topic "I get a very low rating factor for an existing bridge. What is wrong?" available from the Virtis Help/Frequently Asked Questions for ways to track down if your data is entered incorrectly.

Examples of incorrect data might be dead loads entered incorrectly (too large values resulting in DL greater than capacity) or composite properties not being used due to shear connectors not being defined.

FROM: Krisha Kennelly DATE: 12/7/2011 10:22:49 AM Eastern Standard Time  
email response sent to Corin Piacenti from Bridgeware:

Hi Corin,

I took a quick look at your bridge. You can follow these types of steps to determine the source of your problem.

Rate G2 for an HS20 vehicle. See the following rating results. Flexure is controlling at 71' (which is over the pier).

Open the spec check viewer to see the moment capacity computed at this location. Capacity computed for negative moment is zero.

Check the Deck Profile:Reinforcement window to see if there is any slab reinforcement to carry the negative moment. There is not.

If you enter some rebar in the slab to achieve negative moment capacity at the pier location you will get a non-zero rating.

Regards,  
Krisha Kennelly, PE

Description

FROM: Tim Armbrecht DATE: 12/8/2011 1:59:34 PM Eastern Standard Time  
 From my consultant (Souther):

In the referenced Virtis model of a truss-floorbeam-stringer system the attempt to analyze Stringer 1 in Stringer Unit 4 terminates with the following run failure message...

```

...
- Location - 0.3073 (ft)
System Error - Contact Technical Support: Missing data in article: "6B.4 Steel Combined Moment and Shear - " - stage 3, round 2
- Location - 15.6875 (ft)
System Error - Contact Technical Support: Missing data in article: "6B.4 Steel Combined Moment and Shear - " - stage 3, round 2
- Location - 21.3750 (ft)
- Location - 21.4358 (ft)
- Location - 31.3750 (ft)
Fatal error occurred while processing specification checks.
Error - Error performing LFR specification checking!
    
```

Error - Analysis failed!

This stringer has been assigned Analysis Locations at 21.375' & 21.4358'. Web loss is 11.1% starting

### Complete Issue Information

at 21.4358' for a length of 0.50'. Bottom Flange Loss is 16.8% of thickness starting at 21.375' for a length of 2.00'.

Upon investigation, I found that if an analysis location is greater than 15.6975', the analysis fails. If it is 15.6975' or less, it succeeds.

FROM: Wayne Skow DATE: 12/15/2011 8:21:24 AM Eastern Standard Time  
There's a problem in the controller. The controller sets the following:

```
stl_Mp_pos_left = 10012, // Mp from 10.48.1 at left brace location
stl_Mp_pos_right = 10013, // Mp from 10.48.1 at right brace location
stl_Mp_neg_left = 10014, // Mp from 10.48.1 at left brace location
stl_Mp_neg_right = 10015, // Mp from 10.48.1 at right brace location
```

based on the bracing conditions to the left and right of the point. These values aren't getting set properly relative to the UnbracedCantilever flag.

FROM: Krisha Kennelly DATE: 12/15/2011 8:41:34 AM Eastern Standard Time  
A workaround is to select 'Generate at tenth points' for the LFD Control Options on the Member Alt window. You'll get more data than you want but the analysis will run to completion.

Still looking into a proper fix in the code.

FROM: Krisha Kennelly DATE: 12/15/2011 10:17:10 AM Eastern Standard Time  
Fixed for version 6.4. Note to developer: code fixed in AdjustBracePointsForPOIS() - not related to UnbracedCantilever flag

FROM: Mark Mlynarski DATE: 12/19/2011 3:22:44 PM Eastern Standard Time  
Tested new DLL (abaspecctrl.dll) using the attached procedure (see attached file VI-11184-Testing.pdf).  
Problem ran OK with new DLL.

FROM: Krisha Kennelly DATE: 12/21/2011 8:51:21 AM Eastern Standard Time  
Email for DLL via FTP was sent to Tim on Dec 20, 2011 9:27 am from Bridgeware

FROM: Tim Armbrecht DATE: 12/21/2011 10:44:49 AM Eastern Standard Time  
Tested the fix and Tim Souther reports that the error appears to be fixed. Thanks.

FROM: Bin Zhang DATE: 2/3/2012 1:51:08 PM Eastern Standard Time  
Changed teh status to be verified.

FROM: Matt Kolis DATE: 5/5/2012 5:11:26 PM Eastern Daylight Time  
Error during LFR analysis is fixed in VO64 Alpha Build 4, however, the program crashes during an LRFR analysis.

FROM: Krisha Kennelly DATE: 5/22/2012 12:17:19 PM Eastern Daylight Time  
The crash for the LRFR analysis is a different item. I've entered that as issue 11496

FROM: Matt Kolis DATE: 5/23/2012 9:32:14 AM Eastern Daylight Time  
Verified in VO64 Beta Build 1.

### Description

FROM: Todd Thompson DATE: 12/12/2011 3:25:36 PM Eastern Standard Time  
6.3.0 - Virtis OPis

I've been working on a Stringer - Floorbeam - Girder system bridge.  
I've been wanting to verify the live loads of the floorbeams and trying to get the LL distribution factor's used. I checked to output the LL DF's but they never show up in the output anywhere.

I attached the output section for the analysis and what shows up in the output. I'll also attach the XML of the bridge. You can use either the 684 FT or 900 FT units for reviewing the floorbeams.

4/19/2016 3:08:58 PM

HRS AASHTO

2085

## Complete Issue Information

FROM: Herman Lee DATE: 12/12/2011 4:26:59 PM Eastern Standard Time

For GFS system, floorbeam LL analysis will first perform a virtual stringer LL analysis to find out the longitudinal LL reaction at the floorbeam location. That reaction will then be used as the wheel load in the transverse LL analysis.

For Floorbeam 1 in the 684 unit:

1. Select the "Summary Influence Line Loading" and "Detailed Influence Line Loading" AASHTO Engine Reports in the Analysis Settings window.
2. The "Stringer Model LL Detail" and the "Stringer Model LL Summary" files contain the virtual stringer LL analysis. HS20 truck LL reaction at Node 1 is 36.576 kip.
3. The "Span Model LL Detail" and the "Span Model LL Summary" files contain the transverse LL analysis. The wheel load in each loading pattern on the floorbeam is half of the reaction.

Importance: High

Hi Herman:

As per our telephone conversation please find attached the input files for Version 6.2 and 6.3 – we got very high ratings using Version 6.3. Please note that we used BRASS LFD engine for Version 6.2 and AASHTO LFD Engine for ratings. I would appreciate if you could please check and let us know your findings.

Thanks.  
Amin

Subject: FW: Different Rating Results in different virtis versions  
Importance: High

Hi Herman:

You can see that in HS20-44 Lane 6.3 shear governs at supports, where as in 6.2 HS20-44 flexure governs. Usually we do not consider shear at supports – therefore, if we choose point of interest to check flexural capacity, then the flexural ratings for 6.3 is very high compared to 6.2 – I think this a big problem. Actually this example was not a good example because here shear and flexure mixes - I have another example where only flexure governs in both versions and ratings in 6.3 version are very high and I will send this example to you soon – please look at it – this happened only in steel Plate girder bridges – not in Rolled section girder bridges. Thanks.

Amin

To: Mohammad Islam  
Subject: RE: Different Rating Results in different virtis versions

Amin,

I reviewed G2 in the main spans. Virtis LFD ratings are the same in 6.2 and 6.3 (see the attached HS20 Ratings file). AASHTO LFD ratings in 6.3 are comparable with those in Virtis LFD. The attached HS20 lane Load file compares the LL actions at the reported BRASS LFD HS20 lane load controlling location (first interior support). I think the difference is due to the way member stiffness is determined for use in the structural analysis (see attached PDF file, there's a table comparing Virtis LFD and BRASS LFD).

Dear Herman,

I would appreciate if you could please check these above two virtis files and let us know what's wrong with them? The same model is giving different rating values in different virtis versions. As you see, version 6.30 is giving very high rating compared to Version 6.20. Additionally, flexure is governing in version 6.20 and shear in support is governing in version 6.30.

Thanks

Description

FROM: Dean Teal DATE: 12/30/2011 10:35:23 AM Eastern Standard Time  
In the View Analysis Output – do we have any control of the order?

Reason – we use an automated process to capture and use the LRFR results  
AASHTO and BRASS have different orders to the report

LRFR analysis

Using provided LRFR Legal Load Rating template in the analysis setting  
I attached the output from each

This difference in order really makes our automated process unusable

FROM: Herman Lee DATE: 12/31/2011 6:22:27 AM Eastern Standard Time  
The Analysis Output can be sorted by double-clicking the header of the column.

The order of the Live Load and Live Load Type in the Rating Results Summary is based on the order the results are populated by the analysis engine. It will be a minor change in the user interface to sort the results based on certain criteria before displaying.

## Description

FROM: Amanda Jackson DATE: 1/5/2012 12:16:19 PM Eastern Standard Time

I am getting an inventory rating factor of 0.635 for the main exterior girders on the attached bridge. When I track this rating factor down in the spec check (at 100% of span 2 - at support number 3), it shows web buckling from LFD 17th edition article 10.61 as the controlling rating. All of the numbers seem to be correct. The problem is that article 10.61 is a constructability check, which should not control a rating. It is for web buckling before the deck has hardened. Also, live loads should not be applied to the strength calculated in article 10.61, which appears to be what the AASHTO engine is doing when I look at the spec checker (see attached screenshot).

FROM: Krisha Kennelly DATE: 1/5/2012 1:04:22 PM Eastern Standard Time

From MBE 6B.5.3.1, second paragraph, third sentence: For beams, the overload limitations of Article

2092

Complete Issue Information

10.57 of the AASHTO Standard Specifications should also be considered.

From Art. 10.57: Web bend buckling shall be checked for the overload according to Equation 10-173.

Equation 10-173 is in 10.61.1 but it is not being evaluated for constructibility, it is being used to evaluate the overload in 10.57.

Also refer to MBE Appendix L6B.2.5.3 and Appendix A Example A1 to see how this equation is used to compute the rating. Virtis is following this approach.

FROM: Amanda Jackson DATE: 1/5/2012 3:03:38 PM Eastern Standard Time  
Got it. Thanks for the explanation. I was having issues with the rating in the negative moment region over the pier. I knew the rating was too low and thought that was the explanation. I added the thickness of the fill plates to the web thickness for that cross-section and got a more reasonable rating. I'll forward this bridge to you when I get the entire thing created. It's a good one for testing. It is a haunched girder-floorbeam-stringer bridge with a lot of cross-section changes and a mixture of solid floorbeams and truss floorbeams. Virtis seems to be handling it perfectly.

Subject: RE: VIRTIS 6.3

Tim,

The I-80 VIRTIS model can be found on the IDOT ftp site: <ftp://ftp.dot.state.il.us/pub/Bridges/>, in the VIRTIS folder. Below are the questions we have for Baker:

We are currently calculating the load ratings for the Cedar Street Bridge and have noticed some differences between the ratings between VIRTIS version 6.2 and 6.3. Upon further investigation, it seems that V6.3 is using different capacities than V6.2, on some members. One member in particular are the floorbeams of the girder spans. The floorbeam frames between the two girders and then consists of cantilever sections framing into the outside of the girders. In V6.2, the moment capacity was calculated using 10.48.4 of the standard specifications and gave:  
 $Mu = MrRb = 2993.81 * 0.806 = 2413.01 \text{ k*ft}$ . In V6.3, it seems that it is using the equations from 10.48.4, with the same Mr and Rb values; however, the Mu that is being calculated is not correct (see attachment). Have you ran into something like this before?

There also seems to be a difference between the capacities used between V6.2 and V6.3 for the continuous beam spans on the approach spans (Spans 1-4). The cross section at Span 4 – 60% (Fascia Beam) consists of a WF with a bottom cover plate. V6.2 calculates the capacity of the beam using section 10.50 of the standard specifications. In V6.3, the capacity is calculated using section 10.48.4 of the standard specifications and it states that section 10.50 does not apply because cross section contains a cover plate. This assumption seems incorrect.

Please evaluate and verify if errors exist for these two situations.

Thank you,

AARON M. SCHAFFER, EIT | Structural Engineer in Training

Subject: FW: VIRTIS 6.3

Tim,

M&M sent this in (read below). Both BRASS & Virtis purport to use  $\text{Mu}=\text{MrRbR}$  but are getting different results. For the member that produced the attached output, BRASS appears to generate the correct value according to M&M.  
 $\text{Mr}=2993.81$ ,  $\text{Rb}=0.806$ ,  $\text{R}=1.000$  ->  $\text{Mu}$  (BRASS) = 2413.01 k-ft;  $\text{Mu}$ (Virtis) = 1947.19 k-ft.

Please forward this to Baker for evaluation. I presume, if necessary, that M&M could provide an export file for whatever bridge the attached output is based on.

FROM: Wayne Skow DATE: 1/20/2012 1:38:05 PM Eastern Standard Time  
The I-80 bridge is attached to this incident, but I don't think it's the bridge M&M is referring to. Please attach the bridge from which the report in the pdf file came from and specify exactly which member to run.

Thanks,  
Wayne

FROM: Wayne Skow DATE: 1/20/2012 8:12:54 PM Eastern Standard Time  
10.48.4 is producing a bad value because of 10.48.2. 10.48.2 fails, but it is indicating a pass. I can't figure out a work around for it.

FROM: Wayne Skow DATE: 1/21/2012 10:39:40 AM Eastern Standard Time  
Concerning the 10.48.4 issue, there is a problem with 10.48.2. At the point indicated in the pdf file, 10.48.2 should show fail as indicated in 10.48.2.1. But it is showing pass. If 10.48.2 had failed, 10.48.4 would have shown the correct Mu of 2413. But as is, Rb was applied twice. I tried to figure out a work-a-round, but couldn't.

Concerning the bottom flange cover plate. This was discussed last year. When a flange is in compression and has a coverplate, we cannot assume the coveplate can go plastic. Therefore, we don't allow 10.50.2.1 when there's negative moment or 10.50.1.1.2 when there's positive moment. This should probably be controllable so the engineer can decide when to override.

FROM: Krisha Kennelly DATE: 1/25/2012 11:27:04 AM Eastern Standard Time  
The issue with 10.48.4 applying Rb twice has been resolved. A patch dll will be sent to Illinois via FTP.

Please note that the patch is for version 6.3.1. The xml file attached to this issue is for version 6.3.0. Please upgrade your software to version 6.3.1 before applying the patch.

FROM: Bin Zhang DATE: 2/3/2012 1:53:13 PM Eastern Standard Time

Complete Issue Information

Info - Capacities determined using AASHTO Std Specifications 17th Edition  
Info - Ratings determined using AASHTO MBE Specifications 2nd Edition  
Info - Generating Stage 1 Span Model...  
Error - Support constraints are inadequate. Finite element model will be unstable!

Error - Analysis failed!

=====

After changing the assignment of those four stringers the analysis completes without any errors.

Observed that the "Pier 19 Rehabbed Stringers" stringer definition was not associated with any stringer group def. If I switch it to be associated with "4-Sp Group" the stringer analysis is successful.

I think this is probably a tolerance issue. This is not related to Up to date flag changes.

FROM: Herman Lee DATE: 7/13/2012 11:53:06 AM Eastern Daylight Time  
The defect is indirectly related to the fix for Incident 11112.  
Resolved for Beta 3.

### Description

FROM: Aaron Kemna DATE: 1/11/2012 3:46:21 PM Eastern Standard Time

I tried running a large group of bridges (857) in Virtis. At some point during the run an error will kick out. I'll attach the error. The bridge that kicks out is different everytime. I ran 300+, then 607, then 400+ until I started getting the error after each run. Each run began after shutting my system down. Once a bridge kicks out, additional attempts to run without restarting the computer will give the error only for concrete bridges (Some concrete bridges will run, but most spit out the error). Steel bridges are not affected. This is a BRASS Error, but the problem seems to be similar to the dll error that pops up with a 32 bit system. This seems to be a compiler problem so I decided to send this to Virtis.

FROM: Brian Goodrich DATE: 1/12/2012 10:15:23 AM Mountain Standard Time

This issue is the same as BRASS Incident 241, which has been fixed. There is no workaround. WYDOT will release a new version soon.

I would like to see an enhancement to the Virtis rating output that lists the controlling location for all of the spec checks, not just the lowest rating factor. Some ratings calculated by Virtis are conservative

4/19/2016 3:09:00 PM

HRS AASHTO

2100

### Complete Issue Information

(i.e. web stiffness checks in built-up sections – the AASHTO engine ignores the vertical legs of the flange angles). An engineer needs to use judgment in looking at rating results, and is unable to do this without a full output – especially on Girder-Floorbeam-Stringer superstructures, where generating an LFD Analysis Report is not an option.

Also along these lines, it would be helpful to have a control option to ignore certain spec check results. These control options would need to be used with caution, but will help in cases such as rating a bridge where the results of a certain spec check are too conservative, and the engineer has verified a higher rating factor by hand. Checking “ignore” would allow the engineer to get the second controlling condition out of the program.

Conservative results are good in design, but they can be a problem in rating, especially if an engineer is trying to determine whether emergency vehicles can safely cross a bridge. Rating engineers need to be able to pick and choose which spec check conditions are allowed to control the entire bridge rating.

FROM: Herman Lee DATE: 4/2/2012 3:19:27 PM Eastern Daylight Time  
Please see whether the New Detailed LFR Report in the Virtis 6.4 release satisfies your needs.

Complete Issue Information

FROM: Herman Lee DATE: 1/25/2012 3:45:42 PM Eastern Standard Time  
Submitted on behalf of Vinacs M Vinayagamoorthy, Caltrans.

Part of the received e-mail:

=====

Herman

Could you please help in resolving the following issue:

I have analyzed the bridge using 8 permit trucks that Caltrans uses.

However the for one truck configuration it lists the rating in tons as.  
Why?

(Embedded image moved to file: pic16359.jpg)

This happens to the P15DBL wide truck only

Analysis setting is shown here

(Embedded image moved to file: pic08340.jpg)

Also, I am attaching the truck configuration and California specified load factors files below:

(See attached file: LRFR Library.xml)

=====

I'm able to reproduce the problem using the RC Training Bridge 1.

To reproduce the problem.

1. Import the vehicles in the attached Library XML file. Do not import the LRFR factor in the file (see Incident 11222 for reason).
2. Setup the Analysis Settings based on the pic08340.jpg file.
3. Rate G1 in RC Training Bridge 1.

Wayne, please first to check whether the bug is in AbaSpecCtrl.

FROM: Wayne Skow DATE: 2/27/2012 7:23:32 AM Eastern Standard Time

The problem was UiMemberResultsReportVw.cpp. The wrong vehicle Id was being used to determine if it was the special pedestrian vehicle. The ped vehicle Id was 12. So, whenever there are 12 or more vehicles in the analysis, the 12th one is identified as the ped vehicle and those extra fields are filled with values.

Fixed in v6.4. Workaround is to process less than 12 vehicles per analysis.

FROM: Matt Kolis DATE: 5/5/2012 5:41:10 PM Eastern Daylight Time

When attempting to import the LRFR Library, VO64 Alpha Build 4 crashes. See attached Doc2.docx for screenshots.

FROM: Wayne Skow DATE: 5/9/2012 11:02:14 AM Eastern Daylight Time

I was able to successfully import the file into v64a4 (running under Oracle VM VirtualBox)

Cc: Souther, Timothy E; Mertz, Rachel L; Petermeier, David W  
Subject: Error calculating Rb

Tim,

The errors we were encountering previously have been resolved; however, I've noticed another error when calculating Mu in section 10.48.2. When working through the VIRTIS output, it was verified that the member I am looking at meets the requirements of a braced Noncompact section. In Section 10.48.2 (Braced Noncompact Sections) it states that when calculating Rb, fb should be substituted in for the Mr/Sx term. In VIRTIS, fb is not being substituted into the equation and Mr/Sx is being used. The member I am looking at is in the Line Girder Superstructure Definition titled "Spans 9-19 (Double Girder System)". The point of interest is Span 6 at 95.25 ft. I have attached the Mu calculation output and the Rb calculation output for your use. As you can see from the attachments, when VIRTIS calculates Rb it is using Mr/Sx = 36ksi and getting Rb=0.734. If fb=25.67ksi (Inventory Load case I) is

Complete Issue Information

substituted into the equation you get  $R_b=0.79$ , which increases the capacity of the member. Also, by using  $f_b$ , the  $R_b$  values would change for all load cases. Have you come across this error and if not, could you please forward this to Baker for their review. The I-80 model should still be on the IDOT ftp site, but if you need me to send it to you again please let me know.

Thank you,

AARON M. SCHAFFER, EIT | Structural Engineer in Training

FROM: Wayne Skow DATE: 1/31/2012 12:25:52 PM Eastern Standard Time

This is not a bug. Virtis is calculating  $R_b$  as intended when doing a rating. The problem with using  $f_b$  when rating a girder is that the resultant rating factor is not "linear" meaning you cannot take a resultant rating factor of, say, 1.1 from a 10 ton truck and assume you'd get a 1.0 rating factor from an 11 ton truck. In fact, you'd get a rating factor less than 1.0 since  $f_b$  would be larger, making  $R_b$  smaller. To manage this, Virtis uses either  $M_r/S_xc$  or  $F_{cr}$  (as stated in the output for 10.48.4.1. $R_b$ ), which is the maximum allowed stress in the section. The resulting rating factor will be smaller, but the extrapolation to a rating factor of 1.0 is OK since, at that point, the girder is stressed to exactly  $M_r/S_xc$  or  $F_{cr}$ .

### Description

FROM: Srujana Thogaru DATE: 1/31/2012 1:22:11 PM Eastern Standard Time  
(Email from Vinacs M Vinayagamoorthy on Jan 30th 2012)

For the attached Bridge XML file AASHTO LRFR Engine fails to analyze interior girders when support  
skews are varied. Exterior girders are analyzed successfully.

In 6.4 Development I was able to reproduce the problem. Upon further investigation found that the code  
first asserts at Line 7040 in AbaSpecCtrl - scsuperstructure and then the analysis is aborted for  
DoLoadResistanceRcElementSpecCheck.

FROM: Krishna Kennelly DATE: 2/1/2012 10:43:45 AM Eastern Standard Time  
Conservative workaround I found:

For G2, on the Girder Profile: Web Depth tab revise the first range length from 48.457344 to  
48.457340. See attached file.

The member can then be analyzed with the AASHTO LRFR engine. The results for shear at the piers  
will be conservative since the engine is not recognizing these locations as supports and thus shear will  
be evaluated there. If the engine were to properly recognize these locations as supports, dv would be  
computed there and shear would not be checked in the regions located within dv of the support.

The source of the problem is the web range entered by the user as 48.457344 is stored as a section  
change point when exporting the cross section data. Then the engine tries to add the computed  
support at 48.457343563 but it is within the user tolerance of 48.457344 so it is not added as a point to

4/19/2016 3:09:01 PM

HRS AASHTO

2107

Complete Issue Information

be evaluated. (The supports are evaluated to compute dv to determine if user defined points are within the dv location and shear can be ignored there. A rating won't be performed at the supports since you haven't selected tenth pts as a control option.) The engine later compares 48.457344 against the computed span length of 48.457343563 using a tolerance tighter than the user tolerance, finds that they aren't equal and then doesn't consider 8.457344 to be support.

Problem has been fixed for 6.4.

FROM: Matt Kolis DATE: 5/5/2012 5:48:04 PM Eastern Daylight Time  
Fix verified in VO64 Alpha Build 4.

Description

FROM: Dean Teal DATE: 2/1/2012 1:50:25 PM Eastern Standard Time  
I received this from a designer at HNTB (Michael Briggs)

Using the AASHTO engine (V/O v.6.3.1), upon reviewing LRFR output (specifically, in this case for a

Complete Issue Information

steel girder system superstructure) it appears that a 33% Dynamic Load Allowance (IM) is being used to increase to the live load force for lane (reactions at a minimum... but possibly the moment and shears too? The output is not specific in that nature). Either way, is this an output "bug" or is IM actually being applied to the lane load? It should always be 1.00 for lane load.

Screen Shot Attached

FROM: Herman Lee DATE: 2/2/2012 8:00:19 AM Eastern Standard Time  
It is a bug in the output. The reported lane loads are without impact.

FROM: Bin Zhang DATE: 9/11/2012 9:23:54 AM Eastern Daylight Time  
It's a cosmetic error in the report grid, resolved for VO6.5.

FROM: Bin Zhang DATE: 11/27/2012 1:06:15 PM Eastern Standard Time  
This fix will also be available in Version 6.4.1.

FROM: Laura Volle DATE: 11/30/2012 1:26:14 PM Eastern Standard Time  
It has been verified in 6.4.1 beta 2 version that the impact is displayed as 0 for the lane load.

## Description

FROM: Creightyn McMunn DATE: 2/6/2012 4:22:21 PM Eastern Standard Time  
Our consultants have run into some trouble applying the 1979 Specs with the AASHTO LFR engine.

"When the 1979 spec is used for shear, the Virtis LFR and AASHTO LFR engines are calculating the shear capacity very differently. Per the AASHTO 1979 Interim Specification Section 1.6.13 – Shear: "For the design of web reinforcement in simply supported members carrying moving loads, it is recommended that shear be investigated only in the middle half of the span length." Therefore, the Virtis Engine ignores the shear between 0 and 25% & 75% and 100% of the span and the RF is then controlled by moment at midspan. When using the 1979 Spec, the AASHTO Engine is not using this provision and is not ignoring the shear at the end quarters of the span." See attached documents.

FROM: Krisha Kennelly DATE: 2/9/2012 2:21:05 PM Eastern Standard Time  
I have confirmed that this is a bug. The results produced by the AASTHO LFR engine are conservative since it is computing a shear rating factor where it should not be.

FROM: Creightyn McMunn DATE: 2/24/2012 1:36:17 PM Eastern Standard Time  
When will this bug be fixed? We have a large number of bridges in our inventory that rely on the 1979 Specifications.

FROM: Aaron Kemna DATE: 3/28/2012 12:10:41 PM Eastern Daylight Time  
I just want to clarify that for continuous bridges, the ends of girders are checked except at the ends of the bridge. Also, the AASHTO engine adds the vertical prestress force to the shear capacity. I am fairly certain that the vertical prestress force should not be included for 1979 AASHTO.

FROM: Aaron Kemna DATE: 3/30/2012 11:37:21 AM Eastern Daylight Time  
BRASS includes the Vp force. I think this is a carry over from the current AASHTO method. I don't have a problem keeping it in there, but this may be straying away from the code.

4/19/2016 3:09:02 PM

HRS AASHTO

2110

Complete Issue Information

FROM: Creightyn McMunn DATE: 8/9/2012 5:49:28 PM Eastern Daylight Time

This issue has not been fixed for Version 6.4. It is critical that this be fixed before 6.4 is released as Michigan has a large number of bridges requiring the 1979 Shear Specifications. This is even more critical if the Virtis engine is not going to be included in 6.4 because we will have no options available to accurately run the 1979 Shear Specifications.

FROM: Krisha Kennelly DATE: 8/10/2012 9:14:35 AM Eastern Daylight Time

Can you answer the following before we start work on this:

1. Do you want the Vp force included in the capacity?
2. Please clarify what Aaron said on 3/28 about continuous bridges. For continuous span bridges, should the AASHTO engine only ignore shear between 0 and 25% of span 1 and between 75% and 100% of the end span? Shear is to be checked at all other regions of the continuous span?

FROM: Creightyn McMunn DATE: 8/10/2012 11:15:48 AM Eastern Daylight Time

1. I agree with Aaron that using Vp is straying away from the code. I do not believe it should be included in the capacity.

2. I agree with your statement regarding continuous bridges.

FROM: Creightyn McMunn DATE: 8/10/2012 11:16:27 AM Eastern Daylight Time

Please confirm that this will be included in 6.4.

FROM: Krisha Kennelly DATE: 8/10/2012 11:44:53 AM Eastern Daylight Time

Yes, it will be in 6.4.

FROM: Krisha Kennelly DATE: 8/11/2012 9:31:58 AM Eastern Daylight Time

Fixed for 6.4 acceptance build

FROM: Bin Zhang DATE: 8/29/2012 9:50:44 AM Eastern Daylight Time

Verified for acceptance build:

1. Vp is NOT included in the capacity.
2. For simple span bridges, the shear between 0 and 25% & 75% and 100% of the span are ignored.
3. For continuous span bridges, AASHTO LFD engine only ignore shear between 0 and 25% of span 1 and between 75% and 100% of the end span. Shear is checked at all other regions of the continuous span.

FROM: Creightyn McMunn DATE: 9/10/2012 4:06:42 PM Eastern Daylight Time

Results for AASHTO engine in V6.4 Beta 4 are similar to results in V6.3.1 for Virtis engine.

### Description

FROM: Dean Teal DATE: 2/16/2012 10:21:50 AM Eastern Standard Time

I had set up a batch rating of 251 structures

On structure #26 "Existing" wasn't declared so the batch paused till I said OK, when it went on it seemed to be running the analysis way to fast, then it stopped with the attached run time error – this was fatal error that closed Virtis.

I restarted and tried to run the batch again – this time it did not stop on #26, it simply ran for a short time and produced the same run time error and then Virtis closed.

I rebooted and started the same batch again – this time it ran to about #130 before issuing the run time error and fatally closing Virtis. Note – it don't stop at structure #26 like it should have?

This is a windows 7 64 bit installation utilizing the BRASS engine, all LFD.

FROM: Dean Teal DATE: 2/16/2012 12:06:59 PM Eastern Standard Time

Note:

I was able to run the 251 batch load rating on my XP computer, I then tried it on my 64 bit windows 7 laptop and did not have any troubles.

Complete Issue Information

FROM: Dean Teal DATE: 2/21/2012 9:02:46 AM Eastern Standard Time  
I did a uninstall and reinstall of both virtis and brass softwares. The results are unchanged.  
One note - it appears that the program is looking for a file called "MbrAlt1.scratch"

FROM: Dean Teal DATE: 2/22/2012 7:24:48 AM Eastern Standard Time  
We reinstalled oracle - no change  
Note: the stoppage does not occure at the same time or the same bridge - it is very random

FROM: Brian Goodrich DATE: 2/22/2012 1:49:58 PM Mountain Standard Time  
I believe this is identical to BRASS Incident 241. I will send you instructions for downloading a new version.

FROM: Brian Goodrich DATE: 2/23/2012 8:41:06 AM Mountain Standard Time  
Some BRASS subroutines had been storing a memory address in an integer variable that was not the correct size for the 64-bit version. Sometimes the address was OK, but other times it did not which leads to the randomness you're seeing. This was fixed for BRASS Incident 241.

Complete Issue Information

FROM: Bryan Silvis DATE: 2/21/2012 11:00:34 AM Eastern Standard Time

For the attached two-span continuous CIP slab structure, rating results for VDOT's BP-115 and BP-90 vehicle are out-of-line with other ratings with Vehicle Properties set to single trip. With Vehicle Properties set to unlimited crossings, they are in-line with other ratings. This occurs both in Versions 6.2 and 6.3.1.

Attached is the .xml file for the structure, the library export for the BP-115 and BP-90 vehicles, and a pdf containing screenshots of the two vehicle settings and the resulting rating.

FROM: Srujana Thogaru DATE: 10/16/2012 10:01:45 AM Eastern Daylight Time

Above mentioned issue is caused due to difference in the distribution factors.

As mentioned in the analysis progress window For single trip single lane distribution factors are divided by 1.2

Warning - Using single lane distribution factor for special (limited crossing) permit vehicle BP-115!  
For the special (limited crossing) permit truck, the single lane distribution factors have been divided by 1.2 to remove the multiple presence factor.

And

Warning - Using single lane distribution factor for special (limited crossing) permit vehicle BP-90!  
For the special (limited crossing) permit truck, the single lane distribution factors have been divided by 1.2 to remove the multiple presence factor.

Multi Lane distribution factors entered in the LLDF window are not equal if single lane divided by 1.2. Adjusting the distribution factors gives nearly same rating for "Single Trip" and "Unlimited Crossing"

HRS AASHTO

2117

Complete Issue Information

FROM: Creightyn McMunn DATE: 2/27/2012 4:10:18 PM Eastern Standard Time

A consultant brought to my attention that Virtis is using the wrong dead and live loads for the attached parabolic concrete tee beam structure. When reviewing the AASHTO spec check for "B6.5.1 Shear Rating General Concrete Shear", the same dead load and live loads are being used for the entire length of Span 3. The attached spec check screenshots show the same shear near midspan as at the supports.

FROM: Herman Lee DATE: 2/28/2012 8:34:27 AM Eastern Standard Time

Span 3 midspan location cannot be within d from support. There's a defect in retrieving the actions at that location.

FROM: Krisha Kennelly DATE: 2/28/2012 10:32:39 AM Eastern Standard Time

This issue is a duplicate of 11228 which has been fixed for Version 6.4.

Due to tolerance issues, the third support is not being considered as a support.

A workaround is to specify the 4th web profile range on the Girder Profile: Web tab as starting at 0' from Support 3. Then the AASHTO LFR engine will recognize this pt as a support and correctly evaluate points within dv of this support and adjust their shear correctly. See the attached '11253 web profile.png' for the change required in the data entry.

FROM: Creightyn McMunn DATE: 9/10/2012 5:07:43 PM Eastern Daylight Time

Verified fixed in V6. 4 Beta 4.

Description

FROM: Tim Armbrecht DATE: 3/6/2012 10:52:09 AM Eastern Standard Time  
 From my consultant (Souther):

When performing the analysis of either North Truss or South Truss within the referenced Virtis bridge model, the following Error Message is produced:

Error getting rolled shape from steel rolled shape ranges to left of 12.19200000 m!  
 Current tolerance for m is 0.00304800.

It repeats 15 times within the message box.

Two issues:

4/19/2016 3:09:03 PM

HRS AASHTO

2119

Complete Issue Information

- What is causing this error? I haven't found anything that seems erroneous in the input and the results of the analysis seem reasonable.
- Why is it that it is using metric dimension when everything to do with this model is U.S. Customary?

FROM: Bin Zhang DATE: 3/7/2012 10:29:43 AM Eastern Standard Time  
 I could not find any model error in the #11256 bridge, I think it's a program bug related to locate the haunch distance.

FROM: Herman Lee DATE: 12/5/2012 9:13:05 AM Eastern Standard Time  
 The errors are caused by the following stringer definition inputs. Domain computation (helper) functions use metric units, that's why the error message is displayed using metric units.

1. 24WF84(30'/P3) The length of the 24WF84 shape should be 28.6666'.
2. 24WF84(30'/P4) The length of the 24WF84 shape should be 28.6666'.
3. 24WF84(30'/P4') The length of the 24WF84 shape should be 28.6666'.
4. 30WF108(40'/P17') Total length of rolled shape is 35' but the span length in the associated stringer group definition is 40'.

Description

FROM: Tim Armbrecht DATE: 3/6/2012 10:53:37 AM Eastern Standard Time  
From my consultant (Souther) - please use the XML file submitted with 11256.

The multi-lane LLDF calculated by Virtis for the North and South Trusses within the Virtis bridge model contained in the referenced export file are incorrect. The manually calculated multilane LLDF values are 1.38956 for the North Truss and 1.478571 for the South Truss, both based on 3 lanes loaded with a 0.9 reduction factor. The values, respectively, calculated by Virtis are 0.83 and 1.40 (taken from the Truss Rating Results table). It appears that, for the North Truss, Virtis is ignoring vehicle loads located on the two-lane side of the median barrier. I don't know how Virtis is getting the South Truss value.

Note: The referenced export is the same as for the bug report sent by the email with Subject: Virtis: Truss Run Error Message.

FROM: Bin Zhang DATE: 3/13/2012 2:15:00 PM Eastern Daylight Time  
I agree with Souther, I think it's a program bug. Virtis only considers the 1st travelway when calculating the LLDF for the truss bridge.

FROM: Xinmei Li DATE: 3/19/2012 11:21:44 AM Eastern Daylight Time  
While computing multilane distribution factor Median between travelways were considered as another parapet, so travelway2 was not considered. This error also exists in girder system LLDF calculations.

FROM: Xinmei Li DATE: 3/21/2012 2:03:16 PM Eastern Daylight Time  
This bug is resolved for Truss for 64 release.  
I also tested BID19 to make sure that single travel way still works fine. I attached hand calculations for both bridges. The LLDF calculations by virtis match my hand calcs.

FROM: Todd Thompson DATE: 4/10/2012 1:57:29 PM Eastern Daylight Time  
Agree - anytime you have a median barrier - Virtis only sees the first travelway and all LLDF's are based upon that travel way. I have as a workound - eliminate the median barrier - compute the LL DF's (truss or girder) and then put the median barrier back. A pain but a shortcoming with the application.

FROM: Bin Zhang DATE: 4/19/2012 3:25:28 PM Eastern Daylight Time  
Issue still exists for VO64Alpha3, please read the attached "LLDFCalculations\_Detail" for details.

FROM: Xinmei Li DATE: 5/7/2012 1:35:16 PM Eastern Daylight Time  
Please retest. I can't reproduce the attached "LLDFCalculations\_Detail".  
See attached details for North and South trusses. LLDF for multi lane is 1.39 for North and 1.48 for South.

FROM: Bin Zhang DATE: 5/7/2012 2:05:05 PM Eastern Daylight Time  
Verified for VO64Alpha5.

### Description

FROM: Tim Armbrecht DATE: 3/6/2012 10:54:49 AM Eastern Standard Time  
From my consultant (Souther) - please use the XML file submitted with 11256.

The calculation of a non symmetric appurtenance load to be applied to a truss panel point is incorrect. The computation should be based on the lever-rule (for both Stage 1 and Stage 2 loads), which would apply the loading to each truss proportionate to the distance from the load. When the load is defined as Stage 2, it erroneously applies 50% of the load to each truss. And, when it's a Stage 1 load it appears that it applies the entire load to the nearer truss and none to the farther truss. In the

4/19/2016 3:09:04 PM

HRS AASHTO

2122

Complete Issue Information

referenced example, the median barrier is 17.25' oc from the North Truss and 28.25' oc from the South Truss. Therefore the median load should be 58.55% on the North Truss and 41.45% on the South Truss for both Stage 1 and Stage 2 loads.

Note: The referenced export is the same as for the bug report sent by the email with Subject: Virtis: Truss Run Error Message.

FROM: Bin Zhang DATE: 3/14/2012 9:17:52 AM Eastern Daylight Time  
Virtis has several options for the dead load distribution. I listed the description of the dead load distribution for both stage 1 and stage 2 as below. I also attached a figure in the document to show how to set the dead load distribution in the GUI for the user. Please let me know if this does not answer your question.

\*\*\*\*\*  
\*\*\*\*\*

Stage 1 dead load distribution

Specify the manner in which the stage 1 dead loads are to be distributed as either by tributary area, by transverse simple-beam analysis, by transverse continuous-beam analysis, or user input results from independent 3D elastic analysis. These dead load distribution methods are described below. Stage 1 represents non-composite dead load.

Stage 2 dead load distribution

Specify the manner in which the stage 2 dead loads are to be distributed as either uniformly to all girders, by tributary area, by transverse simple-beam analysis, by transverse continuous-beam analysis, or user input results from independent 3D elastic analysis. These dead load distribution methods are described below. Stage 2 represents composite (sustained) dead load.

Description of dead load distribution methods:

1. Uniformly to all girders – the program computes the total dead load and distributes it equally to each girder, regardless of the location of the loads and the girders in the cross section.
2. By tributary area – the program establishes tributary areas for each girder (based on the midpoint between girders) and then distributes all dead loads according to their location within the various tributary areas.
3. By transverse simple-beam analysis – the program distributes all dead loads assuming that the deck behavior is like that of a simple beam, with each girder acting as a simple support.
4. By transverse continuous-beam analysis – the program distributes all dead loads assuming that the deck behavior is like that of a continuous beam, with each girder acting as a support for the continuous deck.
5. User-defined dead load – the program uses the dead loads that you input based on an independent analysis.

\*\*\*\*\*  
\*\*\*\*\*

FROM: Bin Zhang DATE: 3/15/2012 11:30:06 AM Eastern Daylight Time  
In the truss attached in the incident, "By tributary area" is selected to distribute the dead load for stage one. That's the reason why we get "the entire load to the nearer truss and none to the farther truss" for stage one. If "By transverse simple-beam analysis" is selected, Virtis will apply the lever-rule to distribute the dead load as Mr. Souther expected.  
" By transverse simple-beam analysis " is selected to distribute the dead load for stage two. That's the reason why we get "50% of the load to each truss " for stage two. Similarly, we can use the option "By

Description

FROM: Chris Vaisa DATE: 3/7/2012 9:44:36 AM Eastern Standard Time

Refer to the attached version 6.3.1 model, "Jaguar\_dr\_over\_NM599 Version 6-3-1.xml". The final controlling inventory-level & operating-level ratings are unexpectedly low. Both ratings occur near Support 2 and are controlled by shear capacity. Upon some investigation, it appears that the program may not be properly calculating concrete strength,  $V_c$  in the negative moment region, between (but not including) the points 1.09 (0.9 point in Span 1) & 2.01 (0.1 point in Span 2). In this region, the value for  $V_c$  is reverting to  $V_{ci}$  minimum ( $1.7 \sqrt{f'c} b d$ ), which causes a substantial drop in the shear capacities and shear rating factors, as compared to the adjacent tenth points. It appears that this may be caused by incorrect accounting for negative shear values and resulting incorrect calculation of  $V_{ci}$ .

Refer to the attached version 6.2 model of the same bridge, "Jaguar Version 6-2 Model.xml". This model was created to see if the low concrete shear strength & rating factors occur in this earlier version. This model does not appear to have low shear values near/at the support – this conclusion is based on comparison of values at points 1.10 & 2.00, since, unlike version 6.3.1, I did not find calculations for intermediate (non-tenth) points. Shear rating factors at the above points, at Support 2, are quite high (inventory rating factor > 10) due to a large concrete shear capacity,  $V_c$  (which at this point is based on  $V_{ci}$ ). The final rating factors for this model are 1.05 & 1.68, both being controlled by shear in the areas of 0.3 – 0.4 of the spans.

Note: By ignoring the suspect region in the version 6.3.1 model, the controlling shear ratings appear to agree closely with the version 6.2 results – shear rating factors of 1.04 to 1.05 in the same 0.3 – 0.4 regions were observed in the version 6.3.1 model

FROM: Srujana Thogaru DATE: 3/16/2012 2:08:57 PM Eastern Daylight Time

In article 9.20.2.2 Equation 9-27  $M_{max}$  is not handled for the negative moment values.

Fix: Absolute value of the  $M_{max}$  is considered for proper computation of  $V_{ci}$ .

There is no workaround for this issue.

Fixed for 6.4 Release.

Description

FROM: Creightyn McMunn DATE: 3/7/2012 4:44:48 PM Eastern Standard Time  
 When trying to run the "Typical Fascia Beam" in either "Span 1 and Span 4 (Fascia PS Box Beams G1 and G8 Only)" or "Span 2 and Span 3 (Fascia PS Box Beams G1 and G8 Only)" for the attached file, I get the error "Error - Error performing prestress loss LFR specification checking! Analysis failed!" Both will run when using the Virtis Std engine.

FROM: Krisha Kennelly DATE: 3/8/2012 9:43:12 AM Eastern Standard Time  
 Looking at Typical Fascia Beam in "Span 1 and Span 4 (Fascia PS Box Beams G1 and G8 Only)", I see that the haunch to the outside edge of the beam is entered as 22.5". That plus the beam width of 48" equals 70.5". The effective flange width of the slab is entered as 58.5". The routine that creates the sections used in spec checking has a validation that checks that the haunch can't be wider than the effective slab width. Is the data entered for this girder correct?

FROM: Krisha Kennelly DATE: 3/8/2012 2:34:36 PM Eastern Standard Time  
 email from Creightyn:

Complete Issue Information

The effective flange width of 58.5" was computed by Virtis by clicking "Compute from Typical Section...". It seems to me that the correct effective flange width should be 82.5" (1/2 the spacing from CL fascia to CL interior beam plus the distance from the CL of fascia to edge of deck). Entering 82.5" for effective flange width solves the initial concern, but now there is the concern of how the 58.5" was calculated?

Thank you,  
Creightyn

May - please investigate. The correct value should be 82.5". It is computed correctly in debug for 6.4 but incorrectly in 6.3.1 release.

FROM: Xinmei Li DATE: 3/15/2012 1:50:14 PM Eastern Daylight Time  
I can reproduce this issue with 6.3.1. It is a duplicate of VI 10835. It's resolved for 6.4 release.  
Workaround is to enter effective flange width manually.

## Complete Issue Information

Hello, My name is Naveen working with UIC/ Prime Engg. located in Wallingford, CT. I am trying to do a load rating of a Truss Floorbeam Stringer System using Virtis 6.2.

The bridge has three through trusses. Two outside trusses and one inside truss. The outside trusses are identical, the inside truss is similar with different section properties.

I have defined two trusses, floorbeams and stringers. But when I run the program for analyzing the trusses, it gives a error saying,

```
" Computing nodal loads due to floorbeams...
  // Floorbeam1 -> 3.894 kip @ 0.000 ft
  //   Applied to L0 - Node Number 12
  // Floorbeam2 -> 2.698 kip @ 22.812 ft
###Warning - Couldn't find panel point at floorbeam location 22.812446 ft..
###Warning - Couldn't apply floorbeam loads to panel point..
???Error - Unable to compute floorbeam loads ...
???Error - Unable to compute floorsystem loads...
```

and a similar error for the same floorbeam for the other truss also,

```
"Computing nodal loads due to floorbeams...
  // Floorbeam1 -> 3.894 kip @ 0.000 ft
  //   Applied to L0 - Node Number 12
  // Floorbeam2 -> 2.698 kip @ 2.521 ft
###Warning - Couldn't find panel point at floorbeam location 2.520754 ft..
###Warning - Couldn't apply floorbeam loads to panel point..
???Error - Unable to compute floorbeam loads ...
???Error - Unable to compute floorsystem loads...
```

I am attaching the Virtis file and the plan. Any help would be greatly appreciated.  
thank you so much,  
Naveen

FROM: Herman Lee DATE: 3/8/2012 12:49:03 PM Eastern Standard Time  
Please double check that truss panel points are defined at the floorbeam locations.

Please note that the Special Consultant License Option only allows us to provide limited support for installation. The primary support channel for consultant is through the sponsoring agency of your license.

FROM: Navnit Nakrani DATE: 3/8/2012 2:12:45 PM Eastern Standard Time  
Lee, the truss panel points are not at the floorbeam locations for this bridge. Can we use virtis to do such bridges?

FROM: Herman Lee DATE: 3/8/2012 2:54:54 PM Eastern Standard Time  
You could model the structure using truss line superstructure definition.

FROM: Navnit Nakrani DATE: 3/8/2012 4:36:03 PM Eastern Standard Time  
Lee, thank you for the reply.

4/19/2016 3:09:06 PM

Description

FROM: Amanda Jackson DATE: 3/9/2012 5:22:40 PM Eastern Standard Time  
When I run an analysis on the attached deck, I get a 99 rating factor on the deck for all trucks. If I change the number of girders to 14, and make any 3 of the girder bay spacings 3 ft, I get reasonable rating factors for the deck. If I then change the spacings to 2.99 ft or lower, I get the 99 rating factors again. I have no idea what I am doing wrong, or what is causing this. Please help!

FROM: Herman Lee DATE: 3/11/2012 9:56:17 AM Eastern Daylight Time  
There's a defect in generating the deck FE model when the girder spacing is less than 3 ft. For this configuration, no FE node is generated between the supports (girder locations). The resulting influence lines are incorrect. There's no workaround for this problem in 6.3.1.

Developer Note:  
The defect is in CABxDeckModelGen::AddXthPoints.

FROM: Herman Lee DATE: 12/5/2012 7:13:42 AM Eastern Standard Time  
I confirmed that Ben Zhang fixed the defect in the 6.4.0 release.

### Description

FROM: Tim Armbrecht DATE: 3/12/2012 12:53:54 PM Eastern Daylight Time

In the attached files, there seems to be an anomaly in the Design Review report. For some reason there is a negative triple digit ratio at one of the 10th points. For 082-0335 it is at 0.7, span 1, and for 082-0334 it is at 0.6, span 2.

FROM: Xinmei Li DATE: 3/16/2012 11:57:22 AM Eastern Daylight Time

I cannot reproduce this issue with 64 dev version.

For bridge 082-334 design ratio is 2.18 at 0.6, span 2.

For bridge 082-0335 it is 2.09 at 0.7, span 1.

It is resolved for 6.4 release.

FROM: Bin Zhang DATE: 4/19/2012 9:20:15 AM Eastern Daylight Time

Verified for VO64Alpha3.

FROM: Christopher Laughlin DATE: 3/13/2012 10:34:38 AM Eastern Daylight Time  
After running the scripts to convert from the BRASS to AASHTO Engine, what happens to a bridge that was previously analyzed using BRASS ? In other words, if we convert to the AASHTO Engine and then open Virtis and pull up an existing structure, what can a user expect ? Do they just re-analyze and view the new results ? Are there any "white papers" or documentation that will help us determine if we should convert or purchase a BRASS license ? thanks

FROM: Christopher Laughlin DATE: 3/13/2012 11:07:44 AM Eastern Daylight Time  
FYI: We have already reviewed the Release Notes Comparison table. Looking for additional information, impact to users, results, etc.....

FROM: Herman Lee DATE: 3/13/2012 5:00:49 PM Eastern Daylight Time  
After running the scripts to convert from the BRASS to AASHTO Engine, the engine selections set in the bridge will be switched to the AASHTO Engine (see attached AnalysisModules.png file). Analysis will be performed using the AASHTO Engine.

If you haven't applied the optional scripts and BRASS is not installed, a dialog will pop up at the beginning of the analysis for switching to another engine (see attached EngineNotAvailable.png file).

We don't have any feedback from agencies that switched to the AASHTO Engine. My suggestion is to run a group of bridges that represents the inventory to get a feel of the AASHTO Engine.

## Complete Issue Information

| Name | Current State | Summary |
|------|---------------|---------|
|------|---------------|---------|

### Description

FROM: George Huang DATE: 3/14/2012 6:43:50 PM Eastern Daylight Time

In AASHTO LFD engine, when calculate negative moment capacity, reinforced concrete capacity with  $\phi=0.9$  is only used at the center of bent support. The precast prestressing concrete capacity with  $\phi=1.0$  is used at all composite girder location. This may not be right. The reinforced concrete capacity with  $\phi=0.9$  should be used to calculate the negative moment capacity at all composite section, which is used in the AASHTO LRFR engine.

FROM: Krisha Kennelly DATE: 3/19/2012 1:59:03 PM Eastern Daylight Time

I agree this is a bug.

FROM: Krisha Kennelly DATE: 3/19/2012 2:24:24 PM Eastern Daylight Time

George didn't attach a bridge so I attached screen shots from BID 9.

FROM: Srujana Thogaru DATE: 6/7/2012 3:49:25 PM Eastern Daylight Time

Fixed for 6.4 Release. (Available for testing in Beta Build 2)

FROM: George Huang DATE: 8/10/2012 3:37:49 PM Eastern Daylight Time

It was right in 6.4 beta build 2, but it is wrong again in build 3.

FROM: Srujana Thogaru DATE: 8/13/2012 1:45:51 PM Eastern Daylight Time

Fixed for 6.4 acceptance build.

FROM: vinacs vinayagamoorthy DATE: 9/14/2012 10:41:14 AM Eastern Daylight Time

There appears two problems and therefore resubmit this issue on behalf of George Huang

(1) The FIX is NOT working

I reviewed the Flexural Strength reported by Spec Check. For negative moment, it used the  $\phi$  factor of 0.9 and resulted in  $\phi$ -Mn of 2763.26 (at Inventory Level for HS20 loading). However, When I check Flexural Rating Output (using the spec check), the  $\phi$ -Mn is reported as 3070.29 (= 2763.26/0.9); This means the Flexural Rating subroutine gets Mn not  $\phi$ -Mn or It assumes  $\phi$  of 1.0 for both positive and negative moment.

(2) When we have negative moment due to live load, the rating factor should be based on "negative moment capacity" not based on positive moment demand.

I checked the Flexural Rating Spec output at Span1-96.46ft location. The software is using the  $\phi$ -Mn of 13382 kip-ft when establishing the rating factor using negative moment demand.  $\phi$ -Mn of 13382 is positive moment capacity and therefore It is incorrect. It should be using the negative moment capacity. Furthermore, for some reason reported the RF as NA.

The negative moment capacity at this point is -2763.26 ( $\phi=0.9$ , Mn=3070.29). When I evaluated the rating factor for negative moment for P13 truck (#10), it came about as 2.24, which is much lower than what is established (7.67) by the software

$RF = [-2763.26 - 1.3(1946-97.53)] / (1.3 \times 1774) = 2.24$

See attached word document "Negative Moment Capacity for PS-I girder"

In other words, the rating results based on negative demand is NOT properly evaluated and as a result, I resubmit this issue.

2135

Complete Issue Information

FROM: Srujana Thogaru DATE: 9/17/2012 1:05:57 PM Eastern Daylight Time  
Fixed for Beta Build 5.

FROM: Geoffrey Trees DATE: 9/26/2012 4:05:48 PM Eastern Daylight Time  
Verified

FROM: vinacs vinayagamoorthy DATE: 10/3/2012 4:55:22 PM Eastern Daylight Time  
This fix does not take care of the problem reported at 96.46ft location. RF is NOT established using negative moment. The RF at this point for P13 permit truck is given as 7.67. If we did the calculation, the RF based on negative moment 2.34.

The software is checkin whether factored TOTAL demand is positive or negative to decided whether to rate using positive, negative moment, or both. This logic needs to be modified and it should rate for both positive and negative LL demand regardless of the sign of factored TOTAL demand.

FROM: Herman Lee DATE: 10/5/2012 3:19:02 PM Eastern Daylight Time  
I have submitted Incident 11958 for the second issue entered by Vinacs on 9/14.

Description

FROM: Navnit Nakrani DATE: 3/21/2012 2:16:19 PM Eastern Daylight Time

I'm trying to run a non standard gage load on a 2 girder simple span bridge. When I run a standard gage on the bridge, both the girders and the floor beams are analyzed, but when I try to run the non standard load, only the floor beams are analyzed. I've attached a virtis file so you can take a look at it, I'm not sure what I need to change to make it run. Thanks!

 To: Lee, Herman  
 Subject: Issue with Interior girder LLDF for bridge with Nail Laminated Timber Deck

Herman

Attached is a steel bridge that has 6" Nail Laminated Timber Deck. We have some issue with Interior girder LLDF

Per spec, the LLDF should be S/5.0 for One Traffic Lane and S/4.25 for Two or more lanes.

However, the "Calculate" button of Virtis shows the following:

(Embedded image moved to file: pic24276.jpg)

One Lane distribtuion factor is correctly established. However, the multi lane DF

Why is the software is using S/5 to establish multi lane DF?

Subject: Fw: LLDF - Virtis is not acknowledging the MBE 18ft-20ft width as two traffic lane.

Herman

Our engineers are saying the Virtis LLDF calcs does not recognize the bridges with width (18ft to 20ft) as two lane bridge, even if the option of AASHTO Manual for Condition Evaluation is chosen. Is that true?

Attached is the one of our engineers findings. This write up has the bridge model as well.

Hi Herman,

Same problem happens for stringers in Truss bridge. The same problem for floor beams is already included in VI 11015. Thanks.

Complete Issue Information

Is there any way to run NSG on PPC deck beams that are connected with shear keys? They would be similar to the drawing in LRFD Spec Table 4.6.2.2.1-1 (g). Basically, the beams act like a deck.

FROM: Herman Lee DATE: 3/29/2012 4:48:06 PM Eastern Daylight Time

No, a deck is required in the generation of the 3D FE model during the Distribution Factor Analysis.

This issue is a duplicate of Incident 8845 (NSG will not run on Adjacent PS Box bridge with no deck.)

### Description

FROM: Navnit Nakrani DATE: 4/3/2012 3:10:49 PM Eastern Daylight Time

When trying to run a non standard gage analysis on a stringer/floorbeam/girder system, I am getting an error that says 3D Engine did not run, but there are no details as to why. What could be causing this? I've attached the analysis printout.

FROM: Herman Lee DATE: 4/3/2012 4:08:48 PM Eastern Daylight Time

I don't see any files attached in this incident. Please attach the analysis printout again. Thanks.

FROM: Navnit Nakrani DATE: 4/4/2012 9:00:12 AM Eastern Daylight Time

It should be attached now.

FROM: Herman Lee DATE: 4/4/2012 2:02:52 PM Eastern Daylight Time

Please attach the bridge XML file for further investigation.

FROM: Bin Zhang DATE: 4/16/2012 9:25:59 AM Eastern Daylight Time

I tried to run the attached XML using the VO6.2, some of the floorbeams run to completion successfully, some of them failed. I attached the snapshots in the document (NSG analysis1 and 2).

Hi Herman,

I did not see any response from you except the date. Are you still working on the response? The required files were attached for your use.

Thanks,

Navnit

FROM: Herman Lee DATE: 4/9/2012 9:55:55 AM Eastern Daylight Time  
Navnit,

We are investigating whether the issue is caused by a defect in the system. We will keep you posted once we conclude our investigation.

Herman

FROM: Bin Zhang DATE: 4/9/2012 2:54:05 PM Eastern Daylight Time  
I used the HL93 Design Review loading template for the LRFD analysis (figure 1). I don't have a problem with the spec check for the shear (figure 2 and 3). Please read the attached the Word document for the fugures.  
Do I miss something here? Please specify more details so I could reproduce the problem.

FROM: Navnit Nakrani DATE: 4/10/2012 1:53:06 PM Eastern Daylight Time  
Please see attached file "Stage 3 Spec Check Results.xml" I do not get the shear check result. The displayed message is " Shear (5.8.3.3, 5.8.2.5, 5.8.2.7, 5.8.3.5) Ignore by User " It appears from the word document file you are getting results, why we are not?

Thanks,

Navnit

FROM: Bin Zhang DATE: 4/9/2012 5:09:40 PM Eastern Daylight Time  
Thanks, Navnit! I have several quick question.  
1. Can you reproduce this issue on your computer or it just happened occasionally/randomly?  
2. I was using the Shippee-74.75.xml attached in the document, is it the bridge model I suppose to use? Or do you have another XML model to reproduce this issue?  
3. I was using the LRFD loading template(HL-93US, LRFD fatigue truckUS), should I use other vehicles for the LRFD analysis?  
Thanks!

FROM: Navnit Nakrani DATE: 4/11/2012 10:18:55 AM Eastern Daylight Time  
Thanks for quick response.

1. Same issue persist.
2. I am using the same xml file.

HRS AASHTO

2144

Complete Issue Information

3. We are unable to select LRFD analysis template. Rather we are running LRFR rating template and our attached result file is due to rating rather than analysis, which does not run the shear analysis.

4. How do we get selection of analysis template? Do we need additional patches? How do we set up analysis setting?

Your help will be appreciated.

Thanks

Thanks,

Navnit

FROM: Bin Zhang DATE: 4/11/2012 3:16:50 PM Eastern Daylight Time

I am running a full Virtis/Opis version, that's the reason why you don't have the LRFD loading template as I do. Now I can reproduce your problem. In order to calculate the shear results, you need to uncheck the "Ignore design & legal load shear" option under the "Control Options" tab. Please read the attached figure for details (Control Options.png).

FROM: Navnit Nakrani DATE: 4/12/2012 1:29:06 PM Eastern Daylight Time

Thanks,

It is resolved.

Navnit

Subject: RE: Virtis Modeling Help

While running a LRFR analysis for a steel girder system in Virtis, the analysis reports "System Error – Contact Technical Support: Missing data in Article: 6.10.8.2.1 – General" – stage 1, round 2. We believe the problem is due to the shear stud definition, because when the girder/slab interface is made composite, the problem disappears. How can we resolve this issue with Virtis?

FROM: Wayne Skow DATE: 4/13/2012 11:24:19 AM Eastern Daylight Time

When this model is run in v64dev, it asserts in SCSuperSteelGirderElement.cpp at line 1824. Since the assert is inactive in the release version, I assume it is the same problem. I attached screen shots from v631 and v64dev.

FROM: Krisha Kennelly DATE: 5/24/2012 8:46:56 AM Eastern Daylight Time

The workaround was sent to Kyle Ramer on April 13, 2012.  
The workaround is to change the shear connectors settings in the deck profile window. Please read the attached word document with the figures for details.

FROM: Girish Bhanushali DATE: 2/7/2013 1:18:43 PM Eastern Standard Time

This issue has been fixed to be verified in next release (6.5). The fix developed for VI#12155 also took care of this problem.

User posted bridge was used in testing and fix was verified using x64 bit 6.5 debug build.  
Design Review & Rating analysis for G1 and G2 (LRFD and LRFR templates) were successful without any errors. No changes were made to the bridge provided by user.

To: Lee, Herman  
Subject: Errors In AASHTO LRFR Engine

Herman,

Here are some AASHTO LRFR issues for a steel girder bridge. This is the same bridge for the notional vehicle.

When I run LRFR for G2 the first time, there is no error. But when I run second time, the analysis can not complete with follow error message (Embedded image moved to file: pic16658.jpg)

After I close the Virtis and open again, then I am able to run with all live loads again. If I run the entire bridge with G1 and G2 together, then I got the same error message. I was able to run LRFR with two permit vehicles with no error but the results are different (changed from 0.947 and 0.944 to 0.890 and 0.887 as listed here.

(Embedded image moved to file: pic17874.jpg)

I think this is dangerous, since it does not show any error message.

Thanks.

Description

FROM: Todd Thompson DATE: 4/13/2012 1:15:29 PM Eastern Daylight Time  
 I have a truss that normally runs fine. But we were doing an overload today and that specific truck produces an error message that it was unable to Add Axle to Vehicle Description. It says the analysis fails, but the analysis results look ok. And I don't see any problems with the vehicle description.

Will attach bridge.xml, vehicle.xml, and a couple of screen shots of the results and error messages.

FROM: Todd Thompson DATE: 4/13/2012 1:19:36 PM Eastern Daylight Time  
 Ok - this is the same as 11133 --- so go ahead and close this.

FROM: Navnit Nakrani DATE: 4/17/2012 9:20:23 AM Eastern Daylight Time

Good morning,

Attached are two files: 1. VIRTIS input file and 2. Spec Check results

Why the shear check results for symmetrical simple beam are different at a same distance from the supports even though all the properties and materials are same. At one end it passed and at the other end its failed. Please see attached result file.

Thanks,

Navnit R. Nakrani

## Description

FROM: Herman Lee DATE: 4/18/2012 11:15:18 AM Eastern Daylight Time  
Submitted on behalf of Tim Armbrecht, IDOT.

Tim's e-mail attached as a PDF file.

FROM: Bin Zhang DATE: 4/25/2012 12:09:20 PM Eastern Daylight Time  
This is a program bug. The program computed the rating factor to be zero for the counter when both the dead load action and the max live load action are zero. This is the reason why we have the zero rating factor in the rating factors summary table.

FROM: Bin Zhang DATE: 5/9/2012 9:34:08 AM Eastern Daylight Time  
If a counter member is always under compression due to the load case combinations of "DL+LL", the rating factor of this counter is assigned as 99.0. So this counter won't be in control.  
Resolved for VO6.4.

Description

FROM: Herman Lee DATE: 4/20/2012 4:51:27 PM Eastern Daylight Time  
Submitted on behalf of Tim Armbrecht, IDOT.

Received e-mail:

=====

Herman, please enter this as an incident in VI. It is the same bridge as the one submitted with 11256. It's possible that the XML for 11256 contains part of the bridge and not the part referenced here. If you believe that is the case, let me know, and I'll ask M&M to provide a new XML.

Timothy A. Armbrecht, P.E., S.E.  
Chief, Bridge Ratings & Permits Unit  
Illinois Department of Transportation

To: Armbrecht, Tim A  
Cc: Petermeier, David W; Siow, Yuenn-Shuenn; Schafer, Aaron M.  
Subject: FW: VIRTIS calculation of C for FB with Section Loss

Tim,

Per conversations regarding our previous rating work for MLK which originally resulted in low as-inspected floorbeam ratings from Virtis, I am sending you information supporting our opinion that Virtis incorrectly reduces the web buckling coefficient which ultimately produces an overly conservative shear capacity and low as-inspected shear ratings. When the average section loss is applied across a

4/19/2016 3:09:11 PM

HRS AASHTO

2156

Complete Issue Information

shear plane, Virtis automatically reduces the web buckling coefficient (C), even when the section loss is local and occurs in only a small portion of the shear plane. It is our opinion that in situations with this type of section loss, Virtis should use the full web thickness to calculate C. The rating factor would then be calculated by applying the load over the shear plane, using the reduced web area. Please see Aaron's email below and his attached documents for more information.

If you need anything else from us as you forward this information to Baker for their investigation, just let me know.

RACHEL L. MERTZ, PE, SE | Project Engineer

Modjeski and Masters, Inc.  
4 Sunset Hills Professional Center, Edwardsville, IL 62025

From: Schafer, Aaron M.  
Sent: Thursday, April 05, 2012 3:35 PM  
To: Mertz, Rachel L  
Subject: VIRTIS calculation of C for FB with Section Loss

Tim,

An error was observed when rating floorbeams with local web section loss. When web section loss was entered in VIRTIS, the web buckling coefficient (C) is automatically reduced and the shear capacity of the web tends to be overly conservative, even if the section loss is local and occurs over a relatively short length (parallel to the length of the floorbeam as illustrated in the attached sketch).

We believe that for as-inspected ratings, with local section loss only covering a short length of the web panel, the full web thickness should be input to determine C. The plastic shear force (Vp) should then be calculated by applying the load over the shear plane, using the reduced web area.

I have attached a sketch of a floorbeam with noted section loss, hand calculations illustrating the capacity increase due to the increase in C and the data printout of how VIRTIS is calculating the shear capacity of the floorbeam with section loss. Could you please forward this issue to Baker for their review?

Thank you,

AARON M. SCHAFER, EIT | Structural Engineer in Training

To: Armbrecht, Tim A  
Cc: 'Mertz, Rachel L'  
Subject: RE: VIRTIS calculation of C for FB with Section Loss

Tim,

The incident number is 11367.

Is this an enhancement request to implement a control option for "with local section loss only covering a short length of the web panel, the full web thickness should be input to determine C" since engineering judgment is involved in determining whether the loss is local and only cover a short length?

Thanks,  
Herman

### Description

FROM: Dean Teal DATE: 4/24/2012 2:18:56 PM Eastern Daylight Time

I had a consultant send this in and I couldn't answer his questions - will you have a look

I have been working on a load rating for an existing stringer/floorbeam system. In this particular case, the stringers are continuous over 3 interior piers with the middle pier being a simple span floorbeam. I have modeled the bridge as both as Floor System Superstructure and a Floor Line Superstructure. The problem I'm seeing is that the applied floorbeam live loads aren't being computed the same for the floor system as the floor line; it appears that for the Floor Line case, the live loads are calculated as if the stringers were simply supported between interior piers when they should be assumed as continuous. This appears to be underestimating the live loads.

### Documentation attached

FROM: Bin Zhang DATE: 4/27/2012 2:47:46 PM Eastern Daylight Time

For both floor system and floor line, the multiple-span stringer is considered as a continuous other than simply supported. Figure 1 showed the live load moments of a three span stringer in a floor line superstructure. The negative moments distribution showed that it's continuous other than simply supported.

In the bridge model you provided, the live load was transferred in different ways between the floor line and floor system superstructure.

For the Floor Line Superstructure:

Loads are transferred from the deck directly to the floorbeams, the live load is a uniform load here. (figure 2).

4/19/2016 3:09:11 PM

HRS AASHTO

2159

Complete Issue Information

For the Floor System Superstructure:

Loads are transferred from the deck and through the stringers to the floorbeams, the live load is a point load (concentrated load) here (figure 3).

Please read the attached word document for the figures "Floorbeam system and Floorbeam Line.docx".

FROM: Dean Teal DATE: 5/2/2012 9:56:25 AM Eastern Daylight Time

The consultant that reported this doesn't believe this explanation resolves his issues; his response is attached as Response2.docx

FROM: Bin Zhang DATE: 5/10/2012 2:08:24 PM Eastern Daylight Time

The checkbox of "Select Floorbeam Being Described" in the "Floorbeam Member" window does not work, the live load output is the same if we change to any floorbeams listed there. I think it's always using the exterior floorbeam (floorbeam A or E) no matter which floorbeam is picked. It's a bug for the floor line superstructure.

The "SB Prop" LL output is comparable to the LL output of "Floorbeam 1" in the floor system superstructure. So currently we can only compare the LL output for the exterior floorbeam, I did not find a workaround to compare the results between floorline and floorsystem for the interior floorbeam (floorbeam C).

FROM: Herman Lee DATE: 10/24/2012 6:05:35 PM Eastern Daylight Time

Fixed a defect in locating the stringer support for the floorbeam being analyzed in a floor line superstructure definition.

Resolved for 6.4 Service Pack (6.4.1).

Hi Herman,

we are having problem to use the corrugated metal deck in Truss Bridge. See the attached file for details. Thanks.

Subject  
 Issue with corrugated metal deck

4/19/2016 3:09:12 PM

HRS AASHTO

Complete Issue Information

Hi George - I am having trouble running this model. It is a through truss with a corrugated metal deck. For some reason the program is asking me for concrete haunch material properties; however, there is no concrete on this bridge. The stringers run just fine. The floor beams and the trusses can not run.

Here is the virtis file:  
(See attached file: 20C0224SB.xml)

Here is a screen shot of the error message from virtis:

(See attached file: Virtis-error message.bmp)

Please help - thanks,  
Sebastian

=====

FROM: Herman Lee DATE: 12/3/2012 3:43:20 PM Eastern Standard Time  
Duplicate of Incident 12078.

Add haunch load for concrete deck only.

Fixed for 6.4.1 Beta 2. Resolved for 6.4.1 release.

Make the Stringer Unit Layout names to be editable by users.

Currently the stringer unit names are designated by the program and cannot be altered by users. It would be beneficial to be able to rename the stringer units in accordance with their designations on the plans.

### Description

FROM: George Huang DATE: 5/3/2012 1:27:39 PM Eastern Daylight Time

The current Cb formula (AASHTO Std Section 10.48.4.1) is based on the research for the unbraced segment with linear distributed moment. There is also the value of Cb=1.0 for Cantilever and large moment at the middle section of the segment conditions. The curvature of the segment is decided by the end moments. I think this formula is good enough for most structures with intermediate bracings. However this equation may not work for case for the interior spans of a three or more spans continue structure with no bracing between the bent supports. The alternate formula based on the maximum moment and the moments at quarter, center, and three quarter points may be used. In many cases, the Cb values from Virtis are close to 1.0, but they vary from 1.15 to 2.38 based on different moment distribution from the alternate formula (Kirby and Nethercot, 1979). My suggestion is to have the option for user defined Cb value. BRASS engine used to have that option.

FROM: George Huang DATE: 5/3/2012 1:54:04 PM Eastern Daylight Time

This is also very important for the stringer analysis in the stringer-floor beam system, as well as in the truss system.

Description

FROM: Herman Lee DATE: 5/4/2012 2:24:09 PM Eastern Daylight Time  
Submitted on behalf of Scott Cavanaugh, HNTB:

Received Bridgeware Support e-mail:

=====

Herman,  
Some questions have been raised regarding the cb computations in Virtis for NJ Turnpike bridge ratings, specifically for new bridges that have been designed using Merlin-Dash and STLRFD.

Based on this, I had been asked to review the calcs in virtis. In doing so, I noticed the spec article which outlined in tabular form the method for determining cb. See my attached pdf. In this case, why doesn't virtis use equation 7 since it seems as though  $f_{mid} / f_2$  is less than 1.00?

I have also attached my xml file for your use, if needed.

FROM: Wayne Skow DATE: 5/9/2012 10:47:47 AM Eastern Daylight Time  
Referencing eq. 6 as the reason for Cb=1.0, in this case, is not strictly correct. The actual reason is because the section is not prismatic between unbraced lengths (see INPUT: at top of screen shot).

Description

FROM: Creightyn McMunn DATE: 5/8/2012 2:10:10 PM Eastern Daylight Time  
 When running Girder G4 in the attached file, I get a rating factor less than 1.0 for Michigan legal vehicles with service governing at 17.43' of Span 3. The Spec Check at this location shows a rating factor of 0.819 but the Pass/Fail "flag" does not indicate this failure. See attached screenshots.

FROM: Wayne Skow DATE: 5/9/2012 2:29:42 PM Eastern Daylight Time  
 Creighton, when I run it on v6.3.1, I get the errors shown in the attached pdf file (VI\_11424\_1.pdf). Since you reported this problem in v6.3.1, something is amiss. Can you check the model and resubmit?

FROM: Wayne Skow DATE: 5/10/2012 7:34:05 AM Eastern Daylight Time  
 After Krishna fixed a problem in abobrdg/dogirdersystemstructdef.cpp, I was able to run this model in v64dev and reproduce the problem. Therefore, I'm returning the status to Assigned.

The pass/fail flag was not being set properly in ALFR\_2E\_6B\_04\_Steel\_Flexure\_Overload or in ALFR\_1E\_B6\_05\_Steel\_Flexure\_Overload. Fixed in v6.4.

To: Armbrecht, Tim A  
Subject: Virtis 6.4 Development - Truss Builtup Member Revision

Complete Issue Information

This is a proposed Virtis Truss enhancement to provide for coding of a very common truss member type, which cannot be currently coded in Virtis Truss without using a workaround. It is a 4-angled built-up member without flange plates and with lacing or batten plates instead of a web plate (see diagram). It should be defined as a Builtup Member.

FROM: Tim Armbrecht DATE: 5/21/2012 4:15:11 PM Eastern Daylight Time  
From one of our designers (Coppernoll):  
RE: SN 016-2437, My calculation for Art. 10.48.4.1 for a hybrid girder

The project noted above rated below HS 20 at the piers for the case with 50 psf FWS. We heard back from the EOR and they confirmed that their design is adequate for this hybrid, composite-everywhere plate girder. I've spend some time looking into the design checks that were performed by the EOR's software (MDX), Virtis, and some hand calculations that I performed, and I am concerned about the methodology that Virtis seems to employ when determining the limiting value for Mr, which is My. I have attached some output from the Virtis spec checker for the location in question. The program uses My at the bottom of the web as the controlling capacity. The program determines this value using the applied moments and the yield strength of the web (36 ksi). Article 10.53(1.) notes that Fy of the compression flange should be used for Article 10.48.4.1 and it seems counter-productive to limit the strength of the section based on the strength of the web.

I think hybrid girder theory acknowledges that the lower strength web will yield first, but it assumes the stress is distributed to both flanges. The section strength is then limited by the R factor. If the yield strength of the web governed, it seems like the most benefit we could ever get from a hybrid section would be close to the ratio of the two section properties ( $1424.3/1375.3 = 1.03$ ). As a result, perhaps the flange would only need to be around  $36\text{ksi} \times 1.03 = 37.28\text{ ksi}$ ? While this logic isn't absolutely correct, it seems like we should be getting more benefit from the hybrid section than what Virtis is allowing.

We will discuss the design with the EOR and may request additional justification/calculations from the EOR that verify the adequacy. The project is on the August letting, so a quick resolution to the rating issue would be beneficial. We will pass along any supplemental information from the EOR that may allow us to modify the rating and accept the design. We would like to know what Baker's opinion is regarding how Virtis calculates the moment capacity of hybrid sections. Please forward my email and

Wayne, please see whether this is a duplicate Incident 11029.

FROM: Wayne Skow DATE: 5/22/2012 7:14:23 AM Eastern Daylight Time  
Yes it is. This was fixed in v6.4, but it doesn't look like v63sp1 has it. So Tim isn't seeing the change yet.

FROM: Herman Lee DATE: 5/23/2012 11:39:18 AM Eastern Daylight Time  
Ben verified the fix with the update AbanSpec.dll for 6.3.1.

### Description

FROM: Tim Armbrecht DATE: 5/22/2012 11:34:06 AM Eastern Daylight Time  
From my consultant (Shoup):

In checking 081-0011 I noticed that there is a discrepancy of the LLDF for the dual girder system (Spans 20-24). Virtis has the multi lane DF of 4.4608 and M&M has 4.573. I ran the calculation and agree with M&M. I tried to track down the difference between our calculation and what Virtis is calculating but could not figure out exactly how the software is calculating it. There is not a big difference but I don't think that there should be any difference in this calculation.

I have attached the Virtis LLDF Calculation and a copy of the spreadsheet that I am using to verify the LLDF of M&M.

Please use the XML for 081-0011 submitted with previous incidents.

FROM: Herman Lee DATE: 5/22/2012 12:03:26 PM Eastern Daylight Time  
May, please use the bridge attached in Incident 11210 for investigation.

FROM: Tim Armbrecht DATE: 5/22/2012 2:23:07 PM Eastern Daylight Time  
Some additional commentary from another of my consultants, Mr. Souther:

Virtis is only calculating shear and moment LLDF's for one and two lanes loaded. It should also be calculating values for three and four lanes since there is a total of four lanes on the bridge. It is considering the four lanes when computing deflection. I suspect that the presence of the median barrier is causing it to erroneously ignore the traffic lanes on the opposite side of the barrier from the beam in question. This should be reported as a bug to Baker.

FROM: Xinmei Li DATE: 6/1/2012 9:57:27 AM Eastern Daylight Time  
This is the same issue as VI 11257.

FROM: Xinmei Li DATE: 6/5/2012 1:59:14 PM Eastern Daylight Time  
This is resolved for 6.4 release.

Subject: RE: Virtis File - Getting Error

I am using version 6.3.1.3001.

I couldn't figure it out.

Something happening with database.

This file I copied and made changes from MP111.1NO- Here the span lengths are smaller than MP111.1NO.

I changed all the data.

When I was saving the file, the information I am getting are –

Distributed load not on superstructure member.

Shear distribution factor range not on member alternative.

Moment distribution factor range not on member alternative.

When I was running the file for SPAN 2 and SPAN 3, the information I am getting is –

The girder member distributed load will not entirely applied.

But I was able to save analysis results and rating results for all members.

When I was running the file for SPAN 1, the information I am getting is –

The girder member distributed load will not entirely applied.

And It was not saving the results and the message is “Error updating database record set, Line 423 in source file---.

And it was showing result for all members in Span 1 except S11.

The error indicates that duplicate records are added to the results object. The database does not allow duplicates and the saving of results fails.  
This has happened in populating the LFD Critical loads.  
Please assign to appropriate person to correct the population of the LFD Critical Loads object.

FROM: Girish Bhanushali DATE: 1/29/2013 2:33:23 PM Eastern Standard Time  
The problem was due to speck checker processing a point for user entered diaphragm that was too close to a standard point , while engine not able to receive unique point id due to point skipping logic while populating the results.  
This was due to mismatch of node location tolerances used between speck checker and engine.  
This issue has been fixed for next release (6.5).

FROM: Mark Mlynarski DATE: 4/8/2013 6:37:28 PM Eastern Daylight Time  
While backchecking this revision, I encountered a crash when following the steps shown below:  
(the Detaile Windows are in the attached document VI-11524-AdditionalError.docx)

1. Import the bridge attached to issue 11524
2. Use the following analysis settings
3. Analyze Span 1-Girder S11
4. Click on 'Save Analysis Results' icon before 'Saving' bridge
5. You will get the following message
6. Select 'File->Save'
7. Click the 'Save Analysis Results' icon again.

Description

FROM: Bin Zhang DATE: 6/7/2012 1:54:59 PM Eastern Daylight Time  
 Moved from #11410.

FROM: Aaron Kemna DATE: 6/4/2012 3:01:45 PM Eastern Daylight Time  
 We ran into the same problem here recently. A rater was trying to access the "Advanced Rating Results Summary Report" for a non-standard gauge rating and got the same error reported above. I will attach a screen shot of where the report was trying to be accessed. We already tried the above resolution, but the XSL File folder was there. I know I can get this same error outside of Virtis so this could be an operating system issue. Maybe a recent update?

Complete Issue Information

FROM: Aaron Kemna DATE: 6/4/2012 3:28:27 PM Eastern Daylight Time  
I am attaching the bridge xml file and the truck xml file in case that helps. P0202 & House

FROM: Bin Zhang DATE: 6/7/2012 2:00:29 PM Eastern Daylight Time  
I could not reproduce this issue on both WinXP and Win7 OS. I attached the snapshots of the reports I got ("Advanced Rating Results Summary Report\_Win7.png", "Advanced Rating Results Summary Report\_WinXP.png"). Herman, could you help to look into this issue?

FROM: Bin Zhang DATE: 6/7/2012 2:28:44 PM Eastern Daylight Time  
A workaround is to change the Internet Explorer "Access data sources across domains" setting to either "Enable" or "Prompt". (See attached IE Trusted Sites Zone Settings.png file)  
Please let see know whether this works for you.

FROM: Herman Lee DATE: 7/3/2012 8:53:25 AM Eastern Daylight Time  
Information Needed E-mail sent on 7/3/12.

FROM: Aaron Kemna DATE: 7/3/2012 11:52:34 AM Eastern Daylight Time  
I will try to get information about this, but I am having many problems with these reports. When I try to replicate this issue on my machine (V6.3.1), the Advanced Report won't come up when I click on it. I can get the report by finding it on my local drive so I don't appear to be having the XSL issue. I have a 64 bit labtop where I am testing V6.4, but right now I can not access the report tool reports. These reports are coming up as XML text in notepad. I tried opening the files in XML Editor with no luck. Any ideas how to fix these issues?

FROM: Herman Lee DATE: 7/9/2012 10:16:12 AM Eastern Daylight Time  
Aaron, please check whether your machine has Internet Explorer as the associated application for XML files.

=====  
Internet Explorer needs to be the associated application for opening xml files on your computer.  
1) Right-click on any xml file in Windows Explorer.  
2) Select Open With - Choose Program  
3) Select IE in the list, also check "Always use the selected program...", click OK.  
=====

FROM: Aaron Kemna DATE: 7/11/2012 12:25:47 PM Eastern Daylight Time  
OK, I am getting my labtop to work now. When I test this incident in 6.4 - 64 bit, I can access the Advanced Rating Results Summary Report.

FROM: Aaron Kemna DATE: 7/11/2012 2:48:18 PM Eastern Daylight Time  
I tested this on a 32 bit machine - Win 7, V6.4 and I get nothing to happen when I try to access the Advanced Rating Results Summary Report. This is the same as the 6.3.1 test on my machine which is 32 bit. I can't duplicate the XSL issue, but I have seen this.

From: Wolfe, David [mailto:DWolfe@moffatnichol.com]  
 Sent: Tuesday, June 05, 2012 1:30 PM  
 To: Bridgware,  
 Subject: VIRIS 6.3 LRFR Slab Span Cross-Section Based Entry Capacity

Bridgware – Attached is a cross-section based entry of a slab span entered on a per foot basis. The rating results are the same for 1.00 bars and 1.09 bars in the section. That is nominally 9% difference in capacity, but the program (VIRTIS 6.3.1 AASHTO LRFR Engine) assigns the same moment capacity to the sections.

Why is this the result? For entry on a per foot basis, I believe that fractional bars should be available in increments less than 0.1 bars.

Here are capacity calculations from the model:

1.00 BARS PER FOOT

Flexural Reinforcement

Description

FROM: Bin Zhang DATE: 6/14/2012 4:50:56 PM Eastern Daylight Time

I submitted this issue on behalf of Pichura, Mike from Baker

The problem is with the "Automatically save new computed stringer reactions" box in the Preference settings. When importing a truss from Virtis 6.0 to 6.3.1, it was observed that if the box is checked, it applies each load twice since 6.3.1 uses different names for the same load as compared to 6.0.

The email was listed below.

Subject: Virtis 6.3.1 Truss Issues

Herman,

We encountered a problem when importing a truss from Virtis 6.0 to 6.3.1. The problem is with the "Automatically save new computed stringer reactions" box in the Preference settings. It has been our practice to check this box to eliminate the need to manually accept new reactions.

However, it was observed that if the box is checked, it applies each load twice since 6.3.1 uses different names for the same load as compared to 6.0.

See the attached word document for more detailed description of the problem. You can try it yourself using the 6.0 Truss.xml file.

In addition, we also noticed that Virtis is incorrectly calculating stringer reactions for wearing surfaces. For example, a 13'-7" roadway has a 1", 140 pcf overlay. The distributed load applied to each stringer is 0.396 k/ft ( 13.583' \* 0.083' \* 0.140 kcf / 4 stringers ). The reaction should then be 0.277 kips ( 0.396 k/ft \* 14' span length / 2 ). Virtis calculates a reaction of 0.08 kips though. See 6.3.1 Truss.xml.

Let me know if you have any questions.

Thanks,

Mike

### Description

FROM: Creightyn McMunn DATE: 6/15/2012 1:27:08 PM Eastern Daylight Time  
For the attached file, I ran Span 1, Girder E and reviewed the spec check results for 50% (36.25 ft), Stage 3 Flexure. The AASHTO LFD engine is incorrectly including impact in the pedestrian live load calculation. I verified that that AASHTO LRFR engine is NOT including impact in the pedestrian live load calculation.

In addition, it appears as though the Engine Related Help is referencing an incorrect location. When I tried to verify that the Virtis LFD engine did not use the pedestrian live load input, I got the attached screenshot.

FROM: Bin Zhang DATE: 5/23/2013 5:28:54 PM Eastern Daylight Time  
Virtis LFD engine has been removed from the AASHTOWare bridge design and bridge rating, so the Virtis Engine related help document will NOT be available any more.  
Geoff, Please update the help document for Member. For example, the "Pedestrian load" was moved from Member window to Member Loads window.

Description

FROM: Herman Lee DATE: 6/22/2012 11:32:45 AM Eastern Daylight Time  
Submitted on behalf of Fran Karyadi, Jacobs (Fran.Karyadi@jacobs.com).

Received Bridgeware e-mail:

=====

To whom it may concern,  
I am rating the beams using LRFR method.

My input ran fine; however, under H20 or HS20 loading cases (Legal Load Rating – Routine), the moments under H20 and HS20 are zero along the beam, and the RF (H20 or HS20) was 99.0. I tried

4/19/2016 3:09:16 PM

HRS AASHTO

2191

Complete Issue Information

to run all beams, and they all gave me the same results (zero moments under H20/HS20). This case has never happened before.

Could you please help check what I missed in the input? I double-checked my input, and I think I didn't miss any.

Please run BM. #2 under H20/HS20 (Legal Load – Routine).

Thank you very much for your help.

Regards,  
Fran

Reply e-mail:

=====

Fran,

When using HS20 for legal load, Virtis checks the Lane-Type Legal Load Model requirements in MBE (Figure D6A-4 and D6A-5). Since it's a simple span structure and the span length is less than 200 ft, both models do not apply to the analysis.

Herman

Description

FROM: vinacs vinayagamoorthy DATE: 7/2/2012 2:31:24 PM Eastern Daylight Time  
 Moment capacity for girders with Fy <30 ksi should be limited to moment at first yield within LFD.  
 So, whether the user chose the option of ALLOW Plastic Analysis is ON, software should limit the capacity to moment at first yield.

The AASHTO Engine seems to use the plastic moment capacity for girder with Fy=26ksi, when ALLOW PLASTIV ANALYSIS option turned on.

Please use Span 2 MDL 1 of 1, Girder 2 to test. While First Alternative has the control option Allow Plastic Capacity is OFF, the second Alternative has the option ON.

FROM: Herman Lee DATE: 7/2/2012 4:30:12 PM Eastern Daylight Time  
 Wayne, is this a releasae bug or beta bug?

FROM: Herman Lee DATE: 7/3/2012 7:39:11 AM Eastern Daylight Time  
 Wayne confirmed this is a release bug. Changed Folder to /Support Center/Virtis.

FROM: Herman Lee DATE: 7/3/2012 9:44:47 AM Eastern Daylight Time  
 Krishna's comment:

=====

This came up in beta testing when we added LFD to the AASHTO engine.

Neither the Std nor LRFD spec give a hard restriction on the Fy that can achieve Mp.

The Std spec says the following and I don't see the LRFD spec saying anything similar:

Complete Issue Information

10.48.1.2 Article 10.48.1 is applicable to steels with a demonstrated ability to reach Mp. Steels such as AASHTO M 270 Grades 36, 50 and 50W (ASTM A 709 Grades 36, 50 and 50W), and AASHTO M 270 Grade HPS70W (ASTM A 709 Grade HPS70W) meet these requirements. The limitations set forth in Article 10.48.1 are given in Table 10.48.1.2A.

We addressed this in the Method of Solution manual flowcharts by saying the preceding article is controlled by the 'allow plastic analysis' switch.

This is an enhancement subject to TAG agreement and TF direction.

=====  
Changed Category to Enhancement.

FROM: Herman Lee DATE: 7/3/2012 1:33:01 PM Eastern Daylight Time  
E-mail from Vinacs:

=====  
I noticed that Baker considered this VI as enhancement.

This issue came up in the past and BRASS software is modified to limit the capacity to moment at first yield for Fy <30 ksi.

Here is the copy of the MBE Article that lead to limit the capacity to My.  
This MBE requirement is adapted in 1994.

(Embedded image moved to file: pic09518.jpg)

We have a lot bridges that are modeled in our system, where the flag (limit it to yield) is not turned on. These bridges, if rated using AASHTO will yield higher.

I am OK with this as is, however, it needs to be incorporated into the engine.

## Complete Issue Information

### Description

FROM: Bin Zhang DATE: 7/16/2012 4:50:28 PM Eastern Daylight Time

When calculating the transverse load patterns, Virtis uses the parameters listed below.

1. Lane increment = 4.0000 ft
2. Vehicle increment within a lane = 2.0000 ft

The 2 parameters are currently hard coding, and the user is not able to modify them from the GUI. Adding these 2 parameters into the GUI will make Virtis more flexible for the users who are willing to trade somewhat calculation time for the higher accuracy.

 Subject: 4-span continuous PS I-beam Bridge Error

Herman,  
 I have a 4-span continuous PS I-beam (Wide Top Flange Type) bridge that will not run with the AASHTO LFD engine. The following error pulls up.

4/19/2016 3:09:18 PM

HRS AASHTO

2200

Complete Issue Information

The AASHTO LRFR engine as well as the Virtis LFD engine work fine and produce valid results. Can you please have someone look into this?

Thanks,

Mike

\*\*\*\*\*  
\*\*\*\*\*

FROM: Herman Lee DATE: 7/26/2012 12:10:10 PM Eastern Daylight Time  
Std spec transfer length 25" is located on Span 1 left overhang 25.6875". Virtis doesn't consider the left overhang portion in the FE model and unable to determine the FE section at that location. Transfer points that is not within the span length shouldn't be added to the FE model. Need to check for both Std spec and LRFD spec transfer points.

FROM: Herman Lee DATE: 9/21/2012 4:26:28 PM Eastern Daylight Time  
Transfer length issue has been fixed. The fix will be included in the 6.5 release.

Further down the analysis when building spec check domain objects, the AASHTO LFD Engine complains "Unable to set live load nodal displacements!".

FROM: Krishna Kennelly DATE: 4/18/2013 10:23:14 AM Eastern Daylight Time  
Removed the error for setting live load displacements. Code was trying to set live load displacements in the stage 1 model but the models are different for stage 1 and 3. Since LL displacements only occur in stage 3, I removed the setting of the displacements in the stage 1 and 2 spec check objects.

Fixed for 6.5.0

FROM: Steve Salata DATE: 4/22/2013 2:50:19 PM Eastern Daylight Time  
Verified fix. Version 6.5.0 (Beta Build 1) produces the following message:

### Description

FROM: George Huang DATE: 7/29/2012 10:06:51 PM Eastern Daylight Time

The current commands for inputting truss member properties may not be sufficient for the analysis purpose, especially for members with eccentric connections. Here are some suggestions:

- 1)The cross section input need to able to rotate the section, or to switch x and y axes direction. It is very important for members with eccentric connections, since the eccentricity e can be only defined along the vertical direction. Or the direction of eccentricity, e, needs to be defined specifically.
- 2)The effective member length factors Kx and Ky need to be defined separately, since the lateral effective length are not always the same for the in-plan and out of plan buckling. For example, if batten plates are used, the lateral effective length has to be modified based on MCEB. Also the lateral bracing may not be located at all truss joints.
- 3)For the eccentric distance, e, input, both positive and negative signs may be necessary, to order to define the locations are above, or below the CG line.
- 4)If the signs of e are used, then the section modulus S (distances from extreme fibers to CG) for both top and bottom need to be defined.
- 5) The eccentricities at both direction can be specified at the same times. This condition is usefull if the member has some lateral deformatin, or some section loss.

## Description

FROM: Mike Pichura DATE: 7/31/2012 7:55:32 AM Eastern Daylight Time

Just thought I'd share that after getting my new machine with Windows 7, I've had the following issues with trying to view certain graphics in Virtis 6.3.1. Other graphics also have issues, but this one seems to be the worse.

This is submitted by Mike Pichura on behalf of Zach Chill

FROM: Joseph Ihnat DATE: 7/31/2012 10:43:25 AM Eastern Daylight Time

It looks like the computer is using a font size that is larger than the default. Virtis has never supported this.

Description

FROM: Bin Zhang DATE: 8/2/2012 4:48:29 PM Eastern Daylight Time

Currently, Virtis is using the "AASHTO Standard Specifications for Highway Bridges, Seventeenth Edition – 2002" to calculate the allowable stress. The allowable stress is the same for both Inv and Operating when the member is unsupported and under compression. So the Inv RF and the Opr RF are the same for this situation. It's suggested to use "AASHTO Manual for Condition Evaluation of Bridges" to compute the allowable stress for Inv and Opr level.

The issue is submitted on behalf of Adam Summers from Schwartz & Associates, Inc. The contact email was listed below. Figures from Adam were attached in the document.

\*\*\*\*\*  
\*\*\*\*\*

Ben,

I believe that the equation for Fb you have shown should be different for the operating level. In the AASHTO Manual for Condition Evaluation of Bridges the formula is different for inventory and operating levels as shown below.

Inventory Level

Operating Level

If you work through the math of the  $91 \times 10^6 / F.S.$  you get about 50,000,000 for the Inventory level which is shown in your equation for the Fb. For the operating level the 50,000,000 in the Fb equation should be about 68,000,000. It is difficult to explain through email so I am sorry if it is unclear. Please give me a call at (540) 206-3230 if you have any questions.

Complete Issue Information

FROM: Austin Clark DATE: 8/6/2012 12:25:49 PM Eastern Daylight Time  
To whom it may Concern,

We have encountered a discrepancy in the rating factors calculated and summarized for Truss Floorbeams in a Half-Deck Truss Bridge.

The attached Excel uses the output provided in Virtis and calculates the rating factor for the given location. In most locations the excel calculations match the Virtis output RF, however for Node 3, element 2 end and element 3 start, there are some differences in the rating factors.

Example Floorbeam 5

- member U2U3 (3) Start Max Moment Virtis Output RF: 0.966
- member U2U3 (3) Start Max Moment Virtis Calculated RF: 1.001

Could you provide any guidance as to the reason for this discrepancy? The Bridge Model file is also attached.

Regards,

Austin Clark

FROM: Bin Zhang DATE: 9/4/2012 10:54:02 AM Eastern Daylight Time  
I can show you an example how Virtis calculats the RF for member U2U3 with HS20 truck. The table below listed the dead load, max and min live load for each truss members (figure 1). For floorbeam 5, all the truss member are modeled as beam elements (figure 2). Virtis is using interaction rating for the truss floorbeam (figure 3). You can read the "VIRTIS TRUSS ANALYSIS METHOD OF SOLUTION" for details.

Please read the attached word document (11781.docx) for the figures.

### Description

FROM: vinacs vinayagamoorthy DATE: 8/9/2012 3:44:40 PM Eastern Daylight Time  
I have analyzed a bridge using LRFR, where AC overlay exists.

This report does combine the dead loads belongs to DC and DW load cases and report the unfactored dead load. Unfortunately, since contribution of DC and DW is not known, I find it difficult to check the rating factor using the information provided in the report. It would have been better to report DC and DW separately.

I am not sure whether separating the dead load was discussed in the original development and/or for somehow it was slipped through our mind. If this is a new request, I would like to add this as future enhancement request.

### Description

FROM: Brad Wagner DATE: 8/10/2012 1:38:07 PM Eastern Daylight Time

Currently the HL-93 report includes separate tables for Truck and Tandem. The previously available reports consolidated these numbers into one table indicating (T) for locations where the truck controls. A consolidated report would simplify this output.

It was our understanding that LRFR for 6.4 was going to include analysis output similar to the reports available in LFR (Overall Summary, Reactions, Moments, Shears, etc). Upon correction of the issues

4/19/2016 3:09:20 PM

HRS AASHTO

2210

Complete Issue Information

identified in incident 11828, the only desired report that cannot be replicated in LRFR using the detailed rating results Output is the Overall Summary Report. For proper (and useful) documentation of analysis output, the overall summary style report is greatly needed.

FROM: Herman Lee DATE: 8/14/2012 4:31:22 PM Eastern Daylight Time  
Copied below is the work plan for this enhancement.

=====

6. LRFR Analysis Report - detailed report listing ratings at all POI not just the controlling rating factor

- a. Mockup report and UI changes
- b. UI changes to add a new 'canned' report to the Report Tool
- c. Create the 'canned' report

    Xml report will be generated from the Virtis LRFR spec check intermediate results  
    Report will contain a section for each rating category (ie, Flexure, Shear, PS Tensile Stress, Serviceability, etc.) that is performed  
    Report will show each category for each vehicle (eg, Flexure will show up for HL-93, Type 3, etc.)

=====

A sample LRFR report was sent on 8/12/2011 for review and comment. I'm changing this to an enhancement request.

FROM: Brad Wagner DATE: 8/20/2012 8:23:30 AM Eastern Daylight Time  
As I stated - our review was based on the assumption that the reports available in LFR would be available in LRFR.

FROM: Herman Lee DATE: 10/9/2012 2:47:57 PM Eastern Daylight Time  
Changed Folder from Beta Testing to Support Center/Virtis.

FROM: Herman Lee DATE: 10/24/2012 11:26:45 AM Eastern Daylight Time  
Subhadeep, please implement the "Overall Summary" topic for the LRFR Analysis Output. Formatting of the topic should be similar in appearance to the same topic in the LFD Analysis Output. Thanks.

FROM: Subhadeep Ghosh DATE: 11/1/2012 1:55:36 PM Eastern Daylight Time  
Implemented for 6.4.1. The "Overall Summary" for LRFR was created to handle all the LRFR load cases.

FROM: Brad Wagner DATE: 11/14/2012 1:13:49 PM Eastern Standard Time  
This summary report was created to mirror the LFR summary report. The content appears to generate correctly.

In the LFR report, \*\*\*\* are created for levels (inventory or operating) that a given truck that wasn't analyzed for. This becomes an issue for LRFR as there are 4 levels for every truck (inventory, legal, permit, operating), leaving 3 empty rows for every row of data. Can we eliminate the rows for the LRFR report that do not apply on a per truck basis? This would shorten the content significantly.

Complete Issue Information

The LRFR report was truncated as requested. Change going into 6.4.1 Beta 2.

FROM: Brad Wagner DATE: 12/10/2012 11:17:42 AM Eastern Standard Time

### Description

FROM: Paul Campisi DATE: 8/16/2012 12:26:11 PM Eastern Daylight Time

The double angle example on page 32 of the Truss Command Language Manual does show the "Connection Riveted/Bolted/Welded x.x" command. This is typically shown for all other examples. It is noted that this command works for a double angle section. Why is this command left out?

Paul Campisi  
NYSDOT

FROM: Xinmei Li DATE: 8/20/2012 9:36:08 AM Eastern Daylight Time

If you look at page 31 in Command Language Manual, Note 2 for Connection command, it says "Do not enter this command BackBackAngles, or SingleAngle.". So connection command is not for double or single angle sections.

FROM: Xinmei Li DATE: 8/20/2012 2:45:36 PM Eastern Daylight Time

Copied from email on 8/20/2012

Paul,  
The Net Area in Tension is calculated according to the area of the angles only.  
If you have more questions or comments feel free to enter in the incident.  
Thank you.

May

To: Li, Xinmei

Subject: RE: AASHTO Virtis/Opis - Michael Baker Jr., Inc. - priority has been resolved.

How is the Net Area in Tension calculated? This command is available for other members.

Thanks

Paul

FROM: Paul Campisi DATE: 8/21/2012 3:41:13 PM Eastern Daylight Time

I think the "Connection Riveted/Bolted/Welded x.x" command should be include in the example. It appears to work when added the section commands.

FROM: Xinmei Li DATE: 8/22/2012 1:16:17 PM Eastern Daylight Time

The verification should have warned the user that connection command is not available for builtup double angle and single angle sections. This bug exists in last release. So I changed it to 6.3 release bug.

FROM: Xinmei Li DATE: 8/22/2012 3:10:28 PM Eastern Daylight Time

The bug is resolved for next build.

FROM: Bin Zhang DATE: 8/24/2012 10:17:09 AM Eastern Daylight Time

Verified in VO64 Acceptance Build, I am able to capture the error message for builtup double angle and single angle sections when the connection command is used.

FROM: Herman Lee DATE: 8/31/2012 11:01:48 AM Eastern Daylight Time

I consider missing the Connection command for BackBackAngles is a bug.

FROM: Girish Bhanushali DATE: 12/26/2012 2:51:59 PM Eastern Standard Time

Linked to VI# 11903

FROM: Girish Bhanushali DATE: 12/28/2012 10:36:05 AM Eastern Standard Time

Connection command for back to back angle section is supported. Help has been updated. This issue has been resolved for next release (6.5.x).

FROM: Melanie Berry DATE: 4/18/2013 3:27:02 PM Eastern Daylight Time

I verified that the command for Back to Back with connection worked and also compared the rating results with and without the Connection command to make sure the connection k value and effective

Complete Issue Information

FROM: Paul Campisi DATE: 8/16/2012 3:12:45 PM Eastern Daylight Time

For the Built-Up Member named "MyBultup2" on page 31 of the Truss Command Language Manual, there is no provision to space the vertical legs of the angles. lyy is calculated as if the vertical angle legs are in contact (Back to Back Horizontal = 0). The web lacing is usually installed between the vertical angle legs, which increases lyy. There should be a horizontal back To back command to space the angles. Or maybe a default value of 0.75 inches, which is two 0.375 inch lacing bars.

Additionally, there is an incorrect command line in the example. The word "Horizontal" is on its own line as shown below.

```
Bultup = MyBultup2
TopFlangePlate
18.0 1.125 A440-2
BottomFlangePlate
18.0 1.125 A440-2
TopAngles "L 5x3.5x0.75" Horizontal
BottomAngles "L 5x3.5x0.75"
Horizontal <===== ?
BackToBack 20.0
Connection Riveted 10.3125
Lacing Web
```

FROM: Xinmei Li DATE: 8/20/2012 9:34:50 AM Eastern Daylight Time

This example was in 6.3 version. Changed to support.

FROM: Herman Lee DATE: 10/10/2012 9:43:01 AM Eastern Daylight Time

The BackToBack <horizontal> command was added for implementing BackBackAngles in 6.1. It will be an enhancement request to support the BackToBack <horizontal> command for the other built-up sections. Enhancing the Lacing <lacing\_location> command to include thickness is another option for consideration.

May, please fix the incorrect command in the example indicated by Paul.

FROM: Herman Lee DATE: 4/10/2013 7:45:15 AM Eastern Daylight Time

The example in the Truss Command Language Manual will be corrected for the 6.5 release. I'm changing this incident to an enhancemnet request.

FROM: Bin Zhang DATE: 4/12/2013 4:55:45 PM Eastern Daylight Time

The example in the Truss Command Language Manual has been fixed for the 6.5 release.

## Complete Issue Information

| Name | Current State | Summary |
|------|---------------|---------|
|------|---------------|---------|

### Description

FROM: Todd Thompson DATE: 8/29/2012 9:17:11 AM Eastern Daylight Time

For some reason - I have some bridges that I can not save the Analysis Results when I run the bridge analysis from the bridge explorer. (LF Analysis)

I get the following error message -

Unsaved data detected.

08:02:44 AM - Line 5022 in source file UiAnalysisProgressDlg.cpp.

Error updating database record set.

08:02:44 AM - Line 423 in source file DmResultsCritLoadLfd.cpp.

State:23000,Native:2627,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

State:01000,Native:3621,Origin:[Microsoft][ODBC SQL Server Driver][SQL Server]

Violation of PRIMARY KEY constraint 'XPKabw\_results\_crit\_load\_lfd'. Cannot insert duplicate key in object 'dbo.abw\_results\_crit\_load\_lfd'. The duplicate key value is (55, 2, 2, 1, 7365, 3, 1, 61). The statement has been terminated.

The structure is a steel girder system. It rates fine if I don't check the Save Analysis Results box.

There are no problems with LRFR analysis results being saved.

Apologize if this was reported already.

FROM: Geoffrey Trees DATE: 8/29/2012 9:34:32 AM Eastern Daylight Time

Todd, I have not seen this yet but I am able to reproduce the issue with the bridge you have attached.

Since I don't have any other bridges that can produce this problem, I am not able to test this in 6.3.

Does this work properly in 6.3 or is this a new issue in 6.4? Also, did this work in previous betas and just start in beta 3?

FROM: Todd Thompson DATE: 8/29/2012 10:31:04 AM Eastern Daylight Time

Let me check with Virtis 6.3 and see if it is a pre-existing condition or something new.

It was something I just noticed when I was testing in Beta 3.

I had some other bridges that the Exterior Girder would save but I'd get the same error message on the interior girders.

FROM: Todd Thompson DATE: 8/29/2012 11:28:02 AM Eastern Daylight Time

Checked in Virtis 6.3.0 with same structure - and get the same error message. So it's not a new bug in 6.4 but a bug nonetheless.

FROM: Geoffrey Trees DATE: 8/29/2012 2:54:46 PM Eastern Daylight Time

This is a 6.3 Release Bug. I have moved this to the Virtis/Support Center folder.

FROM: Geoffrey Trees DATE: 4/18/2013 1:27:25 PM Eastern Daylight Time

Todd, I just got back to this now and I can no longer reproduce it. I am not sure if this was related to

4/19/2016 3:09:21 PM

HRS AASHTO

2220

Complete Issue Information

another bug and that got resolved or what. I am going to mark it as resolved but when you get the Beta for 6.5, please give it a try again and let me know if you can still produce it. Not sure what the cause was??

FROM: Mark Mlynarski DATE: 4/22/2013 2:05:00 PM Eastern Daylight Time  
Added version 6.4.1 version of XML file.

FROM: Subhadeep Ghosh DATE: 4/24/2013 4:40:40 PM Eastern Daylight Time  
Saving the 6.4.1 version, bridge fails in 6.5 beta 1 but runs in debug. This needs to be tested in the next build.

FROM: Geoffrey Trees DATE: 4/29/2013 10:44:19 AM Eastern Daylight Time  
Sounds good Subhadeep. I think it was fixed during Beta 1 but since we are only repackaging DLLs that developers specify, it has not made it into the release build. Let us test this during Beta 2 when Joe rebuilds all the DLLs with the latest code. If this issue still persists then we need to investigate why it happens in release build but no longer debug build. I am pretty certain that it is only because not all the DLLs were rebuilt for Beta 1 release 2. I make this assumption because I was able to reproduce this issue in debug months ago but now I can't.

FROM: Subhadeep Ghosh DATE: 5/22/2013 5:14:41 PM Eastern Daylight Time  
The problem still persists for both the attached bridges in 6.5 Beta 2.

FROM: Mehrdad Ordoobadi DATE: 6/13/2013 3:15:20 PM Eastern Daylight Time  
I can reproduce this issue in Debug in Beta 3.

The error description suggests that duplicate rows are being added to the LFD Critical Loads results object.

FROM: Mehrdad Ordoobadi DATE: 6/13/2013 3:44:59 PM Eastern Daylight Time  
The AASHTO Engine code is populating the duplicate rows  
BOOL CABxEngineResultGen::LFDCriticalLoads(IDoMemberResultsPtr& MemberResultsPtr, short iStage, bool bRC)

Line 5729.

Herman could you please take a look?

FROM: Herman Lee DATE: 6/20/2013 9:09:32 AM Eastern Daylight Time  
Fixed saving analysis results problem for the Beta 4/Acceptance Build.

FROM: Todd Thompson DATE: 6/24/2013 2:31:35 PM Eastern Daylight Time  
Good - I just noticed for LRFR - NSG Analysis - that Save Analysis Results did not work either...

Will await Beta 4 of 6.5.0

Description

FROM: Krisha Kennelly DATE: 8/29/2012 3:05:00 PM Eastern Daylight Time  
 Structure typical section loads like wearing surface, parapets, etc. are always applied to DC load case for LRFR rating.

Fixed for 6.4 beta build 4. Loads are now assigned to the load case specified by the user.

Description

FROM: Amjad Waheed DATE: 9/5/2012 2:40:50 PM Eastern Daylight Time  
Two issues with this long (31 spans) member.

1. We cannot generate LFD Analysis report using Report Tool. It runs forever.
2. When top or bottom cover plate thickness is entered and "Applied" the plate width get saved in thickness box. Have any one reported this behavior earlier too?

4/19/2016 3:09:22 PM

HRS AASHTO

2223

Complete Issue Information

FROM: Herman Lee DATE: 9/5/2012 2:41:25 PM Eastern Daylight Time

1. Amjad, I'm not able to rate the 31-spans member. What are the tolerance settings in your database and how many vehicles were included in the rating? Thanks.

2. I'm able to reproduce the problem. The entered thickness is being applied correctly but the thickness input is replaced with the width input in the user interface. If you close the window and open again, the entered thickness shows up correctly in the window. This issue has not been reported earlier.

FROM: Amjad Waheed DATE: 9/7/2012 3:26:07 PM Eastern Daylight Time

1. We were able to rate the bridge for HS20. I also attaching our library for your reference.

2. It seems a bug in the program and should be documented, right?

FROM: Joseph Ihnat DATE: 9/11/2012 11:23:58 AM Eastern Daylight Time

Since these are two different problems, a new incident has been created for the second problem (11921).

FROM: Herman Lee DATE: 10/5/2012 1:46:40 PM Eastern Daylight Time

Subhadeep, please see whether you are able to reproduce the first problem. Thanks.

FROM: Subhadeep Ghosh DATE: 10/8/2012 1:32:15 PM Eastern Daylight Time

Tried to reproduce the issue for 6.4 Release and found it to be fixed.

### Description

FROM: Brian McCaffrey DATE: 9/7/2012 9:59:50 AM Eastern Daylight Time

The attached P/S model for either girder will crash on an LRFR analysis with the error detailed in the log file at the end of this message. I traced the problem to the concrete strength values entered for the deck and the beam. The beam f'c is 8.5 ksi and the deck f'c is 4.0 ksi. If the f'c ratio is >2 then this error occurs - the modular ratio calcs seems to be where the problem is. This will effect the Mn calc and cause the analysis crash. Once f'c for the deck is changed to 4.26 ksi or higher the beam runs fine. f'c of 4.25 ksi and below will generate the LRFR analysis error. The analysis will complete for an LFD run but the RF's are all 0. Once the deck f'c is raised to 4.26 the LFD ratings are also normal.

Note that I have the Ignore Design/Legal and Permit load shear buttons unchecked.

Complete Issue Information

When a particular permit vehicle, in this case "P 5 Annual" along with a pedestrian load is analysed for LRFR using Line Girder, the analysis fails to complete (see attached screen shot). To reproduce the problem, run G2 in BID8, PCITrainingBridge5 (see screen shot).

Herman determined the issue is with the vehicle's "notional" switch. When notional, there is a problem. There is no problem when the vehicle is non-notional.

FROM: Herman Lee DATE: 4/8/2013 12:53:45 PM Eastern Daylight Time  
Fixed processing of notional single component (truck, tandem or lane) vehicle + pedestrian load.

Resolved for 6.5 release.

### Description

FROM: Creightyn McMunn DATE: 9/18/2012 4:59:18 PM Eastern Daylight Time

In the attached file, running "A2-A7 Interior Girder" in the AASHTO LFD engine, the Spec Check results indicate the section is compact composite in the positive moment regions but non-compact over the pier. This indicates Equation 10-129d should be used to calculate Mu in the positive moment sections. The spec check shows Equation 10-129c being used instead.

FROM: Krisha Kennelly DATE: 9/19/2012 1:59:53 PM Eastern Daylight Time

Please investigate if this is a release bug or a bug new to 6.4. (Folder is beta testing but version name says 6.3.1) Change the folder to Support Center if it is a bug in 6.3.1, or change the version name if it is new to 6.4.

FROM: Wayne Skow DATE: 9/20/2012 7:21:10 AM Eastern Daylight Time

4/19/2016 3:09:23 PM

HRS AASHTO

2229

Complete Issue Information

This is a release bug. You get the same result from v6.3.1. The problem is that when 10.50.1.1.2 runs for a mid-span location, like 54.37ft on span 1, it looks for a table (Stl\_10\_50\_01\_01\_02PierTable) containing information about the adjacent piers. If that table doesn't exist, it assumes it's a simple span and 129c then controls. That table needs to be created by the controller before stage 3 but is not.

FROM: Krisha Kennelly DATE: 9/25/2012 2:48:50 PM Eastern Daylight Time  
Summary of this issue:

In Std Spec Article 10.50.1.1.2, the moment capacity for compact composite positive moment sections with noncompact pier sections shall be taken as either  $M_y$  determined in Article 10.50(c) or as  $M_u = M_y + A(M_u - M_s)_{pier}$  (10-129d).

For this case in 6.3.1, the AASHTO Std Engine is instead computing the moment capacity as per (10-129b) or (10-129c) which are functions of the plastic moment capacity which is larger than  $M_y$ .

This results in rating factors larger than they should be.

=====

As per TF approval, for Version 6.4 this bug has been fixed to use the moment capacity equal to  $M_y$  as determined in Article 10.50(c).

Version 6.4.1 will include the implementation of Eq. 10-129d.

FROM: Krisha Kennelly DATE: 9/26/2012 2:55:20 PM Eastern Daylight Time  
Verified for the acceptance build by regression testing.

Results of the regression testing for the steel bridges in the test suite:  
- There were no differences for LRFD, LRFR or ASR.

-There were 12 different bridges run with LFR. 1 bridge had its overall rating factor drop but it was due to the 10.50.1.1.2 changes so it is now correct. The others ran with no differences.

FROM: Krisha Kennelly DATE: 10/11/2012 1:50:53 PM Eastern Daylight Time  
New issue has been added for the full implementation of eq 10-129d for version 6.41. Issue 11966 is the new issue.

FROM: Creightyn McMunn DATE: 11/14/2012 3:36:54 PM Eastern Standard Time  
Verified that Eqn 10-129d is now being used in the positive moment region of Span 1, A2-A7 Interior Girder.

On behalf of Scott Cavanaugh sent to bridgeware support.

From: Scott Cavanaugh [mailto:SCavanaugh@HNTB.COM]

Sent: Monday, September 10, 2012 4:41 PM

To: Bridgeware,

Subject: Cannot delete LRFR factors file

Herman,

I cannot seem to figure out why I cannot delete the "NJTA Load Rating Manual" from this virtis file. I have checked and double checked the MEMBER ALTERNATIVES in all 4 spans, and do not see anywhere where this file is currently being used. Any idea why I can't delete?

## Complete Issue Information

Thanks  
Scott

FROM: Geoffrey Trees DATE: 9/24/2012 2:30:33 PM Eastern Daylight Time

We are not sure of the cause of this issue but we have determined if we remove a few values from the database, it will allow for the removal of the affected LRFR factors. Since this has been discovered to be a 6.3 release bug, a fix will be addressed for 6.5 migration and script be provided to users who have this issue.

FROM: Mehrdad Ordoobadi DATE: 4/11/2013 12:11:35 PM Eastern Daylight Time

Removing the LRFR factor fails because the factor is referenced in the ABW\_BEAM\_DEF table. But the field is not editable.

A work around is to run a SQL query to set the value of OVERRIDE\_LRFR\_FACTOR\_ID in table ABW\_BEAM\_DEF to NULL for the bridge.

Here are the instructions:

- 1 - Close the bridge if it is open.
- 2 - Locate the bridge in the Bridge Explorer and find the value in the BID field. Make a note of it.
- 3 - Using the SQL Server Management Studio login to the server.
- 4 - Click "New Query" on the toolbar.
- 5 - Switch to the Virtis/Opis database that you would like to make corrections to by selecting it in the database in the Available Databases drop down list on the toolbar
- 6 - Type in the following SQL statement in the query window.  
UPDATE ABW\_BEAM\_DEF SET OVERRIDE\_LRFR\_FACTOR\_ID = NULL WHERE bridge\_id = <<<The BID from step 2>>>

You need to replace <<<The BID from step 2>>> with the BID that you got in step 2.

- 7 - Click the Execute button.

Now you can open the bridge and remove the LRFR factor and save your bridge.

Please do not do this for other bridges because their situation maybe different.

FROM: Mehrdad Ordoobadi DATE: 4/11/2013 1:07:37 PM Eastern Daylight Time

Migration Wizard / Version Conversion should set all override factors in abw\_beam\_def to null for non stringer , non floorbeam members.

FROM: Mehrdad Ordoobadi DATE: 4/25/2013 3:05:51 PM Eastern Daylight Time

Migration Wizard updated to set the override factors to null in abw\_beam\_def when the beam def is not for stringer or floorbeam.

## Complete Issue Information

Herman,

One of our engineers recently received a live load factor file, and upon importing, both his version of virtis and mine crashed / froze. Is there any way you can take a look at the file and see what is the problem?

Thanks  
Scott

To: Scott Cavanaugh  
Subject: UDOT load rating program questions

Hello Scott,

I'm working on the load rating program and we were given some live load factors to incorporate into our load ratings (see attached). Can you tell me how to import these? I tried to import them into the library explorer under Factors/LRFR but it closes down the program. Could I be doing something wrong?

Thanks,

Cody

FROM: Geoffrey Trees DATE: 9/24/2012 2:36:26 PM Eastern Daylight Time  
We have not yet found the cause for this issue. Since it is a 6.3 release bug, once we find a solution we will add it to 6.5. We will notify the users if we find a work around.

FROM: Mehrdad Ordoobadi DATE: 4/11/2013 1:10:39 PM Eastern Daylight Time  
This problem is casued by a bug in the export code for LRFR Factor Library.

Attached is the corrected Library Factor.

FROM: Steve Salata DATE: 4/24/2013 2:11:24 PM Eastern Daylight Time  
Installed 6.5 and copied Updates folder into installation. When importing 2012 Interim LL factors-Fixed.xml, the following error is generated:

Complete Issue Information

(2) When we have negative moment due to live load, the rating factor should be based on "negative moment capacity" not based on positive moment demand. I checked the Flexural Rating Spec output at Span1-96.46ft location. The software is using the Phi-Mn of 13382 kip-ft when establishing the rating factor using negative moment demand. Phi-Mn of 13382 is positive moment capacity and therefore It is incorrect. It should be using the negative moment capacity. Furthermore, for some reason reported the RF as NA.

The negative moment capacity at this point is -2763.26 (Phi=0.9, Mn=3070.29). When I evaluated the rating factor for negative moment for P13 truck (#10), it came about as 2.24, which is much lower than what is established (7.67) by the software

$$RF = [-2763.26 - 1.3(1946-97.53)]/(1.3 \times 1774) = 2.24$$

See attached word document "Negative Moment Capacity for PS-I girder"  
In other words, the rating results based on negative demand is NOT properly evaluated and as a result, I resubmit this issue.

FROM: vinacs vinayagamoorthy DATE: 10/3/2012 4:55:22 PM Eastern Daylight Time  
This fix does not take care of the problem reported at 96.46ft location. RF is NOT established using negative moment. The RF at this point for P13 permit truck is given as 7.67. If we did the calculation, the RF based on negative moment 2.34.

The software is checkin whether factored TOTAL demand is positive or negative to decided whether to rate using positive, negative moment, or both. This logic needs to be modified and it should rate for both positive and negative LL demand regardless of the sign of factored TOTAL demand.

### Description

FROM: Phil Litchfield DATE: 10/9/2012 3:30:56 PM Eastern Daylight Time

It seems sporadically the vehicle name is missing from the results when running a 3D FEM-Vehicle Path analysis with a NSG vehicle and multiple vehicle paths defined. See screenshot.

FROM: Krisha Kennelly DATE: 10/10/2012 9:15:57 AM Eastern Daylight Time

Can you attach the bridge that has the multiple vehicle paths? thanks.

FROM: Phil Litchfield DATE: 10/10/2012 11:27:10 AM Eastern Daylight Time

There were two bridges that this happened on so far. I've uploaded both.

FROM: Krisha Kennelly DATE: 10/11/2012 9:20:02 AM Eastern Daylight Time

Mehrdad - is there a limit on the length of the vehicle name in the results? I traced through the export and the correct name "Case STX 450 w/ scrapers (Centered) - Truck" does get passed through to the results object. If I shorten the truck name to "Case STX 450 w/ scrap" it works ok. Anything longer than that shows up as blank in the tabular results.

FROM: Mehrdad Ordoobadi DATE: 10/22/2012 2:47:00 PM Eastern Daylight Time

After investigating this problem I have concluded that the source code at line 6780 in AbxAashto3DEngine.cpp:

```
NewEventVehiclePtr->GetName()->SetValue((_bstr_t) plds->m_sVehicleName);
```

is causing this problem and needs to be revised. The vehicle name is limited to 40 characters. The

4/19/2016 3:09:25 PM

From consultant (Shoup):

The trusses are symmetrical but the controlling location is on the "prime" side. I thought this was odd and looked into it and it appears that the controlling prime member has more dead load then the un-prime location. I have been all through this Virtis file and could not see a reason for the difference in the dead load at this location. Can help us out with this?

Complete Issue Information

FROM: Subhadeep Ghosh DATE: 10/11/2012 4:08:48 PM Eastern Daylight Time

The truss is not symmetrical. For example the digonal members U1L0 and L0'U1' were not of the same length when computed geometrically from the X, Y co-ordinates in the design file. This makes the SelfWeight DC result from the truss analysis unsymmetrical. Also the floor beam assigned for Pier 8 and Pier 10 in the member alternative were not the same. leading to unsymmetrical loads.

Description

FROM: Krishna Kennelly DATE: 10/11/2012 1:52:00 PM Eastern Daylight Time  
 Issue originated in Issue 11931. For 6.4, eq 10-129d was partially implemented.

This issue is for the full implementation of eq 10-129d for version 6.4.1.

FROM: Wayne Skow DATE: 10/15/2012 8:30:04 AM Eastern Daylight Time  
 Done. Fully implemented in version 6.4.1 in LFD article 10.50.1.1.2.

FROM: Matt Kolis DATE: 10/31/2012 10:22:39 AM Eastern Daylight Time  
 Verified

FROM: Creightyn McMunn DATE: 11/15/2012 2:17:11 PM Eastern Standard Time  
 I verified that the program is correctly using eqn 10-129d when it should in continuous spans with compact composite positive moment sections and noncompact negative moments at the piers. The correct "My" is shown in the 10.50.1.1.2 spec check table ("My" pulled from First Yield Moment spec check output). I verified "A" varies for interior and end spans as shown in the table. I could not confirm "(Mu - Ms)pier" because I could not find where Ms is calculated. Please indicate how "Ms" is being calculated. It would also be helpful to include "Mu" and "Ms" in the 10.50.1.1.2 spec check table.

FROM: Wayne Skow DATE: 11/20/2012 6:58:05 AM Eastern Standard Time  
 I added another table to 10.50.1.1.2 containing Mu and Ms values for both piers.

Description

FROM: Creightyn McMunn DATE: 10/15/2012 10:30:19 AM Eastern Daylight Time  
Running the AASHTO LFD engine on the Typical Interior Girder gives very low rating factors. It appears as though Virtis is assuming the girders are fully continuous and is limiting the rating to the yield stress since the negative moment section over the pier is non-compact. However, there is a hinge 1.63' left of support 2 which makes the tail span simply supported and thus plastic moment should be used.

FROM: Wayne Skow DATE: 10/16/2012 8:09:09 AM Eastern Daylight Time  
The rating is lowest at the center of span 1 and capacity is controlled by 10.50.1.2 (noncompact sections). In your case, article 10.50.1.1.2 (compact sections) is disallowed because it is a builtup member.

4/19/2016 3:09:25 PM

HRS AASHTO

2245

Complete Issue Information

In version 6.3.0, 10.50.1.1.2 is disallowed for builtup sections and sections with any coverplate. This was modified in version 6.3.1 by allowing sections with coverplates on the tension flange, but not the compression flange. Issues 10828 and 11009 initiated these changes. There's a pdf file attached to issue 11009 that consolidates the discussion and reasoning.

FROM: Creightyn McMunn DATE: 11/15/2012 2:44:46 PM Eastern Standard Time  
 In this case we have a rolled section in Span 1 (the controlling location) and a built-up section in Span 2. Because we cannot mix beam types, the rolled section had to be modelled as a built-up section. There is no cover plate and therefore no holes in the tension flange so it seems as though Section 10.50.1.1.2 should still apply.

FROM: Wayne Skow DATE: 11/19/2012 8:24:59 AM Eastern Standard Time  
 I apologize that my explanation above was not as clear as it should have been. Currently, in Aashto, a built-up section is not allowed to go plastic (10.48.1 and 10.50.1.1.2 are not allowed). As a result of discussions with the TAG in June, 2011, and documented in issue 10828, built-up members are only allowed to consider 10.48.4 (and 10.50.1.2). So, your situation it is not classified as a bug. Any changes to the way built-up members are handled would need to come from the TAG.

Description

FROM: Luis Vargas DATE: 10/15/2012 1:32:51 PM Eastern Daylight Time

We are load rating a steel bridge which has a W36X230 steel beam with a cover plate on the bottom. When the program goes to check the section of AASHTO LFD 10.50.1.1.2 (section checks if the composite section is compact) it makes the statement that the article does not apply to sections with cover plates or built-up sections and virtis uses the first yield moment in the rating as if the section is composite, non-compact. The text of the AASHTO article does not specifically exclude the before mentioned steel sections. It only excludes variable depth sections, sections with longitudinal stiffeners, and sections with holes in the tension flange. We do not believe that adding a cover plate counts as increasing the member depth since the cover plate is essentially a thickened flange for a rolled shape. This would also defeat the purpose of adding a cover plate to a rolled shape since they are already compact and can develop strength past first yielding. It seems like the intent of code is that as long as the buckling criteria of section 10.50.1.1.2 is satisfied the section whether built up or with a cover plate is stable and can develop strength past first yielding. Can you please verify if this is your intent or a bug in the program.

Attached please find a screen capture and the Virtis file.

FROM: Wayne Skow DATE: 10/16/2012 10:04:05 AM Eastern Daylight Time

In version 6.3, 10.50.1.1.2 is disallowed for builtup sections and sections with any coverplate. This was modified in version 6.3.1 by allowing sections with coverplates if they are on the tension flange only. Issues 10828 and 11009 initiated these changes. There's a pdf file attached to issue 11009 that consolidates the discussion and reasoning.

For your bridge, the coverplate is only on the tension flange. If you run the bridge in version 6.3.1, 10.50.1.1.2 is allowed and you get a better rating.

Description

FROM: Brad Wagner DATE: 10/15/2012 3:10:29 PM Eastern Daylight Time

When printing the LFD Analysis Output Overall Summary report to pdf, if I uncheck "Begin each topic on a new page when printed", a page break is still included after each section. I've attached a screenshot and a pdf of the resulting printed report.

FROM: Subhadeep Ghosh DATE: 10/22/2012 1:52:21 PM Eastern Daylight Time

The issue originated from having static XSL files for output reporting from 6.4 release onward. The XSL files were modified to read page\_break tags in the XML, based on which the report was printed. The page\_break tags were inserted into XML based on user response to the format of the report printed. Fix going into 6.4.1.

FROM: Herman Lee DATE: 10/22/2012 2:35:38 PM Eastern Daylight Time

LRFR and LRFD Analysis Outputs have the same problem.

FROM: Matt Kolis DATE: 10/31/2012 3:10:27 PM Eastern Daylight Time

This issue does not appear to have been fixed. Resubmit.

FROM: Joseph Ihnat DATE: 11/6/2012 12:40:15 PM Eastern Standard Time

New XSL files aren't yet being installed by the SP. Try again after copying them from the Updates folder.

FROM: Matt Kolis DATE: 11/6/2012 3:51:39 PM Eastern Standard Time

Verified in Alpha Build 2.

FROM: Brad Wagner DATE: 11/14/2012 12:20:34 PM Eastern Standard Time

Page break between bridge member info and Rating Summary table is fixed, but there is no page break between the table and the successive bridge member info. See attached 6.4.1Summary.pdf. The same problem exists for LRFR summary.

FROM: Subhadeep Ghosh DATE: 12/4/2012 1:31:49 PM Eastern Standard Time

Issue was fixed with page break between member alternative on output report. The fix is available in 6.4.1 Beta 2 both for LFR and LRFR for verification.

FROM: Matt Kolis DATE: 12/4/2012 4:47:19 PM Eastern Standard Time

Verified in 6.4.1 Beta 2.

FROM: Brad Wagner DATE: 12/10/2012 10:45:55 AM Eastern Standard Time

Accepted - 6.4.1 Beta 2

From consultant (Souther):

Analysis of a stringer in a floor system of a truss that was originally designed for railroad loading

4/19/2016 3:09:26 PM

HRS AASHTO

2250

## Complete Issue Information

generated HS20 inventory/operating rating factors of 0.156/0.261, far below what one would expect. The RPG stringers are made up of a 3/8"X45 3/4" web plate and four 6"X4"X7/16" flange angle (with the 4" legs being horizontal). As a result I created a substitute Welded Plate Girder Member (WPG) Alternative of the same depth made up of a 3/8" web and 7/16"X8 3/8" flanges, which has slightly smaller but comparable section properties. The HS20 rating factors for the welded plate girder alternative were 1.774/2.963, which seems reasonable for railroad stringers.

Closer investigation finds that while the section properties are similar for both sections ( $I = 10,456.06$ ,  $S = 454.61$  – RPG;  $I = 9399.52$ ,  $S = 408.67$  – WPG),  $M_u = 223.65$  ft-kips for the RPG and  $M_u = 1021.69$  ft-kip for the WPG. The  $M_u$  for the WPG appears to be correct, however I think the  $M_u$  for the RPG should be 1,136.53 ft-kips. I suspect that the top-flange restraint, entered as full-length continuous for both alternatives is being erroneously ignored for the RPG.

The Virtis model provided is for a simple-span Girder System Superstructure but this applies to Floor & Truss System Superstructures and most likely Girder, Floor & Truss Line Superstructures as well.

FROM: Wayne Skow DATE: 10/17/2012 9:34:17 AM Eastern Daylight Time

There are 3 problems revealed by this model:

1. The RPG  $I_y$  section property is being calculated with the (4") leg as horizontal rather than the 6" leg. This produces a very low  $M_r$  value from 10.48.4.1. $M_r$  ( $I_y$  top flange = 21.42 and  $M_r$  from eq. 10-103c = 223.65). When this model is imported into v6.3.1, it shows the 4" leg as horizontal and the cross-section properties are consistent with that in 10.48.4.1. $M_r$ . However, when it's imported into v6.4, the cross-section shows the 6" leg horizontal, but the cross-section properties in 10.48.4.1. $M_r$  still show as if the 4" leg is horizontal.
2. Lateral support has been specified for the entire length of the member (28.75 ft), but 10.48.4.1. $M_r$  is showing an unbraced length of 345.0 inches (28.75 ft). It should be zero. This produces a very small  $M_r$  value from eq. 10-103c.
3. In v6.3.1, the effective  $M_u$  for the WPG member is 620 k-ft. In v6.4, it's 1021 k-ft due to a bug fix (issue 11210) in January. I'm not sure the higher value is correct and needs to be revisited. For this model, the  $b/t$  ratio of the top flange is 32.86 (14.375/.4375). The limit for 10.48.2 and 10.48.4 is 24. When that value is applied to Eq. 10-99, it produces an  $M_u$  of 620 k-ft, which I think should be the controlling value.

FROM: Wayne Skow DATE: 10/17/2012 9:52:39 AM Eastern Daylight Time

Item 1 above has been moved to it's own issue (11979).

FROM: Wayne Skow DATE: 10/24/2012 8:06:06 AM Eastern Daylight Time

Three issues were identified as itemized above. Here's the resolution:

Item 1. A separate issue (11979) was created for this item. It has not been officially resolved yet, but it looks like it's a display problem in v6.4. The 4" leg is horizontal in the imported model and the properties used during analysis are consistent with that.

Item 2. Virtis is using the correct unbraced length for both 10.48.2 (0.0) and 10.48.4.1. $M_r$  (345.0 in). LFD article 10.48.4 (first paragraph) states that "Bracing shall be provided such that lateral deflection of the compression flange is restrained and the entire section is restrained against twisting." Restraining the top flange only is insufficient. 10.48.2.1(c), however, only requires the top flange to be restrained.

4/19/2016 3:09:26 PM

HRS AASHTO

2251

### Complete Issue Information

It was decided in May, 2011 (see issue 10828), that built-up sections would only consider 10.48.4. Therefore, the RPG section's Mu is low because of the 345" unbraced length compared to the WPG's Mu which qualifies under 10.48.2. Even though the cross-section properties are similar, the rating factor's are very different due to the different Mu's.

Item 3. A bug was inadvertently introduced in v6.4 which allowed the WPG's Mu to be 1021 k-ft. It should be 620 (limited by eq. 10-99) resulting in rating factors for the WPG section that are about 1/2 of what you document above. That bug has been fixed in v6.4 and an updated dll will be provided.

FROM: Herman Lee DATE: 10/25/2012 3:25:15 PM Eastern Daylight Time  
Resolved for 6.4 Service Pack (6.4.1).

FROM: Matt Kolis DATE: 11/1/2012 9:22:15 AM Eastern Daylight Time  
Verified Items 2 and 3.

FROM: Matt Kolis DATE: 11/7/2012 8:52:33 AM Eastern Standard Time  
Verified items 2 and 3 in Virtis 6.4.0.

FROM: Wayne Skow DATE: 11/16/2012 10:17:24 AM Eastern Standard Time  
Phil Litchfield disagrees with the resolution of item 2. Below is the email discussion related to his objection:

Phil,

I think Herman fixed the problem with the issue disappearing from the website. You should be able to see this issue again. If not, please let me know and I'll track down the problem.

Can you add some detail as to what your objection is and set the reviewer status accordingly?

Thanks,  
Wayne

Wayne,

I see you stated "Restraining the top flange only is insufficient." in the incident. Please contact Phil Litchfield to find out why Illinois disagrees with your investigation.

I have switched the Folder for this incident back to /Support Center/Virtis.

Thanks,  
Herman

Complete Issue Information

To: Lee, Herman  
Subject: VI #11974

This issue has disappeared from the VI website. We disagree with Wayne about restraining the top flange only being sufficient in this single span structure. We believe that the braced length should be zero and the Mu for the RPG should be closer to 1021 k-ft.

Thanks,

Phillip Litchfield, P.E.

Illinois Department of Transportation  
Bureau of Bridges & Structures

Email: Phillip.Litchfield@Illinois.gov

FROM: Phil Litchfield DATE: 11/20/2012 5:32:35 PM Eastern Standard Time  
We believe that the RPG should be considered under 10.48.2. And that bracing the top flange is sufficient for the single span.

FROM: Phil Litchfield DATE: 11/29/2012 4:51:15 PM Eastern Standard Time  
Within the spec check for 10.48.2, the summary only lists (c). (a) and (b) are figured and checked in 10.48.2.1 but not listed in the summary of 10.48.2. Are they being considered? And why were they deleted from the summary?

FROM: Wayne Skow DATE: 12/4/2012 7:51:31 AM Eastern Standard Time  
For load factor design 10.48.2.1(a) and (b) are cross-sectional property limits. When designing, its easy to pick a section that meets those requirements. When rating, however, we have to deal with the cross-section that exists. Therefore, the MBE doesn't enforce those limits. The answer to your question above, "are they being considered", is yes and no. Yes in that the b/t ratio is used to calculate Fcr in eq. 10-99 and will result in a low Mu as b/t exceeds 24. No in that eq. 10-100 is not strictly enforced. Since 10.48.2.1(a) and (b) are requirements for both 10.48.2 and 10.48.4, a strict enforcement for rating would result is both articles failing. The reason they were deleted from the summary is to more accurately reflect the MBE's requirements. However, since (a) and (b) are still important limits that the engineer should be aware of when exceeded, 10.48.2.1 continues to report the status of (a) and (b).

FROM: Matt Kolis DATE: 12/5/2012 8:12:19 AM Eastern Standard Time  
No change has been made at this time.

FROM: Phil Litchfield DATE: 4/4/2014 8:02:22 PM Eastern Daylight Time  
From Shoup:

It is interesting on the code layouts.

10.48.1 Compact Sections - Properly Braced (Bracing shall... be capable of preventing lateral displacement and twisting of the main members...)

10.48.2 Braced Noncompact Sections – If Bracing Limits not meet, limited to Mu from Article 10.48.4.1.

10.48.4 Partially Braced Members – (Bracing shall be provided such that lateral deflection of the compression flange is restrained and the entire section is restrained against twisting.)

4/19/2016 3:09:26 PM

HRS AASHTO

2253

Complete Issue Information

Therefore, I do not see this as differences in these articles, I see this as a requirement for the bracing. All bracing must be able to prevent lateral deflection of the compression flange and prevent the entire section from twisting. The article for 10.48.2 does not have this but indirectly references meeting 10.48.4 if outside the bracing limits which does have this statement of preventing twisting.

Ultimately the question is, does the bracing of the top flange (by the stringers) prevent the entire section from twisting? If the stringers frame into the floorbeam I would say it is a definite yes. However, if they are sitting on top of the floorbeam and only connected to the top flange it may be debatable. To me, if the compression flange is braced at the stringers then I do not see from a practical standpoint how the section could twist.(?) The bottom tension flange would be pulled straight and the top compression flange would be braced at the stringers. This bracing would prevent lateral displacement of the compression flange. If the tension flange and compression flange are not able to deflect laterally then how could the web deflect laterally? Therefore, this in turn would prevent the "twisting" of the member.

Based on this I do not see how it is not adequately braced for this section. Does Baker have any examples of the member twisting when the top flange was laterally braced? Do they have any evidence proving that the whole section can twist at a section that only has the compression flange laterally braced?

FROM: Wayne Skow DATE: 4/21/2014 8:06:54 AM Eastern Daylight Time  
Section 10.48.4 reads "Bracing shall be provided such that lateral deflection of the compression flange is restrained and the entire section is restrained against twisting." Initially, we took "entire" to mean both flanges needed restraint. However, we believe the issue is with the compression flange and it's unbraced length. This has been resolved in v66 where the unbraced length is taken as the unbraced length of the compression flange so that fully supported compression flanges will have an Lb of zero.

Description

FROM: Herman Lee DATE: 10/18/2012 4:44:18 PM Eastern Daylight Time

For the "ca" culvert alternative in the attached bridge, I got 1.016 inventory RF for a Type 3 truck. When I changed the fill depth to 11 ft, I got "Error - Unable to perform analysis!". Based on 11853, I expect to see a message saying live load is neglected and receive 0 or 99 rating.

Wayne's investigation:

=====  
The problem is caused by the program printing influence line results when there aren't any. An index goes out of range. This exception is not active in the release version, so does not create an exception.

I changed the WxBoxCulvert.engine in v6.4.1 to not print influence lines when LL's are ignored.  
=====

Resolved for 6.4.1.

FROM: Matt Kolis DATE: 10/31/2012 10:37:47 AM Eastern Daylight Time

Verified there is no longer an error message w/depth of fill set to 11 ft. Inv Rating is 0.945. Ratings are 0 w/fill >14.5 ft.

FROM: Brad Wagner DATE: 11/14/2012 11:42:19 AM Eastern Standard Time

Checked in 6.4.1 Beta 1.

Per Herman's comment above, if live load is neglected, you should receive a 0 or 99 rating. Then why do you have a rating factor of 0.945 at 11 feet, which is greater than the span length of the culvert? Since the structure is able to carry its own dead load, the rating factor should be 99.9.

The way I see it, there are three cases –

- 1)LL is not ignored – RF is reported as is.
- 2)LL is ignored, reserve capacity after dead load is positive, RF should be reported as 99.00
- 3)LL is ignored, reserve capacity after dead load is negative, RF should be reported as 0.00

When I run the attached model, I get 0.945 at 11' and 0.0 at 14.5 feet. However, at both depths, the spec check for the controlling location (0.72' at ext wall 1) shows a live load of 0.51kip. This 0.51 kip is used to determine the 0.945 rating factor for 11 feet. Shouldn't this live load be zero? Also, the RF at 11' should be 99.00, not 0.945.

When I run the attached model at 14.2 feet, I get a positive number at the controlling location when

4/19/2016 3:09:27 PM

HRS AASHTO

2255

Complete Issue Information

considering  $\langle \Phi * V_n - 1.3 * (DC + EH) \rangle$  but the rating factor given in the summary table is 0.006 and the spec check says the location fails for shear. At this depth, the live load should be zero, and the rating factor should be 99.00.

In addition, I reduced the slab thickness to 8 inches, increased the slab bottom steel spacing to 24 inches and increased the wall thickness to 24 inches so that the top slab would not pass. At a depth of 13.5 feet  $\langle \Phi * M_n - 1.3 * (DC + EH + EV) \rangle$  was a negative number and the RF was still reported as 99.00 (see attached screenshot). Note that the LL reported is still not zero. In this case, Virtis still reported the exterior wall controlling in shear.

FROM: Wayne Skow DATE: 11/19/2012 10:52:24 AM Eastern Standard Time  
The reason you're getting the .945 rating factor is due to the 2' live load surcharge (see the RC Box Culvert Loads dialog). That surcharge is considered a live load, so you'll get other than 0 and 99 rating factors, but it acts on the walls only and not the slabs. Therefore, the slabs are reporting a 99 rating. If you remove the live load surcharge, you'll see the type of behavior your expecting.

FROM: Brad Wagner DATE: 11/29/2012 10:03:49 AM Eastern Standard Time  
If surcharge is considered a live load, why is it not ignored??? This is very misleading.

FROM: Herman Lee DATE: 11/29/2012 11:25:11 AM Eastern Standard Time  
Live load surcharge height is entered by the user. Seems like some sort of data checking can be done during the analysis. Is there any case that the user would like to consider LL surcharge but the vehicle LL can be neglected due to fill height?

FROM: Matt Kolis DATE: 12/5/2012 8:59:47 AM Eastern Standard Time  
No additional changes have been made at this time.

FROM: Brad Wagner DATE: 12/10/2012 10:28:29 AM Eastern Standard Time  
Apparently I didn't get a notification when Herman posted his question on 11/29. I cannot think of a case where LL surcharge would be used when LL is ignored. I agree that this could be included in the data checking during the analysis. It says "live load neglected due to dept of fill". That should include anything that the program considers a live load - including surcharge.

FROM: Wayne Skow DATE: 12/11/2012 8:26:51 AM Eastern Standard Time  
The live load reduction due to fill depth is for vehicle wheel loads only as specified in article 3.6.1.2.6 Distribution of Wheel Loads through Earth Fills. It does not include live load surcharge (LS) loads governed by article 3.11.6.4. I changed the message to "Wheel loads neglected due to Fill Depth" to clarify that. Fixed in v6.4.1.

FROM: Srujana Thogaru DATE: 12/18/2012 1:39:57 PM Eastern Standard Time  
Verified in Virtis 6.4.1 Beta 3.

FROM: Wayne Skow DATE: 10/19/2012 8:05:52 AM Eastern Daylight Time  
Actually, the shear values are displayed, but they are labeled as "Interaction." The only way you can tell they are shears is by the force type, Kips rather than Kip-Ft. The reason it was originally output that way was to differentiate between the shear rating article and the MV interaction article. But when we added the filtering switches, it became more of a problem.

I changed the output to the XML file so the records show "Shear" or "Flexure" rather than "Interaction." But you'll need to compare those values with what's displayed by the MV rating article output since you might not see the same RF's if you look at the shear rating article alone. The same applies to flexure. Before, if it said "Shear", it came from the shear article (similar for flexure). If it said "Interaction", it came from the MV article. Now, you'll just look at the interaction article since it will show the values from the shear/flexure article and any changes to the RF's by the interaction article.

Changed in v64sp1.

FROM: Matt Kolis DATE: 10/31/2012 2:17:25 PM Eastern Daylight Time  
Verified. Shear rating results are now shown at 10th points for spans 1 and 3.

Description

FROM: Subhadeep Ghosh DATE: 10/23/2012 6:00:21 PM Eastern Daylight Time  
 Investigated the incident and found this to be a bug in the stringer floor line superstructure analysis. The support reaction for the end support (support 3) for the stringer is used for rating the floorbeam on support 1. Also the Floorbeam C (Bent 3 (MDL 1of 1) cannot be analysed since it is throwing an exception whose screen shot is attached.

Complete Issue Information

To: Lee, Herman  
Cc: George Huang  
Subject: Floor Beam Results seems to be wrong.

Herman

One of our engineer found this problem

We have a two span continuous stringer bridge that is supported on Bent cap beams, which are supported by Column members.

We have modeled the Bent cap beams as Floor beams and columns as supports of Floor beam.

When we analyzed the floor beams (attached xml) the results for Floor beam 1 and 2 came about to be the same, and we could not rate the Third floor beam.

(1) Further investigation reveals that the software ALWAYS uses the Reaction reported for the third support to rate the floorbeams.

Stringer LL Summary sheets shows this For Ben 1 Beams  
(Embedded image moved to file: pic00792.jpg)

Reaction at support 3 is 50.54 kips

The span LL Summary Txt show the following:

(Embedded image moved to file: pic12934.jpg)

Wheel load of 25.27 (1/2 of 50.54 kips) is used for the Floor beam analysis. So, it shows the demand is based on the reaction reported for NODE 21, which corresponds to the support 3.

In other words, software is using the Reaction reported at Support 3 to rate Floor beams at Support 1. If our observation is correct, software needs to be modified.

(2) Please NOTE that the Reaction due to HS20 Truck WITHOUT IMPACT at Support one, two and three should be 39.2 kips, 68.9 kips, 50.54 kips respectively.

(See attached file: 20C0322OK.xml)

Could you please look into this and see whether we made any mistake or identify whether this is a bug or not?

Complete Issue Information

FROM: Herman Lee DATE: 10/24/2012 6:07:50 PM Eastern Daylight Time  
The defect in locating the stringer support for the floorbeam being analyzed in a floor line superstructure definition is a duplicate of Incident 11373. Incident 11373 has been resolved for 6.4 Service Pack (6.4.1).

FROM: Herman Lee DATE: 10/25/2012 9:00:29 AM Eastern Daylight Time  
Fixed a defect in locating the right spacing when the floorbeam being described is the last floorbeam in a floor line superstructure definition.

Resolved for 6.4 Service Pack (6.4.1).

FROM: Matt Kolis DATE: 11/1/2012 4:01:30 PM Eastern Daylight Time  
Verified

FROM: Matt Kolis DATE: 12/6/2012 11:42:52 AM Eastern Standard Time  
Verified in Virtis 6.4.1 Beta 2.

FROM: vinacs vinayagamoorthy DATE: 12/12/2012 10:37:11 AM Eastern Standard Time  
There exists another problem; the software continue to pick the 2nd support reaction to rate the memeber at support 1 or 3.  
I have attached a word document and model for you test and check

FROM: Herman Lee DATE: 12/17/2012 11:03:53 AM Eastern Standard Time  
Fixed an issue in determining the floorbeam being described for the case that two independent sets of stringer spans are entered in the Stringer Spans tab.

Fixed for the next 6.4.1 build. Resolved for 6.4.1 release.  
Above fix verified in Virtis 6.4.1 Beta 3.

### Description

FROM: Todd Thompson DATE: 10/24/2012 11:35:00 AM Eastern Daylight Time

Not sure if I'm overlooking something or if we have a problem in the Spec Checker.

LF Analysis - AASHTO LF Engine

I had a designer state that when looking at Max M and V - and then looking at Max M, Concurrent V and Max V, Concurrent M in the Spec Checker - that it didn't look like it was using the correct values.

Using Training Bridge 1

Girder G2

at Location 80.5 ft

The Maximum Moment is 3885.08 k-ft (lane)

The Maximum Moment is 3634.91 k-ft (truck)

The Maximum Shear is 38.03 k (lane)

The Maximum Shear is 46.76 k (truck)

And when you go to the Spec Checker for this location -

The Maximum Moment is 3885.08 k-ft (lane)

and the concurrent Shear is 38.03 k (lane)

But the Maximum Shear is also 38.03 k (lane)

With Concurrent Moment as 3885.08 k-ft (lane)

And for truck -

The Maximum Moment is 3634.91 k-ft (lane)

and the concurrent Shear is 46.76 k (lane)

But the Maximum Shear is also 46.76 k (lane)

With Concurrent Moment as 3634.91 k-ft (lane)

It appears that the spec checker is using Max Moment and Max Shear - instead of Max Moment with concurrent shear and Max Shear with concurrent Moment.

FROM: Bin Zhang DATE: 10/30/2012 10:22:51 AM Eastern Daylight Time

Per article 10.48.8 LFD Shear Calculations ((AASHTO Standard Specifications for Highway Bridges,

4/19/2016 3:09:28 PM

HRS AASHTO

2262

Complete Issue Information

Seventeenth Edition - 2002)), shear capacity is controlled by Eq(10-113). (figure 1)

Per article (6B2.3), the combined moment and shear rating applies to the section where the shear capacity is governed by Eq 10-114 for stiffened girders (figure 2). So the combined moment and shear does NOT apply here for G2 girder. Please read the highlighted section in figure 3 for details.

You are right! The grid in figure 3 displays the Max Moment and Max Shear – instead of Max Moment with concurrent shear and Max Shear with concurrent Moment.

Please read the attached 11985.PDF for details.

Description

FROM: Todd Thompson DATE: 10/29/2012 8:32:11 AM Eastern Daylight Time  
Started doing some production work and went to print my first culvert load rating and noticed there is no heading or footing for the Rating Results Summary Report.  
I've attached training bridge 1 and culvert example 1 as examples.

Not sure if this was supposed to have been as part of 6.4 and is a warranty issue? Or was just overlooked. The TAG didn't get any report mockups to review, so not sure.

FROM: Joseph Ihnat DATE: 10/29/2012 1:51:58 PM Eastern Daylight Time  
Heading and footing added for 6.4.1

FROM: Matt Kolis DATE: 11/1/2012 11:45:29 AM Eastern Daylight Time  
Header and footer on rating results summary report still does not appear to be showing up for culverts.

FROM: Joseph Ihnat DATE: 11/6/2012 7:59:07 AM Eastern Standard Time  
This wasn't fixed in 6.4.1 Alpha 1. Please reverify in Alpha 2.

FROM: Matt Kolis DATE: 11/6/2012 2:58:44 PM Eastern Standard Time  
Verified in Alpha 2.

FROM: Todd Thompson DATE: 11/13/2012 10:25:01 AM Eastern Standard Time  
Checked and fixed in Beta 1 of 6.4.1

FROM: Matt Kolis DATE: 12/6/2012 2:23:07 PM Eastern Standard Time  
Verified in Virtis 6.4.1 Beta 2.

FROM: Todd Thompson DATE: 12/10/2012 11:33:46 AM Eastern Standard Time  
Accepted but in Beta 2 - the summary table is filled with 0.000 when they should be blanks. Will submit a differnt incident.

### Description

FROM: Phil Litchfield DATE: 10/30/2012 10:51:32 AM Eastern Daylight Time  
From consultant (Souther):

We are getting differing results when using an in-house program to check against Virtis culvert ratings at certain fill depths. We believe that it has to do with the spacing of the wheel loads. If the culvert has multiple lanes on it two wheel loads can be 4' apart. This is taken into consideration in the in-house program, but we believe it is not in the Virtis culvert module. Attached is a copy of the IDOT policy for reference.

FROM: Herman Lee DATE: 10/30/2012 10:53:09 AM Eastern Daylight Time  
AASHTO Culvert Engine does not take multiple lanes into consideration for live load distribution. Please refer to page 31 in the Culvert Method Of Solution Manual for the LFD live load distribution flowchart.

FROM: Phil Litchfield DATE: 11/5/2012 11:57:17 AM Eastern Standard Time  
Herman,  
We would prefer to have the option to consider multiple lane loading. Since in some case this will result in a lower rating. Can you please figure an estimate to make this change?

Description

FROM: Phil Litchfield DATE: 10/31/2012 6:22:50 PM Eastern Daylight Time  
 From consultant (Shoup):

It is appearing to me that the "Ignore positive moment at supports in ratings" under the Continuity Diaphragm in the Beam Details is not working (or there is an issue with it). When I run it with it checked or unchecked with no information in the Continuity Diaphragm I get a rating factor of 0.758 / 1.266 with a controlling point at 1 @ 100% for Flexure. However, if I put information into the table the rating goes up to 1.345 / 2.246 with a controlling point at 2 @ 1.2% for Shear (Assuming 2 - #8 bars at 2"). I get the same results if I leave the information in the table and use the check box for Ignoring the positive moment. Therefore, it appears that this check box is not working to me.

FROM: Herman Lee DATE: 11/1/2012 8:05:06 AM Eastern Daylight Time  
 The EngineHelp for the AASHTO LRF/LRFR/Std engines state that this field is not used by these engines.

FROM: Phil Litchfield DATE: 11/2/2012 3:27:00 PM Eastern Daylight Time  
 What is the propose of the check box if it doesn't work with any of the AASHTO engines?

FROM: Herman Lee DATE: 11/2/2012 3:35:17 PM Eastern Daylight Time  
 3rd-party engines could provide support for this option.

Description

FROM: Brad Wagner DATE: 11/1/2012 1:15:16 PM Eastern Daylight Time

Live load distribution for LRFR is not correct. The live load should spread at a rate of 1.15 multiplied by the fill height. See attached output, the 1.15 factor is not being used. The .xml is also attached.

This same issue was fixed for LFR under incident 11669 during beta testing. At the time, I thought the same issue was occurring for LRFR, but I commented in incident 11669 that it was not.

FROM: Srujana Thogaru DATE: 11/12/2012 9:30:08 AM Eastern Standard Time

Can you please let us know distribution rate factor 1.15 you mention is "based on NCHRP 647 LL distribution" or "based on soil type(Granular soils only have distribution rate factor of 1.15)". If it is based on NCHRP 647 LL Distribution, please check the check box for NCHRP 647 LL Distribution in control options tab.

FROM: Brad Wagner DATE: 11/13/2012 9:16:59 AM Eastern Standard Time

I have just learned that NCHRP 647 LL distribution was voted on by AASHTO SCOBS, so this will soon become a non issue. However:

The method of solution manual (page 25) makes no mention of the 1.00 factor for non-granular soils. In addition, the mockups, page 41 of 55 says "program always uses 1.15H."

Choosing the NCHRP 647 control option includes additional provisions (.06D) that are not part of the LRFD code. I don't believe that the program should require you to choose this provision in order to use the proper (1.15H) LLDF.

FROM: Srujana Thogaru DATE: 11/27/2012 8:53:34 AM Eastern Standard Time

Latest mockups on page 42 has note which says "AASHTO Spec 3.6.1.2.6 says "1.15\*depth for select granular backfill, or the depth of fill in all other cases." The WisDOT Culvert program always uses 1.15H.

Geoff can you please update the method of solution manual on page 24 to display the correct information.

FROM: Geoffrey Trees DATE: 11/27/2012 3:40:44 PM Eastern Standard Time

Updated method of solution.

FROM: Srujana Thogaru DATE: 11/28/2012 9:15:27 AM Eastern Standard Time

Fixed for 6.4.1

FROM: Matt Kolis DATE: 12/4/2012 4:12:48 PM Eastern Standard Time

Verified in 6.4.1 Beta 2.

Complete Issue Information

FROM: Brad Wagner DATE: 12/10/2012 10:12:52 AM Eastern Standard Time  
Page 24 of Method of solution was updated as noted above. However, there are still several discrepancies.

On page 24 it says "when the depth of fill is 2' or greater, the distribution is based on lfrd article....with changes proposed by NCHRP 647. However this is only used if you choose the NCHRP 647 control option.

The equations on page 26 represent the NCHRP and it implies that these equations are always used.

Sentence on page 26 says "the use of the term "D" can be controlled by "UseNCHRP647LLDistribution". This is still a reference to the way control options are used in Wisdot culvert. Also, it implies that only "D" is changed by the control option, which is incorrect.

The manual is still very misleading and does not agree with your response above.

FROM: Srujana Thogaru DATE: 12/13/2012 10:03:27 AM Eastern Standard Time  
Brad, I have made a few changes in the Method of solution manual page 24. I have attached the revised manual to the incident. Please let us know if the changes are clear. Regarding the use of distribution rate factor of 1.15, current Virtis LRFDF for culvert is inherited from wisDot Culvert program which always uses 1.0 dist. Factor rate. Any changes to this would be an enhancement. Please let me know with your suggestions.

### Description

FROM: Brad Wagner DATE: 11/1/2012 1:22:41 PM Eastern Daylight Time

The shear capacity for culvert walls is being calculated incorrectly for LFR. The width of the section (bw) should be equal to 12" in all cases but Virtis is using the wall thickness for bw. This results in unconservative results when wall thickness is greater than 12 inches, and conservative results when wall thickness is less than 12 inches.

A screen shot of the specification check at 0.5ft as well as the .xml file are attached.

It appears that the calculation for LRFR shear is correct.

FROM: Todd Thompson DATE: 11/1/2012 3:12:59 PM Eastern Daylight Time

Good catch Brad.

I confirmed same problem with LFR.

The d is calculated correctly based on wall thickness, resteel size and clear cover.

But the bw is using the wall thickness instead of 12 inches.

Same regardless of exterior wall or interior wall.

Check of top and bottom slabs - shear uses the 12 inch width.

FROM: Wayne Skow DATE: 11/2/2012 7:05:38 AM Eastern Daylight Time

The wrong property was being assigned to bw in article 8.16.6.2.2 when the cross section type was a column (wall).

Fixed in v6.4.1.

FROM: Matt Kolis DATE: 12/4/2012 4:12:28 PM Eastern Standard Time

Verified in 6.4.1 Beta 2.

## Complete Issue Information

This was produced in 6.4.1 VM

LFD analysis reports are missing for following sequence(s).

For fresh bridge first time analysis:

1. Run LRFR deck analysis  
-- only log file generated LRFR
2. Run LFD deck analysis  
--- only log file generated for LFD

Reopen the bridge:

1. Run LFD deck analysis  
--- see all the LFD reports
2. Run LRFR deck analysis  
--- see all the LFD reports  
---- See only log file for LRFR analysis
3. Run LFD deck analysis  
---- see all LFD reports missing

(Analysis output window from eye glasses icon)

FROM: Girish Bhanushali DATE: 11/1/2012 1:37:46 PM Eastern Daylight Time

FROM: Girish Bhanushali DATE: 12/26/2012 2:02:27 PM Eastern Standard Time  
Findings of my investigation are as below:

The above stated behavior is due to the fact that once user loads the vehicle template on analysis settings window, system loses the check box selections under AASHTO Engine Reports on Output tab.

User is hence obligated to do the report check box selection from the scratch, after use of templates.

These AASHTO Engine Reports check boxes are not stored in the database and hence they are not persistent.

Analysis settings window loads the defaults the first time window and the default or user selection stays as long as the BWS is open.

It makes me conclude that, scope of selection persistence is only as far as domain (layer) object is alive for BWS session (DoAnalysisEventPtr).

Analysis engine behaves as per whatever is stored in DoAnalysisEventPtr which stays as long as BWS is open.

This could be intended behavior or bug, which needs to be decided.

If there is anything further needs to be done on this, let me know.

FROM: Joseph Ihnat DATE: 1/2/2013 2:41:18 PM Eastern Standard Time

Appears to be working as intended. Depends on whether you use a template or enter your vehicles manually. If you enter vehicles manually there will be a few reports selected by default. But our sample templates have no engine reports selected.

Description

FROM: Bin Zhang DATE: 11/2/2012 3:21:24 PM Eastern Daylight Time

Please use the attached bridge to reproduce this issue, conduct the permit/ legal analysis to the bridge using the Type 3 vehicle in the bridge explorer. AASHTO engine only rated the girders but not the corrugated deck.

I tried the LRFR INV and OPR rating in the bridge explorer, it did the rating for both girders and the deck.

I submitted this issue on behalf of Dan Staton from Bureau of Land Management, please read the email in the attachment for details.

FROM: Girish Bhanushali DATE: 5/6/2013 11:37:25 AM Eastern Daylight Time

Fix has been applied to take care of permit , legal results not showing up when analysis is conducted

### Description

FROM: Krisha Kennelly DATE: 11/9/2012 12:10:00 PM Eastern Standard Time  
Submitted on behalf of Vinacs via email:

One of our engineer is writing an spread sheet to take the data from the BWS report to adjust the results to consider One Permit + One adjacent H20 truck scenario.

When we compared the results reported for each truck, we noticed some abnormal behavior.

- (1) Number of rows are different. Since the rating factors for each location and each force effect is considered, we anticipated same number of rows for all trucks.
- (2) In some cases, the load effect is missing or repeated twice. When we compared row by row, we noticed that in some cases, load effect is misquoted.

For example, I am showing the values reported at point for two different truck. Row 11, for one truck (left side) Interaction reported twice. However, if you compre the demands, capacities they are the

HRS AASHTO

2275

Complete Issue Information

same. We believe the load effect of Flexure is used to load rate, however, BWS report writer mis quoted it.

Can some one look into these issues for us?

If you want, I can place this in the Issuenet.

Vinacs M Vinayagamoorthy  
Senior Bridge Engineer  
916-227-2676

FROM: Wayne Skow DATE: 11/13/2012 7:17:18 AM Eastern Standard Time  
This issue is similar to 11982. Please read the resolution to that issue as it explains the difference between "Interaction", "Shear" and "Flexure" on the detailed rating results report. The report has been changed in v6.4.1 to remove the "interaction" label. This should give you the result you want.

FROM: Wayne Skow DATE: 11/26/2012 7:45:58 AM Eastern Standard Time  
After additional investigation relative to item (2) above, I did find a bug related to the fix for issue 11982 that causes the inventory and operating RF's to appear on separate lines in the LFD XML report under certain conditions and both values appear under the inventory heading rather than under their own separate headings.

Fixed in v6.4.1.

### Description

FROM: vinacs vinayagamoorthy DATE: 11/13/2012 11:18:57 AM Eastern Standard Time

I have a floor beam with hinge. The AASHTO LFD engine do not consider the effect of hinges. Could you please check that.

Floor beam alternative: Plate Girder ... with Hinge.

FROM: Herman Lee DATE: 12/4/2012 2:38:12 PM Eastern Standard Time

Fixed defect in adding hinge locations for Floorbeam Stringer Floor System and Floor Line superstructure definitions.

Fixed for 6.4.1 Beta 2. Resolved for 6.4.1 release.

FROM: vinacs vinayagamoorthy DATE: 12/17/2012 10:38:24 AM Eastern Standard Time

Though the software analyze the girder with Hinge, the capacity calculation has some problems. The capacity at the end of cantilever end (100th point of Span 1) is underestimated. Please see the attached word document. If I remove the Hinge, the capacity reported seems to be correct.

FROM: Wayne Skow DATE: 12/18/2012 8:35:45 AM Eastern Standard Time

I examined the differences between the plate girder without a hinge and the plate girder with a hinge. The first plate girder is composite. The hinged plate girder is non-composite and the girder is composed of different plate sizes than the first girder. Both girders, however, have shear connectors specified even though the hinged girder does not have a deck specified. If you click the "validate" button for the hinged girder, you get warning messages relative to the deck and shear connector disparity.

I'd like to verify with you that you intended to model the girders as non-hinged, composite and hinged, non-composite.

There is a bug in the program causing the low capacity of the hinged section. The presence of the shear connectors in the hinged girder is causing the program to treat the girder as composite. When it computes section properties, it's expecting a deck to be present which it eliminates when calculating negative moment section properties. Because there isn't one, it wrongly eliminates the top flange instead, which causes the section properties to be low resulting in the low capacity. This is easy to see in the "LFD Steel Elastic Section Properties" spec check output. Notice there is no top flange in the component list of the Negative Flexure Elastic Section Properties table.

If the shear connectors are deleted from the hinged girder, the run produces a good rating factor.

Subject  
doesn't run in 6.4.0 (53 0174R)

(See attached file: 53 1074R mjj.xml)  
This runs in 6.3, but not 6.4; I can fiddle with some lengths and get G1 to run, but G2 seems irreconcilable, as:  
Span 1 = 136.027598 ft & Span 2 = 158.150880 ft, but the program thinks the full length of the girder is 294.178477, and not 294.178478 (span 1 + span 2).

I also attached the error message in the document. I think it's a bug that may be related to the fix for issue #11931.

FROM: Krishna Kennelly DATE: 11/15/2012 9:58:04 AM Eastern Standard Time  
Fixed for 6.4.1 beta 2. There is no workaround.

### Description

FROM: Todd Thompson DATE: 11/20/2012 4:27:40 PM Eastern Standard Time

Trying to confirm or figure out what the application is doing for LL DF when Fill Depth is less than 2 ft.

AASHTO 3.23.3.2 - Uses wheel loads,  $E = 4 + 0.06 * S \leq 7.0$  ft; which is what is on Page 31 of the culvert solution manual

I was comparing Virtis LF Rating with two other applications and the LL Moment in Virtis is quite smaller compared to other applications.

I think it might be related to AASTHO 3.23.3.2 uses E as Wheel Load but I think Virtis thinks it is for Axle load? The LRFD/LRFR DF's uses axle loads where Std Spec uses wheel load.

In the attached example for HS20 LF Rating  
LL Moment is about 4.44 ft-kips

Three other applications I have are 6.62 ft-kips and 7.497 ft-kips and 8.33 ft-kips for LL Moments. I get good agreement on other loads/moments but I end up with RF's being very different (RF = 0.8 vs RF = 1.5 )

I know one difference between the applications are whether one uses clear span or centerline of wall to centerline of wall - which does add some variability to the equation but doesn't produce the large LL Moment differences. (I personally think we are not using the correct span length in this equation)

FROM: Todd Thompson DATE: 11/20/2012 4:28:03 PM Eastern Standard Time  
Culverts - Forgot to add this in the Subject line

FROM: Todd Thompson DATE: 11/26/2012 10:54:03 AM Eastern Standard Time

I also checked an additional application - Texas Culvert (V2.2)

Same Culvert 3-8x6 with Zero Fill

I get a LL Moment of Top Slab (midpoint) with 6.37 Ft-Kips. Which is pretty good agreement with ET-Culvert which was 6.62 Ft-Kips.

Brass Culvert - Produced 8.33 Ft-kips (which seems too high and I can't track down why, but I do know our designers evaluated Brass Culvert and didn't like what they saw but have agreed upon ET-Culvert as one of our design tools/software packages for doing Design. - The other is Virtis Culvert once we get 6.4.1 and get some issues resolved).

FROM: Todd Thompson DATE: 11/26/2012 12:56:58 PM Eastern Standard Time

I re-ran BRASS Culvert and for HS20 truck - I'm getting 6.48 ft kips now, which agrees within 3% of ET-Culvert and Texas Culvert for HS20 Truck moment in the top slabs.

But Virtis Culvert is approximately 33% lower than the other 3 programs.

FROM: Todd Thompson DATE: 11/27/2012 9:09:32 AM Eastern Standard Time

I made a series of runs with Virtis Culvert, ET-Culvert, BRASS Culvert and Texas Culvert with fill depth varying from 0 to 5 ft for the given box culvert.

4/19/2016 3:09:31 PM

HRS AASHTO

2281

Complete Issue Information

I'll attach a spreadsheet with the numbers I got from all 4 applications.

Virtis Culvert appears to be wrong for < 2 ft of fill  
But Virtis Culvert appears to be ok for 2 ft or greater fill  
Of course - a different AASHTO Spec applies for these two different cases.

FROM: Herman Lee DATE: 11/30/2012 8:08:50 AM Eastern Standard Time  
Fixed a defect in applying concentrated loads when fill depth < 2 ft. The LL moment at Top Slab 1 midpoint is now comparable with the other applications for fill depth < 2 ft.  
I also changed the output to report just the live load pattern for the inputted fill depth, not both patterns (< 2 ft and >= 2 ft).

Fixed for 6.4.1 Beta 2. Resolved 6.4.1 release.

FROM: Geoffrey Trees DATE: 12/5/2012 10:58:18 AM Eastern Standard Time  
Verified

FROM: Todd Thompson DATE: 12/10/2012 1:25:01 PM Eastern Standard Time  
Checked in Beta 2 - appears to be corrected and the live load cases that are not to be investigated are no longer shown in the detailed output.

Description

FROM: Todd Thompson DATE: 11/21/2012 9:43:44 AM Eastern Standard Time  
 For culverts with 2 ft or more of fill - LFR, the LL DF is based on 1.75 x Fill Depth.

But when I review the output - I don't see that being considered.

Here is an excerpt from detailed output:

ehicles:  
 -----

HS 20-44 - Truck  
 Description: AASHTO H 20-S 16 Loading, 1944 Edition

Part 2 -

I checked with 3 ft of fill on this culvert and it looked fine (the part thru fill).

My question is that it also has the strip method listed but how does one know which LL model was used in the analysis? I can not find in the detailed analysis output which one was used? Or maybe the question should be asked why not only output the one that was used?

Maybe I'm just missing something in the review of the output.

FROM: Srujana Thogaru DATE: 11/27/2012 9:03:43 AM Eastern Standard Time  
LLDF Uniform Load is based on min of  $\text{load}/E^2$  and  $\text{load}/(1.75 * E)^2$ . In the case of attached culvert file uniform load of  $\text{load}/E^2$  is considered. Please let us know if you agree with it.

FROM: Todd Thompson DATE: 11/27/2012 10:18:13 AM Eastern Standard Time  
For Part 2 - the Output does not indicate which live load case was used or controlled. I think this should be reflected in the output.

For Part 1 -

AASHTO 6.4.1 - States - When the depth of fill is 2 feet or more, concentrated loads shall be considered as uniformly distributed over a square with sides equal to 1.75 times the depth of fill.

So I do not agree with your statement that  $\text{load}/(1.75 * E)^2$  is correct. Replace E with h (or depth of fill) and then I agree with  $\text{load} / (1.75 * h)^2$ .

AASHTO 6.4.2 states that when the fill depth is < 2 ft - the wheel loads are distributed as in slabs with concentrated loads. and then one is referred to 3.24. For this load case it does say if  $\text{load}/(1.75 * h)^2$

4/19/2016 3:09:31 PM

HRS AASHTO

2284

Complete Issue Information

controls over load/(E^2) than that can be used instead.

But I think the way I read the spec - once the fill height is 2 ft or greater - then only 6.4.1 is in effect and then only (1.75\*h)^2 should be in play and E^2 is not to be considered. (maybe I'm wrong or reading it differently?)

I'll try to dig into this a bit more.

FROM: Todd Thompson DATE: 11/27/2012 11:20:19 AM Eastern Standard Time  
I've read and re-read this spec and I consulted one of our designers.  
We both agree that at 2 ft or greater in fill - only AASHTO 6.4.1 should be considered.  
If the fill is less than 2 ft - then the min E (or max pressure) between the two is correct.

FROM: Srujana Thogaru DATE: 12/3/2012 3:50:30 PM Eastern Standard Time  
Code for computation of LLDF has been updated to consider 6.4.1 for fill depth greater than or equal to 2ft and for filled depth less than 2ft to follow 6.4.2.  
Method of solution manual has also been updated. Fixed for 6.4.1 beta 2.

FROM: Geoffrey Trees DATE: 12/4/2012 4:59:24 PM Eastern Standard Time  
Verified

FROM: Todd Thompson DATE: 12/10/2012 1:26:15 PM Eastern Standard Time  
Checked in Beta 2  
LL for LFR looks correct  
Detailed output shows only the correct case  
Quick review of page 31 appears to be correct in the method of solution manual for LF LL DF

From: Staton, Daniel F [mailto:dstaton@blm.gov]  
Sent: Monday, November 19, 2012 5:24 PM  
To: Bridgeware,  
Subject: Analysis Module Error

I'm load rating a bridge with steel girders and a timber plank deck. When I analyze the bridge I get the error message listed below. I've gone into both the superstructure window and the deck window and changed the Engine to Madero ASD. Once I close the window, I go back in and the engine is blank (nothing is selected). Then I save the bridge and re-analyze and I get the same message. The system still performs the load rating, but I get the error message. Any ideas why?

FROM: Bin Zhang DATE: 11/21/2012 11:40:05 AM Eastern Standard Time

Please use madeo asd engine to rate the timber deck in the attached bridge. The analysis report does not show the rating factor after the analysis completed. There is a system error when the analysis completed too. Please read the SystemError in the document for details.

I can also reproduce this issue using BID12TimberTrainingBridge1, I think we may break the Madero engine.

FROM: Herman Lee DATE: 11/21/2012 6:54:26 PM Eastern Standard Time

Analysis Results window doesn't display timber deck rating results is duplicate of Incident 11149.

### Description

FROM: Katy Grime DATE: 11/27/2012 3:35:03 PM Eastern Standard Time

Hello, we are currently inputting a multi-span bridge with rolled steel beams. The beams have top and bottom cover plates over the pier. We have inputted the rolled beams and the cover plates. When we run the analysis in Virtis, the program is outputting Cb values greater than 1 at the cover plate locations between the pier and the crossframe. However, AASHTO requires non-prismatic sections to have a Cb value of 1 as stated in 6.10.8.2.3. Thank you for your time.

FROM: Herman Lee DATE: 11/27/2012 3:37:24 PM Eastern Standard Time

Please attach the bridge XML file and specify which member alternative is having problem. Thanks.

FROM: Katy Grime DATE: 11/30/2012 9:35:28 AM Eastern Standard Time

I have uploaded the XML file. When performing a LRFR rating on Beam 1, Cb values at pier 3, right hand side, are greater than 1 when they should be equal to 1. In addition, virtis is saying that it is a prismatic member when it should be non-prismatic due to the cover plates. Thank you.

FROM: Katy Grime DATE: 12/21/2012 2:14:46 PM Eastern Standard Time

Hello. I am just following up and seeing if there was any progress made on our error? Thank you.

FROM: Bin Zhang DATE: 1/9/2013 3:01:12 PM Eastern Standard Time

I am able to reproduce this incident in version 6.4.1 too, no workaround has been found.

FROM: Wayne Skow DATE: 1/25/2013 7:50:04 AM Eastern Standard Time

Krishna - The section to the right of location 101.5 (support 3) has an unbraced length of 14.5ft. The cover plates end 5ft from the left end of the segment. The segment is being classified as prismatic in article 6.10.8.2.3.Cb, but should be classified as non-prismatic.

Katy - You can work around this by inserting a small segment of W30x116 at a location to the right of support 3. I put a 3 inch segment at a location 5ft to the right of support 3. That segment then becomes non-prismatic and you get a slightly lower rating factor for 90%(truck pair + Lane) load case which then is controlled at support 3 by the strength-I limit state rather than strength-II.

Complete Issue Information

FROM: Krishna Kennelly DATE: 1/25/2013 9:12:11 AM Eastern Standard Time  
Ben - please investigate why the controller sets this point as prismatic.

FROM: Herman Lee DATE: 5/1/2013 2:08:25 PM Eastern Daylight Time  
AASHTO LRFR Engine does not consider the section as non-prismatic due to the cover plate. The BRASS LRFR Engine also doesn't take cover plate into consideration when determining whether a section is prismatic.

Description

FROM: Brad Wagner DATE: 11/29/2012 10:02:28 AM Eastern Standard Time  
The attached culvert is deep enough for live load to be ignored. I ran the structure with a 2' II surcharge, and got rating factors of 5.623 and 9.391 for inventory and operating respectively. Per suggestion in incident 11981, I removed the II surcharge and analyzed the structure again. The rating factors were all zeros, indicating that the structure is not sufficient to carry dead load.

My question - why does the II surcharge increase the rating?

If I go back to the 2' II surcharge case, it indicates that bottom slab moment at 0" controls. At this location, the rating factor is correctly calculated as 5.623 and 9.391.

However, if I look at the top slab at midspan (6B.4.1 RC Flexure screen shot attached), the rating factors are not calculated correctly.  $0.9 * 15.75 - 1.3 * (14.8678 + 0.9937 - 1.6031) = -4.36$ , which indicates that there is no reserve capacity for live load. The rating factor displayed is 99.00.

In addition, the 8.16.3 Flexural spec check indicates that the top slab fails at 4'.

I understand that this represents a case where the II surcharge should not be included, but the rating factors are clearly not calculated correctly, and should be investigated.

FROM: Wayne Skow DATE: 11/30/2012 10:23:53 AM Eastern Standard Time  
There is a problem with the rating factor calculation in the culvert flexural rating article when checking and comparing the sign of the DL, LL and Capacity values and checking DL's against capacity.

Fixed in v6.4.1.

Description

FROM: Amanda Jackson DATE: 11/29/2012 5:17:19 PM Eastern Standard Time  
Our consultant is working on this bridge, and every time he tries to do an analysis, he gets the following error:  
Error computing haunch dead load!  
03:13:08 PM - Line 28300 in source file DoGirderMbrAlt.cpp.

Complete Issue Information

Cannot compute haunch dead load if concrete material not assigned to cross section slab!  
03:13:08 PM - Line 1173 in source file DoSteelBeamDef.cpp.

The bridge has a timber deck. Why is the program trying to calculate a concrete haunch dead load?

We tried rebuilding the member without any concrete defined so that there wasn't a type of concrete in the default materials, but we got the same error.

For now, we will try entering a thin concrete deck just for dead load purposes as a work-around.

FROM: Herman Lee DATE: 12/3/2012 1:54:59 PM Eastern Standard Time  
Add haunch load for concrete deck only.

Fixed for 6.4.1 Beta 2. Resolved for 6.4.1 release.

### Description

FROM: Brad Wagner DATE: 12/3/2012 12:22:35 PM Eastern Standard Time

Virtis says the attached structure is failing in shear at 1.75' of the bottom slab (summary attached). When I look at the spec checks, "6A.4.2.1.BoxCulvert.Concrete Shear General Load Rating Equation - Concrete Shear" passes, but "5.8.3.3.Boxculvert Nominal Shear Resistance" fails. How can this be? Shouldn't the output be based on the General Load Rating Equation check?

FROM: Brad Wagner DATE: 12/3/2012 3:13:28 PM Eastern Standard Time

I also just noticed - the permit rating factor for this structure is 0.931, and the corresponding permit load rating is 257.63 tons. The vehicle only weighs 69.2 Tons.

I also noted this for hl-93 inventory on this same bridge. (RF = 0.986, and Tons = 142.02!)

FROM: Wayne Skow DATE: 12/6/2012 8:01:41 AM Eastern Standard Time

This incident has two parts:

- (1) - Why 6A.4.2.1...shear passes, but 5.8.3.3 fails.
- (2) - The capacity reported with the rating factor appears to be incorrect.

### Resolutions:

(1) - The difference between 6A.. and 5.8.. is that 6A only includes STR-II load cases where 5.8 include both STR-I and STR-II. It's the STR-I load case that's failing, not STR-II. Since permit vehicles are the only vehicles in the analysis, and the permit level does not involve STR-I, STR-I load cases should not appear in any of the articles. The program is currently unable to make that distinction. Presently, if a permit vehicle is specified, STR-II is added to the load cases considered, but there is no logic to

4/19/2016 3:09:33 PM

HRS AASHTO

2295

## Complete Issue Information

remove STR-I if there's no inventory or operating load case. An enhancement request has been added to VI as issue 12091.

(2) - The capacity was being improperly converted between kips and tons in two places: article AppC.6.1 and when the capacity result was handed to the result dialog. This resulted in the capacity being overstated by a factor of 2 or 4 depending on whether AppC.6.1 controlled or not. Fixed in v6.4.1.

FROM: Brad Wagner DATE: 12/10/2012 11:54:39 AM Eastern Standard Time  
(1) Agreed

(2) Works properly for LRFR. However, when I analyze the same culvert per LFR, all tonnages are 1/2 of what they are supposed to be.

FROM: Herman Lee DATE: 12/10/2012 1:28:12 PM Eastern Standard Time  
Resubmitted (2) for Brad Wagner.

FROM: Wayne Skow DATE: 12/11/2012 9:07:45 AM Eastern Standard Time  
There were two similar problems with LFR as with LRFR, but they were compensating. So, before the LRFR fix, LFR capacities were correct. The LRFR fix only fixed one of the LFR bugs causing LFR capacities to become 1/2. Both bugs are now fixed in v6.4.1.

FROM: Srujana Thogaru DATE: 12/18/2012 2:25:38 PM Eastern Standard Time  
Verified in Virtis 6.4.1 Beta 3.

FROM: Todd Thompson DATE: 12/19/2012 2:49:39 PM Eastern Standard Time  
This this was a duplicate of mine (VI 12104) - I decided to check the part (2) - RF times Truck Weight = Tons not being correct. Load Factor Analysis

In Beta 3, using the Truck and Culvert from my incident  
RF = 2.85  
SD Type 3 Truck = 24 Tons  
So Correct Value should be 68.4 tons  
But the report in Spec Check has 71.3 tons  
Same with Rating Summary (RF = 2.85 and tons = 71.3)  
From Bridge Explorer - Bridge Rating is RF = 2.831 and tons = 67.94)

It almost seems like everything is messed up now.  
Spec Check and Rating Summary - tonnage is computed wrong  
Bridge Rating - tonnage is computed correctly, but wrong RF is passed on

FROM: Todd Thompson DATE: 12/19/2012 3:01:05 PM Eastern Standard Time  
Beta 3 Continued  
Attached 3 screen shots displaying what I'm seeing  
Confirmed that SD Type 3 Truck does weight 24 tons (48 kips).  
What is odd - yesterday with Beta 2 - the RF = 2.831  
but today in Spec Check and Rating Summary = RF = 2.85

FROM: Todd Thompson DATE: 12/19/2012 3:17:55 PM Eastern Standard Time  
And a quick check with LRFR Rating with SD Type 3 - Legal rating --

4/19/2016 3:09:33 PM

HRS AASHTO

2296

Complete Issue Information

I also get the same issues as with LF Analysis  
wrong tonnage computed in those two cases.  
right tonnage computed in other case - but wrong RF pulled and used....

FROM: Todd Thompson DATE: 12/19/2012 4:27:47 PM Eastern Standard Time  
I was wrong - grabbed AASHTO Type 3 instead of SD Type 3 truck. All looks good. (as far as RF times  
truck = tons)

FROM: Wayne Skow DATE: 12/6/2012 12:10:19 PM Eastern Standard Time  
I'm submitting this on behalf of Brad Wagner. Brad raised a question in issue 12085 resulting in this enhancement request.

When only permit trucks are specified in box culvert, the analysis includes STR-I, STR-II and SER-I limit states. and STR-I results will be reported in the LRFD spec check article reports. The LRFR code, however, only requires STR-II and SER-I limit states for permit vehicles.

The final rating results as displayed by the Analysis Report dialog filters out the STR-I results. So

Complete Issue Information

those results do not affect the final rating. However, the presence of STR-I limit states can be confusing and misleading. For example, article 5.8.3.3 can show up as "failed" in the spec check results because the STR-I case failed within an article even though all STR-II cases passed.

Please enhance the box culvert analysis so that only the appropriate limit states are displayed.

See the attached pdf file for additional information.

### Description

FROM: Todd Thompson DATE: 12/10/2012 11:42:59 AM Eastern Standard Time

Ok - was confirming VI 11994 was fixed.

But a new issue has popped up - When doing legal rating, or permit rating, or inventory or operating rating - the columns/rows that are not used are now filled with 0.000 instead of being blank.

Checked back and Beta 1 was looking ok, as did previous 6.3.X versions.

Appears to be ok for bridge structures. This only happens with culvert structures and is probably related to the fix in VI 11994 or some other fix.

FROM: Joseph Ihnat DATE: 12/10/2012 1:53:55 PM Eastern Standard Time

This is a different report than 11994. This report looks to be run from the bridge explorer, and it's always been this way.

The report in 11994 is run from the BWS, and it's still fixed.

FROM: Joseph Ihnat DATE: 12/10/2012 3:52:02 PM Eastern Standard Time

Some of the culvert results aren't coming back from the Domain as expected.

For instance, the template "LRFR Design Load Rating" has no Permit or Legal vehicle. So when CDoCulvertSegmentRatingSummary::GetMinRatingResultsSummaryLegalPermit() is called, seems like the flags bNoPermitData and bNoLegalData should contain True.

FROM: Todd Thompson DATE: 12/11/2012 10:06:04 AM Eastern Standard Time

My mistake - 11994 was run from the bridge and summarized.

This bug is related to analysis run from the bridge explorer.

4/19/2016 3:09:33 PM

2299

Complete Issue Information

Bridge structures are ok.

Culvert structures are not ok. Not sure if it is new to 6.4 or 6.4.1 Beta 1 or Beta 2 - but looks like you guys have the bug identified.

FROM: Todd Thompson DATE: 12/11/2012 4:04:08 PM Eastern Standard Time  
This pertains to both LF and LRFR analysis.

FROM: Geoffrey Trees DATE: 3/15/2013 4:50:31 PM Eastern Daylight Time  
I just looked at this. I think Wayne worked on populating the results object so I am going to have him verify his code to make sure it is populated with the flags set.

FROM: Wayne Skow DATE: 3/28/2013 10:57:43 AM Eastern Daylight Time  
There are calls to the IDoCulvertSegmentRatingSummary::AddRow in BoxCulertApp::SetCulvertLRFRCriticalLoads and BoxCulertApp::SetCulvertLRFRCriticalLoads. The last argument in AddRow is a null bit mask and, currently, it's a 0. This may be the source of the problem. However, I'm not sure how to set that bit mask.

FROM: Joseph Ihnat DATE: 3/28/2013 12:35:44 PM Eastern Daylight Time  
See, for example, DoMemberDetailedRatingResults and CABxEngineResultGen::MemberRatingSummary. Set a breakpoint at CDoMemberRatingSummary::AddRow() and run LRFR on TB1 from the BE to see how it's handled for a girder member analysis.

FROM: Wayne Skow DATE: 4/1/2013 1:17:56 PM Eastern Daylight Time  
The error was in DoCulvertRatingResultsSummary.cpp. Fixed in v65.dev.

FROM: Steve Salata DATE: 4/24/2013 2:40:02 PM Eastern Daylight Time  
Ran a few bridges from the Bridge Explorer and still see the 0.000 values for the Culvert Example (see "Bridge Rating Results Report\_verify.pdf" attached).

FROM: Wayne Skow DATE: 4/30/2013 9:53:20 AM Eastern Daylight Time  
The initial fix only considered LRFR. Fix added to LFR.

FROM: Steve Salata DATE: 5/23/2013 2:32:43 PM Eastern Daylight Time  
Fixed.

Description

FROM: Bin Zhang DATE: 12/11/2012 3:50:53 PM Eastern Standard Time  
 I submitted this enhancement request on behalf of CalTran regarding the Fcr calculation for rolled beam with cover plates. Please read the EmailPrint.PFD in the document for details. The bridge model was also attached in the document.

FROM: Herman Lee DATE: 12/12/2012 1:44:51 PM Eastern Standard Time  
 E-mail from George Huang, Caltrans:

=====

Hi Herman,

Caltrans does not have any standard procedure regarding how to calculate the cover plate capacity. However we would like to use total flange thickeners (original flange and the cover plate) with the original flange width (largest width). Please check with other States see which method they prefer.

Thanks.

George Huang  
 Senior Bridge Engineer

Description

FROM: Todd Thompson DATE: 12/13/2012 3:02:30 PM Eastern Standard Time  
 I believe I found an issue when analyzing culverts, LRFR Analysis, with Legal Trucks. The LL Factor is 2.0 as recently adopted by SCOBS in 2012. But we missed the part that the 1.2 multi presence factor should not be included with the 2.0 LL Factor.

I noticed this in the detailed output, that the multi-presence factor of 1.2 is included -

Complete Issue Information

| 2  | 11.0000 | 23.8333 | 0.2029 |
| 3  | 37.0000 | 49.8333 | 0.2029 |
| CG | 26.5167 |         |        |

We need to confirm that the multi-presence factor should be removed for Legal Loads.

We also need to review the Permit Loads and if the appropriate LL Factors and MP 1.2 is being applied (or not being applied) correctly.

FROM: Todd Thompson DATE: 12/13/2012 4:40:18 PM Eastern Standard Time For Permit Loads - currently it appears that the MP factor of 1.2 is being used when it should not be after checking various cases.

Still checking if the Live Load Factors are correct for Permit Loads, but at first glance - appears that the Routine/Annual/Unlimited permits are using the wrong factors - but I'm still checking or confirming that. The new spec states that the Multiple trip load factors given in this table (6A.4.5.4.2a-1) would be appropriate for routine permits. Do NOT use routine permit load factors from this table as they have specially calibrated for two lanes loaded conditons.

FROM: Wayne Skow DATE: 12/17/2012 9:34:25 AM Eastern Standard Time The spec states in 6A.5.12.10.3 that legal and permit loads should not use a multiple presence factor. I changed box culvert to use MPF = 1.0 for legal and permit loads.

Complete Issue Information

Fixed in v6.4.1.

FROM: Todd Thompson DATE: 12/18/2012 11:12:02 AM Eastern Standard Time  
Was the wrong Load Factors for Routine Permit Loads also fixed for 6.4.1?

FROM: Wayne Skow DATE: 12/18/2012 12:53:12 PM Eastern Standard Time  
What did you find wrong? Legal LL factor is 2.0. Permit LL factor is taken from table 6A.4.5.4.2a-1 for single trip special or limited crossing. I checked the program and it is working accordingly.

FROM: Srujana Thogaru DATE: 12/18/2012 2:31:46 PM Eastern Standard Time  
Legal Load MPF is taken as 1.0. Verified in Virtis 6.4.1 Beta 3.

FROM: Todd Thompson DATE: 12/19/2012 9:47:06 AM Eastern Standard Time  
Beta 3

I used a 170K Permit Load with ADTT left blank (unknown value)  
When I choose an Unlimited Crossing permit – I'm getting LL Factor of 1.3 - which appears to come from the Do Not Use section.

Single Trip Mixed –LL Factor of 1.5 – Which is correct  
Single Trip Escorted – LL Factor of 1.15 – Which is correct  
Multi-Trips – LL Factor of 1.85 – Which is correct

I was expecting the Unlimited Crossing to also use the MultiTrips and use LL Factor of 1.85 and not the 1.3 from the Do Not Use Section.

As best as I can tell – the Multi Presence Factor is 1.0 for all the Permit Loads now. Thanks for that fix.

Maybe you can review the Unlimited Crossing LL Factors again? I'll make the update in VI

When using the "Compute from Typical Section" button, we're getting an answer that we don't agree with. Is there somewhere that you can view the calcs. for this?

FROM: Herman Lee DATE: 12/14/2012 2:28:09 PM Eastern Standard Time  
Ben, please do a hand calculation for the computed LFD effective flange width. Thanks.

FROM: Bin Zhang DATE: 12/14/2012 2:40:54 PM Eastern Standard Time  
AASHTOWare does not provide the details calculation to the user regarding the effective flange width calculation. I manually checked the calculations for the interior and exterior girders of Span1 superstructure, they all look good.

Please note that "The web thickness is now included in the std. eff. flange width for PS I beams with Narrow top flanges. It is not included for PS Box beams, steel beams or PS I beams with Wide Top flanges (Article 9.8.3 is followed for Wide Top Flanges)". Please read incident #4946 in the VI for details. Please let me know if this does not answer your question.

### Description

FROM: Richard Withers DATE: 12/18/2012 10:55:34 AM Eastern Standard Time

When rating this reinforced concrete t-beam bridge using the AASHTO LFR engine, the shear capacity is zero at the end of the span (location = 0.0 and 25.4167). There is a vertical shear steel stirrup located at these locations. AASHTO LRFR engine does not have this issue. This issue also happens when rating other RC t-beam bridges we have model in VIRTIS.

I have attached the bridge.

Thanks,  
Richard

FROM: Richard Withers DATE: 1/4/2013 2:46:46 PM Eastern Standard Time

This is still an issue in 6.4.1. Has there been any resolution?

Thanks,  
Richard

FROM: Srujana Thogaru DATE: 1/10/2013 11:48:22 AM Eastern Standard Time

Yes, above mentioned issue has not been resolved for 6.4.1.

One of the reasons of the above issue is may be due to insufficient reinforcement in the cross-section defined. This error also exists in LRFR analysis.

To reproduce this error in LRFR analysis uncheck Ignore design & legal load shear and Ignore permit load shear under LRFR control options, then run the analysis.

Code has been corrected to handle such kind of errors. This fix will be available for 6.5 release.

FROM: Steve Salata DATE: 4/25/2013 10:04:31 AM Eastern Daylight Time

For LFR analysis the shear capacity at locations 0.0 and 25.4167 is greater than zero.

Description

FROM: Todd Thompson DATE: 12/19/2012 1:43:29 PM Eastern Standard Time

I noticed today -  
using 6.4.1 Beta 3

I have two NSG Trucks in my library but when I pull up a LF Analysis and doing a line girder - that the two NSG trucks show up along with all the other Agency "Normal" trucks.  
And if you pic one of those NSG trucks - it does crash the analysis.

I'm wondering why the NSG trucks don't show up under the NSG Vehicles anymore?

FROM: Geoffrey Trees DATE: 2/27/2013 1:35:41 PM Eastern Standard Time

Resolved for 65.

FROM: Subhadeep Ghosh DATE: 4/24/2013 6:32:41 PM Eastern Daylight Time

The NSG vehicles does not appear for Analysis Type: Line Girder but I found that they appear for other Analysis Types. Hence resubmitting.

I checked in debug and 6.5 Beta 1:

For Analysis Type: 3D FEM and Superstructure Definition the NSG vehicles appear under Vehicles:  
Standard: Agency. Attached is the screen shot for 3D FEM

For Analysis Type: Distribution Factor-Line Girder and 3D FEM - Vehicle Path NSG appears under  
Non-Standard Gage Vehicles: Agency which is right.

FROM: Geoffrey Trees DATE: 4/25/2013 11:15:09 AM Eastern Daylight Time

Other cases are resolved

FROM: Subhadeep Ghosh DATE: 4/25/2013 3:44:27 PM Eastern Daylight Time

Verified for 6.5 Beta 1.

FROM: Todd Thompson DATE: 5/31/2013 8:39:22 AM Eastern Daylight Time

Appears to be fixed in my review of Beta 2 - 6.5.0

Description

FROM: Herman Lee DATE: 12/23/2012 8:35:24 PM Eastern Standard Time  
Submitted on behalf of Dean Teal, Kansas DOT.

=====

Using BRASS Import on my XP 32 bit production PC to import into Virtis 6.4.0

If I have a group of brass data files I need to import it will always skip a structure. When a group is selected it will always import the last file first, skip the first file and then import the rest of the files in the list. Every time I have to go back and import the first file by itself.

=====

Geoff, sample BRASS data files for reproducing the problem are available in G:\PROJ\VIRTIS\LONGTERM\Verification\BRASS files.

FROM: Geoffrey Trees DATE: 2/27/2013 3:33:43 PM Eastern Standard Time  
Dean, I began investigating this and I have a few questions. I am not able to exactly reproduce what you said above but I want to investigate this further.

- Do you select each file individually while holding down the Ctrl key?
- Does this occur all the time?
- Do you select all the files in the folder and does this occur if you select all of the files?
- Do all the files appear in same order you selected the files in the Filename text box?
- Does this occur if you select files with the mouse selection box? (Holding down the left button and

4/19/2016 3:09:35 PM

HRS AASHTO

2310

Complete Issue Information

dragging the mouse will allow you to select all the files inside the box).

-- Would you be able to provide me with the files this is happening to?

Thanks,  
Geoff

FROM: Dean Teal DATE: 3/1/2013 7:34:47 AM Eastern Standard Time

Note – I am using XP and it acts this way everytime I import a batch of file. I have not tried this on windows 7.

-- Do you select each file individually while holding down the Ctrl key?

Yes

-- Does this occur all the time?

Yes, as long as I'm doing a group of files

-- Do you select all the files in the folder and does this occur if you select all of the files?

No, I am do not usually select all files in the folders but I have at times selected all files in the folder

-- Do all the files appear in same order you selected the files in the Filename text box?

Don't know, didn't pay any attention to it

-- Does this occur if you select files with the mouse selection box? (Holding down the left button and dragging the mouse will allow you to select all the files inside the box).

I don't follow what you just said?????

I usually select files from a folder that contains a lot of files by using the mouse and the ctrl key

Note: Attached brass .dat files

Each file contains both WSD and LFD

Each file will generate and 2 errors for an "include file", simply ignore the error, the include file does not effect the imported file.

I had to also attached the BRASS-Sections and BRASS-Vehicles files so can import our files

Before selecting files to import, sort them by file name

FROM: Geoffrey Trees DATE: 3/28/2013 11:23:44 AM Eastern Daylight Time

Dean,

For this issue we do see the files being imported out of order. For some reason the Windows open file dialog opens files this way. It is not just with this BRASS Import utility but other products that can open multiple files at a time do this as well. We are not sure why this is.

Regarding the import itself, we tested it and all of the files we selected were imported successfully. I am going to reassign this to Herman. He mentioned that he will see you at an upcoming meeting so perhaps it would be good to show him in person since we can't reproduce it with your dat files.

FROM: Herman Lee DATE: 4/19/2013 4:10:57 PM Eastern Daylight Time

We tried using the Brass Import utility opened from within Virtis and also the standalone Brass Import utility. All the selected files were imported into Virtis. We are not able to reproduce the "skip a structure" problem when importing a group of Brass data files.

FROM: Aaron Kemna DATE: 12/28/2012 11:35:26 AM Eastern Standard Time  
I think there may be some problems with the live load calculated for LFR culverts. The dead load

4/19/2016 3:09:35 PM

HRS AASHTO

2313

Complete Issue Information

calculations appear to be correct so I am assuming it has to do with the distribution of the live load. I looked over 12065 and I disagree with the conclusions. Here is how I understand the distribution of live loads to culverts.

Fill less than 2'

Distribute loads like slab. Distribute wheel line loading across E in transverse direction. No distribution in longitudinal direction.

Fill greater than 2'

Use patch loading equal to 1.75h unless the loading is larger than that produced by 1/E. In that case the smaller load should be used. Live Loading through fill should not create live loads larger than that produced from concentrated loads.

12065 mentions a patch loading of E^2 which I cannot find in the code. Plus, a patch loading is considered for fills less than 2' with the greater effect being used. A 1' fill depth would produce a 1.75' by 1.75' patch load which would easily control. A patch loading should not be considered for fills less than 2'.

For the culvert I was looking at, I was getting similar loads at midspan of top slab, but the load over the walls was smaller than I get using BRASS Culvert. I would like to make sure that the distribution of loads is being done correctly before I look any further into the differences.

FROM: Aaron Kemna DATE: 5/16/2013 4:30:18 PM Eastern Daylight Time

While beta testing I looked at this issue again. The live load distribution for culverts (LFR) is incorrect according to the method of solution I am looking at. It is incorrect to distribute the load over E^2 for fills less than two feet. It is also incorrect to apply a distributed patch load (1.75h^2) for fills under 2'. For fills over 2' the same loading calculated for fills under 2' should be compared to the patch loading and the lesser of the two loads should be applied. The logic is simple. For small fills, culverts are designed like slabs. When the fill gets over two feet the designer can take advantage of the fill, but in no case should a culvert with higher fill have larger live loads than a culvert with a smaller fill height. I lay out the appropriate distribution above. I would like to see this fixed for this upcoming version. Note this contradicts Incident 12065.

control. The limit state is negative flexure at 0% of span 2. The DL and LL moments are each less than 2% different between the versions. However, the LL moment capacity is 33% lower in version 6.4.1. What is causing this significant difference?

The export of the bridge is from version 6.2.

Thanks,  
Richard Withers

FROM: Wayne Skow DATE: 1/9/2013 10:17:51 AM Eastern Standard Time  
The difference is due to different Mu's. At support 2, Aashto is using an Mu of 257 where Virtis is using 314.7 for lane load and 257 vs 386 for truck load. Since the unbraced length of the compression flange is 360", Mu from 10.48.4.1 controls in 10.48.2. The transition article, 10.48.3, is using the full value from 10.48.2 (Mu of 256.88) since 360" unbraced length doesn't fall between the interpolation limits of 150.854" (for 10.48.1) and 111.792" (for 10.48.2).

Subject: Virtis question for Baker

As we discussed.....

My question has to do with the effect of the LRFR Control Options box for "Ignore long. Reinf. in rating".

The subject bridge is a single span, prestressed voided slab with a composite concrete deck overlay.

In the attached xml, the box is NOT checked.

Here is the spec check screen shot. Note the red failed X for 6A.5.9

Now look at the yellow highlighted section on page 2 of the spec check calcs in the file below.

Based on the yellow highlighted section above, I would expect to see a rating factor of less than 1 for the HL-93 in the rating results screen shot (see below). But the RF's for all vehicles (except the NRL) are all greater than 1. So why does the spec calcs indicate that something fails for HL-93, yet the rating results don't seem to reflect that?

Also, the rating results for having this Control Options box checked are identical when this box is NOT checked. The only difference seems to be that Spec Reference 6A.5.9 shows up when the box is NOT checked. But 6A.5.9 seems to simply invoke 5.8.3.5, which is already being done whether the box is checked or not. So what is the difference in the program operation/results between having the box checked and not having it checked?

The value in the article is being calculated but does not appear to be critical results.  
Srujana, can you look at this to and implement the 'save\_critical\_results' similar to the other specifications that calculation rating factors.

FROM: Srujana Thogaru DATE: 1/24/2013 9:16:10 AM Eastern Standard Time  
Reason for values not appearing in critical results is due to improper saving of critical results table in abanspec rating article. This critical results table is not included in the filter for determining the minimum rating factor. Code corrected in abaSpecctrl and abxaashtoengine.  
All the related spec versions (LRFD 5th and 4Th, MBE 1st and 2nd) are corrected to save proper critical results in abanspec.

Fixed for 6.5 release (for internal testing fixed for 6.5 alpha build 1).

Part of the Bridgeware e-mail received on 1/3/2013:

=====  
First, we really need a way to ignore shear for an LFD/LFR analysis on a Steel girder bridge for batch processing. On a individual rating we can look into the output and the engineer can easily ignore or not let shear control. However when batch processing for a permit route that adds time and our permit writers are not engineers so we can't put that responsibility on them. We would like to request an ignore shear toggle for the AASHTO Steel engine.

Description

FROM: Bin Zhang DATE: 1/21/2013 4:50:52 PM Eastern Standard Time

I submitted this incident on behalf of George Huang from CalTran.

Missing description for "AASHTO Std Superstructure Method Of Solution Manual" when AASHTO Manual for Condition Evaluation of Bridges Article 6.7.2.2 is used. The comments / questions from CalTran was listed below:

\*\*\*\*\*  
\*\*\*\*\*

1) Missing description of live load placement for road way between 9 and 10 feet, or 18 to 20 feet when AASHTO Manual for Condition Evaluation of Bridges Article 6.7.2.2 is used.

\*\*\*\*\*  
\*\*\*\*\*

FROM: Bin Zhang DATE: 1/21/2013 4:54:23 PM Eastern Standard Time

When using AASHTO Standard Specifications for Highway Bridges, Article 3.6.3:

Roadway widths from 20 to 24 feet have two design lanes, each equal to one half the roadway width.

When using AASHTO Manual for Condition Evaluation of Bridges, Article 6.7.2.2

Roadway widths from 18 to 24 feet have two design lanes, each equal to one half the roadway width.

The statement above showed the only difference between 3.6.3 and 6.7.2.2.

For both 3.6.3 and 6.7.2.2, the design lane number is 1 for road way between 9 and 10 feet.

For 3.6.3, the design lane number is 1 for road way between 18 and 20 feet.

For 6.7.2.2, the design lane number is 2 for road way between 18 and 20 feet.

FROM: George Huang DATE: 1/25/2013 6:16:26 PM Eastern Standard Time

The one important issue for narrow road way is the width of live load and the edge distance. I'm assuming 9 feet wide live lane load will be used for road way between 9 and 10, and 18 and 20. For the truck wheel line, wheel spacing is still 6 feet, the edge distance will be 1.5 feet (instead of 2 feet), and the wheel spacing between adjacent trucks will be 3 feet (instead of 4 feet).

FROM: Bin Zhang DATE: 1/31/2013 2:55:31 PM Eastern Standard Time

In fact, if the user defined road way is between 9 and 10 feet or 18 and 20, Virtis will still place the traffic loads in a 12 feet wide traffic lanes, wheel spacing is 6 feet, the edge distance is 2 feet, and the wheel spacing between adjacent trucks is 4 feet.

Complete Issue Information

In my opinion, this rule is kind of conservative for the narrow road way bridge. Please read article 3.6 traffic lanes in "AASHTO Standard Specifications for Highway Bridges, 17th Edition, 2002" for details.

To: Lee, Herman  
Cc: Murugesu Vinayagamoorthy  
Subject: Fw: Shear Capacity at the centerline of Hinge - Br#07 0005

Hi Herman,

Virtis give zero shear capacity at the hinge location (center line to 0.5ft beyond) for RC T-beam bridge. Since the hinge is at 0.2 point, and Virtis gives 0.0 rating. In this case we can use defined point of interest to skip 0.2 point. This case will be resolved in V6.5 where user can specify member capacity. However since the Virtis also give zero capacity beyond hinge, which may need to be modified.

I am wondering if Virtis calculate the ratings at hinge location for steel girder bridge?

Thanks,

Subject  
Shear Capacity at the centerline of Hinge - Br#07 0005

The bridge is 6-Span continuous with hinge at 2/10 point in Span 4 (6-ft from centerline of Bent 4). VIRTIS checks the shear capacity at the 2/10 point of Span 4, which is the centerline of the hinge and calculates it to be 0, therefore the RF=0. Adding additional reinforcement at this location does not help.

Capacity remains 0 when checked at every 2-inches past the centerline of hinge until at point 6.5-ft from centerline of Bent 4 (0.5-ft past the centerline of hinge). The shear capacity 2-inches before the centerline of hinge is calculated and is good.

Please see attached file.

Please use AASHTO LFD engine, mem alt of G2 to reproduce this issue. There is a workaround for this incident. Please check the "Ignore shear" option for the POI, then the shear won't be in control any more for the rating. Both the bridge XML model and the workaround snapshot were attached in the document.

FROM: Wayne Skow DATE: 2/18/2013 2:06:27 PM Eastern Standard Time  
The problem was due to the zero moment at that point. A moment is needed to determine whether the top of bottom fiber is in compression. Since  $\mu = 0.0$  at the hinge, the program was using 0.0 as the distance to the extreme fiber. This produced a zero shear capacity. It now uses the minimum distance to either the top or bottom fiber from the centroid of the rebar. This may not be an optimum approach as illustrated by your bridge which now calculates a rating factor at the 96' location, but it is much less than 1.0 and much less than the next point over which has a moment and, therefore, a much larger De value.

Fixed in v6.5.

 I submitted this enhancement request on behalf of George Huang from CalTran. The communication email was listed below:

\*\*\*\*\*

Ben,

Maybe I should say ". I think it should may be revised"

In the floor beam analysis, the 4 feet wheel spacing between two trucks will produce lower moment than 3 feet wheel spacing. Actually I don't have too much concern, since it's unlikely to having 3 feet spacing in real live for heavy trucks with normal speed. The wheel load could also be place on, or beyond the edge of road way with current method in Virtis. This will create more shear on the floor beam, and more live load on truss, which need to be avoided for bridges with low ratings.

Thanks,

HRS AASHTO

2326

Complete Issue Information

This situation is kind of tricky.

For example, when the user defined road way is 9 feet wide, Virtis will set the road way to be 12 feet to produce the maximum stress in the member under consideration. In other words, Virtis consider the situation when some of the truck wheels are beyond/off the 9 feet road way.

Please feel free to let me know if you still have questions about this. This is really a very good question.

Thanks!  
Ben

Subject: RE: Some Questions for Narrow Bridge and Virtis 3D Analysis

Ben,

Here is my respond to your comments of Question 1:

In fact, if the user defined road way is between 9 and 10 feet or 18 and 20, Virtis will still place the traffic loads in a 12 feet wide traffic lanes, wheel spacing is 6 feet, the edge distance is 2 feet, and the wheel spacing between adjacent trucks is 4 feet.

In my opinion, this rule is kind of conservative for the narrow road way bridge. Please read article 3.6 traffic lanes in "AASHTO Standard Specifications for Highway Bridges, 17th Edition, 2002" for details. Above live load dimensions won't work for narrow bridge:

one live load lane: 2 feet (edge) + 6 feet (vehicle)+ 2 feet (edge) = 10 feet > 9 feet.

two live load lanes: 2 feet +6 feet + 4 feet( spacing between truck)+ 6 feet (vehicle) + 2 feet = 20 > 18 feet.

Thanks,

George Huang

When rating (say 50 bridges) from the bridge explorer

When completed you can view the Bridge Rating Results Report

You can View, Print or save to a print file

Can this be sent to excel or word so the data can be used in in-house reports?

Can I only view it or print it?

FROM: Herman Lee DATE: 2/5/2013 2:55:37 PM Eastern Standard Time

Option 1: Copy and paste to Excel or Word.

a. Click on the first column in the first row and drag the mouse down to highlight all the rows (see attached BridgeRatingResults.png).

b. Hit Ctrl+C to copy all the rows and Ctrl+V to paste to Excel or Word.

Option 2: Print to PDF file and use Adobe Acrobat Save As function to Excel or Word.

FROM: Dean Teal DATE: 2/5/2013 3:34:54 PM Eastern Standard Time

Thanks

Sure would be nice to have the rt click for a menu to do that :)

### Description

FROM: Todd Thompson DATE: 2/6/2013 2:23:25 PM Eastern Standard Time  
Using Virtis 6.4.1  
with SQL Server sample DB

I have a timber bridge - deck with stringers.

When I analyze it - I can see the rating results for the stringers but the deck rating is not being displayed and I'm getting an error message for each truck in the analysis.

I'll attach the screenshot I'm getting, along with the bridge XML

FROM: Todd Thompson DATE: 2/6/2013 2:25:17 PM Eastern Standard Time  
The Madero output files are available, along with the log file - everything looks ok with no errors.  
For some reason - the application is not being able to read and display those results.

FROM: Herman Lee DATE: 2/7/2013 9:43:07 AM Eastern Standard Time  
Todd, this issue is a duplicate of Incident 11149. We believe the problem is within the Madero engine since an older version of Madero doesn't have this problem. BridgeTech is in the process of providing us a stripped down version of the Madero engine for us to pinpoint the cause. Before this is fixed, users have to retrieve the rating results at the end of the Madero output text file.

|------|---------------|---------|

Description

FROM: Mike Pichura DATE: 2/13/2013 1:26:32 PM Eastern Standard Time  
For the Truss Floorbeam Stringer Bridge, one of the floorbeams (FB3) had 90% thickness loss to the bottom flange angles from 0.00ft to 5.00ft from support 1. It produced 0.00 ratings. I then changed the thickness loss to 89%. The ratings dramatically improved. When the 90% loss is used, the program uses 0.00 kip-ft for Mu when calculating the rating factor instead of the correct value of 457.12 kip-ft.

FROM: Wayne Skow DATE: 2/19/2013 7:22:25 AM Eastern Standard Time  
When 90% is reached, article 10.48.4 fails due to inadequate member proportions. Since 10.48.4 is the last capacity article, ALFD\_17E\_General\_Stl\_Flexural\_Results reported a zero capacity. This is not proper behavior for LFR. I changed ALFD\_17E\_General\_Stl\_Flexural\_Results to use 10.48.4 even though it technically failed under LRD provisions. Now, the output shows 10.48.4 failing, but still using 10.48.4's capacity value allowing a non-zero rating factor.

Fixed in v6.5.

### Description

FROM: Brad Wagner DATE: 2/20/2013 3:41:52 PM Eastern Standard Time  
AASHTO LFD Section 16.7.4.3 includes provisions for a wider distribution of live loads for analysis of the bottom slab of a cast in place culvert as a function of the culvert height. It appears that Virtis is applying this provision for fill heights greater than 2'. However, it does not include the provision for fill

4/19/2016 3:09:39 PM

HRS AASHTO

2335

Complete Issue Information

heights less than 2'.

In my opinion, this should be incorporated. On a few cases that I've looked at, including the attached, the live load moment on the bottom slab of the culvert is almost the same as the top slab, which seems unrealistic.

For a fill height of 1.1' as attached, the strip width for the bottom slab should equal  $1.1' + 2 \times 10' = 21.1'$

FROM: Herman Lee DATE: 3/19/2013 8:18:10 AM Eastern Daylight Time  
AASHTO Culvert Engine only considers LFD 16.6.4.3 for fill depth greater than and equal to 2 feet. This is documented in the flowchart in the Method of Solution manual and reviewed by the TAG during Beta testing. We would need TF and TAG agreements to consider LFD 16.6.4.3 for fill depth less than 2 feet. Making this change will see less live load at the bottom slab for fill depth less than 2 feet.

Description

FROM: Phil Litchfield DATE: 2/21/2013 12:08:46 PM Eastern Standard Time  
From consultant (Shoup):

After defining bearing stiffeners, the rating was controlled by shear at the bearing with an inventory

4/19/2016 3:09:39 PM

HRS AASHTO

2336

Complete Issue Information

rating factor of 0.983. After further investigation in the spec check, I noticed in the 10.48.8 input that transversely stiffened = No. Once the bearing stiffeners were deleted and defined as transverse stiffeners, the rating increased to 1.127 with a different controlling point. Why are bearing stiffeners not being considered as a transverse stiffener? Also, the "Include Bearing Stiffeners in Rating" option was checked and I can't find anything in the spec check regarding the rating of the bearing stiffeners.

FROM: Herman Lee DATE: 2/21/2013 12:17:31 PM Eastern Standard Time  
The "Include bearing stiffeners in rating" control option is not supported by the AASHTO Engine.

FROM: Wayne Skow DATE: 3/27/2013 12:58:23 PM Eastern Daylight Time  
For modeling purposes, you can add a lateral stiffener to the girder at the same location (3" from support 1) and it'll treat it for shear as you are expecting. I tried it and didn't notice any problems even though the stiffeners are on top of each other.

FROM: Phil Litchfield DATE: 4/1/2013 10:29:25 AM Eastern Daylight Time  
So will the issue with the bearing stiffener not being considered as stiffening the section be corrected in the next version?

FROM: Wayne Skow DATE: 4/1/2013 1:21:54 PM Eastern Daylight Time  
Yes, in version 6.5.

FROM: Herman Lee DATE: 5/12/2013 4:06:56 PM Eastern Daylight Time  
Please disregard above Wayne Skow's statement on 4/1/2013.

As discussed at the May 2013 Beta TAG meeting, bearing stiffeners should not be considered as stiffened.

Description

FROM: Richard Withers DATE: 2/22/2013 3:00:26 PM Eastern Standard Time

I am having the same issues as incidents 12032 and 12123. I have installed the 6.4.1 patch, but it still throws the same error. I have attached a screenshot of the error and a copy of the culvert.

As with the other incidents, the program will run on the stand alone database, but not our production database.

Our production database is a combined Oracle Pontis/Virtis database.

Thanks,  
Richard

I emailed Richard the package for fixing Incident 12032.

AASHTOWare Bridge Design and Rating 6.4.1 Update for Incident 12032 and 12141

FROM: Herman Lee DATE: 2/22/2013 5:00:40 PM Eastern Standard Time

Email from Richard Withers:

=====

Herman,

It says the DL exceeds capacity in the exterior walls. I logged incident 12049 concerning the low wall RF in LFD, but Wayne Skow investigated and said the program is doing the analysis correctly. The box culvert in the analysis is what we have built on our interstates for the past 40 years. We have never had a structural issue with any of these boxes, so getting a DL exceeds capacity issue from the analysis doesn't pass the smell test to me. I attached an export of the bridge to incident 12207. Could you take a look and see if you find any issues?

Thanks,  
Richard

Email from Richard Withers:

=====  
Srujana,

I am investigating this now. We do design for LL surcharge in our current designs, but I am not sure about our older ASD box culverts. The box culvert you are investigating is one of the old ASD boxes.

Thanks,  
Richard

To: Withers, Richard  
Cc: Lee, Herman  
Subject: Regarding VI 12207

Hello Richard,

We have gone through issue 12207 and found no errors in the rating factor computations. One of the tests we have done is making LS Moment and LS Axial as zero and then run the rating analysis. This has drastically changed the rafting factor and culvert now does not fail.

We want confirm with you whether all load types shown in Virtis are considered in your culvert model design. Can you please check and confirm which would help us in the investigation.

Thanks,  
-Srujana

## Description

FROM: Phil Litchfield DATE: 3/4/2013 10:44:54 AM Eastern Standard Time  
From consultant (Souther):

This truss rating is not matching the hand computes rating using the capacity and load forces generated by the model.

FROM: Bin Zhang DATE: 4/19/2013 9:49:35 AM Eastern Daylight Time  
I am able to reproduce this incident for both version 6.4.1 and version 6.5 Alpha2. The rating factor calculation does not match my hand calculation for member U4L4. My hand calculation was listed below.  
I think it's a bug for the truss structure with the counters, although member U4L4 is NOT the counter member.

4/19/2016 3:09:40 PM

HRS AASHTO

2341

Complete Issue Information

I also checked the counter member U3L4, the RF matched my hand calculation very well.

FROM: Bin Zhang DATE: 5/1/2013 5:29:15 PM Eastern Daylight Time

For trusses with tension-only members (counters) the member actions are determined by performing a nonlinear analysis using the AASHTO Finite Element engine. The linear superposition principle does not apply any more. AASHTOWare shall conduct 2 separate calculations for Inv and Opr ratings. So the live load (LL Force) will be different between Inv and Opr loading.

The rating factors in the report are still correct, but we need to update the report to display the LL Force for both Inv and Opr loading. Each line in the report will be divided into 2 lines to show the different LL Force for both Inv and Opr loading.

FROM: Bin Zhang DATE: 5/31/2013 10:18:04 AM Eastern Daylight Time

I revised the fix per Herman's advice.

For the regular truss (no counters), the rating results report remains the same;

For truss with counters, the report will show both the Inv and Opr live load if they are different from each other, the report will only show the Inv live load if the Inv load and the Opr live load are the same.

I attached a copy of the example rating results report in the document (12219.PDF).

This fix will be available for version 6.5 beta 3.

FROM: Kane Gyovai DATE: 6/11/2013 3:33:03 PM Eastern Daylight Time

Verified for Version 6.5 Beta 3.

Complete Issue Information

FROM: Brian Purto DATE: 3/8/2013 1:17:47 PM Eastern Standard Time

Hello- I am trying to rate the attached culvert. I can not get any rating factor or capacity in the output. Can you please provide some idea as to why the culvert is not rating? I have compared it to the example file and previous culverts I have worked on and can not figure out the discrepancy. Thanks!

FROM: Wayne Skow DATE: 3/15/2013 5:12:20 PM Eastern Daylight Time

For an LRFR rating, the controlling location is reported to be the bottom of wall 1. Go to the spec check articles and open article "APPC.6.1 P-M Interaction Diagram" at that point. It reports that dead load forces exceed capacity. Therefore, the rating factor is zero. I also tried releasing the moment at the bottom of the wall, but the controlling location moved to the top of wall 1 with the same problem - dead load forces exceed capacity. Check your loads, wall thicknesses and rebar to make sure they are correct.

## Description

FROM: Krisha Kennelly DATE: 3/14/2013 9:27:54 AM Eastern Daylight Time  
Submitted by David Wolfe, Moffat Nichol, via email:

"The LFD LL DF for moment and shear away from supports for single lane and multi-lane should have different numerical values instead of identical values. Though the difference is likely minor."

See attached output file for G1. The values shown don't appear to be correct.

FROM: Srujana Thogaru DATE: 6/4/2013 10:31:08 AM Eastern Daylight Time  
LFD LL DF for moment and shear have same distribution factors because of VI 10254 (One lane should equal the multilane since the number of lanes is the number of design lanes not the loaded lanes)

AbaLfdAdjacentBeamDistFactors.cpp line 353 has fix for VI 10254.

Error in the display of output text file has been fixed. Fixed for 6.5 Beta 3

FROM: Kane Gyovai DATE: 6/11/2013 3:57:33 PM Eastern Daylight Time  
Verified for Version 6.5 Beta 3.

## Description

FROM: Navnit Nakrani DATE: 3/27/2013 11:01:49 AM Eastern Daylight Time

Hello,

I am doing a loading rating of prestressed butted box beams with a cantilevered deck slab/mountable sidewalk on right side of the bridge. I am trying to run live load for two cases on the exterior beam with the cantilevered slab/sidewalk.

Case 1 - By defining the travelway between curb and sidewalk.

Case 2 - By defining the travelway between the bridge rail systems i.e. the travelway is over the sidewalk.

For both the cases Virtis uses simple lever rule to calculate the distribution factor and appears to use the centerline of beams as a reference (see attached sketches).

4/19/2016 3:09:42 PM

HRS AASHTO

2349

Complete Issue Information

The Virtis calculated distribution factor for Case 1 is 0, which has the travelway limits excluded from being directly over box beam G7. For Case 2 the DF is 1.28, where the travelway extends to face of the bridge rail which results in outer wheel load being located beyond the outside face of fascia box beam G7. But Virtis is using a "DF = 0.50 Wheels" for moment in both the cases and is computing the same LL moments in both the cases. In Case 2, it appears that Virtis is ignoring the outer wheel load.

Can you suggest how I can resolve this problem?

Thank you,  
 Naveen Bitla  
 Prime Engineering, Inc.

FROM: Herman Lee DATE: 3/27/2013 11:37:08 AM Eastern Daylight Time  
 A workaround is to manually enter the LL distribution factors.

Description

FROM: Katy Grime DATE: 4/1/2013 2:20:39 PM Eastern Daylight Time

Hello. We are trying to perform an LRFR rating. Whenever we click analyze for Beam 1, we get the error message that I have attached. We do not have any concentrated loads on the superstructure and are unsure of what it is going on; it also seems to happen for the other beams. I have also attached the Virtis file. Thank you.

FROM: Herman Lee DATE: 4/7/2013 12:18:05 PM Eastern Daylight Time

I am able to complete a LRFR rating for Beam 1 using the "LRFR Design Load Rating" analysis template.

Please provide more information on how to reproduce the error message.

FROM: Katy Grime DATE: 4/8/2013 9:12:32 AM Eastern Daylight Time

First we select LRFR rating method, then choose HL-93 truck for operating and inventory rating vehicles. The error message then appears during the analysis at the "Building Spec Check Domain Objects. Beam 1 - Stage 2"

FROM: Subhadeep Ghosh DATE: 5/10/2013 11:25:27 AM Eastern Daylight Time

I analyzed Beam 1 and Beam 2 with the attached analysis settings (attached under "Documents" as a screenshot) in versions 6.4.0 and version 6.4.1, but could not reproduce the error. Can you please verify whether the analysis settings that you are using matches the one I provided? Did you change any of the control options?

Can you please reproduce the error if possible, save the bridge and then export it to be attached to this incident.

=====  
 During my rating of stringers of a truss bridge, I found the following problems:  
 1. Input  $I_y$  is not taken, and a default value of the standard shape was used, instead.  
 Stringers (historic shape S18x55) of Br 24 0053 span 1 is a non-compact partial braced section, and the input  $I_y=21.19\text{in}^4$   
 in Spec. checking details of 10.48.4, it shows:  
 Top flange  $I_{yt} = 12.4 (\text{in}^4)$   
 Bot flange  $I_{yb} = 12.4 (\text{in}^4)$   
 Section  $I_y = 25.0 (\text{in}^4)$   
 and when a different  $I_y$  is input, the same values are given.  $I_y$  matters when  $M_r$  is controlled by (Eq 10-103c), see belows.  
 =====

Article 10.48.4 is using the  $I_y$  value calculated from the cross-section properties. For rolled sections, properties are often directly input and the article needs to use those when available.

Complete Issue Information

The red # should be 4

=====

"The red # should be 4" (color did not transfer) => 10.48.2 should be 10.48.4.

This is a side effect of some changes made to 10.48.2 where it now fetches Mu from 10.48.4 under certain conditions. Previously, 10.48.2 would fail and 10.48.4 would report the Mu value. It's more helpful to the engineer for the reported article to be 10.48.4, rather than 10.48.2.

FROM: Wayne Skow DATE: 5/13/2013 7:42:20 AM Eastern Daylight Time

## Description

FROM: Phil Litchfield DATE: 4/9/2013 10:34:05 AM Eastern Daylight Time  
from consultant (Mertz):

We noticed a discrepancy with the operating ratings of the continuous three-span girder units. There are negligible differences between the two units (Spans 9-11 and Spans 12-14) which is reflected in the near identical inventory ratings. However, two things caught our attention: first, the operating ratings were significantly different between the two units; and second, the critical location of the operating rating was different than that of the inventory rating. In order to confirm the BrR output and determine the reason for the differences, we looked at the exterior girders for both of the units loaded with the permit vehicle.

I attached the Rating Results Summary Report for both units and an excel file containing information pulled from the Detailed Rating Results Report. In the columns adjacent to the inventory and operating ratings calculated by BrR as shown in the excel sheet, we recalculated the inventory and operating rating factors using the reported capacity, DL and LL. In a couple of instances our calculated operating ratings do not agree with those calculated by the software (they are highlighted in yellow). These errors affect the critical ratings that should be reported. The information highlighted in green corresponds to the critical ratings shown in the Rating Results Summary Report. Note that the corrected operating ratings occur at the same critical locations as the inventory ratings.

FROM: Bin Zhang DATE: 4/23/2013 9:06:11 AM Eastern Daylight Time  
Could you please send us the library file for vehicle 120K-6 Axle, Type3(IL),Type3S-1(IL) and Type3S-2 (IL) to reproduce this issue?Thanks!

FROM: Phil Litchfield DATE: 4/23/2013 10:43:21 AM Eastern Daylight Time  
Uploaded the library file for the trucks.

FROM: Bin Zhang DATE: 5/1/2013 4:45:37 PM Eastern Daylight Time  
I am able to reproduce these rating factors that Phil reported.  
First, I would like to explain why the critical location of the operating rating was different than that of the inventory rating. The short answer is that the moment capacity that is used for calculating the inventory and operating factor could be different even at the same location. Please read the revised excel ("Added\_Henry Rating - Virtis Calculation Errors.xlsx" ) and figure 1 for details. For Structure Definition Name: Span 9-11 (3-Sp. Cont. WF), the moment capacity is -637.5kip-ft other than -544.09kip-ft at span2-43.0 feet for the operating factor calculation.

Figure 1 Rating factor calculation for Span9-11 at the span 2-43 ft location  
The moment capacity relies on the M1 (Article 10.48.1.1 compactness requirements) value. Inv load and

4/19/2016 3:09:43 PM

HRS AASHTO

2355

Complete Issue Information

Opr load generated different M1 values, so the moment capacity could be different for the 2 loading conditions. If Eq10-96 (Article 10.48.1.1) failed, the 10.48.1 does not apply any more. The moment capacity will go into 10.48.2 (figure 2). So Inv loading and Opr loading may have different moment capacities.

Figure 2 Eq 10-96

Secondly, I will answer the question why the operating ratings were significantly different between the two units. For span 9-11, it has a span length of 41.75ft, 43 ft and 42.23 ft. For span 12-14, it has a span length of 42.23 ft, 43 ft and 41.5 ft. Generally speaking, span 9-11 is almost a reverse symmetric copy of span 12-14. So theoretically speaking, both of the 2 superstructures should have very similar rating factors. However, we observed very different rating factors between the 2 structures in AASHTOWare 6.4.1. The short answer is that the diaphragms distribution is not a reverse symmetric copy of each other.

Figure 3 Span 9-11 diaphragms

Figure 4 Span 12-14 diaphragms

Then I will explain how the different diaphragms affect the rating factors for the 2 structures. Let's use vehicle 120K-6Axle for an example. The Opr RF is 1.555 for span 9-11, while the number is 1.881 for span 12-14. The 1.555 RF occurred at the location of span1-41.75 ft (figure 5). The equivalent critical location in span12-14 should be span3-0.0ft (figure 6). By comparing figure 5 and 6 we can see that the different rating factors happened due to the different moment capacities. Then we look at figure 7 and 8, and find out how does Lb affect the moment capacity.

Please read the attached "12338.docx" and "Added\_Henry Rating - Virtis Calculation Errors.xlsx" for details. Please let me know if you still have questions about this issue.

FROM: Bin Zhang DATE: 5/20/2013 2:27:25 PM Eastern Daylight Time  
I changed the status to be resolved.

Description

FROM: Herman Lee DATE: 4/10/2013 10:40:31 AM Eastern Daylight Time  
Submitted on behalf of Alex Pence, WisDOT (Alex.Pence@dot.wi.gov).

Received Bridgeware email:

=====

OK, thanks Herman. I have found that the max live load moments don't match the values in Table C6B-1 of the Manual for Bridge Evaluation. The Madero output is about 2% lower than the actual max LL moment for the bridge I was evaluating. Not a major difference, but it is non-conservative, so finding the actual location and value of maximum moment should perhaps be prioritized in future development of the Madero engine.

Thanks,

Alex

Subject: RE: Timber - Points of Interest

Alex,

I looked at the Engine Related Help for Madero. The Madero ASD Engine only supports points of interest at tenth points.

To: Bridgeware,
Subject: Timber - Points of Interest

I'm using Virtis and trying to look at a point of interest on a timber slab strip (girder line superstructure), other than a tenth point, but I can't figure out how to analyze it. I went to the member alternative definition, in the Control Options tab, checked the box under Points Of Interest to "Generate at User-Defined Points," and then created a couple additional Points of Interest. However, the output still only has data for the tenth points. Can you tell me what I'm doing wrong, or is it only possibly to analyze at tenth points?

Thanks

Description

FROM: Brian McCaffrey DATE: 4/14/2013 12:24:07 PM Eastern Daylight Time  
Greetings,

I have a non-composite Girder-Floorbeam-Stringer bridge with riveted main girders that are laterally supported the entire length by the deck and at two intermediate floorbeam locations but the spec check says it is fully unbraced ( $L_b = \text{span length}$ ) and limits  $\mu$  to  $M_r$  - see attached 6.4.1 xml.

This results in very low flexure ratings being incorrectly reported as controlling but the correct controlling shear ratings are ignored which are very low and indicates that load posting of the bridge is required. I performed hand calcs to recalculate the actual flexural ratings using  $\mu$  instead of  $M_r$  (flexure RF's > 1.0) and got the RF's for shear (shear RF's << 1.0) from the Stage 3 LFD/ASD specification check output.

INPUT:

Section type : Noncomposite  
Longitudinal stiffener: No  
Unbraced length,  $L_b$  : 817.8 (in)  
 $J$  : 4.73 (in<sup>4</sup>)  
 $I_y$  top flange : 843.78 (in<sup>4</sup>)  
Sxc top flange: 4043.77 (in<sup>3</sup>)  
 $I_y$  bot flange : 843.78 (in<sup>4</sup>)  
Sxc bot flange: 4043.77 (in<sup>3</sup>)

Any assistance would be greatly appreciated  
Brian McCaffrey, P.E.

FROM: Wayne Skow DATE: 4/15/2013 7:08:59 AM Eastern Daylight Time  
Your model has lateral support specified the entire length of the top flange. However, bracing requirements for 10.48.4 are more stringent than that. The requirement in article 10.48.4 says "Bracing shall be provided such that lateral deflection of the compression flange is restrained and the entire section is restrained against twisting." Restaining the entire section against twisting requires bottom flange restraint also. This happens at diaphragm locations which your model does not have. Note, this requirement is more restrictive than the lateral bracing requirement of 10.48.2(c). Applying lateral bracing to the top flange does satisfy that requirement.

### Description

FROM: Phil Litchfield DATE: 4/15/2013 11:42:15 AM Eastern Daylight Time  
From (Beisner):

We're trying to model a stringer with web loss. But if the input web loss is greater than 87%, the attached error is generated. How can web loss greater than 87% be modeled?

FROM: Bin Zhang DATE: 4/15/2013 11:56:39 AM Eastern Daylight Time

I tried to analyze the whole bridge with the AASHTO LFR engine, the analysis completed successfully (12355\_Completed.PNG).

The web thickness for beam "10" CB 26#" is 0.26 inch. If you want a web thickness loss of 87%, please make sure that the tolerance setting for inch is less than  $0.26 \times (1 - 87\%) = 0.0338$  inch.

If you want a web loss of 90%, please make sure that the tolerance setting for inch is less than  $0.26 \times (1 - 90\%) = 0.026$  inch. Please let me know if this does not answer your question. Thanks!

Complete Issue Information

FROM: Wayne Skow DATE: 5/1/2013 7:14:38 AM Eastern Daylight Time  
The problem was in AbanLmLiveLoader. Duplicate lane loads were being produced for legal vehicles that specified a lane load.

Tester - Do a 3D LRFR analysis and include the "Lane-Type Legal Load" vehicle spec under "Legal/Routine". Set the analysis settings to fastest run time to minimize the 3D model size since it has no bearing on this problem.

FROM: Herman Lee DATE: 4/24/2013 6:53:59 AM Eastern Daylight Time  
Submitted on behalf of Keith Wetter (kwetter@hwlochner.com), Lochner.

Bridgeware email:

=====

Mr. Lee,  
When I was verifying the loads I was looking at an interior stringer that has 2' tributary.  
The service DL moment due to corrugated deck & fill shows 2.1 k-ft at midspan. (see attached)  
Total load =  $2.1 \times 8 / 16^2 = .0656$  k/ft.  
At 2' trib,  $q = .0656 / 2 = 0.0328$  k/ft<sup>2</sup>.  
This is quite a bit less than your calculated 0.051 k/ft<sup>2</sup> below.  
Please review stringer loading.  
Thanks you.

To: Wetter, Keith  
Subject: RE: Virtis 6.4 Issue

Keith,

Virtis only supports concrete and corrugated decks in Truss system. Please see below for the computed deck load on the truss.

Length per corrugated deck unit =  $2A + B + C = 0.5$  ft  
Fill weight per unit =  $(0.25 \times 0.5 + (0.0521 + 0.1979) \times 0.1667) \times 0.12 = 0.02$   
Plank weight per unit =  $0.5 \times 0.011 = 0.0055$   
Total weight =  $(0.02 + 0.0055) / 0.5 = 0.051$  k/ft<sup>2</sup>  
Truss trib. width = 10 ft  
Apply deck load on truss = 0.51 k/ft

Subject: Virtis 6.4 Issue

I am using Virtis to rate truss and 2-girder systems. It only allows concrete decks or corrugated decks. I am have 2 problems with this.

- 1) Many of these bridges actually have timber decks. What do I use for deck input?
- 2) When a truss has a corrugated metal deck it is not determining the dead load correctly. Under deck definition it appears to ignore the deck input "Load \_\_\_ psf". It also appears that it is not adding in any fill weight between corrugations. (See attached file.) Please check how the weight is calculated.

If you have any questions regarding this, please call me.

### Description

FROM: Brian McCaffrey DATE: 4/30/2013 1:44:51 PM Eastern Daylight Time

The MBE 2013 Interims reworked Table 6A.4.5.4.2a-1 but Virtis 6.4.1 was not updated to reflect the new categories for permit weight ratios.

Will these be incorporated in a future release?

Regards,  
Brian McCaffrey  
HAKS Engineers  
860-632-5155 (232)

FROM: Herman Lee DATE: 4/30/2013 1:46:13 PM Eastern Daylight Time

Brian, nice to hear from you.

The upcoming 6.5 release at the end of June will support the new MBE 2013 Interims spec. The new LL factors will be available in 6.5.

Description

FROM: Amjad Waheed DATE: 4/30/2013 3:06:37 PM Eastern Daylight Time  
One of our consultants (MV) brought to my attention that the attached bridge gives low load rating factors for Service III at Inventory Level. The capacity calculations seem in doubt. Please check.

FROM: Amjad Waheed DATE: 4/30/2013 4:45:18 PM Eastern Daylight Time  
Please ignore this. I figured it out myself. Thank you.

Description

FROM: Herman Lee DATE: 5/7/2013 3:15:40 PM Eastern Daylight Time  
Submitted on behalf of Michael Taylor, MassDOT.

Received Bridgeware email:

=====

Hi

A couple of Virtis 6.4 issues/questions. The first has to do with a 3 span continuous slab bridge.

We have the exact same cross section at the max positive moment location (0.4L) and max negative moment location (1.0L). Virtis gives different moment capacities at each location. Hand calcs confirm the positive moment capacity. I have attached the xml file. As always, thanks for your assistance.

I will send the second question in a separate email to avoid potential confusion.

Michael Taylor  
Ratings and Overloads

=====

The positive and negative moment capacities at 0.4L is the same as 1.0L.

The section is symmetry about the horizontal x-axis. Top rebar configuration (number, size and location) is the same as the bottom rebar configuration but the resulting positive moment capacity is different than the negative moment capacity.

Description

FROM: vinacs vinayagamoorthy DATE: 5/8/2013 9:06:57 AM Eastern Daylight Time  
 I have analyzed a PS-I beam bridge with and without "Ignore long. Reinf. In rating" option within LRFR method.

Results are not improperly displayed. See attached word document.

Member: Exterior girder

FROM: Wayne Skow DATE: 5/10/2013 7:12:28 AM Eastern Daylight Time  
 There are two different shear rating factors calculated for RC and PS girders when the "Ignore long. Reinf." switch is off (6A.5.9 Evaluation for Shear and 6A.4.2.1 General Load Rating Equation - Concrete Shear). They're both labeled "shear" in the Detailed Rating Results report. That accounts for duplicate records at each point. If you go to spec check results at one of those points, both articles are present. If the switch is on, only one shear value appears in the report at each point. It does seem a little confusing, but it is correct.

FROM: Kane Gyovai DATE: 5/22/2013 11:38:07 AM Eastern Daylight Time  
 Verified for Version 6.5 Beta Build 2.

When the switch is on to ignore long. reinf., the spec check results only display one shear value. When the switch is off (long. reinf. NOT ignored), both shear values appear in the report.

FROM: vinacs vinayagamoorthy DATE: 6/21/2013 10:34:47 AM Eastern Daylight Time  
 1. "Detailed Rating" result should list only the critical rating. When the user choose the "logn. Reinf. in Rating", software should establish the rating considering the long. reinf only. It should not report the

Complete Issue Information

values established without considering the reinforcement, even if it is established internally.  
2. The capacity, DL and LL should reflect the values used to establish the RF. When the long Reinf is considered, the Capacity, DL and LL are reported as -1.00. This is wrong.

Screen shot is attached in the word document.

FROM: Wayne Skow DATE: 8/6/2013 1:56:04 PM Eastern Daylight Time  
Addressing point 2. above: The values being reported as -1.00 on the xml reports were not being properly stored by article 6A.5.9. That has been fixed in v6.5.1.

FROM: Bin Zhang DATE: 11/14/2013 4:47:06 PM Eastern Standard Time  
Verified for 6.5.1 Alpha2, the values being reported as -1.00 on the xml reports have been fixed.  
Vinacs, you may uncheck the "Shear" option in the report, so the report will list only the critical rating.  
Please read the attached "12482.png" for details.

Description

FROM: Dean Teal DATE: 5/8/2013 4:12:23 PM Eastern Daylight Time  
I am looking at a 36-48-36 RC Slab  
If I use the LFD Dist. Factor calculation button for a 12" strip I get a moment DF = 0.156

4/19/2016 3:09:46 PM

HRS AASHTO

2373

Complete Issue Information

I had calculated a DF = 0.162

The difference is BrR is using S = 40 (40' is the avg of the 3 spans)  
The way Kansas calculates this is S = 36 (36' is the short span)  
This has been our understanding of the std Spec. and what has been used on 100% of all our slab structures.

FROM: Dean Teal DATE: 5/8/2013 4:33:36 PM Eastern Daylight Time  
Talking with the TAG, some use short span (36) which is conservative, some use avg (40), some use 36 for span 1 & 3 and 48 for span 2.  
I seems we need to let the agency enter the value??

## Description

FROM: Phil Litchfield DATE: 5/13/2013 3:59:30 PM Eastern Daylight Time  
From consultant (Shoup):

The truss has two bays of counters (2-3 & 3-4). When I ran the file with the counters the controlling rating is 0.459 / 0.768 with a controlling location at U21-L22 in Compression. If I take the counters out and rerun to find the controlling rating I get 0.660 / 1.102 with a controlling rating at U21-L22 in Compression. I do not understand this. How can the counters affect this rating when it is so far away from the counters and the controlling member should have little to no effect from the counters?

I was also wondering why analyzing this structure with the counters takes about 10-15 minutes but without the counters is about 30 seconds? Why does limiting these members to tension take so much more time to analyze?

Attached is a zipped copy of the xml.

FROM: Bin Zhang DATE: 5/14/2013 11:33:01 AM Eastern Daylight Time

For a longitudinal truss without counters, once the finite element model geometry and model loads are generated, a 2-D linear is performed and the member forces, reactions and displacements due to dead loads are generated. Forces for each member from each load case are summed up and used in the rating calculations.

For a longitudinal truss with counters, the dead load is analyzed together with live load by using non-linear analysis. Total dead loads due to all dead load cases are summed up, factored and applied as one load cases. When non-linear analysis is complete, member forces are divided by the dead load factor, and will be used in regular rating calculations.

Non-linear analysis with counters has much more output files than the regular truss members. This is also one of the reasons that slow it down.

Please read page 8 in the "Virtis Truss Method of Solution" for details regarding the live load analysis of a longitudinal truss with counters.

Description

FROM: Aaron Kemna DATE: 5/21/2013 11:24:04 AM Eastern Daylight Time

I have a girder where the Points of Interest is set only to Generate at user-defined points. One POI was created at midspan of Span 2. The tabular summary shows ratings controlling at the adjacent piers, too. The spec check shows multiple locations reported around Span 2, but only the midspan and adjacent supports have ratings. The report tool only gives the ratings at midspan. It's my understanding that if you request only user-defined POIs that you should only see these ratings reported in the tabular summary. I would assume the same would go for the spec-check, but maybe there are reasons for reporting more? I have an override set for the POI, but this does not seem to affect the reporting other than the midspan. Attaching bridge. G1 has the POI set.

HRS AASHTO

2380

Complete Issue Information

FROM: Krisha Kennelly DATE: 5/22/2013 11:17:01 AM Eastern Daylight Time  
The moment capacity at the middle of span 2 is dependent on the moment capacity at the pier locations (Std eq 10-129d). The moment capacity at the pier is dependent on the stresses at the adjacent brace points and mid brace points. That is why so many locations are evaluated.

The pier locations need all of the articles to be considered to compute the moment capacity there. But the rating articles should not be processed at the pier locations.

Folder changed to Support Center since this is not related to development of 6.5.

FROM: Krisha Kennelly DATE: 4/4/2014 10:33:34 AM Eastern Daylight Time  
Fixed for version 6.6 (under the VI 12114 issue).

Now the only point that has rating articles performed is 47.5' which is the user point of interest.

Note that more articles are being processed now because as part of 12114 it was found that the safest way to ensure that a girder would run for a POI in any span is to process all piers to compute the moment capacity at the pier. Computing the moment capacity at a pier requires processing the brace pt and mid brace pt to each side of the pier. So you'll see a lot of locations in the spec check details window but only the point you specified will be rated.

FROM: Krisha Kennelly DATE: 4/4/2014 11:02:24 AM Eastern Daylight Time  
i've added a version 6.6 alpha 4 file to this issue for testing. Previous file was a beta file from 6.5 that can't be imported.

FROM: Krisha Kennelly DATE: 4/4/2014 11:05:43 AM Eastern Daylight Time  
IssueNet is locked so I couldn't attach a file, tester can contact me for a file.

FROM: Hanjin Hu DATE: 4/17/2014 10:02:40 AM Eastern Daylight Time  
Backchecked for V6.6.0 Beta Build 1.

### Description

FROM: Load Rater Shanon Murgoitio DATE: 5/24/2013 4:36:56 PM Eastern Daylight Time  
 Attached is an excerpt from the LFR output at midspan of the top slab of the attached culvert (Culvert Definition = Pox. M. Culvert Module). I am having difficulty determining if the proper load factors are being applied for the horizontal earth pressure. A beta factor of 0.5 should be used at this location for the EH loads per Article 3.20. The output does not indicate if the loads are factored or not, and the

4/19/2016 3:09:48 PM

HRS AASHTO

2382

Complete Issue Information

output for the LL does not indicate if impact is included or not. I would like clarification on how the AASHTO engine is applying the LFR load factors for horizontal earth pressure and request that labels be added to the output file to clarify the results.

Thank you,  
Shanon Murgoitio

FROM: Wayne Skow DATE: 5/29/2013 7:45:54 AM Eastern Daylight Time

See the attached word document for explanation details.

The beta factor is specified in the soil material. Loads shown in the rating articles (6B.4) include impact, but are otherwise unfactored. The applied impact factor can be seen in the detailed output file (Click on the eye glasses. Select Detail Output. Search for impact). The three lines in the Envelope report show the max/min of each action with the corresponding values of the other two actions (note that max and min are not algebraic, but refer to the most positive and most negative values.)

Adding labels can be accomplished through an enhancement request.

FROM: Load Rater Shanon Murgoitio DATE: 5/29/2013 11:56:11 AM Eastern Daylight Time  
Wayne,

Thank you for the clarification on the AASHTO LFR Culvert output. I would like to request an enhancement to add meaningful labels to the engine output.

Thank you,  
Shanon Murgoitio

FROM: Herman Lee DATE: 6/10/2013 10:07:50 AM Eastern Daylight Time  
I changed the Category to this incident to Enhancement.

### Description

FROM: Load Rater Shanon Murgoitio DATE: 5/29/2013 3:15:31 PM Eastern Daylight Time

This problem also exists in V6.4.1.

Per the response to incident 12562, and the help item for "Bridge Materials – Soil" the maximum and minimum soil pressures should be entered on the "Bridge Materials – Soils" tab in BrR.

So for the attached xml, the following soil properties were input for an LFR analysis.

Maximum lateral soil pressure = 55 pcf x 1.3 = 71.5 pcf

Minimum lateral soil pressure = 55 pcf x 0.5 = 27.5 pcf

However, when the analysis is run only the maximum lateral soil pressure is shown in the input section of the detailed output. In addition, the EH moment being used in the rating calculation at the corner and midspan of the top slab are the same. The rating calculation at the corner (0 ft) should be using a moment based on the maximum lateral soil pressure (-0.42 k-ft) and the rating factor at midspan (10 ft) should be using a moment based on the minimum lateral soil pressure (-0.16 k-ft). It does not appear that the AASHTO Engine is using the minimum lateral soil pressure for any calculations. Also, the loads shown in the detailed output do not show maximum and minimum EH moments, indicating only the maximum lateral soil pressure is being used.

The attached word document has screen prints of output to help illustrate the issue.

Thank you,  
Shanon Murgoitio

FROM: Wayne Skow DATE: 6/10/2013 9:28:17 AM Eastern Daylight Time

Only the max EH load pressure was being used. Fixed in v6.5b3.

FROM: Kane Gyovai DATE: 6/12/2013 11:37:28 AM Eastern Daylight Time

Maximum and minimum soil pressures appear to be used in determining max and min EH Moment values however max and min soil pressures are not reported as input in the Detail Output file. Only the max soil pressure is being reported.

FROM: Wayne Skow DATE: 6/18/2013 9:50:00 AM Eastern Daylight Time

It now reports both for LFR.

FROM: Load Rater Shanon Murgoitio DATE: 6/19/2013 4:39:52 PM Eastern Daylight Time

Thank you for incorporating the use of the minimum soil pressure. It appears to be working correctly in 6.5 Beta 3. However, the input in the Detail Output file shows the maximum pressure twice and does

4/19/2016 3:09:48 PM

HRS AASHTO

2384

Complete Issue Information

not show the minimum pressure (see attached word document titled "12569\_EH\_Input\_in\_Output"). When this is fixed it would be helpful to add "max" and "min" labels. Thank you.

FROM: Wayne Skow DATE: 6/25/2013 8:06:39 AM Eastern Daylight Time  
That output change had already been made. Not sure why you weren't seeing it. But I changed the program flow slightly to prevent the EH input information from printing twice. I also noticed LFR Appendix G6.1 had not been updated to handle EH max/min, so I made that change.

Fixed in the latest builds of AbanSpec.dll and WxBoxCulvert.dll.

FROM: Kane Gyovai DATE: 6/27/2013 8:27:07 AM Eastern Daylight Time  
Verified for V6.5 Beta 3.

FROM: Subhadeep Ghosh DATE: 7/1/2013 12:29:16 PM Eastern Daylight Time  
Fixed for 6.5, the next release to Beta 3. Please see the attached section EH loads max and min lateral pressure.png from the detailed report

FROM: Subhadeep Ghosh DATE: 7/1/2013 1:10:37 PM Eastern Daylight Time

FROM: Kane Gyovai DATE: 7/9/2013 9:17:27 AM Eastern Daylight Time  
Verified for V6.5 Beta 4/Acceptance Build

FROM: Amjad Waheed DATE: 5/30/2013 9:07:59 AM Eastern Daylight Time

We are trying to code solid box beams in the BrR. We got error while coding solid beams and trying to find the best way to code them. One of our engineer discovered a workaround that requires leaving a void. What is the best way to code them? Please see the attached file for further explanation.

FROM: Srujana Thogaru DATE: 5/30/2013 10:27:53 AM Eastern Daylight Time

Best way to code a solid box beam is using circular void beam with zero number of voids.

As mentioned in your PDF attached to the issue; your bridge xml file once worked correctly and having trouble completing the analysis now. Please attach the bridge xml file so we can locate the error.

Also please let us know the version it worked. Thanks

FROM: Srujana Thogaru DATE: 5/30/2013 3:17:34 PM Eastern Daylight Time

xml file sent in the email (attached to issue) completes analysis correctly. If you want to create a sold box beam please use circular void beam with zero number of voids.

FROM: Amjad Waheed DATE: 5/30/2013 3:31:17 PM Eastern Daylight Time

We have not tried PS box beams with circular voids yet.

This issue is not resolved as of now.

### Description

FROM: Richard Withers DATE: 5/31/2013 10:01:17 AM Eastern Daylight Time

The attached bridge consists of a wide flange girder with welded cover plates. The issue is with the 70-100-100-100-70 Spans#10-14 superstructure definition. When input into Virtis as-built (wide flange section with cover plates), the moment capacity is significantly lower than we were getting with our older load rating software. We "dummied" the section in as a plate girder and the results are on par with our legacy software. It appears Virtis will not fully develop the capacity of the cover plates. What is the reason for this difference?

Under each member, the "Wizard Alternative" is the as-built section and the "Dummied Plate Girder" is exactly what it says it is.

Thanks for the help,  
Richard Withers

FROM: Wayne Skow DATE: 6/10/2013 1:19:00 PM Eastern Daylight Time

This has been fixed in v6.5b2 where the flange and cover plates are now treated as an equivalent single plate with  $(t) = \text{sum of the plate thicknesses}$  and  $(b) = \text{Total area}/(t)$ . This improves  $b/t$  in 10.48.2.1 resulting in a higher allowable. Also, if you select the new Allow Plastic Cover Plate switch, the section will be eligible for compactness which will (if qualified) improve section capacity even more.

Fixed in v6.5.b2

FROM: Herman Lee DATE: 6/18/2013 10:42:27 AM Eastern Daylight Time

This is the same as the Allow Plastic Analysis for Cover Plates enhancement in 6.5.

Description

FROM: Bin Zhang DATE: 5/31/2013 2:21:08 PM Eastern Daylight Time  
 I submitted this incident on behalf of Francisca Karyadi from Jacobs. The communication email with the user was listed below. Please use "South Approach (Spans 2 to 7)" – "Exterior/Outside Girder", using ASD method (trucks Type 3) to reproduce this problem. I think it's a bug for the AASHTO ASD engine when the user picked "Generate at user-defined points". The calculated tension flange allowable stress is 0.0, which caused the 0 rating factor. We need fix the allowable stress computation.

who to ask about this problem I am having with the output. I asked my coworkers who were familiar with this software, but nobody could solve it. Please take a look quickly what is the problem with my input.

Could you run "South Approach (Spans 2 to 7)" – "Exterior/Outside Girder", using ASD method (trucks H20, HS20, 3, 3S2)? Select "Control Options", and check the last box "Generate at user-defined points". It would give 0 ratings, then when you check all 3 boxes in "Control Options", it would give the governing values for shear ratings (well above 0 for Rating Factors).

I have been trying so many different ways, but still could not solve the problem.

Your help is really appreciated.

Thank you so much.

Regards,

Fran

FROM: Wayne Skow DATE: 6/10/2013 1:51:20 PM Eastern Daylight Time  
There was a variable that wasn't initialized properly under all situations. When POI's are generated at 10th pts (most of the time), it did not affect results. But when the only POI's were in the middle of the girder, the first POI would exhibit a zero RF.

Fixed in v6.5.b3.

 Error in closing the combinations.dat file after a failed LRFR analysis  
 I submitted this incident on behalf of Sean Hart from Baker (SHart@mbakercorp.com). The communication email was listed below. The error message and the bridge XML file were attached in the document.

\*\*\*\*\*

From: Hart, Sean  
 Sent: Thursday, May 30, 2013 12:26 PM  
 To: Lee, Herman  
 Subject: Virtis Help

I'm getting the attached errors when running the attached file for G6 & G7. I messed around with the diaphragm locations to move some of the concentrated loads around and I'm still getting the errors.

Any insight as to what the issue is?

\*\*\*\*\*

Please use AASHTO LRFR, member alternative of G6 to reproduce this issue. When I run the bridge at the 1st time, the error message was listed in figure 1. When I tried to run the same mem alt at 1 2nd time, the error message was listed in figure 2. I think Virtis failed to close the combinations.dat file after the 1st analysis failed, so Virtis is not able to open this file for the 2nd analysis (figure 3).

Dear Virtis Support,

Attached are 6 XML Virtis files. We have been comparing BRASS engine with AASHTO engine in Virtis 6.3.1. Most of them are in agreement. These are typical of some that don't agree well. We don't know if the difference is in the AASHTO or BRASS engine. Could you look at this for us and try to find where the difference lies. Below is some info about each bridge, and the Operating Rating from each engine.

| BR NO | TYPE              | BRASS O. R. | AASHTO O.R. |
|-------|-------------------|-------------|-------------|
| 36011 | Steel Simple Span | 3.23        | 2.48        |
| 79503 | Steel Simple Span | 0.87        | 1.16        |
| 9131  | Steel Continuous  | 2.05        | 0.61        |
| 07512 | Steel Continuous  | 1.39        | 1.73        |
| 03009 | Prestressed Beam  | 1.64        | 0.31        |
| 18001 | Prestressed Beam  | 1.16        | 1.74        |

Please let me know if you have any questions. Thank you.

I created a straight, 2-span bridge to parallel a 2-span curved girder with large radius so I could

4/19/2016 3:09:50 PM

HRS AASHTO

2394

Complete Issue Information

compare results expecting them to be fairly close. The straight bridge generates a lot of exception messages during FE analysis.

FROM: Krisha Kennelly DATE: 6/26/2013 10:39:29 AM Eastern Daylight Time  
I get the same bad results for this bridge in 6.4.1. The STAAD file we create in 6.4.1 also fails, it says 'problems in solver'.

I changed the width of the deck by 1' on each side to allow for an overhang of 1'. Then it runs ok.

FROM: Krisha Kennelly DATE: 6/26/2013 11:21:17 AM Eastern Daylight Time  
attached the zip file for 6.4.1 with no overhangs and with overhangs

FROM: Krisha Kennelly DATE: 4/4/2014 11:06:26 AM Eastern Daylight Time  
I don't think we have to support generating a FE model for the attached structure that has the concrete deck stopping at the exterior girders' webs resulting in the steel flange only having a deck over 1/2 of the flange. I also don't think it's necessary to add validation for this extreme case.

Description

FROM: Bryan Silvis DATE: 7/3/2013 1:33:44 PM Eastern Daylight Time  
 Using the 24DollyRigCrabA NSG vehicle found in the attached vehicle library, we get varying LRFR NSG rating results whether it is run from the Bridge Explorer or Bridge Workspace (file attached). In the attached pdf the first two sheets show rating results run from the Bridge Explorer. The final sheet of the Specification Check shows the results run from the Bridge Explorer for the controlling span and girder. They do not match. They did not match when I tried them for the 24DollyRigCrabB either. Advanced settings for the vehicles were set at 0 impact and escorted.

Also as previously forwarded to support (rating results are not available from the Bridge Workspace for each member). Believe Herman said this bug was already input as Incident 12690. I am forwarding this incident for Jonathan Mallard.

FROM: Herman Lee DATE: 7/3/2013 3:10:39 PM Eastern Daylight Time  
 More information from Bryan:

=====

I input Incident 12737 this afternoon about getting different LRFR NSG results when rating from the Bridge Explorer and Bridge Workspace. Wanted to forward a little extra information. I get the same ratings from the BE and BW when I set the advanced settings for the NSG vehicle to 0 impact and escorted from the BE and no adjustments from inside the BW (i.e. I leave the NSG vehicle with the defaults for impact and loading condition, mixed with traffic). From the BW, I get much higher ratings after I switch the impact to 0 and loading condition to escorted.

Bryan

## Complete Issue Information

FROM: Bin Zhang DATE: 7/9/2013 2:12:34 PM Eastern Daylight Time

I am able to reproduce this issue in Beta4. I think the rating factor displayed in the bridge explorer is not correct. For member G2, the BE is using the RF of G3.

Bryan, please use the AdvancedRatingResultsSummary report to view the RF for each member in the bridge workspace (AdvancedRatingResultsSummary.png, attached in the document).

FROM: Mehrdad Ordoobadi DATE: 7/16/2013 11:16:02 AM Eastern Daylight Time

The analysis of Girders are performed but everything is recorded under the linked member alts. For example G3, G4,... G8 are linked to G2 and G9 is linked to G1. All of the results for G3, ... G9 are recorded for Member alts G1 and G2. When we do an analysis in the BWS we open the bridge and we associate each results to the linked member alt and also we provide additional information to indicate which member is analyzed. For example the results for G3 go to G2 member alt but we can figure out which member it belongs to (G3). The association is done by saving the object ID for the member (G3) in the analysis event. This works fine as long as the bridge is open because we use object IDs for this association.

Since doing a bridge explorer analysis does not keep the bridge open we cannot find out which member an analysis results for a linked member belongs to. What the window currently shows is the minimum rating results for each member alt. So since we have multiple results for members G1 and G2 it finds the minimum rating results for each of them and reports it.

There is no quick and easy way to fix this issue fast and include it in 6.5. We need to revise the analysis event and also the analysis engine(s) and the bridge explorer windows to fix this issue. I suggest that we do that in 6.5.1 or later.

From: Duray, Jim

So has this problem existed for a few years (for LFR)?

From: Ordoobadi, Mehrdad

Yes this has been like this for a while (for linked members).

From: Duray, Jim

I think we should change it to the support center for both LFR and LRFR and fix it for 6.6.

FROM: Mehrdad Ordoobadi DATE: 5/1/2014 3:46:08 PM Eastern Daylight Time  
Fixed in 6.6 Beta 2.

FROM: Subhadeep Ghosh DATE: 5/12/2014 11:16:37 AM Eastern Daylight Time  
Verified for 6.6 beta 2.

## Description

FROM: Todd Thompson DATE: 7/10/2013 12:54:39 PM Eastern Daylight Time

In a separate incident - the actual Moment for live load is being calculated incorrectly by dividing 1.2 (taking out the multi-presence factor) but has been fixed for Beta 4.

As I was working through the various combinations of different permit types and the load factors for the permit vehicle, it appears there are some inaccuracies possibly.

Unlimited/Annual - appears to correctly follow 6A.4.5.4.2c - in which the table value is used plus 0.10

But for escorted and unescorted special permits - it appears to use only the table values - when it

4/19/2016 3:09:50 PM

HRS AASHTO

2398

Complete Issue Information

should use 1.1 (escorted) and 1.0 (unescorted).

I could not find if this was reported (and fixed) yet.

FROM: Todd Thompson DATE: 7/11/2013 8:11:38 AM Eastern Daylight Time

In addition -

For the same 2013 Interim Spec -

when Special Permits - mixed with traffic are evaluated using refined analysis - a live load factor of 1.0 is used for permit vehicle AND a 1.1 live load factor is applied on the governing AASHTO legal truck placedd in the adjacent lane. - I don't see where we are applying two live load factors and adding the truck moments together. We are only using the load effect with live load factor for the permit truck.

FROM: Jim Duray DATE: 7/12/2013 3:39:41 PM Eastern Daylight Time

We missed this when we planned and budgeted this spec update task. I'm changing this issue to a maintenance issue.

FROM: Herman Lee DATE: 6/22/2015 3:34:17 PM Eastern Daylight Time

The Adjacent vehicle enhancement in 6.6 release allows users to specify an adjacent vehicle with a user-defined live load factor.

## Complete Issue Information

### Description

FROM: Amanda Jackson DATE: 7/12/2013 3:55:23 PM Eastern Daylight Time

Our consultant is working on the attached truss. When trying to analyze the truss, we get the following error:

Cannot compute haunch dead load if concrete material not assigned to cross section slab!  
01:53:03 PM - Line 1173 in source file DoSteelBeamDef.cpp.

The truss has a corrugated steel deck. It shouldn't be looking for concrete material to calculate a haunch load. I think this is similar to incident 12078.

FROM: Herman Lee DATE: 7/16/2013 7:30:18 AM Eastern Daylight Time

Seems like this problem only exists in cross section based input.

Resolved for 6.5.1 release.

FROM: Joseph Ihnat DATE: 11/15/2013 10:35:19 AM Eastern Standard Time

Verified truss analysis runs to completion in 6.5.1 Alpha Build 2.

FROM: Hanjin Hu DATE: 3/14/2014 11:10:26 AM Eastern Daylight Time

The BrDR (Version 6.6.0 Alpha Build 2) ended up during analysis of the "Right (Upstream) Truss" under "Maiden Rock Truss System Bridge". The rating method used was LFR. The attached screen shot "error 12763" shows the place it stopped.

To: Silvis, Bryan J., P.E. (VDOT)  
Cc: Zhou, Yingmin, P.E. (VDOT)  
Subject: FW: Question about Virtis Negative Moment capacity over the pier

Bryan,

I've verified Yingmin's numbers below, and I agree with her position: Br|R should pick the lower of the two capacity values from A6.1.1 and A6.4.4 since both sections would apply to a continuous girder over an interior support. I confirmed her numbers in both 6.4 and the latest 6.5 beta.

It looks like selecting the toggle in the Control Options to Ignore long. reinf in negative moment capacity causes the program to incorrectly pick one or the other code sections instead of selecting the minimum value which should apply.

Could you please forward this to the incident net?

Complete Issue Information

Thanks!

Jcm

Thanks for the information on phone. I copied more numbers below. You can see that Myt (A6.1.4) numbers are always bigger than Mnc (A6.1.1). My opinion is that we need to meet both A6.1.1 and A6.1.4 since we have Discretely Braced Compression Flanges and Continuously Braced Tension Flanges. The smaller number of them shall control.

Virtis picked Myt to calculate the RF for situation Without negative steel while it picked Mnc to calculate the RF for situation With negative steel. That is possibly why we got bigger RFs for situation without negative steel.

I could be wrong, please let me know if you find any more information.

Thanks.

Hi, Jonathan:

I just tried a 2 span continuous plate girder bridge and came across some questions about the negative moment capacity. It seems to me that Virtis messed up something with or without negative reinforcing steel in the deck. Here is a summary of my run both ways.

Without Negative Steel:

Exterior Girder: RF = 1.57 Myt = 11272 kip\*ft Mnc = 10207 kip\*ft Mp = 11280 kip\*ft  
Interior Girder: RF = 1.58 Myt = 11141 kip\*ft Mnc = 10160 kip\*ft Mp = 11280 kip\*ft

With Negative Steel:

Exterior Girder: RF = 1.49 Myt = 11471 kip\*ft Mnc = 10913 kip\*ft Mp = 12614 kip\*ft  
Interior Girder: RF = 1.54 Myt = 11713 kip\*ft Mnc = 10938 kip\*ft Mp = 12899 kip\*ft

=====

FROM: Wayne Skow DATE: 7/15/2013 10:05:19 AM Eastern Daylight Time  
This is a bug in articles A6.1.2 through A6.1.4. Those articles were using the compression phi factor instead of the flexure phi factor. That caused Article A6.1.4 (phi=.9) to control where A6.1.1 (phi=1.0) would have controlled if A6.1.4's phi had been 1.0.

Fixed in v6.5.b4 AbanSpec.dll dated after 7/16/2013 at 10am.

Submitted on behalf of Bruce Peterson (Bruce.Peterson@jacobs.com), JACOBS.

Received BrDR email:

=====

Another question for you.

I was copying my trusses by right clicking on the existing truss and pasting it to the trusses folder to run them with different distribution factors for the truck trains. When I did this, and modified the copy of the truss to the new distribution factors, it changed all 3 of the copies I had made instead of just the one I was working in. Is this the way it is supposed to work?

I went around it by double clicking on the trusses folder, created new ones and copied the text file into it. Then it seemed to save them as individual files and not link them. However this causes me to wonder what other changes have been linked.

FROM: Wayne Skow DATE: 8/7/2013 7:11:24 AM Eastern Daylight Time  
 The error was a consequence of entering zero for the "n" value on the Deck Concrete tab of the Deck Profile dialog. This caused some NaN's (not-a-number due to divide by zero) to enter the speck check artilces.

Complete Issue Information

Herman - This is probably an input validation issue rather than a speck check issue.

The rating factor summary shows 0.467 for OL11 and 0.522 for OL4 Operating at 186.98 ft. This is below 1.0 and when viewing the spec checks for this location, it is not flagged with an "X" at Span 2 - 89.20 ft, but rather checked as if it passed. Refer to 6B.4 Shear Rating report at 186.98 ft left that show the ratings that correspond with the summary table.

The adjacent section which fails is okay and flagged with an "X".

FROM: Mark Mlynarski DATE: 8/7/2013 9:46:04 AM Eastern Daylight Time

Srujana,

I think we need to determine if this is an existing issue or occurred in previous versions.

### Description

FROM: Dean Teal DATE: 8/7/2013 1:34:06 PM Eastern Daylight Time  
Herman and I had worked on the first part of this issue. I had imported a BRASS data file (girder line steel). In our Steel commands in the data set we had set allowable fatigue at 16 ksi. See the bridge model and Superstructure Def. named BRASS Import – W/Fatigue.  
HS 20 Axel Load Inv = 0.943 controlled by Fatigue

I built a girder system model called K-79 HWY ..... Using girder #2 and entered one POI at 27.5 feet (the spot that controlled in the BRASS data set). I entered the same data on the Fatigue tab that the Brass girder line had – Category B and 16 ksi allowable fatigue. I selected in the control options to only

4/19/2016 3:09:52 PM

HRS AASHTO

2410

Complete Issue Information

evaluate at the entered user POI. Fatigue did not control using the BRASS engine, flexure controlled with an HS20 Axel load Inv = 1.634

1.634 is not correct so I had Brian Goodrich help me find out why fatigue did not control. He had me uncheck all POI selections in the control options. Now the Inv. Ratings match at 0.943.

Now change the engine to the AASHTO engine – HS20 Axel Load Inv = 1.473 with flexure controlling. This is a long way from the 0.943 I got from BRASS and fatigue controlling. Why is the AASHTO engine different than BRASS? How do I get fatigue to control when I limit fatigue allowable = 16 ksi?

FROM: Herman Lee DATE: 8/12/2013 8:47:18 AM Eastern Daylight Time  
The AASHTO Engine doesn't use the Allowable Fatigue Stress entered in the POI. I'm changing this to a Maintenance issue.

FROM: Dean Teal DATE: 8/12/2013 1:59:27 PM Eastern Daylight Time  
Does it use allowable fatigue at all? Where/how is it enter?  
Was this just a BRASS feature that we missed putting into the AASHTO Engine?

FROM: Bin Zhang DATE: 8/13/2013 10:56:10 AM Eastern Daylight Time  
BRASS LFD is using "Allowable Fatigue Stress / Stress Ranges" to calculate the fatigue rating factor. Stress Range means "Moment Range/Section Modulus" here. AASHTO ASD and LFD do not perform the fatigue rating.

FROM: Herman Lee DATE: 1/24/2014 12:38:01 PM Eastern Standard Time  
The Task Force made the decision to hide the data fields in the input window. The API will also be modified to remove access to this data element.

Implemented in the 6.5.1 release.

|                                                                                                 |

=====  
 Incident submitted behalf of : Raybeau William Richardson [raybeau@unm.edu]  
 =====

Bridgeware,

We got this error while rating a bridge and cannot figure out what is wrong:

Missing data in article: "9.16.2.1 - Prestress Losses - General" - stage 2, round 2  
 Missing data in article: "9.16.2.1 - Prestress Losses - General" - stage 2, round 2  
 Fatal error occurred while computing Prestress Losses.  
 Error - Error performing prestress loss LFR specification checking!

Error - Analysis failed!

Can you please explain to us what the problem is? Thanks!

Raybeau Richardson  
 UNM Bridge Load Rating Project

=====  
 Reason for the error is that while computing Prestress losses computation stage one does not perform analysis at 36.33ft and stage 2 requires ALFD\_IndexPsStageTables.PsLoss in Article 9.16.2.13 from stage 1 at this location, which results in missing data error.

Bridge xml file from the email attached.

FROM: Srujana Thogaru DATE: 3/17/2014 11:18:17 AM Eastern Daylight Time  
 In Beam details window under continuous support detail tab at a given support if the distance on left and distance on the right are entered unequal then the span lengths and span numbers are saved incorrectly in stress limit ranges tab causing the above error. Even if the correct data is entered manually and saved, when we reopen the window incorrect data is populated. This error also happens with PCITraninigBridge6 (BID 9) LFR and LRFR analysis.

Complete Issue Information

FROM: Joseph Ihnat DATE: 4/9/2014 1:42:01 PM Eastern Daylight Time  
On the Continuous Support Detail tab, two of the distances are less than the corresponding beam projections. I added validation to this window to prevent that.  
Now after reentering the data (according to the suggestions from the validation), I receive System Error after analysis:

Error getting stress limit from PS stress limit ranges to right of 213.8750000 ft!  
Current tolerance for ft is 0.0010000.  
12:19:41 PM - Line 287 in source file c:\builds\2  
\virtisopis\virtisopis66buildwin32debug\sources\source\domain\abognrl\dorangesetcmdtarget.cpp.

Srujana, please investigate this message.

FROM: Krisha Kennelly DATE: 4/16/2014 10:14:59 AM Eastern Daylight Time  
Fixed for 6.6 Beta 1.

The data entered for the Continuous Support Details and Beam Projections are not consistent. As noted above, the support distance on the Continuous Support Detail tab cannot be less than the corresponding Beam Projections on the Span Detail tab.

1. Validation has been added to the Continuous Support Detail tab to not allow the continuous supports to be less than the beam projection.
2. An internal check has been added to prevent the error message noted on 4/9 from appearing.

FROM: Krisha Kennelly DATE: 4/16/2014 11:38:08 AM Eastern Daylight Time  
Subject text has been modified to indicate this issue is related to validating for incorrect user data and not really related to article 9.16.2.1.

FROM: Hanjin Hu DATE: 4/16/2014 1:21:12 PM Eastern Daylight Time  
Backchecked for V6.6.0 Beta Build 1.

### Description

FROM: Rachel Sharp DATE: 8/15/2013 9:25:14 AM Eastern Daylight Time  
Steel Shear check (6A.4.2.1) not flagged as below 1.0 and it is for Span 2 (87.32 ft). LRFR 3D OL4 and OL11 used.

FROM: Wayne Skow DATE: 8/23/2013 8:48:42 AM Eastern Daylight Time  
Fixed in v6.5.1. Because of issue 12808 you cannot expect to see the same action values during testing. This will be particularly true in span 2. You might want to make the web thinner so the shear RF will drop below 1.0.

This fix will also be included in a special v65 patch.

FROM: Rachel Sharp DATE: 8/29/2013 4:18:52 PM Eastern Daylight Time  
Backcheck is okay.

FROM: Bin Zhang DATE: 11/15/2013 12:06:16 PM Eastern Standard Time  
Verified for version 6.5.1 alpha 2.

Description

3/30/99 D Teal

The calculated Dist. Factors may be different for Pos. and Neg moment areas in multi span structures. AASHTO Table C4.6.2.2.1-1 is used to find "L" for use in the Live Load Dist. Factor equation. In place of making 2 runs, how can this be worked around this portion of the AASHTO Spec?

4/7/99 D Teal

Another factor that the Dist Factor is dependent on is "K" . Which is dependant on the beam cross sectional area and it's moment of inertia.

To make Opis a friendlier design tool the LRFD Live Load Dist. Factor should most definitely be computed internally.

4/12/99 D Teal

I was comparing notes with the designer we sent to Mpls training. This question arose. When doing a Girder System, do we have to calculate and enter the Live Load Dist. Factors or can we leave them blank and let Opis calculate them. If Opis calculates them, where are they recorded? Why isn't there a "compute from typ. Section" button like on the LFD tab. The "compute from typ section" button in the LFD tab and lack of one in the LRFD tab leads you to believe you have to manually calculate it.

FROM:dteal DATE:Tuesday, August 28, 2007 10:39:47 AM

Comments from the Opis group in 07 UG Meeting - they put this in there top 5 on the enhancement list.

VI Incident #1033 category "DESIGN FLAW" -- Wizard for LRFD Dist. Factors.

The consensus from our discussion was:

Initially, with a new bridge the LRFD dist. factors are blank. It would be nice to get an idea of what they will be after you run BRASS. So, for a first estimate of the dist. factors Virtis/Opis could make an assumption with a value of "1" for the stiffness (K value). Then, at the very least, after a BRASS run was made, the values could be populated with the actual values calculated.

FROM: Dean Teal DATE: 8/7/2008 2:07:12 PM Eastern Daylight Time

In my opinion, this incident has been "Over come by events" and should be closed

FROM: Herman Lee DATE: 10/13/2009 1:16:44 PM Eastern Daylight Time

Resolved in 6.1 Release.

### Description

FROM:jduray DATE:05/03/1999 08:12:25  
From Dean Teal:

Spec. Checker - I found several of the AASHTO references wrong.  
For an Interaction Equation you are told to go to 6.10.5.2.3d-1 and should be 6.10.4.1.6.b-1

In another spot you are told to go to 6.10.5.2.2b and should be 6.10.4.2.2b.

It appears to reference 6.10.5 when it should be referencing 6.10.4.

Description

FROM: jduray DATE: 05/04/1999 08:16:37  
Received the following e-mail from Dean:

I believe there is a bust in calculating the LRFD Distribution Factors.

Complete Issue Information

For the Exterior Girder - all is OK (except some differences in the moment of inertia)  
Interior Girder - My hand calc's disagree on Beam Distribution for moment at End of Span #1 & beginning of Span #2 for both single & multi lanes.

|         |            |            |
|---------|------------|------------|
| Moment: | 1 lane     | Multi Lane |
|         | .426 (.44) | .623 (.64) |
|         | .426 (.41) | .623 (.61) |

My numbers are in brackets. I realize that these numbers are close - but.  
I found that our Moment of Inertia (mm<sup>4</sup>) are not the same. Moment Distribution Factors in the exterior girder is not a function of the Moment of Inertia, but for interior girders it is. We agree on Area mm<sup>2</sup> and X-Bar mm, it is the moment of inertia we differ.  
Virtis -----I=10164835E3 mm<sup>4</sup>  
Hand Calc's - I=10207767E3 mm<sup>4</sup>

Also, in the Interior Girder, I found the Dist Factors for Deflection to be wrong. The Dist Factor for Deflection is (# of Lanes/# of Girders) So on my 11 m roadway we could have 3 full lanes. Following is the comparison between Virtis and what it should be.  
Single Lane - Sh/As 0.24 Sh/Be 0.20  
Multi Lane - Sh/As 0.40 Sh/Be 0.60

FROM: dteal DATE: 5/5/1999 7:31 AM  
I erred in the moment of inertia calcs. So the Distribution Factors for moment are OK. There is still a problem with the DF's for deflection.

FROM: bgoodrich DATE: 6/30/1999 6:52 AM  
I suspect the export generated the DIST-CONTROL-LL command with 2-lanes loaded. Therefore, BRASS used this value for the DF comps, so for a single lane, 1/5\*1.2 gives 0.24 and for multiple-lanes, 2/5\*1.0 gives 0.4. Note that BRASS included the multiple presence factor. I will investigate the structure definition engine data for LRFD where this value is controlled by the user. I will check the export to see if it sets the number of lanes to two by default.

FROM: dteal DATE: 8/13/1999 10:37 AM  
See incident #1420

FROM: bgoodrich DATE: 11/29/1999 2:38 PM  
This incident is resolved.

### Description

FROM:jduray DATE:05/04/1999 09:58:02

From Dean Teal:

In the Analysis Progress window - why are the Distribution Factor Schedules listed here for an exterior girder and not an interior girder. I used the new design wizard and let the program find the factors for both. The DF for both are included in the BRASS output.

FROM:kkennelly DATE:06/22/1999 09:33:25

Mehrdad, Jim said to assign this to you since I haven't worked on the Analysis Progress window at all.

FROM:mordoobadi DATE:06/23/1999 11:20:11

If you rate a whole girder system structure definition Analysis Progress window will rate the current member alternatives of all of the girders one by one. So the text you see in this window at the end of the analysis corresponds to the last girder (an exterior girder). If you want to see the progress report for another member alternative you can select that member alternative in the tree control and then hit "View Rating Log".

Description

FROM:jduray DATE:05/12/1999 08:09:20

The following is from an e-mail from Ken Hurst:

Jim probably needs to get started on the "haunch" codes "top web to of top deck" as a constant. That way us lazy designers won't have to go back and recalculate the haunch or width everytime we change the top flange.

FROM:jduray DATE:06/08/1999 10:18:27

We do have this capability.

Description

FROM: dteal DATE: 6/22/1999 7:41 AM

Opis can be used to RATE or as a Design Review tool. But to create an economical design from scratch is by trial and error only. Very time consuming.

There needs to some iteration process to find economical solutions. Plus there needs to be a cost

estimator (by weight/mass) to make comparisons.

Web Thickness or Flange

After a web height is decided, we should be able to give it the thickness and have Opis iterate on flanges. Or the other way around. We should be able to lock one in and iterate on the other. Intermediate Stiffeners should be located and sized based on the web thickness and height. Bearing stiffeners should be sized on the same bases. Trial and error wastes much time and usually will not result in economical designs.

“Distance” needs more explanation in the help file. Is this distance ACTUAL or STRUCTURAL?

FROM: dteal DATE: 8/11/1999 9:08 AM

But, but, but what was the answer? Is the Distance requested here "Actual or Structural"?

## Complete Issue Information

FROM: dteal DATE: 8/11/1999 10:27 AM The current help for this window states that:

### Distance

Enter the distance from the centroid of the deck reinforcing steel described in this row to the location selected in the "Row" column.

### Row

Select whether the deck reinforcing steel described in this row is measured from the top of slab or bottom of slab.

My question is – when measuring from the top of the slab are we to use actual or structural thickness. It is never stated.

FROM: jduray DATE: 08/12/1999 07:48:00

Sorry - the answer is...

E-mail from Brian...

Ken Wilson and I discussed this issue a long time ago and, as I recall, decided the rebar distance should be measured from the effective thickness. The reasoning was because the actual thickness was not a required field. If the user inputs the actual thickness, the export tries to export the dead load from the slab.

We could measure the rebar distance from the top of the actual slab thickness, and require users to enter the actual slab thickness. They would just have to make sure the actual slab width was null or zero, so the slab DL does not get exported if they don't want it to be. Let me know if you want any changes made to the export to address this issue.

----end of e-mail

Revise Help to indicate it is measured from the effective thickness.

FROM: jduray DATE: 08/16/1999 14:45:00

BRASS import doesn't know ACTUAL thickness.

Need to find out what BARS data contains.

Possible solution is to use ACTUAL if not null or use STRUCTURAL if ACTUAL is null.

Right now this is undefined.

Changes to the export would be minor.

FROM: dteal DATE: 9/30/1999 3:23 PM

In answer to the e-mail from Brian - The Actual thickness is recorded in the Structural Typical Section – Deck (cont'd). With these two windows we have both actual and structural thickness.

FROM: jduray DATE: 10/03/2000 09:08:41

Krishna - please check on the status of this. Can we close it?

FROM: kkennelly DATE: 10/10/2000 09:29:02

Help says it is measured from effective deck thickness so we can close this.

OPIS - when I set the extra weight factor to 20%. It does not appear that the extra weight was added based on the moments that appeared in the output.

FROM: bgoodrich DATE: 8/12/1999 8:16 AM

I am unable to duplicate this incident. Please review the BRASS data file to see if the 20% additional weight was exported to Parameter #8 on the LOAD-DEAD-CONTROL command. Note that a new load case is not generated for this additional weight, but rather its effect is included in the Girder Self-weight load case.

### Description

FROM: dteal DATE: 9/21/1999 7:55 AM

I populated the Wearing Surface tab in the Structure Typical Section window. I selected load case - DL3 from the pull down. I had made load case DL3 available in the Load Case Description window as Load Case DL3, Stage 2, Type = D,DW.

After an analysis I looked in the "Analysis Results" for Dead Load Actions, Stage 2. But instead of seeing DL3 in the Dead Load Case pull-down, I see "Superimposed Uniform Dead Load (DW). Is this supposed to overwrite a load case name with this?

FROM:jduray DATE:10/19/1999 16:29:38

This results from the way Virtis and BRASS communicate. I think this can be changed but it needs some investigation.

FROM: Dean Teal DATE: 8/7/2008 2:09:51 PM Eastern Daylight Time

I think this has been "Over come by events" and should be closed

### Description

FROM: dteal DATE: 12/2/1999 1:17 PM

The following needs to be checked.

During transportation, prestressed beams may be subjected to dynamic forces. This "bouncing" of the beam can reduce the dead load on the member which could result in critical tension stresses in the top of the beam. The designer should check these stresses by assuming support points for beam transportation at 5'-0" from the end of the beam or to the first tenth point of the span, whichever is greater. Check tension in the top of the beam over the temporary support due to the cantilevered moment. To approximate the dynamic load effects, assume a beam dead load of "3g" on the cantilevered portion (PCI Design Handbook, 3rd Edition, Chapter 5).

1/5/2016 11:06:43 AM

HRS AASHTO

22

Complete Issue Information

Also check the tension in the top of the beam at the harp point of the strands using the reduced span length due to the temporary supports. Again, use 3g for the overhang force, but use the normal beam dead load "g" when computing forces between the supports. Allow a maximum temporary tension stress of  $6(f'c)^{1/2}$ .

Description

FROM: dteal DATE: 12/3/1999 9:53 AM

By the time user input gets to this point in a girder system, Opis has all the information it needs to calculate the Eff. Width. A compute Button here would be helpful.

The reinforcement in the deck is related to effective width. Therefore if it was calculated in the first tab we would have the value to use when doing the reinforcement

Compute button added to Deck Concrete tab for girder system only for Version 4.2.

Question for programmer: Should we add BWS messaging to the ComputeDeckProfile in case user changes something in Virtis while the Deck Profile window is open?

| 2293.11068 | Suspended     | Structure Framing Plan Details – Diaphragms – Temporary |

Description

FROM:jmckool DATE:12/08/1999 11:31:43

This spec check window calculates a Design Ratio or a Rating Factor based on a resistance stress and dead load and live load stresses. However, it does not say where the stress occurs, i.e. top flange or bottom flange. Is it possible to add that information to this window? I essentially had to work backwards through the stress calculation windows to determine what these stresses are.

Also, is it possible to add what the resistance stress is? For example, initial allowable compression or

1/5/2016 11:06:44 AM

HRS AASHTO

26

Complete Issue Information

final allowable slab compression.

FROM: bgoodrich DATE: 12/14/1999 8:01 AM

The spec check details are written inside general tools that do not know where they are being called from. They were not intended to be used as a stand alone tool that gave a lot of information about the computation. The BRASS output illustrate these comps where one or more sections above a rating comp gives the information about the resistance, stress locations, etc. However, it is possible to add the requested information, but it will take some time. This should be a task force directed task.

Jim - How should we proceed?

Please describe what you mean by this.

FROM: dteal DATE: 2/10/2000 3:50 PM

WE (Kansas) use Temporary metal diaphragms that are removed after the deck is poured. The contractor has the option of using CIP diaphragms (seldom used). The only choices given by Opis are either you have them or you don't. We need a choice for using them only in non-composite stage 1.

| 2363.10999 | Discard       | Shear - P/S beam design using LRFD |

### Description

FROM: snshah DATE: 2/16/2000 7:45 AM

Will OPIS 3.0 have any design capabilities? Currently, the user has to go through a trial and error process in order to select the appropriate shape. The user should be allowed to fix certain values (eg. flange width, web height, etc.) while OPIS selects an appropriate, economical shape (eg. flange thickness, web thickness, etc.)

Is this planned for the 3.0 release? If not, when could we expect to see this option?

FROM: jduray DATE: 02/18/2000 16:10:43

Opis substructure will have "design" capability. Opis superstructure (versions 2 and 3) support "design/review". This approach to the superstructure is based on two factors: money and user survey. We surveyed the user community to better the kind of design tools they are currently using and what they would like to see in the future. The response was overwhelmingly in favor of design/review so the design engineer could control the design iterations. They wanted tools to do the analysis and spec-checking and prefer to make the engineering decisions themselves. Also, we didn't have sufficient funds to develop a new analysis engine and BRASS LRFD was available. BRASS does not support design as you refer to it, only design/review.

### Description

FROM: bbeerman DATE: 2/23/2000 8:52 AM

1. [PS Shear reinforcement ranges] - consider changing the "Horizontal" tab title to "Interface" (for interface reinforcement) and adding a "Longitudinal" tab for item No. 2. I thought I was entering longitudinal reinforcement in this tab.
2. There needs to be a window where Longitudinal reinforcement can be entered so that the correct tables can be used in order to select beta and theta (LRFD 5.8.3).
3. Question(s) - Does BRASS calculate shear capacities base on LRFD 5.8.3 criteria? Is there anyway to view the shear contributions due to the beam, stirrups and prestressing force ( $V_c, V_s, V_p$ )?

FROM: jduray DATE: 02/23/2000 10:55:07

1 & 2 are enhancement requests.

1/5/2016 11:06:45 AM

HRS AASHTO

30

Complete Issue Information

Brian - please answer 3.

FROM: bbeerman DATE: 2/23/2000 12:16 PM

Disregard No. 3, I can see it in the spec. checks in VirtisOpis.

I still think there should be a place to enter longitudinal reinforcement.

FROM: bgoodrich DATE: 2/23/2000 12:30 PM

Item 3: Ben found the spec checks results shown in Opis and/or the detailed intermediate output from BRASS that illustrate all the input parameters and computed results for shear.

FROM:jduray DATE:02/25/2000 13:25:43

FROM: bbeerman DATE: 3/20/2000 1:56 PM  
"resubmit" for item No. 1

FROM:jduray DATE:03/22/2000 17:13:18

This is the only request and we are not changing it without a concensus from several testers.

FROM:kkennelly DATE:03/29/2000 08:42:08

I think this is a very important enhancement. BRASS must not be checking LRFD 5.8.3.5 but we have to let user enter an area of long. steel for the ps beam.

FROM:hlee DATE:4/30/2008 2:21:10 PM

Description

FROM: dteal DATE: 4/7/2000 10:23 AM

Please investigate the attached P/S structure and tell me why I don't get any Rating Factors. I have incidences #'s 1416, 2540 & 2541 also waiting on this.

FROM:jduray DATE:04/07/2000 14:10:13

The rating factor graph for an LRFD analysis of TrainingBridge1 is ok.

The rating factor graph for an LRFD analysis of P/S beam does not display data for the Min. Envelope. The Tabular results lists Limit State Summary but there is no information displayed - why?

FROM: dteal DATE: 4/10/2000 11:03 AM

It appears that the problem was due to not having defined the deck reinforcement over the pier. This may have resolved this incident.

FROM: dteal DATE: 4/11/2000 7:52 AM

Still nothing appears in the rating factor graph.

FROM:jduray DATE:04/11/2000 09:04:40

There was a problem in the graph code. It will be fixed by a service pack that should be available on our web site later today.

FROM: dteal DATE: 4/19/2000 3:34 PM

After installing the service pack, it still doesn't work.

FROM: dteal DATE: 4/19/2000 3:36 PM

I was using the newly attached file.

FROM:jduray DATE:04/20/2000 10:05:30

FROM:mordoobadi DATE:04/20/2000 14:02:58

I imported MLLPS.bbd file. I did an LRFD analysis and I was able to see rating factors in the graph (not in stage 1 because BRASS does not report rating factors in stage 1).

FROM: dteal DATE: 4/20/2000 1:29 PM

I do not get any rating factors in the graph in stage 3 for member 2. I am using the HL(# Design truck and the LRFD fatigue truck. All I get when the Rating Factor in the graph is checked for either Moment or Shear is columns for Location and Distance and the graph is empty. There is no plus sign in front of rating factor, indicating that only one stage at most is available. The only place I can find output for Rating Factors is in the Spec Checker.

FROM:kkennelly DATE:5/14/01 11:11:11 AM  
Report Tool uses DoMemberCriticalLoadsLrfd to report the total DL moments in the Flex Analysis Summary. For PS concrete, BRASS LRFD puts composite DL into Stage 3 which also contains LL. So Report Tool reports DoMemberCriticalLoadsLrfd for Stage 1 since it thinks Stage3 is just the LL stage and there is no Stage 2. Could try to use DoConcreteLimitStateSummary to report the DL's but then wouldn't have a max and min DL moment using max and min DL factors.

FROM:kkennelly DATE:5/15/01 9:49:01 AM  
Change DL column heading in Flexure Analysis Summary and Shear Analysis Summary reports to reflect what is currently being reported. Functions "UseAlternateDLColHeading()" has been added to UiLrfdOutputReport.cpp. Call this function after InitReport is called for LRFD report in UiReportToolVw to determine which heading to use.  
Current heading now for Flexure Analysis Summary report is "Total DL Moment". If UseAlternateDLColHeading() returns FALSE, leave heading as is. If it returns TRUE, use "Stage 1 DL Moment". Similar thing for Shear Analysis Summary report except its title says Shear instead of Moment.

Want to include this in Service Pack 3.

FROM:jihnata DATE:5/15/01 1:19:22 PM  
Krisha, Virtis crashes now (in UseAlternateDLColHeading()) if "Generate Report" is clicked when there are no current results.

FROM:kkennelly DATE:5/16/01 12:01:46 PM  
Crash fixed. Headings for Flexure Analysis Summary and Shear Analysis Summary are now hardcoded into XML file since different members may need different DL headings within the same report.

FROM:jihnata DATE:5/17/01 8:27:11 AM  
Report fixed for Version 4.0 Patch 3 and for Version 4.1.

FROM:jduray DATE:5/25/01 4:19:17 PM  
From Gale (testing)

I tried using pci training bridge 4 to check the supposed malfunction and fix.

Complete Issue Information

in 4.0.2, I get DL results in the Flexure Analysis Summary report. The numbers don't seem to change if I change the magnitude of the FWS load.

in 4.0.3 all I get is \*\* in both columns of

Total  
DL  
Moment

FROM:jihnat DATE:5/29/01 7:46:22 AM

FROM:bgoodrich DATE:05/29/2001 11:36:43

I was able to duplicate the issue described, however, I don't think the export is at fault. When the export gets the number of load scenarios from the domain (LoadScenarioPtr->GetCount()), it returns zero. Therefore, no member dead loads are exported. I repeated this process for PCITrainingBridge3 and the export generated the member dead loads just fine, so there is not a problem with the export or the domain. I checked the database and found that abw\_super\_load\_scenario contains records for both PCITrainingBridge3 and PCITrainingBridge4. However, when I checked abw\_super\_load\_scenario\_item, there were only records for PCITrainingBridge3. There are missing records in abw\_super\_load\_scenario\_item for some other bridges also. I mentioned this problem in a past incident or e-mail, but the Visual Intercept query tool cannot find any reference to it and I have since changed e-mail systems.

FROM:kkennelly DATE:5/29/01 1:17:17 PM

Report fixed, don't get \*\* in DL columns for PCI Training bridge 4.

FROM:gbarnhill DATE:05/31/2001 12:03:24

The headings in the Report Tool now indicate what moment is reported. Due to the limitations of the connection between BRASS results and the report tool, Stage 2 moments are not being reported. Should include this explanation in the SP3 readme file.  
OK in Service Pack 3 for version 4

### Description

FROM:bgoodrich DATE:03/21/2001 16:27:39

When running Opis during the Oklahoma City traing, I pressed F1 for any window to get BRASS-LRFD related help. I then selected the Engine Related Help hot-text and the engine help for BRASS-LFD was opened. There appears to be no way for the user to get BRASS-LRFD help short of manually copying BRASSLRFDENGINE.HLP to ENGINEHELP.HLP. The Help menu needs to be modified to permit the user to change this help like the Engine Help Configuration menu items in the combined Virtis/Opis UI. This problem is due to the EngineHelp.hlp file being installed as that for LFD.

FROM:jduray DATE:4/12/01 11:28:23 AM

It sounds like the installation needs to copy the BRASSLRFDENGINE.HLP help file to EngineHelp.hlp if we are installing Opis and BRASSLFDENGINE.HLP to EngineHelp.hlp if installing Virtis. I think installation of VirtisOpis is ok.

FROM:jihnmat DATE:7/14/2005 3:04:44 PM

The installation already does what Jim suggested (and the LFD engine help doesn't ship with Opis). I was able to reproduce this by installing VirtisOpis, then running the Opis exe. In this case EngineHelp.hlp contained the LFD engine help, and as Brian observed Opis has no way to reset the engine help to LRFD.

Changed Opis program startup to always force LRFD engine help, instead of defaulting to whatever happened to be in the EngineHelp.hlp.

Fixed for 5.4.0

FROM:xli DATE:9/20/2005 9:57:23 AM

works for 5.4.0

## Description

FROM:bgoodrich DATE:03/23/2001 14:53:49

1. The following training manual pages need updated to show the effective width of the deck: PS1-31, PS2-32, PS6-32, and RC1-21.

2. Training manual page RC2-11 needs updated to illustrate the distribution factors for LRFD because BRASS does not compute them for a slab bridge.

3. The training manual page PS2-13 shows the Framing Plan View, however, the deck geometry on page PS2-14 has not been input. The schematic needs to be moved to page PS2-14 under the Structure Typical Section window.

1/5/2016 11:06:47 AM

HRS AASHTO

38

Complete Issue Information

4. Update all examples to have a page similar to pages STL1-10 or STL2-8. Users may not look at the steel examples right before looking at prestress or R/C.

5. On pages PS2-15, PS5-13, and PS6-16, the Sustained Modular Ratio Factor needs to be changed from 3.0 to 2.0.

FROM:kkennelly DATE:5/18/01 9:57:56 AM

- 1. Done
- 2. Not done. This example already has the LRFD distribution factors and the results of an LRFD analysis at the end of the example.
- 3. Not done. You can view the framing plan schematic before you input the structure typical section. If you view this schematic before inputting the structure typ section, the structure definition reference line is placed under the first girder. Span lengths are referenced along this line in the schematic. This schematic correctly shows the struc def ref line under the first girder since we haven't entered the structure typ section yet.
- 4. Done for some examples. All of the examples have the text that tells the user how to do this, some of them just don't have the associated screen snapshot. If I had to modify the example for other reasons, then I added the snapshot. Snapshot added for PS1,PS2,PS5,PS6. It was already in RC1.
- 5. Done

## Description

FROM:bgoodrich DATE:04/13/2001 15:00:15

E-mail from Chad Edward Grinsteiner, P.E., Project Engineer, White Engineering Associates, Inc.:

I believe we have uncovered a possible bug in the fatigue output for a simple-span rolled beam design

1/5/2016 11:06:49 AM

HRS AASHTO

42

Complete Issue Information

we are working on.

Before I get into the details, it may help to understand the nature of the project we are using Opis with: The Oklahoma DOT has contracted our office to develop standard LRFD designs and drawings. As part of the contract, we are to develop original designs using a design program and then confirm the design using a second program. In this instance, the original design was performed using Merlin-DASH (version 7.2) and the confirmation is being done with Opis/BRASS (version 4.0.2). This is a rather unique position to see how programs compare side-by-side.

In the design of a 98.5' simple span, 8" composite deck, 40' roadway with two 13" wide barriers, 4 - W40x324 beam system at 11'-10" spacing (3'-4" overhangs), Merlin-DASH shows that fatigue controls on the exterior girders due the weld of diaphragm connection plates to the top of the bottom flange (category C', fatigue resistance = 6 ksi). Merlin-DASH shows the fatigue stress to be approximately 6.0 ksi at the BOTTOM of the bottom flange (Merlin-DASH does not have a feature to compute stress at a location between the extreme fibers). In confirming the design, we found BRASS to show a fatigue stress of 7.44 ksi at the BOTTOM of the bottom flange (for comparison).

After some investigation and confirmation with programs developed internally by our office and Oklahoma DOT's office, we found the stress computed by Merlin-DASH to be more accurate. We suspect the following possible problems could be the source of the differences:

1. We entered user-specified distribution factors into Opis. It appears that the multi-lane distribution factor is being divided by the multiple presence factor of 1.2, rather than the single-lane distribution factor. This was confirmed by changing the single-lane distribution factor with no change in fatigue results, while changes to the multi-lane distribution factor does affect fatigue results. It is unknown if this a Opis issue or that of BRASS.
2. It also appears the analysis of the fatigue truck is based upon a variable rear axle spacing (14' minimum) rather than the constant axle spacing of 30' specified in LRFD article 3.6.1.4.1. Analysis results for a 14' rear axle spacing, when combined with the effects of point #1, seem to approximately correlate to the BRASS results.

FROM:bgoodrich DATE:04/13/2001 15:04:41  
E-mail from Chad Edward Grinsteiner:

Here's the information you asked for. I've double-checked my input into Opis and cannot find a problem there. I've included runs for a 30'(nominal, 28.5' brg./brg.) simple span and a 100' (98.5' brg./brg.) simple span. The \*.res files are the Merlin-DASH output.

In my email to Jim, I had concluded that if I had used a 14' rear axle spacing on the fatigue truck (combined with the distribution factor problem) with the 100' span, my results were close to BRASS. However, I have since looked at the 30' span and cannot reproduce the BRASS results using the same algorithm I had used on the 100' span. So my idea is suspect.

Our spreadsheet and hand calcs produced the following results:

|                                              | 30' span | 100' span |
|----------------------------------------------|----------|-----------|
|                                              | -----    | -----     |
| distribution factor for fatigue -            | 0.774    | 0.774     |
| fatigue dynamic load allowance factor -      | 1.15     | 1.15      |
| unfactored fatigue moment (g=1.0,IM=0,kft) - | 228.4    | 1236.8    |

1/5/2016 11:06:49 AM

HRS AASHTO

43

Complete Issue Information

|                                            |       |        |
|--------------------------------------------|-------|--------|
| bottom section modulus (in3) -             | 328.5 | 1649.6 |
| fatigue stress at bottom of flange (ksi) - | 5.57  | 6.01   |

I found close correlation with BRASS concerning section properties, so no problems there. I cannot match the fatigue moment, however.

FROM:bgoodrich DATE:04/16/2001 11:08:02

There is a problem with the export of the distribution factors when the fatigue truck is specified for a girder system. Currently, the export only checks if the single lane option is specified using the Advanced button of the Analysis settings window. I have modified the export (BrassLrfdLoadControl.cpp) to also detect if a fatigue truck is specified, so the single lane distribution factors will be exported. Originally, some users did not want to have to enter both single- and multiple-lane distribution factors, so the export was modified to export just the multiple-lane distribution factors when there where multiple lanes and only the single-lane distribution factors when there was only one lane. However, the fatigue truck was overlooked in this regard.

The work-around until the next service pack is to adjust some fields using the Advanced button of the Analysis settings window for the fatigue truck.

1. Check the Single Lane Loaded checkbox.
2. Set the Scale Factor to 0.8333, i.e., 1.0/1.2 to remove the multiple presence factor of 1.2 from the single-lane loaded distribution factors.

FROM:kkennelly DATE:5/31/01 3:38:21 PM

Patch test ok for what Brian wrote about the distribution factors. Didn't test anything about fatigue truck with varying axle spacing submitted by user.

FROM:bgoodrich DATE:06/04/2001 09:39:04

For Fatigue vehicles, BRASS uses a rear axle spacing as specified in the vehicle definition (usually 30 feet). I found nothing wrong with the axle spacing. Additionally, Mr. Grinsteiner's comments entered on 04/13/2001 indicate that he believes the rear axle spacing comments were "suspect."

FROM:bgoodrich DATE:Tuesday, January 28, 2003 3:29:16 PM

Track field marked as "patch test OK". Incident closed.

Member 2 (Interior Girder)  
Fatigue Limit State is our question, Stage 3 at Spant Point 1.5

1) AASHTO LRFD Code 6.10.6.2 states that "The live load flexural stress and shear stress resulting from the fatigue load, as specified in Article 3.6.1.4, shall be taken as twice that calculated using fatigue load combination in Table 3.4.1-1." It appears that Opis (BRASS) is using only one times the fatigue load.

2) AASHTO LRFD Code 6.10.6.3 references 6.10.3.1.4a in the commentary for calculating Dc. And this Dc is used to calculate fcf (max compress flexural stress). The description for fcf states to include "due to the unfactored permanent load and the fatigue loading as specified in Article 6.10.6.2". In reviewing the output of Brass(Opis), it appears that it uses only the fatigue live load (and no permanent (dead) loads). This appears to be in error. A review of "Four LRFD Design Examples of Steel Highway Bridges (VOL. II, Chap 1B Highway Structures Design Handbook)" in pages 1-39 thru 1-42 also supports this interpretation of the specification. I believe Jay's LRFD text book also includes permanent loads in the calculation of Dc and then fcf. Appears the values of Dc and Fcf are both incorrect.

3) This bridge also includes a pedestrian live load of some 154.959 lb/ft. The designer thought that this load should also be included in the Live Load Moment effects for the Fatigue Limit State. But it's not used.

## Note:

We did do the "workaround" as required in Incident 3186 as provided by B Goodrich.

We are using in production Virtis 3.0 Plus all patches/updates. We did check using 4.0.2 and got the same results.

=====

PERFORMING AASHTO SPECIFICATION CHECKS - 6.10.3.1.4 Depth of Web in Compression

Point of Interest : 105.00

Construction Stage: 3

Input Parameters:

Depth = 30.670 in Distance to Web Bot = 1.180 in f bot = 3.129 ksi  
Distance to Web Top = 29.490 in f top = -0.182 ksi

x-bar Computation: (Similar Triangles)

x-bar = Depth \* f bot / (f bot - f top) = 28.981 in

Depth of Web in Compression:

Dc = 0.509 in

Notes:

=> The above flange stresses are due to the combined effect of loads in this stage and previous stages.

=> The x-bar computed above is the effective distance to the centroid of the section.

PERFORMING AASHTO SPECIFICATION CHECKS - 6.10.6 Fatigue Requirements for Webs

Point of Interest : 105.00

Construction Stage: 3

AASHTO REFERENCE: 6.10.6.3 Flexure

EQUATION NO. : 6.10.6.3-1

Input Parameters:

Dc = 0.509 in E = 29000.000 ksi phi = 1.000  
tw = 0.650 in Fyw = 50.000 ksi

Calculated Value:  $2 * Dc / tw = 1.566$

AASHTO Limit :  $5.70 * \text{SQRT}(E / Fyw) = 137.274$

Flange Stress: fcf = 0.375 ksi

AASHTO Limit : phi \* Fyw = 50.000 ksi

Result Code : PASS

=> Note: Result Code lists PASS if the flange stress (fcf) is less than the limiting stress.

FROM:bgoodrich DATE:06/04/2001 09:48:54

BRASS requires the dead load factors for the Fatigue limit state to be set 1.0, which does differ from the AASHTO load factor table (Table 3.4.1-1). BRASS-GIRDER(LRFD) was developed in the specification's infancy, so to prepare for any future changes, the term "unfactored" was interpreted as factored by 1.0. Therefore, BRASS requires the dead load factors for the Fatigue limit state to effectively produce "unfactored" effects. I don't believe this has been conveyed to the users.

## Complete Issue Information

Until the load factor issue is resolved, I suggest copying the LRFD Factors from the library to your bridge. Then, change the dead load factors for the Fatigue limit state to 1.0. Next, you will need to set these factors as the override factors for each structure definition in the bridge. This should address questions 1 and 2.

Regarding question 3, AASHTO 3.6.1.4 does not indicate that the Fatigue vehicle should be combined with any other loading. Therefore, BRASS does not combine it with lane loads. Also, be aware that BRASS-GIRDER(LRFD) does not combine the pedestrian load with the design trucks as outlined in the specification.

FROM:bgoodrich DATE:06/04/2001 16:06:28  
E-mail from Todd Thompson:

For our Question 1) You didn't seem to address the fatigue load being taken times 2 as in 6.10.6.2. [and this hasn't changed since the 1994 Edition] It appears that this is the only spec check for this limit state that needs the load applied times 2. It also is the only place that we noticed that the fatigue limit state included permanent loads. So we did modify the LRFD factors as you suggested and did get results as we expected. (modified the DL factors to be 1.0 and modified the LL to be 1.5 (0.75 times 2))

Except we do think that we should include the Pedestrian Load (PL) for this specific code check. While we agree that one doesn't normally include PL (or other loads like permanent loads) in this limit state, we think that we probably should include PL for calculating Dc and Fcf. (albeit the PL load is pretty small in our case and doesn't really affect the results)

I guess if we make two separate runs, with the corrected load factors, we can get results pretty much as we expect.

FROM:bgoodrich DATE:06/04/2001 17:10:28  
BRASS internally multiplies the factored live load stresses by 2.0 as outlined by AASHTO 6.10.6.2 and has been doing so since before Version 3.0. By inputting 1.5 for the live load factor, the 2.0 factor is double accounted for, which will result in fatigue stresses that are too high. I analyzed the interior girder in TrainingBridge1 and reviewed the fcf value reported by BRASS. It matches my hand comps and is less than 2% different from the result shown in Four LRFD Design Examples... where this bridge was taken. This fatigue stress difference is due to a difference in dead loads. Note that BRASS does not multiply the live load by the 2.0 factor when determining Dc. I will work on getting this part fixed.

Also, I will forward the pedestrian load issue to Jay for comments.

FROM:bgoodrich DATE:06/08/2001 13:56:47  
I have modified BRASS-GIRDER(LRFD) to utilize the 2.0 factor in the fatigue computations for the depth of web in compression (Dc). I believe my previous comments and this one address issues 1 and 2.

Regarding question 3, Jay does not agree that the pedestrian load should be considered in the fatigue computations.

FROM:bgoodrich DATE:06/08/2001 14:01:00  
Jim - We need to address the Fatigue dead load factors. We have a couple options:

1. Change the Standard LRFD Factors in the database. This is option is preferred, but it the table would not look exactly like what is in the spec.

1/5/2016 11:06:49 AM

HRS AASHTO

47

Complete Issue Information

2. Add another item to the Standard LRFD Factors folder in the database. It would just contain Fatigue dead load factors of 1.0. This seems like the a good compromise between options 1 and 3. Jay suggested this option.

3. Ignore any user-input Fatigue dead load factors during the export and hard-code them as 1.0. This takes control away from the user.

FROM:jduray DATE:6/22/01 2:35:57 PM

I think the values in the database are correct or should be changed to NULL for the load factors that AASHTO spec lists as a hyphen.

Either the export to the engine or the engine should handle the load combination and related spec checks appropriately.

FROM:bgoodrich DATE:07/06/2001 16:37:41

I will modify the export to ignore the dead load factors for the fatigue limit state. The export will set these dead load factors to 1.0.

FROM:bgoodrich DATE:07/07/2001 12:21:59

I modified the export (BrassLrfdFactors.cpp) to ignore the LRFD dead load factors for the fatigue limit state. The export now sets these dead load factors to 1.0.

Krishna - Please update the "Factors - LRFD: Load Factors (BRASS LRFD)" help topic with the following:

DC Min, DC Max, DW Min, DW Max

BRASS LRFD uses these dead load factors for all limit states except Fatigue. The Fatigue limit state requires, in some cases, that unfactored dead load actions be combined with factored live load actions. BRASS LRFD considers the term "unfactored" to mean "factored by 1.0". Therefore, dead load factors of 1.0 are exported to the BRASS LRFD engine.

FROM:kkennelly DATE:7/16/01 10:42:29 AM

BRASS LRFD Engine help updated for 4.1. Not updated for 4.0 since source code was not changed in 4.0Maintenance.

FROM:kkennelly DATE:7/16/01 11:14:35 AM

Assigned back to Brian to verify incident is complete.

FROM:bgoodrich DATE:07/25/2001 11:41:39

The export for 4.1 has been updated.

### Description

FROM:ttompson DATE:06/07/2001 15:12:56

We have a designer who thinks there is a problem with the fatigue limit state calculations for Stud Shear Connector Design.

In AASHTO 6.10.7.4.2 (and then 6.6.1.2.5, and then 3.6.14) you are required to calculate ADTT sl based on ADTT times a factor in 3.6.14.

We tried to compare TrainingBridge2 with the AISI Design Example calcs.

1/5/2016 11:06:50 AM

HRS AASHTO

49

## Complete Issue Information

Our designer originally thought that BRASS (OPIS) was not using this factor times the ADTT to calculate ADTT sl.

In reviewing TrainingBridge2, it originally appears to calculate the correct value for N. But further review showed that the data input for ADTT was actually the ADTT sl value.

I guess the question is, is the ADTT value the ADTT value OR is it the ADTT sl value. Based on the help description for this field it appears to be ADTT. AND if so, then ADTT sl is not being calculated correctly.

FROM:tthompson DATE:06/08/2001 07:57:18

Follow up information for the TrainingBridge2.

In the AISI LRFD Example Manual, on page 2-2 it lists the ADTT with 2000.

And on page 2-43 it applies the fraction in a single lane of 0.85 to produce an ADTT sl of 1700. And on page 2-70 you get the result for N = 46,537,500 cycles.

As shipped, the TrainingBridge2 has the ADTT entered as 1700. And in reviewing the Spec Checker for 6.10.7.4 produces the N = .465 E 08 which is the correct answer. But if you enter ADTT of 2000 as in the Example, then you get a different N value (.547 E 08).

In final review, BRASS (or OPIS) is NOT applying the factor for fraction of truck traffic in a single lane (AASHTO Table 3.6.1.4.2-1).

FROM:bgoodrich DATE:06/08/2001 12:54:14

Todd's observations are correct. The export is placing the ADTT from Opis on the a BRASS command parameter for ADTT SL. The fraction of truck traffic in a single lane could be obtained from the number of lanes, but this could vary by structure definition. For girder systems we can get the number of lanes, however, for girder lines, we only know if they are one or multiple lanes loaded. To give the user ultimate control, I suggest adding a new field to girder system and girder line structure definitions to obtain the fraction from Table 3.6.1.4.2-1. For girder systems, this could be an optional entry because the number of lanes is known.

FROM:jduray DATE:6/12/01 10:54:39 AM

Add this for 4.1.

Mehrdad - pass this incident on to Krishna when you get the database, db,de,dm finished.

Krishna - and to the domain and make the changes to the gui and help. Check with Ed, Brian and Mehrdad (NY Migration) about and the imports.

Brian - modify the export.

FROM:mordoobadi DATE:8/3/01 3:29:16 PM

Added truck\_traffic\_fraction to tables abw\_gline\_struct\_def and abw\_girder\_sys\_struct\_def

FROM:mordoobadi DATE:8/6/01 3:16:48 PM

Db, De, Dm classes updated.

Krishna, please update the domain.

FROM:bgoodrich DATE:01/30/2002 15:35:41

I just realized I had not updated this incident. The export was updated for 4.1. Krishna, please add your

OPIS

6.10.7.4.4c Nominal Shear Resistance Specifications Check lists under the Input parameters an Ec of 3625 ksi. But the concrete properties for the concrete we selected has an Ec of 3865.20.

I've attached the bbd (Virtis 3.0 with all Service Packs) and it is for structure definition tjo wizard w30 x 148, member 2, Wizard Alternative at Span Point 1.5 where the incorrect concrete material property is being used in the calculations for Shear Connectors (Studs).

1/5/2016 11:06:50 AM

HRS AASHTO

51

Complete Issue Information

FROM:ttompson DATE:06/11/2001 11:31:53

Follow-up. I did check this Design Review on my test machine for 4.0.3 and got the same erroneous result for Ec of concrete.

FROM:bgoodrich DATE:06/11/2001 13:48:56

For steel structures, there is no BRASS command parameter for directly inputting Ec for the deck. BRASS computes Ec as Es / n. The modular ratio could be set accordingly to obtain the correct Ec.

FROM:jduray DATE:7/10/01 9:15:11 AM

Does the export warn of this? I don't think the user should have to adjust n (which is usually an integer isn't it?) so as to get the desired Ec.

FROM:bgoodrich DATE:02/04/2002 17:44:21

This issue is a limitation of the engine and the export does not currently warn the user of this. I plan on adding a "medium" level warning to the export unless I hear otherwise.

FROM:jduray DATE:2/5/02 9:37:57 AM

Sounds good to me.

FROM:bgoodrich DATE:02/11/2002 10:26:58

I have updated the export file (BrassLrfdMaterials.cpp) to output a medium level warning regarding the Ec for the deck. Fixed for Version 4.1 Service Pack 1.

FROM:dteal DATE:Monday, April 08, 2002 2:13:05 PM

I found the medium level warning displayed as stated.

FROM:bgoodrich DATE:Tuesday, April 09, 2002 5:24:12 PM

Closed.

FROM:jpuckett DATE:08/11/2001 11:47:00

For R/C, a warning seems to appear quite often regarding schmatic limitations. This seems overkill. Please review.

FROM:hlee DATE:8/30/2001 11:15:17 AM

Revised in 4.1 Development. The warning message will now display only one time.

FROM:jihnath DATE:10/16/2001 1:03:36 PM

Accepted via email by Brian Goodrich.

Description

FROM:jpuckett DATE:08/11/2001 11:48:33

Please review manual page RC1-27. The page requires update -- bottom graphic n/a.

FROM:kkennelly DATE:8/15/01 7:53:47 AM

The new version of RC1-27 only has 1 graphic on it so I think this has already been addressed. Example problem was modified on 5/18/01, I think maybe Jay didn't have newest version of RC1.

### Description

FROM:jpuckett DATE:08/11/2001 11:51:37

We have the old AISC shapes from NYDOT and others. These shapes have not yet been loaded into the database, but it has been a long-standing (I think) request. Please try to get this into 4.1, if possible. Thanks.

FROM:kkennelly DATE:10/9/01 3:51:25 PM

Electronic file from Texas is on G:\proj\virtis\longterm\userdb. They have a First Year Rolled and a Last Year Rolled, we don't have these in Virtis db.

FROM:jduray DATE:5/23/02 11:54:54 AM

| 3318.12032 | Information Needed | strand layout window -- note |

Description

FROM:jpuckett DATE:08/11/2001 11:58:39

If the user windows on strands that are both "on" and "off", then right mouse is gray, i.e., it does not know what to do. In this case:

1. Issue a suggestions.
2. Or better, perform operations as requested. For example, turn all marked strands on (if off), and keep on strands on as well. Conversely, turn off all marked strands.
3. Select all/clear all should work on the marked strands in the manner outlined in no. 2.

Perhaps a reset button would be good to reset the state as they entered the window, i.e., they have messed it up badly.

Thanks.

Description

FROM:jpuckett DATE:08/11/2001 12:05:52

We should review the P/S sections and for those that we do not have templates for, we could create equivalent box or I sections. This could suffice in the near-term. For example, the Texas tub could be entered as a box. The dimensions would be close to the actual, but not the same.

FROM:jduray DATE:8/14/01 4:46:43 PM

I don't agree with this since it has been our philosophy all along to model the bridge.

| 3329.12021 | System Test   | PS Design Tool - Ext beam shear df incorrect |

### Description

FROM:jpuckett DATE:08/11/2001 12:08:11

I think that I'm convinced that we should have a generic P/S section where the Stop/Sbot, I, A, etc. are user-defined. BRASS engines should accomodate this directly. The primary issue is inelastic properties. I think that this could be handled with an inelastic effective width. Most cases, the slab is composite, the neutral axis remains in the deck. In cases where the stress block enters the section, we could use the inelastic width. Generally, this is the actual dimension. In the case, where the na drop into the fillet, etc. the inelastic width could be modified as necessary. Most of the time the deck and the top part of the beam will handle balancing the steel. Again, for elastic computations, the elastic properties are used. I will forward to WYDOT for consideration as well. jp

## Complete Issue Information

analysis has to be run to get the average and effective prestress so the AASHTO LRFD equations can be utilized. This seems like an iterative process that the user should be involved in.

BRASS does calculate a development length and provide a summary, but only if the mid-span POI is entered. However, BRASS does not automatically use the development length it calculates, primarily because the mid-span POI may not be present and also because it may not be the first POI analyzed. BRASS provides a command for entering this length (by row), which defaults to 165 times the nominal strand diameter (documented in Technical Manual). In short, the BRASS the user is responsible for entering the development length from their own calculations or from the summary provided by BRASS. I don't think addressing this issue in the engine data would work because the strand rows are controlled from the Opis UI. If there were any changes to the strand row configuration, the engine data would be invalid. Furthermore, the export generates the strand row numbers, which is not available to the user until an analysis is performed.

FROM: bgoodrich DATE: 09/24/2001 12:55:32

The development length is dependent on the strand configuration and its relationship to the plastic neutral axis of the section. Therefore, the development length entry field(s) should be located somewhere within the member alternative. Possible GUI locations could be:

1. Span Detail tab of Beam Details window (add another column to the grid)
2. Strand Layout window (add an edit box)

FROM: kkennelly DATE: 9/27/01 3:35:51 PM

For debonded strands, each row of debonded strands could technically have a different development length so I don't think you could add it to the Beam Details window. The PennDot PS program will calculate this for you so I think BRASS should either be enhanced to compute it or this info should be put on an engine tab.

### Description

FROM:kkennelly DATE:11/5/2001 8:20:14 AM

Submitted for Shri Bhide via email. Opis Educational version can't run PCI Training Bridge 6 in sample database or other user input PS bridge. Get the following error when try to run:

Error generating LRFD Factors command!

Error generating LRFD Factors command!

Unknown exception in the BRASS LRFD Analysis module.

This incident originally submitted around 10/3/01 via phone call and email. I looked into and Brian also looked into it. We couldn't find anything. Can't reproduce in the full release version.

Full text of email 11/1/01 3:24 pm:

Krishna:

As you are aware, on July 31, 2001 PCA was granted a one year license for the educational version of the AASHTOWARE's OPIS computer program. I have not yet been able to use the software.

As we discussed a few weeks ago, for certain input files the program does not function properly. I receive an error message (enclosed) when I try to run the sample problem PCITrainingBridge6 supplied with the software. A similar error was also generated when I tried to analyze a simple span precast prestressed concrete bridge.

Your assistance will be greatly appreciated.

Regards,

Shri.

Shri Bhide, SE, PE

Description

FROM:gchristian DATE:11/15/2001 15:37:11

The spec. check output for Art. 6.10.4.1.9, Noncompact Sect. compression flange bracing indicates that the program is calculating the radius of gyration of the compression flange only and not the compr. flange plus 1/3 the depth of web in compression as per the spec. This was noted on a section in pos. bending under the construction condition (stage 1, top flange). Not including the web portion can be unconservative.

FROM:bgoodrich DATE:11/16/2001 10:14:18

Please review Section 6.3 regarding the notation of "rt" (page 6-9). This definition indicates "rt" is calculated differently for composite and non-composite sections, which differs from the definition in Article 6.10.4.1.9. BRASS calculates "rt" based on the definition in Section 6.3, which is why "rt" for the non-composite stage is only considering the web. The specification should be modified to clarify this definition. I have submitted this issue to Jay Puckett who will forward it to AASHTO.

FROM:gchristian DATE:11/19/2001 10:21:26

I assume you meant that "rt" for the non-comp. stage is only considering the flange. The Specs are confusing, considering that rt is defined explicitly in 6.10.4.1.9 and well as in Arts. 6.10.4.2.5 and 6.10.4.2.6, where the difference in definitions for composite and non-comp. lateral tors. buckling checks is noted. These 2 latter definitions are consistent with the Art. 6.3 definitions for comp. and non-comp. but 6.10.4.2.6 is not mentioned in the Art. 6.3 definition. I have seen published LRFD examples with both definitions of "rb" used for 6.10.4.1.9 for the pos. mom. constructibility check. I also talked with Mike Grubb who said that whether or not to include the web in the "rt" term in this article has come up as an issue and is under review by the researchers.

### Description

FROM:gfrantz DATE:11/20/2001 21:49:15

Today when I phoned for help in installing OPIS, I mentioned that I got an error message when I first started up Opis. I am using Access 2000 and was opening virtis40s. You said to email you with the error message the next time it occurred. Tonight I was installing Opis on my home computer. The same error occurred as at school this afternoon. The error box said "System error", and the whole message is listed below. When I close the error box, the "bridge explorer" screen is visible. If I click on "Sample Bridges" or "Deleted Bridges", the same error message appears. I can open "LRFD Sample Bridges" and look at the samples, but I do not yet know enough about the software to be able to tell if samples are working ok.

This is the message

Error opening database record set.

Error opening database record set.

FROM:jduray DATE:11/21/2001 08:07:20

FROM:mordoobadi DATE:11/21/2001 9:26:43 AM  
I have seen this before. This is because of the DISTINCT keyword used in some of the database views in the database. The error happens only in some new versions of Access 2000. This didn't happen on my old machine but it is happening on my new PC (with a different version of Access 2000).  
Resolution: If an attribute has data type text(2000) and it is present in a view with DISTINCT selection it should be changed to text(255).

FROM:mordoobadi DATE:11/21/2001 9:39:47 AM  
This is considered in 4.1 version. The view that has this problem is abw\_sql\_bridge\_group.

One resolution for 4.0 version is to go to the Access database and change the size of the descr field in the abw\_bridge table from Text(2000) to Text(255).

Description

FROM:gchristian DATE:11/23/2001 15:15:36

When inputting the distance from the longit. stiffener to the top of the bottom flange using a percent of the web depth, if a percent value (eg. 20 for 20 percent) the spec check for art. 6.10.8.3.3.1 shows an absurd calculation for dist. from stiffener to top flange. Note the help says to input it as a percent value. If a fraction is used (e.g. 0.2 for 20%) a reasonable result is produced in this calculation, however the calculation does not seem to be exactly the fraction of the web depth input.

FROM:kkennelly DATE:11/26/2001 8:41:55 AM

PreparePlateStiffener() in CBrassStifLongScheduleGroupCmd is not getting the vertical distance from the domain correctly. Line 702 in BrassStifLongScheduleGroupCmd.cpp is calling GetVertDistance with a unit of U\_UNITLESS. It should use the "iLength" unit. Then dFractionOfWeb should be divided by 100 since we tell the user in the gui to enter the distance as a percentage.

FROM:bgoodrich DATE:11/29/2001 12:20:21

I corrected the export of the longitudinal stiffener distance (as described by Krishna above) when the "% of Web" options is used in functions PreparePlateStiffener and PrepareAngleStiffener. I sent Joe updated export source. Fixed for version 4.1.

### Description

FROM:gchristian DATE:12/03/2001 16:17:25

For the following case: Composite section in positive flexure, Strength I limit state, Strength is controlled by first yielding, and less than  $F_y$  in the top flange due to web load shedding, due to it being a deep girder. The Load rating calculation spec check after determining the pos. moment flexural resistances based on flange stresses only checks that based on the bottom flange stresses. We had a case where the top flange stresses controlled the resistance due to situation described above. The load rating calc. is the only case where a spec check comparing load vs. resistance is directly made without paging through the individual spec check pages to find and compare appropriate stresses. Since the top flange rating check was not made, an 'under-design' situation is missed by the spec checks.

FROM: bgoodrich DATE: 01/07/2002 11:03:33

BRASS adjusts the sign of the stress resistance before computing design ratios and rating factors. In some instances, the sign was incorrectly set, thereby causing the DR or RF to be high or not applicable (and therefore not critical). I corrected this issue for the final build of BRASS-GIRDER(LRFD) 1.5.0 and Opis 4.1.

Description

FROM: gbarnhill DATE: 12/17/2001 14:15:35

This is a followup to Incident 3217. Although the VERSION shows as 4.0 release, the problem also occurs in V410 Rel Candidate 1.

The graph seems to be limited to showing only flexure and shear rating factors (and these are only for the strength limit states). If Force(Bearing) governs, there is no category in the graph to display that. Also, there are no values displayed for Service levels even though they are present. Each rating factors is written to the spec check object, which show up as a fail when less than zero. The graph should be modified, so the rating factors are not tied to an action (moment, shear, etc.). There should be new tree items specifically for Design Ratios and Rating Factors, with the appropriate sub-tree items.

### Description

FROM:bgoodrich DATE:Wednesday, February 20, 2002 5:59:44 PM  
Submitted on behalf of Ed Lutgen (Asst. Ratings Engineer MN/DOT):

I have a bridge I am working on with Kevin Western. It is an example for our new MN LRFD Bridge design Manual. I am using Opis as a check to a consultant design. It is a 2 span continuous plate girder. I have a problem with either my input or the program. At the first abutment only, when it checks fatigue on the shear studs the program incorrectly uses the wrong Inertia for AASHTO Equation 6.10.7.4.1b-1. The program uses stage 1 moment of inertia when it should use stage 3. The resistance is then artificially low and fails. This only happens at the first abutment. Everywhere else the program does it correctly. I checked and rechecked Opis. I even tried adding a line in the shear stud input box that starts at zero and ends at zero (You have to do this for the diaphragm spacing and prestress stirrups) but to no avail. The only way to avoid this is to enter it in composite and not the size and spacing of the studs so the program does not make that check. I hope I explained it enough for you to understand. If I am inputting the bridge incorrectly then what areas should I look to debug the file?

FROM:jduray DATE:Thursday, February 21, 2002 2:27:35 PM

FROM:bgoodrich DATE:Friday, February 22, 2002 3:31:26 PM

The moments at the 100 point are extremely small and cause BRASS to use the negative flexure properties instead of those for positive flexure. I will address this issue for Opis 4.1 Service Pack 1 if at all possible. I cannot think of any way to get around this issue until you get the new engine. Fixed for BRASS-GIRDER(LRFD) 1.5.1.

### Description

FROM:mhurd DATE:Friday, April 19, 2002 2:10:29 PM

I am modeling a 3-span prestressed concrete bridge. The service pack for Opis 4.1 has been installed. After making an analysis run, I have attempted to review concrete stresses using both the Report Tool and Concrete Stress Summary in the Analysis Results.

In the Report Tool under LRFD Analysis Output: when the various stress boxes are checked and

1/5/2016 11:06:59 AM

HRS AASHTO

82

Complete Issue Information

computed, the report is blank. Other options, such as moment summary, do display output.

In the Analysis Report under Concrete Stress Summary: final stresses appear, but when initial stresses is selected, "no data available" is displayed.

I have checked the model input and it seems to be complete. The report tool was functioning prior to installation of the service pack. None of the input has been changed since the service pack was installed. I would appreciate it if you would check this out. Thanks.

FROM:mhurd DATE:Friday, April 19, 2002 2:15:02 PM

FROM:jduray DATE:4/22/02 4:41:16 PM

When BRASS was modified to not generate duplicate results (VI 3692) , the change inadvertently caused the initial stresses to not be written to the results object.

The BRASS DLL has been fixed and is available for dirtribution.

FROM:jduray DATE:5/7/02 2:27:38 PM

This will be released in July with 4.2.

### Description

FROM:dkemna DATE:Thursday, May 09, 2002 3:38:24 PM

When attempting to hand input LRFD factors for a steel plate girder bridge I am unable to analyze the definition or member alternative. I have used factor overrides at both the definition and member alternative levels.

One thing that I have noticed is that the input for load factors contains one more row of data than the default Library factors (1998 AASHTO LRFD).

Before a copy from library is performed the load factors tab contains a row for construction. If a copy from library is attempted after the hand input factors are saved an error will occur that will terminate the program.

I was able to duplicate this error in matrixbridge04. Attached is a bbd file that shows the manual input factors that cause the error.

FROM:kkennelly DATE:5/17/2002 8:12:09 AM

I ran your bridge and got the following error from BRASS:

\*\* ERROR: Parameter 7 on the FACTORS-RESIST-STEEL command must be greater than zero.

When I look at the BRASS LRFD command help in Virtis/Opis for this command, I see that parameter 7 is the resistance factor for flexure and tension for reinforced concrete in a steel structure. The Concrete tab in your LRFD Load Factors window is blank. Enter a value for the first item in the table (Flexure and tension: reinforced concrete) and your member will run.

I am able to reproduce the copy from library terminating the program and will investigate that.

FROM:kkennelly DATE:5/17/2002 8:36:54 AM

Problem is due to when user inputs their own load factors, the Construction row exists and DoLrfdLimitStateSet->GetCount() is 12. When user picks Copy from Library over the factors they've entered, the Construction row is not copied over so there are only 11 rows in the grid. When data is applied, GDX\_Cell() gets called on row 12 but only 11 exist so program exits.

FROM:dkemna DATE:Friday, May 17, 2002 9:17:47 AM

Sorry about the trivial input error. I did not input this bridge myself, but rather used a plate girder bridge that another designer had previously input to check the upgrade to 4.1. The designer said that the bridge was running fine the last time he used it in 4.0.4., but he could not be sure that he did not make a change prior to his last save. Is it possible that this input got lost in the upgrade, our database has been upgraded so I can't check whether the input was there for 4.0.4.

OPIS use the noncomposite instead of the composite section properties to compute creep losses. How can I make use the composite section properties?

FROM:bgoodrich DATE:Thursday, May 16, 2002 5:31:04 PM

Please send me your computations for the creep losses, so I can compare them to BRASS. Also, include the BBD file of your bridge. BRASS computes creep losses in stage 1 when AASHTO losses are specified. Therefore, the stage 1 (non-composite) section properties are applied.

FROM:bgoodrich DATE:Thursday, May 16, 2002 5:31:33 PM

E-mail from Khalid Obeidat (5/16/02):

Here is a the bbd file in addition to our mathcad sheet for the same bridge. Thanks for your help

FROM:bgoodrich DATE:Thursday, May 23, 2002 10:45:46 AM

To get BRASS to more accurately calculate the creep losses for your structure, you must enter the "Percentage DL" on the Prestress Properties window. The BRASS definition of this field is:

"the percentage by which the total Stage 1 actions due to permanent dead load, excluding girder weight, should be adjusted to obtain the effective total actions due to permanent loads from all stages."

The BRASS command manual also contains the following note regarding this input field:

"The creep loss of AASHTO 5.9.5.4.3 is dependent on the change in concrete stress (fcdp) at the center of gravity of the prestressing steel due to permanent loads, excluding girder weight. BRASS computes AASHTO losses during the Stage 1 analysis, so actions due to dead loads from any subsequent stages are not known. Therefore, the dead load percentage parameter is provided so creep losses may be more accurately computed."

Hopefully, this explanation addresses your concerns with the creep calculation. If you don't care for the way BRASS calculates the creep losses or any other losses, you can always input lump-sum losses.

FROM:elutgen DATE:Thursday, May 30, 2002 9:54:42 AM

FROM:bgoodrich DATE:Thursday, May 30, 2002 11:59:00 AM

E-mail from Khalid Obeidat (5/30/02):

It seems to me from usability point of view that the %DL field should be computed by OPIS and BRASS automatically since all the information to compute that fudge factor are there. It is a more efficient to be computed automatically since inputting it manually require running the software twice in addition to the risk of misinterpretation of %DL factor. I am attaching notes I sent to our designers about this matter. Please let me know your thoughts.

### Complete Issue Information

It's good that you are informing the designers of the %DL issue. Your notes (documents) and e-mail discussions describe the issue well. I believe the prestress loss windows were developed using the data required to fill the BRASS commands. The %DL "fudge factor" should have never been added to the Virtis/Opis as a general entry. The %DL is strictly a BRASS issue. Due to the computational flow of BRASS, the %DL method for modifying fcdp was chosen over performing two internal runs to get the stage 2 section properties and moments before computing the losses and applying them to the stage 1 model. It was felt the users would input lump-sum losses if this method was unacceptable to them. Opis should not be responsible for computing the %DL because that is an engine-dependent field. This field should probably be moved to the engine properties window on the member alternative. I will discuss this issue further with Jim Duray and Jay Puckett.

FROM:elutgen DATE:Tuesday, June 18, 2002 1:32:54 PM

FROM:bgoodrich DATE:Tuesday, August 13, 2002 1:25:03 PM  
WYDOT, BridgeTech, and MNDOT engineers discussed the %DL method issue at the 2002 users group meeting in Lincoln. The %DL method does work, but MNDOT has a large number of bridges that would have to be modified. Additionally, ignoring the %DL parameter, i.e., leaving it as zero, makes a large difference in results when high composite dead loads are present. Therefore, BridgeTech will investigate how to address this issue once they receive a work-order from WYDOT.

FROM:bgoodrich DATE:Monday, November 04, 2002 1:12:13 PM  
WYDOT assigned this issue to BRASS Problem Log 367.

FROM:bgoodrich DATE:Saturday, January 25, 2003 10:16:28 AM  
This issue has been addressed in both BRASS engines for the Version 5.0 release.

| 3780.11575 | Duplicate     | Limitation on the number of distributed loads allowed by BRASS |

### Description

FROM:gbarnhill DATE:Thursday, May 30, 2002 12:04:59 PM  
I analyzed an LRFD PS girder with HS20 vehicle.

The report tool for spec check articles shows an HL-93(SI) vehicle name regardless of the vehicle used for analysis.

I've attached a BBD file from the 4.1.1 release.

FROM:bgoodrich DATE:Wednesday, June 05, 2002 5:50:31 PM  
Jim - I don't believe the BRASS export or engine are causing the wrong vehicle to be reported. The error seems to reside in the spec check reporting logic. The correct truck shows up in the LRFD summary reports. Is the vehicle name being obtained from the library or the event?

Refer to incident 3817 for the resolution.

FROM:gbarnhill DATE:Tuesday, February 18, 2003 3:35:11 PM  
Checked OK in 5.0.0 beta 4

### Description

FROM:elutgen DATE:Wednesday, June 05, 2002 11:58:33 AM

It will be nice to have a graphic representation of the girder showing (design) rating factors across the bridge or at critical sections. This will show the overstressed/understressed areas "at a glance" instead of digging through the output files.

FROM:jduray DATE:6/6/02 8:43:12 AM

There is a graph of the rating factors across the length of the member. It is available in the graph tool.

## Complete Issue Information

When the LFD method is used to perform a rating analysis, this structure (C17BD-Prestressed non-voided girder 16"x72" bridge) runs okay. But, it won't run when the LRFD method is used to perform the specifications check.

We encountered similar error messages when using the example templates contained in the database.

FROM:kkennelly DATE:6/10/2002 2:06:57 PM

When I run Member G1 in BRASS LRFD I get the following errors: Parameters 4,5,7 of the Conc-I-Section command cannot be zero. Parameters 2,5 of the Span-General-Segment command cannot be zero. It appears the user is trying to model a solid rectangular precast using the rectangular voided box section. Looks like BRASS LRFD doesn't like the commands generated by the export. Shouldn't Conc-Box-Section commands be generated by the export instead of conc-i-section commands? I've attached a 4.1.1 version of the bbd file to this incident.

FROM:bgoodrich DATE:Wednesday, June 12, 2002 12:08:14 PM

The error checking in the BRASS-GIRDER(LRFD) engine is more thorough than the BRASS-GIRDER engine. Error messages were issued because the web thickness, bottom flange thickness, and web depths were zero. Because the I-section command is used, all parameters must be non-zero. When the Virtis/Opis shapes were mapped to the BRASS commands, only a prestress I-shape and the box shapes were available. BRASS internally converts any box or voided slab shape to an I shape anyway, so the CONC-I-SECTION command was chosen for the export of all prestress shapes. Additionally, CONC-BOX-GIRDER commands were not generated because the Virtis/Opis shape is more general than the BRASS command, e.g., Virtis/Opis allows the top flange to be smaller than the bottom flange while the BRASS command does not. The CONC-VOIDED-SLAB command was also not used because Virtis/Opis allows a three-hole void, which the BRASS command does not directly support.

When the shapes are exported to the BRASS commands, very little error checking is performed. This was done to allow the user to input shapes for which there is no Virtis/Opis beam shape. For the shape in question, a new "Solid Beam" beam shape should be added to Virtis/Opis in which just the width and depth of the shape would be entered. Then, the export would generate the CONC-RECT-SECTION command. Until more beam definitions are added to Virtis/Opis, the user must massage the entry fields for the I or box shapes to get the desired section. For this solid shape, the user must enter a top and bottom flange thickness (as well as a web width (1/2 the shape width). I modified the Virtis/Opis shape as shown in the attached file (PSBoxBeam.jpg) and successfully analyzed the bridge with Opis.

FROM:kkennelly DATE:6/17/2002 1:32:20 PM

Since the "solid beam" shape is not one of the templates asked for by the users, I think it may be better for users to enter a Virtis concrete box with circular voids and input # of voids = 0 then the beam shape will be a solid rectangle.

FROM:dkoenig DATE:Friday, July 05, 2002 12:07:45 PM

A solid rectangular prestressed beam shape without voids is one of the templates that has been asked for by users. We (MoDOT) submitted one of these with the other prestress shapes that we use and were not covered by Virtis. It may have been lost in the shuffle somewhere, but we did submit one of these as an addition to the templates. Our common use for these is on non-state owned structures. They will take precast prestressed slab sections (3 to 4 feet wide) and set them side by side to make a bridge. We also have a similar thing used for reinforced concrete structures. We also submitted that one as an addition for the templates. For the prestressed one, I agree that you can model the prestressed shape using a voided gox girder without any voids. The reinforced concrete one is not as

Description

FROM:dkemna DATE:Tuesday, July 16, 2002 4:05:40 PM  
I am having problems getting the attached plate girder to run with a girder line analysis. I am trying to run the girder at the member alternative level. I have entered two member alternatives, one cross section based and one schedule based, and neither will run. The error that I am receiving is the following:

```
////////////////////////////////////
Internal Errors (1) - Incorrect use of a subroutine or function
```

```
----- Contents of BRASS Error File -----
File: d:\AASHTO BridgeWare\VirtisOpis41\Copy_of_LRFD342Ex\Structure_Definition_1\G1
\Schedule_based\BRASS_LRFD\Schedule_based.ERR
Fatal Error Encountered - Unexpected Termination
Data File: d:\AASHTO BridgeWare\VirtisOpis41\Copy_of_LRFD342Ex\Structure_Definition_1\G1
\Schedule_based\BRASS_LRFD\Schedule_based.DAT
```

Complete Issue Information

-----  
Error No.: 1  
Type : Programmer Error  
Location : GetBracingData

Range number 1 cannot equal zero for bracing schedule.

----- End of Contents of BRASS Error File -----

////////////////////////////////////

I tried to delete the diaphragm placed at the CL of Bent #1 but that did not change the results (and is not what i want to do anyway). I then entered in a new structure definition using a girder system. I had no problems with the girder system analysis at the member alternative level. What am I doing wrong for the girder line runs?

The attached file contains all three member alternatives.

FROM:kkennelly DATE:7/17/2002 8:07:57 AM

I tried to analyze girder line mbr "Plate Girder Shape" and get the same error. I noticed that this member does not have a diaphragm located at the start of span 1 so I added a row to the Bracing Ranges window for a diaphragm at Start Dist = 0, Spacing = 0, 1 space. I still get this BRASS error message. The tolerances in my System Defaults are 0.1 for feet and 0.1 for inches. I get the following BRASS commands generated:

BRACING-SCHEDULE 1, 279.9996, 0.0000, 1679.9976  
BRACING-SCHEDULE 2, 300.0000, 0.0000, 2100.0000  
BRACING-SCHEDULE 3, 279.9996, 0.0000, 1679.9976

If I change the diaphragm spacing for spans 1 and 3 from 23.3333' to 23.333333' I get the following BRASS commands and BRASS runs:

BRACING-SCHEDULE 1, 280.0000, 0.0000, 1680.0000  
BRACING-SCHEDULE 2, 300.0000, 0.0000, 2100.0000  
BRACING-SCHEDULE 3, 280.0000, 0.0000, 1680.0000

Brian, can the export do something using the tolerances to generate these commands without the user changing the diaphragm spacing?

FROM:bgoodrich DATE:Thursday, January 30, 2003 1:16:47 PM  
I uploaded the BBD files for Version 5.0 Beta 3 (Current and Final).

FROM:bgoodrich DATE:Thursday, January 30, 2003 1:35:31 PM

The export does not assume there is a brace at the beginning of a span. This was a decision by the management of the development team. If a bracing range is missing, BRASS-GIRDER(LRFD) will conservatively use the span length as the unbraced length.

Note the following message in the export LOG file:

WARNING (High):

The export detects that a diaphragm does not exist at the 'start' of Span 1! This may affect the BRASS section analysis.

Complete Issue Information

The member alternatives all run with BRASS-GIRDER(LRFD) on Version 5.0 with my tolerances set to 0.1 ft and 0.01 inches. This issue has apparently been fixed.

Description

## Complete Issue Information

FROM:dkemna DATE:Thursday, July 18, 2002 9:45:20 AM

### Incident

I am currently analyzing a plate girder system (it is attached to incident 3812, structure definition 2). I have used the "HL-93 Design Review Template" for my bridge analysis settings. This template applies a "HL-93 (US)" to the Design Loads and a "LRFD Fatigue Truck (US)" to the Fatigue Loads. I am running the analysis at the member alternative level for G1.

1. The Vehicles tab located underneath the Spec Check Filter appears to be misaligned. If I only check the "LRFD Fatigue Truck (US)", no spec checks will appear in the listing for Stage III loads. If I only check the "HL-93 (US)" vehicle, then the fatigue checks will appear, but only the fatigue checks. To get the HL-93 spec checks I have to check the "HL-93 (SI)" vehicle. I have not attempted to try other analysis settings to see whether any of the other check boxes are misaligned.

### 2. Enhancement Request

Also, as an enhancement request, I would like to see the Stage III spec checks further organized. Currently, the user has to click into a specific spec check to see what type of live loads have been used. Even then the user is only given a designation of "LL Combo no. 1, 2, or 3." It appears the spec checks are organized with all of the LL Combo 1 cases grouped together, followed by LL 2 and then 3. I think it would be beneficial to group these in sub folders or at least have the live load given in another column that can be viewed when the spec checks are listed. In addition, I would like to see explanations in the Help menu for Live Load cases 1, 2, and 3. Are they not explained because they are BRASS designations? Maybe this enhancement request is not feasible, but I thought I would throw it out there.

Please let me know if you need further clarification on either of the above topics. Thanks.

FROM:kkennelly DATE:7/19/2002 4:02:33 PM

1. Appears to be a bug.

### Notes for programmer:

The spec check window stores the library vehicle ids in the list control list on the Spec Check Filter Vehicles tab. It then compares these vehicle ids to an id returned by the results. The id returned by the results is no longer the library vehicle id, it is just the number representing the order in which the vehicle was processed. This change was made to enable users to analyze vehicles that were not stored to the database. The spec check filter should use the vehicle dispatch now not the id.

2. I agree with you that we should be able to see the live load when the spec check is listed. I've entered that as a separate incident, Incident 3821. You are correct that the Opis help does not explain Live Load 1,2,3 because those are internal BRASS designations.

FROM:mordoobadi DATE:7/23/2002 5:34:30 PM

The code updated to compare right vehicle IDs with the IDs that come from the results objects.

Temporary vehicles also included in the Vehicles tab.

Writing to the Registry updated to avoid repeated rows for filters.

Fixed in version 5.0.

### Description

FROM:dkemna DATE:Friday, July 19, 2002 9:46:37 AM

I have not been able to get added features to the Report Tool to show up in Internet Explorer. The last five checkboxes under the "LRFD Analysis Output" do nothing, basically. If all the boxes are checked then I will not receive the following:

1. Initial Stresses at transfer of prestress.
2. Final Stresses under Dead Load and Prestress
3. Final Compressive stresses - Design Loads
4. Final Tensile Stresses - Design Loads
5. Final Stresses in Slab

If I only check these five, then nothing will be generated. Checking the P/S intermediate output options under the engine tab of the bridge analysis settings does not appear to matter for this problem. Am I

missing something?

FROM:kkennelly DATE:7/19/2002 2:53:02 PM

In Opis version 4.1.1 the BRASS files are not writing the prestress stress results to the results object in Opis. So you cannot view the prestress stresses in Opis. You can however open the actual BRASS output text files and view the prestress stresses in there. This has been fixed for Opis Version 4.2 which should be released any day now.

Complete Issue Information

BRASS LRFD has a limit of 70 concentrated loads. This structure is very long and has 113 diaphragms on the exterior member. To work around this BRASS limitation, you can remove the diaphragm weights that you have entered on the Framing Plan tab. Keep the diaphragm locations entered, just remove the values in the "Weight" column. Then manually compute the total weight of all diaphragms on the member and divide this total weight by the length of the member to get a uniform weight per foot. You can then enter this uniform weight on the Member Loads window.

FROM:kkennelly DATE:7/25/2002 8:28:31 AM

FROM:kkennelly DATE:7/25/2002 4:17:46 PM

An alternative would be to have the export check if the max number of concentrated loads will be exceeded and if it is issue a warning and compute the uniform weight per foot for the user.

FROM:bgoodrich DATE:Saturday, January 25, 2003 4:18:51 PM  
WYDOT has placed this issue on the BRASS enhancement list.

Add the ability to have different distribution factors for Inventory and Operating

FROM:kkennelly DATE:8/23/2002 8:23:57 AM

Could you tell me where in the specs it says you can use different distribution factors for Inventory and Operating rating?

Complete Issue Information

FROM:jcarney DATE:Tuesday, December 10, 2002 11:16:13 AM

Kristina:

We recently came across this situation and ended up running the program twice to handle the situation. The beam under consideration was located beneath the curb line. In Mass., for rating purposes, a wheel load is considered to be applied at a distance of 2 feet from the curb line or face of bridge rail at inventory level. Using simple beam distribution between the curb beam and next interior beam often provide a lower distribution factor for this situation. If the curb reveal is 12" or less the sidewalk is considered to be mountable by traffic and the higher distribution factor provided using S/5.5 would then be used at operating stress level. I think that the added flexibility of being able to input different live load distribution factors at inventory and operating stress levels would be very helpful in these situations.

UserGroup 2002

Add the ability to select longitudinal symmetry along a beam: Steel, PS & RC

Also see 2190 for symmetry of shear reinforcing

FROM:dteal DATE:Monday, August 19, 2002 12:45:49 PM

Longitudinal Symmetry would also be a great aid when doing a design review. If you have an 8 span symmetrical structure, why waste time waiting for your pc to finish the analysis of the 4 symmetrical spans??

FROM:jduray DATE:11/7/02 11:19:31 AM

We discussed at the UG (with Kristy from NE) the symmetry would be handled in wizards that generate the "other half" so the db would have a full description.

Complete Issue Information

4.2 release (also occurs in 4.1) For a two span steel composite girder, the spec check at 3/10 point Service II fails for 6.10.3.7. The check is for min neg moment steel in the slab. Service II moment is pos at that point.

We don't remember seeing this failure in versions prior to 4.1

The attached files are from 4.2 release.

FROM:bgoodrich DATE:Saturday, January 25, 2003 6:10:58 PM

The 6.10.3.7 check was added in the BRASS engine released with Opis 4.1. The overall Service II moment at the 103 point is negative. However, the moment experienced in the slab is the result of moments from only stage 2 and stage 3, which are 364 ft-kips and -588 ft-kips, respectively. This results in a net negative moment in the slab.

| 3904.11451 | Resolved      | Incorrect allowable tension Values |

Description

FROM: mnelson DATE: Friday, October 11, 2002 4:42:26 PM  
 Requested Box doesn't have user name which is mnelson email mnelson@tb-engr.com

Previously ran Opis Version 4.1 and got apparent accurate results. Version 4.2 was installed and had a number of input and Save problems that were resolved. Basically input the same bridge but now get apparently incorrect results for all Service I and III construction stage 2 results for Axial PS forces. Stage I PS forces are correctly computed but when go to Stage 2 axial PS force it is computed as 2522.147 vs 555.752(stage 1) for Span 2 with 22 strands. The 2522.147 is incorrect and should most likely be less then the 555.752 value. Additionally when Spans 1 & 3 are checked for stage 2 PS force for 8 strands the same 2522.72 value is present. This is true for all the LL combinations for Construction stage two at centerlines. Consequently at the Design Ratios fail. Also the program fails to read the input allowable tension values and gives a false check. We file a separate incident on this problem

FROM: mnelson DATE: Friday, October 11, 2002 5:16:45 PM

FROM: bgoodrich DATE: Thursday, October 24, 2002 12:02:18 AM  
 The axial force of 2522 kips is due to the uniform temperature change, not prestress.

## Description

FROM:mnelson DATE:Saturday, October 12, 2002 2:15:06 PM

This problem is related to incident 3903 which was submitted Fri 11 Oct.

Evidently 3903 made it into the system as didn't get a confirmation it was

"updated" or sent as the form appeared to be locked up and exited the page

by leaving the web sited.However checking today incident 3903 appears to be in the system.

Discription of problem:

Was checking the problem with the Axial PS force In Service I & III for construction Stage 2, all Live

1/5/2016 11:07:12 AM

HRS AASHTO

124

Complete Issue Information

Load cases and noted the allowable tension stress value used to check pass/fail for tensile stress limits was 0 for initial stage 1 and 212 ksi tension for stage 2 (after LL) These values as input in the stress limit page were 0.006 for initial and 0.007 final. (KDOT values of 0.0948 SQRT(fci & fc). The values of 0 & 212 are wrong and must be picked it from some where default as the desired & input values are 6 & 7 psi. Need to have that problem fixed as is critical to analysis/design in addition to problem of incoorect axial PS fprce in stage 2 as noted in Incident 3903

FROM: bgoodrich DATE: Thursday, October 24, 2002 12:16:09 AM  
I found where you input the stress limits in the stress limits group you named "Bridge Stress Limits". However, this group of stress limits must be applied to the prestress beam using the Stress Limit Ranges on the Beam Details window. Note that the ranges you enter on that window reference the end of the precast beam lengths (45.14'-84.36'-45.14').

Complete Issue Information

Enhancement Request:

I would like to be able to specify a specific member, member alternative, or even superstructure definition to use in the report tool.

Currently, if the user selects "member alternative" , for example, when building the tree, all of the member alternatives will be output along with all of the supersture definitions. I think a user would want to report only the alternative used in the final design if given the option and thus the supersture definition containing the desired member alternative. The original BWS report is better set up for specifying members, but you can not take out information that is not related to your design as can be done with the report tool. If further enhancements to the BWS report tool are already planned, let me know.

FROM:jduray DATE:12/5/02 1:41:05 PM  
I agree...good suggestion.

FROM: David Warner DATE: 9/24/2008 10:58:39 AM Eastern Daylight Time  
I've suggested this again as VI# 8885.

Could 4057 and 8885 be moved to enhancement status?

Thanks.

### Description

FROM:dkemna DATE:Thursday, January 23, 2003 9:49:57 AM

I have a general question. I was working on a plate girder design and noticed that my shear resistance changed with the grade of the web (50 and 36 ksi). According to the 2001 AASHTO Interims (6.10.7.2 & 6.10.7.3.3a-7) if the D/tw ratio is greater than a certain value than the shear resistance of the web should not change with grade changes. I looked back at the original 1998 code and noticed that the method or equations used for homogeneous and hybrid girders was slightly different.

My question: When is OPIS updated for new interims and has the spec checks been updated for 6.10.7.2 in OPIS 4.2 or 5.0? Note that I still only have version 4.1 running on my PC.

FROM:jduray DATE:Tuesday, February 04, 2003 10:44:18 AM

FROM:bgoodrich DATE:Tuesday, February 04, 2003 4:00:18 PM

From the "Version Information" topic of the BRASS-GIRDER(LRFD) help (Help > BRASS LRFD Help > Main Help menu item in Opis):

"The BRASS-GIRDER(LRFD) program is current with the AASHTO LRFD Bridge Design Specifications, Second Edition, 1998, with 2000 Interims."

No specification/interim updates have been made to BRASS-GIRDER(LRFD) for the Opis 5.0 release. The AASHTO LRFD 2001 and 2002 Interims are scheduled for implementation for the Fall 2003 release.

### Description

FROM:jmarkel DATE:Tuesday, February 04, 2003 4:00:05 PM

In the Superstructure Typical Section window I input the total deck thickness, and in the Deck Profile window I input the structural deck thickness. When I run my model and view the Load Distribution File, It shows Opis using the total deck thickness to compute the distribution factors. Examples in the "PCI Bridge Design Manual" and "Design of Highway Bridges" use the structural deck thickness to compute the distribution factors. If there is a discrepancy as to what should be used, the designer should have control over what slab thickness is used to calculate the distribution factors.

FROM:bgoodrich DATE:Thursday, February 06, 2003 11:06:56 AM

The BRASS-GIRDER(LRFD) engine provides input for the thickness of the deck used for strength and also an input for an additional thickness for dead load. Opis provides two locations for inputting the total and structural deck thicknesses. The total deck thickness is input on the Superstructure Typical Section window. The structural (effective) deck thickness is entered either on a deck profile or cross section window. The structural thickness may vary depending on how the user defined the schedule of thicknesses or cross sections. The export passes the total deck thickness to the BRASS engine.

There appear to be a few solutions:

- 1) Add another field to Opis for inputting the structural deck thickness in the same location as the total deck thickness.
- 2) Enhance the BRASS engine properties so the user can input a percent of total thickness to be used for the structural thickness. We have tried to stay away from inputting values with units (in, ft, mm, etc.) in the engine properties.
- 3) Enhance the export or domain to determine some average structural thickness for the bridge.

Note that BRASS cannot internally utilize the structural deck thickness, which is included in the cross section geometry, because non-composite bridges would not have this information.

## Complete Issue Information

Here is the information you requested:

Superstructure definition: 5 Beam Girder System  
Member: G2  
Member Alternative: K4 Beam

Please note that after I run my model using the HL-93(SI) load and view the Specification Check under Stage 3, I view the following:

Location: Span 1 - 25110 (for example)

Specification Reference 5.7.3.3.1 Maximum Reinforcement (Ductility)  
Negative Flexure Sense

Input Parameters:

$c = 573.660$  mm

$A_s = 6941.400$  mm<sup>2</sup>  $f_y = 420.000$  MPa  $d_s = 1481.080$  mm

$A_{ps} = 2961.270$  mm<sup>2</sup>  $f_{ps} = 849.134$  Mpa  $d_p = 1008.370$  mm

Computed Value:

$d_e = [\text{AASHTO LRFD Equation (5.7.3.3.1-2)}] = 1262.174$  mm

Computed Value:

$c/d_e = 0.4545$

AASHTO Limit = 0.4200

Result Code : Fail

The area of prestressed reinforcement 'A<sub>ps</sub>', listed in the input parameters, lies within the compression zone and should be considered zero. I may be wrong in my assumption that A<sub>ps</sub> should be zero, but example 9.6 in the "PCI Bridge Design Manual" shows A<sub>ps</sub> equal to zero when calculating d<sub>e</sub> in the negative moment section.

As a note, when viewing this specification in the positive sense, the area of nonprestressed reinforcement 'A<sub>s</sub>' shown in the input parameters is listed as zero.

Although this specification check does not fail at all locations along the structure, the inclusion of prestressed reinforcement when located on the compression side of the neutral axis does occur at all locations along the structure.

I hope this helps.

John Markel  
Schwab-Eaton, P.A.

FROM: bgoodrich DATE: Friday, February 28, 2003 4:50:30 PM

WYDOT has assigned this issue to BRASS Problem Log 410. Incident 4389 will also be included in

1/5/2016 11:07:14 AM

HRS AASHTO

133

Complete Issue Information

this problem log as it pertains to the same specification article.

FROM:bgoodrich DATE:Tuesday, October 21, 2003 6:52:05 PM  
WYDOT authorized this issue on 10/16/03.

FROM:bgoodrich DATE:Thursday, February 12, 2004 9:43:35 AM  
For the purposes of the maximum reinforcement check, the calculation of partial prestress ratio (PPR) was added per the specification language and used accordingly. When the PPR is less than 50%, the calculation of effective depth is taken as that of a reinforced concrete section. Otherwise, the effective depth is calculated from the prestressing strand and mild reinforcement. Additionally, the prestress strand area provided below or above mid-depth (based on the flexure sense) is now used in the maximum reinforcement check instead of the full prestress strand area. This issue has been addressed in BRASS-GIRDER 5.8.8. Fixed for Virtis 5.2.0.

FROM:bgoodrich DATE:Monday, March 06, 2006 2:56:45 PM  
The statement on 2/2/2004 regarding the determination of the effective depth when the PPR is less than 50% is not correct. The effective depth is determined based on the mild and prestressing steel.

## Complete Issue Information

FROM:rmbest DATE:Wednesday, February 19, 2003 12:33:32 PM

Attached is bbd file for a two span continuous steel plate girder. We have specified it to be composite full length of the beam. OPIS (4.1.1) design review is incorrectly computing the stage 2 and stage 3 moments of inertia at the pier to include the concrete deck slab instead of the deck reinforcement. It is interesting to note that run as a VIRTIS rating, it is done correctly.

FROM:bgoodrich DATE:Friday, February 21, 2003 5:11:30 PM

WYDOT has already assigned this issue to BRASS Problem Log 394.

The cross section properties shown in the main BRASS output are those used for the structural analysis to obtain moments, shears, etc. Then, when specification and stress checks are performed, BRASS determines the section properties for both positive and negative bending, and uses them accordingly. The section properties you are looking for are only reported in the intermediate output. We are currently working to add a summary report of these properties to the main output. Appropriate notes are being added to the existing properties report.

FROM:bgoodrich DATE:Tuesday, February 25, 2003 5:23:28 PM

E-mail from Richard Best (2/25/03):

Hello Brian,

Can you clarify your response to OPIS incident 4373 a little more.

1. Are you saying in the stiffness model used for generating moments that the concrete deck slab (not rebars) is included in the I value at the pier?
2. If so, is there justification for this method. We certainly don't include negative moment slab in our stiffness models. It can make a significant difference in moments. Do you know of other programs that do it that way?
3. If so, does VIRTIS and OPIS both do it that way?
4. Is it just the output reporting that is going to be fixed (BRASS problem log 394)?

Richard M. Best, PE

Computer Design Group Engineer

FROM:bgoodrich DATE:Friday, May 09, 2003 5:09:12 PM

I'll answer each of the four questions and after that, I'll propose how we intend to address your issues.

1. If shear connectors or composite regions are defined over the interior piers, BRASS-GIRDER(LRFD) will use the steel beam plus the concrete slab in the stiffness model section properties, which generates moments, shears, etc.
2. The justification for this method is AASHTO LRFD Article 6.10.3.4. I don't know how other programs address this issue. This method will draw more negative moment to the pier and reduce positive moments elsewhere.
3. Opis exports the entire cross section (beam, slab, rebar, etc.) to BRASS-GIRDER(LRFD), which is responsible for utilizing the section properties as described above. Virtis performs a similar export to BRASS-GIRDER, but the engine properties for BRASS-GIRDER allow the user to specify the locations

1/5/2016 11:07:15 AM

HRS AASHTO

135

## Complete Issue Information

of dead load contraflexure, which the export uses to determine which cross section to pass to BRASS-GIRDER (the beam + rebar or the beam + slab).

4. For the Opis 5.0 release, which uses BRASS-GIRDER(LRFD), only the output will be revised to indicate the section properties used for structural analysis versus section analysis (stress checks, etc.).

I discussed this incident with Jay Puckett and we understand your concerns. It appears that BRASS needs some way to control how the section properties for the structural analysis are determined. The commentary to AASHTO LRFD Article 6.10.3.4, i.e., C6.10.3.4, discusses a method by which the beam+rebar stiffness can be used over a distance of 15% of the span length near a pier. If this method was implemented, the percentage of the span length would be controlled by the user, and would probably default to the 15%. Would this help to address your concerns?

Another issue that we recognize is that BRASS-GIRDER(LRFD) performs the structural analysis using one set of section properties (beam+slab) and then performs stress checks, etc. using another (beam+slab or beam+rebar depending on the sign of the moments). We would like to revise this current implementation. AASHTO LRFD Article 6.10.5.1 indicates that stresses MAY be computed assuming the concrete slab is effective for both positive and negative bending. This means section properties for service and fatigue limit state stresses could be computed considering the slab. Stresses for the strength limit state would consider the slab for positive bending moments and the rebar for negative bending moments.

FROM: bgoodrich DATE: Thursday, March 02, 2006 7:22:10 PM

WYDOT has closed this problem log, i.e., it has been addressed to their satisfaction in 2003. Incident marked as resolved.

Description

FROM:dteal DATE:Monday, March 17, 2003 3:10:43 PM

According to 6.10.1.1.6 we only need to satisfy one of the two equations, either 6.10.4.1.6a-1 or 6.10.4.1.6a-2. According to thins spec check in Opis it is only satisfied if both equations are ok, not one or the other. See attached gif file.

FROM:bgoodrich DATE:Thursday, March 20, 2003 5:14:34 PM

WYDOT has assigned this issue to BRASS Problem Log 419.

FROM:bgoodrich DATE:Friday, March 21, 2003 5:15:45 PM

I have corrected the issue in BRASS-GIRDER(LRFD) with respect to AASHTO LRFD 6.10.4.1.6. The wording changed from an "and" to an "or" in in the 1999 Interims. Fixed for Version 5.0 Release.

Description

FROM:dteal DATE:Monday, March 17, 2003 3:11:57 PM

Here are the screen shots that depict the incorrect web depth notation on the schematic view for a rolled beam definition in a schedule-based girder definition. The schematic in the first file states the web depth is 43". The second schematic shows that the rolled beam has a total depth of 43 inches not the web depth. The third schematic shows that BRASS used the proper 43" depth.

FROM:jduray DATE:4/12/2005 4:43:09 PM

The schematic should not label web and flanges for rolled beams.

FROM:jihnat DATE:8/3/2005 1:11:12 PM

Fixed for 5.4.0

### Description

FROM: bgoodrich DATE: Friday, March 28, 2003 1:08:50 PM  
Entered for Timothy A. Armbrecht and Richard Best:

From: Armbrecht, Timothy A.  
Sent: Wednesday, March 26, 2003 2:32 PM  
To: Best, Richard M.  
Cc: Kurtenbach, Tom L.  
Subject: Possible Opis error

Dick, looks like there is a problem with how Opis calculates the distribution factor for a concrete T-Beam. This is a screen from SN 013-0026. Everything looks normal here. But note in the output taken from the results below that  $t_s = 0$  and the moment distribution factor is calculated as infinity. Also, the output says  $I = 129,287 \text{ in}^4$  when it should be  $42,559 \text{ in}^4$  and the output says the beam area =  $1,056 \text{ in}^2$  when it should be  $549 \text{ in}^2$ . It appears that Opis is including the slab in the beam properties, when I believe, for the purpose of distribution, the slab should not be included. This argument is strengthened by the fact that in a concrete T-Beam example in the LRFR specifications developed by Lichtenstein, the slab is not included in the beam properties when calculating the distribution factors.

Complete Issue Information

FROM:bgoodrich DATE:Friday, March 28, 2003 2:25:42 PM

After some investigation, I found that the "Total deck thickness" is not specified in the Structure Typical Section window. BRASS uses the deck thickness entered here in the distribution factor calculations. Once these are input, the distribution factors are more appropriate. However, the issue pertaining to the moment of inertia and area are an engine issue that must be further reviewed. The term  $(K_g / (12 L t^3))^{0.1}$  is generally about 1.0, but in this case, the difference in the methods of determining  $K_g$  leads to BRASS calculating distribution factors that are a few percent different than Tim's calculations. I think both methods are acceptable, but I'll have to discuss this with WYDOT to get their approval to make any modifications. Maybe a user option is in order.

FROM:bgoodrich DATE:Friday, March 28, 2003 2:25:54 PM

E-mail from Richard Best (3/28/03):

"Thanks for you help. I agree that a user option would be a good idea."

FROM:jduray DATE:Sunday, March 30, 2003 3:20:09 PM

FROM:bgoodrich DATE:Friday, May 09, 2003 5:56:16 PM

WYDOT will assign this issue to BRASS Problem Log 429.

FROM:bgoodrich DATE:Monday, June 23, 2003 3:15:16 PM

BRASS-GIRDER(LRFD) has been modified to exclude the top flange (slab) from the properties used to compute the I and A for the distribution factor formulas. Fixed for version 5.0.1.

### Description

FROM:hlee DATE:4/1/2003 5:40:51 PM  
Submitted on behalf of Ken Wilson:

LL (HL 93) moments and shears that are back calculated from Strength I do not agree with generated values.  
Please see attached pdf file.

FROM:bgoodrich DATE:Friday, May 09, 2003 5:57:02 PM  
WYDOT will assign this issue to BRASS Problem Log 430.

FROM:bgoodrich DATE:Thursday, December 11, 2003 6:23:24 PM  
This issue relates to how BRASS-GIRDER(LRFD) calculates the factored moments for structures analyzed in multiple stages. For stage 1, the minimum or maximum dead load factors are considered in determining the maximum and minimum factored moments. These factored dead load moments are

1/5/2016 11:07:18 AM

HRS AASHTO

147

Complete Issue Information

then saved for the subsequent stages. For stage 2, the process is repeated using only the dead load moments from stage 2 loads and then the factored dead load moment from stage 1 is added. For stage 3, the process is repeated using only the live load moments from stage 3 loads and then the factored dead load moments from stages 1 and 2 are added. When there are 3 stages (2 dead and 1 live), the type of dead load factors used for stages 1 and 2 can be different. For the structure in question, minimum dead load factors are used for stage 1 dead loads, while maximum dead load factors are used for stage 2 dead loads. Note that this issue is occurring at the 107 point of a two-span structure, so the dead load moments are quite small compared to the live load moments. The input moments and load combination calculations are shown below:

DL1 = -51.8  
 DL2 = 15.5  
 DW2 = 18.8  
 LL = 1307.8

$$\begin{aligned} \text{Factored Moment (user)} &= 1.25*(-51.8*) + \\ & 1.25*15.5 + \\ & 1.5*18.8 + \\ & 1.75*1307.8 \\ & = 2271.5 \text{ ft-k} \end{aligned}$$

$$\begin{aligned} \text{Factored Moment (BRASS)} &= 0.9*(-51.8*) + \\ & 1.25*15.5 + \\ & 1.5*18.8 + \\ & 1.75*1307.8 \\ & = 2289.6 \text{ ft-k} \end{aligned}$$

Jay Puckett also agreed with the results produced by BRASS.

### Description

FROM:jsmith DATE:Wednesday, April 02, 2003 2:27:45 PM

When I ran an LRFD design review for an adjacent box beam superstructure and looked at the load distribution output file I noticed that it showed distribution factor calculations for spread box beam sections (b and c).

FROM:bgoodrich DATE:Wednesday, May 07, 2003 3:35:45 PM

I analyzed the bridge with the new Version 5.0 and cross section code (f) was used for adjacent box beam sections.

There must have been a problem in how Opis determined if the prestress boxes were adjacent or spread. The BRASS export did not change with respect to determining the code to pass to BRASS.

### Description

FROM:rpaxson DATE:Monday, April 14, 2003 12:11:55 PM

We are unable to enter LRFD values for Mat'l properties (PS strand)and Stress Limit States - Concrete, and possibly others. Have been unable to find a "toggle" to switch off the LFD and turn on the LRFD values, even though the only Factors entered are for 1998(2002 interims)AASHTO LRFD Specs.

FROM:jduray DATE:4/15/03 11:59:11 AM

I assume since you logged this incident into the Opis Support Center you are running Opis 5.0. Please confirm.

FROM:jihnath DATE:5/28/2003 9:00:27 AM  
I don't get a crash, but I can't reopen the Structure Typical Section window.  
IsParallelSystem() is returning FALSE at line 3135 of DoGirderSystemStructDef.cpp  
Tolerance problem? Don't know what specifically about this bridge is causing this.  
Krisha, please look at this.

FROM:kkennelly DATE:5/28/2003 4:12:15 PM  
It appears that since the support skews are different from each other, when the end overhang is changed, the girders are no longer parallel to each other but the girder spacing on the Framing Plan window was specified as "Perpendicular to girder". That spacing type is not valid if the girders are not parallel to each other so you can't open the Framing Plan or Structure Typical Section windows.

I'm still trying to determine what to do with this.

FROM:kkennelly DATE:5/30/2003 3:19:31 PM  
Code fixed so that perpendicular spacing is maintained when user changes overhang. Fixed for Version 5.0 Service Pack 1.

FROM:gbarnhill DATE:Monday, June 23, 2003 5:47:12 PM  
5.0.1-beta - I created a simple span system with different skew for each end, I entered the typical cross section geometry the same at start and end, closed, then reopened and changed the end overhang, closed and was able to reopen.

### Description

FROM:dkoenig DATE:Wednesday, June 18, 2003 9:27:55 AM  
We have noticed some schematic problems on steel structures.

Problem #1: On the first attached file, the girder profile schematic is not displaying correctly in the last span. On the last span, the girder has a change in height. On the schematic, it shows the bottom flange as a line going from this change in height to the end of the bridge instead of showing the change in height. We have seen similar behaviour on other structures.

Problem #2: On the second attached file, the structure framing plan is only showing the girders part of the way across the structure. Once it gets to a certain point, it is only showing the diaphragms.

FROM:kkennelly DATE:6/19/2003 3:00:19 PM

Problem #1 is probably the same as Incident 4592. The girder profile schematic did not accurately draw a girder profile that has a distinct change in depth at a hinge. This problem has been fixed in the service pack 1 for Version 5.0.

FROM:jihnata DATE:7/13/2005 9:05:15 AM

#2: I'm not able to reproduce this, even in version 5.0.0.  
For testing, I've attached version 5.3.0 BBD files.

|                                                                                           |

### Description

FROM:dkemna DATE:Tuesday, August 12, 2003 2:40:33 PM

MoDOT uses separate databases for Virtis and OPIS. An extensive Agency library has been entered into Virtis. I am attempting to export Virtis library files and import them into the OPIS Library. I have no problem exporting files out of Virtis, but an error occurs when I attempt to import files into the OPIS library. The import error also occurs in Virtis. Attached is the xml file and a word document with the error message.

FROM:hlee DATE:8/12/2003 3:01:40 PM

Try the following:

Make sure you are not using Internet Explorer. Locate the file "msxmlfix.bat" in your Virtis/Opis 5.0 installation directory. Double-click on the bat file to fix the version of msxml in your workstation. Restart the workstation and try to import again.

If this doesn't fix the problem, please attach the xml file to the incident.

FROM:dkemna DATE:Tuesday, August 12, 2003 3:43:10 PM

I ran the "msxmlfix.bat" file and restarted my computer. The problem was not corrected. The xml file has already been attached as stated above.

FROM:hlee DATE:8/13/2003 8:08:26 AM

I successfully imported the 27 steel materials in the attached library xml file.

1/5/2016 11:07:21 AM

HRS AASHTO

157

Complete Issue Information

Do you use the same workstation to export and import the library xml file?  
Do you have other workstation that you can try to import the library xml file? (To determine whether the problem is workstation dependent)

I still think the problem is cause by the msxml\*.dll files because all the incidents we have to library export/import are related to those files.

Please try to run msxmlfix.bat again in the following way:

1. Open a Command Prompt window.
2. Change directory to Virtis/Opis 5.0 installation directory.
3. Type in "msxmlfix.bat" and hit Enter. You should see the following:

```

=====
C:\PROGRA~1\AASHTOWARE\VirtisOpis50>msxmlfix
C:\PROGRA~1\AASHTOWARE\VirtisOpis50>xmlinst -u
(scanning process table for use of msxml*.dll)
removed old & new dll entries
C:\PROGRA~1\AASHTOWARE\VirtisOpis50>regsvr32 -s msxml.dll
C:\PROGRA~1\AASHTOWARE\VirtisOpis50>regsvr32 -s msxml2.dll
C:\PROGRA~1\AASHTOWARE\VirtisOpis50>regsvr32 -s msxml3.dll
=====

```

4. Try to import again.

FROM:hlee DATE:8/14/2003 3:45:16 PM  
E-mail to Darren on 8/14:

```

=====
=====
Darren,

```

Do you still have problem in importing library items?

I'm able to import all 27 steel materials in your attached library xml file. I still think the problem is cause by the msxml\*.dll files because all the incidents we have to library export/import are related to those files. Please see the incident for another way to run the msxmlfix.bat file.

```

Complete Issue Information

FROM:dkemna DATE:Friday, August 15, 2003 2:26:32 PM  
I had Dave Koenig run the fix on his Dell and he still cannot get the library import to work. I was using a compaq. We have two independant workstations that cannot perform the Library import.

FROM:hlee DATE:8/18/2003 3:26:38 PM  
E-mail to Darren on 8/18:

=====  
=====

Darren,

More questions:

What version of Windows do you have on the workstation? Windows NT, 2000, or XP

What version of Internet Explorer do you use?

Can you open the library xml file from Internet Explorer?

I just found out you are going to attend the User Group meeting. May be we can discuss this further over there. If you bring a laptop, see whether you can duplicate the problem on the laptop.

=====  
=====

E-mail response from Darren on 8/18:

=====  
=====

Windows 2000 w/ service pack 3  
Internet Explorer 5.50.4134.0600  
I can open the file in my explorer.

I will try to import the file on my laptop before the advanced training sessions.

Darren J. Kemna

=====  
=====

E-mail to Darren on 8/18:

=====  
=====

The MSXML version that is included in IE 5.5 is 2.5 SP1. The MSXML version that supports Virtis/Opis is 3.0 SP3. 3.0 SP3 comes with IE 6.0 SP1.

Please install at least IE 6.0 SP1 to your workstation for library import.

Thanks,  
Herman

Description

FROM:dkemna DATE:Friday, September 12, 2003 9:37:07 AM

In an older file I had given the name "Bent #1 & 4" for a bearing stiffener definition. The program executes fine, but an error occurs when trying to generate a user defined BWS Report using the Report Tool. The following error message occurs:

Cannot view XML input using XSL style sheet. Please correct the error and then click the Refresh button, or try again later.

-----

Whitespace is not allowed at this location. Error processing resource  
'file:///D:/AASHTOWARE/VirtisOpis50/Reports/Steel Plate Girder.xml'. Line 1200, Position 46

<BearingStiffenerName>Bent #1 & 4</BearingStiffenerName>  
-----^

The error refers to whitespace, but the following name was acceptable, "Bent #1\_4", and clearly white space is present. I think it could be the "&" symbol. Either way, I think this error should be corrected or more guidance should be given on the restrictions in acceptable characters in naming fields. I will attach a bbd and xml file below.

FROM:dkemna DATE:Friday, September 12, 2003 9:50:54 AM

FROM:jduray DATE:9/12/2003 3:13:03 PM  
It doesn't like the & character.

Fixed for 5.1

### Description

FROM:dkemna DATE:Wednesday, September 24, 2003 3:22:20 PM

Today I tried to overwrite an Analysis Settings template named "plate girder design". I saved my template as "Plate Girder Design", but ended up with two templates (i guess due case sensitivity). I attempted to overwrite my "Plate Girder Design" template using the Save Template button. I ended up with two "Plate Girder Design" templates, the original one disappeared. I tried to open and delete both of these templates, but instead I recieved error messages.

To duplicate the error I tried to create a "fatigue" template. I had no problems saving the template, but again recieved the same error (actually line #s in the source file changed). I also noticed the description I tried to give this template was shown with one of my "Plate Girder Design" templates. I then created and saved a template named "Fatigue", and this template is working fine.

## Complete Issue Information

Summary tables in the LRFD Analysis Output of the Report Tool use 100% when they should use 90%.

FROM:kkennelly DATE:10/6/2003 2:46:06 PM

The LRFD Analysis Output report in the Report Tool is reporting what is shown in the Analysis Results window, Steel Limit State Summary report. I don't know if what is displayed there is 90% or 100%.

FROM:bgoodrich DATE:Monday, October 06, 2003 3:59:58 PM

The truck train moments are reported as 100%. The 90% is applied when the actions are factored. This request is not a bug, but a preference. At the very least, I suggest we update the Analysis Results help topic for the BRASS LRFD engine with something like this:

"The live load actions for the truck train are not factored by 90%."

This is how we addressed questions on whether the live load actions included impact and distribution factors.

The BRASS output is silent in this regard as well, so I will request permission from WYDOT to update the BRASS output.

FROM:dkemna DATE:Thursday, October 09, 2003 9:34:15 AM

One comment. LRFD 3.6.1.3.1 states that "the extreme force effect shall be taken as the larger of the following"-

simplified below:

1. design tandem + design lane,
2. design truck + design lane,
3. 90% of two design trucks + 90% of design lane (negative moments and reactions)

When a span listing in the analysis results shows moment summaries that are controlled by "Axle" and then "Truck Train", you would expect the above criteria to be used. Otherwise, the user does not know whether the 90% truck train controls over the design truck.

FROM:bgoodrich DATE:Friday, October 10, 2003 5:53:26 PM

After reviewing this issue further and better understanding the issue, I agree with Mr. Kemna that the output reports provided by Opis are inconsistent when the truck train is reported as critical. The reaction, moment, and shear summaries in Opis combine the actions for the design truck + lane, design tandem + lane, and truck train + lane. Opis is simply combining the actions (calculated by BRASS) for the individual trucks, which only contain distribution factors and impact. These results are not adjusted for the 90%. The functions in Opis that combine the truck and lane loads should be modified to account for the 90% prior to generated the XML report. See the CUILRFDOutputReport::AddLaneToReactions, AddLaneToMoments, and AddLaneToShears functions.

My comments regarding the change to the help and BRASS output are still valid and should be addressed.

FROM:jduray DATE:10/13/2003 7:46:16 AM

Krishna - Let's discuss this.

FROM:bgoodrich DATE:Monday, October 13, 2003 11:49:22 AM

Description

FROM:dkemna DATE:Tuesday, November 18, 2003 9:40:14 AM

From the information I have seen, the use of P/S strands for continuity reinforcement at interior bents was supposed to be implemented for 5.1. Both Incident 3633 and the "List of Requested Enhancements" passed out at the 2003 User Group meeting suggest implementation for 5.1. Clearly, this has not been included for 5.1.

My question is: When will this be implemented? Or what version?

FROM:jduray DATE:11/20/2003 3:53:04 PM

Apparently at that time it was thought that it would be in 5.1. To my knowledge WyDOT has not approved nor did we have clear direction from the Task Force as to how to implement it early enough to include int in 5.1. I will check on when it is scheduled.

FROM:hlee DATE:6/4/2004 3:08:36 PM

Changed Category from "Enhancement" to "Enhance BRASS".

### Description

FROM:jduray DATE:1/7/2004 9:42:56 AM

Florida DOT reported they are having trouble getting Pontis and Virtis to work properly when running within the same Oracle instance as stand-alone apps.

The public synonyms Virtis uses for the Pontis tables should be changed to be unique relative to the Pontis synonyms. I suggest we change the following:

```
CREATE PUBLIC SYNONYM bridge for owner.bridge;  
CREATE PUBLIC SYNONYM paramtrs for owner.paramtrs;  
CREATE PUBLIC SYNONYM roadway for owner.roadway;
```

to:

```
CREATE PUBLIC SYNONYM bridge_virtis for owner.bridge;  
CREATE PUBLIC SYNONYM paramtrs_virtis for owner.paramtrs;  
CREATE PUBLIC SYNONYM roadway_virtis for owner.roadway;
```

Change our code to use these synonyms.

For the integrated db these synonyms will point to the Pontis tables. If Virtis stand-alone they should point to the Virtis version of these tables. Views and perhaps other scripts will require similar modifications.

HRS AASHTO

168

Complete Issue Information

FROM:jduray DATE:4/23/2004 8:18:35 AM  
 Resolve this for 5.2.

FROM:mordoobadi DATE:7/14/2004 8:06:44 AM  
 July 13. This resolution would cause VirtisOpis to break while using other types of databases.

There are two work arounds for this issue.

- (1) use of private synonyms for the bridge, paramtrs, and roadway tables for each user.  
 Note: If a user needs to login to both Pontis and Virtis/Opis databases two separate logins should be created for him/her. For the Pontis database the corresponding user accesses the above three tables using PUBLIC SYNONYMS and for the Virtis/Opis database the corresponding user accesses the above three tables using PRIVATE SYNONYMS.
- (2) use separate instances of Oracle for Pontis and Virtis/Opis databases.

## Description

FROM:dkemna DATE:Saturday, February 28, 2004 10:52:41 AM

I have attached a word file that includes some additional reports that would be helpful for the designer of a steel girder. The benefit of these reports are that they would show design ratios for the major aspects of design. I am sure there are other reports that could be included to this list, but this may get the ball rolling. For example, there is no way currently to print a report that shows the controlling design ratios for bearing stiffeners at all bents. A summary for all bents would really help a designer determine quickly whether design changes are necessary. Currently a designer would have to go through the lengthy spec checks (preferably with a spec filter). Even with a spec filter the user would have to click in the detail window to determine how badly it failed for each stage. Also, a design summary is a necessity to create a simple printable report.

Note: If these reports can be handled easier through the charts that would be acceptable but it is always helpful to have the design load and resistance with the design ratios in a report format.

FROM:jduray DATE:4/14/2005 11:25:41 AM

TAG will compile a list of attributes that we need to collect from engines and make available in the report tool.

FROM:jduray DATE:12/21/2006 8:57:32 AM

TAG will provide sample design reports. Will prepare these as "canned" reports in the report tool. Need to prepare an estimate of the cost after we get the samples.

FROM: Krisha Kennelly DATE: 12/22/2009 11:23:02 AM Eastern Standard Time

Attached document contains the UI changes needed to generate the new reports that were approved by the Task Force.

Joe - please implement the UI changes

May - please work on implementing the reports

FROM: Joseph Ihnat DATE: 1/4/2010 9:30:14 AM Eastern Standard Time

UI is done.

This issue is a duplicate of Incident 4779.

FROM:bgoodrich DATE:Thursday, July 08, 2004 12:49:36 PM  
Mr. Donachuk,

I received your files and reviewed your concern. After some investigation, I found that your issue has already been addressed in Service Pack 1 for Opis 5.1, which contains BRASS-GIRDER(LRFD) 1.5.4. You indicated that your agency was not able to upgrade to this service pack, but I'm not sure of the reasons. Please contact Jim Duray at Michael Baker Jr. (412-269-6410) to see if he or someone on that staff can help you with the upgrade.

Regards,

Brian L. Goodrich  
BridgeTech, Inc.

### Description

FROM:dkemna DATE:Friday, July 30, 2004 12:04:08 PM

A designer has input a four span plate girder bridge (196'-230'-230'-161') with a 20 deg. skew. She and I have not been able to find any input errors and our tolerance settings are 0.01 ft and 0.125 in. For G2, the export is successful, but during Engine Analysis an infinite loop error occurs. Please take a look at the attached file to see if you can replicate the problem. We have completely re-input the bridge in a separate file with no success.

FROM:kkennelly DATE:7/30/2004 1:28:12 PM

I get the same error when I run BRASS LRFD. It seems to be something internal in BRASS is creating an (FE?) analysis point at 400.994 and we can't control that from Opis. (I know this isn't a workaround but if I change the span 4 length to 161.1' it will run ok. That's why I think its internal to BRASS.)

FROM:bgoodrich DATE:Sunday, August 01, 2004 1:44:42 PM

I was also able to duplicate the issue, which I forwarded to WYDOT.

FROM:bgoodrich DATE:Wednesday, August 04, 2004 6:40:51 PM

WYDOT assigned this issue to BRASS Problem Log 521.

FROM:bgoodrich DATE:Monday, August 23, 2004 12:38:58 PM

This issue has been addressed in BRASS-GIRDER(LRFD) 1.6.0, which will be released with Opis 5.2.0.

FROM: bgoodrich DATE: Monday, August 16, 2004 3:39:12 PM

Herman indicated that he was trying to increase the top flange thickness (for the ranges left of the 109 POI) in order to reduce the live load stress to that flange. After some investigation, it was determined that the bottom flange is actually the critical component. Therefore, the bottom flange thickness must be changed to get a rating factor greater than 1.0. I changed the bottom flange thickness to 1.5 inches for the ranges from 84'-108' in span 1 and 12'-36' in span 2, which resulted in a design ratio of 1.03.

Description

We're having a problem with VirtisOpis here at ODOT. I'm pretty sure the problem is on our end, but I need some info from you. We just deployed new machines with Windows XP and a new security policy on the C drive. Now when a user double-clicks on a bridge in the bridge explorer there are 2 error messages produced. The first says "file error writing data" and the second is "revert command may not work properly due to error writing backupfile."

I have a feeling the OS user does not have the proper privileges to write to the locations that Virtis is trying to use. Can you let me know what the location of these writes are so I can make sure that security is setup properly?

Contact Jon Nance @ (614) 466-9911 or jnance@dot.state.oh.us

FROM:awaheed DATE:Wednesday, September 22, 2004 2:48:02 PM

FROM:jihnat DATE:9/22/2004 3:53:18 PM

I sent email reply to Jon:

VirtisOpis wants to write files and add directories in the directory where it is installed. The default location is C:\Program Files\AASHTOWARE\VirtisOpis51

FROM:jihnat DATE:9/23/2004 7:51:18 AM

Jon sent email that it was OK to close this incident.

Subject: C3.6.1.3.1 vs. Opis/Virtis

Hello Loads Aficionado's,

The Commentary to 3.6.1.3.1 says "One hundred percent of the combined effect of the design tandems and the design lane load should be used."--when investigating negative moment.

Virtis/BRASS, Vinacs' own program, and CTBridge are both using NINETY% (of the dual tandem \* IM, +lane). I think QCon is, too, although I wasn't able to download their latest version.

1/5/2016 11:07:27 AM

HRS AASHTO

177

## Complete Issue Information

The '100%' interpretation increases negative design moment for adjacent spans lengths less than ~75', only. In other words, for a two-equal-spans 75'-75' in length and greater, 90% of the dual truck always controls over 100% of the low-boy.

Do we change the software to match the Specs, or change the Specs to match the software?

Thanks,  
Sue

Susan E. Hida, P.E.  
AASHTO SCOBS, LRFD, Loads, etc.  
916-227-8738

FROM: bgoodrich DATE: Wednesday, September 29, 2004 1:43:20 PM  
BRASS-GIRDER(LRFD) currently uses 100% of the dual tandem plus lane. This percentage can be adjusted by the user if they wish, but it defaults to 100% for this load combination. I recall BRASS using 90% when the commentary did not specify a percentage, but the software was changed to match the specifications once the "One hundred percent" wording was added.

FROM: bgoodrich DATE: Wednesday, September 29, 2004 1:43:43 PM  
E-mail from Vinacs:

From: murugesu\_vinayagamoorthy@dot.ca.gov [mailto:murugesu\_vinayagamoorthy@dot.ca.gov]  
Sent: Tuesday, September 28, 2004 7:36 AM  
To: Goodrich@BridgeTech-Laramie.com  
Cc: susan\_hida@dot.ca.gov  
Subject: RE: C3.6.1.3.1 vs. Opis/Virtis

Brian

Do we have the same option in the Opis? If so, please direct me to the GUI. I could not locate the GUI that allows me to change the percentage.

When I ran a sample bridge using Opis, Opis did not report results from Tadem Train results.

Vinacs M Vinayagamoorthy

FROM: bgoodrich DATE: Wednesday, September 29, 2004 1:44:48 PM  
BRASS-GIRDER(LRFD) allows the percentage applied to any vehicle to be adjusted. However, this percentage is not exposed to the user in Opis. This is why you could not find it.

The dual tandem (Tandem Train) is only considered if you select it. Click the Advanced button on the Vehicles tab of the Analysis Settings window to check the appropriate box. As you know, the truck and tandem trains are not applicable to simply-supported bridges, so they are automatically removed from the analysis for these structures.

virtis calculates the weight of the deck for stage 1 rxs, etc.

opis does not; it uses a user defined member load value.

therefore, you cant really use the same file for virtis and opis.... if you do, you will essentially be using twice the deck dead load when running virtis.

let me know asap please

thanks

FROM:bgoodrich DATE:Wednesday, January 19, 2005 1:30:56 AM

E-mail reply from Krisha: 1/17/2005 11:39:07 AM >>>

No, that is not true.

BRASS LRFD will compute the dead load of the deck for you in Opis just as BRASS LFD will compute the deck dead load in Virtis.

FROM:bgoodrich DATE:Wednesday, January 19, 2005 1:37:39 AM

This issue is a duplicate of Incident 5086. This issue has been corrected for Opis 5.2.

### Description

FROM:goramasionwu DATE:Monday, January 24, 2005 12:57:50 PM

I am getting the following warnings regarding my shear reinforcing steel not being defined.

Seine River PPCI Girder (Girder System Superstructure Definition)

10M H\_Stirrups (Vertical Shear Reinforcement Definition)

Warning: Reinforcing steel material not defined for shear reinforcement.

Warning: Reinforcement bar size not defined for shear reinforcement.

I think I have defined everything correctly (other than the distribution factors which I must still input.) Is there a way for OPIS to determine the distribution factors since BRASS is able to?

Thanks,

Andy Pankratz  
apankratz@gov.mb.ca

FROM:kkennelly DATE:1/24/2005 1:25:31 PM

1. If you have entered a horizontal shear reinforcement definition, you can ignore the warning you are getting about the vertical shear reinforcement. Opis is trying to validate the vertical shear reinforcement data when it really shouldn't since you have entered a horizontal shear reinf definition. (This was previously entered in Visual Intercept incident 5622.)

2. If you leave the LRFD factors blank in Opis, the BRASS program will compute the LRFD factors for you.

### Description

FROM:goramasionwu DATE:Tuesday, January 25, 2005 12:16:46 PM

Further to IncidentID 5845, the suggestions were followed however, the bridge does not pass from opis to BRASS for analysis. The following errors were given by:

Opis:

Error generating LRFD schedule commands!

Error generating stirrup schedule commands!

Error getting horizontal shear reinf. in vertical shear reinf. range!

Error generating STIRRUP-SCHEDULE or STIRRUP-GROUP commands!

The number of horizontal shear reinf. spaces must be greater than

1/5/2016 11:07:29 AM

HRS AASHTO

183

Complete Issue Information

zero!

BRASS gave the following:

ERROR - The number of horizontal shear reinf. spaces must be greater than zero!

ERROR - Error getting horizontal shear reinf. in vertical shear reinf. range!

WARNING (High):

The P/S shape properties from Virtis are not utilized by the BRASS engine. The properties are computed based on the section dimensions.

WARNING (High):

BRASS does not support a composite (long-term) stage. The results from loads applied to this stage will appear under the composite (short-term) stage.

Analysis failed!

The exact same model was run successfully with Virtis however not with Opis.

FROM:kkennelly DATE:1/25/2005 2:33:30 PM

Virtis runs the BRASS LFD analysis engine and Opis runs the BRASS LRFD analysis engine. The BRASS LRFD analysis engine must have different checks in it and it checks to be sure that you have not entered a zero for number of spaces whereas the BRASS LFD engine must not be checking for that in your input.

I ran G1 and get the same error. If you open the Shear Reinforcement Ranges: Horizontal tab, you will see that you have several rows of data with a "0" for the number of spaces for your horizontal shear reinf. spacing. Change those 0's to 1's so that your input reads similar to "1 space of 0mm" and BRASS LRFD will be able to analyze your girder.

### Description

FROM:goramasionwu DATE:Wednesday, January 26, 2005 4:47:46 PM

In OPIS the type of curing used for the deck was specified as Moist Cure with the girders being Steam cured (as is the common practice). When performing the analysis OPIS passes a generated BRASS input file specifying that the girder is Steam cured and the slab is now steam cured and not moist cured as was input in OPIS. Is this a possible bug in the program?

Also, I would like to use a modified vehicle as a design vehicle other than the standard HL-93 loading configuration. Our agency specifies a modified HSS-25 truck be considered as well as the HL-93 vehicle specified by AASHTO LRFD. When input into the library or as a temporary vehicle the loads generated includes the modified HSS-25 truck as well as a generated truck train, tandem train and lane load for this vehicle.

Our agency only considers the load case of the HSS-25 vehicle alone. Is there a way for OPIS to perform this analysis or does it require that the vehicle must have the trk tmt and lane load combinations as well?

The modified HSS-25 vehicle is defined as one 45kN axle followed by three 180kN axles all at a fixed axle spacing of 4.25m and a standard 1.8m gauge.

FROM:goramasionwu DATE:Friday, January 28, 2005 11:12:02 AM

I changed the HSS-25 Truck to be in the permit load and that solved my problem with this vehicle. However for the HL-93 loading, the tandem train is run either with and without the check box enabled for the under the advanced tab. I have also attempted to reduce the scale factor from 1 to 0.0001 in the advanced tab but this introduces this same scale factor for all combinations for this vehicle and not just the tandem train.

The online help indicates to leave the check box unchecked to disable the tandem train. However, in this version of OPIS (5.1.0) either this feature does not work or I am doing something wrong.

LRFD?

FROM: bgoodrich DATE: Tuesday, March 08, 2005 11:08:25 AM

BRASS allows the user to specify a different cross section at the beam ends to withstand the increased shear forces. However, I do not see any way to specify end blocks in the Opis model. Opis only permits a single beam cross section to be used for the entire length.

Description

FROM:dkemna DATE:Friday, February 25, 2005 11:56:58 AM

The Release notes for version 5.2 and incident 4890 both refer to incident 4683 for information about P/S Strand used for positive moment connection. It appears that 4683 is missing from the list?

FROM:jduray DATE:3/2/2005 8:43:03 AM

4683 is a request to WYDOT to allow strands to be extended for Positive Moment Connection.

FROM:dkemna DATE:Tuesday, March 08, 2005 10:05:23 AM

The release notes say that P/S steel can now be used for the positive moment connection, but I find no evidence that this is true. I have looked through the help, input screens, etc...yet I cannot find anything referring to P/S steel extension into the diaphragm. If incident 4683 was listed then maybe I could find specific information to help guide me.

### Description

FROM:jmarkel DATE:Tuesday, March 01, 2005 7:07:38 PM

I created a Girder System model and found that the generic rail loads were not being distributed to the beams. I searched the output files and found no reference to these loads being generated. I know this was not a problem in previous versions of Opis. Please take a look and let me know if it's something on my end.

John Markel

FROM:kkennelly DATE:3/2/2005 7:55:22 AM

This problem was previously entered in Incident 5753. An AbxBrass replacement file is available on the support website in the "Downloads" section to fix this problem. You should probably add your email address to the "End user mailing list - e Notification" on the support website so you will receive emails notifying you of such fixes.

Below is a spec check showing a failure in a top flange at point 110 (which is at the centerline of the pier beam). .bbd is attached, I used girder line #2 to create this run.

PERFORMING AASHTO LRFD SPECIFICATION CHECKS - 5.9.4 Stress Limits for Concrete

Point of Interest : 110.00

Construction Stage: 2

Units: Stresses are in (MPa).

Stresses After Losses: DL + PS + LL

Stress Comparisons for NEGATIVE Flexure Sense:

| Location   | Compressive  |     | Factored |     | Tensile      |             | Result Codes |  |
|------------|--------------|-----|----------|-----|--------------|-------------|--------------|--|
|            | Stress Limit |     | Stress   |     | Stress Limit | Compressive | Tensile      |  |
| Slab       | -18.000      | ... | 3.071    | ... | 0.000        | N/A         | N/A          |  |
| Top Flange | -21.000      | ... | 1.605    | >   | 1.480        | N/A         | FAIL         |  |
| Bot Flange | -21.000      | ... | -10.165  | <=  | 1.480        | N/A         | PASS         |  |

This point is at the center line of pier where no beam exists (this is the diaphragm area) Because of this questionable check, it will also effect the LRFR BRASS rating at this point.

Checking the end of the beam at the top and bottom for tension and compression does not make sense. (BRASS assumes that the end of the beam is at the centerline of the pier – that is wrong)

FROM:dteal DATE:Friday, March 11, 2005 3:49:46 PM

This was in 5.2 release (not 5.3 beta)

FROM:bgoodrich DATE:Thursday, March 17, 2005 4:03:37 PM

I have forwarded this issue to WYDOT.

FROM:bgoodrich DATE:Friday, May 13, 2005 10:43:00 AM

WYDOT assigned this issue to BRASS Problem Log 589. BRASS-GIRDER(LRFD) 1.6.1 has been modified to allow the user to ignore beam stresses at interior support points of interest. The BRASS export must be revised to utilize this new capability.

FROM:bgoodrich DATE:Tuesday, May 31, 2005 2:14:49 PM

The export has been updated. Fixed for version 5.3 SP1.

FROM:dteal DATE:Monday, June 27, 2005 4:31:43 PM

Accepted

FROM:bgoodrich DATE:Monday, July 11, 2005 9:22:38 AM

Closed.

### Description

FROM:dteal DATE:Friday, March 11, 2005 3:44:06 PM

See the attached jpg for the spec check info. - .bbd attached, used girder #2.

This check, 5.7.3.3.1 Max Reinforcement (Ductility), shouldn't apply to a stage 1 configuration. It is checking for max. reinforcement at ultimate and at stage 1 the beam should not ever be at ultimate (it is not designed to be at ultimate for the beam only). To determine the "C" value, it is using the properties of the beam only. This check is valid for the stage 2 configuration since it is designed to be composite with the slab and therefore the properties determined using the composite section. And at stage 2 is

1/5/2016 11:07:31 AM

where ultimate should be checked.

FROM:bgoodrich DATE:Thursday, March 17, 2005 12:58:47 PM  
I have forwarded this issue to WYDOT.

FROM:bgoodrich DATE:Wednesday, May 18, 2005 11:52:41 AM  
WYDOT assigned this issue to BRASS Problem Log 603.

FROM:bgoodrich DATE:Wednesday, July 13, 2005 2:16:54 PM  
E-mail from C.J. Riley (WYDOT):  
After a more thorough review, I believe we should stick with past policy and leave this check as is. This section of the code is very clear, that if Eq. 5.7.3.3.1-1 is not satisfied (regardless of staging) then the section should be considered overreinforced, which would result in a fail code for the ductility check at some points. However, I don't see a reason not to use the moment capacity specified in the commentary.

FROM:bgoodrich DATE:Wednesday, July 13, 2005 2:22:43 PM  
Incident 6561 was submitted and is duplicate of this issue.

FROM:bgoodrich DATE:Friday, November 11, 2005 9:41:40 AM  
BRASS has been enhanced to consider the commentary equations: C5.7.3.3.1-1 and C5.7.3.3.1-2.  
Fixed for Virtis version 5.4.

FROM:dteal DATE:Wednesday, March 29, 2006 1:01:57 PM  
We (KDOT Engineering staff) disagree with C J's review.  
"that if Eq. 5.7.3.3.1-1 is not satisfied (regardless of staging) then the section should be considered overreinforced"

In 5.5.1 Limit States, General we read – Prestressed concrete structural components shall be investigated for stresses and deformations for each stage that may be critical during construction.....  
We read that to be Stage 1  
What is critical – we know the one thing for sure that's NOT critical here is that we don't have an HL93 load combination during stage 1 construction. This is what BRASS is checking right now – this is wrong.  
Puckett and Barker's book completely ignores this for stage one.

The change I see in 5.4 beta 7 is that we don't call this a "Failed" spec any more, we call it "Not Satisfied". The KDOT looks at it and the way the text referenced above looks at it – is not failed nor not satisfied – it simply shouldn't be checked.

FROM:dteal DATE:Friday, June 09, 2006 8:41:51 AM  
AASHTO Deleted 5.7.3.3.1 from the Spec in the '06 Interims

FROM:dteal DATE:Thursday, June 15, 2006 8:45:42 AM  
What would be nice: If you could set the default to ignore this spec and force the user to turn it back on if they wanted to check this on earlier designed structure.

The release notes say that P/S steel can now be used for the positive moment connection, but I find no evidence that this is true. I have looked through the help, input screens, etc...yet I cannot find anything referring to P/S steel extension into the diaphragm. If incident 4683 was listed then maybe I could find specific information to help guide me. Is it available for something other than P/S-I girders?

FROM:kkennelly DATE:3/17/2005 10:32:57 AM

FROM:kkennelly DATE:3/17/2005 1:20:37 PM  
The subject description for Incident 4683 is misleading as to what was actually implemented. When

1/5/2016 11:07:31 AM

HRS AASHTO

194

### Complete Issue Information

the incident was first submitted by a user, the request was for the ability to extend strands and have them considered for the positive moment connection. After some discussion, it was determined that instead of having the user enter data for extending the strands, the BRASS LRF D program would just be given an option to ignore the positive moment at a support. In previous versions, a fake amount of rebar had been generated by the export to BRASSLRFD when the user checked the "ignore positive moment at supports in ratings" on the Continuity Diaphragm tab. Now instead of generating the fake amount of rebar, the BRASS LRF D program doesn't rate for positive moment at all when the "Ignore positive moment at supports in ratings" checkbox is checked in Opis.

So the user cannot extend the strands for positive moment as the name of the incident implies.

### Description

FROM:dkemna DATE:Friday, March 18, 2005 4:23:23 PM

I have attached a file. In my last incident a discussion involved the "Ignore positive moment at supports in ratings" checkbox in OPIS. Is this box only activated in new files or am i missing something. The attached file was created in 5.0 and the option is inactive. Was this a Virtis enhancement only?

FROM:kkennelly DATE:3/21/2005 8:52:58 AM

Looks like we missed enabling this check box for Opis.

For 5.3:

1. Enable the "Ignore positive moment at supports in ratings" on the Beam Details: Continuity Diaphragm Reinf. tab.
2. Revise Virtis help which says this box is only enabled for Virtis.
3. Revise BRASS LRFD engine help which still says fake amount of rebar is generated.

Joe-1, Krisha-2, Brian - 3.

### Description

FROM:bha DATE:Wednesday, March 23, 2005 12:28:34 PM

Two year ago we requested an enhancement of PS beam section properties in incident 4443. But now we have to repeat this request again because our bridge unit is on the process of fulfillment of LRFD Implementation plan with more than 60% of bridge projects designed with LRFD method using Opis as a main program for design and analysis. So that the accurate requirements of beam elements are high which one of them is the section properties.

Like other commercial programs such as CONSPAN (Leap Software)in which the programmers provide two options for section properties: 1. by User input 2. by Dimensions (input)(we prefer to use option 1). It is very convenience and simple and this task is not a big deal for programming.

The bottom line is (in our opinion) if Virtis/Opis could not fix this problem we rather use other software for LRFD design and analysis. Please consider our requested enhancement as a very high priority.

### Description

FROM:dhorton DATE:Tuesday, March 29, 2005 7:59:19 AM

VDOT often uses a combination of mild steel and prestressed strands in bulb tees. In working with OPIS, our designers did not see a way to incorporate both into the design. Can OPIS handle both or do we have to "fake it out" in some manner using all prestressed strands?

P.S. If this is not the forum for this question, please let us know.

FROM:kkennelly DATE:4/1/2005 7:53:04 AM

Opis does not support mild steel in prestress beams. This was previously submitted in incident 2363

Description

FROM:dteal DATE:Tuesday, March 29, 2005 12:01:50 PM  
 An Opis analysis on the attached bbd file for member #2. This is an Inverted Prestressed Tee with 17 girder lines spaced 675 mm apart. The problem is with the LRFD distribution factors (Virtis LFD distribution factors of S/5.5 are okay). With only a 675 mm girder spacing the values BRASS computes are in error. As you can see from the page below, cut out of the BRASS Load distribution file, that the range of applicability for the beam spacing "S" has failed. At this point the analysis should not have run. But BRASS went ahead and used the "Failed" value in the equation and calculated an erroneous distribution factor. According to AASHTO, when the girder spacing is less than 1100 mm (3.5 ft) a more refined analysis complying with Article 4.6.3 should be used.

FROM:jduray DATE:4/13/2005 12:34:31 PM

BRASS should stop the analysis when this situation is detected. The export should check for this, issue a message to the user to input distribution factors and stop the analysis.

FROM:bgoodrich DATE:Wednesday, April 13, 2005 12:55:08 PM

BRASS does calculate the distribution factor using the LRFD formula even if all the ranges of applicability for spacing, span length, etc. are not met. This is done just to show the user what the distribution factor would have been. However, if you review the "LIVE LOAD DISTRIBUTION FACTORS SUMMARY" in the main output file, you will see that the distribution from the "Lever Rule Override" (LR-O) was actually used. A note after the summary states: "The Lever Rule Override is invoked when the ranges of applicability are not satisfied for the AASHTO LRFD distribution factor formulas." If the user does not agree with the lever rule distribution factors, the distribution factors can be entered manually.

FROM:dteal DATE:Wednesday, April 13, 2005 4:53:14 PM

In this case it didn't do the lever rule! It entered the wrong distribution factor.

FROM:dteal DATE:Thursday, April 14, 2005 3:52:42 PM

Using the lever rule would have been correct -

## Complete Issue Information

FROM:dteal DATE:Monday, April 18, 2005 2:12:19 PM

From what I understand from the BRASS distribution file, BRASS told Virtis to use 0.245 for single lane and 0.305 for multi lane distribution factors. These are wrong!

Lever Rule for a multi lane is  $S/5.5$  and in this case would give a Dist Factor of 0.201 not the 0.305 that was passed on to Virtis.

Note: The  $S/5.5$  has to be divided by 2 to change 2 wheel lines to one.

In the "Load Distribution File" under Distribution factors Summary - the values shown are not values derived from the lever rule – they are values that were calculated from the numbers obtained from the Failed Results of the Ranges Applicability.

I searched this file to find references that you mentioned – "Lever Rule", "LR-O", "Override" – none where found.

You said that there is a note after the summary stating "The Lever Rule Override is invoked when the ranges of applicability are not satisfied for the AASHTO LRFD distribution factor formulas." – there is no note???

It is clearly stated - Result Code: FAIL for Ranges of Applicability and it's clear that it uses these failed values.

FROM:bgoodrich DATE:Friday, April 22, 2005 12:08:49 PM

The MAIN output shows the summary that I noted in previous statements. I did find a bug in the engine in which warnings were not being written to the intermediate output file when the range checks were not satisfied. The code was there, but it was just not being executed. I have fixed this in BRASS-GIRDER(LRFD) 1.6.1, which should be released with Opis 5.3 SP1.

FROM:dteal DATE:Tuesday, June 28, 2005 3:17:26 PM

I think we have to change what we are doing here. We have determined that when girder spacing is small (less than 3.5 feet) a more refined analysis must be used complying with Article 4.6.3 – this DOESN'T SAY when  $S$  less than 3.5 feet that we should use the lever rule. A more refined analysis does not mean to blindly use the lever rule – I was wrong when I said that earlier.

In this example, girder spacing is about 2.2 feet center to center. The lever rule is only distributing to one girder. The girder spacing is so close here that the adjacent girder should be helping out and getting some load. Therefore – the lever rule is not applicable and will result in loads to the one girder far greater than they should be.

I think the only solution here is that when the ranges of applicability get a failed result code for girder spacing – the Opis analysis should stop at that point and put an error message on the screen telling the user that a more refined analysis for distribution factors is required and must be enter by the engineer (not blindly computed for them).

This "stopping" of the analysis would be the only way that we can force the engineer to enter more realistic distribution factors.

Complete Issue Information

FROM:bgoodrich DATE:Monday, July 11, 2005 9:20:32 AM  
I have forwarded this issue to WYDOT for consideration.

FROM:bgoodrich DATE:Wednesday, July 13, 2005 1:57:37 PM  
WYDOT has decided that a warning message will be added to the main output file to more prominently indicate when the lever rule override is used. The analysis will not be halted when the distribution factor formula ranges of applicability are not satisfied. WYDOT assigned this issue to BRASS Problem Log 608.

FROM:bgoodrich DATE:Saturday, August 27, 2005 9:31:24 PM  
A warning has been added to the main output file. Fixed for version 5.4.0.

FROM:dteal DATE:Tuesday, October 25, 2005 10:13:01 AM  
The average user is not going to look at the BRASS output file unless they have reason to. The average user will assume that the DF's have been calculated correctly. User needs to be warned in the GUI before the analysis begins then.

FROM:jduray DATE:10/26/2005 9:15:02 AM  
Resubmitted on behalf of Dean Teal.

FROM:bgoodrich DATE:Friday, November 11, 2005 12:05:02 PM  
The distribution factor calculations are performed within the BRASS engine, so the analysis must be performed. Therefore, it is not possible, given the current implementation, for the GUI to issue a warning prior to analysis. I have a possible solution that I will discuss with the development team.

FROM:dteal DATE:Tuesday, December 06, 2005 2:00:50 PM  
One solution – have the export check the girder spacing. If the girder spacing is less than 3.5 feet and the LRFD Dist. Factor fields are empty then stop the export leaving a message telling the user they need to enter values.  
This isn't just for BRASS – I would assume this would be for all engines.

FROM:bgoodrich DATE:Monday, February 13, 2006 11:44:21 AM  
We have added Incident 6906 for adding a mechanism for engines to send messages back to the Virtis/Opis GUI for display to the user. This is the solution mentioned in the 11/11/2005 comments above.

FROM:dteal DATE:Wednesday, March 08, 2006 3:42:43 PM  
I think we are asking too much of the user to go dig this info out of a text file buried in there drive.

FROM:dteal DATE:Wednesday, November 07, 2007 12:31:24 PM  
I don't think this is resolved

| 6312.15023 | Resolved      | Account for dead load due to sacrificial wear thickness on slabs |

### Description

FROM:dkemna DATE:Thursday, April 14, 2005 4:48:39 PM

I am analyzing a solid slab superstructure. When the "Consider effective slab thickness for design" is selected in the Analysis tab of the Girder Line Superstructure Definition window the effective slab depth is used for dead load calculations. The total depth entered in the Web tab of the Girder Profile window should be used or the option should be given. I determined this by analyzing the moments output by the program as I cannot find where the linear girder weight load is displayed. If I am in error please let me know.

Complete Issue Information

FROM:dkemna DATE:Thursday, April 14, 2005 4:57:22 PM

The workaround is simple, but I thought this might be difficult to catch for users especially if a frame definition is utilized. I don't believe this is addressed in the help?

FROM:kkennelly DATE:4/15/2005 10:33:10 AM

There are additional input commands generated that account for the dead load due to the sacrificial wear thickness. They are:

COMMENT DL1 - Additional Slab

LOAD-DEAD-DESCR 3, DC, 1, DL1 - Additional Slab

LOAD-DEAD-UNIFORM 3, 1, 0.000, 0.039750, 393.701, 0.039750

LOAD-DEAD-UNIFORM 3, 2, 0.000, 0.039750, 393.701, 0.039750

LOAD-DEAD-UNIFORM 3, 3, 0.000, 0.039750, 393.701, 0.039750

The self weight of the slab can be found by searching for "Self-Load Summary" in the BRASS LRFD output file. This will be the dead load of the slab due to the effective slab thickness.

|                                                                           |

Description

FROM:kkennelly DATE:4/15/2005 10:33:42 AM

Found as a result of investigating 6311. See bbd file attached to that incident.

Complete Issue Information

Run Slab Schedule mbr alt using the "Consider eff slab thickness for design" not checked. BRASS LRFD input file has the total slab thickness in the Span-General Segment command which is good. However it has the following commands for the 1" sacrificial wearing thickness:

COMMENT DL1 - Additional Slab  
LOAD-DEAD-DESCR 3, DC, 1, DL1 - Additional Slab  
LOAD-DEAD-UNIFORM 3, 1, 0.000, 0.039750, 393.701, 0.039750  
LOAD-DEAD-UNIFORM 3, 2, 0.000, 0.039750, 393.701, 0.039750  
LOAD-DEAD-UNIFORM 3, 3, 0.000, 0.039750, 393.701, 0.039750

Since the dead load is being based on the total slab thickness in the Span General Segment command, we shouldn't add the additional slab.

FROM:dkemna DATE:Friday, April 15, 2005 2:19:30 PM

I believe the "Additional Slab" load that you are referring to is due to my input in the Member Loads window. I had to create it because OPIS/BRASS only uses the effective slab (when checked) in determining the girder weight. I also noticed that the reinforcement distance from top of slab are being measured from the 1" worn surface, thus putting all the marks an 1" below their desired location. Since a total thickness is input the reinforcement distances should be measured from the original top of slab location. Weight should also be calculated from the total thickness entered.

FROM:bgoodrich DATE:Monday, April 18, 2005 5:04:19 PM

User-defined member loads are assigned to the user's "DL1 - Additional Slab" load case as Mr. Kemna indicated. Therefore, there is not an error with the export process. The help topic for the reinforcement states: "Top of slab is the top of the effective slab thickness." This input method was used so the rebar did not have to be repositioned when the "Consider effective slab thickness for rating/design" was changed. The sacrificial wear thickness is not automatically applied as an additional weight because the Girder Line option was used to define the structure definition. The Girder System structure definition would have performed this calculation automatically.

FROM:kkennelly DATE:4/21/2005 9:28:28 AM

Why can't we compute the extra dead load due to the sacrificial wear thickness? Does the engine help tell the user we don't compute the extra dead load due to sacrificial wear?

FROM:bgoodrich DATE:Thursday, May 12, 2005 1:25:36 PM

After reviewing the export, the selfweight due to the difference between the actual and effective thicknesses for I- and Tee-beams is calculated. So you are correct that this should also be done for the slab-beams. I revised the export to address this issue. Fixed for 5.3 SP1.

| 6369.14966 | Resolved      | Reinforcement entry causes member to be unexecutable |

Description

FROM:kkennelly DATE:4/28/2005 1:16:06 PM  
 Submitted on behalf of Adam Price, TNDOT via email:

For sr37 over doe river, I did notice one problem with the ductility check in the negative moment region. For the specification check on this bridge, you can also filter out design ratio and rating factor. For stage 3, the only two failures will be two ductility failures in span 2. The reported dp is 21.915 inches. This doesn't make sense because the highest strand is only 14 inches from the bottom of the beam. Where is this number coming from?

Thank you,  
 Adam Price

FROM:kkennelly DATE:4/28/2005 1:17:44 PM  
 bbd file is attached to incident 6357

FROM:bgoodrich DATE:Thursday, May 12, 2005 9:14:35 AM  
 I was able to duplicate the problem with the latest version of BRASS. I have forwarded this issue to WYDOT for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Friday, May 13, 2005 1:38:31 PM  
 WYDOT has assigned this issue to BRASS Problem Log 600.

FROM:bgoodrich DATE:Sunday, October 02, 2005 10:11:51 PM  
 This issue has been addressed in the BRASS engine. Fixed for version 5.4.0.

| 6394.14941 | Resolved      | Spek Check Execution Error in R/C Slab using POI Wizard |

### Description

FROM:dkemna DATE:Monday, May 02, 2005 2:21:35 PM

Attached is my file for a 3-span solid slab superstructure. I have many entries into the Reinforcement tab of the "Slab Schedule Full Bar Lengths" member. The member will run until I put in the last entry (Edge #8 Bottom). I am only attempting to run that specific member with the HL-93 template. I had noticed this error before when entering bars that overhang the end bearings. What is causing this execution error? The error is reported as follows.

Description

FROM:dkemna DATE:Thursday, May 05, 2005 9:55:59 AM

Same bridge as my last incident report. I stumbled upon the R/C POI Wizard and attempted to run my member with all the generated POI's. First an execution error occurs as the last POI generated is "Span 0 - 99.03958". After I delete the last POI it runs fine until the spec checks occur and another execution error occurs telling me that the effective web width cannot be 0. The file runs fine using tenth points alone. Any ideas? Too many points generated?

Use the attached file. To replicate both errors select the "Slab Schedule Full Bar Lengths" member and generate all POI's using the wizard. Delete last POI and run to get the second error. HL-93 Design Review.

### Description

FROM:bgoodrich DATE:Monday, May 16, 2005 1:28:47 PM  
Submitted for Andrea Wargula (Baker in SLC):

What do the brace point warnings mean in BRASS output file?

- \*\* WARNING: The distance to the RIGHT bracing point for analysis point 110.00 is NOT located on the same span as the analysis point. Review input carefully.
- \*\* WARNING: The distance to the LEFT bracing point for analysis point 200.00 is NOT located on the same span as the analysis point. Review input carefully.
- \*\* WARNING: The distance to the RIGHT bracing point for analysis point 210.00 is NOT located on the same span as the analysis point. Review input carefully.
- \*\* WARNING: The distance to the LEFT bracing point for analysis point 300.00 is NOT located on the same span as the analysis point. Review input carefully.
- \*\* WARNING: The distance to the RIGHT bracing point for analysis point 310.00 is NOT located on the same span as the analysis point. Review input carefully.
- \*\* WARNING: The distance to the LEFT bracing point for analysis point 400.00 is NOT located on the same span as the analysis point. Review input carefully.

FROM:bgoodrich DATE:Monday, May 16, 2005 1:30:59 PM

The warnings identify points of interest for which the bracing was not intended to extend into the next span, i.e., inputting a cross frame at or near a support was missed. The warning is general and is printed even for interior support points of interest. For these points, there is no problem.

Complete Issue Information

andy

FROM:kkennelly DATE:5/23/2005 3:23:19 PM

Response sent via email:

Hi Andy,

I've entered your problem as incident 6451 on the Virtis/Opis Technical Support website. I am not sure why that transverse stiffener spec check is being performed at the Support 2 location. Someone more familiar with BRASS LRFD will have to look into this problem.

Krishna

FROM:bgoodrich DATE:Tuesday, May 31, 2005 3:00:18 PM

BRASS performs checks for both bearing and transverse stiffeners at support points of interest. The transverse stiffener schedules exported to BRASS are generated independently of the bearing stiffeners. When the stiffeners at the ends of a range are different, the stiffener with the smallest area is exported. BRASS does not know the transverse stiffener at a finite location, but rather it knows the critical transverse stiffener over a range in which the point of interest is located. The solution to your issue is to use the point of interest overrides, which were provided to address this very issue. Add a POI at each support and override the transverse stiffeners schedule to use the dimensions you supply. Note that these schedule overrides only work from Opis.

What tolerances are you using?

FROM:kkennelly DATE:7/13/2005 10:45:43 AM  
Tolerances received from Tim:

ft - 0.010000  
in - 0.125000  
m - 0.003048  
mm - 3.17500  
mi - 0.01000  
km - 0.01000

FROM:kkennelly DATE:7/13/2005 10:58:52 AM  
I can reproduce this with these tolerances.

FROM:bgoodrich DATE:Friday, March 03, 2006 4:27:25 PM  
I can reproduce this issue in 5.3 with the specified tolerances. However, 5.4 runs successfully. Addressing Incident 6936 corrected this issue. Fixed for 5.4.

Complete Issue Information

FROM:dteal DATE:Thursday, June 16, 2005 1:54:19 PM

For Stephen G. Burnett:

I have entered a steel rolled beam bridge into Version 0.9.0(Beta Build 10) Build date May 26, 2005. In the Analysis Settings, I have check only Strength I and Service I Limit States for the Intermediate Output. Also, I have checked output for all three stages of construction. After I analyze a superstructure member (G1 or G2) the output is for Strength I and II and Service II. In addition, I only receive output for Stage 2 and 3. I have attached the file for this structure.

FROM:jduray DATE:6/24/2005 8:45:40 AM

I believe this is not related to substructure so I am assigning to the Support Center.

FROM:jduray DATE:6/24/2005 8:47:10 AM

FROM:bgoodrich DATE:Tuesday, July 19, 2005 10:54:35 AM

In the intermediate and final output, I see output for stages 1, 2, and 3. In the intermediate output files and the spec checker, I see output only for Strength I and Service I. Therefore, I am unable to reproduce this issue. Please submit further details, BRASS data and output files, etc.

FROM:bgoodrich DATE:Wednesday, August 24, 2005 2:51:01 PM

This is a duplicate of incident 6593.

### Description

FROM:dteal DATE:Tuesday, June 28, 2005 4:23:40 PM

The bridge is a simply-supported, fixed-end, beam-slab. When performing a check of the service stress on the negative moment steel, the moment used for calculation consists of moments from the dead load only. The live load, obviously, applies negative moment to the fixed ends, yet the program does not use this when calculating the service stress on the negative moment steel. It is believed that the service moment is being read only from the "Maximum moment" column, rather than from both the "Maximum moment" and "Minimum moment" columns.

FROM:bgoodrich DATE:Tuesday, July 19, 2005 1:31:01 PM

I was able to reproduce this issue. I will forward it to WYDOT.

FROM:bgoodrich DATE:Wednesday, July 20, 2005 10:16:27 AM

WYDOT assigned this issue to BRASS Problem Log 610.

Description

FROM:gcolgrove DATE:Wednesday, August 10, 2005 1:51:28 PM  
REPORTED BY: Tom Lackey, Project Civil Engineer, VTrans - Structures Section

DESCRIPTION: Bug with spec Check 6.10.10.1.3

COMMENTS: Even though the Specification Reference suggests that the transverse spacing has passed, looking into the Spec Check Detail shows that the min, transverse spacing failed.

FROM:gcolgrove DATE:Wednesday, August 10, 2005 1:51:28 PM  
I have enclosed a picture file that shows the bug. The calculations show that the minimum transverse spacing needs to be 88mm. The data entered is 50mm. The result is show to have failed. The next check looks at the minimum clearance to the edge which in this case passes. The conclusion of this check is that the design failed, however in the Specification Reference it says that 6.10.10.1.3 passes.

1/5/2016 11:07:39 AM

HRS AASHTO

224

Complete Issue Information

I do not believe that the check is looking at both conditions to determine pass or fail.

FROM:bgoodrich DATE:Friday, August 12, 2005 1:21:33 AM  
 I have confirmed this issue and forwarded it to WYDOT for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Monday, August 22, 2005 3:09:22 PM  
 WYDOT assigned this issue to BRASS Problem Log 620.

FROM:bgoodrich DATE:Saturday, August 27, 2005 11:27:33 PM  
 This issue has been addressed in BRASS-GIRDER(LRFD) 1.6.3. Fixed for Opis version 5.4.0.

### Description

FROM:dkemna DATE:Wednesday, August 10, 2005 3:28:09 PM  
REPORTED BY:

#### DESCRIPTION:

It appears that there may be a problem with the export for the Analysis settings when analyzing a P/S-Beam. I have a template that I normally use, but the limit states that are reported are different than those set in the analysis settings. Also, only Stage 3 specs and actions are being reported even though Stage 1 is selected in the analysis settings. I have the bbd file attached and screen shots for the BRASS(LRFD) engine properties that were used. Analyze any member to replicate.

#### COMMENTS:

This may be a duplicate of 6516

FROM:dkemna DATE:Wednesday, August 10, 2005 3:41:55 PM

FROM:dkemna DATE:Wednesday, August 10, 2005 3:52:02 PM

FROM:jduray DATE:8/11/2005 2:31:38 PM

FROM:bgoodrich DATE:Friday, August 12, 2005 2:12:45 AM

There appears to be an error in the 5.3.1 engine properties string. The default string contains defaults that do not match the previous version, i.e., the Stage 1 output is set to 0 (off), Strength I output is set to 0 (off), etc. If the string defaults are going to be changed, I think the SetDefaults function should be changed to match. Finally, the MakePropertyString function is not writing the Camber output flag to the properties string. It looks like the camber flag is read from somewhere in the middle of the string instead of just being appended.

This isn't a BRASS issue, so I changed the status to a Bug - Domain 1.

DESCRIPTION:

"Beam Stresses at Interior Support POI"

COMMENTS:

When selecting "Compute based of P/S Modeling Method" or "Ignore beam stresses" article 5.9.4 is not reported in the specification checks for Stage 3 checks. According to the 5.3.1 Release notes and Help, only the interior support POI should ignore the stress checks. Yet, all POI's ignore stresses. I am not sure what was the intent of the enhancement, but it does not sound like it was supposed to eliminate all stage 3 stress checks. Our problem is that we have to go into the member alternative BRASS (LRFD) properties and select "consider beam stresses" when they used to be checked by default. You should be able to use the attached bridge from my last incident to verify. (A5504\_0810)

FROM:bgoodrich DATE:Friday, August 26, 2005 4:30:33 PM

There appears to be an error in the BRASS engine. I have forwarded this issue to WYDOT.

FROM:bgoodrich DATE:Saturday, August 27, 2005 9:27:19 PM

This issue has been corrected in the engine. Fixed for version 5.4.0.

REPORTED BY:Steve Burnett

### DESCRIPTION:

### COMMENTS:

FROM:dteal DATE:Wednesday, September 28, 2005 10:54:51 AM

I am currently designing a 3-span rolled beam bridge that will be constructed in stages. During one of the stages, one lane of traffic will be carried on a portion of the new deck supported by 3 new girders. The traffic lane for that stage will be 3430 mm. As part of the Opis file, I coded this stage as one of the Superstructure Definitions. I wanted a design check of this stage. I left the LRFD Live Load Distributions Factors blank, which forces the engine to calculate them. When I reviewed the output, I found that the live load values for the interior girder to be zero. Looking at the .DST output file, I found the following.

1. AASHTO LRFD Table 4.6.2.2.2b-1 states that when the number of beams equal 3, the distribution factors for moment in Interior Beams is the lesser of the values obtained from the equation in the table with  $N_b = 3$  or the lever rule. BRASS calculated the equation values correctly. However, with the traffic lane width being less than 3600 mm, it was not able to determine the lever rule value and assigned a value of zero for it. Therefore, when comparing those two values, the result was a live load distribution factor of zero.
2. The live load distribution factors for moment in Exterior Beams are similar to that for Interior Beams with the addition of the rigid cross-section provision. Again BRASS used zero for the lever rule. However, BRASS was able to correctly calculate the rigid cross-section value. When the check was made for the greater of the rigid cross-section or the other, the rigid cross-section value was greater and was the value used. That may or may not be the correct value.

I have calculated the LRFD Live Load Distribution Factors by hand and entered them into the OPIS file.

1/5/2016 11:07:41 AM

HRS AASHTO

233

Complete Issue Information

BRASS will use them instead of computing them.

This is something to keep in mind when designing a structure with a travel way of less than a design lane.

Stephen G. Burnett  
KDOT Bridge Design Section  
Office (785) 296-6468  
Fax (785) 296-6946  
e-mail burnett@ksdot.org

FROM:bgoodrich DATE:Friday, November 11, 2005 4:15:51 PM  
BRASS contains a command for specifying the width of the traffic and design lanes, which are by default 12 ft and 10 ft, respectively. This capability is not currently exposed to the the Opis user through the engine properties, but it could be. An export alternative would be to detect when the total travelway width is less than 12 ft and automatically export the DIST-LANE-GEOMETRY command with adjusted traffic lane and design lane widths.

FROM:jduray DATE:12/5/2005 2:44:41 PM  
I think we should handle it in the export and warn the user the widths are being changed from AASHTO prescribed values.

FROM:bgoodrich DATE:Tuesday, December 13, 2005 9:56:29 AM  
I added the DIST-LANE-GEOMETRY command to the export. For travelways between 10 ft and 12 ft, the lane width is set to the travelway width. For travelways between 20 ft and 24 ft, the lane width is set to half the travelway width. Otherwise, the lane width is kept at the default of 12 ft. Fixed for version 5.4.

 REPORTED BY:Steve Burnett

DESCRIPTION:

COMMENTS:

FROM:dteal DATE:Wednesday, September 28, 2005 2:35:24 PM

From my review of the live load distribution factors on the stage construction of one of my bridges, I have found what I consider an error in BRASS Girder LRFD. For and exterior girder with one design lane loaded, the distribution factor is the greater of the lever rule or the rigid cross-section method. However, BRASS Girder LRFD is also considering the equations in section 4.6.2.2.2. The equations should only be used when two or more design lanes are loaded.

FROM:bgoodrich DATE:Friday, November 11, 2005 4:16:46 PM

Complete Issue Information

The BRASS tools that calculate the LRFD formula distribution factors are structured such that they perform both the one-lane and multiple-lanes calculations at the same time. Both of these distribution factors are shown in the intermediate output as well as the main output file. However, if the travelway only supports one lane (determined by the domain, not the export), only the one-lane loaded distribution factors are considered. This can be seen by how the LOAD-LIVE-DEFINITION command is generated:

LOAD-LIVE-DEFINITION 1, DTK\_HL-93\_~1, DTK, D, 100.0000, 1.0000, ONE, YES

Note the "ONE" on parameter 7. I searched the output and did not find anywhere (other than the input echo) where the number of lanes loaded is shown for a particular vehicle. This would be helpful in the following reports: LIVE LOAD SETTINGS SUMMARY or UNFACTORED GIRDER ACTIONS DUE TO APPLIED LIVE LOADS or both. Currently, it isn't clear as to which distribution factors are actually used for a particular vehicle.

Dean - Please attach a BBD file.

FROM:dteal DATE:Monday, November 21, 2005 2:03:02 PM  
The solution here tos to make it clearer which distribution factor is being used.

FROM:bgoodrich DATE:Monday, December 05, 2005 1:19:42 PM  
I have forwarded this issue to WYDOT for assignment to a BRASS Problem Log.

FROM:bgoodrich DATE:Wednesday, December 07, 2005 5:31:01 PM  
WYDOT assigned this issue to BRASS Problem Log 645.

FROM:bgoodrich DATE:Monday, December 12, 2005 6:34:55 PM  
The two BRASS output reports mentioned above were revised to show the lanes loaded. This was done in BRASS-GIRDER(LRFD) 1.6.3. Fixed for version 5.4.

Description

FROM:dteal DATE:Wednesday, September 28, 2005 4:08:52 PM  
 REPORTED BY:Steve Burnett

DESCRIPTION:

COMMENTS:

FROM:dteal DATE:Wednesday, September 28, 2005 4:09:00 PM

In my review of the live load distribution factors for the stage constructed bridge that I am currently designing, I have found what I consider an error in the BRASS Girder LRFD calculations of the distribution factors. For Girder G3, the third girder of the three girder superstructure that will be carrying traffic during Stage II, it will be an exterior girder during that stage. One of the methods used is the Rigid Cross-Section. One of the components used in the Rigid Cross-Section calculations is the distance from C.G. of girder pattern to C.G. of LL group, (eL Avg.). With the placement of the temporary concrete safety barrier, the eL of the one design lane loaded is 450 mm to the left of the C.G. of the girder pattern. That is on the opposite side of the C.G. of the girder pattern than is Girder G3. Therefore, the rotation portion of the calculation would decrease the Live Load in Girder G3. I believe that the program should use a negative value for eL, (-450 mm). I have attached a portion of the BRASS output file .DST showing the Rigid Cross-Section calculations.

PERFORMING AASHTO LIVE LOAD DISTRIBUTION FACTOR COMPUTATIONS

Method: Rigid  
 Girder of Interest (GOI): 3  
 No. of Girders (Nb) : 3  
 No. Lanes Loaded (NL) : 1  
 Distribution Factor Parameters:  
 C.G. of Girders 2680.000 mm  
 Distance from C.G. of girder pattern to girder:  
 Girder No. Xg, mm

-----  
 1 2080.000

Complete Issue Information

2 0.000  
3 2080.000

Xg(GOI) = 2080.000 mm (Distance from C.G. of girder pattern to GOI)  
SUM(Xg^2) = 0.865E+07 mm^2 (Sum of distances from C.G. of girder pattern to each girder)  
eL Avg. = 450.000 mm (Distance from C.G. of girder pattern to C.G. of LL group)

SUM(eL) = NL \* eL Avg. = 450.000 mm (Sum of distances from C.G. of girder pattern to C.G. of each LL )

Distribution Factor Summary:

NL Xg(GOI) SUM(eL)  
g = -- + ----- = 0.442 [AASHTO LRFD C4.6.2.2.2d-1]

Nb SUM(Xg^2)  
mg = m \* g  
= 1.20 \* 0.442 = 0.530

Notes:

- => The wheel positions reference the left edge of the deck.
- => If the girder of interest is left of the center of gravity of the pattern of girders, the truck(s) will be placed with respect to the left edge of the travel way. Otherwise, the truck(s) will be placed with respect to the right edge of the travel way.

FROM:bgoodrich DATE:Friday, November 11, 2005 4:53:02 PM  
BRASS ignores the presence of any medians/barriers between travelways. The "BRASS" travelway is established as the left side of the left-most travelway to the right side of the right-most travelway as set on the Lane Position tab of the Structure Typical Section window. This is discussed in the Engine Related Help for the BRASS-LRFD engine. Please attach the BBD file if these comments do not address the concern.

FROM:dteal DATE:Monday, November 21, 2005 2:04:30 PM  
To completely understand the problem the attached bbd needs to be reviewed.

FROM:bgoodrich DATE:Monday, December 05, 2005 1:52:52 PM  
I now understand the problem and agree that BRASS is incorrectly calculating the rigid method distribution factor for this structure. I have forwarded this issue to WYDOT for assignment to a BRASS Problem Log.

FROM:bgoodrich DATE:Wednesday, December 07, 2005 5:31:37 PM  
WYDOT assigned this issue to BRASS Problem Log 646.

FROM:bgoodrich DATE:Friday, December 09, 2005 11:27:40 AM  
The live load distribution module of BRASS-GIRDER(LRFD) 1.6.3 was revised to include the sign of the eccentricity of the live load group when determining the rotation contribution to the rigid method distribution factor. Fixed for Opis version 5.4.

### Description

FROM:jihnat DATE:10/13/2005 8:17:47 AM

Email from Jon Herbeck, George Butler Associates

I am currently running OPIS Version 5.2. I have modeled a two span plate girder superstructure. Upon inspection of the Analysis Report for the Dead Load Actions, I cannot find the results for the parapet load.

1/5/2016 11:07:42 AM

REPORTED BY:

Complete Issue Information

DESCRIPTION: When you go to analysis settings and choose BRASS LRFD for the engine and then click on Properties ... the program doesn't seem to pick up the settings correctly for limit states and stages that you select.

For example, if you turn on Strength II and turn off the other limit states, you will get Strength I and III in the output, but not Strength II. Also, even if you choose all three stages (I,II and III), it only seems to give you the output for Stage II (SDL) and III (live load). Stage I (DL) is missing.

COMMENTS:

FROM:kkennelly DATE:10/18/2005 12:57:32 PM  
I think this is a duplicate of 6693. Sabine, please verify that fix for 6693 fixes this problem.

FROM:sboukamp DATE:10/21/2005 2:25:29 PM  
Yes, this is a duplicate of 6693 which has also resolved this problem.

Complete Issue Information

File attached. From my consultant:

For an RC-Slab, when custom load factors are specified the ultimate moment capacity (Mn) becomes 0.0. In the example model the custom LF's were saved with the name "Filled Culvert" and applied to the Superstructure Definition, "Double 5x2 RC Box (2.56' Fill)". When the custom LF's were removed, Mn was computed properly.

From the BRASS output:

w/custom LF's...

POSITIVE Flexural Resistance:

FROM:bgoodrich DATE:Tuesday, November 15, 2005 11:47:34 PM

In addition to the load factors, the LFD Factors window contains a tab for specifying the resistance factors. Because these were not specified, the resistance factors were taken as zero. If you specify your own set of LFD factors, you must enter all the factors, not just the factors you want to override.

FROM:bgoodrich DATE:Wednesday, November 16, 2005 12:45:07 PM  
E-mail from Tim Armbrecht (11/16/2005):

Brian, thanks for the response. I didn't realize that LFD analysis utilizes resistance factors, since that term is more commonly associated with LRFD. Are you referring to the strength reduction phi factors from AASHTO 8.16.1.2.2, like 0.9 for moment and 0.85 for shear?

FROM:bgoodrich DATE:Wednesday, November 16, 2005 12:46:42 PM

I am referring to the strength reduction factors. Virtis has the window tab labeled as resistance factors.

FROM:bgoodrich DATE:Wednesday, November 16, 2005 12:46:59 PM  
E-mail from Tim Armbrecht (11/16/2005):

OK, thanks for the clarification.

## Description

FROM:jihnmat DATE:1/12/2006 3:58:32 PM  
received via email:

I ran the attached file in Opis and am having the following problem. When I do a design check, I am getting several failures in maximum reinforcement in stage 3. For these failures, c is given as over 30 inches, which is much higher than what I get for c. Based on my value for c, the slab is not over-reinforced. I believe Opis is making a mistake when calculating c.

Thank you,  
Adam Price  
Tennessee Department of Transportation - Structures Division  
Adam.Price@state.tn.us

FROM:jduray DATE:Monday, January 16, 2006 6:02:42 PM

FROM:bgoodrich DATE:Tuesday, January 31, 2006 11:42:10 AM

I was able to duplicate the negative flexure analysis where BRASS reports a maximum reinforcement failure that results from its calculation of a "c" depth greater than 30 inches. Please send me any calculations and further discussion that illustrates how you think the calculation of "c" should be done.

FROM:bgoodrich DATE:Tuesday, February 28, 2006 8:42:10 PM  
E-mail from Adam Price (2/27/2006):

1/5/2016 11:07:45 AM

Complete Issue Information

Brian,

I apologize for the delay. I am on currently on educational leave. This bridge has bulb-tee beams, and I am assuming a rectangular bottom flange to calculate c. If I use the standard equation for c:

$c = (A_s \cdot f_y) / (0.85 \cdot f'_c \cdot b \cdot \beta_1)$ , I get 11.08 inches for c. Please let me know if you need anything else.

Thank you,  
Adam Price

FROM: bgoodrich DATE: Monday, March 06, 2006 4:43:01 PM

BRASS-GIRDER(LRFD) considers the contribution of the prestressing strand to the summation of forces in the flexural resistance calculation, which results in the N.A. "c" depth reported in the intermediate output. For your structure, this N.A. depth is much higher than that calculated considering only the mild deck steel. The large N.A. depth results in the maximum reinforcement check failing. I need to discuss this issue with the development team. I'll get back to you after that.

FROM: bgoodrich DATE: Tuesday, February 27, 2007 11:24:47 AM

The maximum reinforcement check of LRFD 5.7.3.3.1 was removed from the spec, so this will not be an issue in future releases. However, the difference in the calculation of the N.A. depth remains. To get the "c" of the user, the engine would have to be modified to provide an option to only consider the mild steel in the deck for negative flexure.

FROM: bgoodrich DATE: Wednesday, July 25, 2007 1:44:50 PM

AASHTO LRFD 5.7.3.3.1 has been removed from BRASS-GIRDER(LRFD) 2.0.0. This will no longer be an issue for Opis 5.6 and higher. The issue with calculating the N.A. depth using only the mild reinforcement in the deck is being reviewed by WYDOT engineers.

FROM: bgoodrich DATE: Thursday, November 15, 2007 8:12:34 AM

The issue with calculating the N.A. depth using only the mild reinforcement in the deck has been added to the BRASS Enhancement List to be prioritized by the users.

## Description

FROM:dteal DATE:Tuesday, February 28, 2006 4:07:23 PM

In the spec checker filter, Spec Articles, I have the very first one, 3.6.1.3.2 Live Load Deflection evaluation unchecked. When I do a review of the failed spec's it still reports Live Load Deflection for Design Ratio and Rating Factor Comps.

Being have this unchecked, they should be filtered out – right?

FROM:jduray DATE:Wednesday, March 01, 2006 9:45:17 AM

Yes, we will investigate. Since we did not make any changes to the spec-check filter for this release this either an old bug or changes within BRASS are causing it.

Dean - did it behave this way in 5.3.1?

Brian - please investigate within BRASS.

Complete Issue Information

FROM:dteal DATE:Wednesday, March 01, 2006 10:35:31 AM  
It didn't work in 5.3.1

FROM:jduray DATE:Thursday, March 02, 2006 10:01:14 AM

FROM:bgoodrich DATE:Sunday, March 05, 2006 3:07:22 AM  
The 3.6.1.3.2 reference in the spec check filter only turns on or off that particular check, i.e., output similar to that below:

PERFORMING AASHTO LRFD SPECIFICATION CHECKS - 3.6.1.3.2 Live Load Deflection Evaluation

Point of Interest : 109.00  
Construction Stage: 2

Input Parameters:

Truck: Deflection D(Trk) = 0.144 in Factor f(Trk) = 1.000  
Lane : Deflection D(Lan) = 0.000 in Factor f(Lan) = 0.000  
gamma LL = 1.000

Deflection Summary:

Deflection = gamma LL \* [D(Trk) \* f(Trk) + D(Lan) \* f(Lan)]  
= 0.144 in

The Design Ratio and Rating Factor checks are separate and controlled by the reference of the same name in the filter window. There is no link in the filter between these references nor has there ever been.

FROM:dteal DATE:Monday, March 06, 2006 9:21:41 AM  
Accepted - there is another incident for the LL Deflection filtering for Rating & Desing reviews VI # 5008

FROM:dteal DATE:Wednesday, November 07, 2007 10:39:02 AM  
7141, 5008, 4979 & 2737 are all related to LL Deflection problems

### Description

FROM:bha DATE:Friday, April 14, 2006 1:35:34 PM  
Bridge Section - MassHighway

In LOAD-LIVE-DEFLECTION command of Brass, its fifth parameter is Allowable Deflection Denominator with the value of 800 (default). My question is how to change to 1000 to satisfy the deflection limit of L/1000.

Thanks,

FROM:bgoodrich DATE:Tuesday, April 18, 2006 3:47:11 PM  
This parameter is not currently exposed to the Opis user through the engine properties.

FROM:jduray DATE:Wednesday, August 02, 2006 8:48:45 AM  
This should probably be added one of the windows but not engine data since it pertains to the spec. Brian will check into where the appropriate place would be.

FROM:bgoodrich DATE:Tuesday, February 27, 2007 11:50:39 AM  
BRASS allows the user to specify the allowable deflection denominator or an absolute allowable deflection in inches. Either one of these values can be input for a particular live load combination such as 1) design truck alone or 2) 25% of the design truck plus the design lane load. The deflection check is really independent of the material, so this input could be placed on the Analysis tab of the Superstructure Definition window. Another alternative would be to put this input on the Factors tab of the Member Alternative Description window, which would provide more flexibility if the user wanted to change this on a material basis.

### Description

FROM:jduray DATE:8/4/2006 11:05:23 AM

The Opis UG ranked this number 1 priority.

Add design capability to Opis for P/S beams. This includes design of the strand pattern including harped and debonded strands (to match current analysis capability). It seems their preference is for this to be added to the engine rather than the design tool. We should consider improving the design tool to make it more useable or remove it.

FROM:jduray DATE:8/4/2006 12:11:57 PM

Suggestions from Ken for strand design:

1 Straight - set by number required at CL beam, Start from the bottom up and outside in

2 debond - rules at end (alt%/max), debond in increments of 5 feet.

3 harp - top down, harp location is set by the designer

|------|---------------|---------|

Description

FROM:jduray DATE:8/4/2006 11:13:00 AM

The Opus UG ranked this number 2 priority.

Add design capability to Opus for steel plate girders. Capability should include sizing of the web depth and flanges for simple and continuous span configurations.

FROM:jduray DATE:8/4/2006 11:14:55 AM

Complete Issue Information

FROM:kobeidat DATE:Monday, August 07, 2006 3:47:13 PM

The sizing should not be only based on weight. The cost of splicing might more than offset the saving in weight. The sizing should use some common sence rules ie saving need to be at least 400lbs of steel to offset 1 added connection. Area of the plates can't be doubled on both side of connection and so on

FROM:mhasan DATE:Saturday, January 20, 2007 2:34:43 PM

As a minimum, the Designer should be able to set the limit on these items: a) minimum web thickness; b) maximum web depth; c) minimum flange width (top & bottom); d) web depth variation/increment control for girder optimization; e) minimum haunch to be used for composite section properties (zero to any preferred value); f) member stiffness control in the +ve and -ve regions (this would simplify verification of results between engines).

Also, provide bearing stiffener design and deck pouring sequence analysis/design check capabilities.

Include girder performance ratio in the output.

### Description

FROM:awaheed DATE:Monday, September 18, 2006 3:13:35 PM

One of our engineers coded a bridge (actually one of LRFD Examples) in OPIS. He tried to save the results but it took really long time. I do not know how he got out of that. I later tried to save results of the same bridge and noticed it was taking exceptionally long (more than 15 minutes) to get out of flipping hour glass. Now few days later, today I noticed two events stored. When I try to delete any one, I get an error (see attached). Why is this problem and how can it be corrected?

thanks,

Amjad Waheed

ORA-01013 Oracle error indicates that an operation has taken a long time in processing (a timeout).

1/5/2016 11:07:48 AM

HRS AASHTO

260

Complete Issue Information

The timeout may have been set in two places:

(1) In Virtis/Opis ODBC connection settings on your machine. Go to Control Panel/Administrative Tools/Data Sources (ODBC), double-click on the ODBC data source that you use when you run Virtis/Opis.

"Oracle ODBC Driver Configuration" window appears. In the window look for "Enable Query Timeout" and un-check it if it is checked.

(2) On the Oracle Server machine. Ask your database administrator (DBA) to verify the settings for sqlnet.expire\_time in the sqlnet.ORA file on the server. Increasing the value in the setting may fix your problem.

Please do (1) first and see if it fixes the problem if it didn't fix the problem then ask your DBA to try option (2).

FROM:mordoobadi DATE:5/21/2007 3:22:00 PM

Since I haven't heard from Amjad since September 2006, I assume that the suggested resolutions have worked.

I will mark the incident as resolved.

Michael Hagos (Manitoba Transportation & Government Services) 204-945-5204 reported the first axle is exported using kn and the other axles are exported using newtons.

FROM:jduray DATE:10/2/2006 1:43:54 PM  
email from Michael:

Hi Jim,

As per our phone conversation this morning, please see the attached input data that was generated using OPIS 5.4 in metric SI units. Under the TRUCK-SPECIAL command the truck axle loads are in mixed unites of kN and N.

Any time line when this might be corrected is appreciated.

Regards,

---

The following comments pertain to the Prestress Properties Dialog:

1. The entry for P/S Transfer Stress Ratio is unclear as it relates to the AASHTO LRFD code. A lot of

## Complete Issue Information

times designers will treat the result of equation 5.9.5.2.3a-1 in terms of a percent of ultimate. I suspect that is the intent of the entry. The problem I am having is when beginner designers ask what this entry is about. The term "P/S Transfer Stress Ratio" does not appear in the AASHTO specs anywhere and the help is not necessarily clear as to what this entry refers to. I think some clarification is all that is needed here.

2. I get numerous questions regarding the term used for the bridge life age (or Final Age). I think this should be labeled as "Expected Bridge Life" and it should be entered in years - not days. This would be more self explanatory.

On another topic:

When using the Prestress Design Wizard, the beams are set up without the "Use Creep" flag marked. (See the "Beam Details" Dialog) a warning pops up that states this flags was not set. This flag is not necessary for simple span prestress members. To eliminate the error you need to set the flag to yes - accept the change - then set the flag back to no - then finally accept the flag once more. The warning does not pop up any more. I think there may be an error when setting up data from the wizard.

FROM:gcolgrove DATE:Thursday, December 21, 2006 8:19:20 AM

FROM:kkennelly DATE:5/7/2007 9:10:42 AM

1. The intent of the P/S Transfer Stress Ratio is not the result of equation 5.9.5.2.3a-1. It is used to estimate the concrete stress at the cg of the ps strands due to prestress force and selfweight immediately after transfer. The LFD spec 9.16.2.1.2 lists this factor as 0.63 for stress relieved strand and 0.69 for low relax strand. The LRFD spec 5.9.5.2.3a listed this factor as 0.65fpu for stress relieved strand and 0.7fpu for low relaxation strand in the 3rd edition. The 2005 interims to the 3rd edition changed this factor to 0.9 of the initial prestress before transfer.

I can't find a better name for this field so I will expand the description in the help.

2. Final age is the term used in the spec so that will remain the label in Opis. I will expand the help to include 'expected bridge life'. It is entered as days in the spec so that is what is used in Opis. If you want to change it to years that is a small effort and you can enter an enhancement request for that.

3. I can't reproduce the problem you are having with the PS Design Tool and the 'Use Creep' setting. Are you talking about the "Prestress Design Tool" available on the toolbar when you have selected the name of a prestress member alternative in the BWS tree?

Need a generic section composer for validation purposes (drawing capability using the mouse and grids).

FROM: jduray DATE: 1/22/2007 7:48:12 AM  
WE will need a more detailed description so we can prepare a rough cost estimate and so it can be

Complete Issue Information  
explained to the users and TF.

FROM:mhasan DATE:Sunday, January 28, 2007 12:15:43 PM

Primarily it can be used for computation of generic section properties that are not supported by Opis/Virtis. Also, it can be used for validation of section properties computed by different engines. Our current process for creating non-standard sections is template dependent and non-generic.

Users should be able to select a standard section from the library or create a non-standard section preferably using grids into the section interface window and subsequently add a haunch, deck and re-bars by use of the mouse. The rectangular co-ordinate system will be considered at this time.

Finally, it can be integrated into Opis/Virtis for use by it's members.

### Description

FROM:bmccaffrey DATE:Tuesday, January 23, 2007 3:16:40 PM

Where are live load stresses reported in BRASS LRFD?

FROM:bgoodrich DATE:Monday, January 29, 2007 11:51:34 AM

There is not a table of just live load stresses. Live load stresses are shown in the SERVICE LIMIT STATE SUMMARY and/or STRENGTH LIMIT STATE SUMMARY in the BRASS output. These are also shown in the intermediate output for a point of interest when a design ratio or rating factor is calculated. Additionally, the same information is available in the "Steel Limit State Summary" in the Opis tabular reports. In some strength cases, only the moment is provided if the stress is not needed according to the spec.

FROM:bmccaffrey DATE:Tuesday, May 15, 2007 9:50:02 AM

When will the 4th edition of the LRFD specs be available in Opis?

FROM:jduray DATE:7/23/2007 10:06:50 AM

Are you referring to BRASS or the new LRFD RC super and sub spec-checker? Brian Goodrich will have to respond regarding BRASS. For the new AASHTO LRFD engine it will be in the 6.0 release.

Description

FROM:bmccaffrey DATE:Wednesday, May 16, 2007 11:26:46 AM

It appears that horizontal shear reinforcement info is not being passed to the engine properly - see attached stage 3 spec check @ 22.08'. I can't tell where 's' came from either.

Use G2.

FROM:bgoodrich DATE:Monday, June 18, 2007 4:36:33 PM

The export finds the first vertical shear reinforcement to the right of the left-most support to establish the spacing of the first range. The export then determines the horizontal shear reinforcement within that range. The range is so small that there is no physical horizontal shear reinforcement within it. The export will need to be revised to determine the horizontal shear reinforcement "near" the range for

| 8001.17068 | Assigned      | The effect of the losses and gains due to elastic deformation |

Description

FROM:kobeidat DATE:Tuesday, May 29, 2007 10:36:32 AM

1- ASHTO LRFD Article 5.8.3.4 allows three methods for calculating shear resistance for pre stressed beam. Which of these methods OPIS allows? Can the user pick which method to use and how? If all the methods are not implemented when do you anticipate incorporating them into OPIS?

2- Have OPIS implemented the new horizontal (interface) shear provisions?

3- Have OPIS implemented variable resistance factor for flexural design?

FROM:kkennelly DATE:5/31/2007 8:38:02 AM

1. Opis currently allows Art. 5.8.3.4.1 Simplified and 5.8.3.4.2 General. The third method 5.8.3.4.3 was added in the 2007 edition of the spec and is not yet implemented. We are working on implementing it, it will probably be available in the release scheduled for this fall.

2. It will probably be available in the release scheduled for this fall.

3. It will probably be available in the release scheduled for this fall.

FROM:kkennelly DATE:6/6/2007 8:10:31 AM

Email from Brian Goodrich on 5/31 indicates "WYDOT has scheduled the next major release of BRASS for August 2007. The

4th edition changes are to be implemented for this version."

| 8087.16982 | New           | Enhancement request: provide an option for pre-2005 AASHTO losses |

### Description

FROM:kobeidat DATE:Tuesday, July 10, 2007 12:23:54 PM

OPIS uses the gross section properties for loss calculations. As such the total elastic loss or gain due to applied loads need to be accounted for as required by Article 5.9.5.2.3. In my review for the out put file about losses I didn't see the results for elastic gains due to loading (live and dead loads) and the adjustments for the use of the gross sections. Are these gains and losses included somewhere else or are they ignored? If they are ignored then we are not following the AASHTO intent in Article 5.9.5.2.3

FROM:dkemna DATE:Thursday, July 19, 2007 10:01:41 AM

I have noticed the same error. BRASS-LRFD appears to be using the Approximate method without gains and losses discussed in the commentary.

FROM:bgoodrich DATE:Wednesday, July 25, 2007 12:24:38 PM

Khalid will be sending me some more information on this issue.

FROM:kobeidat DATE:Wednesday, August 15, 2007 2:22:25 PM

It will be nice to have an option that let the user choose if they want to include the gains or not

FROM: Brian Goodrich DATE: 10/2/2008 9:20:37 AM Mountain Daylight Time

Kuok Chiang (Mass Highway Dept) reported this issue today.

Dear Mr.Lee,

1/5/2016 11:07:51 AM

HRS AASHTO

273

## Complete Issue Information

My name is Kuok Chiang. I work for Masshighway Department's In-house Bridge Design section. I was referred to you by my colleague Elizabeth Befikadu. I want to know if Virtis can calculate the elastic gain of prestress strain due to dead and live load.

I am currently working on a preliminary design of a bridge. I used both Virtis/Opis and Conspan to exploring the prestressed beam options. I created the same bridge in both programs and compared the results. I found that the tensile stresses at the bottom of concrete beam (in Service III limit states) from Virtis output is always higher than the output from Conspan ( 0.765 ksi from virtis vs 0.44 ksi from concspan) even though the Mu is the same (8609k-ft from virtis vs 8628 k-ft from conspan). Since the allowable tensile stress at the bottom of beam in service state III limit state is only  $0.19 \times \text{sqrt}(f'c)$  ( 0.484 ksi in my case), the difference is very significant.

After doing some investigation and hand calculation, I found that the difference was mainly caused by the different prestress loss calculation methods used by the two programs. When calculating the prestress load, Conspan included the elastic gain of the strains caused by the dead load, composite dead load, and live load, while virtis did not. Therefore, the total prestress loss computed by conspan is always less than Virtis. In my case the, the total loss is 24.1% from virtis and 18 % from conspan. The prestress gain is also mentioned in AASHTO 2008 LRFD article 5.9.5.2.3a.

Since the difference in terms of prestress loss is significant, I want to know if virtis has the capability to calculate the elastic gain. Moreover, will it be appropriate to include the elastic gain when designing the beam?

Thank you very much

Kuok Chiang

FROM: Brian Goodrich DATE: 3/10/2009 11:59:37 AM Mountain Daylight Time  
BRASS-LRFD is not being revised to consider elastic gains. WYDOT will be adding the following note to the BRASS-GIRDER(LRFD) Technical Manual:

"BRASS does not calculate elastic gains due to superimposed loads. If elastic gains due to superimposed loads are to be considered as discussed in AASHTO LRFD 5.9.5.2.3a, the user must calculate any elastic gains, specify input (lump-sum) losses, and manually include any elastic gains in the total losses."

## Complete Issue Information

### Steel Wish List.

-Moments at field splices. DL breakdown. Positive and negative LL moments. Basically, components required for splice design.

-Fatigue Detail stress checks. Currently POI's are required at diaphragms and splices. Report stress demand, resistance and design ratios.

I know the above two requests are difficult due to POI entry requirements, but they should be included for steel design programs.

### Prestress Reports

I would like to see reports for shear design that give steel area provided and required at tenth points and user POIs. A report would be needed for vertical shear, interface shear, and longitudinal reinforcement.

Also, I would like to see the flexural strength report change (similar to steel) so that Mu, Mr, and DR are reported at tenth points.

Description

FROM:bgoodrich DATE:Monday, September 24, 2007 7:01:24 PM  
E-mail from Charles May via Mike Watters:

I am trying to get the dead load reactions in each beam for BIN 1013909 (Route 17 over 17k). I keep getting error messages for exterior girders: 2E-G1, 3E-G1, 2W-G1, and 3W-G1 when I do a Design Review (Brass LRFD) with Virtis-Opis with a HL-93 LL. There is no apparent reason for this upon our investigation, even replacing the beam entirely yielded no changes. We realize that the bottom plate on the rolled section is a little different from the rest of the composite sections but changing the bottom plate length changed nothing either. Here are a screen shots of the error message(s) as well as the Virtis-Opis file. Can you please suggest a possible solution. Thanks for your assistance in this matter.

Complete Issue Information

Sincerely,

Charles May

FROM:bgoodrich DATE:Monday, September 24, 2007 7:06:37 PM  
There does not appear to be a problem with your input. The source of the problem may be within the BRASS-GIRDER(LRFD) engine. At this time, I don't have a work around. Did this structure successfully run in a previous version of Opis? If so, which one?

FROM:bmccaffrey DATE:Thursday, September 27, 2007 11:07:29 AM

No, it was an existing bridge used for rating. It's being worked on by a designer and this was the first time it was run through BRASS-LRFD.

I get the same error in 5.6 B4

FROM:bgoodrich DATE:Wednesday, October 03, 2007 11:34:27 AM  
I forwarded this issue to WYDOT on Sept. 24 for assignment to a BRASS problem log.

FROM:bgoodrich DATE:Thursday, October 04, 2007 7:46:54 AM  
WYDOT assigned this BRASS Problem Log 784.

FROM:bgoodrich DATE:Friday, December 14, 2007 12:12:37 PM  
An error was found and fixed in the engine. BRASS-GIRDER(LRFD) 2.0.1 will contain this fix.

| 8394.16675 | Assigned      | Missing Specification Checks for RC - Article 5.5.3.2 |

## Description

FROM:rflango DATE:Tuesday, December 04, 2007 2:04:23 PM

Changed simple span supports definition from pin and roller to two pin supports for Structure Definition #1. Added a temperature load. Temperature load appears in the FE Model and FE Actions but not in the following reports:

- Load Combinations
- Specification Checking
- Result graphs

See attached spreadsheet for more details, "Temperature\_Forces\_in\_Spec\_Check.xls".

FROM:jduray DATE:12/5/2007 9:12:29 AM  
Which bridge?

FROM:rflango DATE:Wednesday, December 05, 2007 4:39:03 PM  
Structure Definition #1, Girder 2. Input revised for pinned supports. Refer to attached .xls file.

FROM: Herman Lee DATE: 6/20/2008 2:01:16 PM Eastern Daylight Time  
I tested Structure Definition #1 G2 (attached bridge) in Beta 4. Temperature loads appear in the Limit States Report, Load Combinations Report and Axial branch of the Results Graph.

Krishna: Looks like Article 5.7.4.5 has been removed from rc girder. Which spec article is applicable to axial loads?

FROM: Krishna Kennelly DATE: 6/24/2008 9:40:51 AM Eastern Daylight Time  
The rc girder uses 5.7.3.2 for bending now, I don't think it considers axial loads in the spec check. Ask Jim for sure.

FROM: Krishna Kennelly DATE: 4/9/2012 1:20:25 PM Eastern Daylight Time  
Estimate also needs to include adding temperature to the 3d analysis.

## Complete Issue Information

### Description

FROM:dteal DATE:Thursday, January 24, 2008 3:46:28 PM  
This report has 2 issues for RC slabs

#### First one:

The deflection value is in inches to one decimal. The Analysis Results tabular report has this to 4 decimals. We need more accuracy than 1 decimal to actually be able to use this report. We convert this value to feet which is then used to construct the camber boards for construction formwork.

#### Second one:

This a total dead load camber summary. In our case , dead load includes the slab, the rail and the future wearing surface. For construction purposes we only use the slab dead load to create the camber boards –

FROM:dteal DATE:Friday, February 15, 2008 11:28:56 AM

If sacrificial wear is defined, that would be included in the above construction loads.

FROM:kkennelly DATE:2/28/2008 2:17:28 PM

Item 1: Fixed for beta 3. Camber output is now to 4 decimal places

Item 2: It is an enhancement to separate the slab/girder dead load from the total dead load camber for RC structures. (Note the RC camber report showing total dead load camber was accepted in Incident 7453.)

For BRASS LRFD, Opis is simply reporting the deflections that it receives from the BRASS LRFD program. Changes have to be made inside BRASS LRFD to pass back the separated dead load camber. That isn't in the current work plan.

Herman, can you check if we are able to separate the girder/slab dead load from the rest of the dead load in Opis Lrfd Engine relatively easily? If we can separate them easily please do it as part of the LRFD RC superstructure work plan. Otherwise it is an enhancement.

FROM:dteal DATE:Friday, April 04, 2008 2:51:36 PM

From the analysis results report - all dead loads are reported individually by dead load case - I guess I don't understand what you mean when you said the defelections aren't there??

FROM:hlee DATE:4/23/2008 9:30:30 AM

Is this request for RC slab only?

FROM:dteal DATE:Monday, April 28, 2008 11:54:07 AM

From: Herman Lee [mailto:HLee@mbakercorp.com]

Sent: Monday, April 28, 2008 9:30 AM

To: Dean Teal

Subject: Incident 8443 (Dead Load Camber Summary Report)

Hi Dean,

Is your request to separate slab dead load from the total dead load camber report for RC slab only?

1/5/2016 11:07:53 AM

HRS AASHTO

283

## Complete Issue Information

Thanks,  
Herman

Yes, Incident 8443 was to get all the dead load cambers separate out making this a useful report for creating plans.

But if it can be done steel and PS also, that would be great. This would save the designer time, they have to find all the DL deflections separately anyway to create a set of construction plans.

FROM:hlee DATE:5/6/2008 1:35:41 PM

Some dead load cases reported by the BRASS LRFD engine are composed of more than one dead load component. For example, in RCTrainingBridge1's Structure Definition #1, the "Girder Weight" load case reported by BRASS is the girder weight calculated using the structural thickness of the top flange. The "Top Flange + Diaphragms" load case is the load from the (total - structural) thickness plus the diaphragms.

Each load case in the Opis LRFD Engine represents one dead load component. Currently, the camber report generation doesn't have engine specific instructions. Domain member results (DoMemberXYResults) also need to be enhanced for storing information for each dead load cases. Since this involves the domain and possibly migration of saved results, I changed the status to Suspended and category to Enhancement.

### Description

FROM:elantzy DATE:Thursday, March 20, 2008 9:12:04 AM

Opis seems to be using old formulas to compute the distribution factors for shear in cross sections type f and g (Concrete Box Beams Used in Multibeam Decks), in the LRFD code. The "new" formulas have been in effect since the third edition of LRFD in 2004. Virtis-Opis still uses the formulas from the second edition.

Shear in Interior Beams - Two or more Lanes Loaded: Missing the (b/1200) factor. If this factor is less than 1, use 1 in the formula. Since our beams are 900 or 1200 mm in width, it shouldn't affect our typical designs.

Shear in Exterior Beams - One Lane Loaded: Virtis-Opis uses the Lever Rule. The third and fourth editions of the code use a formula in which the factor depends on the distance between curb and the

1/5/2016 11:07:54 AM

HRS AASHTO

286

Complete Issue Information

exterior beam.

Shear in Exterior Beams - Two or more Lanes Loaded: The formula for g misses the (b/1200) factor, which again doesn't affect our typical designs. The formula for e is new and includes the width of the girder in addition to the "de" distance. The formula from the third and fourth editions may easily increase the shear due to live load by 15%-25%, compared to the formula from the second edition.

Attached is the a .xml file, showing this issue.

Please advise.

Thank you.  
Eric

Subject: Fwd: V5.6 Virtis/Opis output problem--Brass LRFD engine

Brian,

I just spoke to Woldemichael (ALDOT) for the problems he is having with Opis. The upward deflection problem is due to the transverse continuous beam analysis selection for DL distribution. I'm not able to reproduce the live load moment problem. Could you answer the BRASS live load distribution factor question and also see whether you can reproduce the live load moment problem? His number is (334) 242-6080.

Thanks,  
Herman

Subject:

Dear Herman,

We are currently checking an already built bridge having welded steel plate girders with 4 continuous spans (169ft-210ft-210ft-169ft) as a superstructure based on the current AASHTO LRFD Code. We are using OPIS 5.6 to check our hand calculations. While running OPIS-LRFD program using BRASS Engine (the only engine available for LRFD), we encountered some problems which we hope you can help with.

1/5/2016 11:07:54 AM

HRS AASHTO

288

## Complete Issue Information

The following are the main problems encountered

- The composite dead load (the load due the weight of the barrier rail) seems to cause girder no. 2 and 5 to deflect upwards contrary to the usual assumption.
- The calculation of the Live Load Distribution factors seems to be vague. Please look into the outputs. Since the cross-section varies along the bridge, for our hand calculations, we used a weighed value for the  $K_g$  (Longitudinal Stiffness Parameter) like in the example which you did for the Federal Highway Project. Do we have to consider the presence of the deck slab in areas (over the piers) where shear studs are absent? We decided to leave them out (in contrary to OPIS-LRFD using BRASS) while calculating stiffness parameters.
- The STRENGTH I moments (especially the positive moments) are considerably less for the interior girders than for the exteriors. This is in contrary to our hand calculations and also to our original design based on ASD.
- The same applies to the shear forces and reactions.

Thanks

FROM:bgoodrich DATE:Thursday, April 03, 2008 12:48:39 PM

Regarding the live load distribution factor calculations, BRASS uses the non-composite area and moment of inertia to determine  $K_g$ . Additionally, the distance from the centroid of the non-composite steel beam to the center of the deck is also calculated the same for both non-composite and composite structures per a decision by the Wyoming DOT. Therefore, the slab is considered everywhere in the live load distribution factor calculations as far as BRASS is concerned. Also, the slab thickness used in these calculations comes from Structure Typical Section window and not the ranges entered on the Deck Profile window. As you probably know, the workaround would be to input the live load distribution factor schedules manually.

Regarding the lower moments for the interior girders, this could be due to the uplift due to the transverse continuous beam dead load distribution method that was selected. It could also be due to the difference in the live load distribution factors that you reported. Are the factored actions still different from your design calculations after setting the dead load distribution method to tributary or uniform and manually entering the live load distribution factors?

FROM:bgoodrich DATE:Thursday, April 03, 2008 12:50:23 PM

Regarding your comments about the stiffness term ( $K_g$ ), please submit a brief summary of your procedure (and  $K_g$  specifically) for determining the live load distribution factor for a non-composite steel structure. Send any supporting hand calculations or spreadsheets that you might have. This will help

## Complete Issue Information

when I discuss this issue with WYDOT.

I investigated the difference in the live load moments between the exterior and interior girders. For some of the regions along the girder, BRASS is calculating a higher live load distribution factor for the exterior girder than the interior girder. For the exterior girder, the lever-rule is invoked and controls over the rigid method. These distribution factors are greater than those calculated for the interior girder in some of the positive moment regions. Was the lever-rule considered in the original design?

It also appears that some of the LRFD distribution factors were overridden with the lever-rule values because one of the range-of-applicability checks was not satisfied. For some cases, the  $K_g$  term is greater than the range specified in the specification. If this did not occur, more regions along the girder would have greater live load moments for the exterior girder than the interior.

To: Brian L. Goodrich  
Subject: V5.6 Virtis/Opis output problem--Brass LRFD engine

Brian,

As I said earlier, I used more or less the same method used by Baker for the determination of the stiffness term ( $K_g$ ).

Later, I varied  $K_g$  (with and without the slab over the pier region) and recalculated DF, there was only slight change in the final moments. I think the problem lies in the calculation of the live load moments themselves.

Does OPIS use both TRUCK (or TANDEM) and LANE moments or only one of them for the determination of critical values? I have compared my values with the LRFD Moment & Shear Table from the Minnesota DOT (see attached). This is what I get.

Taking Effective Span of 130 ft (Span I,  $L=169$  ft), the Strength I maximum positive moment,  $M_I = 3252*1.25 + (2060*1.33 + 1352)*1.75*0.8 = 9794$  kip-ft.

Where the first term,  $3252*1.25$ , is the dead load component and the second  $(2060*1.33 + 1352)*1.75*0.8$ , is the live load component with  $DF=0.8$  (weighted). The actual live load moment is even higher (loading Span III according to influence lines for the positive moment in Span I). I get 10,600 Kip-ft. OPIS gives a value which is less than 8,000 Kip-ft for the Strength I maximum positive moment in Span I taking  $DF=0.8$ .

Regards,

Berhanu

FROM:bgoodrich DATE:Thursday, April 03, 2008 12:51:24 PM

I ran the member alternative for G2. Then, I opened the Analysis Results window and found the maximum Strength I positive moment in Span 1 is 9836.27 ft-kips. I don't see the moment that you mentioned that is less than 8000 ft-kips. Please send a screen shot that shows this lower moment.

BRASS analyzes the truck, tandem, train, and lane loads individually and then combines them as

outlined in the LRFD spec using the appropriate factors.

FROM:bgoodrich DATE:Monday, April 07, 2008 10:39:18 AM  
E-mail from Herman:

Berhanu and Brian,

I ran the steel structure's G2 member alt in the bridge file attached in Incident 8540 with both the Virtis/Opis software and Opis only software. I'm not able to duplicate the low moments shown in Berhanu's pdf file (cordovam2.pdf). One thing I noticed is that the screen capture in the pdf file show "TEST STEEL", the bridge file attached in 8540 is "WB B017775".

Brian - May be comparing the BRASS input data file will know the difference.

Herman

FROM:bgoodrich DATE:Monday, April 07, 2008 10:40:22 AM  
E-mail from Herman:

I ran the steel structure's G2 member alt in the "02559 - TEST\_STEEL.xml" bridge file and compared the BRASS input data file with "02559-WB-B017775.xml".

The differences are as follows (TEST\_STEEL vs. WB-B017775):

1. Stage 1 dead load distribution method (Tributary area vs. Transverse continuous-beam)
2. Stage 2 dead load distribution method (User defined member loads vs. Uniformly distributed to all girders)
3. Support 1 horizontal restraint (Free vs. Restrained)
4. Support 3 horizontal restraint (Restrained vs. Free)
5. Live load distribution factors schedule (Entered vs. Calculated by BRASS)

Attached is a screen capture of the Strength I results on Page 129 between the two bridge files. Please note that my TEST\_STEEL results doesn't match those listed in cordovam2.pdf.

Brian - Could you double check my comparison?

Thanks,  
Herman

FROM:bgoodrich DATE:Monday, April 07, 2008 10:40:44 AM  
Attached BRASS data files from Berhanu.

After reviewing the BRASS data files that Berhanu sent, I think I have figured out the source of the low moments. In the export to BRASS, the scale factor is being set to 0.8333 for ALL the trucks instead of just the fatigue truck. I'm not sure why this doesn't happen when Herman or I run version 5.6. This issue has already been fixed for the upcoming 5.6 service pack.

FROM:bgoodrich DATE:Tuesday, April 15, 2008 10:33:41 AM  
The service pack for 5.6 has been cancelled. This fix will be available in version 6.0.

Complete Issue Information

FROM: bgoodrich DATE: Thursday, April 17, 2008 10:42:25 AM  
Another user reported the incorrect scale factor:

Subject: Virtis 5.6 Scaling Factor Question.

Hello,

I'm a graduate student at Auburn University, working for AL-Dot on a project doing a comparative study between LRFR and LFR. As requested by AL-Dot we're using Virtis for the actual analysis of our bridge database. I was wondering if you could answer a question I have regarding the use of the scaling factor. It seems that when the scaling factor is set to 1, under the advance options for analysis, that a factor of 5/6 is actually applied to the live load of the structure. And that when the factor is set to 1.2 (6/5) the factor applied to the live load is 1.0. It seems then by default, scaling factor set to 1.0, that a reduction is applied to live load when running analysis, producing non-conservative results. I was just curious about why the factor by default reduces the load by 5/6.

Thank you for any help you can give.

Michael Murdock

334-319-2621  
murdomb@auburn.edu

FROM: bgoodrich DATE: Thursday, April 17, 2008 10:44:32 AM

The 0.833 scale factor should be applied only to the LRFD fatigue vehicle to remove the multiple presence factor of 1.2 from the one-lane loaded distribution factors in the live load analysis. If you are seeing this 0.833 scale factor for any other vehicles, this is a known issue that we have already addressed for the next release of Virtis.

If this is not the condition you are experiencing, then we should discuss your issue. It may be necessary for you to export your problem bridge to an XML file, take some screenshots that illustrate the problem, and send these files to me. This will help the development team duplicate your issue.

FROM: bgoodrich DATE: Thursday, April 17, 2008 10:44:53 AM

I just got off the phone with Michael Murdock. He is indeed getting the 0.833 scale factor applied to all the vehicles. For now he is going to try to input a 1.2 scale factor to negate that effect.

### Description

FROM:elantzy DATE:Wednesday, April 23, 2008 11:05:32 AM

Greetings,

There seems to be an issue with the "phi" calculation (interpolation) for the Flexural Resistance Factor in Art. 5.5.4.2.1 in a metric run.

Specifically, in the attached run, looking at POI 205 the Tensile Strain is 0.003111 which is within the 0.002-0.005 range but the interpolation fails and gives a Phi value of 0. This causes the Factored Flexural Resistance to equal zero, leading to a bunch of failures in the spec check.

When switched to US units the Phi calculations are correct.

Eric

FROM:elantzy DATE:Wednesday, April 23, 2008 11:29:03 AM

The POI of 205 is for G2....I may have left the units US...switch back to SI to see issue.

Thanks.

FROM:dkemna DATE:Friday, June 06, 2008 9:42:10 AM

A user in our office found what I believe is an error in the factored moment used when checking minimum reinforcement for the noncomposite stage. It appears that BRASS (LRFD) makes two checks for minimum reinforcement during stage 1. One check uses the minimum factored dead loading. The other check uses a number that cannot be verified as the maximum factored loading (732.782 k-ft?). Shown below is BRASS (LRFD) output giving a value of 610.652 k-ft for the max factored action. A second snippet of BRASS output shows that the 732.782 number is used? Please let me know if BRASS (LRFD) is in error or if the other value is the result of a calculation not shown in the output.

Point of Interest : 105.00

Now, for the check:

PERFORMING AASHTO LRFD SPECIFICATION CHECKS - 5.7.3.3.2 Minimum Reinforcement (Ductility)

Complete Issue Information

Point of Interest : 105.00  
Construction Stage: 1

POSITIVE Flexure Sense:

Input Parameters:

Mcr = 12274.499 in-k = 1022.875 ft-k  
Mu = 8793.387 in-k = 732.782 ft-k  
Mr = 15550.404 in-k = 1295.867 ft-k

Calculated Values (Adjusted to positive sign):

Mcr = 12274.499 in-k = 1022.875 ft-k  
Mu = 8793.387 in-k = 732.782 ft-k  
Mr = 15550.404 in-k = 1295.867 ft-k

FROM:dkemna DATE:Friday, June 06, 2008 10:02:20 AM  
The analysis is run for the P/S-I Girder Shape on G1.

FROM:bgoodrich DATE:Wednesday, June 11, 2008 10:03:27 AM  
The Minimum Reinforcement check is performed once for each stage using the critical factored moment from all strength limit states. The source of the 732.782 ft-k moment is the Strength IV limit state. See the note at the end of the Minimum Reinforcement check.

=> The Mu value shown here is the critical factored moment based on ALL dead and live load combinations for the Strength limit states. See the CRITICAL LOAD EFFECTS FOR ALL DEAD AND LIVE LOAD COMBINATIONS reports for these factored moments.

FROM:dkemna DATE:Wednesday, June 11, 2008 10:20:41 AM  
Thanks. I dropped the ball on this one.

FROM:dkemna DATE:Wednesday, June 11, 2008 11:37:24 AM  
On Second thought. I only selected one Strength load combination for analysis (Strength-I). There is no information in the BRASS Output for Strength-IV calcs or the report mentioned above. It seems that BRASS (LRFD) is doing an unnecessary and unreported calc if only Strength-I is selected for analysis.

FROM:bgoodrich DATE:Wednesday, June 11, 2008 12:41:32 PM  
How did you select only the Strength I load combination for analysis? Please let me know the window and tab name.

FROM:bgoodrich DATE:Wednesday, June 11, 2008 1:46:34 PM  
E-mail from Darren Kemna:

In the Analysis Settings:  
Engine tab==> Select BRASS LRFD from Drop-down==>Click "Properties" button==>"Intermediate Output Options" tab==>O.K.==>Apply

I have a template that selects Strength-I, Service-I and Service-III only.

The output options you set in engine properties just control which output is written to the BRASS output files and to the Opis specification check results. For P/S, calculations for Strength I-IV, Service I & III, and Fatigue are all performed.

There is a mechanism in BRASS for excluding certain limit states and even specific spec checks, but these are not exposed to the Opis user at this time. See the MAP-LIMIT-STATE and MAP-SPEC-CHECK commands in the command help for BRASS-GIRDER(LRFD).

FROM: Krisha Kennelly DATE: 8/11/2008 11:04:33 AM Eastern Daylight Time  
Logic in Art 5.8.2.5 is not correctly determining when stirrups are required.

If  $V_u > 0.5 * \phi (V_c + V_p)$  (Eq 5.8.2.4-1) then stirrups are required and then Eq 5.8.2.5-1 should be checked.

Attached bitmap is from BID11, Structure Def 1, G1

Description

FROM: Krisha Kennelly DATE: 8/13/2008 8:24:15 AM Eastern Daylight Time  
 Submitted on behalf of David Warner, Montana, at the user group meeting.

BRASS LRFD engine spec has the following status: Fail, General Computation, Pass That allows users to filter the column in the spec check details list view and see all of the "Fails" at the top.

Opis RC LRFD engine has: Computation, Fail, Pass When users sort the column the Fails don't show up at the top of the list. Users are used to seeing the Fails at the top from BRASS so they think everything passed since Computations show up at the top.

Complete Issue Information

Revise "Computation" to "General Computation" for the Opis RC LRFD engine.

FROM: Krisha Kennelly DATE: 8/13/2008 8:40:12 AM Eastern Daylight Time

FROM: Joseph Ihnat DATE: 8/13/2008 10:21:35 AM Eastern Daylight Time  
Fixed for 6.1.0 and 6.0.1

FROM: David Warner DATE: 8/29/2008 10:10:38 AM Eastern Daylight Time  
I see this is fixed now. In Oklahoma it needed work, Thank you.

FROM: Xinmei Li DATE: 5/28/2009 2:16:07 PM Eastern Daylight Time  
Verified fixed for 6.1 Beta1.

Description

FROM: Krisha Kennelly DATE: 8/25/2008 9:14:04 AM Eastern Daylight Time

Article 2.5.2.6.2 always prints out the Pedestrian deflection even when no pedestrian load was applied.

Complete Issue Information

If no pedestrian load was applied the deflection prints out as zero (which is ok) but the critical design ratio ends up belonging to the design truck + ped. This is incorrect since no pedestrian load was applied.

Refer to BID 11, Structure Def 1, G1 for the following at 28':

deflection

Des Truck -0.103  
Ped 0.0

| Vehicle                   | Deflection (inch) | Deflection Limit (inch) | Design Ratio | Pass/Fail |      |
|---------------------------|-------------------|-------------------------|--------------|-----------|------|
| Design Truck              | -0.103            | 0.600                   | 5.802        | PASS      |      |
| Pedestrian + Design Truck | -0.103            | 0.480                   | 4.641        | PASS      | <=== |

gets reported as critical design ratio in reports

It would be better to not print out the pedestrian deflection if no pedestrian load is applied.

FROM: Xinmei Li DATE: 8/25/2008 9:58:21 AM Eastern Daylight Time  
Fixed.

FROM: Srujana Thogaru DATE: 5/28/2009 4:10:43 PM Eastern Daylight Time  
appears to be corrected for 6.1V - Beta 1

FROM: Krisha Kennelly DATE: 9/10/2009 1:19:11 PM Eastern Daylight Time  
tested and accepted in the acceptance build for 6.1

Description

FROM: David Warner DATE: 8/27/2008 12:56:28 PM Eastern Daylight Time  
 BRASS Specification Checking. Little grey box display; lacks spec reference. When Design Ratio Computations fail, the little grey box has no reference to what calculation was used.

It time consuming to find where the numbers come from. See screen capture. How hard is it to put the AASHTO reference in the little grey box? If the little grey box simply had more specification reference information it would save time.

I know the little grey box in my screen capture pulled information from 6.10.8.2.3. Why doesn't the little grey box say that?!!!

FROM: Brian Goodrich DATE: 8/27/2008 11:42:09 AM Mountain Daylight Time  
 The BRASS results output was not designed to be viewed as individual items as is allowed in Opis. For example, the design ratio block was written after the output showing how the corresponding resistance was calculated. These blocks are not currently tied together in Opis. Within the Opis specification check viewer, the results are first displayed in the order in which they were written by the engine. The list can be sorted to find all the fails for instance, but there is currently no mechanism to return the list to its original order while keeping the focus on one particular spec check, which would allow the user to see the other spec checks immediately before and after the one with the focus. Options to address this are:

Complete Issue Information

1. Show the spec references in the Design Ratio Computations output block. Changes would have to be made to the BRASS engine.
2. Revise the spec check list so it can return to the original order while keeping the focus on the selected spec check. Changes would need to be made to the GUI only.
3. Revise the results to show a larger block of results containing multiple spec checks, i.e., a parent block of results holding child blocks of results. Changes would need to be made to the BRASS engine as well as the Opis results object.

FROM: David Warner DATE: 8/29/2008 10:50:08 AM Eastern Daylight Time

I like option #2, contingent on one thing. Please let me know if #2 is the cheapest enhancement. I think it's the cheapest, but if you could tell me you feel it's the cheapest route, I think it will solve this minor "lack of display" problem.

2. Revise the spec check list so it can return to the original order while keeping the focus on the selected spec check. Changes would need to be made to the GUI only.

Thank you,

Dave

FROM: David Warner DATE: 9/12/2008 12:51:07 PM Eastern Daylight Time

Brian,

I really appreciate your thorough description of options with this.

Is there anyway to request that this be turned into an enhancement?

Thanks

FROM: David Warner DATE: 9/17/2008 10:17:43 AM Eastern Daylight Time

If I put "ACCEPTED" in the track field how does that affect this enhancement?

FROM: Herman Lee DATE: 9/19/2008 11:53:15 AM Eastern Daylight Time

This will still be an enhancement request. It will be nice if you also put a brief comment here for the "ACCEPTED" Track field.

### Description

FROM: David Warner DATE: 8/29/2008 1:00:13 PM Eastern Daylight Time

There may be an english to metric unit's problem. See attached JPEG.

Modulus of Rupture, 5.4.2.6. In metric units hasn't changed from 2005 - 2007.

It should have a range of  $0.63$  to  $0.97 * f_c'$ , with  $f_c'$  in MPa.

My deck concrete is 31MPa. so range should be about 20 to 30 for modulus of rupture.

I have a new design ratio failure now that Virtis Opis 6.0 is installed. My bridge used to have no design ratio failures in version 5.6.

I think there's a problem with Ksi and MPa units in Negative moment deck steel. 6.10.1.7 says look up

1/5/2016 11:07:58 AM

Description

FROM: David Warner DATE: 9/11/2008 4:03:00 PM Eastern Daylight Time  
After analyzing a Prestressed girder, Concrete stresses which do not contain Prestress stresses, Where are these located? DC+DW+LL(IM) but no Prestress. All in units of MPa. See attached Picture.

FROM: Brian Goodrich DATE: 9/12/2008 9:11:52 AM Mountain Daylight Time  
BRASS-LRFD calculates the Service I compressive stresses and Service III tensile stresses for each point of interest along the structure. BRASS-LRFD combines the stresses due to dead load, prestressing, and live load using the factors applicable to each limit state. Please clarify the question.

FROM: David Warner DATE: 9/12/2008 12:01:11 PM Eastern Daylight Time

## Complete Issue Information

Attached are the bridge xml and a screen capture (untitled2.jpg). The screen capture may be the clarifying question we need to proceed.

Thanks

FROM: Brian Goodrich DATE: 9/12/2008 4:24:30 PM Mountain Daylight Time  
Thank you for the screen shot.

Herman - The text in the results tree is misleading. The "Dead Load Only" item should include PS. These tree item strings are not generated by BRASS, so I am assigning this back to you.

FROM: Herman Lee DATE: 9/15/2008 12:21:42 PM Eastern Daylight Time  
May, when you modify the text, make sure it only affects "Factored Dead & Prestress".

FROM: David Warner DATE: 9/16/2008 10:44:57 AM Eastern Daylight Time  
So there's no quick spot in the output to get dead load only stresses? DC1, DW, Girder Self Weight?

There's PS always included?

Thanks

FROM: David Warner DATE: 9/17/2008 10:41:14 AM Eastern Daylight Time  
I've attached some screen captures of what I'm talking about. "XML Report Crawler.jpg" The screen capture's two output files are point 105.00 opened twice.

$A(\text{MPa}) = B \text{ (both B's added up) / (Divided by C)}$       See crawler.jpg

So if instead stresses due to girder self weight only, divide the B on the left (DEAD) by the C value and we have Girder self weight stress.

Since the information is contained in the output files, and my screen captures show where, could we dialogue about this being an output enhancement.

It's hard to explain to my engineer's where to look through these text files. They need a quick repeatable report that doesn't involve text surfing.

Let's dialogue about enhancement options. to find DC, DW, Girder Wt, Haunches + Diaphragms, etc... (Stresses)

FROM: Herman Lee DATE: 9/19/2008 9:10:36 AM Eastern Daylight Time  
May, please change the Status to Suspended and Category to Enhancement after you modified the text as Brian Goodrich suggested.

Dave, is this output enhancement request for BRASS output file only OR you would also like to see these uncoupled stresses in Opis user interface?

FROM: David Warner DATE: 9/23/2008 1:31:28 PM Eastern Daylight Time  
Hmmm. I think I am only interested in seeing these as an uncoupled stress in OPIS.

I know where to look in the BRASS output.

1/5/2016 11:07:58 AM

HRS AASHTO

Complete Issue Information

For some engineers the BRASS Ouput is fine. Still, other engineers look for the point, click, results which seem to me to mean grabbing BRASS Output and showing it in OPIS.

I appreciate your help Herman.

Dave W.

## Complete Issue Information

---

### Description

FROM: David Warner DATE: 9/11/2008 4:35:47 PM Eastern Daylight Time  
I didn't attach the three bridges as this is a fairly simple question.

Did the live loader change from 5.6 to 6.0?

I have three steel girder bridges all now with spec check failures which all passed spec check in 5.6. Obviously failures could be due to code changes, but all three of these bridges will not be done with the 2007 code, but with the 2006. One bridge now has live load deflection failures where it did not before. The other two bridges have compression flange strength 1 issues at the pier.

Thanks,

Dave.

FROM: Herman Lee DATE: 9/11/2008 4:48:06 PM Eastern Daylight Time  
Both 5.6 and 6.0 have the same BRASS LRFD Engine (Version 2.0.0). The engine uses the 2007 LRFD spec.

FROM: Brian Goodrich DATE: 9/12/2008 9:24:11 AM Mountain Daylight Time  
Herman is correct regarding the same engine being used. Please attach a bridge for each of the differences you indicated.

FROM: David Warner DATE: 9/12/2008 12:14:06 PM Eastern Daylight Time  
Those XML's sure do zip down small! I attached all three in a zip file. Hopefully they unzip ok. It's these three bridges that are now showing spec check failures, weren't in 5.6, and won't be designed with the 2007 code. The engineers for these bridges first want me to ask if the live loads have changed from 5.6 to 6.0. If the loads are the same, then those engineers will dig through the code and document where differences from 2006 to 2007 are irrelevant to their 2006 design. I look forward to the OPIS LRFD engine with it's spec check seperated from the engine!

Thanks

FROM: Brian Goodrich DATE: 9/12/2008 4:34:12 PM Mountain Daylight Time  
The live loads did not change from 5.6 to 6.0 with respect to Opis. However, there were changes for exporting live loads from Virtis to the BRASS-LRFR engine. Also, please attach the bridge files from the 5.6 version.

FROM: David Warner DATE: 9/16/2008 10:54:05 AM Eastern Daylight Time  
I'll have to ask Paul Jensen when he's in to help me get those bridges back to the 5.6 version. They are all currently in 6.0. I'm not sure if I can get them back into 5.6. To be continued...

FROM: David Warner DATE: 9/16/2008 6:01:14 PM Eastern Daylight Time  
OK, Back to my original question. Did live loads change?

The following proves that Live loads have infact increased, Substantially.

I've scanned my design file. I've attached my excel spreadsheet containing OPIS 5.6 Results - LL

|------|---------------|---------|

### Description

FROM: David Warner DATE: 9/23/2008 5:18:02 PM Eastern Daylight Time  
Do Pedestrian Loads get added in for Analysis?

I have an Engineer who after entering Outlandishly high pedestrian loads, and making pedestrian loads zero, got the exact same results.

FROM: Herman Lee DATE: 9/24/2008 10:19:02 AM Eastern Daylight Time  
The BRASS LRFD engine applies the pedestrian load as an additional live load with no impact. The pedestrian live load is always the last live load. I don't think the pedestrian live load is combined with other live loads in the BRASS LRFD engine.

The Opis LRFD engine also applies the pedestrian load as an additional live load and the pedestrian live load is combined with other live loads (e.g. Design Truck + Pedestrian, ...).

FROM: David Warner DATE: 9/24/2008 11:06:57 AM Eastern Daylight Time  
Ok Thanks.

FROM: David Warner DATE: 9/24/2008 12:26:00 PM Eastern Daylight Time  
OK. Try this. Use the attached bridge. Superstructure Definition "ENGLISH STEEL - 142-178-178-142 7/16/08 ratings not included"

It currently has an 85 ksf pedestrian load. in the Structure Typical Section.

If you analyzed the Girder 5 which has the sidewalk over it. (See Structure Typical Section Schematic)

Then look at Strength 1 reactions, or moments at say the pier and the abutment.

Then make the pedestrian load 500 ksf, analyze it, and look at the same strength 1 results, it should go up, but it does not.

What am I missing?

Thanks.

FROM: Herman Lee DATE: 9/24/2008 1:36:04 PM Eastern Daylight Time  
As mentioned in the F1 Help, the Pedestrian Load in the Sidewalk tab of the Structure Typical Section window is only used in the substructure module. The superstructure module uses the Pedestrian Load in the Member window. Since you are using Virtis/Opis/OpisSub, the Pedestrian Load column is available in the Sidewalk tab.

Description

FROM: David Warner DATE: 9/30/2008 12:58:07 PM Eastern Daylight Time

The moment Gradient Modifier for this particular 3 span steel bridge is wrong. In a location where the bridge contains perfect symmetry, from the pier bearing out to the first cross stiffener, basically facing in from pier 2 or pier 3 to the center span, the Cb factors are different. One side says 1.287 while the other side says 1.013. See attached PDF's front page for hand sketch.

After a closer inspection one can see that at Point 200, where the moment should be sloped and the f1, fmid, & f2, should all be curving, as they are in Point 300, well back at point 200 f1 is the same as fmid. this is wrong, why are point 200 and point 300 using much different Cb factors where they should be the same?

Attached is the PDF's which are scans of the necessary Brass output to support the simple drawings on the first page of the PDF's.

The bridge XML is zipped in VI#8875, Desktop.zip. #15223 - I90307\_06281.xml.

FROM: Brian Goodrich DATE: 9/30/2008 12:23:43 PM Mountain Daylight Time

This issue has already been corrected in BRASS-GIRDER(LRFD) 2.0.1. This version is not yet available to Opis users but should be soon.

FROM: David Warner DATE: 10/1/2008 2:20:46 PM Eastern Daylight Time

OK. I'll accept this when a new version of OPIS is available which uses BRASS 2.0.1.

 Received Bridgeware support e-mail:

=====  
 Jim, You may already be aware of this, but there is an error in the Brass data file that Opis prepares when using a bulb-tee beam with a flat area on the underside of the deck. I am including information to document this error.

Also included is an export of the Opis file.

If this is not already logged as an error, I will be happy to do it. Just wanted to check with you first.

If you have any questions, please let me know.

Description

FROM: Todd Thompson DATE: 10/15/2008 12:59:36 PM Eastern Daylight Time  
I have a 6 span, 7 girder, steel girder bridge that when I do a Design Review with LRFD, I get an error message that there is an interpolation error occuring when positioning live load for critical actions.

I've attached the bridge.xml file and printouts of the error message I get.

it seems to run LFD analysis ok.

FROM: Todd Thompson DATE: 11/5/2008 11:20:40 AM Eastern Standard Time

Complete Issue Information

TST 11-5-2008

Looking for a status update on this incident.

FROM: Brian Goodrich DATE: 11/5/2008 12:57:43 PM Mountain Standard Time  
This interpolation error within the BRASS LRF engine was assigned to Problem Log 826.

FROM: Brian Goodrich DATE: 11/5/2008 1:12:23 PM Mountain Standard Time  
I found one workaround. Change the wheel advancement denominator in the member alternative engine properties from 100 to 98.

FROM: Brian Goodrich DATE: 11/20/2008 9:18:41 AM Mountain Standard Time  
The interpolation error has been corrected in the engine. Fixed for version 6.1.

## Complete Issue Information

The 2007 AASHTO Code, section 3.6.1.6, reads

### 3.6.1.6 Pedestrian Loads

A pedestrian load of  $3.6 \times 10^{-3}$  MPa shall be applied to all sidewalks wider than 600 mm and considered simultaneously with the vehicular design live load.

#### C3.6.1.6

See the provisions of Article 3.6.1.1.2 for applying the pedestrian loads in combination with the vehicular live load.

#### 3.6.1.1.2 Multiple Presence of Live Load

For the purpose of determining the number of lanes when the loading condition includes the pedestrian loads specified in Article 3.6.1.6 combined with one or more lanes of the vehicular live load, the pedestrian loads may be taken to be one loaded lane.

How does Opis handle Multiple presence factor with respect to pedestrian live loads?

If the designer is entering only a girder line distributed load for pedestrian loads (see attached picture), that leads a designer to think that Opis is ignoring multiple presence. Pressing F1 when entering pedestrian live loads brings up the following.

"Pedestrian load

Enter the pedestrian live load acting on the member, in units of force per length of member."

Please explain how the following multipliers are used: (1.2\*=1 lane; 1.0\*=2 lanes; 0.85\*=3 lanes; 0.65\*=4 or more lanes.)

How is Opis using pedestrian loads in combination with lane loads?

FROM: Brian Goodrich DATE: 12/2/2008 9:01:39 AM Mountain Standard Time  
BRASS does not perform the pedestrian load analysis according to the LRFD Specifications. This is a known issue that has already been assigned to BRASS Problem Log 572.

BRASS currently applies the pedestrian load to the structure and multiplies the resulting actions by the distribution factors (input by the user or calculated by BRASS). The pedestrian load is not combined with any other load.

Two issues must be addressed. First, the LRFD formula distribution factors already contain the multiple presence factors, which must be backed out to get the base distribution factor. However, for multiple lanes loaded, what multiple presence factor should be backed out when you don't know the number of lanes that was critical. It could be 2, 3, or more. Second, the spec states that the pedestrian load is one loaded lane, but how much of that lane gets distributed to a particular girder?

I have forwarded this incident to WYDOT.

Description

FROM: Khalid Obeidat DATE: 12/1/2008 1:34:36 PM Eastern Standard Time  
We need to show the anchorage zone calculations for bursting steel. See below:

5.10.10.1 Factored Bursting Resistance

The bursting resistance of pretensioned anchorage zones provided by vertical reinforcement in the ends of pretensioned beams at the service limit state shall be taken as:

$$Pr=fsAs \text{ (5.10.10.1-1)}$$

where:

fs = stress in steel not exceeding 20 ksi

As = total area of vertical reinforcement located within the distance h/4 from the end of the beam (in.<sup>2</sup>)

h = overall depth of precast member (in.)

The resistance shall not be less than 4 percent of the prestressing force at transfer.

The end vertical reinforcement shall be as close to the end of the beam as practicable.

FROM: Brian Goodrich DATE: 12/2/2008 8:44:44 AM Mountain Standard Time  
I have forwarded this issue to WYDOT for consideration in BRASS.

FROM: Brian Goodrich DATE: 5/28/2009 12:01:31 PM Mountain Daylight Time  
WYDOT has added this issue to the list of BRASS enhancements.

FROM: Jim Duray DATE: 6/4/2009 8:17:42 AM Eastern Daylight Time  
This request only applies to the AASHTO LRFD/LRFR engine (per TAG 6/4/09).

FROM: Krisha Kennelly DATE: 10/20/2010 10:22:01 AM Eastern Daylight Time  
Note that the AASHTO LRFD Spec 5th edition references both vertical and horizontal reinforcement for boxes and tubs and voided slabs.

Mild reinforcement cannot currently be entered in Opis for prestressed beams.

FROM: Herman Lee DATE: 7/26/2011 12:57:48 PM Eastern Daylight Time  
Resolved for the 6.3 release (AASHTO Engine only).

### Description

FROM: Herman Lee DATE: 12/5/2008 1:11:30 PM Eastern Standard Time  
Both BrassLrfdLoadControl.cpp and BrassStdLoadControl.cpp uses  
CEngineExport::GetStructDefLanesLoaded to determine whether it's single lane loaded.  
GetStructDefLanesLoaded should only check to use Std Spec or MCEB if the call is coming from  
BrassStdLoadControl.cpp.

FROM: Brian Goodrich DATE: 12/5/2008 2:34:47 PM Mountain Standard Time  
I see that the Standard spec or MCEB is set in the Preferences window. This selection is used to  
compute the simple beam live load distribution factor for the Standard spec. The export uses this  
selection to help determine which distribution factors should be passed on to the engine. Now that  
LRFR is available, it too has an article (6.2.3.2) regarding the number of lanes for roadway widths from

1/5/2016 11:08:02 AM

HRS AASHTO

327

Complete Issue Information

18 to 20 feet. I think this is a design versus rating issue. Do we need a similar input for LRFR or should the existing input be revised to include the LRFD and LRFR articles?

Could the input on the Preferences window be reworked, so the selection can be used for multiple reasons? How about a header that reads "Method for Number of Traffic Lanes (Rating)." The "Compute simple beam distribution..." label could be moved to a note on the window.

FROM: Krisha Kennelly DATE: 4/1/2009 3:43:12 PM Eastern Daylight Time  
Mockup for changes to the Preferences window is attached.

## Description

FROM: Jeff Ruby DATE: 7/14/2009 11:51:46 AM Eastern Daylight Time

When I add a permit load as a vehicle in LRFD Analysis Settings, the spec check and analysis uses this truck as a design truck in the Strength I category. It should only be evaluated in the Strength II category. I attached my bridge, the agency truck in a library file, and some screenshots.

FROM: Jeff Ruby DATE: 7/14/2009 11:53:40 AM Eastern Daylight Time

The first screenshot is without the permit vehicle, the second screenshot is where I added the permit vehicle, and the third screenshot are the results with the permit vehicle.

FROM: Krisha Kennelly DATE: 7/29/2009 9:30:17 AM Eastern Daylight Time

Attached screenshots show BRASS LRFD engine was being used.

FROM: Brian Goodrich DATE: 8/27/2009 2:29:57 PM Mountain Daylight Time

For the LRFD export, the design procedure was not being set for a vehicle based on the analysis event category to which it was assigned. Therefore, Parameter 4 on the LOAD-LIVE-DEFINITION command was always set to "D", i.e., design loads.

FROM: Brian Goodrich DATE: 8/27/2009 4:21:22 PM Mountain Daylight Time

I revised the export to generate the permit load procedure flag on the LOAD-LIVE-DEFINITION. However, I then now discovered that the BRASS-LRFD engine internally sets this flag to design for a design review. Therefore, for a design review, all limit states are considered for every vehicle regardless of the category to which a vehicle is assigned.

If RATING is selected and vehicles are added to the permit category, the limit states other than Strength II are ignored by BRASS when searching for the critical rating factors.

FROM: Jeff Ruby DATE: 5/12/2010 4:45:31 PM Eastern Daylight Time

On further review Opis LRFD doesn't check for the Strength II limit state. The permit truck load is run, but it isn't used in any limit state. It belongs in the Strength II limit state for all the spec checking articles.

Complete Issue Information

FROM: Jeff Ruby DATE: 5/12/2010 4:48:10 PM Eastern Daylight Time  
The subject doesn't tell the "correct" story for the opis lrfd engine. From Brian's comment above, it may never be resolved for the BRASS LRFD engine. I am not sure. But, it looks like it should be able to be fixed with the AASHTO LRFD engine.

FROM: Krisha Kennelly DATE: 5/17/2010 9:20:11 AM Eastern Daylight Time  
I've made a new incident for the Opis LRFD engine so we can track the engines separately. See 9991

FROM: Krisha Kennelly DATE: 5/25/2010 9:12:42 AM Eastern Daylight Time  
This incident can marked as resolved since the new incident deals with the AASHTO LRFD engine.

FROM: Jeff Ruby DATE: 7/12/2010 1:34:32 PM Eastern Daylight Time  
Sorry if I disagree. But, the incident as described above for the BRASS LRFD is still unresolved. Since you created a new incident number to track the AASHTO LRFD engine progress, it is now a "2-part" incident. We can fix 9991. If this incident is not fixed, it isn't resolved. Maybe it needs to be put in the "critical errors" or "issues not resolved" web site. If that happens, we can mark this closed. We can't just ignore this error as described.

FROM: Krisha Kennelly DATE: 7/12/2010 1:43:27 PM Eastern Daylight Time  
I've changed the category to Bug-BRASS

FROM: Herman Lee DATE: 7/12/2010 1:48:17 PM Eastern Daylight Time  
Changed Folder from /Beta Testing to /Support Center/Opis.  
Brian, has this issue been assigned to a BRASS Problem Log number?

FROM: Brian Goodrich DATE: 7/23/2010 8:18:20 AM Mountain Daylight Time  
This issue has not been assigned to a BRASS Problem Log. I have forwarded this discussion to WYDOT.

FROM: Jeff Ruby DATE: 4/13/2011 2:08:47 PM Eastern Daylight Time  
This should be in the Critical Bug Web page for 6.2 Release.

FROM: Brian Goodrich DATE: 5/18/2011 8:20:13 AM Mountain Daylight Time  
This issue was assigned to BRASS Incident 20.

### Description

FROM: Adam Price DATE: 7/15/2009 8:51:22 AM Eastern Daylight Time

I have been working with reinforced concrete slab bridges. I noticed that there are three different places to input impact/dynamic load allowance. I suggest that 2 of these places be removed.

Thank you,

Adam Price, P.E.  
Tennessee Department of Transportation  
Structural Design Division  
Adam.Price@tn.gov

FROM: Herman Lee DATE: 7/15/2009 11:18:34 AM Eastern Daylight Time

Impact / Dynamic Load Allowance window in three different locations in the Bridge Workspace tree is by design. Please see below description of this window from Virtis/Opis Help.

"This window allows you to enter the impact factors. Impact can be entered for a bridge, for a superstructure definition, and for a member alternative. Impact for a member alternative overrides impact for a bridge and a superstructure definition for that specific member alternative. Similarly, impact for a superstructure definition overrides impact for a bridge for that specific superstructure definition.

If you change the impact for a bridge, the impact for any existing superstructure definitions or member alternatives in that bridge is not changed correspondingly. New superstructure definitions that are created will be created using the bridge impact. Likewise, if you change the impact for a superstructure definition, the impact for any existing member alternatives is not changed correspondingly. New member alternatives that are created will be created using the superstructure definition impact."

## Description

FROM: Adam Price DATE: 7/17/2009 9:31:26 AM Eastern Daylight Time

I am running a spec check of a reinforced concrete slab for the attached file. At point 100.62, there are some flexural failures. The output reports an effective area of reinforcement at this location of 0.129in<sup>2</sup>. There is one #9 bar in the bottom of the member, which is a 12" wide slab strip. I know the effective area of reinforcement is reduced because the bars are not fully developed, but I am having trouble matching the 0.129in<sup>2</sup>. Would you please send me the calculations for this number?

Thank you,

A text file containing the development length calculations is created when you do an analysis.

Select the mbr alt in the BWS tree and then click the "eyeglasses" toolbar button. A listing of the files created during the analysis will appear. Open the 'LRFD 'Reinf Dev Length Calcs Log File' to view the calculations used to compute the area of bar developed. If you disagree with the calculations please resubmit this incident.

### Description

FROM: Jim Duray DATE: 10/2/2009 2:50:22 PM Eastern Daylight Time  
See 9287 for background.

I found the following behavior regarding DLA in the UI:

For the BRASS LRFR analysis, if mbr alt DLA is NULL we get the struct def DLA. If the struct def DLA is NULL we get the bridge DLA. This is the desired behavior and it was also implemented for the AASHTO LRFD/LRFR engine.

If the mbr alt and structure def DLA are NULL, the analysis checks the bridge DLA and if it is NULL the analysis is aborted with the following message.

```
"Error generating LRFD load commands!  
Error generating LOAD-LIVE-DYNAMIC command!  
Unable to determine LRFD impact factors!"
```

This is the desired behavior. For 6.1, the exports were changed to default to the AASHTO DLA values (from the data dictionary).

The DLA windows have some problems with default values for DLA:

For the struct def DLA window, if DLA is NULL it populates the window with the DLA from the bridge DLA – even if the user closes the window by clicking Cancel.

If the bridge DLA is NULL and the struct def window is opened, the struct def DLA gets set to 0 and no warning is displayed during the analysis. Not desirable.

If the bridge DLA window is opened and the DLA is NULL the window sets it to 15% and 33% even if the cancel button is clicked. Probably acceptable behavior but not intuitive.

The mbr alt window never gets populated from the struct def or bridge DLA (except when a new mbr alt is created).

The struct def window DLA should get set to NULL if the bridge DLA is NULL instead of zero, or set it to the AASHTO defaults. If the mbr alt DLA is NULL it should get set to the struct def DLA. Or we should

1/5/2016 11:08:04 AM

HRS AASHTO

336

Complete Issue Information

change the behavior so mbr alt and structure def windows do not get DLA from the parent DLA window.

The revisions should be discussed with the TF/TAG.

Description

FROM: Herman Lee DATE: 10/7/2009 4:18:50 PM Eastern Daylight Time  
Submitted on behalf of Adam Price, TN DOT.

Received e-mail:

=====

Herman,

Using DW will not work either because BRASS uses its own load factors. I am inputting the EV load as

1/5/2016 11:08:04 AM

HRS AASHTO

337

Complete Issue Information

a DC load and adjusting it for the difference in load factors between EV and DC. Since EV is not used by BRASS, the user should not have the ability to input this load. By being able to input this load, the user automatically assumes the program will use it properly. Although rare, this is a very dangerous problem and should be corrected as soon as possible.

Thank you for your help,  
Adam

>>> "Lee, Herman" <HLee@mbakercorp.com> 10/7/2009 11:56 AM >>>

Hi Adam,  
I checked the BRASS-GIRDER(LRFD) Technical Manual. Only DC, DW, TU, SE and LL are supported. You could enter the 7.2 k/ft load as a DW load and change the DW load factors to those for EV load.  
Herman

From: Adam Price [mailto:Adam.Price@tn.gov]  
Sent: Wednesday, October 07, 2009 9:59 AM  
To: Lee, Herman  
Subject: EV load

Herman,

We are using OPIS for a design check on the attached culvert top slab. We have modeled the culvert using a 12 inch wide strip. This particular culvert has 60 feet of earth fill on it. We input the EV load case and used a 7.2 k/ft EV load on the span. However, we do not see in the output that it was ever used. Was the EV load included, and if not, how do we include it?

Thanks,

Adam Price, M.S., P.E.

=====

FROM: Brian Goodrich DATE: 10/14/2009 10:48:49 AM Mountain Daylight Time  
The BRASS LRFD Engine help topic for the "Load Case Description" states: "BRASS LRFD only uses types D,DC and D,DW." It is dangerous to ignore the dead loads that do not fall in the DC and DW categories. Should we issue a warning or error here?

The load factors are not exported to the BRASS data file due to the configuration of the input. The "2007 AASHTO LRFD Specifications" LRFD load factors are defined as factors, but they were never applied to the structure definition or member alternative. See the Factors tab on either of these windows. Once this is set, the factors are exported to the BRASS data file.

FROM: Brian Goodrich DATE: 11/18/2009 9:38:15 AM Mountain Standard Time  
I added a "High" warning message when a non-DC and non-DW load case is detected.

WARNING (High):

An unsupported dead load type was specified for Load Case "EV".  
Only DC and DW dead load types are supported.

Description

FROM: Tim Armbrecht DATE: 10/27/2009 10:35:46 AM Eastern Daylight Time  
 Now that we're into the development of 6.2, perhaps you can look at and respond to Phil Coppernoll's email attached below. Phil is our designated Opis user. I believe some, if not all, of his comments and questions are related to BRASS, but since the steel module for the AASHTO engine is now being developed, this may be as good a time as any to address and respond to these concerns. Also note that this applies to 6.1, not 6.1 beta; however, the beta versions are all that are being offered in the drop down boxes for the support center folder. TAA

## Complete Issue Information

Tim,

John and Kevin asked me to investigate how Opis generates live load distribution for LRFD. In particular, they were interested in how the program interprets Table C4.6.2.2.1-1 (Page 4-30) of the 4th Edition (2008 Interim Revisions). After running the program for some bridges using the Brass LRFD engine, and attempting to run some of the test bridges using the Beta version of the Opis LRFD engine, we have come across a few issues that we would like to verify with Baker.

1. It appears as though the program's default logic is to define distribution factor ranges by determining dead load contraflexure points (using DC1 only?). The program then calculates a positive moment distribution factor and a negative moment distribution factor using the corresponding value of L from Table C4.6.2.2.1-1. The program applies the positive moment distribution factor to all moments within the positive moment distribution factor range and the negative moment distribution factor to all moments within the negative moment distribution factor range. Please note the term "all moments" was used because the envelope of live load moments generated by the program produces both positive and negative moments at a given location.

2. Another interpretation of the table would create a distribution factor for all of the positive moments in the envelope and two distribution factors for the negative moments in the envelope. The first distribution factor for negative moments would be calculated using the L for negative moments near interior supports of continuous spans and would be applied to all negative moments between the points of contraflexure produced under a uniform load. The second distribution factor for negative moments would be calculated using the L for negative moments other than near interior supports of continuous spans and would be applied to negative moments beyond the point of contraflexure produced under a uniform load. Using this interpretation of the table, a positive live load moment located near an interior support would have a different distribution factor than the negative live load moment at that same location. The program doesn't do this.

3. Did Baker receive any specific information from the T-5 committee or T-18 committee regarding the interpretation of this table? There doesn't appear to be a difference between the distribution factor calculated for the positive moment region and the distribution factor calculated for the region of negative moments away from the interior support, so why does the table differentiate between the two? Also, what distribution factor is used at the point of contraflexure (average, larger, smaller)? As stated above, the program appears to calculate the contraflexure points using the actual DC1 loads. While this is probably a more refined method than using a uniform load for structures whose sections vary, why wasn't a uniform load used?

I realize that the live load distribution factors calculated by the program appear to follow AASHTO for a majority of the range, and that any discrepancy would typically affect non-critical moments, but we would like to make sure that we understand the logic of the programs we use. To demonstrate how the program calculates distribution factors we ran a number of unusual span ratios and here are our conclusions.

For a case with no contraflexure point on an interior span, the program seems to follow the information presented in AASHTO (see commentary on Page 4-3). The region of negative moment near the interior support was increased to the centerline of the span and the L used to calculate the distribution was taken as the average of the two adjacent spans. The program calculated L using the average of the length of the span in question and the length of the span to the left for the moments from the support up to the centerline of the span, and the average of the length of the span in question and the length of the span to the right for the moments from the centerline of the span to the support.

## Complete Issue Information

For a case with no contraflexure point in an exterior span, the program uses the average of the lengths of the exterior span and first interior span to calculate the distribution factor and applies that distribution factor for all of the exterior span and up to the contraflexure point of in the first interior span. This distribution factor is applied to all moments (positive and negative) raises the same questions mentioned above pertaining to the interpretation of the chart.

For a case with an interior span with only one contraflexure point (spans = 80, 40, 240, 60), the program didn't produce reliable results. The distribution factor output file didn't show calculations for a distribution factor for most of the 40' span, and the moments generated in the 40' span were not accurate (very high, infinite?). While this type of structure is not practical, we may have exceeded the limits of the program. Perhaps an error message should have been deployed.

Baker may not be able to address all of our questions however we would appreciate any information they can provide regarding the assumptions/methodology of their program. I think Kevin may ask Tom to present some of the issues regarding the interpretation of the table to the appropriate AASHTO committees. If you think these issues should be forwarded to Baker for clarification, please feel free to edit my email as you see fit. Thanks.

FROM: Krisha Kennelly DATE: 10/27/2009 1:09:05 PM Eastern Daylight Time  
The following comments apply to the Opis LRFD (AASHTO) engine and not the BRASS LRFD engine. ( I added some numbers to the paragraphs above to make it easier to follow).

1. The AASHTO Opis LRFD engine applies a uniform load to the Stage 3 model to determine the points of dead load contraflexure. Distribution factors are then computed inside the pos and neg ranges as described above.
2. The AASHTO Opis LRFD engine does not use a different distribution factor for pos and neg moment at the same location.
3. T-5 and T-18 were not contacted by Baker. At a point of DL contraflexure, the AASHTO Opis LRFD engine uses the DF from the range to the left of the location. It does not consider max/min or compute the average of the 2 values at that point. The AASHTO Opis LRFD engine does apply a uniform load.

Also note the following difference between the AASHTO Opis LRFD engine and the BRASS LRFD engine: The AASHTO Opis engine uses the distribution factor where the axle is applied rather than the distribution factor where the action is computed.

FROM: Brian Goodrich DATE: 11/19/2009 11:52:46 AM Mountain Standard Time  
The following comments apply to the BRASS LRFD engine.

1. The BRASS LRFD engine applies a uniform load to the first continuous stage model to determine the points of dead load contraflexure. Distribution factors are then computed inside the pos and neg ranges as described above.
2. The BRASS LRFD engine does not use a different distribution factor for pos and neg moment at the

1/5/2016 11:08:05 AM

341

Complete Issue Information

same location.

3. At a point of DL contraflexure, the BRASS LRFD engine uses the DF from the range with the larger factor. It does not compute the average of the two factors at that point. The BRASS LRFD engine does apply a uniform load.

The BRASS engine allows the user to choose how the distribution factor is applied: 1) based on the axle location or 2) based on the point under consideration (where the action is computed). However, this option is not currently exposed to the user. Option 2 is the default.

FROM: Brian Goodrich DATE: 1/26/2010 1:40:00 PM Mountain Standard Time  
Regarding the BRASS LRFD engine, should we update the engine properties with an option for choosing the distribution factor application method?

## Complete Issue Information

### Description

FROM: Todd Thompson DATE: 11/9/2009 10:07:04 AM Eastern Standard Time

We have a designer who's been working on doing an RC Slab bridge design using Opus. Last week reported a problem of getting different results if one goes up mile post and down mile post. This may or may not be related to that. Bottom line is that we are getting results that do not appear to be correct using Opus for Reactions of the LRFD Fatigue Truck.

The designer checked 3 separate applications and gets different results from Opus. He created a model in STAAD, Arcon Beam and Florida LL Generator and gets agreement among all 3 of those applications. But these 3 different applications disagree with Opus.

I've attached his 6.0 Opus Model (4 Span CCB, Slab, 16.5 inch slab (Dist = 1))

I've also attached an Excel spreadsheet containing the comparison of different engines and versions of Opus and the apps the designer used.

FROM: Herman Lee DATE: 11/9/2009 1:26:58 PM Eastern Standard Time

Please see below warning message in the analysis log. For the fatigue truck results, 1.0/1.2 factor is included in the reactions.

For the fatigue truck, the original scale factor has been divided by 1.2 to effectively remove the multiple presence factor from the distribution factors. Additionally, the one-lane distribution factors will be used for fatigue.

Submitted on behalf of Andrea Grunau:

-----  
Good Morning,

I am new to OPIS and am working my way through a 2 span continuous plate girder design. Is there a way in OPIS to use the special loading condition as per AASHTO 4.6.2.2.5 with HL-93 in combination with a permit truck in 1 lane?

Thanks,  
Andrea

Description

FROM: Brian Goodrich DATE: 12/15/2009 10:25:49 AM Mountain Standard Time  
Submitted on behalf of Andrea Grunau:

-----  
Herman,

I am using Brass LRFD as the engine. I am doing design work. I do have the manual that is on the installation CD. I am trying to design the bridge for HL-93 loading, with a permit truck for Strength II and the fatigue truck for the fatigue combination. I just don't understand why when I open the LRFD critical loads in the output that the fatigue truck is governing for the Strength I case.

Thanks,  
Andrea  
-----

FROM: Brian Goodrich DATE: 12/15/2009 10:28:07 AM Mountain Standard Time  
I'm not sure why the Fatigue truck would control the Strength I limit state. I tried this with one of our example bridges but was not able to duplicate the user's issue. I requested the bridge XML file and the Analysis Settings.

FROM: Brian Goodrich DATE: 12/15/2009 4:26:05 PM Mountain Standard Time  
Added Watchung.xml and Watchung Analysis.JPG files.

FROM: Brian Goodrich DATE: 1/25/2010 12:15:26 PM Mountain Standard Time  
Dec. 14 e-mail from Andrea Grunau:

When I set the analysis settings to include HL-93 for the design, a permit truck for the permit loading and the fatigue truck for the fatigue setting, why when I look at the tables does it publish the fatigue truck as governing for strength I? and the HL-93 for the fatigue load combination?

FROM: Brian Goodrich DATE: 1/25/2010 12:33:26 PM Mountain Standard Time  
I am able to duplicate the LRFD Critical Loads issue where the HL-93 truck is showing up as the critical load for the Fatigue limit state. I still don't see where the Fatigue truck is critical for Strength I though.

FROM: Brian Goodrich DATE: 1/25/2010 1:14:17 PM Mountain Standard Time  
The vehicle IDs are set in BRASS to the ID matching a specified name. When the LRFD Critical Loads are set, these are for a particular live load combination such as Design Truck plus Design Lane. For the HL-93 vehicle there are generally four individual live loads: truck, tandem, train, and lane, which result in three combinations. The Fatigue truck becomes live load 5 and combination 4. For the Fatigue limit state, the fatigue truck combination (Combo 4) is critical, but BRASS is getting the vehicle ID for live load 4 instead, which is for HL-93. BRASS must be revised to get the vehicle ID assigned to to the truck portion of the live load combination. I will forward this issue to WYDOT.

Description

FROM: Dean Teal DATE: 3/23/2010 2:54:28 PM Eastern Daylight Time  
 In the attached bridge using member 2 of shelby's bridge  
 Perform an LRFD design review. Bring up the Spec-Checker Viewer filter, turn on everything in the general Tab and in the spec articles clear all and then select 6.10.9.3.2-2 (one spec article)

When I select stage 3 the one spec in the reference window is "Reinforcement Spacing"  
 When I clear all so no specs are selected, "Reinforcement Spacing is still there, it should be empty.  
 The only time the spec viewer works on this bridge is when I select all specs without a filter.

## Complete Issue Information

The second bridge definition is our old TraingBridge1 I used to check out the spec checker with – spec checker/viewer works fine with this test bridge.

FROM: Joseph Ihnat DATE: 3/24/2010 1:43:48 PM Eastern Daylight Time  
I think this is happening because the "Reinforcement Spacing" article isn't in the database.  
Add a row to abw\_lib\_spec\_article table: 5,2141,"Reinforcement Spacing","None"  
spec\_id's 6 and 7 already have a similar row.

FROM: Dean Teal DATE: 3/26/2010 8:53:20 AM Eastern Daylight Time  
My pc brings up the Reinforcement article  
Another designers pc brings up article 6.6.(can't remember the rest of the spec number)

Why would it be different on different pc's?

FROM: Dean Teal DATE: 3/29/2010 9:26:22 AM Eastern Daylight Time  
I verified that with another PC, when I select 6.10.9.3.2-2, the spec checker returns 6.6.1.2.1

FROM: Joseph Ihnat DATE: 3/29/2010 9:54:54 AM Eastern Daylight Time  
I'm able to reproduce your first result but not your second. Is it the same bridge, analyzed the same way?

FROM: Dean Teal DATE: 3/29/2010 10:01:40 AM Eastern Daylight Time  
Same bridge from our Oracle database - different PC

FROM: Mehrdad Ordoobadi DATE: 5/20/2010 1:36:50 PM Eastern Daylight Time  
The results does not have anything for the article "6.10.9.3.2-2". (spec\_article\_id = 1352)  
We need to investigate this by using the debugger.

FROM: Dean Teal DATE: 7/12/2010 12:49:23 PM Eastern Daylight Time  
??

FROM: Dean Teal DATE: 8/24/2010 11:59:06 AM Eastern Daylight Time  
any progress on this bug?

FROM: Joseph Ihnat DATE: 8/24/2010 1:32:51 PM Eastern Daylight Time  
No progress. This is scheduled to be fixed in the 6.3 release.

FROM: Joseph Ihnat DATE: 10/14/2010 8:43:38 AM Eastern Daylight Time  
I looked at this again and came to the same conclusion.  
The issue is not that the results do not contain article 6.10.9.3.2-2.  
The issue is that the results do contain article Reinforcement Spacing, but there's no way to filter those out (you don't see "Reinforcement Spacing" in the Spec Article list in the filter).  
Works OK with the database change I described on 3/24.

FROM: Mehrdad Ordoobadi DATE: 2/1/2011 3:36:20 PM Eastern Standard Time  
Added new row as suggested by Joe. in 6.3.

FROM: Xinmei Li DATE: 3/28/2011 2:42:39 PM Eastern Daylight Time  
Verified fixed for 6.3 Alpha6.

Description

FROM: Dean Teal DATE: 4/1/2010 3:14:44 PM Eastern Daylight Time  
 The Distribution Factor Wizard for RC is missing the skew reduction capability.  
 On heavily skewed slabs, like a 45 skew, you can decrease the DF by 20%.

Was this an oversight or did we leave this out for a reason?

FROM: Krisha Kennelly DATE: 4/7/2010 10:31:36 AM Eastern Daylight Time  
 Is this regarding rc slabs? For rc slabs there is no way to enter the skew value in Opis (since they are girderline only) so the skew reduction factor is not included in the computed distribution factors.

FROM: Dean Teal DATE: 4/14/2010 7:51:37 AM Eastern Daylight Time  
 When computing DF's for a RC slab we have a wizard pop up with 3 possible input fields. Overall slab width, Number of lanes and Slab width. Skew could have been added in this pop up wizard.

FROM: Krisha Kennelly DATE: 4/14/2010 8:52:16 AM Eastern Daylight Time  
 I guess it was an oversight, I've attached the mockups for this wizard that were reviewed by the TAG

### Description

FROM: Todd Thompson DATE: 6/8/2010 2:24:36 PM Eastern Daylight Time

As I've been working in comparing BRASS, VIRTIS and other sources for Steel Girder bridges, I've noticed that I don't always get what I consider to be correct results with BRASS when the LRFD DF's are left blank in the GUI.

I tracked down that BRASS does not by default assume that  $eg = 0$  for Non-Composite sections. And while using BRASS you can allow (or not allow)  $eg = 0$  for noncomposite in BRASS, it is not exposed in Virtis GUI or in the BRASS export from Virtis.

If one uses the LRFD(LRFR) Calculator and save the DF's - one gets the results one would expect with  $eg=0$  for non-composite sections or bridges.

We should probably expose this option for the following BRASS command. (Or maybe it is and I can't find it.) It can make some reasonably different final results. Probably can be marked as an enhancement and isn't necessarily a BETA issue, but it does need to be addressed.

### BRASS

#### DIST-CONTROL-LL

6 . Set  $eg = 0$  for Enter one of the following codes to indicate if  $eg$  is to be set to zero for

Non-composite? non-composite sections. This option is provided because the BRASS

default is to calculate the distance between the centers of gravity of the beam and deck regardless of if the section is composite or non-composite. See AASHTO LRFD 4.6.2.2.1.

able to display the spec check results after the BWS is reopened.

FROM: Mehrdad Ordoobadi DATE: 2/16/2011 8:49:03 AM Eastern Standard Time  
Do we need to fix this for 6.3?

For BRASS results that were saved to the database we, make the spec check results available after the user loads the results from the database. For the AASHTO engines, we don't have a way to display the spec check results after the BWS is closed. I think that we could look for .SpecCheckResults files on the disk for a bridge and load them into memory while opening a bridge. This code will be in the GUI.

Description

FROM: Adam Price DATE: 7/30/2010 3:51:57 PM Eastern Daylight Time

Currently Virtis/Opis only checks span tenth points by default. Any other span points may be checked by using the point of interest option. I believe it would be very beneficial to check the critical sections for shear by default. I always want to check them, so I always have to enter them as points of interest. Would you please consider this?

Thanks,  
Adam Price

 AASHTO engine does not support both harped and debonded strands in prestressed design at the same time.

FROM: Herman Lee DATE: 8/10/2010 3:18:15 PM Eastern Daylight Time  
 AASHTO Engine does support harped and debonded strands at the same time. The Virtis Std Engine (Virtis LFD/ASD) doesn't support this configuration.  
 Jeff, please attach the bridge file to this incident and specify the spec article in question.

FROM: Jeff Olsen DATE: 8/12/2010 7:02:00 PM Eastern Daylight Time  
 Herman, I have included a bridge that contains 2 member alts for beam #2. One has harped strands only. the other has harped and debonded strands. they both produce the same stresses in the dedonded area. I believe that the program is not condisering the debonded strands.

FROM: Jeff Olsen DATE: 10/21/2010 1:13:46 PM Eastern Daylight Time  
Any resolution to this issue? This should be considered a critical bug and resolved ASAP.

FROM: Krisha Kennelly DATE: 10/25/2010 2:15:07 PM Eastern Daylight Time  
I'm looking into this.

FROM: Krisha Kennelly DATE: 10/26/2010 11:19:37 AM Eastern Daylight Time  
Bug has been fixed for 6.3 and 6.2.

I'm starting the process to get a patch issued.

FROM: Krisha Kennelly DATE: 10/26/2010 4:00:57 PM Eastern Daylight Time  
This issue deals with harped and debonded strand configuration not being handled correctly by the AASHTO LRFD/LRFR engine.

The debonded strands are being considered as straight strands over the whole length of the beam.

Effects:

Rating for moment: The critical moment rating factor is not typically found near the ends of the beams so the unconservative moment capacity is probably not critical.

Rating for shear: The beam will have slightly higher shear capacity than it really should within the debonded length. In this bridge it does take the shear rating down from 1.01 to 0.99.

Design: Designers debond at the end to reduce the tensile stress in the top of the beam at release. The bug results in higher (conservative) tensile stress in the top of the beam at release.

FROM: Krisha Kennelly DATE: 10/27/2010 10:52:34 AM Eastern Daylight Time  
I've tested this fix on the attached bridge and also on BID5 and BID9 in the sample db to ensure that the fix did not break anything for straight/debonded and harped strand configurations. LRFD and LRFR spec check results for BID5 and BID9 before and after the fix are identical so nothing was broken.

FROM: Jeff Olsen DATE: 10/28/2010 5:18:32 PM Eastern Daylight Time  
I tested the dll on a couple different bridges and the debonded strands are now being accounted for. The bug appears to be fixed. Thanks Krisha.

FROM: Herman Lee DATE: 12/3/2010 9:26:36 PM Eastern Standard Time  
Resolved for 6.3 Release.

FROM: Xinmei Li DATE: 3/28/2011 10:51:35 AM Eastern Daylight Time  
Verified with 6.3 Alpha 6, I can rate BID5 and BID9 successfully. I did LRFR rating with attached bridge, "Harped only" member alt and "Harped+debonded" member alt. They produce different rating results and stresses.

Issue submitted for Elizabeth Befikadu:

Hi All,

Could you clarify what Brass is doing in calculating the LLDF factor using Lever rule for adjacent box beams.

The wheel is 3ft away from the curb for beam G2 and 6ft away from the curb for beam G3. Is there any reason or I misunderstood the concept.

I have attached the XML file and my sketch.

FROM: Brian Goodrich DATE: 8/20/2010 8:37:17 AM Mountain Daylight Time  
The BRASS LRFD engine will calculate the distribution factors only if there are no LRFD distribution factors input on the Live Load Distribution factor window. Regarding the lever rule, BRASS moves the 12' lanes across the structure with a 10' lane within. These are moved at 6" increments across the structure. Then, the lanes are positioned such that one wheel line is directly over the girder in order to get the maximum effect.

There is enough room to position wheel line directly over the G2 beam. The distribution factor would then be  $0.5 \times 1.2 = 0.6$  for one-lane loaded or  $0.5 \times 1.0 = 0.5$  for two-lanes loaded. For the G3 beam and one-lane loaded, the left wheel line can be positioned directly over the beam, which results in the 0.6 distribution factor. However, for G3 with two-lanes loaded, the left wheel line can be positioned at 81 inches from the left edge of the deck, which results in  $30.34'' / 2 \times 33.5'' = 0.453$ . Note that these calculations are shown in the BRASS Load Distribution File.

PERFORMING AASHTO LIVE LOAD DISTRIBUTION FACTOR COMPUTATIONS

Method: Lever Rule

Girder of Interest: 3  
No. Lanes Loaded : 1

| Truck No. | Wheel Positions, in |         |
|-----------|---------------------|---------|
|           | Left                | Right   |
| 1         | 84.161              | 156.161 |

Distribution Factor Summary:  
Critical Load to Girder = 0.5000

$$mg = m * g$$

$$= 1.20 * 0.500 = 0.600$$

Notes:  
=> The wheel positions reference the left edge of the deck.

PERFORMING AASHTO LIVE LOAD DISTRIBUTION FACTOR COMPUTATIONS

Method: Lever Rule

Girder of Interest: 3  
No. Lanes Loaded : 2

| Truck No. | Wheel Positions, in |       |
|-----------|---------------------|-------|
|           | Left                | Right |

Complete Issue Information

|   |         |         |
|---|---------|---------|
| 1 | 81.000  | 153.000 |
| 2 | 201.000 | 273.000 |

Distribution Factor Summary:  
 Critical Load to Girder = 0.4528

$$mg = m * g$$

$$= 1.00 * 0.453 = 0.453$$

Notes:  
 => The wheel positions reference the left edge of the deck.

### Description

FROM: Brian Goodrich DATE: 8/20/2010 8:39:30 AM Mountain Daylight Time  
Issue submitted for Elizabeth Befikadu:

I have a question regarding LL DF for slab bridges.

I am working on a bridge which is three span continuous RC slab bridge. The LL distribution factor calculated by Brass engine is based on the span length for each span versus AASHTO LRFD 4.6.2.1 indicates that the moments by region which is positive moment and negative moment region. I have attach the XML file for your review.

I would like to know your opinion on this.

With Regards

Elizabeth Befikadu

FROM: Brian Goodrich DATE: 8/20/2010 8:41:33 AM Mountain Daylight Time

I reviewed your bridge, which is an R/C slab entered as a girder line. For this structure, BRASS is not being used to calculate the distribution factors. The "Compute from Typical Section..." button computes these as indicated in the help. The "View Calcs" button shows exactly how these factors are calculated. The equations from Article 4.6.2.3 are dependent on the span length, not the moment region. The stand-alone version of BRASS can calculate distribution factors for a slab bridge and these are done the same way as with the Virtis "Compute" button.

FROM: Brian Goodrich DATE: 8/20/2010 8:42:54 AM Mountain Daylight Time  
E-mail from Elizabeth Befikadu:

The equation are dependent on the span length but the span length that should be used is different for positive and negative moment region.  
For positive moment region, the span length is the maximum span length, for negative moment region the span length is the average span L between the adjacent span.  
I have attached one document that I found on line which I believe is the right approach and let me know what your opinion on this.

Thanks for your help

Elizabeth Befikadu

FROM: Brian Goodrich DATE: 8/20/2010 8:44:18 AM Mountain Daylight Time

For slab-on-beam bridges (as in the example you sent), the specification states the following from Article 4.6.2.2.1:

"Table C1 describes how the term L (length) may be determined for use in the live load distribution factor equations given in Articles 4.6.2.2.2 and 4.6.2.2.3."

This table outlines the span length to use depending on the action and moment region. However, this

1/5/2016 11:08:10 AM

HRS AASHTO

365

Complete Issue Information

doesn't seem to apply to the slab bridges of Article 4.6.2.3. Here, L1 is defined as:

"modified span length taken equal to the lesser of the actual span or 60.0 (ft.)"

## Complete Issue Information

In my output file the "Design Ration Computation" for same location has been shown as "Fail" along with "Pass". (See attached JPEG and xml).

Looking into the computations they both have the exact numbers. (See attached txt file).

While for some locations (near supports), it shows twice "Passes".

I looked into BRASS LRFR manual but couldn't get an affirmative answer.

Please comment. Thanks.

Faisal Aziz, E.I., M.E.  
HUVAL & Associates Inc.

FROM: Brian Goodrich DATE: 8/20/2010 9:24:01 AM Mountain Daylight Time

I opened your bridge, ran it with BRASS, and reviewed the results. At a point of interest, the concrete stresses are checked for the bottom flange, top flange, and slab (if present). This is why you might see a Pass and a Fail at the same point. The "Design Ratio Check.txt" file shows the same check twice. Both of these checks would have produced a "Fail" code. Anytime the design ratio is less than 1.0, the check fails. Please verify that this is the case.

FROM: Brian Goodrich DATE: 8/20/2010 9:24:17 AM Mountain Daylight Time  
E-mail from Faisal Aziz:

Thanks Brian,

Thank you for your valuable feedback and information.

A clarification: I have run my bridge using Virtis LRFR analysis engine. Is there any specific difference between BRASS LRFR and Virtis LRFR analysis engines? I am asking this for the same bridge, keeping all the input parameters same, my Virtis LRFR RF is like 0.25 times the BRASS LRFR RF, shouldn't they be the same?

And one thing beyond engineering judgment is that if the Design Ration is less than 1.0, why the RF shown is greater than one, shouldn't they both be proportional.

Please let me know if need additional information.

Faisal Aziz, E.I., M.E.

FROM: Brian Goodrich DATE: 8/20/2010 9:25:13 AM Mountain Daylight Time

I don't know of any differences that would cause such a drastic difference in the ratings. My only suggestion would be to turn on as much intermediate output as possible to find out where the differences are. Distribution factors, section properties, and losses are two possible areas to verify.

Regarding the design ratio vs. rating factor for the same check, if one is less than 1.0, the other should also be. The same holds true if one is greater than 1.0. However, a critical design ratio could be less than 1.0 for a dead load stage. This can happen for the concrete stress checks (DL + PS). There wouldn't be a rating factor for this because there is no live load for this combination.

### Description

FROM: Dean Teal DATE: 12/29/2010 8:54:40 AM Eastern Standard Time

There are no options in the wizard interface to account for gaps in the stud spacing at bolted field splice locations. The workaround that I found is to manually go in and alter the table that the wizard creates to put the gaps in. I found that in order for the engine to continue to work properly, you MUST assign the gap areas as "Composite". If you just code them in as gap in spacing, the engine goes into non-composite for negative moment analysis mode and everything goes out of whack. Doing this manual manipulation of the table works for me and was able to get the analysis to run just fine.

\*\*A nice future improvement: ability to specify how big of a gap to put on either side of the bolted field splice locations in the wizard interface so we wouldn't have to do this manually in the resulting table.

FROM: Herman Lee DATE: 6/30/2012 9:39:14 AM Eastern Daylight Time  
Implemented for 6.4 release.

FROM: Jeff Ruby DATE: 8/6/2012 4:46:28 PM Eastern Daylight Time

I think this has been a problem from the beginning. The attached bridge was coded in metric. But I set the default units to english for my convenience. Using member G2, if I try to run the shear stud wizard, I get the error box as shown in the attached screen shot. I think it is a tolerance issue. I can get it to work if I change the units box to SI. But, when the wizard calculates the ranges, it all is in feet.

Complete Issue Information

- 1) fix the tolerance issue
- 2) the wizard should check to see what current units are for the dialog box in question and return the appropriate results.

FROM: Krisha Kennelly DATE: 8/7/2012 9:12:01 PM Eastern Daylight Time  
 The items listed by Jeff above are not associated with the splice gap enhancement in this issue. They have been moved to issue 11792 as release bugs.

FROM: Jeff Ruby DATE: 8/8/2012 2:24:32 PM Eastern Daylight Time  
 After doing an LRFD design check with the "wizard" results, I get a Strength Limit State failure for not enough studs. The number of studs are not calculated correctly for Article 6.10.10.4. It appears to be a straight forward calculation once you have the inflection points from the wizard design run. I will attach the file shortly.

FROM: Krisha Kennelly DATE: 9/18/2012 12:44:17 PM Eastern Daylight Time  
 The comments from 8/8/12 are a bug in the shear stud wizard not related to the enhancement for splice gaps. Those comments have been moved to issue 11930 as a release bug.

Complete Issue Information

FROM: Brad Wagner DATE: 1/4/2011 8:24:30 AM Eastern Standard Time  
Two bridges were exported to .xml files from Virtis 6.2.

I opened Opis using Opis.exe and imported the two bridges. Opis confirmed that the bridges were imported, but they do not show up in the bridge explorer window. Repeated attempts to re-import the bridges results in the error "Bridge ID is not Unique". A search of the All Bridges folder yields the imported bridges, which can be opened, but they still do not show up in the Bridge Explorer window.

I closed OPIS and re-opened the program using the Virtis.exe and VirtisOpis.exe files, and the bridges appear in the Bridge Explorer window and can be opened.

FROM: Herman Lee DATE: 1/4/2011 8:56:41 AM Eastern Standard Time  
I'm not able to reproduce the problem. Please attach the two bridge XML files to this incident for us to investigate further. Thanks.

FROM: Herman Lee DATE: 1/4/2011 12:44:18 PM Eastern Standard Time  
Attached are the two bridge XML files from Brad Wagner.

Looks like the bridges were created using VirtisOpis.exe. Both bridges don't have the "available to Opis" checkbox selected. To fix this problem, please use VirtisOpis.exe to open each bridge, check the "available to Opis" selection and save the bridge back to the database (please see attached bmp file). You should be able to see the bridges next time you use Opis.exe.

### Description

FROM: Krisha Kennelly DATE: 3/21/2011 2:00:08 PM Eastern Daylight Time  
the Vc computed by the engine should be adjusted by the percentage of concrete shear entered by the user.

FROM: Krisha Kennelly DATE: 3/22/2011 9:23:49 AM Eastern Daylight Time  
See attached screenshot for an example of adding this value to an article. Please make similar changes to all LRFD articles that compute Vc (and all editions of those articles).

FROM: Mark Mlynarski DATE: 3/31/2011 1:47:14 PM Eastern Daylight Time  
added to the calculation of Vc to include the PercentShear (part of the section property object).  
Made changes for all versions of ALRFD\_05\_08\_03\_05.cs

FROM: Bin Zhang DATE: 5/12/2011 5:09:53 PM Eastern Daylight Time  
I tested using the member alt of G1 in BID 11 bridge.  
I set the shear percentage override by 50% at POI 20ft, and run LRFD with HI93 vehicle. I got an system error.  
Please read the attached document for details.

FROM: Herman Lee DATE: 6/10/2011 8:18:48 AM Eastern Daylight Time  
Ben, you need to enter shear reinforcement data in the POI's Shear tab when you select to override the shear schedule.

PDF of output and calculations applies along with xml of associated model.

Notes for me:

Steve B.  
 BID 1492

FROM: Krisha Kennelly DATE: 4/3/2011 2:42:10 PM Eastern Daylight Time  
 Wayne - please investigate

FROM: Wayne Skow DATE: 4/6/2011 8:30:29 AM Eastern Daylight Time  
 Two bugs were found.

- 1) the minimum wind load of .3klf (LRFD 3.8.1.2.1) was being applied to each flange rather than to the beam as a whole.
- 2) when appendix A controled member resistance, fl (flange stress due to wind) in 6.10.1.6 was incorrectly calculated.

Changes were made to articles LRFD 4.6.2.7.1 and 6.10.1.6 for all 4E versions, 5E and 5E 2010.

FROM: Dean Teal DATE: 5/10/2011 4:31:38 PM Eastern Daylight Time  
 This is marked as resolved - what version should i test it with?

FROM: Krisha Kennelly DATE: 5/11/2011 9:24:45 AM Eastern Daylight Time  
 You should be able to test this in beta 2

Description

FROM: Dean Teal DATE: 4/7/2011 10:11:26 AM Eastern Daylight Time  
Note for me - Charlie Woods, BID #4187

From one of my designers:

1. Discrepancies between the outputs for the Brass and Opis Engines. The first attached screen shot is of the Brass output, which shows the calculated section properties. The second attached screen shot is taken from the Opis output, same location on the bridge, same girder line. It appears not to have any section properties calculated. It indicated that this particular article of 6.10.10.1 is not applicable since  $V_{sr} = 0$ ; however, it appears  $V_{sr} = 0$  due to the fact that the section properties aren't calculated, which results in zero stress range. It seems odd given that Brass calculated section properties at this same location, but Opis did not—maybe user input if a different analysis method is chosen?

Bridge Attached

FROM: Krisha Kennelly DATE: 4/7/2011 10:59:07 AM Eastern Daylight Time  
please investigate.

FROM: Wayne Skow DATE: 4/8/2011 1:56:30 PM Eastern Daylight Time

There appears to be a logic problem in ScSuperSteelGirderElement. Notice in the output:

```
Info - Performing LRFD specification checking...
Building Spec Check Domain objects.
  Welded Plate Girder A - Stage 1
  Welded Plate Girder A - Stage 2
  Welded Plate Girder A - Stage 3
Generic composite ranges found!
The shear connector specification checking will not be performed.    <-----
Performing Specification Check.
- STAGE 1 : Computing Steel Stresses
  - Location - 0.0000 (ft)
```

However, 6.10.10.1.2 gets called anyway:

```
0.000
Article 6.6.1.2.2 completed - stage 3, round 1
Article 6.10.10.1 completed - stage 3, round 1
Article 6.10.10.2 completed - stage 3, round 1
Article 6.10.10.1.2 completed - stage 3, round 1    <-----
Article 6.10.2 completed - stage 3, round 1
Article 6.10.6.2.2 completed - stage 3, round 1
Article 1.3.2.1 completed - stage 3, round 1
Article 4.6.2.7.1 completed - stage 3, round 1
```

Complete Issue Information

Article 6.10.8.2.2 completed - stage 3, round 1

But the ShearConnFlexureType value hasn't been set properly. So 6.10.10.1.2 doesn't process properly.

FROM: Krisha Kennelly DATE: 6/19/2012 10:56:58 AM Eastern Daylight Time  
fixed for 6.4 beta 2

FROM: Matt Kolis DATE: 8/30/2012 2:53:30 PM Eastern Daylight Time  
Verified in VO64, Beta 4.

Description

FROM: Dean Teal DATE: 4/7/2011 10:15:30 AM Eastern Daylight Time  
 Note for me - Charlie Woods, BID #4187

Recieved this from one of my designers:

2. Deals with the calculation of Zr, the fatigue resistance of an individual stud. My assumption is that the new release already takes care of this since the '09 interims included the change to this article and the analyses are being computed based upon '08 interims. In case you need specifics, the Zr is defaulted to  $5.5 \cdot d^2$  when the single lane average daily truck traffic exceeds or is equal to 960. In this case, the exact value of Zr is 4.2 kips, instead of 2.105 kips shown in attachment. This appears to be an addition in the '09 interims. Below, the outputs are still referencing the older Fatigue II, alpha computations. The new Code specifies using Fatigue I (larger load modifier) with the increased resistance, when the number of trucks exceeds 960.

Bridge Attached

FROM: Krisha Kennelly DATE: 4/7/2011 10:46:28 AM Eastern Daylight Time  
 As shown at the top of the attached sceenshot, Version 6.2 is using the 2008 interims. The 2009 interims with the new Fatigue I limit state will not be available until 6.3 is released later this summer.

Description

FROM: Todd Thompson DATE: 4/7/2011 2:48:56 PM Eastern Daylight Time

I had a designer working on a prestressed girder bridge and he came across a bug with PS Girder bridges using Opis LRFD Engine.

from Designer

After analyzing the G1 member of the Superstructure(continuous and simple, 5.2, 6.2, 7.0 & 7.5) there was intial stress failure at transfer of prestress at the 5 percent location of Span 2, but not at the 3.5 or 10.0 location. From looking at the calculations under the spec check, the opis engine is producing a MDL1 = 0 at the 5 percent location only. After reviewing the Results Graph, all moments for the 5 & 95 percent locations of all the spans are blank.

-----

I have attached the bridge XML, along with scanned copies of the output showing the blank values for all the DL moments (At the reported problem spots) along with the Initial PS forces report that show the DL being blank (or zero) and resulting in failures.

FROM: Herman Lee DATE: 4/7/2011 4:54:02 PM Eastern Daylight Time

Krisha, please see whether spec check requires additional nodes in the finite element model.

FROM: Krisha Kennelly DATE: 5/12/2011 9:23:45 AM Eastern Daylight Time

This bug has been fixed as part of the work we are doing for the 6.3 release. The fix was in the updates to beta 1 and is in Beta 2 for 6.3.

See attached screenshot for the spec article in question under the beta2 release testing.

Description

FROM: Brenda Crudele DATE: 4/12/2011 2:02:16 PM Eastern Daylight Time  
 In New York State we are required during design to check a design permit vehicle for strength II as well as for the Service III limit state with an increase stress limit - prestress bridges only.

The AASHTO Engine does not seem to be able to accomplish this. There is no place to choose a specific limit state to be run. It also doesn't allow the user to choose the same vehicle for the design and permit vehicle.

FROM: Krisha Kennelly DATE: 4/26/2011 10:41:12 AM Eastern Daylight Time  
 In 6.4 users will be able to select the Limit States they want to have considered in the LRFD analysis. Maybe this request should be incorporated into that new feature if the TF agrees.

Perhaps this should go into the System Defaults somehow since you also want to increase the stress limit for this vehicle and limit state only and it is for prestressed bridges only.

### Description

FROM: Brenda Crudele DATE: 4/14/2011 8:50:45 AM Eastern Daylight Time  
Opis does not display calculated stress ranges for Fatigue I and Fatigue II limit states.

1. Enhancement would be to have tables for stress ranges for the length of the girder for both the top and bottom flanges for the Fatigue I and Fatigue II Limit States.
2. In addition of the tables for stress ranges checking the stress ranges for specified fatigue categories along the girder would be helpful.

FROM: Krisha Kennelly DATE: 10/18/2011 9:52:14 AM Eastern Daylight Time  
Developer notes for estimating:

1. Art. 6.10.1.1.1b currently contains the fatigue LL stress at the top and bottom of the web. See attached 10745.png. The table requested by Brenda would be a compilation of these computed stresses.
2. I think this ability already exists. User can enter fatigue details on the Point Of Interest: Fatigue tab. If the user enters fatigue details and a Design ADTT on the Bridge: Traffic tab, Art. 6.6.1.2.2 is evaluated for the details. See attached 10745 Art 6 6 1 2 2.png

FROM: Krisha Kennelly DATE: 11/2/2011 11:22:43 AM Eastern Daylight Time  
Task Force has approved item #1 for inclusion in Version 6.4.

 email from Berhanu, Mon 6/13/2011 11:35 AM:

Krisha,

The design is made without the dead load components (see the marked in red below). That is where the problem arises.

Thanks,

Berhanu

FROM: Wayne Skow DATE: 6/21/2011 1:45:24 PM Eastern Daylight Time  
 The 5th edition commentary for article 6.10.1.7 makes it clear that minimum reinforcement is required if there will be tension in the slab at any time either during construction or after. Areas defined as positive moment regions (inflection points based on dead load) were previously excluded, but no longer are. It is appropriate to assume the slab is wet during stage 1 loading and, therefore, any stage 2 + 3 loading causing negative moment needs to be resisted by minimum reinforcement. Note, in the example shown above, that no stage 2 load was defined. Therefore, in this case, the determination of moment direction is based on the stage 3 load alone and minimum reinforcing calculated accordingly.

Description

FROM: Wayne Skow DATE: 6/21/2011 2:18:12 PM Eastern Daylight Time

The note at the bottom of the table is really not accurate. While the failure is correct, the note references #6 bars or minimum yield strength. The real problem is not enough reinforcing. The note should not display in this case. (I suspect it's testing the Fy value without considering there is no rebar specified).

Fixed for 6.4 Release

FROM: Xinmei Li DATE: 8/30/2012 10:06:54 AM Eastern Daylight Time  
Verified the fix for Beta4.  
I used attached bridge, G1, changed modulus ratio to 1 in deck profile window. Analyzed with LRFR, article 6.10.1.7 has correct error message now.

To: Armbrecht, Tim A  
Subject: RE: AASHTO Virtis/Opis - Michael Baker Jr., Inc. - priority has been resolved.

Tim,  
I have attached the .xml files for the structures listed below. I ran the wizard 4 times for each structure (using 0.75" or 0.875" diam. Studs and with or without studs at negative moment areas). The combinations of these options that resulted in errors or incorrect data have been summarized below.

1. Bridge: 48341.xml  
Member: Interior Girder – West  
Member Alt.: W24x76 (E)(C)  
Errors: Missing Data Error for 0.75" and 0.875" studs with no studs at negative moment areas
  
2. Bridge: 47515.xml  
Member: Interior Girder – 1st NW  
Member Alt.: W27x102 (E)(C)  
Errors: Did not reach an optimized solution for 0.75" and 0.875" studs with no studs at negative moment areas  
Wizard ran with no errors but used incorrect spacing for 0.75" studs with studs at negative moment areas
  
3. Bridge: 09-203.xml  
Member: Interior Girder – 1st North  
Member Alt.: W24x94 (E)(C)  
Errors: Missing Data Error for 0.75" and 0.875" studs with no studs at negative moment areas  
Wizard ran with no errors but used incorrect spacing for 0.75" and 0.875" studs with studs at negative moment areas

### Description

FROM: Todd Thompson DATE: 7/7/2011 10:11:18 AM Eastern Daylight Time

I have a designer working on a new RC Slab bridge. (6.2 -- BRASS LRFD Engine)

He noticed when he has a Cross Section Based RC Slab - that he gets different HL-93 Axle/Truck Deflections when he includes or doesn't include the Fatigue Truck. In examining the BRASS.dat file that is created, when one doesn't include the Fatigue Truck - the BRASS file created uses different distribution factors when comparing the BRASS file created when one includes the Fatigue Truck.

And then upon further investigation, he created a Cross Section Based RC Slab and including or not including the fatigue truck makes no difference in the deflections for the HL-93 Axle/Truck.

So it appears that the BRASS files being created for Cross Section based does not work correctly when including or not including the Fatigue Truck.

### For attached XML

-- Use the Interior Strip member definition

---- the two member alternatives are

(1) 12" INTERIOR STRIP (cross section based)

(2) 12" INTERIOR STRIP SCHEDULE (schedule based)

FROM: Todd Thompson DATE: 7/7/2011 10:13:07 AM Eastern Daylight Time

Also attached the BRASS dat and out files for runs with and without Fatigue Truck.

 To: Armbrecht, Tim A  
 Subject: PSC Shear Stirrup Wizard Problems

Tim,  
 There are multiple problems with the shear stirrup wizard for prestressed beams in Virtis 6.3, which render it virtually unworkable for multi-span continuous PS I-beams. Refer to the Virtis model export, PSShearStirrupWizardProbs(0550052)-63.xml.  
 Stirrup Wizard Entry, A = 0.00 ft Start distance; B = 0.166667 ft Start distance:

Complete Issue Information

A B

Then, here's the result after <OK> is clicked:

A B

Applying the Stirrup Wizard deletes the existing stirrup reinforcement in all spans, even though it may be desired to do only one span. Also, the "Symmetry" selections applied to one span are automatically applied to all spans, which is totally unacceptable. It's highly probable that, in the same continuous PS I-beam unit, "Even..." could be selected for one span and "Odd..." would be appropriate for another. This would make the Stirrup Wizard impossible to use for all spans. It is therefore essential that the program be modified to apply the Stirrup Wizard to each span separately.

Second, when "Extends to deck" is selected it applies to all stirrups, even though all stirrups may not extend into the deck. This should be like in the manual stirrup entry where it's only selected for the applicable bars. Remove the global "Extends to deck" and replace it with an "Extends to deck" column to allow it to be selected or not for each entry.

Third, with regard to "Start Distance", the operation of the Wizard is inconsistent with the way that stirrups are and have always been entered. When entering stirrups manually, there is and has never been a stirrup added at the Start location but only at the spacing specified to the right of it. Conversely, as can be seen in the screen shots of the two possible ways of doing "Start Distance", when the Wizard is applied, the results are incorrect. In the example, when 0.00 is used, an extra G2 bar is placed at 0.00 and a 3/4" Thr Rods bar is placed at the very end. When 0.166667 is used for Start Distance, two 3/4" Thr Rods are placed at 0.166667. Both are erroneous and must be manually revised by the user. This is unacceptable. Make the Wizard work consistently with manual entry so that either way of entry yields a correct result.

Description

FROM: Jeff Ruby DATE: 10/11/2011 11:48:22 AM Eastern Daylight Time

I believe there is a critical bug in the calculation for Minimum Negative Flexure Concrete Deck Reinforcement AASHTO 6.10.1.7.

The problem may relate to Incident 10670 where the stress calculation didn't include the modular ratio. Or it may be a database problem.

## Complete Issue Information

At any rate, the stress calculations for the concrete slab need to include the modular ratio.

The attached screenshots show the BRASS output and the AASHTO Engine output at the 1.4 point, 68ft into span 1. The bridge is attached as well. I used the "MAI Design Check, As Rated DRT Aug 2011" superstructure definition with the "Steel Plate Interior" member alternative for member "G2".

The attached "6.3\_release\_ScreenShot\_004.jpg" shows the section modulus towards the bottom for "Slab" as 7911.75 in<sup>3</sup>. If I may be so bold as to make a suggestion, how about changing "Slab" to "Slab (Transformed)" and changing "-7911.75" to "-63294.00". This would certainly be appropriate for the listed "Fy" of 4.0 ksi.

Maybe like this:

NA from Bot of Beam = 62.8252 (in)  
Moment of Inertia, I = 205110.82 (in<sup>4</sup>)

| Component  | C                  | S         | Fy    |
|------------|--------------------|-----------|-------|
| (in)       | (in <sup>3</sup> ) | (ksi)     |       |
| *Slab      | 25.92              | -63294.00 | 4.00  |
| Reinf Row1 | 22.49              | -9121.17  | 60.00 |
| Reinf Row2 | 20.30              | -10104.06 | 60.00 |
| Top Flange | 15.67              | -13085.36 | 50.00 |
| Web Top    | 14.67              | -13977.04 | 50.00 |
| Web Bot    | -61.33             | 3344.64   | 50.00 |
| Bot Flange | -62.83             | 3264.79   | 50.00 |

\* Section modulus has Transformed to Concrete

For more information see "6.3\_release\_Screenshot\_002.jpg" for the BRASS output of section properties.

Just for clarification:

"6.3\_release\_Screenshot\_001.jpg" shows the BRASS calculation for 6.10.1.7 slab stress as 0.147 ksi Tension.

"6.3\_release\_Screenshot\_003.jpg" shows the AASHTO engine calculation for 6.10.1.7 slab stress as 1.18 ksi Tension. If you divide 1.18 by the modular ratio of 8, you get 0.147 ksi.

FROM: Wayne Skow DATE: 11/3/2011 10:20:12 AM Eastern Daylight Time  
Jeff was correct. The modular ratio was not being applied. This bug produces conservative results. It will flag 6.10.1.7 as failed at times, but it has no other affect. Design ratios and rating factors are unaffected.

Fixed in 6.4.

FROM: Herman Lee DATE: 11/3/2011 3:28:29 PM Eastern Daylight Time  
The fix will be included in the 6.3 Service Pack.

FROM: David Warner DATE: 12/16/2011 11:57:01 AM Eastern Standard Time

The attached .xml bridge and the shear stirrup design tool have a problem. I've attached screen captures of the error which says to contact tech support, and of the cross frame layout.

Seems the stirrup design tool can't handle reinforced concrete pier tables. Yet continuity diaphragms, stage 1 vs. stage 3 loading, and other continuous for live program calculations are flawless. Perhaps the shear stirrup wizard needs to only place stirrups in the beam length, not into the pier table.

Thanks,

Dave W.

FROM: Mark Mlynarski DATE: 12/20/2011 2:15:22 PM Eastern Standard Time

Dave,

could you send me the input for the first menu in the 'Shear Stirrup Design Tool'. This could be in the form of a screen capture.

This is the menu that first pops up when you click on the 'Stirrup Design tool' button on the 'PS Shear Reinforcement Ranges' menu

(see attached file VI-11191-MM-Menu.jpg).

Thanks,

Mark

FROM: Mark Mlynarski DATE: 12/20/2011 2:20:10 PM Eastern Standard Time

P.S Also which girder/member alternative are you running?

Thanks,

Mark

FROM: Mark Mlynarski DATE: 1/11/2012 11:43:27 AM Eastern Standard Time

This is a bug and there is currently no workaround for it.

The root of this issue is that the critical shear location on the right end of the first span is being measured from the c.l. of the first pier. It should be measured from the c.l. of simple span bearing. This eventually causes an issue with the stirrup design tool.

FROM: Krisha Kennelly DATE: 8/26/2012 2:10:45 PM Eastern Daylight Time

Fixed for 6.4 beta build 4. I've changed the subject of this issue to reflect what changed for all users.

For continuous prestressed beams: Critical distance for shear ( $d_v$  for LRFD/LRFR and  $h/2d$  for LFD) is now measured from simple span bearings instead of the final continuous bearing location (ie, CL of pier). Previous versions of AASHTO engine checked shear at conservative location closer to the pier than it should have.

FROM: Bin Zhang DATE: 8/29/2012 9:21:06 AM Eastern Daylight Time

Verified for acceptance build

Description

FROM: Brenda Crudele DATE: 12/20/2011 11:21:44 AM Eastern Standard Time  
 File is first run with opis engine in 6.2. Girder 1 takes thirty minutes to run and then you get an error (see G1 error.bmp and G1.log). The spec check is not populated.

File is run with aashto engine in 6.3 with the same result.

File runs successfully with aashto engine in 6.3.

I was able to get G2 to run in Version 6.3 by simplifying the deck reinforcement schedule. The problem is I don't account for all the steel like the original, which has top and bottom steel and the extra steel over the pier. . It must have reduced the calculations and saved on memory.

Complete Issue Information

FROM: Herman Lee DATE: 12/20/2011 11:44:23 AM Eastern Standard Time  
Brenda, are you using the 32-bit version of Opis? Are you looking for ideas/options that you can try to minimize memory usage or you would like us to confirm the error is not caused by other issues?

FROM: Herman Lee DATE: 12/20/2011 12:28:44 PM Eastern Standard Time  
E-mail from Brenda Crudele:

=====  
Herman,  
I am running 32 bit. I would like to know if it is my system or a problem with the aashto engine. How long does it take to run on your machine? Any suggestions for minimizing time will also be appreciated.

Thanks,  
Brenda

=====  
FROM: Geoffrey Trees DATE: 12/20/2011 2:39:18 PM Eastern Standard Time  
Brenda,

I am going to need more information to test your setup. Would you be able to provide me with the analysis settings you are using, the version of windows and service pack, the page-file size, how much RAM your machine has, how much free hard drive space and what your CPU specs are? If you need help finding any of this information, please let me know.

I am able to run your bridge to completion in v6.3.0 - 32 bit and it took about 16 minutes using the HL-93 Design-Review template. The issue may be related to your machine specs.

FROM: Geoffrey Trees DATE: 12/21/2011 10:03:54 AM Eastern Standard Time  
E-mail from Brenda Crudele: (All images are attached to this incident)

=====  
Geoff,  
I took screen shots of all that I could find. I don't know how to find how much RAM I have. Any other information you need please send instructions.

Thanks,  
Brenda

=====  
FROM: Geoffrey Trees DATE: 12/21/2011 10:04:54 AM Eastern Standard Time  
Brenda,

Try going to your start menu, right click "My Computer" and click properties. Please take a screen shot of what is listed on the General tab. I took a screenshot of a Windows XP Virtual Machine I have so you can see what it looks like. Also after you take a picture of that, press the 'Advanced' tab on that window and then under Performance press the 'Settings' button. Once the Performance Options dialog appears, press the 'Advanced' tab and take a screenshot of that as well. That should give me all the information I need in addition to what you gave me below for your system specs.

Complete Issue Information

I also need more information about how you run the bridge(or girder in this case). What vehicles and settings do you use? I was able to run successfully yesterday but I would like to test it doing exactly what you are. It may be easiest if you setup the Analysis Settings exactly how you use it and then take screenshots of each page.

Thanks,  
Geoffrey Trees

E-mail from Brenda Crudele: (All images are attached to this incident)

=====  
Here is the requested info. Let me know if you need anything else.

Thanks for the help,  
Brenda

=====  
Brenda,

A few suggestions I have would be you can try increasing your page file size from 1024 to 2048. See my screenshot below for what the settings should look like. Also I see from your Control Options screenshot you have all three points-of-interest options selected. Try un-checking all but one and running the analysis. If that works, you can run the analysis with one POI control option selected at a time. Finally, try to close any additional programs running on your machine to free up some memory. Other than that, I would suggest speaking to your IT department about your system. Since we can run it here in a Virtual Machine of similar specs, the problem seems to be isolated to your computer.

Thanks,  
Geoff

Description

FROM: Brenda Crudele DATE: 5/30/2012 1:57:17 PM Eastern Daylight Time  
 In NYS we have a Design Permit Vehicle that we run for new designs. For prestressed bridges we are required to check the Strength II and Service III limits states with the design permit vehicle.

Complete Issue Information

If I change the Limit States Checks to include only Strength II and Service III and then run the design permit vehicle as a design vehicle, Strength II is not checked.

If I run the design permit vehicle under a permit load then it will check strength II, but it doesn't seem to check Service III.

Is there a way to check Service III and Strength II for one vehicle with one run?

The program won't run if I put the same vehicle as a design load and permit load.

FROM: Krisha Kennelly DATE: 6/21/2012 2:03:06 PM Eastern Daylight Time  
Virtis/Opis does not allow you to enter the same vehicle in the design and permit load categories.

## Complete Issue Information

I had our culvert expert take a look at the design tool and we came up with the following issues that need serious consideration. The review was not extensive so some of these may not be entirely accurate. Note that we do not license Opis here at MoDOT and I don't know if that will change anytime soon. Thus, additional feedback from Opis users would be helpful.

1. Design tool only has one cover other than bottom slab cover. Typically culverts can have up to four different covers: Top of Top Slab, Outside Exterior Wall, Bottom of Bottom Slab & Inside Cell Cover. This pretty much follows AASHTO.
2. Surcharge height should be calculated by the program. Appears that currently the user would have to calculate this value. An override by the user would make sense, too.
3. Design of culverts should include with and without water checks. It appears that the design tool will use whatever water level is entered as a static condition. Exterior walls designed with water can give significantly smaller thickness than designed without.
4. There needs to be Help for the design tool. For instance, the fill depth for the design tool is different than the value entered for an analysis. One is measured from bottom of slab and the other from top of slab.
5. Not sure that the reinforcing scheme is being populated correctly. I am attaching an image of the reinforcing scheme created by the design tool. The top and bottom slab reinforcement appears to be flipped. I would expect the top bottom slab reinforcement to extend the full length to resist mid cell moments. Also, bottom reinforcement for the top slab was created and centered over the walls. This would be compression reinforcement and does not seem logical.
6. It would be nice if the user could choose to use the General Procedure for shear analysis. This is required by AASHTO for slabs 16" and greater. It might be better to have this option for analysis as it may be difficult to use for a design tool.
7. The program must be able to perform a design review.

FROM: Herman Lee DATE: 7/12/2012 1:09:59 PM Eastern Daylight Time  
1-3, 6 and 7 are enhancement requests for the AASHTO Culvert Engine. 4 and 5 need to be investigated. 5 might be duplicate of Incident 11654.

FROM: Xinmei Li DATE: 7/12/2012 1:14:09 PM Eastern Daylight Time  
4, The fill depth for the design tool is the same as the value entered for an analysis. Both are measured from the top of the slab. See attached bmp file, it's comparison of that in design tool window and RC box culvert loads window.  
5, duplicate of Incident 11654, it's resolved when next beta version is available.

FROM: Herman Lee DATE: 7/13/2012 9:07:50 AM Eastern Daylight Time  
May, please hook up the Help button in the Design Tool.

FROM: Aaron Kemna DATE: 7/13/2012 9:54:16 AM Eastern Daylight Time  
While I consider 1-3 & 7 near necessities for any culvert design program, I am not sure how 3 can be considered an enhancement considering that a design review cannot be performed. Every culvert must be designed with and without water (or high and low water levels for a more exact analysis). With the current set-up, the user would have to run the design tool twice and use the combination of the two

1/5/2016 11:08:19 AM

HRS AASHTO

406

Complete Issue Information

which they would not be able to check with a design review.

As for the fill depth, I attached a summary report which shows the Depth of Fill = 3.5', the slab thickness = 12.5" and the Depth of Backfill for EV Loads = 2.458'. This leads me to believe that the design tool is measuring the fill depth to the bottom of the slab. This would actually make sense for a design tool since this input would not change as the slab depth changes.

FROM: Herman Lee DATE: 7/13/2012 2:02:54 PM Eastern Daylight Time  
Aaron, I should be more clear when I said 1-3, 6 and 7 are enhancement requests for the AASHTO Culvert Engine. In the context of the 6.4 work plan, 1-3, 6 and 7 are considered as enhancement requests.

We will investigate the fill depth issue you identified.

FROM: Brenda Crudele DATE: 7/31/2012 4:47:26 PM Eastern Daylight Time  
This is an enhancement request for shored construction design.

We have been doing some precast bridge systems, formerly called inverset. Typicall there are two girders and a precast deck that is transported to the construction site. For this type of design the girders are shored at the fabrication plant until after the deck is poured making the girder and deck loads composite.

Right now the girder and deck are hard coded to be non-composite loads. Is it possible to add an option to make the girder and/or deck loads composite?

FROM: Herman Lee DATE: 5/13/2014 1:58:41 PM Eastern Daylight Time  
Implemented the option to specify composite self-load and concrete deck load in the upcoming 6.6 release.

Description

FROM: Krisha Kennelly DATE: 8/7/2012 9:12:51 PM Eastern Daylight Time  
Originally submitted by Jeff Ruby in Issue 10340 but that issue was for the splice gap enhancement only. Jeff submitted the following release bugs in the wizard:

Complete Issue Information

I think this has been a problem from the beginning. The attached bridge was coded in metric. But I set the default units to english for my convenience. Using member G2, if I try to run the shear stud wizard, I get the error box as shown in the attached screen shot. I think it is a tolerance issue. I can get it to work if I change the units box to SI. But, when the wizard calculates the ranges, it all is in feet.

2 Issues:

- 1) fix the tolerance issue
- 2) the wizard should check to see what current units are for the dialog box in question and return the appropriate results.

FROM: Girish Bhanushali DATE: 1/25/2013 11:10:58 PM Eastern Standard Time  
Both issues are fixed and tested.

Under Item 2):

Result window did not only return the results in US units when SI was selected, but results were incorrect for SI run when diameter was entered to match that of US default of 0.875".

Fix also needed to get correct results from the design module for SI unit run.

Testing was done using Training Bridge 1 and attached bridge from Jeff. Test successfully ran on SI and US units. Results now match when exactly same stud diameter is entered for SI as for US run.

Fix has been checked in to be available in 6.5 release for validation by Jeff.

FROM: Melanie Berry DATE: 4/18/2013 3:20:39 PM Eastern Daylight Time  
Verified that the shear stud wizard worked with US and SI units.

### Description

FROM: Krisha Kennelly DATE: 8/21/2012 4:46:02 PM Eastern Daylight Time

For the bridge attached to 11191, use the Stirrup Design Tool on G1. (Don't need to enter any data in the Sitrrup Design Tool) Will get an 'Error Loading influence lines' for the HL93 loading. Running a line girder on G1 runs ok.

FROM: Herman Lee DATE: 8/22/2012 9:04:33 AM Eastern Daylight Time

Stirrup Design Tool should include the library Pedestrian vehicle in the Analysis Event. Same issue in the Shear Stud Design Tool.

Resolved for 6.4 Release.

FROM: Srujana Thogaru DATE: 8/29/2012 11:42:37 AM Eastern Daylight Time

### Description

FROM: Krisha Kennelly DATE: 9/18/2012 1:01:24 PM Eastern Daylight Time  
Split out from comments in 10340:

FROM: Jeff Ruby DATE: 8/8/2012 2:24:32 PM Eastern Daylight Time  
After doing an LRF design check with the "wizard" results, I get a Strength Limit State failure for not enough studs. The number of studs are not calculated correctly for Article 6.10.10.4. It appears to be a straight forward calculation once you have the inflection points from the wizard design run. I will attach the file shortly.

FROM: Girish Bhanushali DATE: 2/22/2013 12:29:36 PM Eastern Standard Time  
Hi Jeff,  
This issue has been fixed to be verified in next release (6.5).

6.10.10.4 passes at all check-points after the fix. See attached document with "From Dev".

1/5/2016 11:08:21 AM

HRS AASHTO

413

## Complete Issue Information

Fix was tested on x64 bit development build (was necessary to run the provided bridge) without making any changes to the bridge you provided, except shear stud design wizard was run and new results were stored.

Please let us know should you have any further questions or concerns

Thanks.

FROM: Melanie Berry DATE: 4/18/2013 4:15:53 PM Eastern Daylight Time  
Verified that Article 6.10.10.4 passed after using the shear stud design wizard.

FROM: Jeff Ruby DATE: 5/30/2013 3:57:29 PM Eastern Daylight Time  
Steps I took to "break" it.

- 1) import VI-11792-V641-SubstructureExample01.xml
- 2) open Deck Profile for G2
- 3) change units to SI/Metric
- 4) Click "shear stud tool wizard"
- 5) Enter gaps as shown in my screenshot
- 6) Hit continue
- 7) Apply
- 8) change units to US Customary
- 9) perform analysis

### Observations:

The stud wizard produces the same spacing for all ranges. (see StudWizardDesignRanges.jpg)  
As an example the first range from 0 to 59 ft doesn't have enough studs

### Resubmitted Version 6.5.0 Beta 2

FROM: Jeff Ruby DATE: 6/18/2013 3:27:26 PM Eastern Daylight Time  
After reading some more at Issue 12623, some of this may be fixed, but I am not sure this is just a "metric" issue. It appears maybe the "gaps" are causing some problems? Don't know. I have only tested the wizard with gaps.

This is listed as a verified bug since Beta 1. I am assuming this is going to be fixed for 6.5.0 release.

I noticed that Issue 12102 isn't in the list of "fixed" bugs, but is definitely related.

FROM: Jeff Ruby DATE: 6/20/2013 4:55:44 PM Eastern Daylight Time  
Actually, I again tried to trace the whole history of this and related bugs. I came up with these related issues:

10430 -> split to 11792 and 11930 (this one, currently needs some fixing of some sorts)  
12101  
12155  
12166  
12169

It is getting confusing. I will try to keep up.

Complete Issue Information

FROM: Girish Bhanushali DATE: 6/25/2013 4:07:48 PM Eastern Daylight Time

Thank you Jeff.

Kindly note as my comment in Issue 12102 regarding a fix that we had to roll back for further evaluation due to interdependencies.

We have a comprehensive fix in place and we are in the process of verifying related bugs. We'll also review your list to see if any of the resolutions were affected.

I'll keep you posted.

Thanks.

FROM: Girish Bhanushali DATE: 7/2/2013 12:36:48 PM Eastern Daylight Time

Hi Jeff,

For better tracking, we have split this incident into two new ones: VI# 12733 and 12734.

This incident will represent first four comments that were related to attached bridge "ShearStudWizardProblem.xml".

We are in the process of re-verifying initial issue with "ShearStudWizardProblem.xml" bridge.

Gaps related problems will be addressed under VI# 12733 with newer related bridge that you have attached "VI-11792-V641-SubstructureExample01.xml".

Thank you.

Regards

Description

FROM: Brenda Crudele DATE: 10/16/2012 10:37:47 AM Eastern Daylight Time  
NYSDOT would like to request a LRFD splice analysis to be added to the program as an enhancement.  
We would be willing to use service units. Full description of request in attached as a word file.

Features of the enhancement would include the following:

- Hybrid girder splice capability
- Curved girder splice capability
- Follows AASHTO LRFD Section 6.13.6 including the commentary of Section C6.13.6.1.4c
- LRFR capability
- Has a simple input with a viewer that shows the input.

In addition to the LRFD ability we would like to have it priced out as to how much it would cost for LFD analysis and load rating. This would include a normal splice and a continuous for live load splice at a pier.

FROM: Herman Lee DATE: 3/27/2015 2:56:41 PM Eastern Daylight Time  
This enhancement has been implemented in the 6.7 release.

Description

FROM: Phil Litchfield DATE: 10/16/2012 5:05:14 PM Eastern Daylight Time  
From consultant (Staggemeyer):

I have noticed that the Steel Limit State Summary Report in OPIS isn't displaying everything that it has in the past. I have attached the .xml file and a screenshot. This was also checked and found not working in 6.4 Beta 5.

FROM: Herman Lee DATE: 10/17/2012 9:00:32 AM Eastern Daylight Time  
The data in the Steel Limit State Summary Report is populated by the analysis engine used for the Design Review. Are you comparing the report populated by the AASHTO LRFD Engine with the report populated by the BRASS LRFD Engine?

FROM: Phil Litchfield DATE: 10/22/2012 10:50:08 AM Eastern Daylight Time  
I'm not sure which engine the previous report was ran using. I attached a copy of the previous report that includes much more information in it than the current report generated.

FROM: Bin Zhang DATE: 10/31/2012 9:14:16 AM Eastern Daylight Time  
The previous report is generated from the BRASS LRFD engine. AASHTO engine provides less information in the Analysis Results window. However, you can use the report tool to generate a detailed report from AASHTO engine. Please refer to figure 1 and figure 2 regarding the generation of the report. I also provided a snapshot of the report in figure 3.  
Please read the attached 11978.docx for details.

Description

FROM: Herman Lee DATE: 10/31/2012 2:59:58 PM Eastern Daylight Time  
 Submitted on behalf of An Tran, CO DOT.

Part of the Bridgeware e-mail received on 10/30/2012:

=====  
 1/ The Culvert Design Tool does not design for reinforcement bars at the inner face of the exterior walls, resulting in a Rating Factor = 0.  
 =====

Reply e-mail:

=====  
 I see reinforcements specified at the inner face of the exterior walls in the culvert output file. I suspect there's a problem in translating the design output when creating the culvert model.  
 =====

FROM: Srujana Thogaru DATE: 2/1/2013 2:55:41 PM Eastern Standard Time  
 Above mentioned problem was fixed for 6.5 release. For internal testing fixed for 6.5 Alpha Build 1

Complete Issue Information

FROM: Melanie Berry DATE: 4/18/2013 4:29:13 PM Eastern Daylight Time  
I input the example attached in the RC Box Culvert Design Tool, ran the analysis for the created member alternative and checked the ratings.

Description

FROM: Dean Teal DATE: 11/6/2012 1:36:33 PM Eastern Standard Time  
With the attached structure  
BRASS used as LRFD engine on Girder line #2  
View the spec checker and the Specification Reference column is blank  
If you double click on a particular line item you get a blanked out Spec Info window then a fatal error that crashes Virtis.

FROM: Dean Teal DATE: 11/8/2012 3:44:09 PM Eastern Standard Time  
Is this a BRASS issue or a GUI issue?

FROM: Dean Teal DATE: 11/9/2012 8:05:07 AM Eastern Standard Time  
I confirmed that this is a brass error that I reported (and they fixed it) inversion 6.3.0  
BRASS Incident #280  
I reopened the brass incident

1/5/2016 11:08:23 AM

HRS AASHTO

421

Complete Issue Information

FROM: Brian Goodrich DATE: 11/9/2012 11:10:08 AM Mountain Standard Time  
I don't have access to the AASHTO engine. Can someone check if the crash is happening for that engine too?

FROM: Herman Lee DATE: 11/11/2012 2:12:31 PM Eastern Standard Time  
For the AASHTO Engine, the Spec Check Detail window is not blanked out and Opis doesn't crash after that.

FROM: Joseph Ihnat DATE: 11/14/2012 1:48:42 PM Eastern Standard Time  
Crash is fixed for 6.4.1

FROM: Herman Lee DATE: 11/20/2012 9:41:43 AM Eastern Standard Time  
There are two issues in this incident.  
1. Spec check window crash when opening BRASS results – AASHTO issue. This is fixed for 6.4.1 (Beta 2).  
2. Blank spec names – BRASS issue (BRASS Incident #280). Seems like the scripts provided by BRASS installation have issues with Oracle database.

This incident is for issue #1. Please track issue #2 using BRASS Incident #280.

FROM: Dean Teal DATE: 11/21/2012 1:05:31 PM Eastern Standard Time  
I tested the BRASS incident #280 with my oracle 11g test server and it failed - same results

FROM: Geoffrey Trees DATE: 12/4/2012 2:57:35 PM Eastern Standard Time  
1. I am able to run the bridge with the BRASS engine and open the Spec Check window without any crash.  
2. We do not have the updated BRASS Script.

Verified.

### Description

FROM: Jeff Ruby DATE: 12/5/2012 9:54:11 AM Eastern Standard Time

I discovered that the Spec check for Article 6.10.10.2 is not using the calculated values from the "Spec Check Detail for 6.6.1.2.2 Design Criteria." Screen shot 006 shows:

ADTT = 1248  
p = 1  
n = 1.0  
ADTTsl = 1248  
N = 34164000

But "Spec Check Detail for 6.10.10.2 Fatigue Resistance" in screen shot 007 shows:

ADTT = 1248  
p = 1  
n = 2  
ADTTsl = 624  
N = 34164000

I notice 2 problems in 6.10.10.2 calculations:

1/5/2016 11:08:23 AM

HRS AASHTO

423

Complete Issue Information

- 1) n is wrong
- 2) ADTTsl is calculated wrong.

I propose not recalculating values that have already been calculated, especially when not done the same.

I used "Design Check SMA 10/21012" Superstructure Definition on G2, Haunched Plate Girder. But any steel bridge with stud should do.

|------|---------------|---------|

### Description

FROM: Todd Thompson DATE: 12/12/2012 3:13:28 PM Eastern Standard Time

I have only done load ratings up to this point and since I had some extra time - decided to try a culvert Design. Noticed a few issues, some of which may be user education issues, some of which may be bugs and some which may need to be enhancement requests.

As necessary - you can break apart these 7 issues into separate incidences.

(1) I checked - consider haunches on the first screen of the Design - but in reviewing the output - the log file stated "no haunches" - Either the design tool doesn't use the information entered on the GUI? Or maybe the design decided haunches were not necessary as part of the design. If it's the later - the output log should state that while haunches were to be considered, they were not used or necessary in the design.

(2) I observed that there was no resteel placed/designed for the inside face of the exterior walls - this seems to be an omission/error.

(3) After the Design Tool runs - One is given a choice of Apply or Close. Help states that Apply will populate the explorer tree. I've tried hitting Apply and nothing ever seems to happen. ONLY when I hit close - does the tree get populated with the culvert design. Either the help is wrong or the apply button is not functioning as intended.

(4) There is no option in the Design to consider the new NCHRP 647 LL DF for culverts.

(5) There is no option to ignore Shear, if the user so chooses

(6) Two of the rebars generated by the design tool - project outside of the box culvert. Clearly a bug. Warning - Rebar(s), B509, B510 projects out of the Culvert

(7) A quick LRFR Analysis produces 0.000 RF's for HL-93 truck (and all trucks). The controlling member(s) appears to be the Exterior Wall - approximately 5.2 ft up --- Not sure why one would get ZERO RF's when OPIS just did a successful design. (Related to missing exterior wall resteel maybe?) A quick check shows that the top slab also fails in Flexure.

I've attached my culvert XML with two test alternatives that I used to try to do a successful design and analysis.

FROM: Todd Thompson DATE: 12/12/2012 3:17:28 PM Eastern Standard Time

I'll attach two of the txt files generated from the Design also from my Test 2

FROM: Todd Thompson DATE: 12/12/2012 4:12:02 PM Eastern Standard Time

Item (2) - I do see that the design document does not list a bar being generated here - so I guess the Designs will almost always fail after doing them and then running an analysis. I guess Item (2) will be a needed enhancement or system shortcoming.

But I'm not sure why the Top Slab passes in Design Review but fails in Analysis for HL-93

Description

FROM: Jeff Ruby DATE: 12/12/2012 5:25:34 PM Eastern Standard Time  
 For Attached Bridge at Span 1 (60ft) Article 6.10.10.4 calculates the number of studs incorrectly. If you see the screenshot, you will see that the statement "Region between point of max. LL+I moment and CL of adjacent interior support." Is CORRECT. But the "Region Start Distance" is wrong.

Region Start Distance = 42.7033 (ft) <---- Should be 24 ft (max LL+I moment)  
 Region End Distance = 60.0000 (ft)  
 Number connectors in region = 52 <----- Should be about 110 to 122 (+/-)

FROM: Jeff Ruby DATE: 12/12/2012 5:27:59 PM Eastern Standard Time

Complete Issue Information

Attached Bridge. Used Revised Design Check JSR, 11/07, G2 Member Alt and Member.

FROM: Jim Duray DATE: 12/13/2012 10:36:33 AM Eastern Standard Time  
If this is new to 6.4.1 (i.e. not in 6.4.0) we should fix now. If it also in 6.4 it can wait for the 6.5 release.

FROM: Jeff Ruby DATE: 12/13/2012 1:51:03 PM Eastern Standard Time  
Whatever the Task Force thinks. It looks like it has been broke for a while. It should at least make it to the list of critical bugs so that all users know that the stud spec checking does not work.

FROM: Jeff Ruby DATE: 12/13/2012 2:04:10 PM Eastern Standard Time  
I think 10340, 11792, and 11930 are related somehow. But, this issue is a serious bug. The others are annoyances at best.

FROM: Girish Bhanushali DATE: 2/8/2013 3:36:09 PM Eastern Standard Time  
Hi Jeff,

Thank you very much for your detailed feedback.

After fixing numerous related issues, this issue has been resolved to be verified in next release (6.5).

Please refer to the attached document(s) - name starting with "FromDev".

Kindly note that new results are as expected while no other changes were made to the bridge that you provided.

Also, check point region in question (60 ft) is a negative flexure region while connectors are still designed using maximum positive moment range as per the spec.

Please feel free to let us know, should you have any other concerns.

Regards

FROM: Subhadeep Ghosh DATE: 5/6/2013 5:12:46 PM Eastern Daylight Time  
Number of shear studs computed were verified and the region start distance were verified as per the attached screen shots. Verified for Beta 1 6.5.

FROM: Jeff Ruby DATE: 5/7/2013 2:05:00 PM Eastern Daylight Time  
I tried the exact same point mentioned at the start. See FromJeff\_6.10.10.4\_6.5.0beta1.txt file attached.  
In version 6.5.0 Beta 1 with new dll's, the results appear the same as before. Not fixed.

FROM: Girish Bhanushali DATE: 6/25/2013 12:03:53 PM Eastern Daylight Time  
Hi Jeff,

Thank you for your feedback.

We investigated this and it turned out that one of the fixes that was positively affecting this incident and

1/5/2016 11:08:24 AM

HRS AASHTO

427

Complete Issue Information

others similar, had to be rolled back for further evaluation.

We are working on a comprehensive fix and it is going through our testing.

Current fix that is under testing, addresses both correct range distances and number of studs in the spec check report for the above case.

I'll definitely keep you posted.

Thanks again.

FROM: Girish Bhanushali DATE: 6/27/2013 2:21:18 PM Eastern Daylight Time  
Issue is resolved to be verified in next beta or updates. (Fix is connected to 11524).  
Please see attached file: Post\_Fix\_Results\_06\_26\_2013.txt

FROM: Jeff Ruby DATE: 7/9/2013 12:20:21 PM Eastern Daylight Time  
Thanks,

Accepted 6.5.0 Beta 3 with updated dlls

FROM: Girish Bhanushali DATE: 7/9/2013 3:20:35 PM Eastern Daylight Time  
Status changed to Accepted based on previous comment from Jeff.

Description

FROM: David Warner DATE: 1/18/2013 5:40:08 PM Eastern Standard Time  
When analyzing the attached prestressed beams in P00003068\_03001.xml.

The only spec check failures are the following (2) PDF's, described below.

LRFD 5.5.3.1 and 5.5.3.2: Calculating concrete stresses for fatigue loading, V/O is choosing flexure from a Service I truck/lane configuration rather than the fatigue truck causing overstress "failure" in prestressed beams.

LRFD 5.8.3.5: when determining the amount of longitudinal reinforcing needed in a prestress beam, V/O is using a resistance factor of 0.9 for flexure, rather than 1.0 resulting in "failure" for certain configurations.

Thank you.

Complete Issue Information

FROM: Srujana Thogaru DATE: 3/27/2014 4:13:10 PM Eastern Daylight Time

Issue 1: LRFD 5.5.3.1 and 5.5.3.2: Calculating concrete stresses for fatigue loading, V/O is choosing flexure from a Service I truck/lane configuration rather than the fatigue truck causing overstress "failure" in prestressed beams.

=====  
 Issue 1 has been fixed for 6.6 release. (For internal testing Issue 1 has been fixed for 6.6 alpha 4 updates. Note to tester: Please use attached bridge with the incident and perform Design review with 5th edition 2010I to verify)

Issue 2: LRFD 5.8.3.5: when determining the amount of longitudinal reinforcing needed in a prestress beam, V/O is using a resistance factor of 0.9 for flexure, rather than 1.0 resulting in "failure" for certain configurations.

=====  
 Reason for using resistance factor of 0.9 instead of 1.0 is that resistance factor in LRFD Factors window under concrete tab is entered as 0.9. To use value of 1.0 please change the resistance factor to 1.0 in factors window.

### Description

FROM: Girish Bhanushali DATE: 1/28/2013 11:31:43 AM Eastern Standard Time

This issue was found during the testing after investigation and fixing of VI#11792 (linked).

The following issues were found using User's provided bridge (Jeff Ruby).  
Problems did not occur with Training Bridge 1.

After first successful run of shear stud design wizard :

Case 1:

1. Results applied
2. Run the wizard again (keep the bridge open). Don't delete previous results applied.
3. Received multiple assertions (see attached)
4. At the end V/O crashed

Case 2:

1. Close the bridge
2. Close the V/O
3. Open the bridge (Fresh start with wizard previously run and applied)
4. Delete the results from last run on Shear Connectors tab on deck profile
5. Run the wizard
6. Problems occurred as in Case 1, step 3 and 4.

Complete Issue Information

Errors encountered in (originated from) ShearStudFitness.cs and SCSuperSteelGirderElement.cpp

See attached documents.

FROM: Girish Bhanushali DATE: 1/30/2013 1:18:58 PM Eastern Standard Time  
Crashed has been fixed. This was related to tolerance. Unit testing was done on Mr. Jeff's bridge (VI# 11792) for US and SI units.  
New results varied from the pre fix but they PASS. From Calcs, design ratios were greater than 1.  
Code has been checked in for next release. (6.5)

Complete Issue Information

FROM: Girish Bhanushali DATE: 1/31/2013 12:42:11 PM Eastern Standard Time

Notes:

1. This incident is after fixing VI#12155, that was a crash during the wizard run ( in VI#11792 Jeff's bridge). Review of Calcs indicated everything passed. Wizard ran successfully.

2. After looking in to VI#12101 (& linked VI#10430), I was able to reproduce errors in Design Review of Ruby's bridge with his manually entered results. However, Jeff's comment indicated that his errors were based on "wizard" results. I think that is not correct. Since I found the errors he posted were based on his manually entered studs. his connectors data included splice gaps as composite.

3. This led me to check his other copy of the bridge that had "wizard" generated bridge, from my VI#11792, VI# 12155 work. Interestingly the design review with "wizard" results exhibited different errors with more information (as in attached). Related to Missing data in article: 6.10.8.2.3 Lateral Torsional Buckling Resistance. (No splice gap included in wizard generated results refered here)

I suspect that problems are due to tolerance related since missing data error is being thrown while getting cross section locations.

FROM: Girish Bhanushali DATE: 2/2/2013 1:17:43 PM Eastern Standard Time

This issue was due to missing tolerance and hence some of the support locations were being incorrectly marked for spec check, which ended up excluding stress related article causing spec check to fail.

Incident has been fixed for next release (6.5).

Fix was unit tested by stepping through to make sure it worked. Also, fix enable the analysis to continue beyond the errors but at the end produced issue documented in VI#12169.

Completion of design review analysis needs to be verified as a part of VI# 12169 on x64 bit build to see the design review successful.

FROM: Girish Bhanushali DATE: 2/4/2013 1:29:23 PM Eastern Standard Time

FROM: Girish Bhanushali DATE: 2/6/2013 4:21:59 PM Eastern Standard Time

Completion of design review analysis was successfully verified using x64 bit build.

FROM: Subhadeep Ghosh DATE: 4/25/2013 4:46:46 PM Eastern Daylight Time  
Verified for 6.5 Beta 1.

### Description

FROM: Phil Litchfield DATE: 2/8/2013 11:25:33 AM Eastern Standard Time

I don't see where the LRFD load modifiers are being applied in the LRFD design review of culverts. I changed the load modifiers in the LRFD factors and nothing is being applied to the culvert.

FROM: Wayne Skow DATE: 2/18/2013 3:23:14 PM Eastern Standard Time

This appears to be a duplicate of 12119. The override factors are not being passed into AashtoBridge from the GUI.

FROM: Herman Lee DATE: 3/11/2013 4:40:40 PM Eastern Daylight Time

This issue is not a duplicate of Incident 12119.

1/5/2016 11:08:26 AM

HRS AASHTO

436

Complete Issue Information

The WisDOT Box Culvert program that the AASHTO Culvert Engine based on doesn't have inputs for load modifiers.

FROM: Herman Lee DATE: 4/29/2013 8:04:13 AM Eastern Daylight Time  
Resolved for 6.5 release.

FROM: Herman Lee DATE: 5/24/2013 2:25:04 PM Eastern Daylight Time  
I changed the load modifiers for Service I but kept the max and min products to 1.0. The resulting Service I loads should be the same as before.

FROM: Wayne Skow DATE: 5/28/2013 7:18:13 AM Eastern Daylight Time  
The max/min calculation was fixed.

FROM: Phil Litchfield DATE: 6/3/2013 6:59:45 PM Eastern Daylight Time  
Checked in 6.5 Beta 2 and load modifiers were not used in the calculation in the spec check.

FROM: Wayne Skow DATE: 6/10/2013 9:19:40 AM Eastern Daylight Time  
This change hasn't been added to Beta 2 updates. I don't think you'll see it until Beta 3 is released.

FROM: Phil Litchfield DATE: 7/18/2013 10:41:47 AM Eastern Daylight Time  
This still appears to not be working in Beta 4.

FROM: Wayne Skow DATE: 7/19/2013 9:17:05 AM Eastern Daylight Time  
When performing design review, the user can control which set of factors is used for the LRFR articles (from the Specs tab of the Culvert Alternatives dialog), but not which set of factors are used for the LRFD articles. When specifying the spec version to use with LRFR (see the Spec tab), you currently have 3 choices:

- MBE 2nd 2011i, LRFD 5th (2010 AASHTO LRFD Specifications)
  - MBE 2nd 2011i, LRFD 5th 2010i (2010 AASHTO LRFD Specifications)
  - MBE 2nd 2011i, LRFD 6th (2012 AASHTO LRFD Specifications)
- For each of those LRFD specs, there's a corresponding factor set that is not user specifiable.

So, if you're running LRFR, you cannot change the default modifiers. You can, however, specify a user created set of factors when doing an LRFD design analysis.

How are you running it?

FROM: Phil Litchfield DATE: 7/22/2013 11:15:11 AM Eastern Daylight Time  
Ok, got it to work right. I didn't change the factors enough to see a change in the results.

See the attached word document for screenshots and full description.

Fatigue live load stress prints as 0.0 ksi for 4th edition, 2008i specifications. Gives "good" (nonzero) results for 5th edition, 2010i specifications.

Note: Changing the specs to 4th edition with 2009 interims gives nonzero results as well.

FROM: Krishna Kennelly DATE: 3/22/2013 9:52:14 AM Eastern Daylight Time  
Please investigate. I suspect this is due to the 2008 specs only had 1 Fatigue limit state, Fatigue. then

1/5/2016 11:08:27 AM

HRS AASHTO

439

Complete Issue Information

the 2009 interims changed it to have 2, a Fatigue I and a Fatigue II. Try to determine if when using the 2008 interim specs, the correct load factor is not being retrieved for the Fatigue limit state. Look in abaspecctrl/ScSuperSteelGriderElement and maybe ScSuperstructure, ScSuperstructureElement.

FROM: Subhadeep Ghosh DATE: 3/25/2013 4:10:15 PM Eastern Daylight Time  
For Article 6.6.1.2.2 2008i: No load factor set for "Fatigue" limit state when considering Article 6.6.1.2.2 2008i specifications when considering 1994, 1998, 2004, 2007, 2010 and 2012 AASHTO LRFD Specifications (Factors). Also the the MaxLL+I and MinLL+I is only read in the article when the fatigue category is undefined, other wise it turns out to be zero. Code change required to handle this discrepancy.

FROM: Subhadeep Ghosh DATE: 4/2/2013 10:15:02 AM Eastern Daylight Time

Changes were made to the following LRFD articles:

- Article 6.6.1.2.2 4th 2008i: "Fatigue" limitstate was changed to "Fatigue I" since no load factor is assigned for "Fatigue"
- Article APPD6.2 4th 2008i; 5th: Changed limit state "Fatigue" to limitstatecategory "Fatigue" to exclude all cases of "Fatigue"
- Article 6.10.1.1.1b 4th 2008i, 2009i; 5th 2010i: Changed limit state "Fatigue" to limitstatecategory "Fatigue" to exclude all cases of "Fatigue"

### Description

FROM: Jeff Olsen DATE: 5/7/2013 5:02:45 PM Eastern Daylight Time

When I run the shear stirrup design tool, the stirrup spacing that is generated has errors in the table.

The end distance of one range does not equal the beginning of the next. Therefore, when you apply the ranges, the spacing goes beyond the end of the beam. See the attached screen shots. See girder G2 in the bridge file.

FROM: Girish Bhanushali DATE: 5/24/2013 2:24:18 PM Eastern Daylight Time

Hi Jeff,

Thank you for posting the incident and related information.

I'd like to kindly request if you could provide us the capture of first window that shows the actual input you entered, that would be great.

Thanks

FROM: Jeff Olsen DATE: 7/9/2013 3:36:36 PM Eastern Daylight Time

I added a screen capture of the input screen and the resulting ranges.

FROM: Girish Bhanushali DATE: 7/12/2013 3:59:58 PM Eastern Daylight Time

This incident is moved to support center from 6.5 beta since this is pre-existing and related to earlier release than 6.5.

6.4.1

One of our designers had a good idea for reporting/output/charts

the option of providing a Service I line to your output "Results Graph" screen in the "Critical LRFD" loads. This will be very helpful in design since the code requires crack control on design sections.

Please add this to the Reports bucket. I'm not sure if this is a duplicate or not.

### Description

FROM: Phil Litchfield DATE: 6/3/2013 7:07:36 PM Eastern Daylight Time

I added additional limit states to be checked in the LRFD spec. None of the additional limit states were considered.

FROM: Phil Litchfield DATE: 6/6/2013 10:48:05 AM Eastern Daylight Time

By default Strength I & II, Service I and Fatigue I & II are selected for Reinforced Concrete in the 2012 AASHTO LRFD Specifications. Yet in a culvert analysis only Strength I and Service I look like they are being checked. Is the culvert analysis limited to Strength I and Service I only?

FROM: Herman Lee DATE: 6/6/2013 10:48:24 AM Eastern Daylight Time

Yes, this is another case that user specified selection in the user interface is not being considered due to the original limitations of the box culvert program. I will prepare an estimate for the Task Force to review in next week meeting.

FROM: Herman Lee DATE: 5/29/2014 1:11:11 PM Eastern Daylight Time

2014 TAG decision: Change Category to Maintenance.

### Description

FROM: Subhadeep Ghosh DATE: 6/6/2013 8:49:05 AM Eastern Daylight Time  
I was reviewing LRFD 5th edition article 6.10.10.4 for implementing curved girder changes.

As per the LRFD article 6.10.10.4.2, the value of "Pn" (used to compute "P" for continuous span composite in negative flexure) has to be computed for a case where the "P" is considered between Max M LL+I and adjacent interior support.

In the code, the above region is defined under the enumerator ShearConnRegionType as Negative.

1/5/2016 11:08:28 AM

HRS AASHTO

448

Complete Issue Information

But in code ALRFD\_5E\_06\_10\_10\_04.cs (also present in 4th 2008I and 2009I) the "Pn" only gets computed for the following:

Line#375

if (shearConnRegionType == ShearConnRegionType.PositiveContinuous)

This above check is a bug and should be for corrected to:

if (shearConnRegionType == ShearConnRegionType.Negative)

I have crossed checked with LRFD edition 4th with 2008I and 6th for article 6.10.10.4.2.

Please assign it back to me, after you have verified the above. Thanks!

FROM: Jeff Ruby DATE: 6/6/2013 5:15:31 PM Eastern Daylight Time

Thank you for finding this!

Shear stud calcs have been broke for a long time.

Could it solve some of the problems referred to in Issues 11930 and 12102?

FROM: Krisha Kennelly DATE: 6/13/2013 1:19:37 PM Eastern Daylight Time

I agree with this change. 11930 looks more like a metric/English problem to me but we'll see if this helps it. Please see if 11930 and 12102 are fixed by this as well.

FROM: Subhadeep Ghosh DATE: 6/17/2013 11:21:57 AM Eastern Daylight Time

This deos not solve issues with 11930 and 12102.

This increases the nominal shear for regions between Max M LL+I and adjacent interior support and hence it increases the minimum number of shear connectors required as per strength limit state (6.10.10.4).

The before fix (Before fix.txt) after after fix (after fix.txt) shear stud wizard design computation has been attached for Training Bridge 3 (Considering composite in neg. flexure). For verification look at computation between Max M LL+I and adjacent interior support.

Fixed for 6.5 next beta release to beta 3.

FROM: Subhadeep Ghosh DATE: 6/17/2013 3:31:09 PM Eastern Daylight Time

FROM: Jeff Ruby DATE: 6/18/2013 3:16:44 PM Eastern Daylight Time

One step closer. Thanks.

Accepted in 6.5.0 Beta 3

Now let's see if we can fix 11930 and 12102.

Description

FROM: Girish Bhanushali DATE: 7/2/2013 12:46:45 PM Eastern Daylight Time

Following is split (copied) from VI# 11930:  
Use the attached documents (copied from VI# 11930)

//////////

FROM: Jeff Ruby DATE: 5/30/2013 3:57:29 PM Eastern Daylight Time

- Steps I took to "break" it.
- 1) import VI-11792-V641-SubstructureExample01.xml
  - 2) open Deck Profile for G2
  - 3) change units to SI/Metric
  - 4) Click "shear stud tool wizard"
  - 5) Enter gaps as shown in my screenshot
  - 6) Hit continue
  - 7) Apply
  - 8) change units to US Customary
  - 9) perform analysis

Complete Issue Information

Observations:

The stud wizard produces the same spacing for all ranges. (see StudWizardDesignRanges.jpg)  
As an example the first range from 0 to 59 ft doesn't have enough studs

Resubmitted Version 6.5.0 Beta 2

FROM: Jeff Ruby DATE: 6/18/2013 3:27:26 PM Eastern Daylight Time  
After reading some more at Issue 12623, some of this may be fixed, but I am not sure this is just a "metric" issue. It appears maybe the "gaps" are causing some problems? Don't know. I have only tested the wizard with gaps.

This is listed as a verified bug since Beta 1. I am assuming this is going to be fixed for 6.5.0 release.

Description

FROM: Girish Bhanushali DATE: 7/2/2013 12:51:31 PM Eastern Daylight Time

Following is split from VI# 11930:

//////////

FROM: Jeff Ruby DATE: 6/20/2013 4:55:44 PM Eastern Daylight Time

Actually, I again tried to trace the whole history of this and related bugs. I came up with these related issues:

10430 -> split to 11792 and 11930 (this one, currently needs some fixing of some sorts)

12101  
12155  
12166  
12169

It is getting confusing. I will try to keep up.

### Description

FROM: Brenda Crudele DATE: 8/15/2013 11:09:48 AM Eastern Daylight Time

With the AASHTO LFRD engine, the program is checking article 6.10.7.1.1 for negative flexure for two locations along G2. It gives a failure at 99ft for Strength I with the negative load case for HL-93 plus lane. It is curious because at 240 feet it gives the same failure for strength 1 for the negative case of tandem plus lane, but flags strength 1 with negative live load for truck plus lane as negative and therefore no failure. Also note that when the file is run with the AASHTO LRF engine no failures are given.

Attached is the .xml file. Girder 2 is the beam in question. I have also attached the files with the output that shows a failure where it shouldn't be checked.

FROM: Wayne Skow DATE: 8/16/2013 1:44:34 PM Eastern Daylight Time

When checking a section for positive flexure capacity, a negative LL should produce a rating factor of "99." The problem is that in v641, this article did not check the sign of the live load properly and would, as this model shows, produce a negative rating factor. That problem was discovered and fixed when the capacity override enhancement was added to v65. Therefore, the problem is no longer present.

Complete Issue Information

When entering Bridge Alternates, Foundation Alternates, Pier Footing Geometry the geometry assumes the pier column (shaft) is centered on the footing. This may not be the case. There are cases (Fort Pitt Blvd.) where the shaft isn't centered or symmetrical on the footing. It would be advantageous to be able to input both the transverse and longitudinal dimensions from centerline of shaft to edge of footing in both directions.

Description

FROM:lvolle DATE:Wednesday, January 12, 2005 10:58:46 AM

In Alpha Build 5, after the second update, I entered in the superstructure and substructure for the verification bridge. I was not able to get any dead loads to compute in the superstructure loads window of the substructure. I then went into the superstructure and attempted to analyze the member alternative. I was given an error that the deflection live load distribution factor was not defined. I was able to remedy this by removing the moment and shear distribution factors and allow brass to compute these values.

I would not have known what the error was unless I analyzed the piers individually. It would be beneficial to be given a message indicating that the reason the dead loads could not be calculated was because of that problem in the superstructure.

### Description

FROM:jduray DATE:1/13/2005 12:59:54 PM

Change the default such that no load cases and load combinations are selected.

FROM:jduray DATE:1/13/2005 1:03:14 PM

Because there are possibly thousands of load cases and combinations I think we need to add some navigation features to the selection of load and combinations:

Add Next and Prev buttons to navigate to the next or previous selected item.

Add counters in the view to display the number of limit states, load cases and combinations selected.

Include the envelop yes or no.

We also should have progress bar but that is too much effort and not in scope.

Also need an abort button (again out of scope)

FROM:jduray DATE:1/13/2005 1:31:36 PM

Need to change the pointer to the hour glass while the report is processing.

FROM: Jim Duray DATE: 6/4/2009 10:04:16 AM Eastern Daylight Time

TAG discussed that this enh could be limited to the summary of selected items.

### Description

FROM:glang DATE:Friday, January 14, 2005 10:14:18 AM

Under the Pier Data (Pier Skew), can this be linked to the skew data provided in the Structure Framing Plan Details Layout so the skew doesn't need to be added again? It can easily be missed by the user.

### Description

FROM:gfreeby DATE:Wednesday, February 02, 2005 10:19:18 AM

I know we cut this but it would be really useful to have a graphical display or some sort of visual display that shows you the relationship of the pier alternatives to the structure alternatives. Right now it takes careful study of the data to be sure you've assigned the correct superstructure to the pier.

| 5991.13354 | Resolved      | override button for figuring BR or other loads - need an analysis log file |

Description

FROM:kwestern DATE:Thursday, February 03, 2005 1:37:12 PM

After defining the first column of a multi column pier, need to be able to copy attributes to all other columns in the frame.

FROM:jduray DATE:2/21/2005 8:01:28 AM

Joe - Let's discuss this.

FROM:jduray DATE:2/22/2005 9:15:43 AM

This is a fair amount of work to accomplish. It is too late to do for the first release because it involves significant changes to several windows that have already been tested. Suggest doing this for the second release of substructure.

FROM:jihnat DATE:2/22/2005 9:51:01 AM

The changes we discussed:

- 1) Being able to Copy on a column and then Paste on another column.
- 2) The Paste operation will replace the receiver's Properties, Components and Geometry data.
- 3) If those windows happen to be open they will need to be refreshed (see Deck Profile as possible)

1/5/2016 11:10:57 AM

HRS AASHTO

12

Description

FROM:tkoch DATE:Thursday, February 03, 2005 2:05:30 PM  
When figuring substructure loads, if override button is enabled, analysis will not run if no loads are entered. Program should give a warning (preferred) or assume zero if no loads are entered, but instead it crashes.

FROM:kkennelly DATE:2/8/2005 8:59:10 AM

1/5/2016 11:10:57 AM

HRS AASHTO

13

Complete Issue Information

Having the override button checked with no override loads entered does not cause the analysis to fail. The analysis failing is addressed in incident 5989.

The log file we create for the analysis should simply state user chose override but then did not enter any override loads.

### Description

FROM:tkurtenbach DATE:Friday, February 04, 2005 1:20:43 PM

in the bridge alternatives screen, substructures tab, opis seems to know the stations that it will accept. Any other answer is "not loacted on the reference line". If Opis knows the answer that it wants, could it just fill it in?

FROM:kkennelly DATE:2/4/2005 3:01:16 PM

I guess we could fill in the superstructure span lengths after you pick the order of the substructure units.

1. Domain code can't currently compute the span length until the order of the substructure units has been saved. Will have to change code to work with non-persistent domain object.

2. Do we compute the length after the second substructure unit selection loses focus? Or do we add a compute button?

FROM:jduray DATE:2/4/2005 5:10:45 PM

So is the domain checking and the window doesn't know anything about the correct values?

How long will #1 above take? Let's discuss.

1/5/2016 11:10:58 AM

HRS AASHTO

15

Complete Issue Information

FROM:kkennelly DATE:2/7/2005 8:24:43 AM

Right now we pass the superstruct ref line data (distance, offset, angle), the superstruct span lengths entered in the grid and the substructure units selected to the domain and the domain validates the span lengths against the substructure units.

We touched on this during morning discussion:

Need some more explanation (helpscreen or?) on the relationship between this screen and load palette.

Also, we weren't aware of meaning of 'save' feature...

May want to populate 'library' (if possible) with common tasks.

Description

FROM:kkennelly DATE:2/10/2005 8:54:48 AM

It would be nice to minimize the time for the superstructure analysis when it is launched from a pier analysis by setting the engine properties to not generate pois and turn off output.

Column geometry varies linearly over its height.

Would be nice to have a listbox or something where you could specify if you want to see the cross section for the top or bottom of the column segment. Right now you have to know that you have to right click to get a list where you can pick top or bottom cross section. (I think a lot of users will have trouble with this.)

| 6575.14760 | Resolved      | Can't select inputted I beam shape |

### Description

FROM:kkennelly DATE:7/13/2005 12:58:40 PM

BID 22. Analyze pier for current LL settings with lane increment = 4 ft. Change lane increment to 1', re-analyze pier alt. The Live Load Patterns report is not re-generated with 1' increment and my total number of load combinations did not change between the 2 runs. I think it should have increased in the second run because I should have more LL positions.

FROM:jduray DATE:7/14/2005 11:00:13 AM

I suspect the data change tracker (DCT) is not aware of the change and the TL is not actually being run (or the code that checks the DCT is not working properly).

FROM:jduray DATE:6/4/2008 4:28:34 PM

Resolved for beta 4.

FROM:kkennelly DATE:6/16/2008 2:36:18 PM

This is not working in beta 4. I changed the lane increment and vehicle increment in lane and the Live Load Patterns report is not regenerated. The analysis progress log states that "Vehicle patterns were generated by a previous analysis. "

FROM: Jim Duray DATE: 7/10/2008 10:42:19 AM Eastern Daylight Time

The change tracker is not being updated from the Superstructure Loads window - LL Settings tab.

FROM: Joseph Ihnat DATE: 7/10/2008 4:04:53 PM Eastern Daylight Time

The DataChangeTracker was being updated for the substructure instead of the superstructure. Fixed

Description

FROM:dhorton DATE:Tuesday, August 09, 2005 8:54:14 AM  
 REPORTED BY:Doug Horton

DESCRIPTION: We have been working with the demo, testing some of the various configurations. Defaults have typically been used. The runs are being made on a P3, 1.2 GigaHertz processor w/ 256 Ram. This is a slow machine, but the results are still excessive. Completion of the final analysis for the sample Hammerhead took 2 hours to run and reported 323,456 load combinations had been investigated. Very thorough, but borders on the ridiculous. A three column pier has been running for 9 hours and still is not completed. The long run time may be due to the number of combinations tested, or there may be something wrong with the routine. With that many cases reviewed, there has to be many which are almost identical. The program needs some sort of internal decision tree that will reduce the time of analysis or we can stop development now because it will never be used. We recently reviewed BRASS Pier (evaluation version) and LEAP's RCPier, both of which have relatively short compute times. BRIDGEWare will not be used if much faster products are available.

COMMENTS:

This should be added to the Milwaukee agenda for discussion.  
 FROM:dhorton DATE:Tuesday, August 09, 2005 8:54:14 AM

Complete Issue Information

FROM:jduray DATE:8/10/2005 8:54:29 AM

I agree completely that we need to do something about the performance. We have thoroughly tested the load combinations routine and believe it is functioning properly. The issue is the number of combinations that are generated. This stems mostly from the number of live load patterns.

We have discussed this at previous TF meetings and concluded it is ok this way and I believe someone said other software takes similar time when considering all loadings. I submitted mockups for windows that would allow the user to better control the number of live load positions (patterns) which dramatically effects the number of combinations. I believe it is planned to implement these for Phase 2.

I will investigate a little more before our conference call meeting.

|------------|---------------|------------------------------------------------------------------------|
| 6591.14744 | Resolved      | Load Combinations - factors for DL should skip DLmin if equal to DLmax |

### Description

FROM:kkennelly DATE:8/9/2005 10:10:00 AM  
Reported in 2005 UG training:

BID 23, open the Load Combinations window for the pier alt. The LRFD factors displayed at top of window show 1998 spec factors. For the Preliminary Design Setting (US) in the library, the factors are the 2004 factors.

FROM:xli DATE:8/15/2005 8:24:43 AM

In BID 23, the design settings of pier alt "Pier 1 hammerhead" is set default, so in load combinations window the system default LRFD factors are displayed.

If user creates an "LRFD substructure design setting" and assign 2004 factors as LRFD factors, and overrides design settings of this pier alt with the one that he created, then in load combination windows 2004 factors are displayed.

Is this the way that we wanted it to work?

FROM:kkennelly DATE:8/15/2005 12:46:29 PM

FROM:kkennelly DATE:8/15/2005 12:46:54 PM

No, the Load Combinations window should always display the LRFD factors that belong to the Design Setting that is displayed in the Load Combinations window.

FROM:xli DATE:8/15/2005 1:32:57 PM

Get the default LRFD factor Id from the DoLibSubStructLrfdDesignSetting object instead of DoLibDefault object.

Description

FROM:dhorton DATE:Monday, August 15, 2005 4:07:21 PM  
REPORTED BY: A. Zickler

Complete Issue Information

DESCRIPTION: For the future, when super and sub will coexist, provide dropdown or option in some manner to allow only superstructure or only substructure analysis. When both exist in the tree, the analysis runs through them both as it appears now.

COMMENTS: This will definitely be needed and may already be in the plan for the final substructure. there will also have to be some sort of "option" to work with just the footing, column or cap.

FROM:dhorton DATE:Monday, August 15, 2005 4:07:31 PM

FROM:jduray DATE:12/13/2007 9:33:26 AM

Super and sub have independent Analyze buttons. Change this incident request to the need to be able to do spec-checks of individual pier components (cap, column 1, column2, etc).

| 6691.14649 | On Hold       | Shear envelope doesn't look right on the 3D schematic |

Description

FROM:dkemna DATE:Thursday, August 18, 2005 11:50:36 AM  
REPORTED BY:

DESCRIPTION:

I ran the attached bridge with the computed LL values only and checked moment along cap. I then overrided the values and increased the axle contribution by tenfold while leaving the lane values the same. Reran and got the same moment values. If the overrides are working like I expect the values should have been much larger.

COMMENTS:

Important if the user designs the super in another program and wants to use minimal input for the super portion of the substructure program.

| 7515.15819 | Closed        | Unable to save new bridge in OpisSub within Oracle database |

## Description

FROM:dkemna DATE:Monday, July 24, 2006 9:06:21 AM

I'm trying to generate a model in the 0.9.1 demo version of the OPIS Substructure program. I get the attached error message upon generation. I searched the file over and can't find any errors in input. I need some help.

FROM:kkennelly DATE:7/24/2006 1:20:37 PM

If I use the Validate function on Pier 1 (Validate toolbar button when Pier 1 is selected) I see the following errors reported:

ERROR: Distributed load not on pier cap.

Column2 (Column)

ERROR: Concrete material not defined for column segment.

Column3 (Column)

ERROR: Concrete material not defined for column segment.

If you open the Components window for the these 2 columns you will see "Class A" listed as the concrete segment. That is because when the window is opened, we default to the first material in the list. So it looks like you have a concrete material already applied but I don't think you really do. You

1/5/2016 11:11:05 AM

HRS AASHTO

44

### Complete Issue Information

have to hit OK or Apply when this window is opened to save this concrete material.

If I hit OK to close these 2 windows, I don't get that Validation error anymore.

The error about the distributed load on the cap is due to the cap length being computed as  $7.2917+24.4167+24.4167+7.2917=63.4168'$ . The distributed load is entered with a length = 63.42' which is longer than the cap. You have to be consistent with the number of decimal places you enter throughout Opis.

If you make the above changes you can get the model to generate.

Above is a workaround. Code needs to be fixed: Since the grid is already populated for the user, they don't have to enter anything in the grid. I suspect since the user doesn't have to enter anything the grid is not being triggered to save the data. The Column Segment window should not default to the first concrete material if a material is not selected. That way the user is forced to pick a material and hit Ok or Apply. Do same for Wall windows.

FROM:xli DATE:7/27/2006 11:08:33 AM

Code is fixed.

When component window is first open, material column is blank. If user saves the window without choosing any material, a message will come up to warn user to set material type.

### Description

FROM:mordoobadi DATE:7/24/2006 9:16:33 AM  
John Gahagan : MODOT reported this issue.

He is not able to save a new bridge to a 0.9.1 database. With the following errors:

Unable to save Bridge data!

Error updating database record set  
ORA-00001: Unique constraint (OPISADM.XPKABW\_BRIDGE\_DESIGN\_PARAM) violated,

FROM:mordoobadi DATE:7/24/2006 9:24:25 AM  
When you run the database creation scripts did you create a spool file? If so please send it to me so that I can inspect it for errors. I suspect something went wrong during database creation.

FROM:mordoobadi DATE:7/24/2006 9:26:06 AM  
I found what is happening. SQL\*Plus does not tolerate blank lines within a SQL statement. For that reason, population of two rows (BIDs 21 and 23) in the abw\_bridge table failed. Consequently, this prevented some foreign keys to be created. When a new bridge is saved, OpisSub assigns BID of 23 for the new bridge because the last BID in abw\_bridge is 22. Then it attempts to save a row with a row with BID 23 in abw\_bridge\_design\_param table. But a row with the same ID already exists, so you get an error.

I have prepared a script that will resolve the issue. Please log-in as the schema owner and run the attached script.

Please let us know whether this fixes your problem or not.

FROM:mordoobadi DATE:7/24/2006 9:26:33 AM  
Darren Kemna verified that the script resolved the issue:

I have successfully saved a file. Thanks to everyone for their help.

FROM:mordoobadi DATE:7/24/2006 9:28:39 AM  
Oracle database scripts updated to resolve this issue. An email should be sent to OpisSub participants informing them of the problem.

The Oracle database creation scripts for OpisSub version 0.9.1 contained a few errors. If the scripts are run in the Oracle's SQL\*Plus utility program some of the SQL commands may fail. If you are using an Oracle database server for your 0.9.1 database please follow the instructions listed below to resolve the issue:

- (1) Using internet explorer go to <ftp://ftp.mbakercorp.com>
- (2) Login with username/password hrsdept/jetta

1/5/2016 11:11:05 AM

HRS AASHTO

46

## Complete Issue Information

- (3) Browse to the Outgoing/OpisSub folder
- (4) Download a file called OpisSubOracleDBFix.zip to your local machine.
- (5) Extract the contents of the file to a folder on your machine (e.g. C:\Temp). Please note that the zip file is password protected and the password is "opissub".
- (6) If you have already created the OpisSub 0.9.1 database then do the following:
  - a) Start SQL\*Plus and login as the OpisSub database schema owner
  - b) At the prompt enter the following SQL commands:

```
> set echo on;
> set define off;
> prompt off;
> @ C:\Temp\Fix-091-DB-Oracle.SQL
>
```
- (7) If you haven't created the OpisSub 0.9.1 database yet, then you can just use the corrected database creation scripts:
  - \* AllScripts-ProdDB-091-Oracle.SQL
  - \* AllScripts-SampleDB-091-Oracle.SQL(that you extracted from the zip file in step 5) when you create your OpisSub database. Please refer to section 7.2 of Opis Substructure Startup Guide for detailed instructions.

Description

FROM:kobeidat DATE:Tuesday, July 25, 2006 9:39:05 AM  
during our test run of OPIS sub we encountered many crashes without a meaningful help about the reason for the crash. Please advise  
Note i'm attaching both bbd and xml file of the input

FROM:kobeidat DATE:Tuesday, July 25, 2006 11:30:57 AM

FROM:kobeidat DATE:Tuesday, July 25, 2006 11:31:32 AM

FROM:kkennelly DATE:7/27/2006 12:17:54 PM  
I started to look into this. The crash occurs when I try to view the 3D schematic of the pier or when I try to generate the FE Model. I suspect some data in the db is corrupted. I did look at the input on each window for the pier and the input looked reasonable.

FROM:kkennelly DATE:8/9/2006 8:50:06 AM  
Problem is in the ModelDomain code. That code is not correctly handling the case where the superstructure girders are linked.

As a workaround for the user, try unlinking the superstructure girders and be sure to define the prestress shape assigned to the member alts for G3 and G4 in Superstructure 1. Opis is trying to compute the superstructure depth but it can't since G3 and G4 don't have a PS shape assigned in their Beam Details window and code is not recognizing that these mbrs are linked. Code is not exiting gracefully when it finds that G3 and G4 don't have PS shapes assigned.

FROM:kkennelly DATE:8/9/2006 10:48:21 AM  
Code is fixed to recognize linked girders and to recognize if beam shapes are assigned to the mbr alt.

Maybe something that should be added to the readme text file on the cd for the tutorials using Pier 1 and Pier 2.

Microflash media player security on every PC I've tried it on need to be changed. The Global Security setting needed to be set to "Always Allow". See attached.

If this isn't done, the only way to exit was to use the Task Manager and end the program.

FROM:kkennelly DATE:6/4/2008 3:10:21 PM

marked as on hold since we'll have to re-generate the tutorials when we release 6.0

On our end we can't adjust the screen size, it doesn't auto fit. Have to do some scrolling up and down to see the whole screen on a 19" monitor.

Is there some way the user can adjust the screen size?? Fit Screen?

If not is there anyway in the future this tutorial can be sent so it does fit our screens?

Or is it just me?

FROM:hlee DATE:7/28/2006 12:44:47 PM

We've to check whether auto fit is available as a option in the software we used to make the tutorials.

The following is a work around for now:

1. Copy the tutorial files to your local machine.

1/5/2016 11:11:06 AM

HRS AASHTO

50

Complete Issue Information

2. Open "Pier1Tutorial\_Topic1.htm" with Notepad.
3. Locate the line (Line 12) that ends with:  
width="973" height="865" ID="Captive1">
4. Change the width and height to a smaller number.
5. Save the htm file.
6. Try and see whether it fits the screen. You can double-click on "Opis Substructure Tutorial 1 - Solid Shaft Pier.html" topic 1 or each topic htm file to try.

FROM:kkennelly DATE:6/4/2008 3:09:41 PM  
 marked as on hold since we'll have to re-generate the tutorials when we release 6.0

| 7544.15790 | Suspended     | Don't show forces for rigid links in the 3D schematic |

### Description

FROM:kkennelly DATE:8/7/2006 8:55:49 AM

Suggestion from 2006 UG training. BID23, hammerhead pier analysis from Pier1 Example problem. Shrinkage forces show up on the 3D schematic and they look like big values when in fact hammerhead shouldn't have shrinkage forces. If you hover over the shrinkage the forces all show up as 0.00.

Suggestion is to not show values if they are all essentially zero.

| 7557.15778 | Closed        | Text Printed Over Lines |

Description

FROM:kkennelly DATE:8/9/2006 8:11:36 AM  
 Attached file was originally attached to incident 7523. It was exported from Opis Sub 0.9.1. I'm trying to import it into 5.6 so I can debug the problem in 7523. I changed the majorversionnumber, minorversionnumber, patchnumber, and buildnumber manually so I could import into 5.6.0. When I try to import, the DmMbrAltConcDeckRange import fails because it has a record for "eff\_width\_lrfd" instead of "eff\_width\_lrfd\_start" and "eff\_width\_lrfd\_end". Should we be handling this import even though 0.9.1 isn't a licensable product yet?

Complete Issue Information

FROM:kkennelly DATE:8/9/2006 8:23:35 AM

I was able to import for debugging by changing the tag to "eff\_width\_lrfd\_start" and "eff\_width\_std\_start".

FROM:kkennelly DATE:8/9/2006 8:26:48 AM

Can't save the bridge, get following error:  
Trying to set DIST\_FACTOR\_VARIATION\_TYPE to NULL in table ABW\_LL\_DISTFACTOR\_RANGE, but the field is not allowed to be NULL.

I tried opening each Dist Factor window, selecting the type and hitting OK. Unlinked the mbrs and tried setting their dist factor types but still get same message and can't save.

FROM:mordoobadi DATE:8/14/2006 9:18:35 AM

We do not support importing from 0.9.1 to 5.6.0.

FROM:mordoobadi DATE:8/14/2006 10:22:38 AM

You may change the version numbers in the XML file from 0.9.1.3001 to 5.4.0.3001 then try importing it.

Description

FROM:dteal DATE:Thursday, August 10, 2006 3:52:57 PM

In several GUI's I have noticed that the dimension text is being written over the top of other lines making the text hard to read. Is this supposed to be that way? Can it be printed so it's not over the top of another line?

Examples: See GUI on page 2-30 and 2-33 of the Substructure Workshop manual, look at the center, right hand side.

FROM:jduray DATE:8/11/2006 3:30:26 PM

FROM:kkennelly DATE:8/14/2006 7:48:41 AM

Dean is referring to the column cross section dimensions and footing dimensions appearing over the dashed centerlines in the plan view. I've just captured a screen shot of what is shown in the UI. Girish, can we do something to make the text easier to read in these windows? Maybe make the dashed centerlines a lighter weight or move the edit control slightly away from the line?

FROM:gbhanushali DATE:8/15/2006 4:10:13 PM

Cross section centerline lengths are reduced such that they are not touching or overlapping the dimension text. (Fixed in 5.6 code in sourcesafe.)

Please Let me know if the changes are not acceptable.

FROM:gbhanushali DATE:8/28/2006 1:19:42 PM

fixed checked in for next release.

## Description

FROM:kkennelly DATE:1/22/2008 10:05:12 AM

When you sit on the cap, columns or footings, the spec check button is available but doesn't do anything. Our original mockups specified that you would be able to sit on an individual component and do a spec check of just that component. Is that still in our workplan?

intended? Sure would be nice to see a GUI showing the pile locations.

FROM:jduray DATE:3/5/2008 9:55:10 AM

I believe (Krisha - please confirm) footings are new to this development effort and schematics were removed from scope by the substructure TAG and TF to save \$.

FROM:kkennelly DATE:3/5/2008 12:29:15 PM

That is correct. The TAG and TF decided to not implement any new schematics or add to any existing schematics to save money. Piles are a new feature and no schematics were planned for them in the work plan. (Although I agree it would be very nice to see the pile locations.)

Description

FROM:dwarner DATE:Monday, February 11, 2008 10:27:52 AM

I'm inputting a design that uses round steel pile piles in the footing. So far I've entered properties for a 508mm pipe pile as a W-shape that has symmetrical [I-mm^4 and Z-mm^3] in the x and y direction, and named it "508 pile". Is there a Steel Beam Shape for round pipe piles for the footing? We commonly use steel pipe piles in footings.

Description

FROM:dteal DATE:Thursday, March 06, 2008 11:45:37 AM

Enhancement Request:

In the GUI for Column Reinforcement

In column design it is common to use 1% steel as a minimum.

To cut down on iterations by the designer, it would be nice to have a wizard that would calculate and provide 1% steel for a starting place with a new design, that is what the designer is going to do anyway – lets save him some steps!!

After this check is done with 1% steel then the designer would have the option to increase as the designer see's fit.

FROM:kkennelly DATE:3/6/2008 1:15:49 PM

Good suggestion. Wizard could ask user what bar size and then come up with a pattern that satisfies 1%

FROM: Herman Lee DATE: 4/7/2010 5:21:07 PM Eastern Daylight Time

AI 2009-VO-088

Wizard to place Min. Steel required in columns and shafts.

### Description

FROM:pjensen DATE:Wednesday, March 12, 2008 5:48:15 PM

I have been looking a substructure and there are some items in the GUI that are issues.

1- if you are in SI/Metric, the user can not read the dimensions of the girder spacings. they spill over into the adjoining dimension.

2- when editing the dimensional data, the window for data entry is not large enough to fit the data the the user is entering.

3-there is a consistency issue with data the user is inputing on a screen. The footing screen is typical. Vertical component is in meters and the plan view is in millimeters. Dave and myself messed up several times because of this dimensional unit issue.

4-there needs to have a better error message other than a domain error when data is incorrect or missing. I have one pier that i do not have a clue (because of my dimentional frustration) where my error is located.

5- where the heck are the graphs. After anlysis, the graphs and table are not what i expected. the values are in error and there were no graphs, any where.

FROM:kkennelly DATE:6/4/2008 1:13:11 PM

Description

FROM:gcolgrove DATE:Wednesday, April 02, 2008 2:23:38 PM

I have an issue with the tree including the substructure components. I do not think it is consistent with what we have used with V/O w/o Sub. I think the tree should be rearranged to have Substructure definitions directly after the superstructure definitions. The flow of the tree counters a easy flow through the process of entering data. There is a lot of back and forth - which causes many errors - until you clean it all up. I think this can be streamlined. See the enclosed documentation (in the document tab) for my suggestions.

FROM:gcolgrove DATE:Wednesday, April 02, 2008 3:14:15 PM

Also in the Documents Tab is a jpeg of a suggested modification of the Pier Alternative Dialog. It adds the ability for the user to select an approaching and departing span for the pier if the bridge is comprised of multiple simple spans, or has the user select a continuous span and number of support.

FROM:jduray DATE:4/3/2008 8:28:22 AM

The tree was established 4 years ago after numerous meetings with the Substructure TAG and cannot be changed at this point without significant rework. The suggestions you are making may require an extensive redesign of the database. It would be useful for us to see a diagram of your ideas and we could then explore the possibility of revising the UI (but not for the 6.0 release). I'm setting the Category for this incident to Enhancement.

FROM:gcolgrove DATE:Thursday, April 03, 2008 2:52:14 PM

Thanks Jim I agree with you. For 6.0 this is not practical. I wish I had looked at the Sub part a little closer a few years ago, but it never got to the top of my to do list. I started many times but got pulled off to other things. A few days ago I had a brief meeting here with a couple users here and went over some gui stuff after I had used it for a week, and this was discussed. I just passed this along for future discussion. The diagram you asked for is included in the documents tab (see the PDF). I swapped some stuff around on the tree.

### Description

FROM:gcolgrove DATE:Wednesday, April 02, 2008 2:41:13 PM

"LRFD Substructure Design Settings" – Vehicles Tab – It is not intuitive that you need to select a limit state prior to selecting truck to analyze. I think it would be better to swap the Vehicle Selection and Vehicle Summary fields. When you click on a limit state, trucks that can be selected will show.

See pic in documents.

FROM:jduray DATE:4/3/2008 8:35:23 AM

This is as designed and not a bug. Changing to an enhancement.

Description

FROM:gcogrove DATE:Wednesday, April 02, 2008 3:10:56 PM

While defining the dimensions of a pier cap, some entries are in mm and others are in m. These all should be entered in the same units. Preferably mm. This is true almost everywhere. I get a lot of errors because I enter mm instead of m. I think all entries should be in mm for metric. This is true for almost every dialog for SUB.

FROM:kkennelly DATE:6/9/2008 9:15:09 AM

We followed the dimensioning practice on sample plans that we received from the original Substructure TAG. Elevations are in meters and all other dimensions are in millimeters as per the plans we received from that TAG.

## Complete Issue Information

These are a few things I found while entering a completely new pair of hammer head piers on spread footings. I had previously "copied" a finished three span steel bridge from version 5.5 over to 6.0 Beta. I was adding a foundation to this bridge and found a few areas that may speed things up, or could use some work.

1)

Pictured x-section:

This applies to column reinforcement, spread footing reinforcement, and cap/hammerheads. A pictured cross section of reinforcement placing would dramatically reduce designer and checker time.

Preferably a printable picture with dots for bars. I added a URL in the documents section. KSU\_RC is a program I use for Moment Curvature and Force deflection. It has a great interface for displaying bar placement. A picture display of bar placement drastically reduces time spent seeing if bars are located correctly.

FROM:kkennelly DATE:4/22/2008 1:29:07 PM

Our original mockups for Substructure contained windows where you could view the reinforcement in the pier cross sections. These windows were eliminated from 6.0 to reduce costs.

Items that are related either need to be locked or dynamically linked (if you change the span length or reference line in one place it will update ALL locations.

At Minimum we need to pop up a warning

FROM: Jim Duray DATE: 6/4/2009 11:41:05 AM Eastern Daylight Time

4-there needs to have a better error message other than a domain error when data is incorrect or missing. I have one pier that i do not have a clue (because of my dimentional frustration) where my error is located.

FROM:kkennelly DATE:6/4/2008 3:54:19 PM

The Pier Alt has a Validation function that you can use to find input errors. Select the name of the Pier Alt in the BWS tree and click the 'Validation' button on the toolbar.

For Beta 4 we have added Validation to be performed before you do a pier analysis or a spec check. (I believe Dean send out an email on (6/3/08 with a document illustrating this Validation). The Validation will describe errors in your data that should be easy to follow. You then have the opportunity to cancel the Analysis and go fix your data. Advanced users can turn off this Validation on the Preferences:Analysis tab.

Description

FROM: Jeff Ruby DATE: 6/25/2008 10:00:43 AM Eastern Daylight Time  
 I have observed that when you "Duplicate" a line in the Reinforcement tabs of various substructure elements that the "Start Distance" of the duplicated line doesn't get populated with the "End Distance" of the previous line. This appears to be inconsistent with the "Superstructure" windows of Opis. At least that seems to be the default behavior of the superstructure tabs. It would be nice if the substructure windows were consistent with this format. It saves on input time.

FROM: Joseph Ihnat DATE: 7/1/2008 12:15:32 PM Eastern Daylight Time  
 Not all windows behave as you describe. That behavior was not specified for this window. See also the reinforcement for a Schedule Based RC Structure.

FROM: Jeff Ruby DATE: 7/2/2008 10:46:14 AM Eastern Daylight Time  
 I would think that ALL "schedule based" input windows with the "Duplicate" button should act the way I described. If I wasn't going to start where I left off, no matter what number that carried forward with the "duplicate" would probably have to be edited anyway. So, by carrying the previous number forward

Complete Issue Information

there is only a potential for saving time on input. Plus, isn't it easier for the programmers to always do it the same? I vote for always starting a "duplicate" from the previous "end of the range". At least change the Severity to Annoying. If you want your users to be annoyed, this is a sure-fire way to do it. In addition, Even though I view this as a design flaw, if you don't accept it that way at least change this to an enhancement. I would rather have a chance to fix this than just consider the issue resolved. Thanks.

FROM: Jeff Ruby DATE: 7/2/2008 10:47:03 AM Eastern Daylight Time  
Oops. Forgot to change the status to "Resubmit" before I updated.

FROM: Krisha Kennelly DATE: 7/15/2008 8:25:25 AM Eastern Daylight Time  
I'm going to mark this as a suspended enhancement.

We follow the following logic in the UI:

For items that cannot have a gap or overlap along the length of the beam (like steel flange plates) the New and Duplicate buttons populate the Start Distance with the previous end distance.

For items that can have gaps or overlaps (like schedule based reinforcement in the superstructure beam and the pier) we do not populate the Start Distance with the previous end distance. Reinforcement typically overlaps due to required development lengths before the bars are developed so we expect users to overlap bars and thought it would be annoying to force the user to change the start distance. (The superstructure Schedule based RC Girder Profile window has operated this way since it was introduced in version 5.2)

I know everything isn't totally complete. But it would be nice if the 3D schematic would at least "acknowledge" in some way that we have piling defined. With the batter and orientation options we have, it would be nice to see visually that things were entered correctly. At least for now a "line" where the piling are would be a help.

Description

FROM: David Warner DATE: 6/26/2008 11:08:47 AM Eastern Daylight Time

When I look at my 3-D schematic of my pier, and then click properties, and make dimensioning show up, see attached JPEG, Is there anyway to make those properties stay. Each time I open the 3-d schematic I have to click properties and make dimensions show up. Those dimensions go away each time I close a 3-d Schematic. Can those properties tab choices be a little more permanent?

FROM: Jim Duray DATE: 6/26/2008 12:28:32 PM Eastern Daylight Time

I am changing the incident to an enhancement request.

Description

FROM: David Warner DATE: 7/7/2008 1:11:55 PM Eastern Daylight Time  
Flexural resistance (5.7.3.2) has a resistance factor specified from 5.5.4.2.

Where are the calculations for this phi value? How do you know if you have a tension, compression, or transition situation? See Figure C5.5.4.3.1-1.

In the screen shot of the footing flexural resistance, it just says  $\phi \cdot M_n$ .

I happen to agree with this  $\phi \cdot M_n$  value, it's close enough. In this case it's tension controlled, and  $\phi = 0.9$ . But I would like to see how you came about gathering the phi value.

For other kinds of members this phi value can be variable, and needs checking.

Complete Issue Information

FROM: Jim Duray DATE: 7/9/2008 8:06:45 AM Eastern Daylight Time  
The current code checks for the transition region but the details for those computations are not reported, just the resulting phi value.

Description

FROM: Tom Kurtenbach DATE: 7/16/2008 11:40:33 AM Eastern Daylight Time

I propose that a default exposure factor is provided for the concrete components. Perhaps class 2 (0.75) for components that are above or partially above the ground line, and class 1 (1.00) for components that are completely below the groundline. Or at least class 2 for everything and be conservative.

If it is not provided, when analyzing for service limit state I, the analysis will stop and provide the "no lines returned when 1 expected" message, which can be tough to sort out.

### Description

FROM: Krisha Kennelly DATE: 8/11/2008 10:15:31 AM Eastern Daylight Time

The window currently validates if the rebar exists within the column cross section as well as the footing or cap if the bars extend into the footing or cap. The Validation won't let you continue if it finds a rebar outside the cross section. That creates a problem in the standard entry of the pier, the footing is not created yet but user is trying to assign column rebar that extends into the footing. We should just issue the validation warning but give user the option to continue and save the rebar in the window even if it fails validation.

FROM: Joseph Ihnat DATE: 9/3/2008 10:26:02 AM Eastern Daylight Time

Fixed for 6.1.0 and 6.0.1

FROM: Xinmei Li DATE: 5/28/2009 1:38:49 PM Eastern Daylight Time

Verified the fix for 6.1 Beta1.

FROM: Krisha Kennelly DATE: 8/11/2009 1:04:02 PM Eastern Daylight Time

The warning message given can be quite long (and it made the users groan at the 2009 UG meeting for the example pier we entered).

If a current Foundation alt does not exist and the validation returns a warning we should issue a generic message like 'Reinforcement extends into the footing but a current Foundation Alternative is not defined yet.' instead of the detailed message we issue now.

If a current Foundation alt does exist, issue the message we issue now.

FROM: Joseph Ihnat DATE: 8/13/2009 10:45:16 AM Eastern Daylight Time

Done for Beta Build 4.

Description

FROM: Krisha Kennelly DATE: 8/11/2008 10:34:20 AM Eastern Daylight Time  
To reproduce: BID23, Analyze and then Spec Check the pier in Final Design mode.

Open the Superstructure Loads window, on LL settings tab switch from Automated to User Defined Lanes. Add 1 lane pattern.

Hit Analyze and then Spec Check, open Spec Check detail windows and none of the cross sections have rebar anymore.

There may be other ways to reproduce this, they should be investigated.

FROM: Krisha Kennelly DATE: 8/12/2008 12:56:21 PM Eastern Daylight Time  
Fixed for version 6.0 Service Pack 1.

(Problem was changing superstructure loading caused pier model domain to be rebuilt and that caused the rebar to be deleted but not rebuilt. Code fixed in abobrdg)

### Description

FROM: Krisha Kennelly DATE: 8/18/2008 11:46:53 AM Eastern Daylight Time

The program reports the correct values for the computed pile loads in a pile footing but the computed pile loads are shown for the incorrect piles.

This bug does not cause any incorrect pile loads or footing moments or shears to be computed for typical, symmetric pile patterns

See attached bitmaps for BID20, 2 span bridge. Pile 1 should have critical load but in 6.0 Release Pile 10 had the critical load.

FROM: Xinmei Li DATE: 5/28/2009 2:26:39 PM Eastern Daylight Time

Verified fixed for 6.1 Beta1, Pile1 has max pile load.

Run spec check on LRFD Substructure Example 4.  
Files get written to Column1\_Pile\_footing folder.

1/5/2016 11:11:20 AM

HRS AASHTO

105

Complete Issue Information

These files aren't included in either LST file:

Footing Long Effective Depth Section at Dist .000 Beam Capacity Summary.txt  
Footing Trans Effective Depth Section at Dist .000 Beam Capacity Summary.txt

Because they are not in the LST file, they aren't included in the Analysis Output tree (Eyeglasses window).

Also, "Delete files and folders" (when bridge is deleted) will not work correctly.

FROM: Krisha Kennelly DATE: 9/22/2008 10:39:31 AM Eastern Daylight Time  
Fixed for 6.0 service pack 1.

Eff depth files are now included in the LST file. Also the footing files are now referenced by their text in the Analysis Output tree instead of all saying at .000 Dist.

FROM: Xinmei Li DATE: 5/28/2009 2:49:48 PM Eastern Daylight Time  
Verified fixed for 6.1 Beta1.

### Description

FROM: Krisha Kennelly DATE: 10/27/2008 1:25:11 PM Eastern Daylight Time  
Found during ALDOT training by Paul Froede.

I think it was BID 20. Under '2 span bridge' alt, create a 3rd superstructure which is the 2 span continuous option. (I think this superstructure should have been created under a new bridge alt during training)

Open Cap window, enter pedestals, hit OK, Reopen Cap window and pedestals are gone. Don't have an xml file.

Description

FROM: Khalid Obeidat DATE: 5/28/2009 5:03:16 PM Eastern Daylight Time  
 I'm trying to input this example on OPUS sub to prepare for my presentation this year in VOBUG but the program can't generate a model and can't run and get stuck without giving me a clue on what is wrong. This my first input and I'm going on vacation on July so I need to finish this in the next few days and I appreciate any help in guiding me. The program need to give a clue on what is wrong with the data but it only become nonresponsive. Please note that I couldn't attach the file to your website because of a problem on your server and I'll be sending it using email

 Hi Khalid,

Complete Issue Information

Perform validation on the pier will reveal what is missing in the pier. Some materials and steel shapes are not defined. After I entered the required materials and steel shapes, analysis complained that PS strands are not defined in the superstructure. Attached is the updated pier, it should allow you to move on for your presentation preparation. We will investigate (Incident 9207) why Opis becomes non-responsive when there're missing materials and steel shapes.

I'm trying to generate super structure dead load and it is giving me an error on live load which is not related to dead load generation. Please help. Also the technical support on your web site is not working and I couldn't attach my file there.  
thanks

=====

Reply bridgeware e-mail:

=====

Looks like there's a problem in analyzing the superstructure when the members are linked. I'm able to complete the analysis and spec checks after I unlinked the members and defined the PS strands in Member1 of the right superstructure. Attached is the modified bridge. I will add the member linking issue to Incident 9207.

Herman

I'm able to reproduce the crash using the OpisOpisSub executable. Last time I used VirtisOpisOpisSub executable, both analysis and spec checks for final design were completed successfully. Please try again using the VirtisOpisOpisSub executable. VirtisOpisOpisSub should be available in the AASHTOWARE Start Menu. I will enter the crash as a bug in the Support Center.

Sent: Friday, June 05, 2009 9:07 AM  
To: Bridgeware,  
Subject: RE: OPIS SUB problem

We tried running it again on another computer and it crashed again when running Spec check for final design. We could not print all the data in the tech error screen but I'm attaching the beginning of the screen. Please help.  
thanks

>>> "Bridgeware," <Bridgeware@mbakercorp.com> 6/4/2009 9:03 AM >>>

I tried the Final Design Settings, both analysis and spec checks were completed successfully but analysis took a long time to complete. The Preliminary Settings has only 1 limit state and generated 944 LRFD Combinations. On the other hand, the Final Settings has 6 limit states and generated 36124 LRFD Combinations. This is the main reason for the long analysis time.  
Could you try again to see whether Opis still crashes? If you are able to crash Opis again, we need more detail descriptions on how you initiate the analysis and spec checks so we can reproduce the crash? Could you also send us a screen capture of the crash if there is one?

Thanks,  
Herman

To: Bridgeware,  
Subject: RE: OPIS SUB problem

The program still crashes when I run final design template and then run Spec check. No reason is given for the crash. The program perform ok when using the the preliminary design template. Please advise.  
thanks

=====  
=====

Since 6.1 will not have OpisOpisSub configuration, need to check whether the attached pier crashes VirtisOpis and Opis in 6.1.

FROM: Jim Duray DATE: 7/13/2009 3:19:37 PM Eastern Daylight Time  
Herman - Are we able to repoduce the crash?

FROM: Herman Lee DATE: 10/28/2009 10:41:00 AM Eastern Daylight Time  
I tried the Preliminary Settings analysis and spec checks for the pier attached in this incident in the 6.1 Release. The spec checks were not completed successfully.

May, please find out why the spec checks completed successfully in 6.0 but not in 6.1. Also try the Final Design Settings analysis and spec checks in both the VirtisOpis and Opis executables to see

1/5/2016 11:11:23 AM

HRS AASHTO

116

Complete Issue Information

whether you can reproduce the crash.

FROM: Xinmei Li DATE: 2/18/2010 1:26:21 PM Eastern Standard Time

I tried the following scenarios to reproduce the crash:

- 1 Opis 6.1 Release, Preliminary design setting analysis - successful
- 2 Opis 6.1 Release, Preliminary design setting spec checks - not successful, got error as below
- 3 Opis 6.1 Release, Final design setting analysis - successful
- 4 Opis 6.1 Release, Final design setting spec checks - crashed

- 5 VirtisOpis 6.1 Release, Preliminary design setting analysis - successful
- 6 VirtisOpis 6.1 Release, Preliminary design setting spec checks - not successful, got error as below
- 7 VirtisOpis 6.1 Release, Final design setting analysis - successful
- 8 VirtisOpis 6.1 Release, Final design setting spec checks - crashed

=====  
- Component 4 of 7 - Column3  
- Location - 0.0000 (ft)  
Missing data in article: "5.8.2.7 - Maximum Spacing of Transverse Reinforcement"  
Fatal error occured while processing specification checks.  
Writing Specification Check results.  
Completed.

Substructure specification check encountered errors and did not successfully complete!

=====  
FROM: Xinmei Li DATE: 2/24/2010 10:54:56 AM Eastern Standard Time  
For the error message while doing spec check was because the table "RcBeamColumnResultsTable" that should be genrated in article 5.7.4.5 is not successfully generated. If you look at spec check details for Column 3 at 0' article 5.7.4.5, there is an error message at the bottom "Failed to compute capacity of cross section!" Error occurs at AbanGeometry\Polygon.cs line 484. The work around for this error is to change the diameter of the column 3 from 3ft to 3.01ft.

FROM: Xinmei Li DATE: 2/26/2010 9:08:00 AM Eastern Standard Time  
Final design setting spec checks crash is fixed for next release. The crash was due to a block of code added to ALRFD\_4E\_05\_07\_03\_04\_Crack on Aug 23, 2009. It shouldn't be called if the beam or column is not prestress.

Jim, could you take a look at article 5.7.4.5 and see why the "RcBeamColumnResultsTable" was not generated correctly?

FROM: Jim Duray DATE: 4/11/2011 1:07:20 PM Eastern Daylight Time  
I was not able to repoduce this problem. Spec-check results are attached.

Description

FROM: Krisha Kennelly DATE: 7/13/2009 11:32:42 AM Eastern Daylight Time  
submitted for Dave Warner via email:

when I look at the bridge, I have transverse reinforcement in the column.

I have 8.5m of it in a 7.5m column, some in the cap and some in the footing.

please tell me why the spec check is failing, not finishing and erroring about transverse column reinforcement.

FROM: David Warner DATE: 7/14/2009 9:32:37 AM Eastern Daylight Time  
My testing is frozen until this is resolved.

FROM: David Warner DATE: 7/15/2009 11:52:13 AM Eastern Daylight Time  
May I please have some help with this?

Complete Issue Information

FROM: Krisha Kennelly DATE: 7/15/2009 1:42:18 PM Eastern Daylight Time  
Error is being issued because article 5.8.2.7 needs the dv value which was calculated in the 5.7.4.5 biaxial flexure article but that article failed.

Failure of that article appears to be related to not having any LL on the pier.  
User defined lanes is selected on the Superstructure Loads: LL Settings tab but no lanes are defined.

Dave: If you don't want to apply LL to the pier, open the Load Palette window from the toolbar, Clear all load types and then add the DC and DW loads. Spec check will then run.

Jim:

1. User has picked 'user defined lanes' but not entered any lanes. When trying to analyze LmTransverseLiveLoader::GenerateModelLoadsHelper() will return false (not Analysis\_failed). Maybe it should return Analysis\_failed and abort?

2. Not sure why 5.7.4.5 fails to compute the section capacity when 'user defined lanes' is picked but no lanes are entered.

3. Since so many other articles depend on dv maybe we should abort the analysis when 5.7.4.5 fails to compute the capacity?

FROM: David Warner DATE: 7/20/2009 1:15:51 PM Eastern Daylight Time  
Engineers need confidence in their models. Much confidence comes from self weight calculations.

Please keep in mind a way to check self weights. DL's if you will.

Thanks.

FROM: Jim Duray DATE: 9/2/2009 8:24:25 AM Eastern Daylight Time  
This is not new to 6.1.  
I modified LmTransverseLiveLoader::GenerateModelLoadsHelper() to return ANALYSIS\_FAILED if no user-defined patterns. The analysis will abort at that point and issue a message.  
Resolved for 6.1 acceptance build.

Then I built the substructure piece by piece.

analysis is frozen because of the concrete composition error.

FROM: David Warner DATE: 8/14/2009 9:40:52 AM Eastern Daylight Time  
Unable to determine concrete composition type!  
07:30:28 AM - Line 2080 in source file .MdColumn.cpp.

Unable to determine concrete composition type!  
07:30:25 AM - Line 2080 in source file .MdColumn.cpp.

The concrete material library has only one type now, the deck concrete. One type of concrete used everywhere. superstructure and substructure. still won't analyze substructure. concrete composition type error.

FROM: Herman Lee DATE: 8/14/2009 9:55:29 AM Eastern Daylight Time  
Changed Folder to /Support Center/Opis Sub since the reported issue is not new in 6.1 Beta.

The start distances for Column2 flexural and shear reinforcements are causing the problem. The start distance is the distance from the bottom of column to the start of the range. All entered start distances in Column2 are negative. Opis is not able to determine the concrete material at the reinforcement locations since they are located below the column. I'm able to analyze the pier after I changed the start distances in Column2 to the same as those in Column1.

FROM: David Warner DATE: 8/14/2009 12:01:36 PM Eastern Daylight Time  
I'll rebuild the whole bridge's elevations.

The problem is the negative elevations?

Working...

FROM: David Warner DATE: 8/17/2009 3:52:40 PM Eastern Daylight Time  
I would appreciate it if you would not mark an issue resolved until I've told you things are working.

this issue is still very unresolved.

I've yet to get an analysis to work.

I've made a new incident.

FROM: Herman Lee DATE: 8/18/2009 9:12:46 AM Eastern Daylight Time  
When what described in an incident has been investigated and fixed/commented, we usually change the Status to Resolved. Resolved signifies the incident is ready for the Submitter to review. If the Submitter is not satisfy with the fix/comment, the Reviewer Status or the Track can be marked as Resubmit so we can change the Status back to Assigned. Attached (Visual Intercept Statuses.pdf) is a flow chart of the process. For assignment and bookkeeping purposes, we would like to have only one issue in an incident if possible.

FROM: David Warner DATE: 8/20/2009 8:39:53 AM Eastern Daylight Time  
First time I've seen the flow chart. I'll use it.

Description

FROM: Herman Lee DATE: 11/13/2009 10:40:29 AM Eastern Standard Time  
 Submitted on behalf of Harjit Bal, NJ DOT.

To reproduce the problem, try entering -32.9 Deg in the Skew angle for Pier 1.

FROM: Herman Lee DATE: 11/13/2009 11:03:17 AM Eastern Standard Time  
 Program froze when creating a new foundation alternative.

Developer Note:

UiNewFoundationAltDescPpg.cpp Line 845 - 848 stuck in an infinite loop.

```

=====
while (lpSteelShapeDisp)
{
    if(!ShapeType != TYP_LIBSTL_WSHAPE)
        continue;
    .....
=====

```

FROM: Joseph Ihnat DATE: 11/19/2009 2:18:59 PM Eastern Standard Time  
 Fixed the New Foundation Alt problem for version 6.2  
 Krishna, please investigate the skew angle problem.

FROM: Krishna Kennelly DATE: 8/22/2012 1:21:14 PM Eastern Daylight Time  
 The skew angle problem is not reproducible in version 6.4 or in 6.3.1. I am able to enter negative values for the Pier Skew and save them.

### Description

FROM: Andrea Grunau DATE: 1/25/2010 9:58:30 AM Eastern Standard Time

I am currently trying to check a pier in the final design condition. I can analyze the structure without any problems, but every time I run the specification check it crashes OPIS.

FROM: Herman Lee DATE: 1/25/2010 3:13:28 PM Eastern Standard Time

Please export the bridge to a XML file and attach to this incident for our investigation.

FROM: Andrea Grunau DATE: 1/25/2010 3:37:03 PM Eastern Standard Time

I have attached the XML file.....it is Pier 1 under the 2 span bridge option that I am having trouble with. Thanks.

FROM: Herman Lee DATE: 1/26/2010 9:52:06 AM Eastern Standard Time

We don't see the XML file in the Documents tab. Please try to attach it again or e-mail the XML file to [bridgeware@mbakercorp.com](mailto:bridgeware@mbakercorp.com). Thanks.

FROM: Andrea Grunau DATE: 2/3/2010 5:52:57 PM Eastern Standard Time

I emailed the XML file. Please let me know if you received it. Thanks.

FROM: Herman Lee DATE: 2/4/2010 11:02:32 AM Eastern Standard Time

I attached your XML file in this incident.

FROM: Andrea Grunau DATE: 3/9/2010 2:56:00 PM Eastern Standard Time

Any progress on this issue? It is still crashing when I try to run the specification check in the final design mode. Thanks.

Description

FROM: Herman Lee DATE: 3/18/2010 8:57:19 AM Eastern Daylight Time  
 Submitted on behalf of Golda Davydov, CO DOT.

=====

The program is doing the analysis for the superstructure (for the Girder 1 to the Girder 25), but I am interested in the analysis of the Substructure for the Piers 2 and 3. Please, see the attached input file. I am using Opus/Opus sub, version 6.0. I would very much appreciate your assistance in helping me make the program run so I can analyze Piers 2 and 3 in the attached input file.

Thank you,

Golda Davydov, P.E.

=====

I'm able to perform Pier 2 substructure analysis using 6.0 VirtisOpisOpisSub.exe but not 6.0 OpisOpisSub.exe.

May, please see whether you are able to reproduce the problem in 6.1 VirtisOpis.exe and 6.1 Opis.exe.

FROM: Joseph Ihnat DATE: 3/19/2010 11:17:57 AM Eastern Daylight Time  
 Neither 6.1 exe successfully runs this bridge and both do the same thing (run for awhile then crash).

FROM: Joseph Ihnat DATE: 3/19/2010 11:29:39 AM Eastern Daylight Time  
 The "crash" is that the program just disappears, with no "Send message to Microsoft" window.  
 Log file is attached.

FROM: Jim Duray DATE: 5/7/2010 1:45:37 PM Eastern Daylight Time  
 The transverse loader goes into an infinite loop (or so it seems).

FROM: Jeff Ruby DATE: 4/13/2011 11:51:18 AM Eastern Daylight Time

1/5/2016 11:11:25 AM

HRS AASHTO

128

Complete Issue Information

Testing on 6.3 Beta 1, the transverse loader did complete (after 25 minutes) with 35950 vehicle patterns and 71900 vehicle patterns. It then crashed later generating wind load on superstructure. That may or may not be a separate issue. See attached screen shot.

FROM: Jim Duray DATE: 7/13/2012 8:53:38 AM Eastern Daylight Time  
The problem is with computing the wind load. I attached a version of the xml bridge description with only one transverse vehilce position so it runs quicker.

FROM: Jim Duray DATE: 7/13/2012 2:32:23 PM Eastern Daylight Time  
I resolved the problem with wind on super and wind on live. There is a problem with computing the load due to water on substructure.  
Use "HL F-17-WP MARCH 17 - jad.xml" attached.

FROM: Krisha Kennelly DATE: 8/22/2012 9:52:09 AM Eastern Daylight Time  
Water on substructure problem fixed for 6.4 acceptance build. the attached "HL F-17-WP MARCH 17 - jad.xml" now runs to completion. Hand calcs verified the computed water on substructure loads.

FROM: Matt Kolis DATE: 8/29/2012 10:33:40 AM Eastern Daylight Time  
In VO64, Beta 4, Pier 2 runs to completion, however, Pier 3 takes way too long to run and then gives the attached error.

FROM: Bin Zhang DATE: 8/31/2012 1:27:38 PM Eastern Daylight Time  
Verified for the acceptance build. Pier 3 took 51 minutes to complete in my VM (Win7 64Bit).

Description

FROM: Rich Schoedel DATE: 4/22/2010 12:48:50 PM Eastern Daylight Time  
 The calucation of the moment of inertia about the pier transverse axis appears incorrectly in the "Stiffness" window. See attached markup. LRFD Substructure Example 4.

FROM: Krisha Kennelly DATE: 4/28/2010 12:38:02 PM Eastern Daylight Time  
 fixed for version 6.2

Transverse moment of inertia was computed incorrectly in the Pier Alt:Stiffness window for a solid shaft pier.

FROM: Jim Duray DATE: 5/4/2010 7:55:47 AM Eastern Daylight Time  
 Using the A4 with updates through this morning the window still shows 470 for the MOI. I think it should be 1396 ft^4 as shown in the FE model report (28,956,852 in^4)

Description

FROM: Jeff Ruby DATE: 5/11/2010 9:59:36 AM Eastern Daylight Time

When importing an xml file exported from the previous version, I got this error. See the attached log file. Also, I attached the xml file I tried to import.

FROM: George Colgrove DATE: 5/11/2010 10:19:22 AM Eastern Daylight Time

I was able to load into the debug build (fresh as of afternoon 5/10/10) but could not be saved. Gave this error:

Unable to save Bridge data!

Saving New and Modified objects failed while processing CDmBridgeSubLrfdDsVehicle (SaveOrder object 107).

Error updating database record set.

Complete Issue Information

Duplicate of 9934.

FROM: George Colgrove DATE: 5/12/2010 3:47:00 PM Eastern Daylight Time  
This worked

FROM: Jeff Ruby DATE: 5/13/2010 2:20:00 PM Eastern Daylight Time  
Still doesn't work with attached bridge.

FROM: Mehrdad Ordoobadi DATE: 5/13/2010 2:32:01 PM Eastern Daylight Time  
Please follow the instructions provided in the issue 9334 that is repeated below:

The issue is due to not having the same vehicle that was referenced in the Substructure Design Settings in the 6.2 database Library vehicle. The vehicle existed in the original 6.1 database but it doesn't exist in the 6.2 database. That's the reason for not being able to save.

To resolve:

- 1 - Open the "Jeffs Substructure Settings" Design Setting.
- 2 - In the vehicle Tab, there is a vehicle under "Strength-II limit state" that does not have any label. Select that vehicle and then remove it from the vehicle summary tree.
- 3 - Then save. Save should be successful.

FROM: Jeff Ruby DATE: 9/7/2010 10:46:15 AM Eastern Daylight Time  
Ok, this is a "workaround" then. So what does "resolved" mean? Will this be listed on the website as a workaround? Or did you add better error handling? I don't see how this was "resolved" yet. We can do 2 things.

- 1) Better error handling (message) so the user can figure out what to do.
- 2) Enter how to solve this problem somewhere on the web site.

FROM: Jeff Ruby DATE: 9/7/2010 10:52:23 AM Eastern Daylight Time  
I see that 9934 states that there needs to be some discussion on how to "solve" this. It isn't going to be done for 6.2 So this cannot be resolved for 6.2 Remove it from the 6.2 list and add it to the 6.3 list or something.

FROM: Jim Duray DATE: 9/7/2010 2:15:33 PM Eastern Daylight Time  
I changed it to a 6.1 release bug since it existed in previous releases (not new to 6.2 beta). Special handling of vehicle-related data in an import/export is actually an enhancement to the process.

FROM: Mehrdad Ordoobadi DATE: 2/2/2011 8:11:27 AM Eastern Standard Time  
Changed the domain code to ignore the vehicles that do not exist. The vehicles that are referenced in a bridge export file but do not exist (their IDs) will not be added to the LRFD Design Settings.

FROM: Mehrdad Ordoobadi DATE: 2/2/2011 8:33:14 AM Eastern Standard Time  
Fixed for 6.3

FROM: Xinmei Li DATE: 3/28/2011 4:31:16 PM Eastern Daylight Time  
Verified fixed for 6.3 Alpha6.

FROM: Jeff Ruby DATE: 4/12/2011 1:51:07 PM Eastern Daylight Time  
Accepted in Version 6.3 Beta 1

Yes this does work - but  
Should we have to do this  
If a bridge created by a consultant and delivered to an agency, this would prevent us from including this

1/5/2016 11:11:27 AM

HRS AASHTO

137

Complete Issue Information

in our database.

Or the same goes when sending this out to a consultant

Do we want to have this happen without a reasonable way for the agency or consultant to handle this? The failed save operation doesn't point the average user to a resolution.

FROM: Jim Duray DATE: 7/23/2010 11:20:12 AM Eastern Daylight Time

This is not new to 6.2 (although it was discovered while testing 6.2). It has been there since the first release of substructure. Mehrdad's description on 5/12 above explains the issue. We need to decide how best to handle this situation. It is too late in the testing of 6.2 to implement for the 6.2 release.

I think our choices are to either not export/import the design settings or export/import info about the vehicles so we can determine if the vehicle is the same in the target DB as in the source DB. We currently do not export vehicles with a bridge workspace. The only other time we store vehicle id's in the BWS is with analysis results and we do not export analysis results with the BWS.

### Description

FROM: Russell Howells DATE: 1/19/2011 10:02:15 AM Eastern Standard Time  
In the column reinforcement screen it would be helpful to be able to see the same information that is provided in the "Generate Pattern" screen. This information includes the following:

- Section selected for the reinforcement
- Reinforcement Bar Size
- Clear Cover

This information is required in the checking process and appears to only be verified by checking the geometry in a spreadsheet to verify these dimensions. The problem is that when the user clicks on the "Generate Pattern" button, the new window does not have any of the information that was used to generate the current pattern.

Please do one of the following to provide easier user interface:

1. When the "Generate Pattern" button is clicked, the information used to generate the existing

### Complete Issue Information

pattern is saved and displayed. The user can then modify that data as required to modify the existing pattern or to generate a new pattern.

2. Provide this information in the column reinforcement window.

Attached one page PDF.

Basically the Spread footing is doing everything right if build on Rock. But there's a radio button on the spread footing foundation alternative, under subsurface type, [soil or rock] which is a bit misleading as it's not doing soil correctly. Instead a uniform pressure on a reduced effective footing size is used on soils. If one doesn't go below the bottom of footing then the linearly varying pressure is whats needed for footing structural design. Good. Lastly since the values "e" "B" and "V" are already calculated and used correctly in the linearly varying footing pressures a uniform pressure column can be added very

Submitted on behalf of Dave Warner, Montana DOT

attached bridge, pier 2. Has user entered override LL's and checked the box to use the override live loads.

But the live load analysis is not using these loads. I can change the user entered override LL drastically and the LL applied to the pier never changes.

FROM: Herman Lee DATE: 8/28/2012 8:45:40 AM Eastern Daylight Time  
Fixed by Jim Duray for the 6.4 release.

FROM: Xinmei Li DATE: 8/29/2012 7:55:46 PM Eastern Daylight Time  
Tested with Beta4, I think the live load reactions still don't change when override live load changes. I used attached bridge Pier2, I changed the live load distribution in superstructure loads window, I changed the axle load and uniform load and also checked the override checkbox. The live load reaction summary always reports the same live load reactions as if I selected computed in the live load distribution tab.

FROM: Xinmei Li DATE: 8/30/2012 3:35:33 PM Eastern Daylight Time  
Verified the fix for beta 4.  
I ran pier2 with computed LL and overridden LL, values are different. I also ran it by entering computed LL to the overrid LL tables, the LL reactions match the computed results.

### Description

FROM: David Warner DATE: 10/19/2011 2:34:07 PM Eastern Daylight Time

The superstructure analyzes without incident. It's a two span continuous prestressed girder. It has a wider than normal pier but my design work for the superstructure tells me the superstructure is working very well.

The substructure however seems to have a bug. The 3-d view looks good. It's a bit wider than most bridges. I've tried multiple live load settings below in the pier superstructure loading area. Each time the analysis pegs on Transverse live loader... and never comes out of it. I even ran it all night and this morning was a warning screen that virtis/opis had to close due to a fatal error.

Any help is much appreciated. I am confident the substructure has all dimensions and reinforcing

### Description

FROM: Joseph Ihnat DATE: 4/17/2012 9:45:23 AM Eastern Daylight Time

Don't know if this is two problems or the same problem.

Using LRFD Substructure Example 1:

- 1) Open the Column1 Components window, create 4 segments, set cross section types 1-4 to Rectangular, Round, Round Nose, Wedge Nose.
- 2) Click OK. Reopen the window to verify segments are in the order we just entered.
- 3) Close the BWS to save the bridge, then reopen and open column components window again. Segments are now in reverse order.
- 4) If you just Save instead of closing BWS to save, segments are not reordered.

Also:

- 1) Perform step (1) as above.
- 2) Copy pier alt "3-column pier".
- 3) Under pier alt "Copy of 3-column pier", open Column1 Components window. Order of segments is reversed.

FROM: Joseph Ihnat DATE: 4/17/2012 10:03:21 AM Eastern Daylight Time

Disregard. Works OK if I enter the elevations.

Description

FROM: Aaron Kemna DATE: 8/10/2012 1:55:23 PM Eastern Daylight Time  
I had someone take a quick look at the drilled shaft module and he reported the following issues. I am attaching an xml file. He thinks that some of the issues may be user error.

Chris:

I was unable to get the drilled shaft module to run in OPIS. I kept getting an error that the finite element model could not be created. I was also unable to save the file after copying and pasting a foundation definition. The program crashes after closing the 3D schematic of the substructure which only shows the schematic for the last column.

Some things that are missing from the program (Chris's opinion):

- No input for rock (weak or strong) soil-type for p-y curves.
- No input for web wall or collision wall plate elements.
- No input for tie beams.

Aaron:

Would it make sense to set up soil user definitions in the library since there are no default rock definitions for the p-y curves?

FROM: Jim Duray DATE: 8/10/2012 2:05:47 PM Eastern Daylight Time  
Drilled shaft is not included in the 6.4 release (actually only the UI is included). The analysis is (or should be) disabled. I see that the disabling of the analysis didn't make into the Beta 3 build. The next build will display the following message:

"Analysis of piers with a drilled shaft foundation is not currently supported by the software. Analysis will be supported beginning with version 6.4.1.

Analysis failed!"

FROM: Jim Duray DATE: 8/14/2012 10:49:21 AM Eastern Daylight Time  
The items above that are "missing" are enhancements.

FROM: Herman Lee DATE: 10/9/2012 4:17:13 PM Eastern Daylight Time  
Changed Folder from Beta Testing to Support Center/Opis Sub.

### Description

FROM: Jeff Ruby DATE: 8/13/2012 2:14:32 PM Eastern Daylight Time

It would be helpful to at least have some ball park number to enter for soil layers.

The following is taken from the COM624P dos program's help file:

p-y Curve Criteria  
Soil Modulus Parameter k  
Soil Strain Parameter E50

p-y Curve Criteria

These criteria are used by LPILE1 to calculate p-y curves internally

- Option 1 - Soft Clay (Matlock, 1970)
- Option 2 - Stiff Clay Below the Watertable (Reese et al., 1975)
- Option 3 - Stiff Clay Above the Watertable (Reese & Welch, 1975)
- Option 4 - Sand (Reese et al., 1974)

Complete Issue Information

Soil Modulus Parameter k for Clays

| Average Undrained Shear Strength                                           | Static                    | Cyclic                   |
|----------------------------------------------------------------------------|---------------------------|--------------------------|
| Soft Clay, c = 1.74 to 3.47 psi<br>250 to 500 psf<br>12 to 24 KPa          | 30 pci<br>8,140 KPa/m     | -<br>-                   |
| Medium Clay, c = 3.47 to 6.94 psi<br>500 to 1000 psf<br>24 to 48 KPa       | 100 pci<br>27,150 KPa/m   | -<br>-                   |
| Stiff Clay, c = 6.94 to 13.9 psi<br>1000 to 2000 psf<br>48 to 96 KPa       | 500 pci<br>136,000 KPa/m  | 200 pci<br>54,300 KPa/m  |
| Very Stiff Clay, c = 13.9 to 27.8 psi<br>2000 to 4000 psf<br>96 to 192 KPa | 1000 pci<br>271,000 KPa/m | 400 pci<br>108,500 KPa/m |
| Hard Clay, c = 27.8 to 55.6 psi<br>4000 to 8000 psf<br>192 to 383 KPa      | 2000 pci<br>543,000 KPa/m | 800 pci<br>217,000 KPa/m |

Soil Modulus Parameter k for Sands

| Relative Density        | Loose                                | Medium                                | Dense                                  |
|-------------------------|--------------------------------------|---------------------------------------|----------------------------------------|
| Submerged Sand<br>" " " | 20 lb/in <sup>3</sup><br>5,430 KPa/m | 60 lb/in <sup>3</sup><br>16,300 KPa/m | 125 lb/in <sup>3</sup><br>33,900 KPa/m |
| Sand Above WT<br>" " "  | 25 lb/in <sup>3</sup><br>6,790 KPa/m | 90 lb/in <sup>3</sup><br>24,430 KPa/m | 225 lb/in <sup>3</sup><br>61,000 KPa/m |

Soil Strain Parameter E50

|                                                                      |             |
|----------------------------------------------------------------------|-------------|
| Soft Clay, c = 1.74 to 3.47 psi<br>250 to 500 psf<br>12 to 24 KPa    | E50 = 0.02  |
| Medium Clay, c = 3.47 to 6.94 psi<br>500 to 1000 psf<br>24 to 48 KPa | E50 = 0.01  |
| Stiff Clay, c = 6.94 to 13.9 psi<br>1000 to 2000 psf<br>48 to 96 KPa | E50 = 0.007 |

Complete Issue Information

Very Stiff Clay, c = 13.9 to 27.8 psi E50 = 0.005  
 2000 to 4000 psf  
 96 to 192 KPa

Hard Clay, c = 27.8 to 55.6 psi E50 = 0.004  
 4000 to 8000 psf  
 192 to 383 KPa

### Description

FROM: Jim Duray DATE: 11/29/2012 3:33:03 PM Eastern Standard Time

I modified the scale factor for plotting results and got incorrect results:

For moment y:

Change the scale factor from 10 to 20 - worked, then change back to 10 - it seems like the 10 was added to the 20 to give a larger amplification.

Change the factor to zero - crash.

Use any pier.

FROM: Girish Bhanushali DATE: 11/30/2012 2:21:58 PM Eastern Standard Time

Resolution reached after co-investigation with Jim (on Jim's machine) that rest is working fine and only need to take care of the crash when result scale values are entered zero. (prevent zero and less than zero values entered by user)

FROM: Joseph Ihnat DATE: 11/30/2012 3:12:33 PM Eastern Standard Time

Probably always been like this. I was able to reproduce this crash in version 6.3

### Description

FROM: Todd Thompson DATE: 1/31/2013 10:01:11 AM Eastern Standard Time  
Using Opus Sub 6.3.0

This is our first real design where we are trying to use Opus Substructure but we are having problems getting this to work. When the designer attempts to click on the substructure loads - he keeps getting this error message. The pier does validate ok. The superstructure does work ok.

Attached the bridge xml and a screen shot of the error message.

Not sure if we are missing something obvious or what?

FROM: Krisha Kennelly DATE: 2/1/2013 10:45:49 AM Eastern Standard Time  
There is a tolerance problem here. Code will be fixed for 6.5.

In the meantime you can use this workaround:

For the superstructure definition "BAF Design - Simple Final", change the structure length on the Superstructure Def window from 119.9583' to 119.9580'. (See attached screenshot). This window can then be opened and the pier can be analyzed and spec checked.

FROM: Krisha Kennelly DATE: 4/24/2013 2:51:02 PM Eastern Daylight Time  
Fixed for 6.5.0

### Description

FROM: Brad Wagner DATE: 5/7/2013 4:00:06 PM Eastern Daylight Time

I've tested this enhancement in several places, and for some reason it will not work for LRFD Substructure Example 1. It seems to work for most other models except for models that run very quickly.

FROM: Herman Lee DATE: 7/8/2013 3:42:25 PM Eastern Daylight Time

The enhancement (Incident 9641) asked to add more checks for aborting the analysis of a single member alternative. The source code we modified are not shared between superstructure and substructure analyses. I'm changing this to an enhancement request for adding more checks for aborting substructure analysis.
